Permission denied	Confirm whether access permission of the message file (%s1) is correctly set. (*2) If access permission is incorrect, set a correct one.
Invalid data	Confirm whether the message file (%s1) is an HTML file. If it is not, set the HTML file.

\*1 For details on the message file and original file, refer to 'Customizing Messages Displayed on a Web Browser' - 'Messages that can be Customized' in the chapter 'Single Sign-on Customization' of the Single Sign-on Operator's Guide.

\*2 For details on setting access permission, see 'Single Sign-on Customization' - 'Customizing Messages Displayed on a Web Browser' - 'Setting Access Authority for a Message File' in the Single Sign-on Operator's Guide.

## 21.3.26 sso02038

### SSO: ERROR: sso02038: Initialization of access log failed. Logfile=(%s1) Reason=(%s2)

#### Variable Information

%s1 = Output destination file name of the authentication server access log

%s2 = Cause of the error

#### Explanation

The access log of the Interstage Single Sign-on Authentication server failed to be initialized. The possible causes are as follows:

- The upgrade the authentication server from a previous version might have been unsuccessful.
- In all other cases, the possible causes are shown in the table below.

Table 21.32 Reasons for Access Log Error

Cause of error (%s2)	Explanation
Permission denied	No access permission is set for the access log output destination directory of the authentication server.
	No access permission is set for the access log output destination file (%s1) of the authentication server.
	The access log output destination file (%s1) of the authentication server may be in use with another application.
	<b>Solaris32/64 Linux32/64</b> There is no authority for access to the log daemon process.
Directory not found	The access log output destination directory of the authentication server is not found.
Filename is directory	A directory is set as the access log output destination file name of the authentication server.
Not enough disk space	The amount of free disk space is insufficient.
Not enough memory	The memory space required for the Interstage Single Sign-on Authentication server is insufficient.
Acquisition of shared memory failed	There was an error in the shared memory required for the Interstage Single Sign-on Authentication server.
Operation of shared memory failed	
Acquisition of exclusive lock resource failed	There was an error in the exclusion control resource (semaphore) required for the Interstage Single Sign-on Authentication server.
Exclusive lock failed	
System error	A system error occurred during operation of the Interstage Single Sign-on Authentication server.

#### User Action

Take the following action:

- Check that the authentication server access log output file (%s1) path is valid. (\*1) If the path is invalid, check that the procedure used to upgrade the authentication server was correct.
- In all other cases, take action according to the error cause (%s2). Error causes are shown in the table below.

Table 21.33 User Actions for Access Log Error

Cause of Error (%s2)	Action
Permission denied	Confirm whether access permission is correctly set for the directory of the access log output destination file (%s1) of the authentication server. If access permission is incorrect, set a correct one. (*2)
	If the access log output destination file (%s1) of the authentication server exists, confirm whether access permission is correctly set for the output destination file. If access permission is incorrect, set a correct one. (*2)
	Confirm whether the access log output destination file (%s1) of the authentication server is being used by another application. If it is, close another application. (*2)
	<p><b>Solaris32/64</b> <b>Linux32/64</b></p> <p>In Integrated Windows Authentication, the start user authority of the WorkUnit used to deploy the Integrated Windows Authentication application and the Web server effective user or group authority may not match. Start the WorkUnit as a user for whom the authorities match. (*3)</p>
Directory not found	Confirm whether the directory of the access log output destination file (%s1) of the authentication server exists and whether the directory in the output destination file name exists.
Filename is directory	Set the file name as the access log output destination file (%s1) of the authentication server. (*1)
Not enough disk space	Allocate a free area, for example by saving unnecessary files.
Not enough memory	<p>Close all unnecessary programs. Alternatively, confirm whether enough memory space is allocated for Interstage Single Sign-on operation.</p> <p>For details on the required memory space, refer to "Memory Requirements" in the "Resource Requirements" chapter of the Tuning Guide.</p>
Acquisition of shared memory failed	<p><b>Solaris32/64</b> <b>Linux32/64</b></p> <p>Confirm the system parameters. For details on the system parameters, refer to the "System Tuning" chapter in the Tuning Guide.</p>
Acquisition of exclusive lock resource failed	
Operation of shared memory failed	
Exclusive lock failed	
System error	<p>If the authentication server is running, briefly stop it and then restart it. (*4)</p> <p>If this message is still output, immediately after the message is output, use the <code>iscollectinfo</code> command to collect investigation information, then contact your service engineer.</p>

\*1 To set the access log output destination, select [Security] > [Single Sign-on] > [Authentication infrastructure] > [Authentication server] > [File name] in [Access Log Settings] of the [Settings] tab on the Interstage Management Console.

\*2 For details on setting access permission, see 'Operation and Maintenance' - 'Changing Effective User for Web Server' in the Single Sign-on Operator's Guide.

\*3 For details about the WorkUnit start user, refer to 'Operation and Maintenance' - 'Starting Single Sign-on' - 'Starting an Authentication Server' in the Single Sign-on Operator's Guide.

\*4 For details on stopping and starting the authentication server, refer to 'Stopping an Authentication Server' and 'Starting an Authentication Server' in the 'Operation and Maintenance' chapter of the Single Sign-on Operator's Guide.

## 21.3.27 sso02039

**SSO: WARNING: sso02039: Can not write access log. Logfile=(%s1) Reason=(%s2)**

## Variable Information

%s1 = Absolute path of the access log output destination file of the authentication server

%s2 = Cause of the error

## Explanation

The access log of the Interstage Single Sign-on Authentication server failed to be written. The possible causes are shown in the following table.

Table 21.34 Reasons for Access Log Failure

Cause of error (%s2)	Explanation
Permission denied	There is no permission to write data in the access log output destination file (%s1) of the authentication server.
	The output destination file (%s1) for the authentication server access log or the backup file used when switching access logs (%s1.last or %s1.YYYYMMDDHHMMSS (the string after the period represents the date and time the file was saved)) may be in use by another application.
Not enough disk space	The amount of free disk space is insufficient
Not enough memory	The memory space required for the Interstage Single Sign-on Authentication server is insufficient.
Acquisition of shared memory failed	There was an error in the shared memory required for the Interstage Single Sign-on Authentication server.
Operation of shared memory failed	
Acquisition of exclusive lock resource failed	There was an error in the exclusion control resource (semaphore) required for the Interstage Single Sign-on Authentication server.
Exclusive lock failed	
System error	A system error occurred during operation of the Interstage Single Sign-on Authentication server.
	<b>Solaris32/64</b> <b>Linux32/64</b> The access log output destination file of the authentication server may be a symbolic link.

## User Action

Take the following action described in the following table:

Table 21.35 User Actions for Access Log Failure

Cause of error (%s2)	Action
Permission denied	Confirm whether access permission of the access log output destination file (%s1) of the authentication server is correctly set. If access permission is incorrect, set a correct one. (*1)
	Check if the access log output destination file (%s1) of the authentication server or the backup file used when switching access logs (%s1.last or %s1.YYYYMMDDHHMMSS (the string after the period represents the date and time the file was saved)) is in use by another application. If it is, close another application. (*1)
Not enough disk space	Allocate free space, for example by saving unnecessary files to another location.
Not enough memory	Close all unnecessary programs. Alternatively, ensure that enough memory space is allocated for Interstage Single Sign-on.  For details on the required memory space, refer to "Memory Requirements" in the "Resource Requirements" chapter of the Tuning Guide.

Cause of error (%s2)	Action
Acquisition of shared memory failed	<a href="#">Solaris32/64</a> <a href="#">Linux32/64</a> Confirm the system parameters. For details on the system parameters, refer to the "System Tuning" chapter in the Tuning Guide.
Acquisition of exclusive lock resource failed	
Operation of shared memory failed	
Exclusive lock failed	
System error	Briefly stop the authentication server and then restart it. (*2) If this message is still output, immediately after the message is output, use the <code>iscollectinfo</code> command to collect investigation information, then contact your service engineer.
	<a href="#">Solaris32/64</a> <a href="#">Linux32/64</a> Confirm whether the symbolic link exists for the access log output destination file (%s1) of the authentication server.

\*1 For details on setting access permission, see 'Operation and Maintenance' - 'Changing Effective User for Web Server' in the Single Sign-on Operator's Guide.

\*2 For details on stopping and starting the authentication server, refer to 'Stopping an Authentication Server' and 'Starting an Authentication Server' in the 'Operation and Maintenance' chapter of the Single Sign-on Operator's Guide.

## 21.3.28 sso02040

**SSO: WARNING: sso02040: Error is in setting of configuration file. Default value is used. Filename=(%s1) Item=(%s2) Value=(%s3)**

### Variable Information

%s1 = Absolute path of the authentication server configuration file

%s2 = Configuration item name

%s3 = Setting value

### Explanation

The default value was used because an unspecified value (%s3) was set in the configuration item (%s2) of the Interstage Single Sign-on Authentication server configuration file (%s1).

This message may be output two or more times when the authentication server starts.

### User Action

Take the following action:

- Check configuration item (%s2) of authentication server configuration file (%s1) and take the following response measures:

Table 21.36 User Actions

Configuration items(%s2)	Action
reject-incorrect-protection-resource-url	See 'Settings for Protection Resource in Authentication Server' in the Single Sign-on Operator's Guide to confirm whether the setting is correct.
allow-sm-cert-auth	Refer to the "Settings of the certificate authentication that performs a session management on the system" and check if the settings are correct.

If "reject-incorrect-protection-resource-url" was shown in the configuration item name (%s2) of the authentication server configuration file (%s1), see 'Settings for Protection Resource in Authentication Server' in the Single Sign-on Operator's Guide to confirm whether the setting is correct.

- In cases other than the above, take the following action:
  - On the Interstage Management Console, select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Authentication server] and click the Update button of [Settings] to update the authentication server environment settings. The default value is set.

## 21.3.29 sso02041

---

**SSO: WARNING: sso02041: Error is in setting of configuration file. Invalid value is omitted. Filename=(%s1) Item=(%s2) Value=(%s3)**

### Variable Information

%s1 = Absolute path of the authentication server configuration file

%s2 = Configuration item name

%s3 = Setting value

### Explanation

The target setting value was invalidated because an invalid value (%s3) was set in the configuration item (%s2) of the Interstage Single Sign-on Authentication server configuration file (%s1).

This message is output two or more times at startup.

### User Action

Take the following action:

- Select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Authentication server] > the 'Update' button of [Settings] on the Interstage Management Console to update the authentication server environment settings. The incorrect setting value becomes invalid.

## 21.3.30 sso02044

---

**SSO: ERROR: sso02044: Allocation of memory or shared memory failed. Code=(%s1)**

### Variable Information

%s1 = Maintenance information

### Explanation

**Windows32/64**

The memory required for the Interstage Single Sign-on Authentication server failed to be allocated. The memory space required for the Interstage Single Sign-on Authentication server is insufficient.

**Solaris32/64 Linux32/64**

The memory or shared memory required for the Interstage Single Sign-on Authentication server failed to be allocated. The memory space required for the Interstage Single Sign-on Authentication server is insufficient. Alternatively, there was an error in the shared memory settings.

### User Action

**Windows32/64**

Close all unnecessary programs. Alternatively, confirm whether enough memory space enough is allocated for the Interstage Single Sign-on Authentication server.

For details on the required memory space, refer to "Memory Requirements" in the "Resource Requirements" chapter of the Tuning Guide.

When enough memory space is allocated, use the *iscollectinfo* command immediately after the message is output to collect investigation information, then contact your service engineer.

Solaris32/64 Linux32/64

Close all unnecessary programs. Alternatively, confirm whether enough memory space is allocated for the Interstage Single Sign-on Authentication server and whether the size of the shared memory is correctly set.

For details on the required memory space, refer to "Memory Requirements" in the "Resource Requirements" chapter of the Tuning Guide. For details on the size of the required shared memory, refer to the "System Tuning" chapter in the Tuning Guide.

When enough memory space is allocated and the shared memory size is correctly set, use the *iscollectinfo* command immediately after the message is output to collect investigation information, then contact your service engineer.

### 21.3.31 sso02045

---

**SSO: WARNING: sso02045: SSO Authentication server is already running.**

#### Explanation

The Interstage Single Sign-on Authentication server has already started.

### 21.3.32 sso02046

---

**SSO: ERROR: sso02046: Operation of shared memory failed. Code=(%s1)**

#### Variable Information

%s1 = Maintenance information

#### Explanation

Windows32/64

The Interstage Single Sign-on Authentication server failed to reference the shared memory already created. The memory space required for the Interstage Single Sign-on Authentication server may be insufficient.

Solaris32/64 Linux32/64

The Interstage Single Sign-on Authentication server failed to reference the shared memory already created. The memory space or shared memory size required for the Interstage Single Sign-on Authentication server may be insufficient.

#### User Action

Windows32/64

Close the unnecessary programs. Alternatively, confirm whether the memory space enough for the Interstage Single Sign-on Authentication server is allocated.

For details on the required memory space, refer to "Memory Requirements" in the "Resource Requirements" chapter of the Tuning Guide.

When enough memory space is allocated, use the *iscollectinfo* command immediately after the message is output to collect investigation information, then contact your service engineer.

Solaris32/64 Linux32/64

Close all unnecessary programs. Alternatively, confirm whether enough memory space is allocated for the Interstage Single Sign-on Authentication server and whether the size of the shared memory is correctly set.

For details on the required memory space, refer to "Memory Requirements" in the "Resource Requirements" chapter of the Tuning Guide. For details on the size of the required shared memory, refer to the "System Tuning" chapter in the Tuning Guide.

When enough memory space is allocated and the shared memory size is correctly set, use the *iscollectinfo* command immediately after the message is output to collect investigation information, then contact your service engineer.

### 21.3.33 sso02047

---

**SSO: ERROR: sso02047: Initialization of lock control failed. Code=(%s1)**

## Variable Information

%s1 = Maintenance information

## Explanation

Windows32/64

The exclusion control resource required for the Interstage Single Sign-on Authentication server failed to be allocated. The memory space required for the Interstage Single Sign-on Authentication server may be insufficient.

Solaris32/64 Linux32/64

The exclusion control resource required for the Interstage Single Sign-on Authentication server failed to be allocated. The memory space or exclusion control resource (semaphore) required for the Interstage Single Sign-on Authentication server may be insufficient.

## User Action

Windows32/64

Close all unnecessary programs. Alternatively, confirm whether enough memory space is allocated for the Interstage Single Sign-on Authentication server.

For details on the required memory space, refer to "Memory Requirements" in the "Resource Requirements" chapter of the Tuning Guide.

When enough memory space is allocated, use the *iscollectinfo* command immediately after the message is output to collect investigation information, then contact your service engineer.

Solaris32/64 Linux32/64

Close all unnecessary programs. Alternatively, confirm whether enough memory space is allocated for the Interstage Single Sign-on Authentication server and whether the size of the exclusion control resource (semaphore) is correctly set.

For details on the required memory space, refer to "Memory Requirements" in the "Resource Requirements" chapter of the Tuning Guide. For details on the size of the required exclusion control resource (semaphore), refer to the "System Tuning" chapter in the Tuning Guide.

When enough memory space is allocated and the exclusion control resource (semaphore) size is correctly set, use the *iscollectinfo* command immediately after the message is output to collect investigation information, then contact your service engineer.

## 21.3.34 sso02049

---

**SSO: ERROR: sso02049: Lock control failed. Code=(%s1)**

## Variable Information

%s1 = Maintenance information

## Explanation

Windows32/64

The Interstage Single Sign-on Authentication server failed to perform exclusion control processing. The memory space required for the Interstage Single Sign-on Authentication server may be insufficient.

Solaris32/64 Linux32/64

The Interstage Single Sign-on Authentication server failed to perform exclusion control processing. The memory space or exclusion control resource (semaphore) required for the Interstage Single Sign-on Authentication server may be insufficient.

## User Action

Windows32/64

Close all unnecessary programs. Alternatively, confirm whether enough memory space is allocated for Interstage Single Sign-on operation.

For details on the required memory space, refer to "Memory Requirements" in the "Resource Requirements" chapter of the Tuning Guide.

When enough memory space is allocated, use the *iscollectinfo* command immediately after the message is output to collect investigation information, then contact your service engineer.

**Solaris32/64** **Linux32/64**

Close all unnecessary programs. Alternatively, confirm whether enough memory space is allocated for Interstage Single Sign-on operation and whether the size of the exclusion control resource (semaphore) is correctly set.

For details on the required memory space, refer to "Memory Requirements" in the "Resource Requirements" chapter of the Tuning Guide. For details on the size of the required exclusion control resource (semaphore), refer to the "System Tuning" chapter in the Tuning Guide.

When enough memory space is allocated and the exclusion control resource (semaphore) size is correctly set, use the *iscollectinfo* command immediately after the message is output to collect investigation information, then contact your service engineer.

## 21.3.35 sso02050

---

**SSO: ERROR: sso02050: Invalid response was received. Host=(%s1) Detail=(%s2)**

### Variable Information

%s1 = IP address or host name of the repository server

%s2 = Maintenance information

### Explanation

The Interstage Single Sign-on Authentication server has received an invalid response from the repository server. The possible causes are as follows:

- The response data may be destroyed due to a network environment error.
- The Interstage Single Sign-on Authentication server failed to normally process the response sent from the repository server because that server was temporarily overloaded.

### User Action

Take the following action:

- Confirm the network environment.
- End the Web browser, then restart it. Alternatively, reload the Web browser to perform authentication again.

## 21.3.36 sso02051

---

**SSO: ERROR: sso02051: There is an inconsistency in the environment settings of one of the SSO authentication servers. IPAddr=(%s1) Detail=(%s2) Code=(%s3)**

### Variable Information

%s1 = The IP address or host name of the requesting source

%s2 = Maintenance information

%s3 = Maintenance information

### Explanation

The Interstage Single Sign-on Authentication server received an invalid request. The possible causes are as follows:

- After the authentication server settings are changed, there is a possibility that the operation was performed in a Web browser that was running before the changes were made.
- The Interstage Single Sign-on Authentication server has different settings or is a different version.
- There was an external attack.

## User Action

Take the following action:

- Ask the user to close the Web browser, restart it, and then reaccess.
- If there is more than one authentication server, check that all the authentication server environment settings are the same. If they are not the same, change the settings or, if they cannot be changed, set up the authentication server again. (\*1)
- Check the combination of versions that are in operation (\*2)
- In all other cases, there is a possibility that there was an external attack. Investigate the possibility that there was an external attack based on the request source IP address or hostname (%s1).

\*1 Use the following procedure to rebuild the authentication server:

1. From the Interstage Management Console, select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [List] tab to delete the authentication server once.
2. Build the authentication server with the [Authentication infrastructure Settings] tab.

\*2 For details about operating a combination of versions, refer to "Notes on Interstage Single Sign-on" - "Notes about Setting up Single Sign-on Systems Containing Mixed Versions and Editions" in the "Product Notes."

## 21.3.37 sso02056

---

**SSO: ERROR: sso02056: Invalid request was received. URL of the protection resource is incorrect. IPAddr=(%s1) URL=(%s2)**

### Variable Information

%s1 = The IP address or host name of the requesting source

%s2 = The notified URL as the URL of protection resource

### Explanation

The authentication server of Interstage Single Sign-on accepted an invalid request. The protection resource URL notified from the requesting source is incorrect. This may be due to one of the following:

- The configuration of authentication server is incorrect or the configuration has been changed.
- A security breach from an outside source may have occurred.

### User Action

Confirm whether the protection resource URL notified from the requesting source is the same as the protection resource which has been registered in the SSO repository.

If the protection resource is the same, confirm that the setting of "protection-resource-url" in the authentication server's configuration file (ssoatcag.conf) includes the protection resource registered in the SSO repository. If necessary, modify and ensure the setting is correct, and then restart the authentication server.

If the protection resource is not the same as the notified URL registered in the SSO repository, request the business server administrator to confirm that the notified URL is the protection resource in the business system.

If the notified URL is the protection resource in the business system, there may be inconsistency in the business system and the state of registration of the protection resource in the SSO repository. Modify the protection resource if necessary. For details of how to modify the protection resource, see 'Operation and Maintenance' - 'Authorization-related Operation' - 'Amending Protection Resource' in the Single Sign-on Operator's Guide.

If the notified URL is not the protection resource in the business system, after changing the protection resource, the access control information may not be changed correctly. Request the business server administrator to modify the access control information. After the access control information is modified, guide the (%s1) user of the requesting source to close the web browser and then reaccess the protection resource. Alternatively, the possibility of an external security breach should be considered. Investigate this possibility from the IP address (%s1) or host name (%s1) of the requesting source.

For details of how to modify the authentication server configuration file, see 'Settings for Protection Resource in Authentication Server' in the Single Sign-on Operator's Guide.

## 21.3.38 sso02057

---

### SSO: ERROR: sso02057: Failed to get information required for processing. Code=(%s1)

#### Variable Information

%s1 = Maintenance information

#### Explanation

The Interstage Single Sign-on Authentication server failed to get information required for processing. The possible causes are as follows:

- An Integrated Windows Authentication servlet is running on an Interstage HTTP Server in which the authentication server has not been set up.
- Integrated Windows Authentication is disabled in the authentication server environment settings.
- An inconsistency exists within the authentication server environment settings.

#### User Action

Take action according to the following procedure:

- When the authentication server is deleted, undeploy the Integrated Windows Authentication servlet (\*2). When Integrated Windows Authentication is used, create the authentication server. (\*1)
- Enable Integrated Windows Authentication in the authentication server environment settings.
- Set up the authentication server again (\*3).

\*1 In the Interstage Management Console, click [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Authentication infrastructure Settings], and create the authentication server.

\*2 In the Interstage Management Console, click [System] > [WorkUnit] > ["IIServer Name"] > [Application Status/Undeploy]. Select "winauth" and then click [Undeploy].

\*3 Use the following procedure to rebuild the authentication server:

1. From the Interstage Management Console, select the [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [List] tab to delete the authentication server once.
2. Build the authentication server with the [Authentication infrastructure Settings] tab.

## 21.4 sso03000 to sso03064

---

### 21.4.1 sso03000

---

#### SSO: INFO: sso03000: SSO Business server started.

#### Explanation

The Interstage Single Sign-on Business server has started.

### 21.4.2 sso03001

---

#### SSO: INFO: sso03001: SSO Business server stopped.

#### Explanation

The Interstage Single Sign-on Business server has stopped.

## 21.4.3 sso03002

### SSO: ERROR: sso03002: Starting SSO Business server failed.

#### Explanation

The Interstage Single Sign-on Business server failed to start due to the cause of the error indicated in the message output immediately before this message.

The following status is entered when this message is output:

The business server is in error and resides in the Web server. If it is accessed from the browser, it returns 500 Internal Server Error.

#### User Action

Confirm the message output immediately before this message to remove the cause of the error, and stop and restart the business server.

After restarting the business server, be sure to access the protection resource to confirm that authentication/authorization is performed. If authentication/authorization is not performed correctly, confirm the message contents to delete the cause of the error.

## 21.4.4 sso03004

### SSO: ERROR: sso03004: Reading configuration file failed. Filename=(%s1) Detail=(%s2)

#### Variable Information

%s1 = Absolute path to the business server setup file

%s2 = Cause of the error

#### Explanation

An error occurred during reading of the configuration file of the Interstage Single Sign-on Business server. The possible causes are listed in the following table.

This message may be output more than once when the business server starts.

Table 21.37 Reasons for Access Log Failure

Cause of error (%s2)	Explanation
File not found	Upgrade of the business server from a previous version might have been unsuccessful.
	The business server setup file (%s1) does not exist.
Permission denied	Access authorization is not set for the business server setup file (%s1).
	The business server setup file (%s1) may be in use by another application.
	If a business server is included in Microsoft(R) Internet Information Services 6.0 or later, then the latter might be incorrectly configured.
Invalid data	The data in the business server setup file (%s1) is incorrect.
Internal error	An internal error occurred.

#### User Action

Take one of the following actions:

Table 21.38 User Actions for Access Log Failure

Cause of error (%s2)	Action
File not found	Check that the upgrade procedure was correct.
	The business server setup file (%s1) does not exist.
	From the Interstage Management Console, select [System] > [Security] > [Single Sign-on] > [Business system] > [List] tab to delete the business server for the

Cause of error (%s2)	Action
	moment. Then, add and rebuild a business server with the [Addition of Business server] tab.
Permission denied	Determine whether access authorization is correctly set for the business server setup file (%s1). If access authorization is incorrect, set it correctly. (*1)
	Determine whether the business server setup file (%s1) is in use by another application. If it is used, close the application.
	If a business server is included in Microsoft(R) Internet Information Services 6.0 or later, ensure that the Microsoft(R) Internet Information Services application pool ID configuration is valid. (*2)
Invalid data	<p>The data of the business server setup file (%s1) is incorrect.</p> <p>From the Interstage Management Console, select [System] &gt; [Security] &gt; [Single Sign-on] &gt; [Business system] &gt; [List] tab to delete the business server for the moment. Then, add and rebuild a business server with the [Addition of Business server] tab.</p>
Internal error	<p>Use the following configuration file or configuration information of the Web server that operates the business server and the iscollectinfo command to immediately collect investigation information and contact your service engineer.</p> <p><b>Windows32/64</b></p> <ul style="list-style-type: none"> <li>- For Microsoft(R) Internet Information Services, collect information using the following procedure: <ol style="list-style-type: none"> <li>1. Create any file.</li> <li>2. Write the configuration information of the Web server in the above file.</li> </ol> </li> </ul> <p><b>Solaris32</b></p> <ul style="list-style-type: none"> <li>- For Sun Java System Web Server 6.1, use the Sun Java System Web Server 6.1 configuration files (magnus.conf, obj.conf, server.xml).</li> </ul>

\*1 For details on setting access authorization, see "Operation and Maintenance" - "Changing Effective User for Web Server" in the Single Sign-on Operator's Guide.

\*2 For details, refer to "Environment Setup (Business Server Administrators)" - "Integrating into the Web Server" in the Single Sign-on Operator's Guide.

## 21.4.5 sso03005

### SSO: ERROR: sso03005: Can not access configuration file. Filename=(%s1)

#### Variable Information

%s1 = Absolute path to the business server setup file

#### Explanation

The setup file of the Interstage Single Sign-on Business server failed to be accessed. The possible causes are as follows:

- Access authorization is not set for the business server setup file.
- The memory space required for the Interstage Single Sign-on Business server is insufficient.

#### User Action

Take one of the following actions:

- If access authorization is not set for the business server setup file (%s1), set it correctly. (\*1)

- Close all unnecessary programs if the memory space required for Interstage Single Sign-on Business server is insufficient. Alternatively, confirm whether enough memory space for the Interstage Single Sign-on Business server is allocated.

For details on the required memory space, refer to 'Resource Requirements' - 'Memory Requirements' in the Tuning Guide.

\*1 For details on setting access authorization, see 'Operation and Maintenance' - 'Changing Effective User for Web Server' in the Single Sign-on Operator's Guide.

## 21.4.6 sso03006

---

**SSO: WARNING: sso03006: Error is in setting of configuration file. Default value is used. Filename=(%s1) Item=(%s2) Value=(%s3)**

### Variable Information

%s1 = Absolute path to the business server setup file

%s2 = Configuration item name

%s3 = Setting value

### Explanation

The default value was used for processing because an unspecified value (%s3) was set in the Configuration item (%s2) of the Interstage Single Sign-on Business server setup file (%s1).

This message is output when the business server starts or when the business server accepts access from a user for the first time. This message may be output more than once.

### User Action

Take the following action:

- Select [System] > [Security] > [Single Sign-on] > [Business system] > [Business system Name] > [Settings] and press the 'Update' button on the Interstage Management Console to update the business server environment settings. With this, the default value is set.

## 21.4.7 sso03007

---

**SSO: ERROR: sso03007: Error is in setting of configuration file. Filename=(%s1) Item=(%s2) Value=(%s3)**

### Variable Information

%s1 = Absolute path to the business server setup file

%s2 = Configuration item name

%s3 = Setting value

### Explanation

The setting value (%s3) in the configuration item (%s2) of the Interstage Single Sign-on Business server configuration file (%s1) is incorrect. If the setting value (%s3) is not displayed, no value is set even though it is a required item.

Upgrade of the business server from a previous version might have been unsuccessful.

This message may be output more than once when the business server starts.

### User Action

Take the following action:

- If the business server was upgraded from a previous version, check that the procedure was correct.
- Rebuild the business server.

To rebuild the business server, use the following procedure:

1. From the Interstage Management Console, see [System] > [Security] > [Single Sign-on] > [Business system] > [List] tab to delete the business server for the moment.
2. Add a business server with the [Addition of Business server] tab.

## 21.4.8 sso03009

---

### SSO: ERROR: sso03009: Reading service ID file failed. Filename=(%s1)

#### Variable Information

%s1 = Absolute path to the service ID file.

#### Explanation

The service ID file for the Interstage Single Sign-on Business server failed to be read. The possible causes are listed below. (\*1)

This message may be output more than once when the business server starts.

- No access authorization is set for the business server service ID file.
- The business server service ID file may be in use by another application.
- The memory space required for the Interstage Single Sign-on Business server is insufficient.
- The business server service ID file does not exist.
- The service ID file for the repository server and for the authentication server is specified for the business server service ID file.
- FQDN or domain name set for the business server service ID file is incorrect.
- The data of the business server service ID file is destroyed.

#### User Action

Take one of the following actions:

- If access authorization is not set for the business server service ID file, set it correctly. (\*2)
- If the business server service ID file is in use by another application, close the application.
- If the memory space required for the Interstage Single Sign-on Business server is insufficient, close all unnecessary programs. Alternatively, confirm whether enough memory space for the Interstage Single Sign-on Business server is allocated.

For details on the required memory space, refer to 'Required Resources' - 'Memory Space' in the Tuning Guide.

- In cases other than the above, rebuild the business server using the following procedure:
  1. From the Interstage Management Console, select [System] > [Security] > [Single Sign-on] > [Business system] > [List] tab to delete the business server for the moment.
  2. Add a business server with the [Addition of Business server] tab.

\*1 For details on the service ID file, refer to 'Preparations for Setting up a Business System' in the 'Environment Setup (SSO Administrators)' chapter of the Single Sign-on Operator's Guide.

\*2 For details on setting access authorization, refer to 'Changing Effective User for Web Server' in the 'Operation and Maintenance' chapter of the Single Sign-on Operator's Guide.

## 21.4.9 sso03011

---

### SSO: ERROR: sso03011: Access to SSO Business server resources failed. Resource=(%s1)

#### Variable Information

%s1 = Message file name

#### Explanation

The message file (%s1) of the Interstage Single Sign-on Business server failed to be accessed. The possible causes are listed below.

This message may be output more than once when the business server starts.

- The message file (%s1) does not exist.
- Access authorization for the message file (%s1) is not set.

#### User Action

Take one of the following actions:

- Confirm whether the message file (%s1) exists. If not, restore the message file (%s1) from the original file. (\*1)
- If access authorization for the message file (%s1) is not set, set it correctly. (\*2)

\*1 For details on the message file and original file, refer to 'Customizing the Messages Displayed on a Web Browsers' - 'Messages that Can be Customized' - 'Authorization Error Messages' in the chapter 'Single Sign-on Customization' of the Single Sign-on Operator's Guide.

\*2 For details on setting message file access authorization, see 'Single Sign-on Customization' - 'Customizing the Messages Displayed on a Web Browsers' - 'Setting Access Authority for a Message File' - 'Access Authority for the Authorization Error Message File' in the Single Sign-on Operator's Guide.

## 21.4.10 sso03012

---

### SSO: ERROR: sso03012: An access control information file is not found. Filename=(%s1)

#### Variable Information

%s1 = Absolute path to the access control information file

#### Explanation

The access control information file (%s1) required for the Interstage Single Sign-on Business server is not found.

This message may be output more than once when the business server starts.

#### User Action

Check whether the access control information file (%s1) exists. If it does not, from the Interstage Management Console, select [System] > [Security] > [Single Sign-on] > [Business system] > [Business system Name] > [Update access control information] tab to update access control information.

## 21.4.11 sso03013

---

### SSO: ERROR: sso03013: Can not access an access control information file. Filename=(%s1)

#### Variable Information

%s1 = Absolute path to the access control information file

#### Explanation

The access control information file (%s1) of the Interstage Single Sign-on Business server failed to be accessed. The possible causes are as follows:

- Access authorization is not set for the business server access control information file (%s1).
- The business server access control information file (%s1) may be in use by another application.

#### User Action

Take one of the following actions:

- If access authorization is not set for the business server access control information file (%s1), set it correctly. (\*1)
- If the business server access control information file (%s1) is in use by another application, close the application.

\*1 For details on setting access authorization, see 'Operation and Maintenance' - 'Changing Effective User for Web Server' in the Single Sign-on Operator's Guide.

## 21.4.12 sso03015

---

**SSO: INFO: sso03015: Access control information was updated. Name=(%s1)**

### Variable Information

%s1 = Business system name

### Explanation

The business server (business system name (%s1)) access control information cache was updated.

## 21.4.13 sso03016

---

**SSO: ERROR: sso03016: Internal error. Detail=(%s1)**

### Variable Information

%s1 = Maintenance information

### Explanation

An internal error occurred in the Interstage Single Sign-on Business server.

This message may be output more than once when the business server starts.

### User Action

Use the configuration file or configuration information of the Web server that operates the following business servers and the *iscollectinfo* command, collect investigation information immediately, and contact your service engineer.

#### Windows32/64

- For Microsoft(R) Internet Information Services, collect information using the following procedure:
  1. Create any file
  2. Write the Web server configuration information in the above file.

#### Solaris32

- For Sun Java System Web Server 6.1, use the Sun Java System Web Server 6.1 configuration files (magnus.conf, obj.conf, server.xml).

## 21.4.14 sso03017

---

**SSO: ERROR: sso03017: Allocation of memory failed.**

### Explanation

The memory space required for the Interstage Single Sign-on Business server failed to be acquired.

This message may be output more than once when the business server starts.

### User Action

Close all unnecessary programs. Alternatively, confirm whether enough memory space for the Interstage Single Sign-on Business server is allocated.

For details on the required memory space, refer to "Memory Requirements" in the "Resource Requirements" chapter of the Tuning Guide.

## 21.4.15 sso03018

---

**SSO: ERROR: sso03018: The length of URL is too long. Name=(%s1) (Location URL:%d2)**

## Variable Information

%s1 = Business system name

%d2 = Location URL length

## Explanation

The length of URL used when the Interstage Single Sign-on Business server (business system name (%s1)) operates exceeded the upper limit. The possible causes are as follows:

- URL may be too long.
- The authentication server and business server may be built on the Interstage HTTP Server of a single system and the same port of the Interstage HTTP Server may be used. In addition, '/' (root path) may be set in the path configuration of the access control information.
- The same host name and port number as those of the business server may be set in [Authentication infrastructure URL] in [Authentication Infrastructure Information Settings] of the business server environment settings.

## User Action

Take one of the following actions:

- Check if the length of the URL character string when the business server was accessed meets the following estimation expression condition:

2048 bytes > length-of-URL-character-string(\*1)-when-business-server-was-accessed + URL-character-string-length-of-authentication-infrastructure + FQDN-character-string-of-business-system-public-URL + 128 bytes

Also adjust the length of the URL character string by referencing 'Developing Applications' - 'Setting User Information Report with Environment Variables' in the Single Sign-on Operator's Guide.

- If the authentication server and business server are set up on the same machine, set up the system again so that they are on different machines.

\*1 Calculate the 'length of the URL character string when the business server was accessed' using URL encoding. The length of URL character string also includes query characters.

## 21.4.16 sso03019

---

### SSO: ERROR: sso03019: Invalid service ID.

## Explanation

The service ID for the Interstage Single Sign-on Business server is incorrect. (\*1)

## User Action

Rebuild the business server using the following procedure:

1. From the Interstage Management Console, select [System] > [Security] > [Single Sign-on] > [Business system] > [List] tab to delete the business server for the moment.
2. Add a business server with the [Addition of Business server] tab.

\*1 For details on the service ID, see 'Environment Setup (SSO Administrators)' - 'Registering a Business System' - 'Preparations for Setting up a Business System' in the Single Sign-on Operator's Guide.

## 21.4.17 sso03020

---

### SSO: ERROR: sso03020: Reading of an access control information file failed. Filename=(%s1)

## Variable Information

%s1 = Absolute path to the access control information file

## Explanation

The access control information required for the Interstage Single Sign-on Business server failed to be read. The possible causes are:

- Because data of the access control information file (%s1) is incorrect, access control information cannot be read.
- The SSO repository site configuration is incorrect.

## User Action

Take one of the following actions:

- If the data of the access control information file is incorrect, select [System] > [Security] > [Single Sign-on] > [Business system] > [Business system Name] > [Update access control information] tab to update access control information file (%s1).
- Ask the SSO administrator whether the SSO repository site configuration is correct or not.

## 21.4.18 sso03021

---

### SSO: ERROR: sso03021: Decryption of credential failed.

## Explanation

Credential information required for the Interstage Single Sign-on Business server failed to be encrypted. The possible causes are:

- Business servers created with the following information of different business systems coexist in the same domain:
  - Business system setup file created with 'No' in [Linkage with Interstage Portalworks?] of [Business system Information]
  - Business system setup file created with 'Yes' in [Linkage with Interstage Portalworks?] of [Business system Information]
- Data in the business server service ID file is incorrect. (\*1)
- Data from a browser failed to be received, or data is destroyed.
- External security attack from an unauthorized person may be occurring.

## User Action

Take one of the following actions:

- If business servers created with information of different business systems co-exist among business servers in the same domain, all business servers need be created with the information from the same business system. Create business servers with the same information based on one of the following business systems:
  - Business system setup file created with 'No' of [Linkage with Interstage Portalworks?] in [Business system Information] displayed by selecting [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Business System Setup File] tab on the Interstage Management Console
  - Business system setup file created with 'Yes' of [Linkage with Interstage Portalworks?] in [Business system Information] displayed by selecting [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Business System Setup File] tab on the Interstage Management Console.
- If the data of the business server service ID file is incorrect, rebuild the business server using the following procedure: (\*1)
  1. From the Interstage Management Console, select [System] > [Security] > [Single Sign-on] > [Business system] > [List] tab to delete the business server.
  2. Add a business server with the [Addition of Business server] tab.
- If data from a browser failed to be received or destroyed, it may have been damaged because a network environment error is occurring. Examine the network environment.
- If the server is under security attack from outside, examine whether the attack is occurring based on the IP address of the browser recorded in the access log.

If any of the above actions do not solve the problem, perform authentication again, after restarting all browsers.

\*1 For details on the service ID file, see 'Environment Setup (SSO Administrators)' - 'Registering a Business System' - 'Preparations for Setting up a Business System' in the Single Sign-on Operator's Guide.

## 21.4.19 sso03022

---

### SSO: ERROR: sso03022: Acquisition of registry information failed.

#### Explanation

Registry information required for the Interstage Single Sign-on Business server failed to be acquired.

#### User Action

Reinstall the Interstage Single Sign-on Business server.

## 21.4.20 sso03024

---

### SSO: ERROR: sso03024: Initialization of maintenance log failed.

#### Explanation

**Windows32/64**

The maintenance log of the Interstage Single Sign-on Business server failed to be initialized. The memory space required for the Interstage Single Sign-on Business server may be insufficient.

This message may be output more than once when the business server starts.

**Solaris32/64** **Linux32/64**

The maintenance log of the Interstage Single Sign-on Business server failed to be initialized. The memory space required for the Interstage Single Sign-on Business server may be insufficient. Alternatively, there may be an error in the shared memory/exclusion control resource (semaphore) settings.

#### User Action

**Windows32/64**

Close all unnecessary programs. Alternatively, confirm whether enough memory space is allocated for the Interstage Single Sign-on Business server.

For details on the required memory space, refer to "Memory Requirements" in the "Resource Requirements" chapter of the Tuning Guide.

**Solaris32/64** **Linux32/64**

Close all unnecessary programs. Alternatively, confirm whether enough memory space for the Interstage Single Sign-on Business server is allocated and whether the size of the shared memory or exclusion control resource (semaphore) is correctly set.

For details on the required memory space, refer to "Memory Requirements" in the "Resource Requirements" chapter of the Tuning Guide. For details on the sizes of the required shared memory and exclusion control resource (semaphore), refer to the "System Tuning" chapter in the Tuning Guide.

If the problem is still not resolved by taking the above action, there is a possibility that the IPC resources required for running Interstage Single Sign-on and the IPC resources being used by another application are the same. For this reason, the IPC resources must be customized. For details, refer to "Setting IPC resources" in the Tuning Guide.

## 21.4.21 sso03025

---

### SSO: WARNING: sso03025: The notice of message to a client failed. Filename=(%s1) Reason=(%s2)

#### Variable Information

%s1 = Name of the message file whose message notification failed

%s2 = Cause of the error

#### Explanation

Message notification from a server to a browser failed. The possible causes are listed in the following table:

Table 21.39 Reasons for Message Notification Failure

Cause of error (%s2)	Explanation
File not found	The message file to be displayed does not exist.
Permission denied	Access authorization is not set for the message file to be displayed.
Invalid data	The format of the message file to be displayed is different.

User Action

Take one of the following actions:

Table 21.40 User Action for Message Notification Failure

Cause of error (%s2)	Action
File not found	Confirm whether the message file (%s1) exists. If it does not, restore the message file (%s1) from the original file. (*1)
Permission denied	Determine whether access authorization for the message file (%s1) is set correctly. If access authorization is incorrect, set it correctly. (*2)
Invalid data	Confirm whether the message file (%s1) is an HTML file.

\*1 For details on the message file and original file, refer to 'Customizing Messages Displayed on a Web Browser' - 'Messages that can be Customized' - 'Authentication Error Messages' in the chapter 'Single Sign-on Customization' of the Single Sign-on Operator's Guide.

\*2 For details on setting access authorization, see 'Single Sign-on Customization' - 'Customizing Messages Displayed on a Web Browser' - 'Setting Access Authority for a Message File' - 'Access Authority for the Authorization Error Message File' in the Single Sign-on Operator's Guide.

## 21.4.22 sso03026

**SSO: ERROR: sso03026: Acquisition of access control information failed. Name=(%s1) Code=(%x2)**

Variable Information

%s1 = Business system name

%x2 = Error code

Explanation

When the business server (business system name (%s1)) starts, an attempt was made to acquire access control information from the repository server, but the acquisition failed.

User Action

Remove the cause of the error code (%x1). For details on the meanings of the error codes, see 'List of the error codes for acquiring access control information'.

List of the error codes for acquiring access control information is shown in the following table.

**When session management is used**

Table 21.41 Error Codes for Acquiring Access Control Information

Code	Error	Action
0x00	An error occurred during communication processing.	Check the message that is output immediately before this message to establish and fix the cause of the error.
0x01 0x04 0x0a 0x0c	The Business server environment settings were incorrect.	Set up the business server again. (*1)

Code	Error	Action
0x11 0x12 0x30 0x31		
0x05	Memory required to run the Business server was insufficient.	Close unnecessary programs, or secure sufficient memory required to run the Business server. For details about the required memory, refer to "Resources Requirements" - "Memory Requirements" in the Tuning Guide.
0x06	The disk volume is insufficient.	Get rid of unnecessary files, stop the business server, and then restart it. (*2)
0x1c 0x2c	The role definition, the Business server Site definition, and the path definition are not registered in the SSO repository, or the definition is incorrect.	Ask the SSO administrator to check the information registered in the SSO repository.
0x1e	The connection to the SSO repository failed.	Ask the SSO administrator to refer to the repository server system log and check whether an abnormality occurred.
0x2d 0x2e	Exclusion control failed.	<a href="#">Windows32/64</a> Take the following action:
0x2f	The shared memory operation failed.	<ul style="list-style-type: none"> <li>- Stop the business server and then restart it. (*2)</li> <li>- If the memory required to run the business server was insufficient, close unnecessary programs or check whether sufficient memory required to run the Business server was secured. For details about the required memory, refer to "Resources Requirements" - "Memory Requirements" in the Tuning Guide.</li> <li>- If sufficient memory required running the business server was secured, immediately after the message is output, use the iscollectinfo command to collect investigation information, then contact your service engineer.</li> </ul>
0x52	There were insufficient resources.	Check the message that is output immediately before this message to establish and fix the cause of the error.
0x5a	The attempt to update access control information failed.	Ask the SSO administrator to refer to the Interstage Single Sign-on Authentication server and repository server system logs and check whether an abnormality occurred.
0x5b	An error occurred in the system function.	Check the message that is output immediately before this message to establish and fix the cause of the error.
0x5d	The received data is invalid.	Take the following action: <ul style="list-style-type: none"> <li>- Check [Authentication server URL] set for the started Interstage Single Sign-on Business server, and check that the information for the SSO administrator is correct. (*3) If it is incorrect, change it, stop the business server, and then restart it. (*2)</li> <li>- Ask the SSO administrator to refer to the authentication server and repository server system logs and check whether an abnormality occurred.</li> <li>- Ask the network administrator to check whether communication between the Interstage Single Sign-on Authentication server and business server can be performed normally in this environment.</li> </ul>

Code	Error	Action
0x5f	The IS_HOME environment variable was not set.	Check the message that is output immediately before this message to establish and fix the cause of the error.
0x89	The attribute name which is not set in the repository environment settings [Extended user information] is set in the SSO repository path configuration.	Contact the SSO administrator and request that the required action is taken referring to the repository server system log.  The SSO administrator should ask the business server administrator to update the access control information when the SSO repository is changed (*9)
0x5c	An internal error occurred.	Immediately after the message is output, use the iscollectinfo command to collect investigation information, and then contact your service engineer.
Other than the above		

**When session management is not used**

**Table 21.42 Error Codes for Acquiring Access Control Information**

Code	Error	Action
0x05	The memory required for the Interstage Single Sign-on Business server is insufficient.	Close unnecessary programs. Alternatively, confirm whether enough memory space for the Interstage Single Sign-on Business server is allocated.  For details on the required memory space, refer to "Memory Requirements" in the "Resource Requirements" chapter of the Tuning Guide.
0x06	The disk volume is insufficient.	Back up the unnecessary files, and stop and restart the business server. (*2)
0x19	The specified repository server failed to be connected.	<ul style="list-style-type: none"> <li>- Check the Repository server URL (*7), and check that the settings for using session management are the same in both the connection Repository server and Business server. (*4) (*5) If the settings have not been made to use session management in both servers, change them so that they are. (*6)</li> <li>- Confirm whether the repository server is active.</li> </ul> <p>The repository server may be running through SSL communication. Operate the repository server through non-SSL.</p> <ul style="list-style-type: none"> <li>- [Authentication Infrastructure Information Settings] of the business server environment settings is incorrectly set. Set a URL of the correct repository server. (*7)</li> <li>- Examine the network environment.</li> <li>- An error was detected during communication with repository server. If any of the above does not solve the problem, refer to the system error log of the repository server to remove the cause of the error. Alternatively, restart the business server. (*2)</li> </ul>
0x1a	A timeout occurred at connection to the specified repository server.	
0x21	An error occurred during communication with the repository server.	
0x1c	The role configuration and site configuration and path configuration of the relevant business server are not registered in the SSO repository.  Alternatively, the configurations are incorrect.	Ask the SSO administrator to recheck information registered in the SSO repository.
0x1d	The site configuration of the relevant business server cannot be specified because its	

Code	Error	Action
	registration in the SSO repository is not complete.	
0x29	Invalid data was received from the repository server.	[Authentication Infrastructure Information Settings] of the business server environment is incorrectly set. Set a correct URL of the repository server, stop the Business server, and then restart it. (*2) (*7)  Ask the SSO administrator to recheck information registered in the SSO repository.
Other than the above	An internal error occurred.	An internal error occurred. The access control information file name or service ID file may be incorrect. Rebuild the business server. (*1) (*8)

\*1 Use the following procedure to rebuild the business server:

1. From the Interstage Management Console, select [System] > [Security] > [Single Sign-on] > [Business system] > [List] tab to delete the business server for the moment.
2. Add a business server with the [Addition of Business server] tab.

\*2 For details about stopping the business server, refer to "Operation and Maintenance" - "Stopping Single Sign-on" - "Stopping a Business server" in the Single Sign-on Operator's Guide. For details about starting the business server, refer to "Operation and Maintenance" - "Starting Single Sign-on" - "Starting a Business server" in the Single Sign-on Operator's Guide.

\*3 In the Interstage Management Console click [System] > [Security] > [Single Sign-on] > [Business System] > [Business system Name] > [Settings] > [Detailed Settings [Show]] > [Authentication Infrastructure Information Settings] > [Authentication server URL].

\*4 In the Interstage Management Console click [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Repository server] > [Settings] > [Session management detailed settings [Show]] > [Session management Settings] > [Use Session management?]. Alternatively, click [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Repository server (reference system)] > [Settings] > [Detailed Settings [Show]] > [Authentication Infrastructure Information Settings] > [Use Session management?].

\*5 In the Interstage Management Console click [System] > [Security] > [Single Sign-on] > [Business System] > [Business system Name] > [Settings] > [Detailed Settings [Show]] > [Authentication Infrastructure Information Settings] > [Use Session management?].

\*6 Make the session management settings the same in both servers according to the following procedure:

- If session management is used

Change the repository server or business server settings so that session management is used.

- If session management is not used

Set up the repository server or business server again.

For details about switching to a system that uses session management, refer to "Environment settings and functions in previous versions" - "Switching to a system that uses session management" in the Single Sign-on Operator's Guide.

\*7 In the Interstage Management Console click [System] > [Security] > [Single Sign-on] > [Business System] > [Business system Name] > [Settings] > [Detailed Settings [Show]] > [Authentication Infrastructure Information Settings] > [Repository server URL].

\*8 For details on the service ID file, see 'Notes on previous versions' in the Single Sign-on Operator's Guide.

\*9 To update access control information, in the Interstage Management Console click [System] > [Security] > [Single Sign-on] > [Business System] > [Business system Name] > [Access control information update].

## 21.4.23 sso03027

**SSO: WARNING: sso03027: Can not write access log. Logfile=(%s1) Reason=(%s2)**

Variable Information

%s1 = Access log output destination file name of the business server

%s2 = Cause of the error

## Explanation

The access log of the Interstage Single Sign-on Business server failed to be written. The possible causes are listed below in the following table.

Table 21.43 Reasons for Access Log Failure

Cause of error (%s2)	Explanation
Permission denied	There is no authorization to write data in the access log output destination file (%s1) of the business server.
	The output destination file (%s1) for the business server access log or the backup file used when switching access logs (%s1.last or %s1.YYYYMMDDHHMMSS (the string after the period represents the date and time the file was saved)) may be in use by another application.
Not enough disk space	The disk free volume is insufficient.
Not enough memory	The memory space required for the Interstage Single Sign-on Business server is insufficient.
Acquisition of shared memory failed	There was an error in the shared memory required for the Interstage Single Sign-on Business server is insufficient.
Operation of shared memory failed	
Acquisition of exclusive lock resource failed	There was an error in the exclusion control resource required for the Interstage Single Sign-on Business server is insufficient.
Exclusive lock failed	
System error	An internal error is occurring during operation of the Interstage Single Sign-on Business server.
	<b>Solaris32/64</b> <b>Linux32/64</b> The access log output destination file of the business server may be a symbolic link.

## User Action

Take one of the following actions shown in the following table:

Table 21.44 User Actions for Access Log Failure

Cause of error (%s2)	Action
Permission denied	Determine whether access authorization is correctly set for the access log output destination file (%s1) of the business server. If access authorization is incorrect, set it correctly. (*1)
	Determine if the access log output destination file (%s1) of the business server or the backup file used when switching access logs (%s1.last or %s1.YYYYMMDDHHMMSS (the string after the period represents the date and time the file was saved)) is in use by another application. If so, close the application. (*1)
Not enough disk space	Allocate a free area, for example by backing up unnecessary files.
Not enough memory	Close unnecessary programs. Alternatively, confirm whether enough memory space for Interstage Single Sign-on operation is allocated. For details on the required memory space, refer to "Memory Requirements" in the "Resource Requirements" chapter of the Tuning Guide.
Acquisition of shared memory failed	<b>Solaris32/64</b> <b>Linux32/64</b> Confirm the system parameters. For details on the system parameters, refer to the "System Tuning" chapter in the Tuning Guide.
Acquisition of exclusive lock resource failed	

Cause of error (%s2)	Action
Operation of shared memory failed	
Exclusive lock failed	
System error	<ul style="list-style-type: none"> <li>- Use the following configuration file or configuration information of the Web server that operates the business server and the iscollectinfo command to immediately collect investigation information, and contact your service engineer.</li> </ul> <p data-bbox="560 483 695 510"><b>Windows32/64</b></p> <ul style="list-style-type: none"> <li>- For Microsoft(R) Internet Information Server and Microsoft(R) Internet Information Services, collect information using the following procedure:               <ol style="list-style-type: none"> <li>1. Create any file.</li> <li>2. Write the Web server configuration information in the above file.</li> </ol> </li> <li>- <b>Solaris32</b> For Sun Java System Web Server 6.1, use the Sun Java System Web Server 6.1 configuration files (magnus.conf, obj.conf, server.xml).</li> </ul>

\*1 For details on setting access authorization, see 'Operation and Maintenance' - ' Changing Effective User for Web Server ' in the Single Sign-on Operator's Guide.

## 21.4.24 sso03030

### SSO: ERROR: sso03030: Error occurred in the WWW server. Code=(%x1) Detail=(%s2)

#### Variable Information

%x1 = Error code posted from the Web server

%s2 = Internal information

#### Explanation

An error occurred in the Web server in which the Interstage Single Sign-on Business server was running.

The possible causes are:

- The system may be overloaded.
- The network may have been disconnected while communicating with a client, or another network-related problem may have occurred.

#### User Action

Take one of the following actions:

- Contact the network administrator to check if any problems have occurred in the network environment connecting the client and the business server.
- If Microsoft(R) Internet Information Services are used as Web servers and the error code (%x1) is 0x2736, the error may be prevented with the following operations:
  1. From the [Start] menu, select [Programs] - [Administrative Tools] - [Internet Service Manager].
  2. Select a site, then select [Action] - [Properties].
  3. If 'Connections limited to:' of the Web site connections is set, increase the value. Alternatively, if IIS5.0 is used, increase the performance tuning value.

- In cases other than the above (or if this message is output even after the above operation), use the following configuration file or configuration information of the Web server that operates the business server and the `iscollectinfo` command to immediately collect investigation information. Then contact your service engineer.

#### Windows32/64

- For Microsoft(R) Internet Information Services, collect information using the following procedure:
  1. Create any file.
  2. Write the Web server configuration information in the above file.

#### Solaris32

- For Sun Java System Web Server 6.1, use the Sun Java System Web Server 6.1 configuration files (`magnus.conf`, `obj.conf`, `server.xml`).

## 21.4.25 sso03040

---

### SSO: ERROR: sso03040: Allocation of memory or shared memory failed. Code=(%d1-%d2-%d3)

#### Variable Information

%d1 = Maintenance information

%d2 = Maintenance information

%d3 = Maintenance information

#### Explanation

##### Windows32/64

The memory required for the Interstage Single Sign-on Business server failed to be allocated. The memory space required for the Interstage Single Sign-on Business server is insufficient.

##### Solaris32/64 Linux32/64

The memory or shared memory required for the Interstage Single Sign-on Business server failed to be allocated. The memory space or the shared memory size required for the Interstage Single Sign-on Business server is insufficient.

#### User Action

##### Windows32/64

Close all unnecessary programs. Alternatively, confirm whether enough memory space is allocated for the Interstage Single Sign-on Business server.

For details on the required memory space, refer to "Memory Requirements" in the "Resource Requirements" chapter of the Tuning Guide.

Suppose that the required memory space is already allocated. In this case, use the following configuration file or configuration information of the Web server that operates a business server and the `iscollectinfo` command to immediately collect investigation information, and contact your service engineer.

- For the Microsoft(R) Internet Information Services, collect information using the following procedure:
  1. Create any file.
  2. Write the Web server configuration information in the above file.

##### Solaris32/64 Linux32/64

Close all unnecessary programs. Alternatively, confirm whether enough memory space is allocated for the Interstage Single Sign-on Business server and whether the shared memory size is correctly set.

For details on the required memory space, refer to "Memory Requirements" in the "Resource Requirements" chapter of the Tuning Guide.

For details on the required shared memory size, refer to the "System Tuning" chapter in the Tuning Guide.

If the required memory space has been allocated and the shared memory size is correctly set, use the following configuration file or configuration information of the Web server that operates the business server and the *iscollectinfo* command to collect diagnostic information, and contact your service engineer.

#### Solaris32

- For Sun Java System Web Server 6.1, use the Sun Java System Web Server 6.1 configuration files (magnus.conf, obj.conf, server.xml).

## 21.4.26 sso03042

### SSO: ERROR: sso03042: Operation of shared memory failed. Code=(%d1-%d2-%d3)

#### Variable Information

%d1 = Maintenance information

%d2 = Maintenance information

%d3 = Maintenance information

#### Explanation

##### Windows32/64

The Interstage Single Sign-on Business server failed to reference the shared memory already created. The memory space required for the Interstage Single Sign-on Business server may be insufficient.

##### Solaris32/64 Linux32/64

The Interstage Single Sign-on Business server failed to reference the shared memory already created. The memory space or the shared memory size required for the Interstage Single Sign-on Business server may be insufficient.

#### User Action

##### Windows32/64

Take the following action:

- Stop and restart the Interstage Single Sign-on Business server.
- If the memory space required for the Interstage Single Sign-on Business server is insufficient, close unnecessary programs. Alternatively, confirm whether enough memory space for the Interstage Single Sign-on Business server is allocated.  
For details on the required memory space, refer to "Memory Requirements" in the "Resource Requirements" chapter of the Tuning Guide.
- If the required memory space has been allocated and the shared memory size is correctly set, use the following configuration file or configuration information of the Web server that operates the business server and the *iscollectinfo* command to collect diagnostic information, and contact your service engineer.
  - For Microsoft(R) Internet Information Services, collect information using the following procedure:
    1. Create any file.
    2. Write the Web server configuration information in the above file.

##### Solaris32/64 Linux32/64

Take the following action:

- Stop and restart the Interstage Single Sign-on Business server.
- If the memory space or the shared memory required for the Interstage Single Sign-on Business server is insufficient, close all unnecessary programs. Alternatively, confirm whether enough memory space for the Interstage Single Sign-on Business server is allocated and whether the shared memory size is correctly set.  
For details on the required memory space, refer to "Memory Requirements" in the "Resource Requirements" chapter of the Tuning Guide. For details on the required shared memory size, refer to the "System Tuning" chapter in the Tuning Guide.

- If the required memory space is already allocated and the shared memory size is correctly set, then, use the following configuration file or configuration information of the Web server that operates the business server and the `iscollectinfo` command to immediately collect investigation information, and contact your service engineer.

**Solaris32**

- For Sun Java System Web Server 6.1, use the Sun Java System Web Server 6.1 configuration files (`magnus.conf`, `obj.conf`, `server.xml`).

## 21.4.27 sso03043

---

### SSO: ERROR: sso03043: Initialization of lock control failed. Code=(%d1-%d2-%d3)

#### Variable Information

%d1 = Maintenance information

%d2 = Maintenance information

%d3 = Maintenance information

#### Explanation

**Windows32/64**

The exclusion control resource required for the Interstage Single Sign-on Business server failed to be acquired. The memory space required for the Interstage Single Sign-on Business server may be insufficient.

**Solaris32/64 Linux32/64**

The exclusion control resource required for the Interstage Single Sign-on Business server failed to be acquired. The memory space or the exclusion control resource (semaphore) size required for the Interstage Single Sign-on Business server may be insufficient.

#### User Action

**Windows32/64**

Close all unnecessary programs. Alternatively, confirm whether enough memory space for the Interstage Single Sign-on Business server is allocated.

For details on the required memory space, refer to "Memory Requirements" in the "Resource Requirements" chapter of the Tuning Guide.

If adequate memory has been allocated, then use the following configuration file or configuration information of the Web server that operates the business server and the `iscollectinfo` command to immediately collect investigation information, and contact your service engineer.

- For the Microsoft(R) Internet Information Services, collect information using the following procedure:

1. Create any file.
2. Write the Web server configuration information in the above file.

**Solaris32/64 Linux32/64**

Close all unnecessary programs. Alternatively, confirm whether enough memory space for the Interstage Single Sign-on Business server is allocated and whether the exclusion control resource (semaphore) size is correctly set.

For details on the required memory space, refer to "Memory Requirements" in the "Resource Requirements" chapter of the Tuning Guide. For details on the required shared memory size, refer to the "System Tuning" chapter in the Tuning Guide.

Suppose that the required memory space is already allocated and the exclusion control resource (semaphore) size is correctly set.

In this case, use the following configuration file or the configuration information for the Web server that operates the business server and the `iscollectinfo` command to immediately collect investigation information, and then contact your service engineer.

**Solaris32**

- For Sun Java System Web Server 6.1, use the Sun Java System Web Server 6.1 configuration files (magnus.conf, obj.conf, server.xml).

## 21.4.28 sso03045

---

### SSO: ERROR: sso03045: Lock control failed. Code=(%d1-%d2-%d3)

#### Variable Information

%d1 = Maintenance information

%d2 = Maintenance information

%d3 = Maintenance information

#### Explanation

**Windows32/64**

The Interstage Single Sign-on Business server failed to perform exclusion control processing. The memory space required for the Interstage Single Sign-on Business server may be insufficient.

**Solaris32/64** **Linux32/64**

The Interstage Single Sign-on Business server failed to perform exclusion control processing. The memory space or the exclusion control resource (semaphore) size required for the Interstage Single Sign-on Business server may be insufficient.

#### User Action

**Windows32/64**

Take the following action:

- Stop and restart the Interstage Single Sign-on Business server.
- If the memory space required for the Interstage Single Sign-on Business server is insufficient, close unnecessary programs. Alternatively, confirm whether enough memory space for the Interstage Single Sign-on Business server is allocated.  
For details on the required memory space, refer to "Memory Requirements" in the "Resource Requirements" chapter of the Tuning Guide.
- Ensure that the required memory space is already allocated. In this case, use the following configuration file or configuration information of the Web server that operates the business server and the iscollectinfo command to immediately collect investigation information, and contact your service engineer.
  - For Microsoft(R) Internet Information Services, collect information using the following procedure:
    1. Create any file.
    2. Write the Web server configuration information in the above file.

**Solaris32/64** **Linux32/64**

Take the following action:

- Stop and restart the Interstage Single Sign-on Business server.
- If the memory space or the exclusion control resource (semaphore) size required for the Interstage Single Sign-on Business server is insufficient, close unnecessary programs. Alternatively, confirm whether enough memory space for the Interstage Single Sign-on Business server is allocated and whether the exclusion control resource (semaphore) size is correctly set.

For details on the required memory space, refer to "Memory Requirements" in the "Resource Requirements" chapter of the Tuning Guide. For details on the required exclusion control resource (semaphore) size, refer to the "System Tuning" chapter in the Tuning Guide.

- Ensure that the required memory space is already allocated and the exclusion control resource (semaphore) size is correctly set. In this case, use the following configuration file or configuration information of the Web server that operates the business server and the iscollectinfo command to immediately collect investigation information, and contact your service engineer.

**Solaris32**

- For Sun Java System Web Server 6.1, use the Sun Java System Web Server 6.1 configuration files (magnus.conf, obj.conf, server.xml).

## 21.4.29 sso03046

### SSO: ERROR: sso03046: Initialization of access log failed. Logfile=(%s1) Reason=(%s2)

#### Variable Information

%s1 = Access log output destination file name of the business server

%s2 = Cause of error

#### Explanation

The access log of the Interstage Single Sign-on Business server failed to be initialized. The possible causes are described the following table:

Table 21.45 Reasons Why Access Log for SSO Business Server Failed to be Initialized

Cause of error (%s2)	Explanation
Permission denied	Access authorization is not set for the directory of the business server access log output destination file (%s1).
	Access authorization is not set for the business server access log output destination file (%s1).
	The business server access log output destination file (%s1) may be in use by another application.
Directory not found	The directory of the business server access log output destination file (%s1) is not found.
Filename is directory	The directory is set as the business server access log output destination file name.
Not enough disk space	The disk free volume is insufficient.
Not enough memory	The memory space required for the Interstage Single Sign-on Business server is insufficient.
Acquisition of shared memory failed	There was an error in the shared memory required for the Interstage Single Sign-on Business server.
Operation of shared memory failed	
Acquisition of exclusive lock resource failed	There was an error in the exclusion control resource required for the Interstage Single Sign-on Business server.
Exclusive lock failed	
System error	An internal error is occurring during operation of the Interstage Single Sign-on Business server.

#### User Action

Take one of the following actions shown in the following table:

Table 21.46 User Actions for Access Log SSO Business Server Failure

Cause of error (%s2)	Action	
Permission denied	Determine whether access authorization is correctly set for the directory of the business server access log output destination file (%s1). If access authorization is incorrect, set it correctly. (*1)	
	If the business server access log output destination file (%s1) exists, confirm whether access authorization for the output destination file is correctly set. If access authorization is incorrect, set it correctly. (*1)	
	Determine whether the business server access log output destination file (%s1) is in use by another application. If it is, close the application. (*1)	
Directory not found	Confirm whether the directory of the business server access log output destination file (%s1) and the directories in the output destination path exist.	
Filename is directory	The directory name is set as the business server access log output destination file (%s1). Set the file name. (*2)	
Not enough disk space	Allocate a free area, for example by backing up unnecessary files.	
Not enough memory	Close all unnecessary programs. Alternatively, confirm whether enough memory space for Interstage Single Sign-on operation is allocated. For details on the required memory space, refer to "Memory Requirements" in the "Resource Requirements" chapter of the Tuning Guide.	
Acquisition of shared memory failed Acquisition of exclusive lock resource failed Operation of shared memory failed Exclusive lock failed	<p><b>Windows32/64</b></p> <p>If Microsoft(R) Internet Information Services is the Web server used to operate the business server, check that the procedure used to integrate a business server with Microsoft(R) Internet Information Services 6.0 is correct. For details on the procedure to integrate a business server, see 'Environment Setup (Business Server Administrators)' - 'Setting up Business Servers' - 'Integrating into the Web Server' in the Single Sign-on Operator's Guide.</p> <p><b>Solaris32/64 Linux32/64</b></p> <p>Confirm the system parameters. For details on the system parameters, refer to the "System Tuning" chapter in the Tuning Guide.</p>	
	System error	<p>If a system log is output immediately before this message, examine the content of the messages in the system log and eliminate the cause of the problem. If no log has been output, use the following configuration file or configuration information of the Web server that operates the business server and the iscollectinfo command to immediately collect investigation information, and contact your service engineer.</p> <p><b>Windows32/64</b></p> <ul style="list-style-type: none"> <li>- For Microsoft(R) Internet Information Services, collect information using the following procedure: <ul style="list-style-type: none"> <li>1. Create any file.</li> <li>2. Write the Web server configuration information in the above file.</li> </ul> </li> </ul> <p><b>Solaris32</b></p> <ul style="list-style-type: none"> <li>- For Sun Java System Web Server 6.1, use the Sun Java System Web Server 6.1 configuration files (magnus.conf, obj.conf, server.xml).</li> </ul>

\*1 For details on setting access authorization, see 'Operation and Maintenance' - 'Changing Effective User for Web Server' in the Single Sign-on Operator's Guide.

\*2 To confirm the access log output destination, select [System] > [Security] > [Single Sign-on] > [Business system] > [Business system Name] > [File name] in [Access Log Settings] of the [Settings] tab on the Interstage Management Console.

## 21.4.30 sso03047

### SSO: ERROR: sso03047: Invalid role setting in access control information. Name=(%s1)

#### Variable Information

%s1 = Business system name

#### Explanation

Failed to update the business server (business system name (%s1)) access control information because the role found in the path configuration of the SSO repository access control information is not found in the role configuration.

This message may be output more than once when the business server starts.

#### User Action

The system log is output to the repository server. Ask the SSO administrator to recheck the role configuration. After rechecking the role configuration, stop and restart the business server.

After restarting the business server, be sure to access the protection resource to confirm that authentication/authorization is performed. If authentication/authorization is not correctly performed, examine the message and remove the cause of the error.

## 21.4.31 sso03048

### SSO: ERROR: sso03048: Updating of access control information failed. Name=(%s1) Filename=(%s2) Code=(%d3)

#### Variable Information

%s1 = Business system name

%s2 = Absolute path to the access control information file

%d3 = Error code

#### Explanation

Failed to update the business server (business system name (%s1)) access control information cache.

#### User Action

Remove the cause of the error code (%d2). Details about the meaning of each error code are described in the table below.

#### List of the error codes for updating access control information

Table 21.47 Error Codes for Updating Access Control Information

Code	Error	Action
3012	The access control information file is not found.	The access control information file (%s1) does not exist. From the Interstage Management Console, select [System] > [Security] > [Single Sign-on] > [Business system] > [Business system Name] > [Update access control information] tab to update the access control information.
3013	Access authorization is not set for the access control information file.	Determine whether access authorization is correctly set for the access control information file (%s1). If access authorization is incorrect, set it correctly. (*1)
		Determine whether the access control information file (%s1) is in use by another application. If so, close the application. (*1)
3020	Access control information failed to be read. The possible cause is:	From the Interstage Management Console, select [System] > [Security] > [Single Sign-on] > [Business system] > [Business system Name] > [Update access control information] tab to update access control information file (%s1).
	Data of the access control information file is invalid.	Examine whether the SSO repository site configuration is correct or not.

\*1 For details on setting access authorization, see 'Operation and Maintenance' - 'Changing Effective User for Web Server' in the Single Sign-on Operator's Guide.

## 21.4.32 sso03052

---

### SSO: ERROR: sso03052: Invalid environment. %s1

#### Variable Information

%s1 = Maintenance information

#### Explanation

The possible causes are:

- The environment variables needed for the Interstage single sign-on business server to operate have not been set.
- The files and/or directories needed for the Interstage single sign-on business server to operate do not exist.
- The Microsoft(R) Internet Information Services environment settings are incorrect.

Note that maintenance information may not be output on some occasions.

#### User Action

Take the following action:

- When maintenance information (%s1) is not displayed:
  - Specify the Interstage installation directory in the "IS\_HOME" environment variable.
- When maintenance information (%s1) is displayed:
  - If the maintenance information (%s1) is Reason=(IIS)
    - Check whether the Interstage Single Sign-on Business server has been integrated with more than one web site used in Microsoft(R) Internet Information Services.
    - If the business server has been integrated with more than one web site, change the environment so that the business server is integrated with only one site.
    - If the business server has not been integrated with more than one web site, the TCP port of a Web site that requests SSL communication may have been accessed. Configure the settings so that the TCP port is not accessed.
  - In all other cases:
    - Check that the access permissions of the business server operation resources are set correctly.
    - For information about setting access permissions for business server operation resources, refer to 'Setting the Access Permission for Operation Resources of a Web Server Used by a Business Server' in the chapter 'Environment Setup (Business Server Administrators)' of the Single Sign-on Operator's Guide.

## 21.4.33 sso03059

---

### SSO: ERROR: sso03059: An error occurred in the SSO Authentication server or the SSO Repository server. Host=(%s1)

#### Variable Information

%s1 = IP address or host name of authentication server

#### Explanation

An error has occurred in the authentication server or repository server.

#### User Action

Check the system log of the authentication server (%s1) for errors.

If an error has occurred, take the necessary measures to address the problem indicated by the system log.

If no errors are indicated by the system log of the authentication server (%s1), check for errors in the system log of the repository server.

If an error has occurred, take the necessary measures to address the problem indicated by the system log.

### 21.4.34 sso03060

---

**SSO: ERROR: sso03060: The Web server environment settings are incorrect. Detail=(%s1)**

#### Variable Information

%s1 = Cause of error

#### Explanation

The Web server (Interstage HTTP Server) environment settings are incorrect.

The possible causes are:

- The Single Sign-on environment settings required for the Web server (Interstage HTTP Server) environment definition file (httpd.conf) have been corrupted.

#### User Action

Use the *iscollectinfo* command immediately after the message is output to collect investigation information, then contact your service engineer.

### 21.4.35 sso03061

---

**SSO: ERROR: sso03061: There is an inconsistency in the port number of the business server and the port number of the Web server. Port=(%s1)**

#### Variable Information

%s1 = The port number of the business server containing the inconsistency

#### Explanation

The port number of the configured business server does not match the port number of the Web server.

#### User Action

Check that the port number of the business server displayed in variable information (%s1) matches the port number set for the Web server. The business server port number can be checked by clicking the Interstage Management Console [System] > [Security] > [Single Sign-on] > [Business System] > [List] tabs. If they do not match, change the settings.

### 21.4.36 sso03062

---

**SSO: ERROR: sso03062: The authentication information could not be cached because the cache size was exceeded. Name=(%s1) Size=(%s2)**

#### Variable Information

%s1 = Business system name

%s2 = Authentication information size

#### Explanation

The Interstage Single sign-on business server (%s1) failed to cache authentication information because the size of the user's authentication information exceeded the cache size.

## User Action

Operations may continue however if the size of the users authentication information is in excess of the cache size, authorization performance may deteriorate. Calculate the size of authentication information considering the type of operation being performed, and then change the value of cache size.

For information on calculating the size of authentication information, refer to "Environment Definition for Interstage Single Sign-on" - "Tuning for Setting up the Business Server" in the Tuning Guide.

To change the authentication information cache size in the business server Interstage Management Console, click [System] > [Security] > [Single Sign-on] > [Business System] > [Business system Name]> [Settings] > [Detailed settings [Display]], and then [Cache size] in [Authentication information cache].

## 21.4.37 sso03063

---

**SSO: ERROR: sso03063: The authentication information could not be cached because the number of records that can be cached was exceeded. Name=(%s1)**

### Variable Information

%s1 = Business system name

### Explanation

Authentication information could not be cached on the Interstage single sign-on business server (Business system name (%s1)) because the user has exceeded the number of records that are able to be cached.

### User Action

The user may continue with operations, however authorization performance may deteriorate. Calculate the number of cache records of authentication information considering the type of operation being performed.

This message is only displayed once, when the user has exceeded the number of records that are able to be cached and accesses the business server, after the business server has been started.

For the number of cache records of the authentication information, refer to "Environment Definition for Interstage Single Sign-on" - "Tuning for Setting up the Business Server" in the Tuning Guide.

To change the number of cache records of the authentication information, in the business server Interstage Management Console, click [System] > [Security] > [Single Sign-on] > [Business System] > [Business system Name]> [Settings] > [Detailed settings [Show]], and then [Cache count] in [Authentication information cache].

## 21.4.38 sso03064

---

**SSO: ERROR: sso03064: There is an inconsistency in the extended user information settings. Name=(%s1) Attribute=(%s2)**

### Variable Information

%s1 = Business system name

%s2 = The name of the attribute where the inconsistency occurred

### Explanation

Extended user information (%s2) which is not set in the repository server is set in the SSO repository protection resource.

### User Action

Request that the SSO administrator performs the following actions:

[When the attribute name (%s2) that detected an inconsistency is notified]

1. Set the attribute name (%s2) that detected an inconsistency in [Extended user information] in the environment settings in the repository server (\*1)

[When the attribute name (%s2) that detected an inconsistency is not notified]

1. Set the attribute name (%s2) that detected an inconsistency in [Extended user information] in the environment settings in the repository server (\*1)
2. Check the Extended user information set in the SSO repository protection resource to see if the attribute name (%s2) that detected an inconsistency is set. If it is set, delete it (\*2)
3. Delete the attribute name (%s2) that detected an inconsistency from [Extended user information] in the environment settings in the repository server (\*1)

\*1 [Extended user information] can be checked and set in the Interstage Management Console of the repository server, from [Extended user information] in [Information notified to the Business System], by clicking [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Repository server] > [Settings] > [Repository server detailed settings [Show]].

\*2 Using the repository server in the Interstage Management Console, set [Notify extended user information] of [Path Configuration Settings] by clicking [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Repository server] > [Protection resource] > [Site Configuration] > [Protection path] > [List] tab.

## 21.5 sso04000 to sso04001

---

### 21.5.1 sso04000

---

**SSO: ERROR: sso04000: The environmental configuration of the Web Server (Interstage HTTP Server) is broken.**

#### Explanation

The port number cannot be acquired because the environment configuration of the Web server (Interstage HTTP Server) is damaged.

#### User Action

If the server was upgraded from a previous version, check that the upgrade procedure was correct.

In all other cases, take the following action:

- Check for the port numbers displayed in the list of the authentication infrastructure. For acquiring the list of the authentication infrastructure, on the Interstage Management Console, select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [List] tab. If there is a server whose port number is displayed as 'Unknown', delete the appropriate server, then reestablish the authentication infrastructure. (\*1)
- Check for the port numbers displayed in the list of business systems. To acquire the list of business systems, on the Interstage Management Console, select [System] > [Security] > [Single Sign-on] > [Business system] > [List] tab. If there is a server whose port number is displayed as 'Unknown', delete the appropriate server, then reestablish the business system. (\*2)

\*1 For details about reestablishing the authentication infrastructure, see 'Environment Setup (SSO Administrators)' in the Single Sign-on Operator's Guide.

\*2 For details about reestablishing the business system, see 'Environment Setup (Business Server Administrators)' in the Single Sign-on Operator's Guide.

### 21.5.2 sso04001

---

**SSO: INFO: sso04001: The WorkUnit is required to reboot. (%s1)**

#### Variable Information

%s1 = Supplementary information

#### Explanation

The WorkUnit used in the function displayed in the supplementary information (%s1) must be restarted in order to start the Interstage Single Sign-on application.

## User Action

When the servlet application used in the function displayed in the supplementary information (%s1) is deployed, restart the WorkUnit of the IJServer name specified in the ssoDeploy command.

To stop and start the WorkUnit, in the Interstage Management Console click [System] > [WorkUnit] > ["IJServer Name"] > [Action].

## 21.6 sso04101 to sso04153

---

### 21.6.1 sso04101

---

#### SSO: ERROR: sso04101: The password is incorrect.

##### Explanation

The password is incorrect.

##### User Action

Enter the correct password

### 21.6.2 sso04109

---

#### SSO: ERROR: sso04109: Insufficient Memory space.

##### Explanation

The memory space has become insufficient.

##### User Action

Close all applications no longer needed to secure sufficient memory space.

For details on required memory, refer to "Memory Requirements" in the "Resource Requirements" chapter of the Tuning Guide.

### 21.6.3 sso04110

---

#### SSO: ERROR: sso04110: Insufficient Disk space.

##### Explanation

The space that was previously free in the disk has become insufficient.

##### User Action

Ensure there is sufficient disk space for directories in which each servers configuration files are stored:

##### Windows32/64

- Repository server: C:\Interstage\F3FMssso\ssoatcsv\conf
- Authentication server: C:\Interstage\F3FMssso\ssoatcag\conf
- Business server: C:\Interstage\F3FMssso\ssoatzag\conf

##### Solaris32/64 Linux32/64

- Repository server: /etc/opt/FJSVssosv/conf
- Authentication server: /etc/opt/FJSVssaac/conf
- Business server: /etc/opt/FJSVssaoz/conf

### 21.6.4 sso04113

---

---

**SSO: ERROR: sso04113: The Web Server (Interstage HTTP Server) has been already deleted. Web Server=(%s1)**

Variable Information

%s1 = Web server name

Explanation

The Web server (%s1) of Interstage HTTP Server does not exist. It may have been deleted by another user.

User Action

Check whether the selected Web server of Interstage HTTP Server exists. The Web server of Interstage HTTP Server can be checked by clicking the Interstage Management Console [System] > [Services] > [Web Server] > [List] tab.

If the Web server does not exist, select another Web server.

---

## 21.6.5 sso04114

**SSO: ERROR: sso04114: The host of the Web Server (Interstage HTTP Server) has been already deleted. Web Server=(%s1) Host=(%s2)**

Variable Information

%s1 = Web server name

%s2 = Host name

Explanation

The host (%s2) of Web server (%s1) of Interstage HTTP Server does not exist. It may have been deleted by another user.

User Action

Check whether the selected host of Web server of Interstage HTTP Server exists. The host of Web server of Interstage HTTP Server can be checked by clicking the Interstage Management Console [System] > [Services] > [Web Server] > [Web Server Name] > [Virtual Host] > [List] tab.

If the Web server host does not exist, select another Web server host.

---

## 21.6.6 sso04117

**SSO: ERROR: sso04117: Web Server (Interstage HTTP Server) is not installed.**

Explanation

The Web server (Interstage HTTP Server) has not been installed.

User Action

**Windows32/64**

Install the Web server (Interstage HTTP Server).

**Solaris32/64 Linux32/64**

Install the following package:

- FJSVihs (Web server (Interstage HTTP Server))

---

## 21.6.7 sso04120

**SSO: ERROR: sso04120: Secure Communications Service package is not installed.**

Explanation

The Secure Communication Service has not been installed.

## User Action

### Windows32/64

Install the Secure Communication Service.

### Solaris32

Install the following packages:

- FJSVslcr (Securecrypto Library RunTime)
- FJSVsmee (CA/EE common certificate management function, key management function)
- FSUNssll (Secure Socket Option)

### Solaris64

Install the following packages:

- FJSVsl64 (Securecrypto Library RunTime)
- FJSVsm64 (CA/EE common certificate management function, key management function)

### Linux32

Install the following packages:

- FJSVslcr (Securecrypto Library RunTime)
- FJSVsmee (CA/EE common certificate management function, key management function)

### Linux64

Install the following packages:

- FJSVsl64 (Securecrypto Library RunTime)
- FJSVsm64 (CA/EE common certificate management function, key management function)

## 21.6.8 sso04122

---

### SSO: ERROR: sso04122: Interstage Directory Service package is not installed.

#### Explanation

Interstage Directory Service has not been installed or the environment of Interstage Directory Service is damaged.

#### User Action

### Windows32/64

Install Interstage Directory Service and Interstage data store. If they have been already installed, reinstall them. (\*1)

### Solaris32/64 Linux32/64

Install the following packages. If they have been already installed, reinstall them. (\*1)

- FJSVirep (Interstage Directory Service )
- FJSVena (Interstage data store for enterprise content knowledge and document management )

\*1 After uninstalling the above mentioned packages, delete all files under the following directories:

### Windows32/64

- C:\Interstage\IREP
- C:\Interstage\Enabler

Solaris32/64 Linux32/64

- /opt/FJSVirep
- /var/opt/FJSVirep
- /etc/opt/FJSVirep
- /opt/FJSVena
- /var/opt/FJSVena

## 21.6.9 sso04123

---

**SSO: ERROR: sso04123: Single Sign-on Common Library package is not installed.**

### Explanation

The Interstage Single Sign-on Common Library has not been installed.

### User Action

Windows32/64

Install Interstage Single Sign-on.

Solaris32/64 Linux32/64

Install the following package:

- FJSVssocm (Interstage Single Sign-on Common Library)

## 21.6.10 sso04124

---

**SSO: ERROR: sso04124: An error occurred in Interstage JMX service.**

### Explanation

An error occurred in the Interstage JMX service.

### User Action

See the log file of the Interstage JMX service, remove the cause, then reexecute the processing.

If you cannot identify the cause by the contents of the log file, reexecute the same operation.

If the above measures do not solve the problem, immediately use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer

## 21.6.11 sso04125

---

**SSO: ERROR: sso04125: Internal error.**

### Explanation

The possible causes are:

- An internal error occurred.

Windows32/64

- The DOS device name may have been specified in the following log output file names.
  - Access Log
  - Session Management Log
- Interstage Application Server may have been installed when the Terminal service was in application mode.

## User Action

Take the following action:

- See the log file of the Interstage JMX service, remove the cause, then reexecute the process.

If you cannot identify the cause by the contents of the log file, reexecute the same operation.

If this user action is not successful, use the `iscollectinfo` command to collect diagnostic information, then contact your service engineer.

### Windows32/64

- Check if the DOS device name was specified in the following log output file names. (\*1)
  - Access Log
  - Session Management Log
- If Interstage Application Server was installed when the Terminal service was in application mode, uninstall Interstage Application Server, execute `[CHANGE USER /INSTALL]`, and then reinstall Interstage Application Server. After reinstalling Interstage Application Server, execute `[CHANGE USER /EXECUTE]`.

If the above measures do not solve the problem, immediately use the `iscollectinfo` command to collect diagnostic information, then contact your service engineer

\*1 The output files for the access logs of each server and the session management log can be referenced using the Interstage Management Console. Click the tabs shown below.

- Repository Server Access Log  
[System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Repository server] > [Settings] > [Access Log Settings]
- Authentication Server Access Log  
[System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Authentication server] > [Settings] > [Access Log Settings]
- Business Server Access Log  
[System] > [Security] > [Single Sign-on] > [Business system] > [Business system Name] > [Settings] > [Access Log Settings]
- Session Management Log  
[System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Repository server] > [Settings] > [Session management Log Settings]

## 21.6.12 sso04126

---

### SSO: ERROR: sso04126: An error occurred in network processing.

#### Explanation

An error has occurred in the network environment or a network process.

#### User Action

Check for errors in the network environment. Eliminate the causes of any errors that are found and run the process again.

If the above measures do not solve the problem, immediately use the `iscollectinfo` command to collect diagnostic information, then contact your service engineer

## 21.6.13 sso04130

---

### SSO: ERROR: sso04130: Can not access the file. File name=(%s1)

## Variable Information

%s1 = Absolute path of the file

## Explanation

The permission to access the file is not granted. Alternatively, the file may be in use by another application.

## User Action

Check for the permission to access the file (%s1). Alternatively, check that another application is not using the file (%s1). If another application is using the file (%s1), terminate the application.

## 21.6.14 sso04131

---

**SSO: ERROR: sso04131: The specified file name is invalid. File name=(%s1)**

## Variable Information

%s1 = File name

## Explanation

The specification format of the file name is incorrect. Possible causes of the error are as follows:

- The specified file name exceeds 256 characters.
- The specified file name includes a character that cannot be specified.

**Windows32/64**

- The DOS device name may have been specified in the following log output file names.
  - Access Log
  - Session Management Log

## User Action

For the file name to be specified, check the following:

- Specify a file name up to 256 characters including the fixed character string on the Settings window and the specified file.
- Check that the following characters that cannot be specified are not included in the file name:
  - Backslash (\)
  - Slash (/)
  - Colon (:)
  - Comma (,)
  - Semicolon (;)
  - Asterisk (\*)
  - Question mark (?)
  - Double quotation (')
  - Less-than sign (<)
  - Greater-than sign (>)
  - Bar line (|)

If the fixed character string on the window includes a character above, the environment of the server may be damaged. Reestablish the environment of the server using the following procedure:

### **Procedure for Reestablishing the Repository Server**

1. On the Interstage Management Console, select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [List] tab to once delete the repository server.
2. Then establish the repository server by the [Authentication infrastructure Settings] tab.

#### Procedure for Reestablishing the Authentication Server

1. On the Interstage Management Console, select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [List] tab to delete the authentication server.
2. Establish the authentication server by using the [Authentication infrastructure Settings] tab.

#### Procedure for Reestablishing the Business Server

1. On the Interstage Management Console, select [System] > [Security] > [Single Sign-on] > [Business system] > [List] tab to once delete the business server.
2. Then add the business server by the [Addition of Business server] tab.

#### Windows32/64

- Check if the DOS device name was specified in the following log output file names.
  - Access Log
  - Session Management Log

The output files for the access logs of each server and the session management log can be referenced using the Interstage Management Console. Click the tabs shown below.

- Repository Server Access Log  
[System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Repository server] > [Settings] > [Access Log Settings]
- Authentication Server Access Log  
[System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Authentication server] > [Settings] > [Access Log Settings]
- Business Server Access Log  
[System] > [Security] > [Single Sign-on] > [Business system] > [Business system Name] > [Settings] > [Access Log Settings]
- Session Management Log  
[System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Repository server] > [Settings] > [Session management Log Settings]

## 21.6.15 sso04132

**The SSL configuration has been already deleted. SSL configuration=(%s1)**

#### Variable Information

%s1 = SSL configuration

#### Explanation

The specified SSL configuration (%s1) does not exist. It may have been deleted by another user.

#### User Action

Check that the SSL configuration of the Interstage certificate environment specified for the environment setting exists by selecting the [System] > [Security] > [SSL] > [SSL: View SSL Configurations] window on the Interstage Management Console. If the SSL configuration does not exist, create the SSL configuration by [System] > [Security] > [SSL] > [Create a new SSL Configuration] tab on the Interstage Management Console. (\*1)

\*1 For creating the SSL configuration, see 'Environment Setup (SSO Administrators)' - 'Setup of Authentication Server' - 'SSL Communication Environment Setup' in the Single Sign-on Operator's Guide.

## 21.6.16 sso04133

---

### SSO: ERROR: sso04133: The domain name is invalid. Domain name=(%s1)

#### Variable Information

%s1 = Domain name

#### Explanation

The domain name (%s1) is incorrect.

#### User Action

Check for the domain name (%s1).

The domain name must be specified with a character string according to the following:

- The en-size alphanumeric characters and the following symbols can be specified:
  - Hyphen (-)
  - Period (.)
- The length of the character string is in the range 4 to 255 bytes.
- The first character must be a period (.)
- Specify a domain name of two or more layers. (\*1)

Additionally, the domain name cannot be specified as follows:

- Periods (.) are specified successively.
- A period (.) is followed by a hyphen (-).
- A period (.) is specified at the end of a character string.
- A period (.) is specified at the end of a character string.

\*1 When a 2-layered domain name is specified (such as .co.jp), the Web browser sometimes does not accept cookie so that the business system cannot operate. If the browser does not accept cookie for the specified domain name, the HTTP status code of 403 is reported to the browser during operation. In this case, specify a domain name of 3 layers or more (such as .fujitsu.co.jp) to create the business system setup file, then create the business server in the following procedure:

1. On the Interstage Management Console, select the [System] > [Security] > [Single Sign-on] > [Business system] > [List] tab to once delete the business server.
2. Then add the business server on the [Addition of Business server] tab.

## 21.6.17 sso04134

---

### SSO: ERROR: sso04134: The host name is invalid. Host name=(%s1)

#### Variable Information

%s1 = Host name

#### Explanation

The host name (%s1) is incorrect.

#### User Action

Check for the host name (%s1).

A host name is a character string in the range 1 to 255 bytes. The en-size alphanumeric characters and the following symbols can be used. However, at the beginning and end of the host name, specify en-size alphanumeric characters.

- Hyphen (-)

- Period (.)

## 21.6.18 sso04135

---

### SSO: ERROR: sso04135: The password is invalid.

#### Explanation

The password is incorrect.

#### User Action

Check for the specified password.

A password is a character string in the range 6 to 128 bytes. The alphanumeric characters, symbols, and en-size spaces can be used.

## 21.6.19 sso04136

---

### SSO: ERROR: sso04136: The FQDN is invalid. FQDN=(%s1)

#### Variable Information

%s1 = FQDN

#### Explanation

The FQDN (%s1) is incorrect.

#### User Action

Check for the FQDN (%s1).

An FQDN (host name + domain name) is a character string in the range 1 to 255 bytes. The en-size alphanumeric characters and the following symbols can be specified. However, at the beginning and end of the FQDN, specify en-size alphanumeric characters.

- Hyphen (-)
- Period (.)

## 21.6.20 sso04137

---

### SSO: ERROR: sso04137: The attribute name is invalid. Attribute name=(%s1)

#### Variable Information

%s1 = Attribute name

#### Explanation

The attribute name (%s1) is invalid.

#### User Action

Check the attribute name (%s1). Specify the attribute name according to the following conditions:

- The attribute name can be between 1 and 512 characters.
- Strings containing Japanese cannot be specified.
- Commas (,) cannot be specified.
- For security, the userPassword attribute cannot be specified.
- Attributes containing binary data cannot be specified.

## 21.6.21 sso04138

---

---

**SSO: ERROR: sso04138: The authentication method to notify the Web application is invalid.  
Method=(%s1)**

**Variable Information**

%s1 = Authentication method

**Explanation**

The authentication method (%s1) that was specified to notify that the Web application is invalid.

**User Action**

Check the authentication method (%s1) that was specified to notify the Web application. Specify an authentication method according to the following conditions:

- Between 1 and 64 characters can be specified.
- Strings containing Japanese cannot be specified.

---

## 21.6.22 sso04139

---

**SSO: ERROR: sso04139: Internal error. Detail=(%d1,%s2)**

**Variable Information**

%d1 = Maintenance information

%s2 = Maintenance information

**Explanation**

Possible causes of the error are as follows:

- The port number of the SSO repository that is being used by the Single Sign-on Repository server may be in use by another LDAP server on the same machine.
- An internal error occurred.

**Windows32/64**

- Interstage Application Server may have been installed when the Terminal service was in application mode.

**User Action**

Take the following action:

- If the SSO repository port number is being used by another LDAP server on the same machine, stop the other LDAP server or change the SSO repository port number and then reexecute processing. (\*1)
- See the log file of the Interstage JMX service, remove the cause, then reexecute the process.

If you cannot identify the cause by the contents of the log file, reexecute the same operation.

If this user action is not successful, use the `iscollectinfo` command to collect diagnostic information, then contact your service engineer.

**Windows32/64**

- If Interstage Application Server was installed when the Terminal service was in application mode, uninstall Interstage Application Server, execute `[CHANGE USER /INSTALL]`, and then reinstall Interstage Application Server. After reinstalling Interstage Application Server, execute `[CHANGE USER /EXECUTE]`.

If the above measures do not solve the problem, immediately use the `iscollectinfo` command to collect diagnostic information, then contact your service engineer

\*1 For details on the SSO repository, refer to the "Directory Service Operator's Guide".

## 21.6.23 sso04140

---

**SSO: ERROR: sso04140: An error occurred in the system function. Detail=(%d1,%s2)**

### Variable Information

%d1 = Maintenance information

%s2 = Maintenance information

### Explanation

An error occurred in a system function during processing. Possible causes of the error are as follows:

- There is insufficient memory.
- There is insufficient disk capacity.
- An error occurred in the system function.

### User Action

Take the following steps:

- Close unnecessary applications and secure required memory capacity.

For details about required memory capacity, refer to "Resource Requirements" - "Memory Requirements" in the Tuning Guide.

- Secure space by getting rid of unnecessary files.
- Wait a few moments and perform the operation again.

If this does not solve the problem, immediately use the `iscollectinfo` command to collect diagnostic information, then contact your service engineer

## 21.6.24 sso04141

---

**SSO: ERROR: sso04141: Insufficient system resources. Resource=(%s1)**

### Variable Information

%s1 = Resource name

FD = File descriptor

STREAMS = STREAMS resource

### Explanation

There are insufficient system resources. The possible causes are:

- If the system resource (%s1) is "FD":  
There are insufficient file descriptors.
- If the system resource (%s1) is "STREAMS":  
The resources used by the STREAMS mechanism are insufficient.

### User Action

Close any other programs that are running and perform the operation again.

## 21.6.25 sso04142

---

**SSO: ERROR: sso04142: Environment variable is not set (IS\_HOME).**

### Explanation

An environment variable (IS\_HOME) needed for Interstage to operate has not been set.

#### User Action

Set the absolute path of the Interstage installation directory in the environment variable ("IS\_HOME").

### 21.6.26 sso04143

---

#### **SSO: ERROR: sso04143: An error occurred in SSL communication.**

#### Explanation

An error occurred during SSL communication.

#### User Action

Examine the system log that is output at the same time as this error and take any appropriate measures.

### 21.6.27 sso04144

---

#### **SSO: ERROR: sso04144: Interstage certificate environment was not created.**

#### Explanation

The Interstage certificate environment has not been created.

#### User Action

Create the Interstage certificate environment.

Refer to "Creating the Interstage certificate environment" in "Preparations for SSL Communication" in the Single Sign-on Operator's Guide for information about creating Interstage certificate environments.

### 21.6.28 sso04145

---

#### **SSO: ERROR: sso04145: Could not access the Interstage certificate environment.**

#### Explanation

The user does not have permission to access the Interstage certificate environment.

#### User Action

Check the access permissions of the Interstage certificate environment.

Refer to "Setting and Use of the Interstage Certificate Environment" in the Security System Guide for information about Interstage certificate environment access permissions.

### 21.6.29 sso04146

---

#### **SSO: ERROR: sso04146: Access to the Interstage certificate environment was refused.**

#### Explanation

Access to the Interstage certificate environment was refused because the environment was overloaded.

#### User Action

Close any other programs that are running and perform the operation again.

### 21.6.30 sso04147

---

#### **SSO: ERROR: sso04147: Interstage certificate environment is broken. Detail=(%s1)**

#### Variable Information

%s1 = Maintenance information

## Explanation

The Interstage certificate environment is damaged.

## User Action

Create the Interstage certificate environment again.

Refer to "Setting and Use of the Interstage Certificate Environment" in the Security System Guide for information about the Interstage certificate environment.

## 21.6.31 sso04148

---

**SSO: ERROR: sso04148: An internal error occurred in the SCS function. Detail=(%d1,%s2)**

### Variable Information

%d1 = Maintenance information

%s2 = Maintenance information

## Explanation

An internal conflict occurred within an SCS function.

## User Action

Immediately after the message is output, use the *iscollectinfo* command to collect investigation information, then contact your service engineer.

## 21.6.32 sso04149

---

**SSO: ERROR: sso04149: An error occurred during access to the file. Filename=(%s1) Detail=(%s2)**

### Variable Information

%s1 = File name

%s2 = Maintenance information

## Explanation

An error occurred accessing the file during processing. The possible causes are:

- An error occurred reading the file.
- An error occurred writing to the file.
- There was insufficient disk space.
- An error occurred in the system function.

## User Action

Take the following action:

- Check that the file (%s1) can be read.
- Check that the file (%s1) can be written to.
- Secure available disk space by evacuating unnecessary files.
- Wait for a while and then reexecute. If the message is still output, immediately after the message is output, use the *iscollectinfo* command to collect investigation information, then contact your service engineer.

## 21.6.33 sso04151

---

**SSO: ERROR: sso04151: The definition file contents are incorrect. Filename=(%s1)**

## Variable Information

%s1 = Configuration file name

## Explanation

The XML syntax is incorrect in the Interstage single sign-on Configuration file (%s1).

## User Action

Take the following actions for Configuration file (%s1).

Table 21.48 Configuration File Corrections

Configuration file name(%s1)	Action
ssowinauth.xml	After deleting the Configuration file (%s1), click the [Update] button using the Interstage Management Console [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Authentication server] > [Settings] tab.

## 21.6.34 sso04153

### SSO: ERROR: sso04153: An error occurred in SSL communication. Detail=(%s1,%s2)

## Variable Information

%s1 = SSL configuration name

%s2 = Maintenance information

## Explanation

The possible causes are:

- The URL of the directory service is incorrect.
- The certificate used for directory service connection is not registered in the Interstage certificate environment.
- The machine that setup the Interstage single sign-on repository server may have the following combinations.
  - For operation security, SSL is used for the connection with the directory service
  - In the repository server, SSL is used for the connection with Active Directory.
- An error occurred during SSL communication.

## User Action

Take the following action:

- Check the URL of the directory service. (\*1)
- Register the certificate used for the directory service connection in the Interstage certificate environment. (\*2)
- Change the SSL communication to one of the following as an alternative. (\*3)
  - For operation security, use SSL for the connection with the directory service.
  - In the repository server, use SSL for the connection with Active Directory.
- Refer to the maintenance information (%s2) for actions other than those listed above. (\*4)

\*1 For the URL of the directory service, in the Interstage Management Console click [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Repository server] > [Settings]. Click [Repository server detailed settings[Display]], and then refer to [Directory service URL] in the [Repository Settings] > [Active Directory Settings].

\*2 For the certificate used for connection with the directory service, refer to "Settings for Active Directory Linkage" - "Use Active Directory for the directory service to register the user information" - "Constructing SSL communication environment" in the Single Sign-on Operator's Guide.

\*3 For alternative methods, refer to the notes "Environment settings (SSO Administrators)" - "Repository Server Setup" - "Constructing a Repository Server (One Server or Update System)" in the Single Sign-on Operator's Guide.

\*4 When "errtype" or "SSLErrorCode" is displayed in the maintenance information, refer to "SSLException Error Types" and "SSL Error Codes" in the "Error Codes to be Reported from Interstage Directory Service" chapter.

## 21.7 sso04200 to sso04270

---

### 21.7.1 sso04200

---

**SSO: INFO: sso04200: Repository server and Authentication server were created. The Web Server (Interstage HTTP Server) is required to reboot ([System] > [Services] > [Web Server]).**

#### Explanation

The repository server and authentication server of Interstage Single Sign-on have been set up. To start the operation, restarting the Web server (Interstage HTTP Server) is required. On the Interstage Management Console, select [System] > [Services] > [Web Server] > [Web Server Name] > [Web Server Status] tab to restart the Web server (Interstage HTTP Server).

To add a business system to the Single Sign-on system: (\*1)

1. By [Protection resource] of the set up repository server, create [Site Configuration Settings] of the business system.
2. By the [Protection path] of the site configuration created in step 1, create the path configuration.
3. By [Authentication infrastructure], download the business system setup file to pass it to the business server administrator.

\*1 For details on how to add a business system, refer to 'Environment Setup Flow' under 'Environment Setup (Business Server Administrators)' in the Single Sign-on Operator's Guide.

### 21.7.2 sso04201

---

**SSO: INFO: sso04201: Repository server was created. The Web Server (Interstage HTTP Server) is required to reboot ([System] > [Services] > [Web Server]).**

#### Explanation

The repository server of Interstage Single Sign-on has been set up. To start the operation, the Web server (Interstage HTTP Server) needs to be restarted. On the Interstage Management Console, select [System] > [Services] > [Web Server] > [Web Server Name] > [Web Server Status] tab to restart the Web server (Interstage HTTP Server).

For setting up the repository server (reference system) or authentication server, download the authentication infrastructure setup file by [Authentication infrastructure]. (\*1)

\*1 For details about how to set up the repository server (reference system) or authentication server, see 'Environment Setup (SSO Administrators)' - 'Environment Setup Flow' in the Single Sign-on Operator's Guide.

### 21.7.3 sso04202

---

**SSO: INFO: sso04202: Repository server (reference system) was created. The Web Server (Interstage HTTP Server) is required to reboot ([System] > [Services] > [Web Server]).**

#### Explanation

The repository server (reference system) of Interstage Single Sign-on has been established. To start the operation, restarting the Web server (Interstage HTTP Server) is required. On the Interstage Management Console, select [System] > [Services] > [Web Server] > [Web Server Name] > [Web Server Status] tab to restart the Web server (Interstage HTTP Server).

### 21.7.4 sso04203

---

**SSO: INFO: sso04203: The environmental configuration of the Repository server was updated. The Web Server (Interstage HTTP Server) is required to reboot ([System] > [Services] > [Web Server]). (%s1)**

## Variable Information

%s1 = Supplementary information

## Explanation

The environment configuration of the repository server of Interstage Single Sign-on has been updated. To start the operation with the updated configuration, the Web server (Interstage HTTP Server) needs to be restarted. On the Interstage Management Console, select [System] > [Services] > [Web Server] > [Web Server Name] > [Web Server Status] tab to restart the Web server (Interstage HTTP Server).

Note that if "Server connection information has changed" appears in the supplementary information, the authentication server and SSL accelerator settings should be changed as needed.

## 21.7.5 sso04204

---

**SSO: ERROR: sso04204: The Repository server has been already deleted.**

## Explanation

The repository server of Interstage Single Sign-on does not exist. It may have been deleted by another user.

## User Action

Take the following steps:

1. On the Interstage Management Console, select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [List] tab to acquire the latest list of servers that establish the authentication infrastructure.
2. See the list acquired in step 1 to check that the repository server exists.
3. If the repository server does not exist in step 2, on the Interstage Management Console, select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Establishing Authentication infrastructure] tab to reestablish the repository server.

## 21.7.6 sso04205

---

**SSO: INFO: sso04205: The user accessing was unlocked. UserID=(%s1)**

## Variable Information

%s1 = User ID

## Explanation

The user with the user ID (%s1) has been unlocked.

## 21.7.7 sso04206

---

**SSO: INFO: sso04206: Role information was updated. Please request Business server administrator to update access control information.**

## Explanation

The role information has been updated.

The SSO administrator must ask the business server administrator to update the access control information.

## 21.7.8 sso04207

---

**SSO: INFO: sso04207: The environmental configuration of the Repository server was updated. Shift the operation that manages the session to the Repository server (reference system), Authentication server, and Business server.**

## Explanation

The environment settings of an Interstage single sign-on repository server have been updated. Switch the repository server (reference system), authentication server and business server that have been created to session management operation.

For details on switching to session management operation, refer to 'Switching to an Application to Perform Session Management' under 'Notes on Previous Versions' in the Single Sign-on Operator's Guide.

## 21.7.9 sso04209

---

**SSO: INFO: sso04209: Site configuration was created in the SSO Repository. Site configuration=(%s1)**

### Variable Information

%s1 = FQDN:port number

### Explanation

The site configuration (%s1) has been created for the protection resource in the SSO repository. Create the path configuration by [Protection path] of the created site configuration, download the business system setup file by [Authentication infrastructure], then pass it to the business server administrator.

For details on how to add a business system, refer to 'Environment Setup Flow' under 'Environment Setup (Business Server Administrators)' in the Single Sign-on Operator's Guide.

## 21.7.10 sso04210

---

**SSO: ERROR: sso04210: The Site configuration has been already deleted from the SSO Repository. Site configuration=(%s1)**

### Variable Information

%s1 = FQDN:port number

### Explanation

The site configuration has not been registered in the protection resource in the SSO repository. It may have been deleted by another user.

### User Action

Take the following steps:

1. On the Interstage Management Console, select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Repository server] > [Protection resource] > [List] tab to acquire the latest list of site configurations.
2. See the list acquired in step 1 to check that the site configuration exists.
3. If the site configuration does not exist in step 2, on the Interstage Management Console, select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Repository server] > [Protection resource] to create the site configuration.

## 21.7.11 sso04211

---

**SSO: INFO: sso04211: The Site configuration was deleted from the SSO Repository. Site configuration=(%s1)**

### Variable Information

%s1 = FQDN:port number

### Explanation

The site configuration (%s1) has been deleted from the protection resource in the SSO repository.

## 21.7.12 sso04212

---

**SSO: INFO: sso04212: The Site configuration in the SSO Repository was updated. Site configuration=(%s1)**

### Variable Information

%s1 = FQDN:port number

### Explanation

The site configuration (%s1) for the protection resource in the SSO repository has been updated. To start the operation based on the updated site configuration, create the path configuration by [Protection path] of the updated site configuration, download the business system setup file by [Authentication infrastructure], then pass it to the business server administrator.

For details about how to add a business system, refer to 'Environment Setup Flow' under 'Environment Setup (Business Server Administrators)' in the Single Sign-on Operator's Guide.

## 21.7.13 sso04213

---

**SSO: ERROR: sso04213: The Path configuration has been already deleted from the SSO Repository. Site configuration=(%s1) Path configuration=(%s2)**

### Variable Information

%s1 = FQDN:port number

%s2 = Path configuration

### Explanation

The path configuration (%s2) has not been registered in the site configuration (%s1) for the protection resource in the SSO repository. It may have been deleted by another user.

### User Action

Take the following steps:

1. On the Interstage Management Console, select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Repository server] > [Protection resource] > [Site Configuration] > [Protection path] > [List] tab to acquire the latest list of path configurations.
2. See the list acquired in step 1 to check that the path configuration exists.
3. If the path configuration does not exist in step 2, on the Interstage Management Console, select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Repository server] > [Protection resource] > [Site Configuration] to recreate the path configuration.

## 21.7.14 sso04214

---

**SSO: INFO: sso04214: The Path configuration was deleted from the SSO Repository. Please request Business server administrator to update access control information. Site configuration=(%s1) Path configuration=(%s2)**

### Variable Information

%s1 = FQDN: port number

%s2 = Path configuration

### Explanation

The path configuration (%s2) has been deleted from the site configuration (%s1) for the protection resource in the SSO repository.

The SSO administrator must ask the business server administrator to update the access control information.

## 21.7.15 sso04215

---

**SSO: INFO: sso04215: Path configuration was created in the SSO Repository. Please request Business server administrator to update access control information. Site configuration=(%s1) Path configuration=(%s2)**

### Variable Information

%s1 = FQDN:port number

%s2 = Path configuration

### Explanation

The path configuration (%s2) has been created in the site configuration (%s1) for the protection resource in the SSO repository.

The SSO administrator must ask the business server administrator to update the access control information.

## 21.7.16 sso04216

---

**SSO: INFO: sso04216: The Path configuration in the SSO Repository was updated. Please request Business server administrator to update access control information. Site configuration=(%s1) Path configuration=(%s2)**

### Variable Information

%s1 = FQDN:port number

%s2 = Path configuration

### Explanation

The path configuration (%s2) in the site configuration (%s1) for the protection resource in the SSO repository has been updated.

The SSO administrator must ask the business server administrator to update the access control information.

## 21.7.17 sso04217

---

**SSO: INFO: sso04217: The Role/Role set has been already deleted from the SSO Repository. Site configuration=(%s1) Path configuration=(%s2) Role/Role set=(%s3)**

### Variable Information

%s1 = FQDN:port number

%s2 = Path configuration

%s3 = Role/role set

### Explanation

The role/role set (%s3), which has been specified in the path configuration (%s2) in the site configuration (%s1) of the SSO repository, does not exist in the role configuration. It may have been deleted by another user.

### User Action

Check that the role/role set (%s3), which has been specified in the path configuration (%s2) in the site configuration (%s1) of the SSO repository, exists in the role configuration of the SSO repository.

If the role/role set (%s3) has not been registered in the role configuration, register the role/role set (%s3). (\*1) If the role/role set (%s3) has been correctly registered in the role configuration, check that the role/role set (%s3) has been correctly specified in the path configuration (%s2).

If the role/role set (%s3) has not been registered in the path configuration, reconfigure the role/role set (%s3). (\*2)

After the review, the SSO administrator must ask the business server administrator to update the access control information.

\*1 For checking the registration contents of the SSO repository, use a tool such as the entry administration tool. For details, see 'Entry Management' in the Directory Service Operator's Guide.

\*2 For setting up the role/role set, on the Interstage Management Console, see [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Repository server] > [Protection resource] > [Site Configuration] > [Protection path] > [List] tab.

## 21.7.18 sso04218

---

### SSO: INFO: sso04218: The Repository server was deleted.

#### Explanation

The repository server of Interstage Single Sign-on has been deleted.

The authentication server and business system has been established or added by the authentication infrastructure setup file. In addition, the business system setup file has been downloaded by using the deleted repository server and as a result cannot be used after this operation.

## 21.7.19 sso04219

---

### SSO: ERROR: sso04219: Small-scale system can not be created because Repository server already exists.

#### Explanation

A new small-scale system (repository server and authentication server run on a single machine) cannot be established because the repository server of Interstage Single Sign-on has already been established.

#### User Action

Check for the selections for the system to be established.

To establish a new small-scale system (repository server and authentication server run on a single machine), take the following steps:

1. If the repository server and authentication server of Interstage Single Sign-on exist, on the Interstage Management Console, select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [List] tab to once delete the repository server and authentication server.
2. Then establish the small-scale system by selecting [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Establishing Authentication infrastructure] tab on the Interstage Management Console. (\*1)

\*1 For details on establishing a small-scale system, see 'Environment Setup (SSO Administrators)' in the Single Sign-on Operator's Guide.

## 21.7.20 sso04220

---

### SSO: ERROR: sso04220: Repository server can not be created because SSO Repository selected stand-alone or master as the replication operating does not exist.

#### Explanation

The repository server (update system) of Interstage Single Sign-on cannot be set up because the SSO repository whose operation mode of replication is stand-alone or master does not exist.

#### User Action

After taking either of the following actions, set up repository server (update system) of Interstage Single Sign-on. (\*1)

- Create the SSO repository whose operation mode of replication is stand-alone.
- Create the SSO repository whose operation mode of replication is master mode. (\*2)

\*1 For details on creating the SSO repository, see 'Environment Setup (SSO Administrators)' - 'Repository Server Setup' in the Single Sign-on Operator's Guide.

\*2 Refer to the Directory Service Operator's Guide for detailed information about creating an SSO repository.

## 21.7.21 sso04221

---

### **SSO: ERROR: sso04221: Authentication infrastructure setup file can not be downloaded because Repository server does not exist.**

#### Explanation

The authentication infrastructure setup file cannot be downloaded because the repository server does not exist. The repository server may have been deleted by another user.

#### User Action

Take the following steps:

1. On the Interstage Management Console, select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [List] tab to acquire the latest list of the repository server
2. See the list acquired in step 1 to check that the repository server exists.
3. If the repository server does not exist in step 2, on the Interstage Management Console, select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Establishing Authentication infrastructure] tab to reestablish the repository server.

## 21.7.22 sso04222

---

### **SSO: ERROR: sso04222: Authentication infrastructure setup file can not be downloaded from the Repository server (reference system).**

#### Explanation

The authentication infrastructure setup file cannot be downloaded from the repository server (reference system).

#### User Action

Download the authentication infrastructure setup file from the machine where the update system repository server is running.

## 21.7.23 sso04223

---

### **SSO: ERROR: sso04223: Business system setup file can not be downloaded because Repository server does not exist.**

#### Explanation

The business system setup file cannot be downloaded because the repository server does not exist. The repository server may have been deleted by another user.

#### User Action

Take the following steps:

1. On the Interstage Management Console, select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [List] tab to acquire the latest list of the repository server.
2. See the list acquired in step 1 to check that the repository server exists.
3. If the repository server does not exist in step 2, on the Interstage Management Console, select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Establishing Authentication infrastructure] tab to reestablish the repository server.

## 21.7.24 sso04224

---

### **SSO: ERROR: sso04224: Business system setup file can not be downloaded from the Repository server (reference system).**

#### Explanation

The business system setup file cannot be downloaded from the repository server (reference system).

## User Action

Download the business system setup file from the machine where the update system repository server is running.

### 21.7.25 sso04225

---

**SSO: ERROR: sso04225: Business system setup file can not be downloaded because Site configuration does not exist in the SSO Repository.**

#### Explanation

The business system setup file cannot be downloaded because the site configuration does not exist in the repository server.

#### User Action

Take the following steps:

1. On the Interstage Management Console, select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Repository server] > [Protection resource] > [Create a New Site configuration] tab to add the site configuration to the repository server.
2. Download the business system setup file.

### 21.7.26 sso04226

---

**SSO: ERROR: sso04226: Business system setup file can not be downloaded because Path configuration does not exist in the SSO Repository.**

#### Explanation

The business system setup file cannot be downloaded because the path configuration does not exist in the site configuration of the repository server.

#### User Action

Take the following steps:

1. On the Interstage Management Console, select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Repository server] > [Protection resource] > [Site Configuration] > [Protection path] > [Create a New Path configuration] tab to add the path configuration to the site configuration of the repository server.
2. Download the business system setup file.

### 21.7.27 sso04231

---

**SSO: ERROR: sso04231: Repository server (reference system) can not be created because SSO Repository selected slave as the replication operating does not exist.**

#### Explanation

The repository server (reference system) of Interstage Single Sign-on cannot be set up because the SSO repository whose operation mode of replication is slave does not exist.

#### User Action

After creating an SSO repository whose replication operation mode is slave (\*1), create an Interstage single sign-on repository server (reference system). (\*2)

\*1 Refer to the Directory Service Operator's Guide for detailed information about creating an SSO repository.

\*2 For details on setting up the repository server, see 'Environment Setup (SSO Administrators)' -'Repository Server Setup' in the Single Sign-on Operator's Guide.

### 21.7.28 sso04232

---

---

**SSO: ERROR: sso04232: Repository server cat not be created because Repository server already exists.****Explanation**

A new repository server cannot be established because the repository server of Interstage Single Sign-on has been already established.

**User Action**

Check which system has been selected to be established.

To reestablish the repository server, take the following steps:

1. On the Interstage Management Console, select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [List] tab to delete the existing repository server.
2. Then reestablish the repository server by selecting [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Authentication infrastructure Setting] tab on the Interstage Management Console.

---

**21.7.29 sso04233**

---

**SSO: ERROR: sso04233: Repository server package is not installed.****Explanation**

The repository server of Interstage Single Sign-on has not been installed.

**User Action**

**Windows32/64**

Install the Interstage Single Sign-on (repository server).

**Solaris32/64** **Linux32/64**

Install the following package:

- FJSVssosv (Interstage Single Sign-on Repository server)

---

**21.7.30 sso04240**

---

**SSO: WARNING: sso04240: Although the Repository server was deleted, Protection resource was not deleted from the SSO Repository.****Explanation**

Although the repository server of Interstage Single Sign-on was deleted, the protection resource having been registered in the SSO repository was not deleted. (\*1)

\*1 To delete the protection resource in the SSO repository after deleting the repository server, use a tool such as the entry administration tool. For details, see 'Entry Management' in the Directory Service Operator's Guide.

---

**21.7.31 sso04241**

---

**SSO: INFO: sso04241: The Site configuration in the SSO Repository was changed. Old Site configuration=(%s1) New Site configuration=(%s2)****Variable Information**

%s1 = FQDN:port number of original site configuration

%s2 = FQDN:port number of changed site configuration

**Explanation**

The site configuration (%s1) of the protection resource in the SSO repository was changed to the site configuration (%s2).

To start the operation based on the changed site configuration, create the path configuration by [Protection path] of the changed site configuration, download the business system setup file by [Authentication infrastructure], then pass it to the business server administrator. (\*1)

\*1 For details on the procedure for adding a business system, refer to 'Environment Setup (Business Server Administrators)' - 'Environment Setup Flow' in the Single Sign-on Operator's Guide.

## 21.7.32 sso04242

---

**SSO: INFO: sso04242: The Path configuration in the SSO Repository was changed. Please request Business server administrator to update access control information. Site configuration =( %s1) Old Path configuration=( %s2) New Path configuration =( %s3)**

### Variable Information

%s1 = FQDN:port number

%s2 = Original path configuration

%s3 = Changed path configuration

### Explanation

The path configuration (%s2) in the site configuration (%s1) of the protection resource in the SSO repository was changed to the path configuration (%s3).

The SSO administrator must ask the business server administrator to update the access control information.

## 21.7.33 sso04243

---

**SSO: ERROR: sso04243: The Business system setup file could not be downloaded because an error occurred in communication with the Repository server.**

### Explanation

The business system setup file could not be downloaded because an error occurred during communication with the Interstage single sign-on repository server.

Possible causes of the error are as follows:

- A repository server whose settings have been updated incorrectly may be in use.
- There may be a problem on a communication path.
- There is a possibility that the repository server environment settings are incorrect, or that the environment is broken.

### User Action

Take the following actions:

- Examine the system log output to the repository server and take appropriate measures to correct the problem. Refer to "sso00001 to sso00207", "sso01000 to sso01212" and "sso11001 to sso11008" for information about the repository server system log.

If the system log is not output, there is a possibility that the Web server (Interstage HTTP Server) did not restart after the repository server settings were updated. In the Interstage Management Console, click [System] > [Service] > [Web Server] > [Web Server Name] > [Web Server Status] to restart the Web server (Interstage HTTP Server) and download the business system setup file again.

- Examine the repository server (update system) URL and 'Web server used' settings and ask the network administrator to verify that the environment allows connection with the repository server. (\*1) (\*2)
- In the Interstage Management Console, click [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Repository server] > [Settings] > [Update] to update the repository server environment settings. After the update is complete, download the business system setup file again.

1\* To verify the repository server (update system) URL, in the Interstage Management Console select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Repository Server] then select the [Settings] tab, click [Repository server detailed settings [Show]] and check [Repository server (update system) URL] under [Authentication infrastructure Information Settings].

\*2 To verify the 'Web server used' of the repository server (update system), in the Interstage Management Console select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Repository Server], then select the [Settings] tab, click [Repository server detailed settings [Show]] and check [Web server used] under [Communication Settings].

## 21.7.34 sso04244

---

### **SSO: ERROR: sso04244: Repository server environment is broken.**

#### Explanation

The environment of the Interstage single sign-on repository server is damaged.

#### User Action

If the repository server was upgraded from a previous version, check that the upgrade procedure was correct.

In all other cases, use the following procedure to rebuild the Interstage single sign-on repository server. (\*1)

1. In the Interstage Management Console select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure], then select the [List] tab, and delete the repository server.
2. Use [Authentication Infrastructure Settings] tab to build the repository server.

\*1 Refer to "Environment Setup" (SSO Administrator) in the Single Sign-on Operator's Guide for detailed information about creating the repository server environment.

## 21.7.35 sso04245

---

### **SSO: ERROR: sso04245: Repository server could not be updated because the specified access log file name and the session management log file name overlap. File name=(%s1)**

#### Variable Information

%s1 = Access log file name

#### Explanation

The repository server environment settings could not be updated because the access log file name (%s1) of the specified repository server is the same as the session management log file name.

#### User Action

Change either the access log file name or the session management log file name.

## 21.7.36 sso04250

---

### **SSO: INFO: sso04250: Repository server and Authentication server were created. The Web Server (Interstage HTTP Server) is required to read configuration and reboot by using Interstage Management Console of the Admin Server.**

#### Explanation

The Interstage Single Sign-on Repository server and authentication server have been created.

Start the operation using the following procedure. In the following procedure, the environment definition contents of the Web server (Interstage HTTP Server) on the Managed Server on which the repository server and authentication server were created must be reflected in the business configuration management repository on the Admin Server. In addition, the Web server (Interstage HTTP Server) must be restarted.

1. Log in to the Interstage Management Console of the Admin Server.

2. In the Interstage Management Console, click [Application Management] > [Interstage] > [Interstage Application Server] > [Services] > [Web Server] > [FJapache(Server Group Name or Server Name)]. Click the [Get Definition] tab, then select the Managed Server on which the repository server and authentication server were created. Click the [Select] button, then click the [Update] button.

3. In the Interstage Management Console, click [Application Management] > [Interstage] > [Interstage Application Server] > [Services] > [Web Server]. Select the Server Group or Managed Server to be run, then click [Start].

Alternatively, click [Application Management] > [Interstage] > [Interstage Application Server] > [Services] > [Web Server] > [FJapache(Server Group Name or Server Name)], and click [Start].

If Managed Servers are included in the Server Group, create the repository server and authentication server for all of the Managed Servers before executing the above procedure.

Alternatively, execute the following procedure to add a business system to a Single Sign-on system. (\*1)

1. Log in to the Managed Server Interstage Management Console in which the repository server was created.
2. Create the business system [Site Configuration] using [Protected Resources] of the created repository server.
3. Create the path configuration using the [Protected Path] of the site configuration created in Step 2.
4. Download the business system setup file using [Authentication infrastructure], and pass it to the business server administrator.

\*1 For details on the procedure for adding a business system, refer to 'Environment Setup (Business Server Administrators)' - 'Environment Setup Flow' in the Single Sign-on Operator's Guide.

## 21.7.37 sso04251

---

**SSO: INFO: sso04251: Repository server was created. The Web Server (Interstage HTTP Server) is required to read configuration and reboot by using Interstage Management Console of the Admin Server.**

### Explanation

The Interstage Single Sign-on Repository server has been created.

Start the operation using the following procedure. In the following procedure, the environment definition contents of the Web server (Interstage HTTP Server) on the Managed Server on which the repository server was created must be reflected in the business configuration management repository on the Admin Server. In addition, the Web server (Interstage HTTP Server) must be restarted.

1. Log in to the Interstage Management Console of the Admin Server.
2. In the Interstage Management Console, click [Application Management] > [Interstage] > [Interstage Application Server] > [Services] > [Web Server] > [FJapache(Server Group Name or Server Name)]. Click the [Get Definition] tab and select the Managed Server on which the repository server was created. Click the [Select] button, then click the [Update] button.
3. In the Interstage Management Console, click [Application Management] > [Interstage] > [Interstage Application Server] > [Services] > [Web Server]. Select the Server Group or Managed Server to be run, then click [Start].

Alternatively, click [Application Management] > [Interstage] > [Interstage Application Server] > [Services] > [Web Server] > [FJapache(Server Group Name or Server Name)], then click [Start].

If Managed Servers are included in the Server Group, create a repository server for all of the Managed Servers before executing the above procedure.

Alternatively, create a repository server (reference system) or authentication server by downloading the authentication infrastructure setup file using [Authentication infrastructure]. (\*1)

\*1 For details on the procedure for creating a repository server (reference system) or an authentication server, refer to 'Environment Setup (SSO Administrators)' - 'Environment Setup Flow' in the Single Sign-on Operator's Guide.

## 21.7.38 sso04252

---

**SSO: INFO: sso04252: Repository server (reference system) was created. The Web Server (Interstage HTTP Server) is required to read configuration and reboot by using Interstage Management Console of the Admin Server.**

## Explanation

The Interstage Single Sign-on Repository server (reference type) has been created.

Start the operation using the following procedure. In the following procedure, the environment definition contents of the Web server (Interstage HTTP Server) on the Managed Server on which the repository server (reference type) was created must be reflected in the business configuration management repository on the Admin Server. In addition, the Web server (Interstage HTTP Server) must be restarted.

1. Log in to the Interstage Management Console of the Admin Server.
2. In the Interstage Management Console, click [Application Management] > [Interstage] > [Interstage Application Server] > [Services] > [Web Server] > [FJapache(Server Group Name or Server Name)]. Click the [Get Definition] tab and select the Managed Server on which the repository server (reference type) was created. Click the [Select] button, then click the [Update] button.
3. In the Interstage Management Console, click [Application Management] > [Interstage] > [Interstage Application Server] > [Services] > [Web Server]. Select the Server Group or Managed Server to be run, then click [Start].

Alternatively, click [Application Management] > [Interstage] > [Interstage Application Server] > [Services] > [Web Server] > [FJapache(Server Group Name or Server Name)], then click [Start].

If Managed Servers are included in the Server Group, create a repository server (reference system) for all of the Managed Servers before executing the above procedure.

## 21.7.39 sso04253

---

**SSO: INFO: sso04253: The environmental configuration of the Repository server was updated. The Web Server (Interstage HTTP Server) is required to read configuration and reboot by using Interstage Management Console of the Admin Server. (%s1)**

### Variable Information

%s1 = Supplementary information

## Explanation

The Interstage Single Sign-on Repository server environment definition has been updated.

Start the operation using the updated definition as shown in the following procedure. In the following procedure, the environment definition contents of the Web server (Interstage HTTP Server) on the Managed Server on which the repository server has been updated must be reflected in the business configuration management repository on the Admin Server. In addition, the Web server (Interstage HTTP Server) must be restarted.

1. Log in to the Interstage Management Console of the Admin Server.
2. In the Interstage Management Console, click [Application Management] > [Interstage] > [Interstage Application Server] > [Services] > [Web Server] > [FJapache(Server Group Name or Server Name)]. Click the [Get Definition] tab, and select the Managed Server on which the repository server environment settings have been updated. Click the [Select] button, then click the [Update] button.
3. In the Interstage Management Console, click [Application Management] > [Interstage] > [Interstage Application Server] > [Services] > [Web Server]. Select the Server Group or Managed Server to be run, then click [Start].

Alternatively, click [Application Management] > [Interstage] > [Interstage Application Server] > [Services] > [Web Server] > [FJapache(Server Group Name or Server Name)], then click [Start].

If Managed Servers are included in the Server Group, update the environment settings for all of the Managed Servers before executing the above procedure.

Note that if "Server connection information has changed" appears in the supplementary information, the authentication server and SSL accelerator settings should be changed as needed.

## 21.7.40 sso04254

---

---

**SSO: INFO: sso04254: The Repository server was deleted. The Web Server (Interstage HTTP Server) is required to read configuration by using Interstage Management Console of the Admin Server.**

**Explanation**

The Interstage Single Sign-on Repository server has been deleted.

In the following procedure, the environment definition contents of the Web server (Interstage HTTP Server) on the Managed Server on which the repository server was deleted must be reflected in the business configuration management repository on the Admin Server.

1. Log in to the Interstage Management Console of the Admin Server.
2. In the Interstage Management Console, click [Application Management] > [Interstage] > [Interstage Application Server] > [Services] > [Web Server] > [FJapache(Server Group Name or Server Name)]. Click the [Get Definition] tab and select the Managed Server on which the repository server was deleted. Click the [Select] button, then click the [Update] button.

If Managed Servers are included in the Server Group, delete the repository server for all the Managed Servers before executing the above procedure.

Authentication infrastructure setup files fetched using the deleted repository server environment; authentication servers added and set up using the business system setup file; and business systems cannot be used after this operation.

---

### 21.7.41 sso04255

---

**SSO: WARNING: sso04255: Although the Repository server was deleted, Protection resource was not deleted from the SSO Repository. The Web Server (Interstage HTTP Server) is required to read configuration by using Interstage Management Console of the Admin Server.**

**Explanation**

The Interstage Single Sign-on Repository server has been deleted, but protected resources registered in the SSO repository were not deleted. (\*1)

In the following procedure, the environment definition contents of the Web server (Interstage HTTP Server) on the Managed Server on which the repository server was deleted must be reflected in the business configuration management repository on the Admin Server.

1. Log in to the Interstage Management Console of the Admin Server.
2. In the Interstage Management Console, click [Application Management] > [Interstage] > [Interstage Application Server] > [Services] > [Web Server] > [FJapache(Server Group Name or Server Name)]. Click the [Get Definition] tab and select the Managed Server on which the repository server was deleted. Click the [Select] button, then click the [Update] button.

If Managed Servers are included in the Server Group, delete the repository server for all of the Managed Servers before executing the above procedure.

Authentication infrastructure setup files fetched using the deleted repository server environment; authentication servers added and set up using the business system setup file; and business systems cannot be used after this operation.

\*1 After the repository server has been deleted, use the Entry Management Tool to delete protected resources in the SSO repository. For details, refer to 'Entry Management' in the Directory Service Operator's Guide.

---

### 21.7.42 sso04268

---

**SSO: ERROR: sso04268: There is no Web Server (Interstage HTTP Server) that can be used to create the Repository server.**

**Explanation**

The repository server cannot be created because another Single Sign-on server (authentication server or business server) has already been created for all the Web servers (Interstage HTTP Server) on this machine.

**User Action**

Either delete the other Single Sign-on server (authentication server or business server) created on this machine (\*1), or create a new Web server (Interstage HTTP Server). (\*2)

\*1 To delete the authentication server, in the Interstage Management Console click [System] > [Security]> [Single Sign-on] > [Authentication infrastructure] > [List], and delete the authentication server. To delete the business server, in the Interstage Management Console click [System] > [Security]> [Single Sign-on] > [Business system]> [List], and delete the business server displayed in Web server name (%s1).

\*2 To create the new Web server (Interstage HTTP Server), in the Interstage Management Console click [System] > [Services] > [Web Server] > [New].

## 21.7.43 sso04269

---

**SSO: ERROR: sso04269: The Repository server can not be created because there is no SSO repository that can use non-SSL communication and the replication operating is either stand-alone or master.**

### Explanation

There is no SSO repository with a standalone or master replication style that can use non-SSL communication, therefore the Single Sign-on Repository server (update type) cannot be created.

### User Action

Take one of the actions shown below, then create the Interstage single sign-on repository server (update type): (\*1)

- Create an SSO repository of which the replication style is either master or standalone, and which uses a non-SSL port. (\*2)
- Create an SSO repository of which the replication style is either master or standalone, and which uses both a non-SSL port and an SSL port. (\*2)

\*1 For details on how to create the repository server (update type), refer to "Environment Setup (SSO Administrators)" - "Repository Server Setup" in the Single Sign-on Operator's Guide.

\*2 For details on how to create the SSO repository, refer to "Environment Setup (SSO Administrators)" - "Repository Server Setup" - "Creating an SSO Repository" in the Single Sign-on Operator's Guide.

## 21.7.44 sso04270

---

**SSO: ERROR: sso04270: The Repository server (reference type) can not be created because there is no SSO repository that can use non-SSL communication and the replication operating is slave.**

### Explanation

There is no SSO repository with a slave replication style that can use non-SSL communication, therefore the Interstage Single Sign-on Repository server (reference type) cannot be created.

### User Action

Create the SSO repository of which the replication style is slave, and which uses both a non-SSL port and an SSL port, then create the Interstage single sign-on repository server (reference type). (\*1)

\*1 For details on how to create the repository server (reference type), refer to "Environment Setup (SSO Administrators)" - "Repository Server Setup" - "Adding a Repository Server (Reference System)" in the Single Sign-on Operator's Guide.

## 21.8 sso04301 to sso04371

---

### 21.8.1 sso04301

---

**SSO: ERROR: sso04301: Repository server can not be created because the specified port number is already in use. Port number=(%s1)**

### Variable Information

%s1 = Port number

## Explanation

The repository server cannot be set up because the specified port number (%s1) has been already used by one of the following:

- Repository server
- Authentication server
- Business server
- Web server (Interstage HTTP Server)

## User Action

To check whether the specified port number (%s1) is being used, refer to "Notes on Interstage Operation" - "Common Notes for Interstage" - "Setting Port Numbers Used for Individual Services" in the Product Notes.

If the port number (%s1) is already being used, specify another port number and then create the Interstage Single Sign-on Repository server.

## 21.8.2 sso04302

---

**SSO: ERROR: sso04302: The environmental configuration of the Repository server can not be updated because the specified port number is already in use. Port number =(%s1)**

### Variable Information

%s1 = Port number

## Explanation

The specified port number (%s1) has been used by either of the followings:

- Authentication server
- Business server
- Web server (Interstage HTTP Server)

## User Action

To check whether the specified port number (%s1) is being used, refer to "Notes on Interstage Operation" - "Common Notes for Interstage" - "Setting Port Numbers Used for Individual Services" in the Product Notes.

If the port number (%s1) is already being used in any of the above cases, specify another port number and then update the Interstage Single Sign-on Repository server environment settings.

## 21.8.3 sso04303

---

**SSO: ERROR: sso04303: Repository server package is not installed.**

### Explanation

The repository server of Interstage Single Sign-on has not been installed.

### User Action

**Windows32/64**

Install Interstage Single Sign-on (repository server).

**Solaris32/64** **Linux32/64**

Install the following package:

- FJSVssosv (Interstage Single Sign-on Repository server)

## 21.8.4 sso04304

---

### SSO: ERROR: sso04304: The Repository server environment is broken.

#### Explanation

The environment of the repository server of Interstage Single Sign-on is damaged.

#### User Action

If the repository server was upgraded from a previous version, check if there were any errors in the upgrade procedure.

If there were no errors, reestablish the repository server of Interstage Single Sign-on in the following procedure: (\*1)

1. On the Interstage Management Console, select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [List] tab to once delete the repository server.
2. Then establish the repository server by the [Establishing Authentication infrastructure] tab.

\*1 For details on reestablishing the repository server, see 'Environment Setup (SSO Administrators)' in the Single Sign-on Operator's Guide.

## 21.8.5 sso04305

---

### SSO: ERROR: sso04305: Repository server has been already created.

#### Explanation

The repository server of Interstage Single Sign-on has been already set up.

#### User Action

To establish a new repository server of Interstage Single Sign-on, take the following steps: (\*1)

1. On the Interstage Management Console, select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [List] tab to delete the existing repository server.
2. Establish the repository server by the [Establishing Authentication infrastructure] tab.

\*1 For details on reestablishing the repository server, see 'Environment Setup (SSO Administrators)' in the Single Sign-on Operator's Guide.

## 21.8.6 sso04306

---

### SSO: ERROR: sso04306: The Repository server has been already deleted.

#### Explanation

The repository server of Interstage Single Sign-on does not exist. It may have been deleted by another user.

#### User Action

Take the following steps:

1. On the Interstage Management Console, select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [List] tab to acquire the latest list of servers that establish the authentication infrastructure.
2. See the list acquired in step 1 to check that the repository server exists.
3. If the repository server does not exist in step 2, on the Interstage Management Console, select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Establishing Authentication infrastructure] tab to reestablish the repository server.

## 21.8.7 sso04307

---

### SSO: ERROR: sso04307: The Site configuration already exists in the SSO Repository. Site configuration=(%s1)

## Variable Information

%s1 = FQDN:port number

## Explanation

The site configuration of the FQDN of the business service and port number specified for the protection resource in the SSO repository already exists.

## User Action

On the Interstage Management Console, select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Repository server] > [Protection resource] > [List] tab to check for the FQDN of the business service and port number (%s1) specified for the site configuration.

Specify the FQDN of correct business service or another port number in the site configuration.

When the system can be accessed only from the clients on the Internet in corporation with Application Gateway, the site configuration may have been registered because multiple business system public URLs become identical. Register the protection path for the site configuration that has been already registered.

## 21.8.8 sso04308

---

**SSO: ERROR: sso04308: The Site configuration has been already deleted from the SSO Repository. Site configuration=(%s1)**

## Variable Information

%s1 = FQDN:port number

## Explanation

The site configuration (%s1) has not been registered in the protection resource in the SSO repository. It may have been deleted by another user. Alternatively, the attribute name (dc) of the site configuration (%s1) is incorrect.

## User Action

Check that the site configuration (%s1) has been registered in the protection resource in the SSO repository. (\*1)

If the site configuration (%s1) has not been registered in the protection resource, register the site configuration (%s1). (\*2)

If the site configuration (%s1) has been registered in the protection resource, check that an attribute name (dc) has been registered in the site configuration (%s1) or that multiple attribute names (dc) have not been registered. If no attribute name (dc) has been registered, register an attribute name (dc). If multiple attribute names (dc) have been registered, register only one attribute name (dc). (\*3)

\*1 On the Interstage Management Console, select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Repository server] > [Protection resource] > [List] tab to acquire the latest list of site configurations.

\*2 If the site configuration does not exist, on the Interstage Management Console, select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Repository server] > [Protection resource] to create the site configuration.

\*3 For checking the registration contents of the SSO repository, use a tool such as the entry administration tool. For details, see 'Entry Management' in the Directory Service Operator's Guide.

## 21.8.9 sso04309

---

**SSO: ERROR: sso04309: The Path configuration has been already deleted from the SSO Repository. Site configuration=(%s1) Path configuration=(%s2)**

## Variable Information

%s1 = FQDN:port number

%s2 = Path configuration

## Explanation

The path configuration (%s2) has not been registered in the site configuration (%s1) of the protection resource in the SSO repository. It may have been deleted by another user. Alternatively, the attribute name (cn) of the path configuration (%s2) is incorrect.

## User Action

Check that the path configuration (%s2) has been registered in the site configuration (%s1) of the protection resource in the SSO repository. (\*1)

If the path configuration (%s2) has not been registered in the site configuration (%s1) of the protection resource, register the path configuration (%s2). (\*2)

If the path configuration (%s2) has been registered in the site configuration (%s1) of the protection resource, check that an attribute name (cn) has been registered in the path configuration (%s2) or that multiple attribute names (cn) have not been registered. If no attribute name (cn) has been registered, register an attribute name (cn). If multiple attribute names (cn) have been registered, register only one attribute name (cn). (\*3)

After the review, the SSO administrator must ask the business server administrator to update the access control information.

\*1 On the Interstage Management Console, select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Repository server] > [Protection resource] > [Site Configuration] > [Protection path] > [List] tab to acquire the latest list of path configurations.

\*2 If the path configuration does not exist, from the Interstage Management Console, select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Repository server] > [Protection resource] > [Site Configuration] > [Protection path] to create the path configuration.

\*3 For checking the registration contents of the SSO repository, use a tool such as the entry administration tool. For details, see 'Entry Management' in the Directory Service Operator's Guide.

## 21.8.10 sso04310

---

**SSO: ERROR: sso04310: The Path configuration already exists in the SSO Repository. Site configuration=(%s1) Path configuration=(%s2)**

### Variable Information

%s1 = FQDN:port number

%s2 = Path configuration

## Explanation

The path configuration (%s2) already exists in the site configuration (%s1) of the protection resource in the SSO repository.

## User Action

On the Interstage Management Console, select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Repository server] > [Protection resource] > [Site Configuration] > [Protection path] > [List] tab to check for the path specified for the path configuration. Alternatively, specify another path.

When the system can be accessed only from the clients on the Internet in corporation with Application Gateway, multiple business system public URLs become identical. Therefore, it is necessary to design the business systems so that the protection paths are not duplicated.

When the business server administrator has reported a protection path that has been already registered, ask the business server administrator to review the design of the business system so that the protection paths are not duplicated.

## 21.8.11 sso04313

---

**SSO: ERROR: sso04313: The Role/Role set has been already deleted.Role/Role set=(%s1)**

### Variable Information

%s1 = Role/role set

## Explanation

The role/role set (%s1) specified for the SSO repository does not exist. It may have been deleted by another user. Alternatively, the attribute name (cn) of the role/role set (%s1) is incorrect.

## User Action

Check that the role/role set (%s1) has been registered in the role configuration in the SSO repository.

If the role/role set (%s1) has not been registered in the role configuration, register the role/role set (%s1). (\*1)

If the role/role set (%s1) has been registered in the role configuration, check that an attribute name (cn) for the role/role set (%s1) has been registered or that multiple attribute names (cn) have not been registered.

If no attribute name (cn) has been registered, register an attribute name (cn). If multiple attribute names (cn) have been registered, register only one attribute name (cn). (\*1)

If the role/role set (%s1) has been correctly registered in the role configuration, check that the role/role set (%s1) has been correctly specified for the path configuration. If the role/role set (%s1) has not been registered in the path configuration, reconfigure the role/role set (%s1). (\*2)

After the review, the SSO administrator must ask the business server administrator to update the access control information.

\*1 For checking the registration contents of the SSO repository, use a tool such as the entry administration tool. For details, see 'Entry Management' in the Directory Service Operator's Guide.

\*2 For setting up the role/role set, on the Interstage Management Console, see [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Repository server] > [Protection resource] > [Site Configuration] > [Protection path] > [List] tab.

## 21.8.12 sso04314

---

### SSO: ERROR: sso04314: The user activating the unlock functionality does not exist. User ID =(%s1)

#### Variable Information

%s1 = User ID

#### Explanation

When the Active Directory is used as the destination to register user information, read "Active Directory" for "SSO repository" and "User logon name" for "User ID."

Possible causes of the error are as follows:

- The user ID (%s1) of the user to be unlocked does not exist.
- If the Interstage directory service is used for the directory service that registers the user information, object class 'ssoUser' was not specified when the user information was created in the SSO repository.
- If Active Directory is used for the directory service that registers the user information, the single sign-on extended schema may not be set correctly.
- If Active Directory is used to register user information, then it may be using the referral function.

#### User Action

Take the following action:

- Check for the user ID (%s1). If the user ID (%s1) is correct, check that the specified user ID has been registered in the SSO repository. (\*1) (\*2) (\*3)
- If the Interstage directory service is used for the directory service that registers the user information, check that 'ssoUser' has been specified for the object class of the user information. (\*1)
- If Active Directory is used for the directory service that registers the user information, check that the single sign-on extended schema has been set correctly (\*4)
- If Active Directory is used to register user information, then make sure that it is not using the referral function, since there can be no linkage between them.

\*1 For user information to be registered in the SSO repository, see 'Environment Setup (SSO Administrators)' - 'Repository Server Setup' in the Single Sign-on Operator's Guide.

\*2 If the Interstage directory service is used in the user information registration destination, use a tool such as the entry administration tool to check the registration contents of the SSO repository,. For details, see 'Entry Management' in the Directory Service Operator's Guide.

\*3 For details on how to confirm Active Directory, refer to the Active Directory Manual.

\*4 For details on how to confirm the single sign-on extended schema, refer to "Troubleshooting" - "Examples of Errors" - "Trouble when Active Directory is used for the directory service that registers the user information" in the Single Sign-on Operator's Guide.

## 21.8.13 sso04315

---

**SSO: ERROR: sso04315: The user activating the unlock functionality can not be specified because the user ID is duplicated. User ID=(%s1)**

### Variable Information

%s1 = User ID

### Explanation

When Active Directory is used as the destination to register user information, read "Active Directory" for "SSO repository."

The user cannot be identified because the user ID (%s1) of the user to be unlocked is duplicated in the repository server.

### User Action

A user ID to be registered in an entry of the SSO repository as the user information must be valid and unique to the SSO repository.  
(\*1) (\*2) (\*3)

\*1 For the user information of the user to be registered in the SSO repository, refer to 'Repository Server Setup' under 'Environment Setup (SSO Administrators)' in the Single Sign-on Operator's Guide.

\*2 If the Interstage directory service is used in the user information registration destination, use a tool such as the entry administration tool to check the registration contents of the SSO repository. For details, see 'Entry Management' in the Directory Service Operator's Guide.

\*3 For details on how to confirm Active Directory, refer to the Active Directory Manual.

## 21.8.14 sso04316

---

**SSO: ERROR: sso04316: The registration entry of User information does not exist.**

### Explanation

When Active Directory is used as the destination to register user information, read "Active Directory" for "SSO repository."

The registration destination entry of the user information does not exist. Possible causes of the error are as follows:

- 'Registration destination entry of user information' that has been specified for the environment setting of the repository server does not exist in the SSO repository.
- For the registration destination entry of the user information of the SSO repository, the user information has not been registered.

### User Action

Take the following action:

- Check for the specification of 'registration destination entry of user information' in the environment settings of the repository server of Interstage Single Sign-on in the following procedure:
  1. On the Interstage Management Console, select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Repository server] or [Repository server (reference system)] > [Settings] tab and click [Repository server detailed setting [Show]] or [Detailed Setting [Show]].
  2. Check it by [Repository].

- Use a tool such as the entry administration tool to check that the user information has been registered in the registration destination entry of the user information of the SSO repository. (\*1) (\*2)

\*1 When the Interstage directory service is used in the user information registration destination, use a tool such as the entry administration tool to check the registration contents of the SSO repository. For details, see 'Entry Management' in the Directory Service Operator's Guide.

\*2 For details on how to confirm Active Directory, refer to the Active Directory Manual.

## 21.8.15 sso04317

---

### SSO: ERROR: sso04317: The registration entry of Role configuration does not exist.

#### Explanation

The registration destination entry of the role configuration does not exist. Possible causes of the error are as follows:

- 'Registration destination entry of role configuration' that has been specified for the environment setting of the repository server does not exist in the SSO repository.
- For the registration destination entry of the role configuration of the SSO repository, the role or role set has not been registered.

#### User Action

Take the following action:

- Check for the specification of 'registration destination entry of role configuration' in the environment settings of the repository server of Interstage Single Sign-on in the following procedure:
  1. On the Interstage Management Console, select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Repository server] or [Repository server (reference system)] > [Settings] tab and click [Repository server detailed setting [Show]] or [Detailed Setting [Show]].
  2. Check it by [Repository].
- Use a tool such as the entry administration tool to check that the role or role set has been registered in the registration destination entry of the role configuration of the SSO repository. For details, see 'Entry Management' in the Directory Service Operator's Guide.

## 21.8.16 sso04318

---

### SSO: ERROR: sso04318: The registration entry of Protection resource does not exist.

#### Explanation

The registration destination entry of the protection resource does not exist. Possible causes of the error are as follows:

- 'Registration destination entry of protection resource' that has been specified for the environment setting of the repository server does not exist in the SSO repository.
- For the registration destination entry of the protection resource of the SSO repository, the protection resource has not been registered.

#### User Action

Take the following action:

- Check for the specification of 'registration destination entry of protection resource' in the environment settings of the repository server of Interstage Single Sign-on in the following procedure:
  1. On the Interstage Management Console, select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Repository server] or [Repository server (reference system)] > [Settings] tab and click [Repository server detailed setting [Show]] or [Detailed Setting [Show]].
  2. Check it by [Repository].

- Use a tool such as the entry administration tool to check that the protection resource has been registered in the registration destination entry of the protection resource of the SSO repository. For details, see 'Entry Management' in the Directory Service Operator's Guide.

## 21.8.17 sso04319

---

### SSO: ERROR: sso04319: Can not connect with the SSO Repository. Repository name=(%s1)

#### Variable Information

%s1 = Repository name

#### Explanation

Connection to the SSO repository is disabled. Possible causes of the error are as follows:

- If the correct repository name appears for the repository name (%s1), the SSO repository has not been started.
- If a space ( ) appears for the repository name (%s1), no 'repository name' in the environment settings of the repository server has been selected.

#### User Action

Take the following action:

- If the correct repository name appears for the repository name (%s1), check that the SSO repository has been started as described in the following procedure:
  1. On the Interstage Management Console, select [System] > [Services] > [Repository] > [View Status] tab to check the status of the SSO repository.
  2. If the targeted SSO repository has not been started, enter a check in the checkbox and click the 'Start' button to start the SSO repository.
- If a space ( ) appears for the repository name (%s1), select a 'repository name' in the environment settings of the repository server in the following procedure:
  1. On the Interstage Management Console, select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Repository server] or [Repository server (reference system)] > [Settings] tab and click [Repository server detailed setting [Show]] or [Detailed Setting [Show]].
  2. Select [Repository Name] of [Repository].

## 21.8.18 sso04320

---

### SSO: ERROR: sso04320: An error occurred in access to the SSO Repository. Repository name=(%s1) Code=(%x2)

#### Variable Information

%s1 = Repository name

%x2 = Error code reported by the SSO repository

#### Explanation

Access the SSO repository (%s1) failed.

#### User Action

Check the error code posted by the SSO repository (%s1) and takes the following action:

- When the error code (%s2) is "0x35":
  - When [User Information Registration Entry], [Role Configuration Registration Entry], [Protection Resource Registration Entry] is set or changed.
 

In the repository server environment settings, check that [User Information Registration Entry], [Role Configuration Registration Entry], and [Protection Resource Registration Entry] are included for the SSO repository (%s1). (\*1)
  - When protection resource, path definition and the user lock release are performed
 

No writing is possible in the SSO repository, as the replication operation mode is slave. Use the repository server that selects the replication operation mode of the standalone or master SSO repository.
  - In all other cases
 

Check the environment settings of the SSO repository (%s1). (\*2)
- When the error code (%s2) is "0x32":
 

Check the environment settings of the SSO repository (%s1). (\*2)
- When the error code (%s2) is any other value:
 

See the following table to find an appropriate action.

Table 21.49 Codes Posted from the SSO Repository.

Code	Error	Action
0x01	SSO repository processing is disabled.	SSO repository processing cannot be correctly performed, for example because the SSO repository is in the process of starting.  If this code is posted continuously although the SSO repository has already been started, use the iscollectinfo command immediately after the message is output to collect investigation information, then contact your service engineer.
0x02	An LDAP protocol error occurred.	SSO repository processing cannot be correctly performed, for example because the SSO repository is in the process of starting.  If this code is posted continuously although the SSO repository has already been started, use the iscollectinfo command immediately after the message is output to collect investigation information, then contact your service engineer.
0x0a 0x20	No relevant entry exists.	Check whether the values set for the 'User Information Registration Entry', 'Role Configuration Registration Entry' and 'Protection Resource Registration Entry' repository server environment settings match the user information, role configuration, and protection resource SSO repository registration data. (*1)  When the repository server environment setting is correct, register the user information, role configuration, and protection resource in the SSO repository.
0x10	Relevant attribute name does not exist.	Upgrade of the repository server from a previous version might have been unsuccessful. Check that the upgrade procedure was correct.  The repository server environment is destroyed. From the Interstage Management Console, select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [List] tab to delete the repository server once, then rebuild the repository server with the [Authentication infrastructure Setting] tab. (*3)
0x11 0x57	The attribute name is invalid.	The value that was set for [Attribute used for authentication] in [Integrated Windows Authentication Setting] in the authentication server environment settings is invalid.

Code	Error	Action
		<p>In the Interstage Management Console, click [System] &gt; [Security] &gt; [Single Sign-on] &gt; [Authentication infrastructure] &gt; [Authentication server] &gt; [Settings] &gt; [Detailed Settings [Show]], set a correct value for [Attribute used for authentication] in [Integrated Windows Authentication Setting], stop the authentication server and then restart it. (*4)</p>
0x15	Failed to update the SSO repository entry	<p>If "Active Directory" is selected in the directory service used for the information registration destination and a single sign-on extended schema is used, take the following action:</p> <ul style="list-style-type: none"> <li>- If the value set in [Directory Service URL] of [Active Directory Settings] in the repository server environment settings is incorrect.</li> </ul> <p>In the Interstage Management Console, click [System] &gt; [Security] &gt; [single sign-on] &gt; [Authentication infrastructure] &gt; [repository server] &gt; [Settings] &gt; [Repository server detailed settings [Show]], correct the value of [Directory Service URL] in [Repository Settings] &gt; [Active Directory settings], then stop the repository server and restart it (*5).</p> <ul style="list-style-type: none"> <li>- If the single sign-on extended schema is not set in Active Directory.</li> </ul> <p>Set the single sign-on extended schema in Active Directory and then execute it again (*7).</p>
0x22	The DN format is incorrect.	<p>Access to the SSO repository failed because the setting values of 'User Information Registration Entry', 'Role Configuration Registration Entry', and 'Protection Resource Registration Entry' in the repository server environment settings are not in the DN format. (*1)</p> <p>After setting the correct value for each one, stop the repository server, then restart it. (*5)</p> <p>The DN format is the name of the object uniquely assigned in the SSO repository. It also defines the entry indicating the object and the string of the relative distinguished names (RDN) of the upper entry of that entry.</p> <p>The protection resource may have been changed using a tool such as the entry management tool, not the Interstage Management Console.</p> <p>With the method used to modify the protection resource, restore the resource to the status it had before it was changed. If the restoration fails, use the same method to delete the protection resource, and then, on the Interstage Management Console, select the tab [System] &gt; [Security] &gt; [Single Sign-on] &gt; [Authentication infrastructure] &gt; [Repository server] &gt; [Protection resource] &gt; [Create a New Site configuration] to recreate the protection resource.</p>
0x30 0x31	The administrator DN or password for binding (authenticating) to the SSO repository is not correct.	<p>The administrator DN or password for the SSO repository may have been changed.</p> <p>If either was changed, stop the repository server, then restart it. (*5)</p>

Code	Error	Action
		The SSO repository port number may be in use by another LDAP server on the same machine. In this case, either stop the other LDAP server, or change the SSO repository port number. (*2)
0x32	Access to the SSO repository is invalid.	<p>If this server is setup as the repository server (reference system), it may have been accessed from the authentication server as the repository server (update system).</p> <p>Confirm whether the host name or IP address of the repository server (reference system) is not set for the setting value of 'repository server (update system) URL' in 'Setting Communication with the Repository Server' of the authentication server environment settings. To confirm the authentication server environment settings, display Communication Settings with Repository server. To display it, select [System] &gt; [Security] &gt; [Single Sign-on] &gt; [Authentication infrastructure] &gt; [Authentication server] &gt; [Detailed Settings [Show]] of the [Settings] tab on the Interstage Management Console.</p> <p>If the repository server (reference system) is set, set the host name or IP address of the repository server (update system) again, stop the authentication server, and then restart it. (*4)</p> <p>In all other cases, check the SSO repository environment settings. (*2) (*6)</p>
0x33	The SSO repository is busy.	<p>The SSO repository processing is disabled, for example because the load on it is high.</p> <p>Wait until the SSO repository becomes communicable, then reexecute it.</p> <p>If a message that begins with irep is output immediately before this message, check the message and rectify the cause of error.</p>

Other than above	An error occurred accessing the SSO repository.	<p>Check the error code notified from the SSO repository using the LDAP error code and take action.</p> <p>If there is still no improvement immediately after the message is output, use the <code>iscollectinfo</code> command to collect investigation information, then contact your service engineer.</p>

\*1 To make the repository server environment settings, in the Interstage Management Console click [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Repository server], or [Repository server (reference system)] > [Settings] > [Repository server detailed settings[Show]] or [Detailed Settings[Show]], and check the following options in [Repository Settings]:

- User Information Registration Entry
- Role Configuration Registration Entry
- Protection Resource Registration Entry

\*2 For details on SSO repositories, see the Directory Service Operator's Guide.

\*3 For details on setting up the repository server environment, see 'Environment Setup (SSO Administrators)' in the Single Sign-on Operator's Guide.

\*4 For details about stopping the authentication server, refer to "Operation and Maintenance" - "Stopping Single Sign-on" - "Stopping an Authentication server" in the Single Sign-on Operator's Guide. For details about starting the authentication server, refer to "Operation and Maintenance" - "Starting Single Sign-on" - "Starting an Authentication server" in the Single Sign-on Operator's Guide.

\*5 For details on stopping the repository server, see 'Operation and Maintenance' - 'Stopping Single Sign-on' - 'Stopping a Repository Server' in the Single Sign-on Operator's Guide. For details on starting the repository server, see 'Operation and Maintenance' - 'Starting Single Sign-on' - 'Starting a Repository Server' in the Single Sign-on Operator's Guide.

\*6 In the Interstage Management Console, click [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Repository server], or [Repository server (reference system)] > [Settings] > [Repository server detailed settings[Show]], or [Detailed Settings[Show]] > [Repository] > [Repository Name].

\*7 For details on how to set up the single sign-on extended schema, refer to "Settings for Active Directory Linkage" - "Active Directory is used for the directory service that registers the user information" - "Single sign-on extension schema settings" in the Single Sign-on Operator's Guide.

## 21.8.19 sso04321

**SSO: ERROR: sso04321: Role information can not be updated because the connecting with the Repository server was failed.**

## Explanation

Role information cannot be updated because connection to the repository server of Interstage Single Sign-on failed.

## User Action

Check that the repository server of Interstage Single Sign-on has been started as described in the following procedure:

1. On the Interstage Management Console, select [System] > [Services] > [Web Server] > [Web Server Name] > [Web Server Status] tab to check that the Web server (Interstage HTTP Server) has been started.
2. If the Web server (Interstage HTTP Server) has not been started in step 1, click the 'Start' button to start the Web server (Interstage HTTP Server) so as to start the repository server.

If the repository server has been started, see the system log of the repository server to find an appropriate action. For the system log of the repository server, see 'sso00001 to sso00207', 'sso01000 to sso01212' and 'sso11000 to sso11008'.

## 21.8.20 sso04322

---

### **SSO: ERROR: sso04322: Role information can not be updated because the connecting with the SSO Repository was failed.**

## Explanation

Role information cannot be updated because connection to the SSO Repository failed.

## User Action

Check that the SSO repository has been started as described in the following procedure:

1. On the Interstage Management Console, select [System] > [Services] > [Repository] > [View Status] tab to check that the target SSO repository has been started.
2. If the target SSO repository has not been started in step 1, make a check in the checkbox and click the 'Start' button to activate the SSO repository server.

If the SSO repository has been started, see the system log of the repository server of Interstage Single Sign-on to find an appropriate action. For the system log of the repository server, see 'sso00001 to sso00207', 'sso01000 to sso01212' and 'sso11000 to sso11008'.

## 21.8.21 sso04323

---

### **SSO: ERROR: sso04323: Role information can not be updated because a timeout occurred in connection with the Repository server.**

## Explanation

Role information cannot be updated because a timeout occurred during connection to the Repository server.

## User Action

The processing may take a long time to update large amount of role information. Review the content of the SSO repository to check if there are role information items that are no longer needed.

## 21.8.22 sso04324

---

### **SSO: ERROR: sso04324: Role information can not be updated because an error occurred in communication with the Repository server.**

## Explanation

The role information cannot be updated because an error occurred in the communication with the repository server of Interstage Single Sign-on.

## User Action

Take the following action:

- On the Interstage Management Console, select [System] > [Services] > [Web Server] > [Web Server Name], then click [Web Server Status] tab, and restart the Web Server (Interstage HTTP Server).
- There may be a problem in the communication path. Ask the network administrator whether the environment allows the connection to the repository server for Interstage Single Sign-on.

## 21.8.23 sso04325

---

**SSO: ERROR: sso04325: Role information can not be updated because the environmental configuration is incorrect.**

### Explanation

The role information cannot be updated if the business server and repository server of Interstage Single Sign-on are running on the same machine and the business server and repository server use the same port number.

### User Action

If the business server and repository server of Interstage Single Sign-on are running on the same machine, use different port numbers for the business server and repository server.

## 21.8.24 sso04326

---

**SSO: WARNING: sso04326: The specified Role in the Role set does not exist in the SSO Repository.**

### Explanation

A role that does not exist in the role set in the role configuration of the SSO repository has been specified.

The non-existent role was assumed to be invalid and the role information was updated.

### User Action

Review the specification of the role set in the role configuration of the SSO repository. (\*1)

If the nonexistent role cannot be identified, see the system log of the repository server of Interstage Single Sign-on. (\*2)

\*1 For checking the registration contents of the SSO repository, use a tool such as the entry administration tool. For details, see 'Entry Management' in the Directory Service Operator's Guide.

\*2 For the system log of the repository server, see 'sso00001 to sso00207', 'sso01000 to sso01212' and 'sso11000 to sso11008'.

## 21.8.25 sso04327

---

**SSO: ERROR: sso04327: Access authority to the file required in operating Repository server can not be set up because the user name set at the environmental configuration of the Web Server (Interstage HTTP Server) does not exist.**

### Explanation

The access permission of the file required for the operation of repository server cannot be set up because there is an error in the user configuration in the environment configuration file (httpd.conf) of the Web server (Interstage HTTP Server). Possible causes of the error are as follows:

- A user name not existing in the user management register of the OS has been specified in the user configuration in the environment configuration file (httpd.conf) of the Web server (Interstage HTTP Server).
- The user configuration (user name) has not been specified in the environment configuration file (httpd.conf) of the Web server (Interstage HTTP Server).

### User Action

Specify a user name existing in the user management register of the OS to the user configuration in the environment configuration file (httpd.conf) of the Web server (Interstage HTTP Server). After specifying it, on the Interstage Management Console, select [System] > [Services] > [Web Server] > [Web Server Name] > [Web Server Status] tab to restart the Web server (Interstage HTTP Server).

## 21.8.26 sso04328

---

**SSO: ERROR: sso04328: Repository server can not be created because the user name set at the environmental configuration of the Web Server (Interstage HTTP Server) does not exist.**

### Explanation

The repository server cannot be set up because there is an error in the user configuration in the environment configuration file (httpd.conf) of the Web server (Interstage HTTP Server). Possible causes of the error are as follows:

- A user name not existing in the user management register of the OS has been specified in the user configuration in the environment configuration file (httpd.conf) of the Web server (Interstage HTTP Server).
- The user configuration (user name) has not been specified in the environment configuration file (httpd.conf) of the Web server (Interstage HTTP Server).

### User Action

Specify a user name existing in the user management register of the OS to the user configuration in the environment configuration file (httpd.conf) of the Web server (Interstage HTTP Server). After specifying it, on the Interstage Management Console, select [System] > [Services] > [Web Server] > [Web Server Name] > [Web Server Status] tab to restart the Web server (Interstage HTTP Server).

## 21.8.27 sso04329

---

**SSO: ERROR: sso04329: The SSO Repository environment is broken. Repository name=(%s1)**

### Variable Information

%s1 = Repository name

### Explanation

The environment of the SSO repository (%s1) is damaged. Alternatively, the environment of the Interstage Directory Service is damaged.

### User Action

On the Interstage Management Console, select [System] > [Services] > [Repository] > [Create a New Repository] tab to recreate the SSO repository (%s1). (\*1)

**Windows32/64**

If it cannot be recreated, reinstall the Interstage Directory Service and Interstage data store. (\*2)

**Solaris32/64 Linux32/64**

If it cannot be recreated, reinstall the following packages: (\*2)

- FJSVirep (Interstage Directory Service )
- FJSVena (Interstage data store for enterprise content knowledge and document management )

\*1 For details on creating the SSO repository, refer to 'Repository Server Setup' under 'Environment Setup (SSO Administrators)' in the Single Sign-on Operator's Guide.

\*2 After uninstalling the above mentioned packages, delete all files under the following directories:

**Windows32/64**

- C:\Interstage\IREP
- C:\Interstage\Enabler

**Solaris32/64 Linux32/64**

- /opt/FJSVirep
- /var/opt/FJSVirep

- /etc/opt/FJSVirep
- /opt/FJSVena
- /var/opt/FJSVena

## 21.8.28 sso04330

---

**SSO: ERROR: sso04330: Repository server can not be created with using SSO Repository selecting slave as the replication operating.**

### Explanation

The repository server (update system) of Interstage Single Sign-on cannot be set up while the SSO repository whose operation mode of replication is slave is selected.

### User Action

Take one of the following measures and then rebuild the Interstage single sign-on repository server (update system). (\*1)

When setting up the repository server (update system) of Interstage Single Sign-on, select the SSO repository whose operation mode of replication is set to stand-alone or master. Take the following steps: (\*1)

- Select an SSO repository whose replication operation mode is standalone.
- Select an SSO repository whose replication operation mode is master.

\*1 For details on creating the SSO repository, refer to 'Repository Server Setup' under 'Environment Setup (SSO Administrators)' in the Single Sign-on Operator's Guide.

## 21.8.29 sso04331

---

**SSO: ERROR: sso04331: Repository server (reference system) can not be created with using SSO Repository selecting stand-alone or master as the replication operating.**

### Explanation

The repository server (reference system) of Interstage Single Sign-on cannot be set up while the SSO repository whose operation mode of replication is stand-alone or master is selected.

### User Action

Select an SSO repository whose replication operation mode is slave and then build an Interstage single sign-on repository server (reference system).

For details on creating the SSO repository, refer to 'Repository Server Setup' under 'Environment Setup (SSO Administrators)' in the Single Sign-on Operator's Guide.

## 21.8.30 sso04332

---

**SSO: ERROR: sso04332: The Repository server can not be started because any Role does not exist in the SSO Repository.**

### Explanation

The repository server of Interstage Single Sign-on cannot be started because the role does not exist in the role configuration of the SSO repository. Possible causes of the error are:

- 'Registration destination entry of role configuration' that has been specified for the environment setting of the repository server does not exist in the SSO repository.
- The role or role set has not been registered in the registration destination entry of the role configuration in the SSO repository.

### User Action

Take the following action:

- Check if there is an error in the specification of 'registration destination entry of role configuration' in the environment settings of the repository server of Interstage Single Sign-on by using the following procedure:
  1. On the Interstage Management Console, select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Repository server] or [Repository server (reference system)] > [Settings] tab and click [Repository server detailed setting [Show]] or [Detailed Setting [Show]].
  2. Check it by [Repository].
- Check that the role or role set has been registered in the registration destination entry of the role configuration in the SSO repository. (\*1)

\*1 For checking the registration contents of the SSO repository, use a tool such as the entry administration tool. For details, see 'Entry Management' in the Directory Service Operator's Guide.

## 21.8.31 sso04333

---

**SSO: ERROR: sso04333: Authentication of the SSO Repository failed. Repository name=(%s1)**

### Variable Information

%s1 = Repository name

### Explanation

Authentication of the SSO Repository (%s1) failed.

### User Action

Check whether the SSO repository port number is being used by another LDAP server on the same machine. If this is the case, stop the other LDAP server or change the SSO repository port number, and restart the operation.

For details on SSO repository, refer to the "Directory Service Operator's Guide".

## 21.8.32 sso04338

---

**SSO: ERROR: sso04338: The Repository server can not be deleted because the Web Server (Interstage HTTP Server) is running.**

### Explanation

The repository server of Interstage Single Sign-on cannot be deleted because the Web server (Interstage HTTP Server) is running.

### User Action

On the Interstage Management Console, select [System] > [Services] > [Web Server] > [Web Server Name] > [Web Server Status] tab to check the running status of the Web server (Interstage HTTP Server).

If the Web server (Interstage HTTP Server) is running, once stop the Web server (Interstage HTTP Server), then reexecute the process.

## 21.8.33 sso04339

---

**SSO: ERROR: sso04339: The setup file can not be downloaded in an environment in which slave is selected as the replication operation mode for the SSO repository.**

### Explanation

The setup file cannot be downloaded in an environment in which slave is selected as the replication operation mode for the SSO repository.

### User Action

Download from a repository server (update system) that has selected a replication operation mode of either standalone or master SSO repository.

## 21.8.34 sso04340

---

### **SSO: ERROR: sso04340: Authentication infrastructure setup file can not be downloaded because Authentication infrastructure URL is not set up.**

#### Explanation

The Authentication infrastructure setup file cannot be downloaded because the Authentication infrastructure URL is not set up in the environment setting of the repository server.

#### User Action

Check if the URL of the authentication infrastructure has been set up in the environment settings of the repository server as described in the following procedure, and then performs the operation again.

1. On the Interstage Management Console, select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Repository server] > [Settings] tab and click [Repository server detailed setting [Show]].
2. Check the URL by [Authentication infrastructure URL] of [Information on Authentication infrastructure].
3. If the URL of the authentication infrastructure has not been set up in step 2, set up the URL of the authentication infrastructure.

## 21.8.35 sso04341

---

### **SSO: ERROR: sso04341: The business system setup file cannot be downloaded because the Authentication infrastructure URL is not set up.**

#### Explanation

The business system setup file cannot be downloaded because the URL of the authentication infrastructure has not been set up for the environment setting of the repository server.

#### User Action

Check if the URL of the authentication infrastructure has been set up in the environment settings of the repository server as described in the following procedure, then performs the operation again.

1. On the Interstage Management Console, select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Repository server] > [Settings] tab and click [Repository server detailed setting [Show]].
2. Check the URL by [Authentication infrastructure URL] of [Information on Authentication infrastructure].
3. If the URL of the authentication infrastructure has not been set up in step 2, set up the URL of the authentication infrastructure.

## 21.8.36 sso04342

---

### **SSO: ERROR: sso04342: The user accessing can not be unlocked in the Repository server (reference system).**

#### Explanation

The user in the lock status cannot be unlocked in the repository server (reference system).

#### User Action

Unlock the user in the lock status in the repository server (update system).

## 21.8.37 sso04343

---

### **SSO: ERROR: sso04343: Authentication infrastructure setup file can not be downloaded in the Repository server (reference system).**

#### Explanation

The authentication infrastructure setup file cannot be downloaded in the repository server (reference system). Possible causes of the error are described below:

- The authentication infrastructure setup file may have been downloaded from the repository server (reference system).
- The repository server upgrade procedure may not have been performed correctly.

#### User Action

Take any of the following actions:

- Download the authentication infrastructure setup file in the repository server (update system).
- Check for errors in the repository server upgrade procedure.

### 21.8.38 sso04344

---

**SSO: ERROR: sso04344: Business system setup file can not be downloaded in the Repository server (reference system).**

#### Explanation

The business system setup file cannot be downloaded in the repository server (reference system). Possible causes of the error are described below:

- The business system setup file may have been downloaded from the repository server (reference system).
- The repository server upgrade procedure may not have been performed correctly.

#### User Action

Take any of the following actions:

- Download the business system setup file in the repository server (update system).
- Check for errors in the repository server upgrade procedure.

### 21.8.39 sso04345

---

**SSO: ERROR: sso04345: The Repository server (reference system) can not be created if Active Directory is used where the user information is registered.**

#### Explanation

The Repository server (reference system) cannot be created if Active Directory is used where the user information is registered.

#### User Action

When creating the repository server (reference system), obtain the Authentication infrastructure setup file from the repository server (update system) that uses the Interstage directory service in the user information registration destination.

### 21.8.40 sso04346

---

**SSO: ERROR: sso04346: Can not connect to the Directory service. Url=(%s1)**

#### Variable Information

%s1 = Directory Service URL

#### Explanation

A connection to the Directory Service (%s1) cannot be established. Possible causes of the error are described below:

- The Directory Service (%s1) URL is incorrect.
- The user information registration entry is incorrect.
- The Directory Service (%s1) has not been started .
- There are problems in the network environment.

## User Action

Take any of the following actions:

- Check the Directory Service (%s1) URL.
- Check the user information registration entry.
- Check if the Directory Service (%s1) is started.
- Check the network environment once again.

\*1 For the Directory Service URL, in the Interstage Management Console, click [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Repository server ] > [Settings] tab, [Repository server detailed settings[Display]], and refer to [Repository Settings] > [Active Directory settings] > [Directory Service URL].

\*2 For the user information registration entry, in the Interstage Management Console, click [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Repository server] > [Settings] tab, then click [Repository server detailed settings[Display]], and refer to [Repository Settings] > [User Information Registration Entry].

## 21.8.41 sso04347

---

**SSO: ERROR: sso04347: An error occurred accessing the Directory service. Url=(%s1) DN=(%s2) Code=(%x3)**

### Variable Information

%s1 = Directory Service URL

%s2 = Connection DN

%x3 = Error code notified from the Directory Service

### Explanation

The Directory Service (%s1) could not be accessed.

### User Action

Check the error code (%x3) notified from the Directory Service (%s1) and take the following action.

- Error code (%x3) is "0x32"

Inappropriate access to the Directory Service (%s1). Check the Directory Service (%s1) environment setting or access control settings for the connection DN (%s2). (\*1)

- Error code (%x3) is "0x35"

- When [User Information Registration Entry], [Role Configuration Registration Entry], [Protection Resource Registration Entry] are set or their settings are changed.

Check if [User Information Registration Entry],[Role Configuration Registration Entry] and [Protection Resource Registration Entry] exist in the Directory Service (%s1). (\*2)

- Other than the above

Check the Directory Service(%s1) environment settings. (\*1)

- Error code (%x3) is other than the above

Check the Directory Service (%s1) environment settings. (\*1)

\*1 For Directory Service details, refer to the Directory Service document.

\*2 In the Interstage Management Console, click [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Repository server] > [Settings] tab > [Repository server detailed settings[Display]], and check the following items of [Repository Settings].

- User Information Registration Entry
- Role Configuration Registration Entry

- Protection Resource Registration Entry

## 21.8.42 sso04348

---

**SSO: ERROR: sso04348: Authentication of the Directory service failed. Url=(%s1) DN=(%s2)**

### Variable Information

%s1 = Directory Service URL

%s2 = Connection DN

### Explanation

Directory Service (%s1) authentication failed. Possible causes of the error are described below:

- The Connection DN for the Directory Service (%s1) is incorrect.
- The Directory Service (%s1) Connection DN password is not set.
- The Directory Service (%s1) Connection DN password is incorrect.
- The Directory Service (%s1) Connection DN password exceeded the valid input range.
- Access to the connection DN (%s2) may not be authorized.

### User Action

Take any of the following actions:

- Set the correct Directory Service (%s1) Connection DN. (\*1)
- Set the password for the Directory Service (%s1) Connection DN. (\*2)
- Set the correct password for the Directory Service (%s1) Connection DN. (\*2)
- Ensure that the Directory Service (%s1) Connection DN password is within 1-128 bytes. (\*3)
- Set access control for the Connection DN (%s2). (\*4)

\*1 To update the Connection DN, in the Interstage Management Console click [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Repository server] > [Settings] tab [Repository server detailed settings[Display]], and update [Repository Settings] > [Active Directory Settings] > [Connection DN].

\*2 To update the Connection DNpassword details, in the Interstage Management Console, click [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Repository server] > [Settings] tab, [Repository server detailed settings[Display]], and update [Repository Settings] > [Active Directory Settings] > [Connection DN password].

\*3 If the Directory Service (%s1) side Connection DN password is not set or exceeds 128 bytes, set the Directory Service (%s1) connection DN password within the 1-128 bytes range.

\*4 For Directory Service details, refer to the Directory Service documents.

## 21.8.43 sso04350

---

**SSO: ERROR: sso04350: The specified Authentication infrastructure setup file is incorrect.**

### Explanation

The specified file may not be the authentication infrastructure setup file. Alternatively, the specified authentication infrastructure setup file may be damaged.

### User Action

Reacquire the authentication infrastructure setup file.

## 21.8.44 sso04352

---

---

**SSO: ERROR: sso04352: The path is invalid. Path=(%s1)****Variable Information**

%s1 = Path

**Explanation**

The path (%s1) is incorrect.

**User Action**

Check for the path (%s1) and specify a path according to the following:

- 1 to 256 bytes of characters can be used.
- Specify '/' for the first character.
- A character string including '//', './.', or '/../' cannot be specified for a path.
- A character string ending with './', '/../', or '/' cannot be specified for a path.
- A character string including Japanese characters cannot be specified for a path.

---

**21.8.45 sso04353**

---

**SSO: ERROR: sso04353: Invalid attribute name specified in the extended user information. Attribute name=(%s1)****Variable Information**

%s1 = Attribute name

**Explanation**

Extended user information is not appropriate.

**User Action**

Check the extended user information, and specify the attribute name according to the following rules:

- Alphanumeric characters including the underscore ( \_ ) can be used.
- More than one attribute name can be specified with each name separated by a comma ( , ).
- One attribute name can be specified in up to 512 bytes.
- When more than one attribute is specified the maximum size is 950bytes (including commas).
- The same attribute name cannot be specified more than once.
- The following attributes cannot be specified.
  - userPassword
  - ssoRoleName
  - uid
  - ssoSessionInfo
  - USER\_DN
  - USER\_ID
  - AUTH\_METHOD
  - AUTH\_METHOD\_EX
  - IP\_ADDRESS
  - FIRST\_ACCESS\_TIME

- EXPIRATION\_TIME
- LAST\_SIGNON\_TIME

## 21.8.46 sso04354

---

**SSO: ERROR: sso04354: The attribute name used for the role is invalid. Attribute name=(%s1)**

### Variable Information

%s1 = attribute name

### Explanation

The attribute name used for the role is invalid.

### User Action

Check the attribute name used for the role and specify the attribute name in accordance with the following rules:

- Alphanumeric characters including the underscore ( \_ ) can be used in the attribute name.
- More than one attribute name can be specified with each name separated by a comma ( , ).
- One attribute name can be specified in up to 512 bytes.
- When more than one attribute is specified the maximum size is 950bytes (including commas).
- The same attribute name cannot be specified more than once.

## 21.8.47 sso04355

---

**SSO: ERROR: sso04355: The connection DN is invalid. DN=(%s1)**

### Variable Information

%s1 = Connection DN

### Explanation

The connection DN is invalid.

### User Action

Check the Connection DN and specify the Connection DN in accordance with the following rule:

- The Connection DN can be specified in up to 576 bytes.

## 21.8.48 sso04356

---

**SSO: ERROR: sso04356: The password of connection DN is invalid.**

### Explanation

The connection DN password is invalid.

### User Action

Check the specified connection DN password and specify the password in accordance with the following rules:

- A string between 1 and 128 bytes can be specified.
- Alphanumeric characters, symbols and single byte spaces can be specified.

## 21.8.49 sso04358

---

---

**SSO: ERROR: sso04358: The environmental configuration of the Repository server can not be updated by selecting a SSO repository that can not use non-SSL communication.**

**Explanation**

The Single Sign-on Repository server (update type) configuration cannot be updated by selecting an SSO repository that cannot use non-SSL communication.

**User Action**

Take one of the actions shown below, then update the Interstage single sign-on repository server (update type) environment settings. (\*1)

- Select an SSO repository of which the replication style is either master or standalone, and which uses a non-SSL port.
- Select an SSO repository of which the replication style is either master or standalone, and which uses both a non-SSL port and an SSL port.

\*1 For details on how to update the repository server (update type) environment settings, refer to "Operation and Maintenance" - "Changing Environment Settings" - "Changing the Environment Settings of Repository Server, Authentication Server and Business Server" in the Single Sign-on Operator's Guide.

---

## 21.8.50 sso04359

**SSO: ERROR: sso04359: The environmental configuration of the Repository server (reference type) can not be updated by selecting a SSO repository that can not use non-SSL communication.**

**Explanation**

The Single Sign-on Repository server (reference type) configuration cannot be updated by selecting an SSO repository that cannot use non-SSL communication.

**User Action**

Select the SSO repository of which the replication style is slave, and which uses both a non-SSL port and an SSL port, then update the Interstage single sign-on repository server (reference type) environment settings. (\*1)

\*1 For details on how to update the repository server (reference type) environment settings, refer to "Operation and Maintenance" - "Changing Environment Settings" - "Changing the Environment Settings of Repository Server, Authentication Server and Business Server" in the Single Sign-on Operator's Guide.

---

## 21.8.51 sso04360

**SSO: ERROR: sso04360: Acquisition of the SSO Repository information was failed. Repository name=(%s1) Code=(%x2)**

**Variable Information**

%s1 = Repository name

%x2 = Detailed error code

**Explanation**

Acquiring the information on the SSO repository failed.

**User Action**

Remove the cause indicated by the detailed error code (%x2). For the meaning of the detailed error codes, see [List of Error Codes on Acquiring Information on SSO repository] and take appropriate action.

[List of Error Codes on Acquiring Information on SSO repository]

Table 21.50 Error Codes for Acquiring Information on SSO Repository

Code	Description of error	Action to be taken
0x06	The SSO repository (%s1) does not exist.	Check that the SSO repository (%s1) has not been deleted. (*1) If it has been deleted, on the Interstage Management Console, select [System] > [Services] > [Repository] > [Create a New Repository] tab to recreate the SSO repository (%s1). (*2)
0x08	Interstage Directory Service has not been installed. Alternatively, the environment of Interstage Directory Service is damaged.	<b>Windows32/64</b> Install Interstage Directory Service and Interstage data store. If they have been already installed, reinstall them. (*3) <b>Solaris32/64</b> <b>Linux32/64</b> Install the following packages. If they have been already installed, reinstall them. (*3) - FJSVirep (Interstage Directory Service ) - FJSVena (Interstage data store for enterprise content knowledge and document management )
0x0d	Memory is insufficient.	Close all applications no longer needed to ensure the free space of memory. For the required memory, refer to 'Memory Capacity' under 'Required Resources' in the Tuning Guide.
0x0e 0x10 0x13	The environment of the SSO repository (%s1) is damaged. Alternatively, the environment of Interstage Directory Service is damaged.	On the Interstage Management Console, select [System] > [Services] > [Repository] > [Create a New Repository] tab to recreate the SSO repository (%s1). (*2) <b>Windows32/64</b> If it cannot be recreated, reinstall Interstage Directory Service and Interstage data store. (*3) <b>Solaris32/64</b> <b>Linux32/64</b> If it cannot be recreated, reinstall the following packages: (*3) - FJSVirep (Interstage Directory Service) - FJSVena (Interstage data store for enterprise content knowledge and document management)
0x14	Possible causes of the error are as follows:  The network resources are insufficient.  The network has been incorrectly set up.  An error occurs in the network environment.	Take the following action:  - Check that the network allows the communication.  - If the network has been correctly set up, close all programs no longer needed.  - Check that the network environment is correct. If the network environment is incorrect, reconfigure it.
Other than above	Another error occurred.	Check that a message starting with irep has been output in the system log.  If a message has been output, check it to remove the cause of error. Otherwise, after a message is output, immediately use the iscollectinfo command to collect investigation information, then contact your service engineer.

\*1 On the Interstage Management Console, select [System] > [Services] > [Repository] > [View Status] tab to check it.

\*2 For details on creating the SSO repository, refer to 'Repository Server Setup' under 'Environment Setup (SSO Administrators)' in the Single Sign-on Operator's Guide.

\*3 After uninstalling them, delete all files under the following directories:

#### Windows32/64

- C:\Interstage\IREP
- C:\Interstage\Enabler

#### Solaris32/64 Linux32/64

- /opt/FJSVirep
- /var/opt/FJSVirep
- /etc/opt/FJSVirep
- /opt/FJSVena
- /var/opt/FJSVena

## 21.8.52 sso04362

---

**SSO: ERROR: sso04362: The Repository server environment is broken. Detail=(%s1,%s2)**

### Variable Information

%s1 = Maintenance information

%s2 = Maintenance information

### Explanation

The environment of the Interstage single sign-on repository server is damaged.

### User Action

If the repository server was upgraded from a previous version, check that the upgrade procedure was correct.

In all other cases, use the following procedure to rebuild the Interstage single sign-on repository server. (\*1)

1. On the Interstage Management Console, select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure], then select the [List] tab and delete the repository server.
2. Use the [Authentication Infrastructure Settings] tab to build the repository server.

\*1 Refer to "Environment Setup" (SSO Administrator)" in the Single Sign-on Operator's Guide for detailed information about creating the repository server environment.

## 21.8.53 sso04363

---

**SSO: ERROR: sso04363: Role information could not be updated because an error occurred in communication with the Repository server. Detail=(%d1,%s2)**

### Variable Information

%d1 = Maintenance information

%s2 = Maintenance information

### Explanation

Role information could not be updated because an error occurred during communication with the Interstage single sign-on repository server.

## User Action

Take any of the following actions:

- On the Interstage Management Console, select [System] > [Services] > [Web Server] > [Web Server Name], then click the [Web Server Status] tab, and restart the Web Server (Interstage HTTP Server).
- There may be a problem in the communication path. Ask the network administrator if the environment can connect to the Interstage single sign-on repository server.

## 21.8.54 sso04364

---

**SSO: ERROR: sso04364: Role information could not be updated because an error occurred while updating the role information.**

### Explanation

Role information could not be updated because an error occurred during the update process.

### User Action

Examine the system log that is output to the Interstage single sign-on repository server at the same time as this error and take any appropriate measures.

Refer to 'sso00001 to sso00207', 'sso01000 to sso01212' and 'sso11000 to sso11008' for information about the repository server system log.

## 21.8.55 sso04367

---

**SSO: ERROR: sso04367: The Repository server can not be created because another server of Single Sign-on has already been created for the Web Server (Interstage HTTP Server). Web Server=(%s1)**

### Variable Information

%s1 = Web server name

### Explanation

The repository server cannot be created because another Single Sign-on server (authentication server or business server) has already been created for the Web server (%s1).

### User Action

Either delete the other Single Sign-on server (authentication server or business server) created for the Web server (%s1) (\*1), or create a new Web server (Interstage HTTP Server). (\*2)

1\* To delete the authentication server, in the Interstage Management Console click [System] > [Security]> [Single Sign-on] > [Authentication infrastructure] > [List], and delete the authentication server. To delete the business server, in the Interstage Management Console click [System] > [Security]> [Single Sign-on] > [Business system]> [List], and delete the business server displayed in Web server name (%s1).

\*2 To create the new Web server (Interstage HTTP Server), in the Interstage Management Console click [System] > [Services] > [Web Server] > [New].

## 21.8.56 sso04368

---

**SSO: ERROR: sso04368: The Single Sign-on Repository server environment settings can not be updated. Detail=(%s1)**

### Variable Information

%s1 = Error message number output when the environment settings were updated

## Explanation

Failed to update the Single Sign-on Repository server environment settings. Since the Web server (Interstage HTTP Server) environment settings update was successful, a contradiction may have occurred with the Single Sign-on Repository server environment settings.

## User Action

Check the error message (%s1) and take action. For details about error messages, refer to "21.6 sso04101 to sso04153" and "21.8 sso04301 to sso04371".

## 21.8.57 sso04369

---

**SSO: WARNING: sso04369: The settings for the Web Server (Interstage HTTP Server) used in the Single Sign-on Repository server have been changed. Check that it is possible to run the Single Sign-on Repository server.**

## Explanation

The settings for the Web Server (Interstage HTTP Server) used in the Single Sign-on Repository server have been changed.

## User Action

Check that it is possible to run the Single Sign-on Repository server.

## 21.8.58 sso04370

---

**SSO: ERROR: sso04370: The Repository server can not be created by selecting a SSO repository that can not use non-SSL communication.**

## Explanation

The Single Sign-on Repository server (update type) cannot be created by selecting an SSO repository that cannot use non-SSL communication.

## User Action

Take one of the actions shown below, then create the Interstage single sign-on repository server (update type). (\*1)

- Select an SSO repository of which the replication style is either master or standalone, and which uses a non-SSL port.
- Select an SSO repository of which the replication style is either master or standalone, and which uses both a non-SSL port and an SSL port.

\*1 For details on how to create the repository server (update type), refer to "Environment Setup (SSO Administrators)" - "Repository Server Setup" in the Single Sign-on Operator's Guide.

## 21.8.59 sso04371

---

**SSO: ERROR: sso04371: The Repository server (reference type) can not be created by selecting a SSO repository that can not use non-SSL communication.**

## Explanation

The Single Sign-on Repository server (reference type) cannot be created by selecting an SSO repository that cannot use non-SSL communication.

## User Action

Select the SSO repository of which the replication style is slave, and which uses both a non-SSL port and an SSL port, then create the Interstage single sign-on repository server (reference type). (\*1)

\*1 For details on how to create the repository server (reference type), refer to "Environment Setup (SSO Administrators)" - "Repository Server Setup" - "Adding a Repository Server (Reference System)" in the Single Sign-on Operator's Guide.

## 21.9 sso04400 to sso04468

---

### 21.9.1 sso04400

---

**SSO: INFO: sso04400: Authentication server was created. The Web Server (Interstage HTTP Server) is required to reboot ([System] > [Services] > [Web Server]).**

#### Explanation

An Interstage Single Sign-on Authentication server has been created. To put it into operation, select [System] > [Services] > [Web Server] > [Web Server Name] on the Interstage Management Console, then restart the Web server (Interstage HTTP Server) on the [Web Server Status] tab.

To add a business system to the Interstage Single Sign-on system, complete the following steps: (\*1)

1. Create a site configuration of the business system by using [Protection resource] for the repository server created.
2. Create a path configuration by using [Protective Path] of the site configuration created.
3. By using [Authentication infrastructure], download a business system setup file, then deliver it to the business server administrator.

\*1 For information about how to add a business system, see 'Environment Setup (Business Server Administrators)' - 'Environment Setup Flow ' in the Single Sign-on Operator's Guide.

### 21.9.2 sso04401

---

**SSO: INFO: sso04401: The environmental configuration of the Authentication server was updated. The Web Server (Interstage HTTP Server) is required to reboot ([System] > [Services] > [Web Server]). (%s1)**

#### Variable Information

%s1 = Supplementary information

#### Explanation

Some environment settings of the Interstage Single Sign-on Authentication server have been modified. To put it into operation, select [System] > [Services] > [Web Server] > [Web Server Name] on the Interstage Management Console, then restart the Web server (Interstage HTTP Server) on the [Web Server Status] tab.

Note that if "Server connection information has changed" appears in the supplementary information, the authentication server and SSL accelerator settings should be changed as needed.

### 21.9.3 sso04402

---

**SSO: ERROR: sso04402: The Authentication server has been already deleted.**

#### Explanation

The Interstage Single Sign-on Authentication server could not be found. It may have been deleted by another user.

#### User Action

Take the following steps to action the error:

1. Select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] on the Interstage Management Console, then obtain the latest list of servers in which the authentication infrastructure is to be established on the [List] tab.
2. Check that the authentication server exists on the list obtained in step 1.
3. If the authentication server is not on the list in step 2, select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] on the Interstage Management Console, then reestablish the authentication server on the [Establishing Authentication infrastructure] tab.

## 21.9.4 sso04403

---

**SSO: WARNING: sso04403: SSL is not available because SSL configuration does not exist.**

### Explanation

The Interstage Certificate Environment includes no SSL configuration; SSL is unavailable on the authentication server.

### User Action

To use SSL on an authentication server, select [System] > [Security] > [SSL] on the Interstage Management Console, then create an SSL configuration on the [Create a new SSL Configuration] tab in advance. (\*1)

\*1 For how to create an SSL configuration, see 'Environment Setup (SSO Administrators)' - 'Setup of Authentication Server' - 'SSL Communication Environment Setup' in the Single Sign-on Operator's Guide.

## 21.9.5 sso04404

---

**SSO: INFO: sso04404: The Authentication server was deleted.**

### Explanation

The Interstage Single Sign-on Authentication server has been deleted.

## 21.9.6 sso04405

---

**SSO: ERROR: sso04405: Small-scale system can not be created because Authentication server already exists.**

### Explanation

An Interstage Single Sign-on Authentication server has already been established; it is no longer allowed to establish a new small-scale system (which includes a repository server and an authentication server in one machine).

### User Action

Check for the type of system to be established.

To establish a new small-scale system (which includes a repository server and an authentication server in one machine), take the following steps:

1. If an Interstage Single Sign-on Authentication server and repository server already exist, select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] on the Interstage Management Console, then delete the authentication server and repository server on the [List] tab.
2. Select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] on the Interstage Management Console, then establish a small-scale system on the [Establishing Authentication infrastructure] tab. (\*1)

\*1 For how to establish a small-scale system, see 'Environment Setup (SSO Administrators)' in the Single Sign-on Operator's Guide.

## 21.9.7 sso04406

---

**SSO: ERROR: sso04406: The selected SSL configuration does not exist. SSL configuration=(%s1)**

### Variable Information

%s1 = SSL configuration

### Explanation

The SSL configuration selected (%s1) does not exist. It may have possibly been deleted by another user.

## User Action

Check that there is an SSL configuration in the Interstage Certificate Environment. If there is no SSL configuration, select [System] > [Security] > [SSL] on the Interstage Management Console, then recreate an SSL configuration on the [Create a new SSL Configuration] tab. (\*1)

\*1 For how to create an SSL configuration, see 'Environment Setup (SSO Administrators)' - 'Setup of Authentication Server' - 'SSL Communication Environment Setup' in the Single Sign-on Operator's Guide.

## 21.9.8 sso04432

---

**SSO: ERROR: sso04432: Authentication server can not be created because Authentication server already exists.**

### Explanation

An Interstage Single Sign-on Authentication server has been established; it is no longer allowed to create a new authentication server.

### User Action

Check for the type of the system to be established.

To reestablish an authentication server, complete the following steps:

1. Select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] on the Interstage Management Console, then delete the existing authentication server on the [List] tab.
2. Select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] on the Interstage Management Console, then establish a new authentication server on the [Establishing Authentication infrastructure] tab.

## 21.9.9 sso04433

---

**SSO: ERROR: sso04433: Authentication server package is not installed.**

### Explanation

No Interstage Single Sign-on Authentication server has been installed.

### User Action

**Windows32/64**

Install Interstage Single Sign-on (authentication server).

**Solaris32/64 Linux32/64**

Install the package indicated below:

- FJSVssoc (Interstage Single Sign-on Authentication server)

## 21.9.10 sso04450

---

**SSO: INFO: sso04450: Authentication server was created. The Web Server (Interstage HTTP Server) is required to read configuration and reboot by using Interstage Management Console of the Admin Server.**

### Explanation

The Interstage Single Sign-on Authentication server was created.

Start the operation according to the procedure shown below. The Web server (Interstage HTTP Server) environment definition on the Managed Server where the authentication server has been created must be reflected in the business configuration management repository on the Admin Server. Additionally, the Web server (Interstage HTTP Server) must be restarted.

1. Log in to the Interstage Management Console of the Admin Server.

2. In the Interstage Management Console, click [Application Management] > [Interstage] > [Interstage Application Server] > [Services] > [Web Server] > [FJapache(Server Group Name or Server Name)]. Click the [Get Definition] tab, and select the Managed Server on which the authentication server has been created. Click the [Select] button, and then click [Update].
3. In the Interstage Management Console, click [Application Management] > [Interstage] > [Interstage Application Server] > [Services] > [Web Server]. Select the Server Group or Managed Server to be operated, and then click [Start].

Alternatively, click [Application Management] > [Interstage] > [Interstage Application Server] > [Services] > [Web Server] > [FJapache(Server Group Name or Server Name)], and then click [Start].

If Managed Servers are included in the Server Group, first create the authentication server for all the Managed Servers, and then execute the above procedure.

Alternatively, to add a business system to a Single Sign-on system, execute the following procedure. (\*1)

1. Log in to the Managed Server Interstage Management Console in which the repository server was created.
2. Create the business system [Site Configuration] using [Protected Resources] of the created repository server.
3. Create the path configuration using [Protected Path] of the site configuration created in Step 2.
4. Download the business system setup file using [Authentication infrastructure], and pass it to the business server administrator.

\*1 For details about the procedure to add a business system, refer to the Single Sign-on Operator's Guide. The relevant section is 'Environment Setup (Business Server Administrators)' - 'Environment Setup Flow'.

## 21.9.11 sso04451

---

**SSO: INFO: sso04451: The environmental configuration of the Authentication server was updated. The Web Server (Interstage HTTP Server) is required to read configuration and reboot by using Interstage Management Console of the Admin Server. (%s1)**

### Variable Information

%s1 = Supplementary information

### Explanation

The Interstage Single Sign-on Authentication server environment settings were updated.

In the following procedure, the environment definition contents of the Web server (Interstage HTTP Server) on the Managed Server on which the authentication server has been created must be reflected in the business configuration management repository on the Admin Server, and the Web server (Interstage HTTP Server) must be restarted.

1. Log in to the Interstage Management Console of the Admin Server.
2. In the Interstage Management Console, click [Application Management] > [Interstage] > [Interstage Application Server] > [Services] > [Web Server] > [FJapache(Server Group Name or Server Name)]. Click the [Get Definition] tab, and select the Managed Server on which the authentication server environment settings have been updated. Click the [Select] button, and then click [Update].
3. In the Interstage Management Console, click [Application Management] > [Interstage] > [Interstage Application Server] > [Services] > [Web Server]. Select the Server Group or Managed Server to be operated, and then click [Start].

Alternatively, click [Application Management] > [Interstage] > [Interstage Application Server] > [Services] > [Web Server] > [FJapache(Server Group Name or Server Name)], and then click [Start].

If Managed Servers are included in the Server Group, first update the server environment settings of the authentication server for all the Managed Servers, and then execute the above procedure.

Note that if "Server connection information has changed" appears in the supplementary information, the authentication server and SSL accelerator settings should be changed as needed.

## 21.9.12 sso04454

---

**SSO: INFO: sso04454: The Authentication server was deleted. The Web Server (Interstage HTTP Server) is required to read configuration by using Interstage Management Console of the Admin Server.**

## Explanation

The Interstage Single Sign-on Authentication server was deleted.

In the following procedure, the Web server (Interstage HTTP Server) environment definition on the Managed Server where the authentication server has been deleted must be reflected in the business configuration management repository on the Admin Server.

1. Log in to the Interstage Management Console of the Admin Server.
2. In the Interstage Management Console, click [Application Management] > [Interstage] > [Interstage Application Server] > [Services] > [Web Server] > [FJapache(Server Group Name or Server Name)]. Click the [Get Definition] tab, and select the Managed Server on which the authentication server has been deleted. Click the [Select] button, and then click [Update].

If Managed Servers are included in the Server Group, first delete the authentication server for all the Managed Servers, and then execute the above procedure.

## 21.9.13 sso04468

---

**SSO: ERROR: sso04468: There is no Web Server (Interstage HTTP Server) that can be used to create the Authentication server.**

### Explanation

The authentication server cannot be created because another Single Sign-on server (repository server or business server) has already been created for all the Web servers (Interstage HTTP Server) on this machine.

Either delete the other Single Sign-on server (repository server or business server) created on this machine (\*1), or create a new Web server (Interstage HTTP Server). (\*2)

\*1 To delete the repository server, in the Interstage Management Console click [System] > [Security]> [Single Sign-on] > [Authentication infrastructure] > [List], and delete the repository server. To delete the business server, in the Interstage Management Console click [System] > [Security]> [Single Sign-on] > [Business system]> [List], and delete the business server displayed in Web server name (%s1).

\*2 To create the new Web server (Interstage HTTP Server), in the Interstage Management Console click [System] > [Services] > [Web Server] > [New].

## 21.10 sso04501 to sso04569

---

### 21.10.1 sso04501

---

**SSO: ERROR: sso04501: Authentication server can not be created because the specified port number is already in use. Port number=(%s1)**

#### Variable Information

%s1 = Port number

### Explanation

At least one of the following servers have already used the specified port number (%s1); the authentication server could not be created:

- Repository server
- Authentication server
- Business server
- Web server (Interstage HTTP Server)

### User Action

To check whether the specified port number (%s1) is being used, refer to "Notes on Interstage Operation" - "Common Notes for Interstage" - "Setting Port Numbers Used for Individual Services" in the Product Notes.

If the port number (%s1) is already being used, specify another port number and then create the Interstage Single Sign-on Authentication server.

## 21.10.2 sso04502

---

**SSO: ERROR: sso04502: The environmental configuration of the Authentication server can not be updated because the specified port number is already in use. Port number=(%s1)**

### Variable Information

%s1 = Port number

### Explanation

At least one of the following servers have already used the specified port number (%s1); the environment settings for the authentication server could not be updated.

- Repository server
- Business server
- Web server (Interstage HTTP Server).

### User Action

To check whether the specified port number (%s1) is being used, refer to "Notes on Interstage Operation" - "Common Notes for Interstage" - "Setting Port Numbers Used for Individual Services" in the Product Notes.

If the port number (%s1) is already being used, specify another port number and then update the Interstage Single Sign-on Authentication server environment settings.

## 21.10.3 sso04503

---

**SSO: ERROR: sso04503: Authentication server package is not installed.**

### Explanation

No Interstage Single Sign-on Authentication server has been installed.

### User Action

**Windows32/64**

Install Interstage Single Sign-on (authentication server).

**Solaris32/64** **Linux32/64**

Install the package indicated below:

- FJSVssoc (Interstage Single Sign-on Authentication server)

## 21.10.4 sso04504

---

**SSO: ERROR: sso04504: The Authentication server environment is broken.**

### Explanation

The environment of the Interstage Single Sign-on Authentication server has been damaged.

### User Action

If the authentication server was upgraded from a previous version, check if there were any errors in the upgrade procedure.

If there were no errors, reestablish the Interstage Single Sign-on Authentication server with the following steps: (\*1)

1. Select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] on the Interstage Management Console, then delete the authentication server on the [List] tab.

2. Establish the authentication server on the [Establishing Authentication infrastructure] tab.

\*1 For how to reestablish an authentication server, see 'Environment Setup (SSO Administrators)' in the Single Sign-on Operator's Guide.

## 21.10.5 sso04505

---

### **SSO: ERROR: sso04505: Authentication server has been already created.**

#### Explanation

The Interstage Single Sign-on Authentication server has already been created.

#### User Action

To establish a new Interstage Single Sign-on Authentication server, take the following steps: (\*1)

1. Select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] on the Interstage Management Console, then delete the existing Interstage Single Sign-on Authentication server on the [List] tab.
2. Establish an authentication server on the [Establishing Authentication infrastructure] tab.

\*1 For information on how to reestablish an authentication server, see 'Environment Setup (SSO Administrators)' in the Single Sign-on Operator's Guide.

## 21.10.6 sso04506

---

### **SSO: ERROR: sso04506: The Authentication server has been already deleted.**

#### Explanation

The Interstage Single Sign-on Authentication server could not be found. It may have possibly been deleted by another user.

#### User Action

Complete the following steps to action the error:

1. Select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] on the Interstage Management Console, then obtain the latest list of servers in which the authentication infrastructure is to be established on the [List] tab.
2. Check that the authentication server exists on the list obtained in step 1.
3. If the authentication server is not on the list in step 2, select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] on the Interstage Management Console, then reestablish the authentication server on the [Establishing Authentication infrastructure] tab.

## 21.10.7 sso04527

---

### **SSO: ERROR: sso04527: Access authority to the file required in operating Authentication server can not be set up because the user name set at the environmental configuration of the Web Server (Interstage HTTP Server) does not exist.**

#### Explanation

The environment configuration file (httpd.conf) for the Web server (Interstage HTTP Server) has an incorrect User configuration; any permission to access the files required for the operation of the authentication server could not be set. Possible causes of the error are as follows:

- A user name which is not in the user management register of the operating system has been set in a User configuration in the environment configuration file (httpd.conf) of the Web server (Interstage HTTP Server).
- No User configuration (user name) has been set in the environment configuration file (httpd.conf) of the Web server (Interstage HTTP Server).

## User Action

Set a user name which is in the user management register of the operating system to a User configuration in the environment configuration file (httpd.conf) of the Web server (Interstage HTTP Server). After setting it, select [System] > [Services] > [Web Server] > [Web Server Name] on the Interstage Management Console, then restart the Web server (Interstage HTTP Server) on the [Web Server Status] tab.

## 21.10.8 sso04528

---

**SSO: ERROR: sso04528: Authentication server can not be created because the user name set at the environmental configuration of the Web Server (Interstage HTTP Server) does not exist.**

### Explanation

A User configuration has been incorrectly set in the environment configuration file (httpd.conf) of the Web server (Interstage HTTP Server); the authentication server could not be created. Possible causes of the error are as follows:

- A user name which is not in the user management register of the operating system has been set in a User configuration in the environment configuration file (httpd.conf) of the Web server (Interstage HTTP Server).
- No User configuration (user name) has been set in the environment configuration file (httpd.conf) of the Web server (Interstage HTTP Server).

## User Action

Set a user name which is in the user management register of the operating system to a User configuration in the environment configuration file (httpd.conf) of the Web server (Interstage HTTP Server). After setting it, select [System] > [Services] > [Web Server] > [Web Server Name] on the Interstage Management Console, then restart the Web server (Interstage HTTP Server) on the [Web Server Status] tab.

## 21.10.9 sso04530

---

**SSO: ERROR: sso04530: The specified Authentication infrastructure setup file is incorrect.**

### Explanation

The specified file is not an authentication infrastructure setup file or the specified authentication infrastructure setup file may have been possibly damaged.

## User Action

Obtain the authentication infrastructure setup file again.

## 21.10.10 sso04537

---

**SSO: ERROR: sso04537: Access authority to the file required in operating Authentication server cannot be set up because the group name set at the environmental configuration of the Web Server (Interstage HTTP Server) does not exist.**

### Explanation

The environment configuration file (httpd.conf) for the Web server (Interstage HTTP Server) has an incorrect Group configuration. Any permission to access the files required for the operation of the authentication server could not be set. Possible causes of the error are as follows:

- A group name which is not in the group management register of the operating system has been set in a Group configuration in the environment configuration file (httpd.conf) of the Web server (Interstage HTTP Server).
- No Group configuration (user name) has been set in the environment configuration file (httpd.conf) of the Web server (Interstage HTTP Server).

## User Action

Set a group name which is in the group management register of the operating system to a Group configuration in the environment configuration file (httpd.conf) of the Web server (Interstage HTTP Server). After setting it, select [System] > [Services] > [Web Server] > [Web Server Name] on the Interstage Management Console, then restart the Web server (Interstage HTTP Server) on the [Web Server Status] tab.

## 21.10.11 sso04538

---

### SSO: ERROR: sso04538: The Authentication server can not be deleted because the Web Server (Interstage HTTP Server) is running.

#### Explanation

The Web server (Interstage HTTP Server) was starting up; the Interstage Single Sign-on Authentication server could not be deleted.

#### User Action

Select [System] > [Services] > [Web Server] > [Web Server Name] on the Interstage Management Console, then stop the Web server (Interstage HTTP Server) on the [Web Server Status] tab, then delete it again.

## 21.10.12 sso04539

---

### SSO: ERROR: sso04539: The Authentication server environment is broken. Detail=(%s1,%s2)

#### Variable Information

%s1 = Maintenance information

%s2 = Maintenance information

#### Explanation

The Interstage Single Sign-on Authentication server environment has been corrupted.

#### User Action

Set up the authentication server again according to the following procedure.

1. In the Interstage Management Console, click [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [List] tab, and delete the authentication server.
2. Click [Authentication infrastructure Settings] tab, and set up the authentication server.

For details about setting up the authentication server, refer to "Environment Setup" (SSO Administrators )" in the Single Sign-on Operator's Guide.

[Windows32/64](#) [Linux32/64](#)

## 21.10.13 sso04567

---

### SSO: ERROR: sso04567: The Authentication server can not be created because another server of Single Sign-on has already been created for the Web Server (Interstage HTTP Server). Web Server=(%s1)

#### Variable Information

%s1 = Web server name

#### Explanation

The authentication server cannot be created because another Single Sign-on server (repository server or business server) has already been created for the Web server (%s1).

## User Action

Either delete the other Single Sign-on server (repository server or business server) created for the Web server (%s1) (\*1), or create a new Web server (Interstage HTTP Server). (\*2)

\*1 To delete the repository server, in the Interstage Management Console click [System] > [Security]> [Single Sign-on] > [Authentication infrastructure] > [List], and delete the repository server. To delete the business server, in the Interstage Management Console click [System] > [Security]> [Single Sign-on] > [Business system]> [List], and delete the business server displayed in Web server name (%s1).

\*2 To create the new Web server (Interstage HTTP Server), in the Interstage Management Console click [System] > [Services] > [Web Server] > [New].

## 21.10.14 sso04568

---

**SSO: ERROR: sso04568: The Single Sign-on Authentication server environment settings can not be updated. Detail=(%s1)**

### Variable Information

%s1 = Error message number output when the environment settings were updated

### Explanation

Failed to update the Single Sign-on Authentication server environment settings. Since the Web server (Interstage HTTP Server) environment settings update was successful, a contradiction may have occurred with the Single Sign-on Authentication server environment settings.

### User Action

Check the error message (%s1) and take action. For details about error messages, refer to "21.6 sso04101 to sso04153" and "21.10 sso04501 to sso04569".

## 21.10.15 sso04569

---

**SSO: WARNING: sso04569: The settings for the Web Server (Interstage HTTP Server) used in the Single Sign-on Authentication server have been changed. Check that it is possible to operate the Authentication server.**

### Explanation

The settings for the Web Server (Interstage HTTP Server) used in the Single Sign-on Authentication server have been changed.

### User Action

Check that it is still possible to run the Single Sign-on Authentication server.

## 21.11 sso04600 to sso04669

---

### 21.11.1 sso04600

---

**SSO: INFO: sso04600: Business server was added. The Web Server (Interstage HTTP Server) is required to reboot ([System] > [Services] > [Web Server]). Business server=(%s1)**

### Variable Information

%s1 = Name of a business system

## Explanation

The Interstage Single Sign-on Business server (%s1) was added. To put it into operation, select [System] > [Services] > [Web Server] > [Web Server Name] on the Interstage Management Console, then restart the Web server (Interstage HTTP Server) on the [Web Server Status] tab.

### 21.11.2 sso04601

---

**SSO: INFO: sso04601: The environmental configuration of the Business server was updated. The Web Server (Interstage HTTP Server) is required to reboot ([System] > [Services] > [Web Server]). (%s2) Business server=(%s1)**

#### Variable Information

%s1 = Name of a business system

%s2 = Supplementary information

## Explanation

The environment configuration of the business server of Interstage Single Sign-on has been updated. To put it into operation, select [System] > [Services] > [Web Server] > [Web Server Name] on the Interstage Management Console, then restart the Web server (Interstage HTTP Server) on the [Web Server Status] tab.

Note that if "Connection information between servers was changed" appears in the supplementary information, the load balancer and/or SSL accelerator settings should be changed as needed.

### 21.11.3 sso04602

---

**SSO: ERROR: sso04602: The Business server has been already deleted. Business server=(%s1)**

#### Variable Information

%s1 = Name of a business system

## Explanation

The Interstage Single Sign-on Business server (%s1) could not be found. It may have possibly been deleted by another user.

#### User Action

Complete the following steps to action the error:

1. Select [System] > [Security] > [Single Sign-on] > [Business system] on the Interstage Management Console, then obtain the latest list of business systems on the [List] tab.
2. Check that the business server exists on the list obtained in step 1.
3. If the business server is not on the list in step 2, select [System] > [Security] > [Single Sign-on] > [Business system] on the Interstage Management Console, then add the business server on the [Addition of Business Server] tab.

### 21.11.4 sso04603

---

**SSO: INFO: sso04603: Access control information was updated.**

## Explanation

The access control information has been updated.

### 21.11.5 sso04604

---

**SSO: WARNING: sso04604: Although Business server was added, the updating of access control information was failed. Business server=(%s1) Detail=(%s2)**

## Variable Information

%s1 = Name of a business system

%s2 = Number of an error message for an update of the access control information

## Explanation

The Interstage Single Sign-on Business server (%s1) was added, but the access control information could not be updated. Take action according to the error message (%s2). For error messages from sso04701 to sso04747, refer to "21.12 sso04701 to sso04769".

To apply the updated access control information, select [System] > [Services] > [Web Server] > [Web Server Name] on the Interstage Management Console, then restart the Web server (Interstage HTTP Server) on the [Web Server Status] tab.

## 21.11.6 sso04605

---

**SSO: INFO: sso04605: It was ready for adding Business server. Please add the Business server to your Web Server. Business server=(%s1)**

## Variable Information

%s1 = Name of a business system

## Explanation

The Interstage Single Sign-on Business server (%s1) was added. Combine the Interstage Single Sign-on Business server with the Web server in use. (\*1)

To put the business server in operation, restart the Web server that is currently in use.

\*1 For how to put a server into the Web server, see 'Environment Setup (Business Server Administrators)' - 'Integration into the Web server' in the Single Sign-on Operator's Guide.

## 21.11.7 sso04606

---

**SSO: INFO: sso04606: The environmental configuration of the Business server was updated. The Web Server is required to reboot. (%s2) Business server=(%s1)**

## Variable Information

%s1 = Name of a business system

%s2 = Supplementary information

## Explanation

Some environment settings of the Interstage Single Sign-on Business server (%s1) have been modified. If no business server has been configured in the Web server being used, put a business server into the Web server. (\*1)

At this point, start the business server in operation and then restart the Web server currently in use..

Note that if "Connection information between servers was changed" appears in the supplementary information, the load balancer and/or SSL accelerator settings should be changed as needed.

\*1 For information about how to put a server into the Web server, see 'Environment Setup (Business Server Administrators)' - 'Integration into the Web server' in the Single Sign-on Operator's Guide.

## 21.11.8 sso04607

---

**SSO: INFO: sso04607: The Business server was deleted. Business server=(%s1)**

## Variable Information

%s1 = Name of a business system

## Explanation

The Interstage Single Sign-on Business server (%s1) has been deleted.

If the Web server in use is not Interstage HTTP Server, the Interstage Single Sign-on Business server needs to be removed from the Web server.

## 21.11.9 sso04608

---

**SSO: WARNING: sso04608: Although it was ready for adding Business server, the updating of access control information was failed. Business server=(%s1) Detail=(%s2)**

### Variable Information

%s1 = Name of a business system

%s2 = Number of an error message for an update of the access control information

### Explanation

The Interstage Single Sign-on Business server (%s1) was ready to be added, but the access control information could not be updated. Take action according to the error message (%s2). For error messages from sso04701 to sso04747, refer to "[21.12 sso04701 to sso04769](#)".

After an update of the access control information, an Interstage Single Sign-on Business server needs to be put into the Web server in use. To put the business server in operation, restart the Web server. (\*1)

\*1 For details on how to put a server into the Web server, see 'Environment Setup (Business Server Administrators)' - 'Integration into the Web server' in the Single Sign-on Operator's Guide.

## 21.11.10 sso04609

---

**SSO: ERROR: sso04609: Two or more Business servers of the Web Server (Interstage HTTP Server) can not be added on the same machine.**

### Explanation

It is not allowed to create multiple business servers related to the Web server (Interstage HTTP Server) on one machine.

### User Action

Do not create multiple business servers related to the Web server (Interstage HTTP Server) on one machine.

## 21.11.11 sso04635

---

**SSO: ERROR: sso04635: The Business server could not be added because there are already 256 Business servers on the same machine.**

### Explanation

An attempt failed to add another business server because 256 or more Interstage single sign-on business servers had already been created on the same machine.

### User Action

To add another Interstage single sign-on business server to the same machine, open the Interstage Management Console and select [System] > [Security] > [Single Sign-on] > [Business System], then select [List] tab and delete an existing business server, then perform the business server addition procedure again.

If it is necessary to add more than 256 Interstage single sign-on business servers, use a different machine.

## 21.11.12 sso04650

---

**SSO: INFO: sso04650: Business server was added. The Web Server (Interstage HTTP Server) is required to read configuration and reboot by using Interstage Management Console of the Admin Server. Business server=(%s1)**

### Variable Information

%s1 = Business system name

### Explanation

The Interstage Single Sign-on Business server(%s1) was added.

In the following procedure, the Web server (Interstage HTTP Server) environment definition on the Managed Server where the business server has been added must be reflected in the business configuration management repository on the Admin Server. Additionally, the Web server (Interstage HTTP Server) must be restarted.

1. Log in to the Interstage Management Console of the Admin Server.
2. In the Interstage Management Console, click [Application Management] > [Interstage] > [Interstage Application Server] > [Services] > [Web Server] > [FJapache(Server Group Name or Server Name)]. Click the [Get Definition] tab, and select the Managed Server to which the business server has been added. Click the [Select] button, and then click the [Update] button.
3. In the Interstage Management Console, click the [Application Management] > [Interstage] > [Interstage Application Server] > [Services] > [Web Server]. Select the Server Group or Managed Server to be operated, and then click [Start].

Alternatively, click [Application Management] > [Interstage] > [Interstage Application Server] > [Services] > [Web Server] > [FJapache(Server Group Name or Server Name)], and then click [Start].

If Managed Servers are included in the Server Group, first add the business server for all the Managed Servers, and then execute the above procedure.

## 21.11.13 sso04651

---

**SSO: INFO: sso04651: The environmental configuration of the Business server was updated. The Web Server (Interstage HTTP Server) is required to read configuration and reboot by using Interstage Management Console of the Admin Server. (%s2) Business server=(%s1)**

### Variable Information

%s1 = Business system name

%s2 = Supplementary information

### Explanation

The Interstage Single Sign-on Business server (%s1) environment settings were updated.

Start the operation using the updated definition according to the procedure shown below. Using the updated definition, the Web server (Interstage HTTP Server) environment definition on the Managed Server where the business server has been updated must be reflected in the business configuration management repository on the Admin Server. Additionally, the Web server (Interstage HTTP Server) must be restarted.

1. Log in to the Interstage Management Console of the Admin Server.
2. In the Interstage Management Console, click [Application Management] > [Interstage] > [Interstage Application Server] > [Services] > [Web Server] > [FJapache(Server Group Name or Server Name)]. Click the [Get Definition] tab, and select the Managed Server for which the business server environment settings have been updated. Click the [Select] button, and then click [Update].

3. In the Interstage Management Console, click [Application Management] > [Interstage] > [Interstage Application Server] > [Services] > [Web Server]. Select the Server Group or Managed Server to be operated, and then click [Start].

Alternatively, click [Application Management] > [Interstage] > [Interstage Application Server] > [Services] > [Web Server] > [FJapache(Server Group Name or Server Name)], and then click [Start].

If Managed Servers are included in the Server Group, first update the environment settings for the business server for all the Managed Servers, and then execute the above procedure.

Note that if "Connection information between servers was changed" appears in the supplementary information, the load balancer and/or SSL accelerator settings should be changed as needed.

## 21.11.14 sso04654

---

**SSO: WARNING: sso04654: Although Business server was added, the updating of access control information was failed. Business server=(%s1) Detail=(%s2)**

### Variable Information

%s1 = Business system name

%s2 = Number of the error message that occurred during access control information update

### Explanation

The Interstage Single Sign-on Business server (%s1) was added, but the access control information update failed. Check the error message (%s2), and take corrective action. For details of error messages from sso04701 to sso04747, refer to "[21.12 sso04701 to sso04769](#)".

If corrective action is taken for the error, and the update of the access control information is successful, in the following procedure, the Web server (Interstage HTTP Server) environment definition on the Managed Server where the business server has been added must be reflected in the business configuration management repository on the Admin Server. Additionally, the Web server (Interstage HTTP Server) must be restarted.

1. Log in to the Interstage Management Console of the Admin Server.
2. In the Interstage Management Console, click [Application Management] > [Interstage] > [Interstage Application Server] > [Services] > [Web Server] > [FJapache(Server Group Name or Server Name)]. Click the [Get Definition] tab, and select the Managed Server to which the business server has been added. Click the [Select] button, and then click [Update].
3. In the Interstage Management Console, click [Application Management] > [Interstage] > [Interstage Application Server] > [Services] > [Web Server]. Select the Server Group or Managed Server to be operated, and then click [Start].

Alternatively, click [Application Management] > [Interstage] > [Interstage Application Server] > [Services] > [Web Server] > [FJapache(Server Group Name or Server Name)], and then click [Start].

If Managed Servers are included in the Server Group, first add the business server for all the Managed Servers, and then execute the above procedure.

## 21.11.15 sso04657

---

**SSO: INFO: sso04657: The Business server was deleted. The Web Server (Interstage HTTP Server) is required to read configuration by using Interstage Management Console of the Admin Server. Business server=(%s1)**

### Variable Information

%s1 = Business system name

### Explanation

The Interstage Single Sign-on Business server (%s1) was deleted.

In the following procedure, the Web server (Interstage HTTP Server) environment definition on the Managed Server where the business server has been deleted must be reflected in the business configuration management repository on the Admin Server.

1. Log in to the Interstage Management Console of the Admin Server.
2. In the Interstage Management Console, click [Application Management] > [Interstage] > [Interstage Application Server] > [Services] > [Web Server] > [FJapache(Server Group Name or Server Name)]. Click the [Get Definition] tab, and select the Managed Server on which the business server has been deleted. Click the [Select] button, and then click [Update].

If Managed Servers are included in the Server Group, first delete the business server for all the Managed Servers, and then execute the above procedure.

## 21.11.16 sso04668

---

**SSO: WARNING: sso04668: There is no Web Server (Interstage HTTP Server) that can be used to add the Business server.**

### Explanation

The business server cannot be added to the Web server (Interstage HTTP Server) because another Single Sign-on server (repository server, authentication server, or business server) has already been created for all the Web servers (Interstage HTTP Server) on this machine.

### User Action

Take one of the following actions:

- Delete the other Single Sign-on server (repository server or authentication server) created on this machine. (\*1)
- Create a new Web server (Interstage HTTP Server) or host. (\*2) (\*3)
- Add the business server to another (non-Interstage HTTP Server) Web server.

\*1 To delete the repository server or authentication server, in the Interstage Management Console click [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [List], and then delete the repository server or authentication server.

\*2 To create the new Web server (Interstage HTTP Server), in the Interstage Management Console click [System] > [Services] > [Web Server] > [New].

\*3 To create the new host, in the Interstage Management Console click [System] > [Services] > [Web Server] > [Web Server Name] > [Virtual Host] > [New].

## 21.11.17 sso04669

---

**SSO: ERROR: sso04669: There is no Web Server that can be used to add the Business server.**

### Explanation

The business server cannot be added because other Single Sign-on servers (repository server, authentication server, or business server) have been created in all the Web servers (Interstage HTTP Server) on this machine.

### User Action

Delete the other Single Sign-on servers (repository server or authentication server) (\*1) created on this machine, or create a new Web server (Interstage HTTP Server) or host. (\*2) (\*3)

\*1 To delete the repository server or authentication server, in the Interstage Management Console click [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [List] tab.

\*2 To create the new Web server (Interstage HTTP Server), in the Interstage Management Console click [System] > [Services] > [Web Server] > [New] tab.

\*3 To create the new host, in the Interstage Management Console click [System] > [Services] > [Web Server] > [Web Server Name] > [Virtual Host] > [New] tab.

## 21.12 sso04701 to sso04769

---

### 21.12.1 sso04701

---

**SSO: ERROR: sso04701: Business server can not be added because the specified port number of the Business server is already in use. Port number=(%s1)**

#### Variable Information

%s1 = Port number

#### Explanation

At least one of the following servers have already used the specified port number of the business server (%s1); the business server could not be added:

- Repository server
- Authentication server
- Business server
- Web server (Interstage HTTP Server)

#### User Action

To check whether the specified port number (%s1) is being used, refer to "Notes on Interstage Operation" - "Common Notes for Interstage" - "Setting Port Numbers Used for Individual Services" in the Product Notes.

If the port number (%s1) is already being used, specify another port number and then add the business server.

### 21.12.2 sso04702

---

**SSO: ERROR: sso04702: The environmental configuration of the Business server can not be updated because the specified port number of the Business server is already in use. Port number =(%s1)**

#### Variable Information

%s1 = Port number

#### Explanation

At least one of the following servers has already used the specified port number (%s1); and the environment settings for the business server could not be modified.

- Repository server
- Authentication server
- Business server
- Web server (Interstage HTTP Server)

#### User Action

To check whether the specified port number (%s1) is being used, refer to "Notes on Interstage Operation" - "Common Notes for Interstage" - "Setting Port Numbers Used for Individual Services" in the Product Notes.

If the port number (%s1) is already being used, specify another port number and then update the business server environment settings.

### 21.12.3 sso04703

---

**SSO: ERROR: sso04703: Business server package is not installed.**

#### Explanation

No Interstage Single Sign-on Business server has been installed.

## User Action

**Windows32/64**

Install Interstage Single Sign-on (business server).

**Solaris32/64 Linux32/64**

Install the package indicated below:

- FJSVsssoaz (Interstage Single Sign-on Business server)

## 21.12.4 sso04704

---

**SSO: ERROR: sso04704: The Business server environment is broken.**

### Explanation

The environment of the Interstage Single Sign-on Business server has been damaged.

### User Action

If the business server was upgraded from a previous version, check that the upgrade procedure was correct.

In all other cases, use the following steps to reestablish the Interstage Single Sign-on Business server:

1. Select [System] > [Security] > [Single Sign-on] > [Business system] on the Interstage Management Console, then delete the business server on the [List] tab.
2. Select [System] > [Security] > [Single Sign-on] > [Business system] on the Interstage Management Console, then add the business server from the [Addition of Business Server] tab.

\*1 For details on how to establish the business server environment, see 'Environment Setup (Business Server Administrators)' in the Single Sign-on Operator's Guide.

## 21.12.5 sso04706

---

**SSO: ERROR: sso04706: The Business server has been already deleted.**

### Explanation

The Interstage Single Sign-on Business server to be handled could not be found. It may have been deleted by another user.

### User Action

Complete the following steps to cope with the error: (\*1)

1. Select [System] > [Security] > [Single Sign-on] > [Business system] on the Interstage Management Console, then obtain the latest list of business systems on the [List] tab.
2. Check that the business server exists on the list obtained in step 1.
3. If the business server is not on the list in step 2, select [System] > [Security] > [Single Sign-on] > [Business system] on the Interstage Management Console, then add the business server from the [Addition of Business Server] tab.

\*1 For details on how to establish the business server environment, see 'Environment Setup (Business Server Administrators)' in the Single Sign-on Operator's Guide.

## 21.12.6 sso04707

---

**SSO: ERROR: sso04707: Business server can not be added because the specified name of Business system is already in use. Name=(%s1)**

### Variable Information

%s1 = Name of a business system

## Explanation

The name specified for a business system (%s1) has already been used for the Interstage Single Sign-on Business server.

## User Action

Add the Interstage Single Sign-on Business server using another business system name. For business system names, select [System] > [Security] > [Single Sign-on] > [Business system] on the Interstage Management Console, then check the names on the [List] tab.

## 21.12.7 sso04709

---

### **SSO: ERROR: sso04709: The access control information is incorrect.**

## Explanation

The access control information has an incorrect setting.

The business server performs authorization by using the access control information which has been used before this error is indicated. If this error message is output for the first update, it performs authentication and authorization to all paths. In addition, all users registered in the SSO repository are allowed to make access to all paths.

## User Action

An Interstage Single Sign-on Repository server or authentication server may have been reestablished. Complete the following steps to correct the error: (\*1)

1. Obtain the business system setup file from the SSO administrator.
2. Select [System] > [Security] > [Single Sign-on] > [Business system] on the Interstage Management Console, then delete the Interstage Single Sign-on Business server from the [List] tab.
3. Select [System] > [Security] > [Single Sign-on] > [Business system] on the Interstage Management Console, then add the Interstage Single Sign-on Business server from the [Addition of Business Server] tab.

\*1 For details on how to establish the business server environment, see 'Environment Setup (Business Server Administrators)' in the Single Sign-on Operator's Guide.

## 21.12.8 sso04710

---

### **SSO: ERROR: sso04710: Access control information can not be extracted because Protection resource has not been created in the SSO Repository.**

## Explanation

No site or path configurations for protection resources of the business server have been created. Alternatively, site or path configurations for protection resources of the business server have been incorrectly specified in the Interstage Single Sign-on Repository server. As a result, no access control information could be obtained.

The business server performs authorization using the access control information which has been used before this error is indicated. If this error message is output for the first update, it performs authentication and authorization to all paths. In addition, all users registered in the SSO repository are allowed to make access to all paths.

## User Action

Ask the SSO administrator to check that site and path configurations of the business server have been created in the Interstage Single Sign-on Repository server. Alternatively, ask the SSO administrator to check that site and path configurations for protection resources of the business server have been correctly specified.

## 21.12.9 sso04711

---

### **SSO: ERROR: sso04711: Access control information can not be updated because the connecting with the Repository server was failed.**

## Explanation

The Interstage Single Sign-on Repository server could not be connected to and the access control information could not be updated.

The business server performs authorization by using the access control information which has been used before this error is indicated. If this error message is output for the first update, it performs authentication and authorization to all paths. In addition, all users registered in the SSO repository are allowed to make access to all paths.

## User Action

Ask the SSO administrator to check that the Interstage Single Sign-on Repository server has been activated. When the repository server has been activated, take action according to the system log of the repository server. For relevant messages in the system log, see 'sso00001 to sso00207', 'sso01000 to sso01212' and 'sso11000 to sso11008'. If the repository server has no error or problem, ask the network administrator whether the environment has been secured for communication with the repository server.

To check the URL of a repository server, select [System] > [Security] > [Single Sign-on] > [Business system] > [Business system Name] on the Interstage Management Console. Click [Detailed Settings [Show]] on the [Settings] tab, then check [Repository Server URL] of [Authentication Infrastructure Information Settings].

## 21.12.10 sso04712

---

### **SSO: ERROR: sso04712: Access control information can not be updated because a timeout occurred in connection with the Repository server.**

## Explanation

A timeout occurred for a connection with the Interstage Single Sign-on Repository server and the access control information could not be updated. Possible causes of the error are described below:

- The repository server may have possibly stopped during communication.
- The repository may have been modifying a large amount of information about roles and taking a long time.

The business server performs authorization by using the access control information which has been used before this error is indicated. If this error message is output for the first update, it performs authentication and authorization to all paths. In addition, all users registered in the SSO repository are allowed to make access to all paths.

## User Action

Take any of the following actions:

- Ask the SSO administrator to check that the repository server has been activated. If it has been activated, ask the network administrator whether the environment has been secured for communication with the repository server.

To check the URL of a repository server, select [System] > [Security] > [Single Sign-on] > [Business system] > [Business system Name] on the Interstage Management Console. Click [Detailed Settings [Show]] on the [Settings] tab, then check [Repository Server URL] of [Authentication Infrastructure Information Settings].

- Ask the SSO administrator if a large amount of role information has been registered with the SSO repository. If a large amount of SSO information has been registered, ask the SSO administrator to check the content of the SSO repository for any unnecessary role information.

Otherwise, the business server environment may have been possibly damaged. To solve the error, take the following steps:

1. Select [System] > [Security] > [Single Sign-on] > [Business system] on the Interstage Management Console, then delete the business server on the [List] tab.
2. Select [System] > [Security] > [Single Sign-on] > [Business system] on the Interstage Management Console, then add the business server on the [Addition of Business Server] tab. (\*1)

\*1 For details on how to establish the business server environment, see 'Environment Setup (Business Server Administrators)' in the Single Sign-on Operator's Guide.

## 21.12.11 sso04713

---

### **SSO: ERROR: sso04713: Access control information can not be updated because an error occurred in communication with the Repository server.**

#### Explanation

An error occurred in communication with the Interstage Single Sign-on Repository server. Possible causes of the error are shown below

- The repository server may have possibly stopped, or a repository server with different settings or of a different version may be operating.
- There may be a problem on a communication path.

The business server performs authorization by using the access control information which has been used before this error is indicated. If this error message is output for the first update, it performs authentication and authorization to all paths. In addition, all users registered in the SSO repository are allowed to make access to all paths.

#### User Action

Take any of the following actions:

- Ask the SSO administrator to check that the Interstage Single Sign-on Repository server has been activated. When the repository server has been activated, take action according to the system log of the repository server. For relevant messages in the system log, see 'sso00001 to sso00207', 'sso01000 to sso01212' and 'sso11000 to sso11008'.
- Ask the network administrator whether the environment has been secured for communication with the Interstage Single Sign-on Repository server.

To check the URL of a repository server, select [System] > [Security] > [Single Sign-on] > [Business system] > [Business system Name] on the Interstage Management Console. Click [Detailed Settings [Show]] on the [Settings] tab, then check [Repository Server URL] of [Authentication Infrastructure Information Settings].

## 21.12.12 sso04714

---

### **SSO: ERROR: sso04714: Access control information can not be updated.**

#### Explanation

The access control information could not be updated.

The business server performs authorization by using the access control information which has been used before this error is indicated. If this error message is output for the first update, it performs authentication and authorization to all paths. In addition, all users registered in the SSO repository are allowed to make access to all paths.

#### User Action

Take action according to the system log for the Interstage Single Sign-on Business server. For relevant messages in the system log, refer to "21.1 sso00001 to sso00207", "21.4 sso03000 to sso03064" and "21.18 sso13001 to sso13008".

## 21.12.13 sso04715

---

### **SSO: ERROR: sso04715: Acquisition of lock control resources was failed.**

#### Explanation

The exclusion control resource required for update of access control information failed to be acquired. The memory space required for the Interstage Single Sign-on Business server may be insufficient.

The business server authorizes the path according to the access control information for the previous update.

If this message is displayed when the access control information is updated for the first time after the business server has been set up, the business server authenticates and authorizes all paths. This enables all the users registered in the SSO repository to access the paths.

#### User Action

**Windows32/64**

Take any of the following actions:

- Close all unnecessary programs. Alternatively, confirm whether enough memory space for the Interstage Single Sign-on is allocated.

For details on the required memory space, refer to "Memory Requirements" in the "Resource Requirements" chapter of the Tuning Guide.

- Restart the Web server with the Interstage Single Sign-on Business server included, then attempt to update the access control information again.

**Solaris32/64 Linux32/64**

Take any of the following actions:

- Close all unnecessary programs. Alternatively, confirm whether enough memory space for the Interstage Single Sign-on is allocated and whether the exclusion control resource (semaphore) size is correctly set.

For details on the required memory space, refer to "Memory Requirements" in the "Resource Requirements" chapter of the Tuning Guide. For details on the required shared memory size, refer to the "System Tuning" chapter in the Tuning Guide.

- Restart the Web server with the Interstage Single Sign-on Business server included, then attempt to update the access control information again.

## 21.12.14 sso04716

---

### SSO: ERROR: sso04716: Lock control was failed.

#### Explanation

The exclusion control failed during update of access control information.

The business server authorizes the path according to the access control information for the previous update.

If this message is displayed when the access control information is updated for the first time after the business server has been set up, the business server authenticates and authorizes all paths. This enables all the users registered in the SSO repository to access the paths.

#### User Action

Restart the Web server where the business server of Interstage Single Sign-on is built in.

## 21.12.15 sso04717

---

### SSO: ERROR: sso04717: Operation of shared memory was failed.

#### Explanation

**Windows32/64**

The memory required for update of access control information or shared memory failed to be allocated. The memory space required for the Interstage Single Sign-on is insufficient.

The business server authorizes the path according to the access control information for the previous update.

If this message is displayed when the access control information is updated for the first time after the business server has been set up, the business server authenticates and authorizes all paths. This enables all the users registered in the SSO repository to access the paths.

**Solaris32/64 Linux32/64**

The memory required for update of access control information or shared memory required for the Interstage Single Sign-on Business server failed to be allocated. The memory space or the shared memory size required for the Interstage Single Sign-on is insufficient.

If this message is displayed when the access control information is updated for the first time after the business server has been set up, the business server authenticates and authorizes all paths. This enables all the users registered in the SSO repository to access the paths.

#### User Action

**Windows32/64**

Take any of the following actions:

- Close all unnecessary programs. Alternatively, confirm whether enough memory space for the Interstage Single Sign-on is allocated.

For details on the required memory space, refer to "Memory Requirements" in the "Resource Requirements" chapter of the Tuning Guide.

- Restart the Web server with the Interstage Single Sign-on Business server included, and then attempt to update the access control information again.

**Solaris32/64 Linux32/64**

Take any of the following actions:

- Close all unnecessary programs. Alternatively, confirm whether enough memory space for the Interstage Single Sign-on is allocated and whether the exclusion control resource (semaphore) size is correctly set.

For details on the required memory space, refer to "Memory Requirements" in the "Resource Requirements" chapter of the Tuning Guide. For details on the required shared memory size, refer to the "System Tuning" chapter in the Tuning Guide.

- Restart the Web server with the Interstage Single Sign-on Business server included, and then attempt to update the access control information again.

## 21.12.16 sso04718

---

**SSO: INFO: sso04718: Access control information was updated. The Web Server is required to boot.**

#### Explanation

The access control information has been updated. To start the operation, the Web server needs to be restarted. When the Web server has already been started, take the following action to refresh the access control information:

**Solaris32/64 Linux32/64**

Restart all the Web servers that contain the Single Sign-on Business server.

## 21.12.17 sso04719

---

**SSO: ERROR: sso04719: The management file required for updating the access control information is broken.**

#### Explanation

A control file required to update the access control information has been damaged.

The business server performs authorization by using the access control information which has been used before this error is indicated.

If this error message is output for the first update, it performs authentication and authorization to all paths. In addition, all users registered in the SSO repository are allowed to access all paths.

## User Action

Restart the Web server with the Interstage Single Sign-on Business server included, and then attempt to update the access control information again.

## 21.12.18 sso04720

---

**SSO: ERROR: sso04720: Can not access the management file required for updating the access control information.**

### Explanation

No access permission was available for a control file required to update the access control information.

The business server performs authorization using the access control information which has been used before this error is indicated. If this error message is output for the first update, it performs authentication and authorization to all paths. In addition, all users registered in the SSO repository are allowed to access all paths.

### User Action

Restart the Web server with the Interstage Single Sign-on Business server included, and then attempt to update the access control information again.

## 21.12.19 sso04721

---

**SSO: ERROR: sso04721: The specified Role in the Path configuration does not exist in the SSO Repository.**

### Explanation

A non-existent role has been set for a path configuration in the access control information; user authorization could not be performed for a resource to be accessed.

The business server performs authorization by using the access control information which has been used before this error is indicated. If this error message is output for the first update, it performs authentication and authorization to all paths. In addition, all users registered in the SSO repository are allowed to make access to all paths.

### User Action

Ask the SSO administrator to check for the roles set in the path configurations within the access control information. If the role could not be found, check the system log of the Interstage Single Sign-on Repository server, then ask the SSO administrator to action according to 'sso00001 to sso00207', 'sso01000 to sso01212' and 'sso11000 to sso11008'.

## 21.12.20 sso04722

---

**SSO: ERROR: sso04722: An attribute was set in the path definition but omitted from the extended user information.**

### Explanation

Access control information could not be updated because, in the repository server environment settings, an attribute was set in the path configuration but omitted from the extended user information.

For the business server, the authorization is given based on the access control information prior to this transaction. When this message is output at the first update, authorization and authentication are given to all paths. Moreover, all users registered with the SSO repository can access to the path.

## User Action

The business server administrator should ask the SSO administrator to rectify the problem in the system log for the repository server. After rectifying the repository server system log problem, the SSO administrator should ask the business server administrator to update the access control information.

For details on how to update access control information, in the Interstage Management Console, refer to [System] > [Security] > [Single Sign-on] > [Business system] > [Business system name] > [Update access control information] tab.

## 21.12.21 sso04724

---

**SSO: ERROR: sso04724: Business server cannot be added because the user name set at the environmental configuration of the Web Server (Interstage HTTP Server) differs from the effective user name of the other Business server.**

### Explanation

The effective user name set in the Web server (Interstage HTTP Server) when adding a business server is different from the effective user name set in all the business servers already created on the machine. As a result, a new business server could not be created.

### User Action

When creating multiple business servers on one machine, complete the steps below to match the effective user name set in the Web server (Interstage HTTP Server) when adding business server to the effective user name set in all the business server already created.

1. If a business server has already been created as a non-Interstage HTTP Server Web server, to check the effective user name in the business server, select [System] > [Security] > [Single Sign-on] > [Business system] > [Business system Name] on the Interstage Management Console. Click [Detailed Settings [Show]] on the [Settings] tab, then reference [Web Server Settings] > [Web Server used] > [Effective user name].
2. Check the effective user name set to the User configuration in the environment configuration file (httpd.conf) for the Web server used in the business server that has already been created and the Web server used in the business server that has been added.
3. If the effective user name checked is different, change it so that all effective user names are the same. (\*1)
4. Restart the Web server for which the effective user name was changed.

\*1 For details about changing the Web server effective user, refer to 'Operation and Maintenance' - 'Changing Environment Settings' - 'Changing Effective User for Web Server' in the Single Sign-on Operator's Guide.

## 21.12.22 sso04725

---

**SSO: ERROR: sso04725: Business server cannot be added because the specified effective user name differs from the effective user name of the other Business server. User name=(%s1)**

### Variable Information

%s1 = Name of an effective user

### Explanation

The specified effective user name (%s1) is different from the effective name of the user set in all the business servers already created on the machine. Therefore, a new business server could not be created.

### User Action

When creating multiple business servers on one machine, complete the steps below to match the specified effective user name and the effective name of the user that has been set in all the business servers already created:

1. If a business server has already been created as a non-Interstage HTTP Server Web server, to check the effective user name in the business server, select [System] > [Security] > [Single Sign-on] > [Business system] > [Business system Name] on the

Interstage Management Console, click [Detailed Settings [Show]] on the [Settings] tab, then reference [Web Server Settings] > [Web Server used] > [Effective user name].

2. Check the effective user name set to the User configuration in the environment configuration file (httpd.conf) for the Web server used in the business server.
3. If the effective user name checked is different, change it so that all effective user names are the same. (\*1)
4. Restart the Web server for which the effective user name was changed.

\*1 For details about changing the Web server effective user, refer to 'Operation and Maintenance' - 'Changing Environment Settings' - 'Changing Effective User for Web Server' in the Single Sign-on Operator's Guide.

## 21.12.23 sso04726

---

**SSO: ERROR: sso04726: Access authority to the file required in operating Business server can not be set up because the user name set at the environmental configuration of the Web Server (Interstage HTTP Server) does not exist.**

### Explanation

The environment configuration file (httpd.conf) for the Web server (Interstage HTTP Server) has an incorrect User configuration. Any permission to access the files required to operate the business server could not be set. Possible causes of the error are as follows:

- A user name that is not in the user management register of the operating system has been set in a User configuration in the environment configuration file (httpd.conf) of the Web server (Interstage HTTP Server).
- No User configuration (user name) has been set in the environment configuration file (httpd.conf) of the Web server (Interstage HTTP Server).

### User Action

Set a user name that is in the user management register of the operating system to a User configuration in the environment configuration file (httpd.conf) of the Web server (Interstage HTTP Server). After setting it, select [System] > [Services] > [Web Server] > [Web Server Name] on the Interstage Management Console, then restart the Web server (Interstage HTTP Server) on the [Web Server Status] tab.

## 21.12.24 sso04727

---

**SSO: ERROR: sso04727: Access authority to the file required in operating Business server can not be set up because the specified effective user name does not exist. User name=(%s1)**

### Variable Information

%s1 = Name of an effective user

### Explanation

A user name which is not in the user management register of the operating system (%s1) was specified. Any permission to access the files required for the operation of the business server could not be set.

### User Action

Check that the specified effective user name is in the user management register of the operating system.

## 21.12.25 sso04728

---

**SSO: ERROR: sso04728: Business server can not be added because the effective user name set as the environmental configuration of the Web Server (Interstage HTTP Server) does not exist. User name=(%s1)**

## Variable Information

%s1 = Name of an effective user

## Explanation

A User configuration has been incorrectly set in the environment configuration file (httpd.conf) of the Web server (Interstage HTTP Server). A new business server could not be created. Possible causes of the error are as follows:

- A user name which is not in the user management register of the operating system has been set in a User configuration in the environment configuration file (httpd.conf) of the Web server (Interstage HTTP Server).
- No User configuration (user name) has been set in the environment configuration file (httpd.conf) of the Web server (Interstage HTTP Server).

## User Action

Set a user name that is in the user management register of the operating system to a User configuration in the environment configuration file (httpd.conf) of the Web server (Interstage HTTP Server).

After setting it, select [System] > [Services] > [Web Server] > [Web Server Name] on the Interstage Management Console, then restart the Web server (Interstage HTTP Server) on the [Web Server Status] tab.

## 21.12.26 sso04729

---

**SSO: ERROR: sso04729: Business server can not be added because the specified effective user name does not exist. User name=(%s1)**

## Variable Information

%s1 = Name of an effective user

## Explanation

A user name which is not in the user management register of the operating system (%s1) was specified; the business server could not be created.

## User Action

Check that the specified effective user name is in the user management register of the operating system.

## 21.12.27 sso04730

---

**SSO: ERROR: sso04730: The specified Business system setup file is incorrect.**

## Explanation

The specified file is not a business system setup file or the specified business system setup file may have been damaged.

## User Action

Obtain the business system setup file from the SSO administrator again.

## 21.12.28 sso04733

---

**SSO: ERROR: sso04733: The Business system name is invalid.Name=(%s1)**

## Variable Information

%s1 = Name of a domain

## Explanation

The business system name was invalid.

## User Action

Check for the business system name (%s1).

For the name of a business system, the alphanumeric characters and symbols listed below are usable from 1 to 32 bytes:

- Hyphen (-)
- Underscore (\_)
- Left bracket ([)
- Right bracket (])
- Left square bracket ([)
- Right square bracket (])

## 21.12.29 sso04734

---

**SSO: ERROR: sso04734: Two or more Business servers of the Web Server (Interstage HTTP Server) can not be added on the same machine.**

## Explanation

It is not allowed to create multiple business servers related to the Web server (Interstage HTTP Server) on one machine.

## User Action

**Windows32/64 Solaris32/64**

When creating multiple business servers on one machine, complete the steps below to change the Web server type to be used to [Other]:

1. Select [System] > [Security] > [Single Sign-on] > [Business system] on the Interstage Management Console, then click on [Addition of Business Server].
2. Select [Web server to use] > [Others (Excluding Interstage HTTP Server)].

**Linux32/64**

Do not create multiple business servers related to the Web server (Interstage HTTP Server) on one machine.

## 21.12.30 sso04735

---

**SSO: ERROR: sso04735: The Business server could not be added because there are already 256 Business servers on the same machine.**

## Explanation

An attempt failed to add another business server because 256 or more Interstage single sign-on business servers had already been created on the same machine.

## User Action

To add another Interstage single sign-on business server to the same machine, open the Interstage Management Console and select [System] > [Security] > [Single Sign-on] > [Business System], and then select [List] tab and delete an existing business server, then perform the business server addition procedure again.

If it is necessary to add more than 256 Interstage single sign-on business servers, use a different machine.

## 21.12.31 sso04736

---

**SSO: ERROR: sso04736: The environmental configuration of the Business server could not be updated because there are already 257 Business servers on the same machine.**

### Explanation

The business server environment settings could not be updated because more than 257 Interstage single sign-on business servers had already been created on the same machine.

### User Action

Run the process again after deleting unnecessary Interstage single sign-on business servers.

To delete a business server, open the Interstage Management Console and select [System] > [Security] > [Single Sign-on] > [Business System], and then select [List] tab and select the business server to remove.

## 21.12.32 sso04738

---

**SSO: ERROR: sso04738: The Business server can not be deleted because the Web Server (Interstage HTTP Server) is running.**

### Explanation

While the Web server (Interstage HTTP Server) was starting up; the Interstage Single Sign-on Business server could not be deleted.

### User Action

Stop the Web server (Interstage HTTP Server), then reexecute the command.

## 21.12.33 sso04740

---

**SSO: ERROR: sso04740: Access control information can not be updated because Repository server URL is not set up.**

### Explanation

The environment settings of the business server have no URL of the repository server and the access control information could not be updated.

### User Action

Complete the following steps to cope with the error:

1. Select [System] > [Security] > [Single Sign-on] > [Business system]> [Business system Name] on Interstage Management Console, then click [Detailed Settings [Show]] on the [Settings] tab.
2. Select [Authentication Infrastructure Information Settings] > [Repository Server URL] to check that the URL of the repository server has been set in the environment settings of the business server.
3. If the URL of the repository server has not been set, set it in the environment settings of the business server.

## 21.12.34 sso04741

---

**SSO: ERROR: sso04741: The Business server can not be updated because the specified access log file already exists. File name=(%s1)**

## Variable Information

%s1 = Name of an access log file

## Explanation

The specified name of the access log file (%s1) is the same with the name of an access log file in a business server already created on the machine; the environment settings of the business server could not be updated.

## User Action

Specify a name different from the name of the access log file in the business server already created on the machine for the access log file of the business server.

## 21.12.35 sso04742

---

### **SSO: ERROR: sso04742: The Business server environment is broken. Detail=(%s1,%s2)**

## Variable Information

%s1 = Maintenance information

%s2 = Maintenance information

## Explanation

The Interstage single sign-on business server environment is damaged.

## User Action

If the business server was upgraded from a previous version, check that the upgrade procedure was correct.

In all other cases, use the following steps to reestablish the Interstage Single Sign-on Business server: (\*1)

1. Select [System] > [Security] > [Single Sign-on] > [Business system] on the Interstage Management Console, then delete the business server on the [List] tab.
2. Select [System] > [Security] > [Single Sign-on] > [Business system] on the Interstage Management Console, then add the business server from the [Addition of Business Server] tab.

\*1 For details on how to establish the business server environment, see 'Environment Setup (Business Server Administrators)' in the Single Sign-on Operator's Guide.

## 21.12.36 sso04743

---

### **SSO: ERROR: sso04743: Access control information could not be updated because an error occurred in communication with the Authentication server. Detail=(%d1,%s2)**

## Variable Information

%d1 = Maintenance information

%s2 = Maintenance information

## Explanation

Access control information could not be updated because an error occurred during communication with the Interstage single sign-on authentication server. Possible causes of the error are shown below

- The authentication server may have stopped, or an authentication server with different settings or of a different version may be operating.
- There may be a problem with the communication path.

Note that the Interstage single sign-on business server will perform authorization according to the access control information that was valid prior to this process. If this message is output during the first update, authentication and authorization will be performed on all paths, and all users registered with the SSO repository will be able to access those paths.

### User Action

Take any of the following actions:

- Ask the SSO administrator to check if the Interstage single sign-on authentication server is running. If the authentication server is running, examine the authentication server system log and take the appropriate measures. Refer to 'sso00001 to sso00207', 'sso02000 to sso02056' and 'sso12000 to sso12008' for relevant messages in the system log.
- Ask the network administrator to verify that the environment allows connection with the Interstage single sign-on authentication server.

Note that the authentication server URL can be verified using the Interstage Management Console as follows: Select [System] > [Security] > [Single Sign-on] > [Business System] > [Business system Name] and then select [Settings]tab and click [Detailed Settings [Show]]. The authentication server URL will be displayed in [Authentication server URL] under [Authentication Infrastructure Information Settings].

## 21.12.37 sso04744

---

**SSO: ERROR: sso04744: Access control information could not be updated because the connection with the Authentication server failed.**

### Explanation

The access control information could not be updated because an attempt failed to connect to the Interstage single sign-on authentication server. Possible causes of the error are shown below

- The authentication server may have stopped.
- There may be a problem with the communication path.

Note that the Interstage single sign-on business server will perform authorization according to the access control information that was valid prior to this process. If this message is output during the first update, authentication and authorization will be performed on all paths, and all users registered with the SSO repository will be able to access those paths.

### User Action

Take any of the following actions:

- Ask the SSO administrator to check if the Interstage single sign-on authentication server is running. If the authentication server is running, examine the authentication server system log and take the appropriate measures. Refer to 'sso00001 to sso00207', 'sso02000 to sso02056' and 'sso12000 to sso12008' for relevant messages in the system log.
- Ask the network administrator to verify that the environment allows connection with the Interstage single sign-on authentication server.

Note that the authentication server URL can be verified using the Interstage Management Console as follows: Select [System] > [Security] > [Single Sign-on] > [Business System] > [Business system Name] and then select [Settings]tab and click [Detailed Settings [Show]]. The authentication server URL will be displayed in [Authentication server URL] under [Authentication Infrastructure Information Settings].

## 21.12.38 sso04745

---

**SSO: ERROR: sso04745: Access control information could not be updated because a timeout occurred in connection with the Authentication server.**

## Explanation

The access control information could not be updated because a timeout occurred during the connection with the Interstage single sign-on authentication server. Possible causes of the error are shown below

- The authentication server may have stopped while communication was taking place.
- A large amount of role information that has been registered may be increasing processing time.

Note that the Interstage single sign-on business server will perform authorization according to the access control information that was valid prior to this process. If this message is output during the first update, authentication and authorization will be performed on all paths, and all users registered with the SSO repository will be able to access those paths.

## User Action

Take any of the following actions:

- Ask the SSO administrator to check if the Interstage single sign-on authentication server is running. If the authentication server is running, ask the network administrator to verify that the environment allows connection with the Interstage single sign-on authentication server.

Note that the authentication server URL can be verified using the Interstage Management Console as follows: Select [System] > [Security] > [Single Sign-on] > [Business System] > [Business system Name] and then select [Settings] tab and click [Detailed Settings [Show]]. The authentication server URL will be displayed in [Authentication server URL] under [Authentication Infrastructure Information Settings].

- Ask the SSO administrator if a large amount of role information has been registered with the SSO repository. If a large amount of SSO information has been registered, ask the SSO administrator to check the content of the SSO repository for any unnecessary role information.

If the problem is not caused by the above, the business server environment may be damaged. Use the following procedure to rebuild the business server. (\*1)

1. Select [System] > [Security] > [Single Sign-on] > [Business system] on the Interstage Management Console, then delete the business server on the [List] tab.
2. Select [System] > [Security] > [Single Sign-on] > [Business system] on the Interstage Management Console, then add the business server from the [Addition of Business Server] tab.

\*1 For details on how to establish the business server environment, see 'Environment Setup (Business Server Administrators)' in the Single Sign-on Operator's Guide.

## 21.12.39 sso04746

---

### SSO: ERROR: sso04746: The name resolution of the Authentication server failed. Host name=(%s1)

#### Variable Information

%s1 = Host name

#### Explanation

The host name (%s1) of the Interstage single sign-on authentication server failed to be resolved. The current situation prevents the host name of the authentication server from being resolved.

#### User Action

Take any of the following actions:

Check the host name. The host name of the authentication server can be verified using the Interstage Management Console as follows: Select [System] > [Security] > [Single Sign-on] > [Business System] > [Business system Name], and then select [Settings] tab and click [Detailed Settings [Show]]. The authentication server URL will be displayed in [Authentication server URL] under [Authentication Infrastructure Information Settings].

If the specified host name is correct, name resolution may have failed on the network. Review the network environment including the hosts file and DNS to see if name resolution is taking place normally.

## 21.12.40 sso04747

---

### SSO: ERROR: sso04747: Invalid request was received. Detail=(%d1,%s2)

#### Variable Information

%d1 = Maintenance information

%s2 = Maintenance information

#### Explanation

Invalid data was received. The received data may have become corrupted during communication with the Interstage single sign-on authentication server.

#### User Action

Take any of the following actions:

Perform the operation again.

If the problem remains, the Interstage single sign-on business server environment is damaged. Use the following procedure to rebuild the business server. (\*1)

1. Select [System] > [Security] > [Single Sign-on] > [Business system] on the Interstage Management Console, then delete the business server on the [List] tab.
2. Select [System] > [Security] > [Single Sign-on] > [Business system] on the Interstage Management Console, then add the business server from the [Addition of Business Server] tab.

\*1 For details on how to establish the business server environment, see 'Environment Setup (Business Server Administrators)' in the Single Sign-on Operator's Guide.

## 21.12.41 sso04766

---

### SSO: ERROR: sso04766: The Business server can not be added because another server of Single Sign-on has already been created for the host of Web Server (Interstage HTTP Server). Web Server=(%s1) Host=(%s2)

#### Variable Information

%s1 = Web server name

%s2 = Host name

#### Explanation

The business server cannot be added because another business server has already been created for the host (%s2) of Web server (%s1).

#### User Action

Either delete the Single Sign-on Business server created for the Web server (%s1) (\*1), or create a new host of Web server (Interstage HTTP Server). (\*2)

\*1 To delete the business server, in the Interstage Management Console click [System] > [Security]>[Single Sign-on] > [Business system] > [List], and then delete the business server of host (%s2) of Web server (%s1) .

\*2 To create the new Web server (Interstage HTTP Server) host, in the Interstage Management Console click [System] > [Services] > [Web Server] > [Web Server Name] > [Virtual Host] > [New].

## 21.12.42 sso04767

---

---

**SSO: ERROR: sso04767: The Business server can not be added because another server of Single Sign-on has already been created for the Web Server (Interstage HTTP Server). Web Server=(%s1)**

Variable Information

%s1 = Web server name

Explanation

The business server cannot be created because another Single Sign-on server (repository server or authentication server) has already been created for the Web server (%s1).

User Action

Either delete the other Single Sign-on server (repository server or authentication server) created for the Web server (%s1) (\*1), or create a new Web server (Interstage HTTP Server). (\*2)

\*1 To delete the repository server or authentication server, in the Interstage Management Console click [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [List] , and then delete the repository server or authentication server.

\*2 To create the new Web server (Interstage HTTP Server), in the Interstage Management Console click [System] > [Services] > [Web Server] > [New].

## 21.12.43 sso04768

---

**SSO: ERROR: sso04768: The Single Sign-on Business server environment settings can not be updated. Name=(%s1) Detail=(%s2)**

Variable Information

%s1 = Business system name

%s2 = Error message number output when the environment settings were updated

Explanation

Failed to update the Single Sign-on Business server (%s1) environment settings. Since the Web server (Interstage HTTP Server) environment settings update was successful, a contradiction may have occurred with the Single Sign-on Business server environment settings.

User Action

Check the error message (%s1) and take action. For details about error messages, refer to "21.6 sso04101 to sso04153" and "21.12 sso04701 to sso04769".

## 21.12.44 sso04769

---

**SSO: WARNING: sso04769: The settings for the Web Server (Interstage HTTP Server) used in the Single Sign-on Business server have been changed. Check that it is possible to run the Single Sign-on Business server. Name=(%s1)**

Variable Information

%s1 = Business system name

Explanation

The settings for the Web Server (Interstage HTTP Server) used in the Single Sign-on Business server (%s1) have been changed.

User Action

Check that it is possible to run the Single Sign-on Business server (%s1).

## 21.13 sso06000 to sso06900

---

### 21.13.1 sso06000

---

**SSO: INFO: sso06000: SSO Session management server is running.**

#### Explanation

The Interstage single sign-on session management server has started.

### 21.13.2 sso06001

---

**SSO: INFO: sso06001: SSO Session management server was stopped.**

#### Explanation

The Interstage single sign-on session management server has stopped.

### 21.13.3 sso06002

---

**SSO: ERROR: sso06002: Failed to start SSO Session management server.**

#### Explanation

The Interstage single sign-on session management server failed to start.

#### User Action

Refer to the message immediately preceding this message to eliminate the cause of the problem.

### 21.13.4 sso06003

---

**SSO: ERROR: sso06003: Invalid environment. Detail=(%s1) Code=(%s2)**

#### Variable Information

%s1 = Maintenance information

%s2 = Maintenance information

#### Explanation

An attempt to read environment variables or registry information needed for the Interstage single sign-on session management server to start failed. Possible causes are shown below.

- The Interstage single sign-on repository server environment is damaged.
- The Interstage single sign-on repository server is not correctly installed.

#### User Action

If data that includes environment variables or registry information has been backed up, restore the data.

If no data has been backed up, or if the same message appears even after the data has been restored, reinstall the Interstage Single Sign-on Repository server.

### 21.13.5 sso06004

---

**SSO: ERROR: sso06004: There is no authority for starting SSO Session management server.**

#### Explanation

The user does not have permission to run the Interstage Single Sign-on session management server.

## User Action

The Interstage Single Sign-on session management server must be run by a user with administrator permissions.

### 21.13.6 sso06005

---

#### **SSO: ERROR: sso06005: SSO Session management server was already started.**

##### Explanation

An attempt was made to start the Interstage single sign-on session management server while the server was already running.

##### User Action

If it is necessary to restart the session management server, stop the session management server before restarting it.

The session management server can be started or stopped by starting or stopping the repository server.

### 21.13.7 sso06006

---

#### **SSO: ERROR: sso06006: The user name is incorrect. User=(%s1) Reason=(%s2)**

##### Variable Information

%s1 = Effective user name

%s2 = Error cause

##### Explanation

There is an error in the environment settings of the Interstage single sign-on repository server.

##### User Action

To update the environment settings of the repository server, open the Interstage Management Console and select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Repository Server], then click the [Settings] tab followed by the [Update] button. This will update the repository server environment settings with correct values.

If the above operation does not resolve the problem, open the Interstage Management Console and select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure], and use the [List] tab to delete the repository server, then click the [Authentication infrastructure Settings] tab and rebuild the repository server.

### 21.13.8 sso06007

---

#### **SSO: ERROR: sso06007: Start processing was not completed. Reason=(%s1) Detail=(%s2) Code=(%s3)**

##### Variable Information

%s1 = Error cause

%s2 = Detailed information

%s3 = Maintenance information

##### Explanation

The Interstage single sign-on session management server failed to start. Possible causes are shown below.

Table 21.51 Possible causes

Cause of error (%s1)	Details of cause
4	The Interstage single sign-on repository server environment is damaged. Or, the Interstage single sign-on repository server is not correctly installed.
5	
Other	An internal error occurred in the session management server.

### User Action

Take any of the following actions:

Table 21.52 User actions

Cause of error (%s1)	Action
4	Reinstall the Interstage single sign-on repository server.
5	
Other	Immediately after the message is output, use the iscollectinfo command to collect investigation information, then contact your service engineer.

## 21.13.9 sso06008

---

**SSO: ERROR: sso06008: The lock control file could not be accessed. Reason=(%s1) Filename=(%s2)**

### Variable Information

%s1 = Error cause

%s2 = Name of lock control file

### Explanation

The Interstage single sign-on session management server failed to access the lock control file (%s2). Possible causes are shown below.

Table 21.53 Possible causes

Cause of error (%s1)	Details of cause
4	The Interstage single sign-on repository server environment is damaged. Or, the Interstage single sign-on repository server is not correctly installed.
5	
Other	An internal error occurred in the session management server.

### User Action

Take any of the following actions:

Table 21.54 User actions

Cause of error (%s1)	Action
4	Reinstall the Interstage single sign-on repository server.
5	
Other	Immediately after the message is output, use the iscollectinfo command to collect investigation information, then contact your service engineer.

## 21.13.10 sso06009

---

**SSO: ERROR: sso06009: The lock control file failed to lock. Reason=(%s1) Filename=(%s2)**

### Variable Information

%s1 = Error cause

%s2 = File name

### Explanation

A file (%s2) failed to be locked on the Interstage single sign-on session management server. Possible causes are shown below.

Table 21.55 Possible causes

Cause of error (%s1)	Details of cause
0	The Interstage single sign-on repository server environment is damaged. Or, the Interstage single sign-on repository server is not correctly installed.
Other	An internal error occurred in the session management server.

User Action

Take any of the following actions:

Table 21.56 User actions

Cause of error (%s1)	Action
0	Reinstall the Interstage single sign-on repository server.
Other	Immediately after the message is output, use the <code>iscollectinfo</code> command to collect investigation information, then contact your service engineer.

## 21.13.11 sso06010

### SSO: ERROR: sso06010: Initialization of lock control failed. Detail=(%s1) Code=(%s2)

Variable Information

%s1 = Maintenance information

%s2 = Maintenance information

Explanation

**Windows32/64**

The exclusive lock resources needed for the Interstage single sign-on session management server to operate failed to be allocated. There may not be enough memory for the Interstage single sign-on session management server to operate.

**Solaris32/64 Linux32/64**

The exclusive lock resources needed for the Interstage single sign-on session management server to operate failed to be allocated. There may not be enough memory or exclusive lock resources (semaphores) for the Interstage single sign-on session management server to operate.

User Action

**Windows32/64**

Close all unnecessary programs, or ensure that ample memory is available for the Interstage single sign-on repository server to operate. Refer to "Memory Requirements" in "Resource Requirements" in the Tuning Guide for an explanation of memory requirements.

If enough memory is available, immediately after the message is output, use the `iscollectinfo` command to collect investigation information, then contact your service engineer.

**Solaris32/64**

Close all unnecessary programs. Alternatively, ensure that ample memory is available for Interstage single sign-on to operate, and check that the size of the exclusive lock resources (semaphores) is set correctly.

Refer to "Memory Requirements" in "Resource Requirements" in the Tuning Guide for an explanation of memory requirements, and "System Tuning" in the Tuning Guide for an explanation of the required size of exclusive lock resources (semaphores).

If sufficient memory is secured, and the shared memory/exclusion control resource (semaphore) settings are correct, immediately after the message is output, use the `iscollectinfo` command to collect investigation information, then contact your service engineer.

## 21.13.12 sso06011

---

### SSO: ERROR: sso06011: Lock control failed. Detail=(%s1) Code=(%s2)

#### Variable Information

%s1 = Maintenance information

%s2 = Maintenance information

#### Explanation

**Windows32/64**

The Interstage single sign-on session management server failed to operate the exclusive lock resources. There may not be enough memory for the Interstage single sign-on session management server to operate.

**Solaris32/64 Linux32/64**

The Interstage single sign-on session management server failed to operate the exclusive lock resources. There may not be enough memory or exclusive lock resources (semaphores) for the Interstage single sign-on session management server to operate.

#### User Action

**Windows32/64**

Close all unnecessary programs, or ensure that ample memory is available for the Interstage single sign-on repository server to operate. Refer to "Memory Requirements" in "Resource Requirements" in the Tuning Guide for an explanation of memory requirements.

If enough memory is available, immediately after the message is output, use the *iscollectinfo* command to collect investigation information, then contact your service engineer.

**Solaris32/64 Linux32/64**

Close all unnecessary programs. Alternatively, ensure that ample memory is available for Interstage single sign-on to operate, and check that the size of the exclusive lock resources (semaphores) is set correctly.

Refer to "Memory Requirements" in "Resource Requirements" in the Tuning Guide for an explanation of memory requirements, and "System Tuning" in the Tuning Guide for an explanation of the required size of exclusive lock resources (semaphores).

If sufficient memory is secured, and the shared memory/exclusion control resource (semaphore) settings are correct, immediately after the message is output, use the *iscollectinfo* command to collect investigation information, then contact your service engineer.

## 21.13.13 sso06012

---

### SSO: ERROR: sso06012: The environment variable settings are incorrect. Name=(%s1) Value=(%s2)

#### Variable Information

%s1 = Name of environment variable

%s2 = Value of environment variable

#### Explanation

The value (%s2) set for the environment variable (%s1) is not valid.

#### User Action

Set a valid value for the environment variable (%s1).

## 21.13.14 sso06101

---

### SSO: ERROR: sso06101: Internal error. Detail=(%s1) Code=(%s2)

#### Variable Information

%s1 = Detailed information

%s2 = Maintenance information

#### Explanation

An internal error occurred in the Interstage single sign-on session management server.

#### User Action

Immediately after the message is output, use the iscollectinfo command to collect investigation information, then contact your service engineer.

## 21.13.15 sso06102

---

### SSO: ERROR: sso06102: Allocation of memory failed. Detail=(%s1) Code=(%s2)

#### Variable Information

%s1 = Detailed information

%s2 = Maintenance information

#### Explanation

Sufficient memory to run the Interstage single sign-on session management server failed to be allocated.

#### User Action

Ensure that there is enough memory to run Interstage Single Sign-on, stop the repository server, and then restart it.

Refer to "Memory Requirements" in "Resource Requirements" in the Tuning Guide for an explanation of memory requirements.

## 21.13.16 sso06103

---

### SSO: ERROR: sso06103: Acquisition of service ID failed. Reason=(%s1) Detail=(%s2)

#### Variable Information

%s1 = Error cause

%s2 = Detailed information

#### Explanation

An attempt failed to obtain a service ID for the Interstage single sign-on session management server. The environment of the Interstage single sign-on repository server that manages the session management server is damaged.

#### User Action

Open the Interstage Management Console and select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure]. Use the [List] tab to delete the repository server, then click the [Authentication infrastructure Settings] tab and rebuild the repository server.

## 21.13.17 sso06104

---

---

**SSO: ERROR: sso06104: Initialization of lock control for thread failed. Reason=(%s1)****Variable Information**

%s1 = Error cause

**Explanation**

Interstage single sign-on session management failed to initialize exclusive lock resources. Possible causes are shown below.

**Table 21.57 Possible causes**

Cause of error (%s1)	Details of cause
12	Insufficient memory.
Other	Another error has occurred.

**User Action**

Take any of the following actions:

**Table 21.58 User actions**

Cause of error (%s1)	Action
12	Close all unnecessary programs, or ensure that ample memory is available for Interstage single sign-on to operate. Refer to "Memory Requirements" in "Resource Requirements" in the Tuning Guide for an explanation of memory requirements.
Other	Immediately after the message is output, use the iscollectinfo command to collect investigation information, then contact your service engineer.

## 21.13.18 sso06105

---

**SSO: ERROR: sso06105: Acquisition of lock for thread failed. Reason=(%s1) Code=(%s2)****Variable Information**

%s1 = Error cause

%s2 = Maintenance information

**Explanation**

Interstage single sign-on session management failed to obtain exclusive control for threads.

**User Action**

Immediately after the message is output, use the iscollectinfo command to collect investigation information, then contact your service engineer.

## 21.13.19 sso06106

---

**SSO: ERROR: sso06106: Release of lock for thread failed. Reason=(%s1) Code=(%s2)****Variable Information**

%s1 = Error cause

%s2 = Maintenance information

**Explanation**

Interstage single sign-on session management failed to release exclusive control for threads.

## User Action

Immediately after the message is output, use the `iscollectinfo` command to collect investigation information, then contact your service engineer.

## 21.13.20 sso06108

---

### SSO: ERROR: sso06108: Creation of thread failed. Reason=(%s1)

#### Variable Information

%s1 = Error cause

#### Explanation

An attempt failed to create a thread for use by Interstage single sign-on session management. Thread creation may have failed because of a shortage of memory.

#### User Action

Close all unnecessary programs, or ensure that ample memory is available for Interstage single sign-on to operate.

Refer to "Memory Requirements" in "Resource Requirements" in the Tuning Guide for an explanation of memory requirements.

## 21.13.21 sso06109

---

### SSO: ERROR: sso06109: The specified port number is being used. Port=(%s1)

#### Variable Information

%s1 = Port number

#### Explanation

The port number used by Interstage single sign-on session management is already being used by another program.

#### User Action

Identify which program is using the port number (%s1) and undertake a review of operation policy.

To change the port number used by the session management server, open the Interstage Management Console and select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Repository Server], then select the [Settings] tab and click [Session management detailed settings [Show]]. Change the value of [Port number] under [Communication Settings].

## 21.13.22 sso06110

---

### SSO: ERROR: sso06110: Initialization of socket failed. Reason=(%s1)

#### Variable Information

%s1 = Error cause

#### Explanation

The WinSock library failed to be initialized.

#### User Action

Immediately after the message is output, use the `iscollectinfo` command to collect investigation information, then contact your service engineer.

## 21.13.23 sso06111

**SSO: ERROR: sso06111: Assignment of socket failed. Port=(%s1) Func=(%s2) Reason=(%s3) Code=(%s4)**

### Variable Information

%s1 = Port number

%s2 = Function name

%s3 = Error cause

%s4 = Maintenance information

### Explanation

Socket allocation failed. Possible causes are shown below.

**Windows32/64**

Table 21.59 Possible causes

Cause of error (%s3)	Details of cause
10055	Insufficient memory.
Other	Another error has occurred.

Table 21.60 Possible causes

Cause of error (%s3)	Details of cause
12	Insufficient memory.
125	The specified port number (%s1) is being used by something else.
Other	Another error has occurred.

### User Action

Take any of the following actions:

**Windows32/64**

Table 21.61 User actions

Cause of error (%s3)	Action
10055	Close all unnecessary programs, or ensure that ample memory is available for Interstage single sign-on to operate.  Refer to "Memory Requirements" in "Resource Requirements" in the Tuning Guide for an explanation of memory requirements.
Other	Ask the network administrator or other responsible party to reexamine the network environment.

**Solaris32/64 Linux32/64**

Table 21.62 User actions

Cause of error (%s3)	Action
12	Close all unnecessary programs, or ensure that ample memory is available for Interstage single sign-on to operate.

Cause of error (%s3)	Action
	Refer to "Memory Requirements" in "Resource Requirements" in the Tuning Guide for an explanation of memory requirements.
125	Identify which program is using the port number (%s1) and undertake a review of operation policy.  To change the port number used by the session management server, open the Interstage Management Console and select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Repository Server], then select the [Settings] tab and click [Session management detailed settings [Show]]. Change the value of Port number under Communication Settings.
Other	Ask the network administrator or other responsible party to reexamine the network environment.

## 21.13.24 sso06112

### SSO: ERROR: sso06112: Closing of socket failed. Reason=(%s1) Code=(%s2)

#### Variable Information

%s1 = Error cause

%s1 = Maintenance information

#### Explanation

A socket failed to close.

#### User Action

Immediately after the message is output, use the iscollectinfo command to collect investigation information, then contact your service engineer.

## 21.13.25 sso06113

### SSO: ERROR: sso06113: Registration of connection demand failed. Reason=(%s1)

#### Variable Information

%s1 = Error cause

#### Explanation

The Interstage single sign-on session management server failed to receive a connection request. Possible causes are shown below.

**Windows32/64**

Table 21.63 Possible causes

Cause of error (%s1)	Details of cause
10055	Insufficient memory.
Other	Another error has occurred.

**Solaris32/64 Linux32/64**

Table 21.64 Possible causes

Cause of error (%s1)	Details of cause
12	Insufficient memory.

Cause of error (%s1)	Details of cause
Other	Another error has occurred.

#### User Action

Take any of the following actions:

[Windows32/64](#)

Table 21.65 User actions

Cause of error (%s1)	Action
10055	Close all unnecessary programs, or ensure that ample memory is available for Interstage single sign-on to operate.  Refer to "Memory Requirements" in "Resource Requirements" in the Tuning Guide for an explanation of memory requirements.
Other	Ask the network administrator or other responsible party to reexamine the network environment.

[Solaris32/64](#) [Linux32/64](#)

Table 21.66 User actions

Cause of error (%s1)	Action
12	Close all unnecessary programs, or ensure that ample memory is available for Interstage single sign-on to operate.  Refer to "Memory Requirements" in "Resource Requirements" in the Tuning Guide for an explanation of memory requirements.
Other	Ask the network administrator or other responsible party to reexamine the network environment.

## 21.13.26 sso06114

---

**SSO: ERROR: sso06114: Receipt of request failed. Reason=(%s1) IPAddr=(%s2)**

#### Variable Information

%s1 = Error cause

%s2 = IP address from which the request originated

#### Explanation

Request data failed to be received. Possible causes are shown below.

[Windows32/64](#)

Table 21.67 Possible causes

Cause of error (%s1)	Details of cause
10055	Insufficient memory.
Other	Another error has occurred.

[Solaris32/64](#) [Linux32/64](#)

Table 21.68 Possible causes

Cause of error (%s1)	Details of cause
12	Insufficient memory.
Other	Another error has occurred.

#### User Action

Take any of the following actions:

[Windows32/64](#)

Table 21.69 User actions

Cause of error (%s1)	Action
10055	Close all unnecessary programs, or ensure that ample memory is available for Interstage single sign-on to operate.  Refer to "Memory Requirements" in "Resource Requirements" in the Tuning Guide for an explanation of memory requirements.
Other	Ask the network administrator or other responsible party to reexamine the network environment.

[Solaris32/64](#) [Linux32/64](#)

Table 21.70 User actions

Cause of error (%s1)	Action
12	Close all unnecessary programs, or ensure that ample memory is available for Interstage single sign-on to operate.  Refer to "Memory Requirements" in "Resource Requirements" in the Tuning Guide for an explanation of memory requirements.
Other	Ask the network administrator or other responsible party to reexamine the network environment.

## 21.13.27 sso06115

### Variable Information

**SSO: ERROR: sso06115: Transmission of response failed. Reason=(%s1) IPAddr=(%s2)**

#### Variable Information

%s1 = Error cause

%s2 = IP address from which the request originated

#### Explanation

Response data failed to be received. Possible causes are shown below.

[Windows32/64](#)

Table 21.71 Possible causes

Cause of error (%s1)	Details of cause
10055	Insufficient memory.
Other	Another error has occurred.

Solaris32/64 Linux32/64

Table 21.72 Possible causes

Cause of error (%s1)	Details of cause
12	Insufficient memory.
Other	Another error has occurred.

#### User Action

Take any of the following actions:

Windows32/64

Table 21.73 User actions

Cause of error (%s1)	Action
10055	Close all unnecessary programs, or ensure that ample memory is available for Interstage single sign-on to operate.  Refer to "Memory Requirements" in "Resource Requirements" in the Tuning Guide for an explanation of memory requirements.
Other	Ask the network administrator or other responsible party to reexamine the network environment.

Solaris32/64 Linux32/64

Table 21.74 User actions

Cause of error (%s1)	Action
12	Close all unnecessary programs, or ensure that ample memory is available for Interstage single sign-on to operate.  Refer to "Memory Requirements" in "Resource Requirements" in the Tuning Guide for an explanation of memory requirements.
Other	Ask the network administrator or other responsible party to reexamine the network environment.

## 21.13.28 sso06116

---

**SSO: ERROR: sso06116: Timeout occurred while receiving request. IPAddr=(%s1)**

#### Variable Information

%s1 = IP address from which the request originated

#### Explanation

A timeout occurred during the process to receive a request from IP address (%s1).

The system may be overloaded.

#### User Action

Resolve the overloaded status by measures such as closing all unnecessary programs.

## 21.13.29 sso06200

---

**SSO: ERROR: sso06200: Could not access the configuration file. Reason=(%s1) Filename=(%s2)**

## Variable Information

%s1 = Error cause

%s2 = Configuration file name

## Explanation

An attempt failed to access configuration file (%s2) that is needed for the Interstage single sign-on session management server to operate. Possible causes are shown below.

Table 21.75 Possible causes

Cause of error (%s1)	Details of cause
5	The configuration file (%s2) that is needed for the session management server to operate may be in use by another application.
6	The configuration file (%s2) that is needed for the session management server to operate does not exist.
Other	An internal error occurred in the session management server.

## User Action

Take any of the following actions:

Table 21.76 User actions

Cause of error (%s1)	Action
5	Check if the configuration file (%s2) that is needed for the session management server to operate is being used by another application.
6	Check if the configuration file (%s2) that is needed for the session management server to operate exists. If it does not exist, rebuild the repository server that is managing the Interstage single sign-on session management server.
Other	Immediately after the message is output, use the <i>iscollectinfo</i> command to collect investigation information, then contact your service engineer.

## 21.13.30 sso06201

---

### SSO: ERROR: sso06201: Failed to read the configuration file.

## Explanation

An attempt to read a definition file that is needed for the Interstage single sign-on session management server to operate failed.

## User Action

Open the Interstage Management Console and select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure], use the [List] tab to delete the repository server, then click the [Authentication infrastructure settings] tab and rebuild the repository server.

## 21.13.31 sso06202

---

### SSO: ERROR: sso06202: The configuration file settings are incorrect. Item=(%s1) Value=(%s2)

## Variable Information

%s1 = Configuration item name

%s2 = Setting

## Explanation

There is an error in a configuration file that is needed for the Interstage single sign-on session management server to operate. The Interstage single sign-on environment may be damaged.

## User Action

Open the Interstage Management Console and select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure], use the [List] tab to delete the repository server, then click the [Authentication infrastructure settings] tab and rebuild the repository server.

## 21.13.32 sso06203

---

**SSO: WARNING: sso06203: The configuration file settings are incorrect. Default value is used. Item=(%s1) Value=(%s2)**

### Variable Information

%s1 = Configuration item name

%s2 = Setting

## Explanation

An invalid value (%s2) was assigned to configuration item (%s1) in a configuration file that is needed for the Interstage single sign-on session management server to operate, so processing took place using the default value.

## User Action

Open the Interstage Management Console and select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure], use the [List] tab to delete the repository server, then click the [Authentication infrastructure settings] tab and rebuild the repository server.

## 21.13.33 sso06204

---

**SSO: ERROR: sso06204: The configuration file settings were omitted. Item=(%s1)**

### Variable Information

%s1 = Configuration item name

## Explanation

A mandatory configuration item (%s1) was not specified in a configuration file that is needed for the Interstage single sign-on session management server to operate. The environment of the repository server managing the session management server may be damaged.

## User Action

Open the Interstage Management Console and select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure], use the [List] tab to delete the repository server, then click the [Authentication infrastructure settings] tab and rebuild the repository server.

## 21.13.34 sso06205

---

**SSO: ERROR: sso06205: Could not access the service ID file. Reason=(%s1) Filename=(%s2)**

### Variable Information

%s1 = Error cause

%s2 = Service ID file name

## Explanation

An attempt to access the service ID file (%s2) for the Interstage single sign-on session management server failed. Possible causes are shown below.

Table 21.77 Possible causes

Cause of error (%s1)	Details of cause
5	The service ID file (%s2) for the session management server may be in use by another application.
6	The service ID file (%s2) for the session management server does not exist.
Other	An internal error occurred in the session management server.

## User Action

Take any of the following actions:

Table 21.78 User actions

Cause of error (%s1)	Action
5	Check if the service ID file (%s2) for the session management server is being used by another application.
6	Check if the service ID file (%s2) for the session management server exists. If it does not exist, rebuild the repository server that is managing the Interstage single sign-on session management server.
Other	Immediately after the message is output, use the <i>iscollectinfo</i> command to collect investigation information, then contact your service engineer.

## 21.13.35 sso06206

---

### SSO: ERROR: sso06206: Failed to read the service ID file. Filename=(%s1)

#### Variable Information

%s1 = Service ID file name

#### Explanation

An attempt failed to read the service ID file for the Interstage single sign-on session management server. The environment of the repository server that is managing the session management server may be damaged.

#### User Action

Open the Interstage Management Console and select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] and use [List] tab and delete the repository server, then click [Authentication infrastructure settings] tab and rebuild the repository server.

## 21.13.36 sso06207

---

### SSO: ERROR: sso06207: The session management log output directory file settings are incorrect. Reason=(%s1) Filename=(%s2)

#### Variable Information

%s1 = Error cause

%s2 = Name of session management log output destination file

## Explanation

An attempt failed to obtain the session management log output destination file (%s2) of the Interstage single sign-on session management server. Possible causes are shown below.

Table 21.79 Possible causes

Cause of error (%s1)	Details of cause
17	The name of the session management log output destination file (%s2) points to a location under a nonexistent directory.
18	The name of the session management log output destination file (%s2) is a directory.
Other	An internal error occurred in the session management server.

## User Action

Take any of the following actions:

Table 21.80 User actions

Cause of error (%s1)	Action
17	Check if the session management log output destination file name (%s2) specifies a path in a nonexistent directory. (*1)
18	Check if the session management log output destination file name (%s2) specifies an existing directory path. (*1)
Other	Immediately after the message is output, use the iscollectinfo command to collect investigation information, then contact your service engineer.

\*1 To check the output destination of the session management log, open the Interstage Management Console and select [System] > [Security] > [Single Sign-on] > [Authentication Mechanism] > [Repository Server] then select [Settings] tab and check [File name] under [Session management Log Settings]

## 21.13.37 sso06300

---

**SSO: ERROR: sso06300: Initialization of maintenance log failed. Reason=(%s1) Detail=(%s2) Code=(%s3)**

### Variable Information

%s1 = Error cause

%s2 = Detailed information

%s2 = Maintenance information

### Explanation

**Windows32/64**

The maintenance log for the Interstage single sign-on session management server failed to be initialized. There is a possibility that there is insufficient capacity required for running Interstage Single Sign-on session management.

**Solaris32/64 Linux32/64**

The maintenance log for the Interstage single sign-on session management server failed to be initialized. There is a possibility that there is insufficient capacity required for running Interstage Single Sign-on session management, or that the shared memory/exclusion control resource (semaphore) settings failed.

### User Action

**Windows32/64**

Close unnecessary programs, or check that there is sufficient capacity for running Interstage Single Sign-on. For details about required memory capacity, refer to "Resource Requirements" - "Memory Requirements" in the Tuning Guide.

If sufficient memory is secured, immediately after the message is output, use the `iscollectinfo` command to collect investigation information, then contact your service engineer.

**Solaris32/64 Linux32/64**

Close unnecessary programs, or check that there is sufficient capacity for running Interstage Single Sign-on, and that the shared memory/exclusion control resource (semaphore) settings are correct. For details about required memory capacity, refer to "Resource Requirements" - "Memory Requirements" in the Tuning Guide. For details about the shared memory/exclusion control resource (semaphore) settings, refer to the "System Tuning" chapter in the Tuning Guide.

If the problem is still not resolved by taking the above action, there is a possibility that the IPC resources required for running Interstage Single Sign-on and the IPC resources being used by another application are the same. For this reason, the IPC resources must be customized. For details, refer to "Setting IPC resources" in the Tuning Guide.

If sufficient memory is secured, and the shared memory/exclusion control resource (semaphore) settings are correct, immediately after the message is output, use the `iscollectinfo` command to collect investigation information, then contact your service engineer.

## 21.13.38 sso06301

---

**SSO: WARNING: sso06301: Could not write maintenance log. Reason=(%s1) Detail=(%s2) Code=(%s3)**

### Variable Information

%s1 = Error cause

%s2 = Detailed information

%s3 = Maintenance information

### Explanation

The maintenance log for the Interstage single sign-on session management server failed to be output.

### User Action

Immediately after the message is output, use the `iscollectinfo` command to collect investigation information, then contact your service engineer.

## 21.13.39 sso06302

---

**SSO: ERROR: sso06302: Initialization of session management log failed. LogFile=(%s1) Reason=(%s2)**

### Variable Information

%s1 = Name of session management log output destination file

%s2 = Error cause

### Explanation

The Interstage single sign-on session management log failed to be initialized. Possible causes are shown below.

Table 21.81 Possible causes

Cause of error (%s2)	Details of cause
Permission denied	Access permissions are not set for the directory containing the session management log output destination file (%s1).
	Access permissions are not set for the session management log output destination file (%s1).

Cause of error (%s2)	Details of cause
	Another application may be using the session management log output destination file (%s1).
Directory not found	The directory containing the session management log output destination file (%s1) cannot be found.
Filename is directory	A directory is set as the name of the session management log output destination file.
Not enough disk space	There is not enough available disk space.
Not enough memory	There is not enough memory to operate the Interstage single sign-on session management server.
Acquisition of shared memory failed	There is not enough shared memory to operate the Interstage single sign-on session management server.
Operation of shared memory failed	
Acquisition of exclusive lock resource failed	There are not enough exclusive lock resources (semaphores) to operate the Interstage single sign-on session management server.
Exclusive lock failed	
System error	An internal conflict occurred while the Interstage single sign-on session management server was operating.

## User Action

Take any of the following actions:

Table 21.82 User actions

Cause of error (%s2)	Action
Permission denied	Check if the access permissions of the directory containing the session management log output destination file (%s1) are set correctly. Correct any errors in the access permissions. (*1)
	If the session management log output destination file (%s1) exists, check that the access permissions of the output destination file are set correctly. Correct any errors in the access permissions. (*1)
	Check if the session management log output destination file (%s1) is being used by another application. If it is, close that application. (*1)
Directory not found	Check if the directory containing the session management log output destination file (%s1) and all the directories included in the output destination file pathname exist.
Filename is directory	A directory name was set as the session management log output destination file (%s1). Set the name of a file.
Not enough disk space	Back up any unnecessary files to free up disk space.
Not enough memory	<p><b>Windows32/64</b></p> <p>Close all unnecessary programs, or ensure that ample memory is available for Interstage single sign-on to operate.</p> <p>Refer to "Memory Requirements" in "Resource Requirements" in the Tuning Guide for an explanation of memory requirements.</p>
	<p><b>Solaris32/64 Linux32/64</b></p> <p>Close all unnecessary programs. Alternatively, ensure that ample memory is available for Interstage single sign-on to operate, and check that the size of the shared memory is set correctly.</p>

Cause of error (%s2)	Action
	Refer to "Memory Requirements" in "Resource Requirements" in the Tuning Guide for an explanation of memory requirements, and "System Tuning" in the Tuning Guide for an explanation of the required size of shared memory.
Acquisition of shared memory failed	<a href="#">Solaris32/64</a> <a href="#">Linux32/64</a> Check system parameters. Refer to "System Tuning" in the Tuning Guide for information about system parameters
Operation of shared memory failed	
Acquisition of exclusive lock resource failed	
Exclusive lock failed	
System error	Immediately after the message is output, use the iscollectinfo command to collect investigation information, then contact your service engineer.

\*1 Refer to "Changing Effective User for Web Server" in "Changing Environment Settings" in "Operation and Maintenance" in the Single Sign-on Operator's Guide for information about setting access permissions.

## 21.13.40 sso06303

**SSO: WARNING: sso06303: Could not write session management log. LogFile=(%s1) Reason=(%s2)**

### Variable Information

%s1 = Name of session management log output destination file

%s2 = Error cause

### Explanation

An attempt failed to write to the Interstage single sign-on session management log. Possible causes are shown below.

Table 21.83 Possible causes

Cause of error (%s2)	Details of cause
Permission denied	The user does not have permission to write to the session management log output destination file (%s1).
	The session management log output destination file (%s1) or the backup file used when switching the session management log (%s1.last or %s1.YYYYMMDDHHMMSS (a string indicating the date and time the file was saved)) may be in use by another application.
Not enough disk space	There is not enough available disk space.
Not enough memory	There is not enough memory to operate the Interstage single sign-on session management server.
Acquisition of shared memory failed	There is not enough shared memory to operate the Interstage single sign-on session management server.
Operation of shared memory failed	
Acquisition of exclusive lock resource failed	There are not enough exclusive lock resources (semaphores) to operate the Interstage single sign-on session management server.
Exclusive lock failed	
System error	An internal conflict occurred while the Interstage single sign-on session management server was operating.
	<a href="#">Solaris32/64</a> <a href="#">Linux32/64</a> The session management log output destination file may be a symbolic link.

### User Action

Take any of the following actions:

Table 21.84 User actions

Cause of error (%s2)	Action
Permission denied	Check that the access permissions of the session management log output destination file (%s1) are set correctly. Correct any errors in the access permissions. (*1)
	Check if the session management log output destination file (%s1) or the backup file used when switching the session management log (%s1.last or %s1.YYYYMMDDHHMMSS (a string indicating the date and time the file was saved)) is being used by another application. If it is, close that application. (*1)
Not enough disk space	Back up any unnecessary files to free up disk space.
Not enough memory	<a href="#">Windows32/64</a> Close all unnecessary programs, or ensure that ample memory is available for Interstage single sign-on to operate. Refer to "Memory Requirements" in "Resource Requirements" in the Tuning Guide for an explanation of memory requirements.
Acquisition of shared memory failed	<a href="#">Solaris32/64</a> <a href="#">Linux32/64</a> Check system parameters. Refer to "System Tuning" in the Tuning Guide for information about system parameters
Operation of shared memory failed	
Acquisition of exclusive lock resource failed	
Exclusive lock failed	
System error	Immediately after the message is output, use the iscollectinfo command to collect investigation information, then contact your service engineer.
	<a href="#">Solaris32/64</a> <a href="#">Linux32/64</a> Check if a symbolic link to the session management log output destination file (%s1) exists.

\*1 Refer to "Changing Effective User for Web Server" in "Changing Environment Settings" in "Operation and Maintenance" in the Single Sign-on Operator's Guide for information about setting access permissions.

## 21.13.41 sso06404

### SSO: ERROR: sso06404: Received data exceeded the maximum size. IPAddr=(%s1)

#### Variable Information

%s1 = IP address from which the request originated

#### Explanation

The amount of data received from the IP address (%s1) exceeded the maximum size that can be received. Possible causes are shown below.

- The extended user information value that is notified to the business system may be too large.
- A problem in the network environment may have corrupted the request data.
- The system may be under attack from outside the network.

#### User Action

Take any of the following actions:

- Rectify the extended user information value to be notified to the business system.
- Check the network environment.

- Check if an Interstage single sign-on repository server is operating at the IP address (%s1) from which the request originated.

If an Interstage single sign-on repository server is not operating at the IP address (%s1) from which the request originated, the system may be under attack from outside the network. Use the IP address (%s1) of the server from which the request originated to investigate a possible attack.

## 21.13.42 sso06406

---

### SSO: ERROR: sso06406: A fatal error occurred. Reason=(%s1)

#### Variable Information

%s1 = Error cause

#### Explanation

Processing cannot continue because a fatal error occurred in the Interstage single sign-on session management server.

#### User Action

Examine the session management server messages output immediately before this message, and eliminate the causes of any errors.

## 21.13.43 sso06407

---

### SSO: ERROR: sso06407: Session information is too large. User=(%s1) Detail=(%s2)

#### Variable Information

%s1 = User ID of target user

%s1 = Detailed information

#### Explanation

The Interstage single sign-on session management server could not generate more session information because the size of the session information had reached its maximum limit.

#### User Action

Adjust the session information size so that it is within the following range.

4000 bytes  $\leq (256 \text{ bytes} + X (*1)) * 1.5$

\*1 Add the following.

- Length of DN to show the user (%s1) (\*1)
- Length of FQDN (Host name + domain name) machine that confirmed this message.

\*2 Check the length of the DN value that shows the SSO repository (When using Active Directory(\*3) in the Directory Service that registers user information, Active Directory) user (%s1).

\*3 For details on how to confirm Active Directory, refer to the Active Directory Manual.

## 21.13.44 sso06408

---

### SSO: WARNING: sso06408: More than one Sign-on was detected. User=(%s1) ClientIP=(%s2)

#### Variable Information

%s1 = User ID of target user

%s1 = IP address of the host used by the target user

## Explanation

The user with the specified user ID (%s1) attempted to sign on while he or she was already signed on. The second sign-on operation failed because multiple sign-ons are not permitted.

## User Action

To check the possibility of an external attack, ask the user with user ID %s1 and IP address %s2 if he or she attempted to sign on more than once.

## 21.13.45 sso06409

---

**SSO: INFO: sso06409: More than one Sign-on was detected. User=(%s1) ClientIP=(%s2)**

### Variable Information

%s1 = User ID of target user

%s2 = IP address of the host used by the target user

## Explanation

The user with the specified user ID (%s1) attempted to sign on while he or she was already signed on. Because multiple sign-ons are not allowed, the system will ask the user if he or she wants to sign on forcibly.

## 21.13.46 sso06900

---

**SSO: ERROR: sso06900: SSO Session management server could not be started. Reason=(%s1)**

### Variable Information

%s1 = Error cause

## Explanation

The Interstage single sign-on session management server could not start. Possible causes are shown below.

Table 21.85 Possible causes

Cause of error (%s1)	Details of cause
4	A signal was received during the startup process.
11	A temporary resource shortage occurred.
12	Insufficient memory.
Other	The Interstage single sign-on repository server may not be installed correctly.

## User Action

Take any of the following actions:

Table 21.86 User actions

Cause of error (%s1)	Action
4	Stop and then restart the session management server. (*1)
11	
12	Close all unnecessary programs, or ensure that ample memory is available for Interstage single sign-on to operate.  Refer to "Memory Requirements" in "Resource Requirements" in the Tuning Guide for an explanation of memory requirements.

Cause of error (%s1)	Action
Other	Reinstall the Interstage single sign-on repository server.

\*1 The session management server can be started or stopped by starting or stopping the repository server.

## 21.14 sso07000 to sso07011

---

### 21.14.1 sso07000

---

#### SSO: ERROR: sso07000: Can not access the configuration file. Filename=(%s1)

##### Variable Information

%s1 = Absolute path of the configuration file

##### Explanation

Failed to access the Interstage Single Sign-on Integrated Windows Authentication application configuration file (%s1). Possible causes are shown below.

- The configuration file (%s1) does not exist or required access authorization has not been set for the configuration file (%s1).
- The configuration file (%s1) may be in use by another application.

##### User Action

Take any of the following actions:

- In the Interstage Management Console, click the [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Authentication server] > [Settings] tab and [Update] button to restart the authentication server and Integrated Windows Authentication applications. (\*1)
- Check whether the configuration file (%s1) is being used by another application. If it is, close the other application.

\*1 For details on stopping and starting the authentication server and Integrated Windows Authentication applications, refer to 'Stopping Single Sign-on' - 'Stopping an Authentication Server' and 'Starting Single Sign-on' - 'Starting an Authentication Server' in the chapter 'Operation and Maintenance' of the Single Sign-on Operator's Guide.

### 21.14.2 sso07001

---

#### SSO: ERROR: sso07001: The configuration file settings are incorrect. Filename=(%s1) Item=(%s2) Value=(%s3)

##### Variable Information

%s1 = Absolute path of the configuration file

%s2 = Configuration item name

%s3 = Settings contents

##### Explanation

The contents of the Interstage Single Sign-on Integrated Windows Authentication application configuration file (%s1) are incorrect.

##### User Action

Configure the Integrated Windows Authentication settings using the Interstage Management Console in the Interstage Single Sign-on Authentication server, and then restart the authentication server and the Integrated Windows Authentication application.

To configure the Integrated Windows Authentication settings, in the Interstage Management Console click [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Authentication server] > [Settings] > [Detailed Settings [Show]] > [Integrated Windows Authentication Setting].

For details on stopping and starting the authentication server and Integrated Windows Authentication applications, refer to 'Stopping Single Sign-on' - 'Stopping an Authentication Server' and 'Starting Single Sign-on' - 'Starting an Authentication Server' in the chapter 'Operation and Maintenance' of the Single Sign-on Operator's Guide.

## 21.14.3 sso07002

---

### SSO: ERROR: sso07002: Failed to access the message file. Resource=(%s1)

#### Variable Information

%s1 = Absolute path of the message file

#### Explanation

Failed to access the Interstage Single Sign-on Integrated Windows Authentication application resource file (%s1). Possible causes are shown below.

- The message file (%s1) does not exist.
- Required access authorization has not been set for the message file (%s1).
- The message file (%s1) is not an HTML format file.

#### User Action

Take any of the following actions:

- Check that the message file (%s1) exists. If it does not, restore the message file (%s1) from the original file and then restart the Integrated Windows Authentication application. (\*1) (\*2)
- Check the message file (%s1) access authorization and correct it if necessary. (\*3)
- Check whether the message file (%s1) is an HTML format file. If it is not, restore the message file (%s1) from the original file and then restart the Integrated Windows Authentication application. (\*1) (\*2)

\*1 For details on the message file and original file, see 'Customizing Messages Displayed on a Web Browser' - 'Messages that can be Customized' - 'Messages displayed in Integrated Windows Authentication' in the chapter 'Single Sign-on Customization' of the Single Sign-on Operator's Guide.

\*2 For details on stopping and starting the authentication server and Integrated Windows Authentication applications, refer to 'Stopping Single Sign-on' - 'Stopping an Authentication Server' and 'Starting Single Sign-on' - 'Starting an Authentication Server' in the chapter 'Operation and Maintenance' of the Single Sign-on Operator's Guide.

\*3 For details about the access authorization settings, refer to 'Customizing Messages Displayed on a Web Browser' - 'Setting Access Authority for a Message File' in the chapter 'Single Sign-on Customization' of the Single Sign-on Operator's Guide.

## 21.14.4 sso07003

---

### SSO: ERROR: sso07003: The environment settings are incorrect. Detail=(%s1)

#### Variable Information

%s1 = Maintenance information

#### Explanation

The environment settings required for running Interstage Single Sign-on Integrated Windows Authentication applications are incorrect. Possible causes are shown below.

- Communication between Active Directory and the Interstage Single Sign-on Authentication server failed.
- The system time of the machine used for running Active Directory and the system time of the machine on which the Interstage Single Sign-on Authentication server has been set up may not match.
- The value specified for the "kdc" argument of the sso deploy command used when the Integrated Windows Authentication application was deployed is incorrect.
- An encryption cipher that cannot be used in Active Directory or the client operating system was used.

- Failed to register the authentication server in Active Directory.
- Failed to create the keytab file.
- The encryption cipher used in Integrated Windows Authentication was not correctly set.
- The Active Directory update program required for linkage with Microsoft(R) Windows Server(R) 2008 has not been applied.
- The authentication server has been registered in the domain of the ActiveDirectory to be linked to.

## User Action

Take any of the following actions:

- Check whether the machine used for running Active Directory is running. If it has stopped, start it if necessary.  
If it is running, check the network environment to see whether communication between the machines used for running Active Directory and the Interstage Single Sign-on Authentication server is possible.  
Also check whether the FQDN of Authentication infrastructure URL can be resolved correctly in the machine used for running Active Directory.
- Ensure that the system time of the machine used for running Active Directory and the system time of the machine on which the Interstage Single Sign-on Authentication server has been set up match.
- Check whether the value for the "java.security.krb5.kdc" option set for the JAVA VM option of the WorkUnit used to deploy the Integrated Windows Authentication application matches the host name of the machine used for running Active Directory. (\*1) If it does not match, enter the correct host name and then restart the Integrated Windows Authentication application. (\*2)
- If the encryption cipher cannot be used in Active Directory or the client operating system: (\*3)
  - If the encryption cipher cannot be used in the client operating system:  
Instruct the user to access from an operating system in which the used encryption cipher can be used.
  - If the encryption cipher cannot be used in the Active Directory operating system:  
Change the system configuration so that Active Directory of an operating system in which the used encryption cipher can be used is used. If the system configuration was changed, delete the authentication server accounts and WorkUnits (to which the Integrated Windows Authentication applications have been deployed) registered in Active Directory, then reconfigure the Active Directory settings and redeploy the Integrated Windows Authentication applications. (\*4)
  - When none of the above can be executed:  
Change the encryption cipher used in Integrated Windows Authentication to an encryption cipher that can be used in all operating systems. To do that, delete the authentication server accounts and WorkUnits (to which the Integrated Windows Authentication applications have been deployed) registered in Active Directory, then reconfigure the Active Directory and redeploy the Integrated Windows Authentication applications. (\*4)
- If "Cannot find key of appropriate type to decrypt AP REP - RC4 with HMAC" is displayed in the maintenance information (%s1), check [Account options] of the authentication server account created when the authentication server was registered in Active Directory. If "Use DES encryption types for this account" has not been set, select this option and then restart the Integrated Windows Authentication application. (\*2) (\*3)  
If the user is already logged on in the domain when changing the account, instruct the user to log off from the domain once and then log on again.
- Delete the account for the authentication server registered in Active Directory and the WorkUnit used to deploy the Integrated Windows Authentication application, and then reconfigure Active Directory settings and redeploy the Integrated Windows Authentication application. (\*4)
- Apply the Active Directory update program required for linkage with Microsoft(R) Windows Server(R) 2008. Next, delete the WorkUnit that the Integrated Windows Authentication application has been deployed to, then reconfigure the Integrated Windows Authentication. For details on the Active Directory update programs required for linkage, refer to "Product Notes", section "Supported Software" > "Software Products Required for Application Execution" > "Other Functions".
- If the authentication server has been registered in the domain of the ActiveDirectory to be linked to, then configure the network-related settings and rebuild the entire server environment. For details on the network-related settings, refer to "Product Notes", section "Notes on Interstage Operations" > "Notes on Interstage Single Sign-on" > "Notes on Integrated Windows Authentication".

\*1 To check the WorkUnit JAVA VM option, in the Interstage Management Console click [System] > [WorkUnit] > [JServer Name] > [Settings] > [WorkUnit Settings [Show]] > [Java VM Options].

\*2 For details on stopping and starting the authentication server and Integrated Windows Authentication applications, refer to 'Stopping Single Sign-on' - 'Stopping an Authentication Server' and 'Starting Single Sign-on' - 'Starting an Authentication Server' in the chapter 'Operation and Maintenance' of the Single Sign-on Operator's Guide.

\*3 For details on which encryption ciphers are used with Integrated Windows Authentication, refer to "Overview" - "Authentication" - "Integrated Windows Authentication" in the Single Sign-on Operator's Guide.

\*4 For details on Active Directory settings, and deploying Integrated Windows Authentication applications, refer to the Appendix 'Settings for Active Directory Linkage' of the Single Sign-on Operator's Guide.

## 21.14.5 sso07004

---

**SSO: ERROR: sso07004: An invalid request was received. IPAddr=(%s1) Detail=(%s2) Code=(%s3)**

### Variable Information

%s1 = Request source IP address, or host name (\*1)

%s2 = Maintenance information

%s3 = Maintenance information

### Explanation

The Interstage Single Sign-on Integrated Windows Authentication application received an illegal request. Possible causes are shown below.

- The contents of the following message files may be incorrect. (\*2)
  - 200\_confirm\_winatuh\_en.html
  - 200\_confirm\_timeout\_en.html
  - 200\_confirm\_expired\_en.html
- The Integrated Windows Authentication application may have been accessed by a Web browser other than Microsoft(R) Internet Explorer on the client.
- The Integrated Windows Authentication application may have been accessed from the client directly.
- An external security breach may have occurred.

### User Action

Take any of the following actions:

- Check whether the contents described in the <form> tags of the following message files are correct. Correct the tag contents if necessary. (\*2)
  - 200\_confirm\_winatuh\_en.html
  - 200\_confirm\_timeout\_en.html
  - 200\_confirm\_expired\_en.html
- Use Microsoft(R) Internet Explorer as the client Web browser.
- Check whether the Integrated Windows Authentication application path was accessed directly to perform authentication in the application. If it was, change to an application that accesses the Authentication infrastructure URL to perform authentication.
- If no problem was found as a result of the above check, it means that an external security breach may have occurred. Verify by checking the request source IP address or host name (%s1).

\*1 If the request source cannot be identified, "Unknown" is output.

\*2 For details on customizing the message file, refer to 'Customizing Messages Displayed on a Web Browser' - 'Specifying tags for messages displayed for Integrated Windows Authentication' in the chapter 'Single Sign-on Customization' of the Single Sign-on Operator's Guide.

## 21.14.6 sso07005

---

### SSO: ERROR: sso07005: Failed to allocate memory.

#### Explanation

Failed to get the required memory for running Interstage Single Sign-on Integrated Windows Authentication applications.

#### User Action

Close unnecessary programs. Check that there is sufficient memory available to run Interstage Single Sign-on Integrated Windows Authentication applications, or required memory for running the authentication server function.

For details about memory requirements, refer to "Required resources" - "Memory" in the Tuning Guide.

## 21.14.7 sso07006

---

### SSO: ERROR: sso07006: Internal error. Detail=(%s1)

#### Explanation

Possible causes are as follows:

- If %s1 is "Integrity check on decrypted field failed", the user may not be able to use Windows authentication correctly in the current state.
- If %s1 is "Encryption type AES256 CTS mode with HMAC SHA1-96 is not supported/enabled", an unsupported encryption cipher, "This account supports Kerberos AES 256 bit encryption", was selected for "Encryption options" of the authentication server account created during registration of the authentication server in Active Directory.
- In all other cases, an internal error occurred in the Interstage Single Sign-on Integrated Windows Authentication application.

#### User Action

Take one of the following actions:

- If "Integrity check on decrypted field failed" is included in the maintenance information (%s1)
  - The user may not be able to use Integrated Windows Authentication correctly. Instruct the user to log off from the domain and then log on to the domain again.
  - If the same problem occurs during relogin to the domain, an invalid authentication infrastructure URL may have been specified when the service principal name (SPN) was assigned to the authentication server. Delete the WorkUnit to which the Integrated Windows Authentication application was deployed, then reconfigure the Active Directory settings, and redeploy the Integrated Windows Authentication application. (\*1)
- If %s1 is "Encryption type AES256 CTS mode with HMAC SHA1-96 is not supported/enabled", delete the authentication server accounts and WorkUnits (to which the Integrated Windows Authentication applications have been deployed) registered in Active Directory, then reconfigure the Active Directory settings and redeploy the Integrated Windows Authentication applications. (\*1)
- Apply the Active Directory update program required for linkage with Microsoft(R) Windows Server(R) 2008. Next, delete the WorkUnit that the Integrated Windows Authentication application has been deployed to, then reconfigure the Integrated Windows Authentication. For details on the Active Directory update programs required for linkage, refer to "Product Notes", section "Supported Software" > "Software Products Required for Application Execution" > "Other Functions".
- Refer to the security log of the machine used to run ActiveDirectory and check whether there is a problem. If there is a problem, check the ActiveDirectory settings.
- If the problem is still not resolved, immediately after the message is output, use the *iscollectinfo* command to collect investigation information, then contact your service engineer.

\*1 For Active Directory settings and Integrated Windows Authentication application deployment, refer to "Settings for Active Directory Linkage" - "User Active Directory in the Directory Service that registers user information" - "Settings for the integrated Windows authentication" in the Single Sign-on Operator's Guide.

## 21.14.8 sso07007

### SSO: ERROR: sso07007: Failed to initialize the maintenance log. Reason=(%s1)

#### Variable Information

%s1 = Error cause

#### Explanation

Failed to initialize the maintenance log output by the Interstage Single Sign-on Integrated Windows Authentication application. Possible causes are shown below.

Table 21.87 Errors and Possible Causes

Error Cause (%s1)	Details of Cause
3	There is not enough required memory for the application.
4	There is no authority for access to the log daemon process.
7	The log daemon process is not running.
18	There are not enough system resources.
Other	An internal error occurred.

#### User Action

Take one of the following actions:

Table 21.88 Errors and User Actions

Error Cause (%s1)	Action
3	Close unnecessary programs. Check that there is sufficient memory available to run Interstage Single Sign-on.  For details about memory requirements, refer to 'Required resources' - 'Memory' in the Tuning Guide.
4	<b>Solaris32/64</b> <b>Linux32/64</b>  In Integrated Windows Authentication, the authority of the start user of the WorkUnit used to deploy the application may not match the user or group authority for the Web server that the authentication server is using. Start the WorkUnit as a user for whom the authorities match. (*1)
7	Check whether the Interstage Single Sign-on Authentication server is running. If it is not, check the system log, fix the error, and then restart the authentication server and the Integrated Windows Authentication application. (*2)
18	Close unnecessary programs.
Other	Immediately after the message is output, use the iscollectinfo command to collect investigation information, then contact your service engineer.

\*1 For details about the WorkUnit start user, refer to 'Operation and Maintenance' - 'Starting Single Sign-on' - 'Starting an Authentication Server' in the Single Sign-on Operator's Guide.

\*2 For details on stopping and starting the authentication server and Integrated Windows Authentication applications, refer to 'Stopping Single Sign-on' - 'Stopping an Authentication Server' and 'Starting Single Sign-on' - 'Starting an Authentication Server' in the chapter 'Operation and Maintenance' of the Single Sign-on Operator's Guide.

## 21.14.9 sso07008

---

### SSO: ERROR: sso07008: Failed to output the maintenance log. Reason=(%s1)

#### Variable Information

%s1 = Error cause

#### Explanation

Failed to output the Interstage Single Sign-on Integrated Windows Authentication application maintenance log.

#### User Action

Immediately after the message is output, use the iscollectinfo command to collect investigation information, then contact your service engineer.

## 21.14.10 sso07009

---

### SSO: ERROR: sso07009: Single Sign-on Common Library package is not installed. Reason=(%s1)

#### Variable Information

%s1 = Maintenance information

#### Explanation

Interstage Single Sign-on Common Library is not installed.

#### User Action

**Windows32/64**

Install Interstage Single Sign-on.

**Solaris32/64 Linux32/64**

Install the following package:

- FJSVssocm(Interstage Single Sign-on Common Library)

## 21.14.11 sso07010

---

### SSO: ERROR: sso07010: SSO Integrated Windows Authentication application did not restart after the SSO Authentication server was restarted.

#### Explanation

The Integrated Windows Authentication application did not restart after the Interstage Single Sign-on Authentication server environment settings were modified.

#### User Action

Restart the Interstage Single Sign-on Integrated Windows Authentication application.

For details on stopping and starting Integrated Windows Authentication applications, refer to 'Stopping Single Sign-on' - 'Stopping an Authentication Server' and 'Starting Single Sign-on' - 'Starting an Authentication Server' in the chapter 'Operation and Maintenance' of the Single Sign-on Operator's Guide

## 21.14.12 sso07011

---

---

**SSO: ERROR: sso07011: The environment is broken. Detail=(%s1)****Variable Information**

%s1 = Maintenance information

**Explanation**

The Interstage Single Sign-on Authentication server may not have been installed correctly, or the environment has been corrupted.

**User Action**

Restart the Integrated Windows Authentication application. (\*1)

If this problem still occurs, immediately after the message is output, use the `iscollectinfo` command to collect investigation information, then contact your service engineer.

\*1 For details on stopping and starting Integrated Windows Authentication applications, refer to 'Stopping Single Sign-on' - 'Stopping an Authentication Server' and 'Starting Single Sign-on' - 'Starting an Authentication Server' in the chapter 'Operation and Maintenance' of the Single Sign-on Operator's Guide

---

## 21.15 sso10000 to sso10001

---

### 21.15.1 sso10000

---

**SSO: ERROR: sso10000: Request was received from invalid business server. ServerKind=(%s1) FQDN=(%s2) Code=(%s3)****Variable Information**

%s1 = Server name or command name

%s2 = FQND and port number of business server

%s3 = Maintenance information

**Explanation**

A request was received from an invalid business server. Possible causes are shown below.

- After a business server was deleted, a client may have resent an earlier request that was originally sent before the business system was deleted.
- There is a problem in the environment of the Interstage single sign-on business server.
- The system may be under attack from outside the network.

**User Action**

Take any of the following actions:

- Delete a business system only after access from all clients has stopped (i.e., Web browsers have closed).
- Use the following procedure to rebuild a business server. (\*1)
  1. Select [System] > [Security] > [Single Sign-on] > [Business system] on the Interstage Management Console, then delete the business server on the [List] tab.
  2. Select [System] > [Security] > [Single Sign-on] > [Business system] on the Interstage Management Console, then add the business server from the [Addition of Business Server] tab.

If the above cases do not apply, use the IP address or host name from which the request originated to investigate the possibility of an attack.

\*1 For details on how to establish the business server environment, see 'Environment Setup (Business Server Administrators)' in the Single Sign-on Operator's Guide.

## 21.15.2 sso10001

---

**SSO: ERROR: sso10001: Notice of message to the client failed. ServerKind=(%s1) Filename=(%s2) Reason=(%s3) Code=(%s4)**

### Variable Information

%s1 = Server name or command name

%s2 = Absolute path of message file that failed to be reported

%s3 = Error cause

%s4 = Maintenance information

### Explanation

Message notification from a server to a browser failed. Possible causes are shown below.

Table 21.89 Possible causes

Content of error cause (%s3)	Cause
File not found	The message file (%s2) to be displayed does not exist.
Permission denied	The user does not have permission to access the message file (%s2) to be displayed.
Invalid data	The format of the message file (%s2) to be displayed is incorrect.

### User Action

Take one of the following actions:

Table 21.90 User actions

Content of error cause (%s3)	Action
File not found	Check if the message file (%s2) exists. If it does not, restore the message file (%s2) from the original file. (*1)
Permission denied	Check if the access permissions of the message file (%s2) are set correctly, and correct them if they are wrong. (*1)
Invalid data	Check if the message file (%s2) is an HTML file. If it is not an HTML file, specify a file in HTML format.

\*1 For details on the message file and original file, see 'Customizing Messages Displayed on a Web Browser' - 'Messages that can be Customized' in the chapter 'Single Sign-on Customization' of the Single Sign-on Operator's Guide.

\*2 For details, refer to 'Customizing Messages Displayed on a Web Browser' - 'Setting Access Authority for a Message File' in the chapter 'Single Sign-on Customization' of the Single Sign-on Operator's Guide.

## 21.16 sso11001 to sso11008

---

### 21.16.1 sso11001

---

**SSO: ERROR: sso11001: An invalid request was received. There is an inconsistency in the environment settings of the server from which the request originated. IPAddr=(%s1) Detail=(%s2) Code=(%s3)**

### Variable Information

%s1 = IP address or host name from which the request originated

%s2 = Maintenance information

%s3 = Maintenance information

## Explanation

The Interstage single sign-on repository server received an illegal request. Possible causes are shown below.

- An Interstage single sign-on authentication server with different settings or of a different version is operating.
- An Interstage single sign-on business server with different settings or of a different version is operating.
- If load balancing is being performed on an Interstage Single Sign-on Repository server (update system) or on a repository server and an authentication server that have been installed on more than one machine, the system time of each server may not be the same.
- The system may be under attack from outside the network.

## User Action

Take any of the following actions:

- Check if the session management settings of the authentication server indicated by %s1 (IP address or host name from which the request originated) match those of the repository server. (\*1) (\*2)
  - If the session management settings match:  
Stop and then restart the authentication server and the repository server. (\*3) (\*4)
  - If the session management settings do not match:
    - If session management is to be performed:  
Change the settings of the authentication server or the repository server to perform session management. (\*5)
    - If session management is not to be performed:  
Rebuild the authentication server or the repository server. (\*6) (\*7)
- Check if the session management settings of the business server indicated by %s1 (IP address or host name from which the request originated) match those of the repository server. (\*2) (\*8)
  - If the session management settings match:  
Stop and then restart the business server and the repository server. (\*4) (\*9)
  - If the session management settings do not match:
    - If session management is to be performed:  
Change the settings of the business server or the repository server to perform session management. (\*5)
    - If session management is not to be performed:  
Rebuild the business server or the repository server. (\*7) (\*10)
- Check the migration procedure if migrating to a system that uses Active Directory for Directory Service (\*11)
- Check the combination of versions that can be implemented (\*12)
- Set the system time for the business server, the authentication server, and the repository server so that it is the same on each server.
- If none of the above applies, the system may be under attack from outside the network. Use the IP address (%s1) or host name (%s1) from which the request originated to investigate a possible attack.

\*1 On the authentication server, open the Interstage Management Console and select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Authentication server] then select [Settings] tab and click [Detailed Settings [Show]] and check [Use Session management?] under [Authentication infrastructure Information].

\*2 On the repository server, open the Interstage Management Console and select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Repository server] then select [Settings] tab and click [Session management detailed settings [Show]] and check [Use Session management?] under [Session management Setting]. Alternatively, open the Interstage Management Console and select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Repository server (reference system)] then select [Settings] tab and click [Detailed Settings [Show]] and check [Use Session management?] under [Authentication Infrastructure Information Settings].

\*3 For information about stopping the authentication server, refer to "Stopping an Authentication Server" in "Stopping Single Sign-on" in "Operation and Maintenance" in the Single Sign-on Operator's Guide. For information about starting the authentication server, refer to "Starting an Authentication Server" in "Starting Single Sign-on" in "Operation and Maintenance" in the Single Sign-on Operator's Guide.

\*4 For information about stopping the repository server, refer to "Stopping a Repository Server" in "Stopping Single Sign-on" in "Operation and Maintenance" in the Single Sign-on Operator's Guide. For information about starting the repository server, refer to "Starting a Repository Server" in "Starting Single Sign-on" in "Operation and Maintenance" in the Single Sign-on Operator's Guide.

\*5 For information about switching to session management operation, refer to "Switching to an Application to Perform Session Management" in "Notes on Previous Versions" in the Single Sign-on Operator's Guide.

\*6 The following procedure is used to rebuild the authentication server.

1. Open the Interstage Management Console and select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] then select [List] tab and delete the authentication server.
2. Use [Authentication infrastructure Settings] tab to build the authentication server.

\*7 The following procedure is used to rebuild the repository server.

1. Open the Interstage Management Console and select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] then select [List] tab and delete the repository server.
2. Use [Authentication infrastructure Settings] tab to build the repository server.

\*8 In the business server Interstage Management Console, ask the business server administrator to check by clicking [System] > [Security] > [Single Sign-on] > [Business system] > [Business system Name] > [Settings] > [Detailed Settings [Show]] > [Authentication Infrastructure Information Settings] > [Use Session management?].

\*9 Ask the administrator of the business server to restart the business server. For information about stopping the business server, refer to "Stopping a Business Server" in "Stopping Single Sign-on" in "Operation and Maintenance" in the Single Sign-on Operator's Guide. For information about starting the business server, refer to "Starting a Business Server" in "Starting Single Sign-on" in "Operation and Maintenance" in the Single Sign-on Operator's Guide.

\*10 Ask the administrator of the business server to rebuild the business server using the following procedure.

1. Open the Interstage Management Console and select [System] > [Security] > [Single Sign-on] > [Business system] then select [List] tab and delete the business server.
2. Use [Addition of Business server] tab to add the business server.

\*11 For details on migrating a system that uses Active Directory for Directory Service, refer to "Notes on Previous Versions" - "Migrating the system that uses the Active Directory to the Directory Service" in the "Single sign-on Operator's Guide".

\*12 For details on implementing combinations of versions, refer to "Notes on Interstage Single Sign-on" - "Notes about Setting up Single Sign-on Systems Containing Mixed Versions and Editions" in the "Product Notes".

## 21.16.2 sso11002

---

**SSO: ERROR: sso11002: An invalid response was received. There is an inconsistency in the environment settings of the server from which the response originated. Host=(%s1) Detail=(%s2) Code=(%s3)**

### Variable Information

%s1 = IP address or host name of the session management server

%s2 = Maintenance information

%s3 = Maintenance information

### Explanation

The Interstage single sign-on repository server received an invalid response from the Interstage single sign-on session management server. Possible causes are shown below.

- The repository server was not restarted after encryption information (service ID) was updated.
- The repository server environment is damaged.

## User Action

Take any of the following actions:

- Stop and then restart the repository server. (\*1)
- If this does not resolve the problem, rebuild the repository server. (\*2)

\*1 For information about stopping the repository server, refer to "Stopping a Repository Server" in "Stopping Single Sign-on" in "Operation and Maintenance" in the Single Sign-on Operator's Guide. For information about starting the repository server, refer to "Starting a Repository Server" in "Starting Single Sign-on" in "Operation and Maintenance" in the Single Sign-on Operator's Guide.

\*2 The following procedure is used to rebuild the repository server.

1. Open the Interstage Management Console and select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] then select [List] tab and delete the repository server.
2. Use [Authentication infrastructure Settings] tab to build the repository server.

## 21.16.3 sso11005

---

### SSO: ERROR: sso11005: Request data is broken. IPAddr=(%s1) Detail=(%s2) Code=(%s3)

#### Variable Information

%s1 = IP address or host name from which the request originated

%s2 = Maintenance information

%s3 = Maintenance information

#### Explanation

The request data received by the Interstage single sign-on repository server was corrupt or could not be interpreted. Possible causes are shown below.

- There may be a problem with the communication path, or the request data may be corrupt.
- An Interstage single sign-on authentication server with different settings or of a different version is operating.
- An Interstage single sign-on repository server with different settings or of a different version may be in use.
- The system may be under attack from outside the network.

## User Action

Take any of the following actions:

- Ask the network administrator to verify that the environment allows normal communications between the machines with the IP address or host name (%s1) of the requesting server and the repository server.
- Check if the session management settings of the authentication server and the repository server match. (\*1) (\*2)
  - If the session management settings match:  
Stop and then restart the repository server. (\*3)
  - If the session management settings do not match:
    - If session management is to be performed:  
Change the settings of the authentication server or the repository server to perform session management. (\*4)
    - If session management is not to be performed:  
Rebuild the authentication server or the repository server. (\*5) (\*6)
- If more than one repository server is installed, check if the session management settings of all repository servers match. (\*2)  
If they do not match, either change the settings or, if this is not possible, rebuild the relevant repository servers. (\*4) (\*6)
- Check the combination of versions that can be implemented (\*7)

- If none of the above conditions exists, the system may be under attack from outside the network. Use the IP address (%s1) or host name (%s1) from which the request originated to investigate a possible attack.

\*1 On the authentication server, open the Interstage Management Console and select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Authentication server] then select [Settings] tab and click [Detailed Settings [Show]] and check [Use Session management?] under [Authentication infrastructure Information].

\*2 On the repository server, open the Interstage Management Console and select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Repository server] then select [Settings] tab and click [Session management detailed settings [Show]] and check [Use Session management?] under [Session management Setting]. Alternatively, open the Interstage Management Console and select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Repository server (reference system)] then select [Settings] tab and click [Detailed Settings [Show]] and check [Use Session management?] under [Authentication Infrastructure Information Settings].

\*3 For information about stopping the repository server, refer to "Stopping a Repository Server" in "Stopping Single Sign-on" in "Operation and Maintenance" in the Single Sign-on Operator's Guide. For information about starting the repository server, refer to "Starting a Repository Server" in "Starting Single Sign-on" in "Operation and Maintenance" in the Single Sign-on Operator's Guide.

\*4 For information about switching to session management operation, refer to "Switching to an Application to Perform Session Management" in "Notes on Previous Versions" in the Single Sign-on Operator's Guide.

\*5 The following procedure is used to rebuild the authentication server.

1. Open the Interstage Management Console and select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] then select [List] tab and delete the authentication server.
2. Use [Authentication infrastructure Settings] tab to build the authentication server.

\*6 The following procedure is used to rebuild the repository server.

1. Open the Interstage Management Console and select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] then select [List] tab and delete the repository server.
2. Use [Authentication infrastructure Settings] tab to build the repository server.

\*7 For details on implementing combinations of versions, refer to "Notes on Interstage Single Sign-on" - "Notes about Setting up Single Sign-on Systems Containing Mixed Versions and Editions" in the "Product Notes."

## 21.16.4 sso11006

---

**SSO: ERROR: sso11006: Response data is broken. Host=(%s1) Detail=(%s2) Code=(%s3)**

### Variable Information

%s1 = IP address or host name of the session management server

%s2 = Maintenance information

%s3 = Maintenance information

### Explanation

The Interstage single sign-on repository server could not interpret the response from the Interstage single sign-on session management server. Possible causes are shown below.

- There is a problem with the communication path and the response data is corrupt.
- The repository server environment is damaged.

### User Action

Take any of the following actions:

- Ask the network administrator to verify that the environment allows normal communications between the session management server (%s1) and the repository server.
- If the above environment is normal, rebuild the repository server. (\*1)

\*1 The following procedure is used to rebuild the repository server.

1. Open the Interstage Management Console and select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] then select [List] tab and delete the repository server.
2. Use [Authentication infrastructure Settings] tab to build the repository server.

## 21.16.5 sso11007

---

### SSO: ERROR: sso11007: Analysis of request data failed. IPAddr=(%s1) Detail=(%s2) Code=(%s3)

#### Variable Information

%s1 = IP address or host name from which the request originated

%s2 = Maintenance information

%s3 = Maintenance information

#### Explanation

Analysis of the request data received by the Interstage single sign-on repository server failed. Possible causes are shown below.

- A request was received from an Interstage Single Sign-on Authentication server or business server created using a different authentication infrastructure.
- After the repository server was set up again, a request was received from an Interstage Single Sign-on Authentication server or business server created before the setup.
- An inconsistency may have occurred in the encryption information (service ID) within the servers making up the Interstage single sign-on system.
- A Single sign-on repository server with settings or a version different to the requesting server is used.
- The request could not be processed normally because the repository server was temporarily overloaded.
- The system may be under attack from outside the network.

#### User Action

Take any of the following actions:

- Check that the connection is correct.
  - Request source IP address or hostname (%s1) is the Authentication server  
Ask the Authentication server SSO administrator to check.
  - Request source IP address or hostname (%s1) is the Business server  
Ask the Business server administrator to check.
- If the repository server was rebuilt, take the following action:
  - Request source IP address or hostname (%s1) is the Authentication server  
Rebuild the authentication server as well. (\*1)
  - Request source IP address or hostname (%s1) is the Business server  
Ask the Business server administrator to set up the Business server again. (\*2)
- Check for inconsistencies in the encryption information (service ID) within the servers making up the Interstage single sign-on system. (\*3)
- Check the combination of versions that can be implemented (\*4)
- Check the network environment.
- Close and then restart the Web browser or refresh the Web browser content and then perform the operation again.
- Check that an adequate client send/receive timeout interval was specified in the Timeout directive in the Interstage HTTP Server environment configuration file (httpd.conf). (\*5)

If none of the above applies, or if the above checks do not indicate any problems, the system may be under attack from outside the network. Use the IP address or host name (%s1) from which the request originated to investigate a possible attack.

\*1 The following procedure is used to rebuild the authentication server.

1. Open the Interstage Management Console and select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] then select [List] tab and delete the authentication server.
2. Use [Authentication infrastructure Settings] tab to build the authentication server.

\*2 Ask the administrator of the business server to rebuild the business server using the following procedure.

1. Open the Interstage Management Console and select [System] > [Security] > [Single Sign-on] > [Business system] then select [List] tab and delete the business server.
2. Use [Addition of Business server] tab to add the business server.

\*3 For information about checking the consistency of encryption information (service ID), refer to "Threats when a business server or authentication server is located within a DMZ" in "Possible Threats" in "Interstage Single Sign-on" in "Security Risks" in the Security System Guide.

\*4 For details on implementing combined versions, refer to "Notes on Interstage Single Sign-on" - "Notes about Setting up Single Sign-on Systems Containing Mixed Versions and Editions" in the "Product Notes".

\*5 For information about the client send/receive timeout interval, refer to "Web Server (Interstage HTTP Server) Environment Definition" in the Tuning Guide.

## 21.16.6 sso11008

---

**SSO: ERROR: sso11008: Analysis of response data failed. Host=(%s1) Detail=(%s2) Code=(%s3)**

### Variable Information

%s1 = IP address or host name of the session management server

%s2 = Maintenance information

%s3 = Maintenance information

### Explanation

The Interstage single sign-on repository server failed to analyze the response from the Interstage single sign-on session management server. Possible causes are shown below.

- An inconsistency may have occurred in the encryption information (service ID) within the servers making up the Interstage single sign-on system.
- The response from the session management server could not be processed normally because the Interstage single sign-on repository server became temporarily overloaded.
- The repository server environment is damaged.

### User Action

Take any of the following actions:

- Check for inconsistencies in the encryption information (service ID) in the servers making up the Interstage single sign-on system. (\*1)
- Check the network environment.
- Close and then restart the Web browser or refresh the Web browser content and then perform the operation again.
- If the above measures do not resolve the problem, rebuild the repository server. (\*2)

\*1 For information about checking the consistency of encryption information (service ID), refer to "Threats when a business server or authentication server is located within a DMZ" in "Possible Threats" in "Interstage Single Sign-on" in "Security Risks" in the Security System Guide.

\*2 The following procedure is used to rebuild the repository server.

1. Open the Interstage Management Console and select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] then select [List] tab and delete the repository server.
2. Use [Authentication infrastructure Settings] tab to build the repository server.

## 21.17 sso12001 to sso12011

---

### 21.17.1 sso12001

---

**SSO: ERROR: sso12001: An invalid request was received. There is an inconsistency in the environment settings of the server from which the request originated. IPAddr=(%s1) URL=(%s2) Detail=(%s3) Code=(%s4)**

#### Variable Information

%s1 = IP address or host name from which the request originated

%s2 = Protection resource URL (\*1)

%s3 = Maintenance information

%s4 = Maintenance information

#### Explanation

The Interstage single sign-on authentication server received an illegal request. Possible causes are shown below.

- An Interstage single sign-on business server with different settings or of a different version is operating.
- After changing the settings of the Interstage Single sign-on authentication server, the operation may have been performed using a Web browser before changes were applied to it.
- The system may be under attack from outside the network.

#### User Action

Take any of the following actions:

- If the URL of a business server is displayed in the protection resource URL (%s2), check if the session management settings of that business server and the authentication server match. (\*2) (\*3)
  - If the session management settings match:
    - Stop and then restart the business server and the authentication server. (\*4) (\*5)
  - If the session management settings do not match:
    - If session management is to be performed:
      - Change the settings of the business server or the authentication server to perform session management. (\*6)
    - If session management is not to be performed:
      - Rebuild the business server or the authentication server. (\*7) (\*8)

Note that if "unknown" is displayed in the protection resource URL (%s2) and the business server from which the request originated cannot be identified, contact the user indicated by %s1 (IP address or host name of the server from which the request originated) to identify the business server.

- If the protection resource URL (%s2) is a business server that is not managed by the authentication infrastructure that received the request, ask the administrator of the business server from which the request originated to check for errors at the connection destination.
- Check the combination of versions that can be implemented (\*9)
- Instruct the user to stop the Web browser once, restart it and then access it again.
- If none of the above apply, the system may be under attack from outside the network. Use the IP address or host name (%s1) from which the request originated to investigate a possible attack.

\*1 If the request is an authentication request from an application that uses the JAAS (Single Sign-on Java API), the string "SSO-JavaAPI" will be output. If the server from which the request originated cannot be identified, the string "unknown" will be output.

\*2 On a business server, ask the administrator of the business server to open the Interstage Management Console and select [System] > [Security] > [Single Sign-on] > [Business System] > [Business System Name] then select [Settings] tab and click [Detailed Settings [Show]] and check [Use Session management?] under [Authentication Infrastructure Information Settings].

\*3 On the authentication server, open the Interstage Management Console and select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Authentication server] then select [Settings] tab and click [Detailed Settings [Show]] and check [Use Session management?] under [Authentication infrastructure Information].

\*4 Ask the administrator of the business server to restart the business server. For information about stopping the business server, refer to "Stopping a Business Server" in "Stopping Single Sign-on" in "Operation and Maintenance" in the Single Sign-on Operator's Guide. For information about starting the business server, refer to "Starting a Business Server" in "Starting Single Sign-on" in "Operation and Maintenance" in the Single Sign-on Operator's Guide.

\*5 For information about stopping the authentication server, refer to "Stopping an Authentication Server" in "Stopping Single Sign-on" in "Operation and Maintenance" in the Single Sign-on Operator's Guide. For information about starting the authentication server, refer to "Starting an Authentication Server" in "Starting Single Sign-on" in "Operation and Maintenance" in the Single Sign-on Operator's Guide.

\*6 For information about switching to session management operation, refer to "Switching to an Application to Perform Session Management" in "Notes on Previous Versions" in the Single Sign-on Operator's Guide.

\*7 Ask the administrator of the business server to rebuild the business server using the following procedure.

1. Open the Interstage Management Console and select [System] > [Security] > [Single Sign-on] > [Business system] then select [List] tab and delete the business server.
2. Use [Addition of Business server] tab to add the business server.

\*8 The following procedure is used to rebuild the authentication server.

1. Open the Interstage Management Console and select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] then select [List] tab and delete the authentication server.
2. Use [Authentication infrastructure Settings] tab to build the authentication server.

\*9 For details on implementing combinations of versions, refer to "Notes on Interstage Single Sign-on" - "Notes about Setting up Single Sign-on Systems Containing Mixed Versions and Editions" in the "Product Notes".

## 21.17.2 sso12002

---

**SSO: ERROR: sso12002: An invalid response was received. There is an inconsistency in the environment settings of the server from which the response originated. Host=(%s1) Detail=(%s2) Code=(%s3)**

### Variable Information

%s1 = IP address or host name of the session repository server

%s2 = Maintenance information

%s3 = Maintenance information

### Explanation

The Interstage single sign-on authentication server received an invalid response from the Interstage single sign-on repository server. Possible causes are shown below.

- The Interstage single sign-on authentication server is communicating with the wrong repository server.
- A different version of Interstage single sign-on repository server is operating.
- The authentication server environment is damaged.

### User Action

Take any of the following actions:

- If there is an error in the IP address or host name (%s1) of the repository server, open the Interstage Management Console and select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Authentication Server] then select [Settings] tab and click [Detailed Settings [Show]] and use [Repository Server (reference system) URL] under [Communication Settings with Repository server (reference system)] to correct the error.

Note that it will not be possible to make any changes if there is an error in the repository server (update system) URL, so rebuild all the servers making up the Interstage single sign-on system.

- Check if the session management settings of the repository server (%s1) and the authentication server match. (\*1) (\*2)
  - If the session management settings match:
    - Stop and then restart the authentication server and the repository server. (\*3) (\*4)
  - If the session management settings do not match:
    - If session management is to be performed:
      - Change the settings of the authentication server or the repository server to perform session management. (\*5)
    - If session management is not to be performed:
      - Rebuild the repository server or the authentication server. (\*6) (\*7)
  - Check the combination of versions that can be implemented (\*8)
  - If none of the above applies, rebuild the authentication server. (\*7)

\*1 On the repository server, open the Interstage Management Console and select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Repository server] then select [Settings] tab and click [Session management detailed settings [Show]] and check [Use Session management?] under [Session management Setting]. Alternatively, open the Interstage Management Console and select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Repository server (reference system)] then select [Settings] tab and click [Detailed Settings [Show]] and check [Use Session management?] under [Authentication Infrastructure Information Settings].

\*2 On the authentication server, open the Interstage Management Console and select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Authentication server] then select [Settings] tab and click [Detailed Settings [Show]] and check [Use Session management?] under [Authentication infrastructure Information].

\*3 For information about stopping the authentication server, refer to "Stopping an Authentication Server" in "Stopping Single Sign-on" in "Operation and Maintenance" in the Single Sign-on Operator's Guide. For information about starting the authentication server, refer to "Starting an Authentication Server" in "Starting Single Sign-on" in "Operation and Maintenance" in the Single Sign-on Operator's Guide.

\*4 For information about stopping the repository server, refer to "Stopping a Repository Server" in "Stopping Single Sign-on" in "Operation and Maintenance" in the Single Sign-on Operator's Guide. For information about starting the repository server, refer to "Starting a Repository Server" in "Starting Single Sign-on" in "Operation and Maintenance" in the Single Sign-on Operator's Guide.

\*5 For information about switching to session management operation, refer to "Switching to an Application to Perform Session Management" in "Notes on Previous Versions" in the Single Sign-on Operator's Guide.

\*6 In the case of the repository server (update system), rebuild all the servers making up the Interstage single sign-on system. The following procedure is used to rebuild the repository server (reference system).

1. Open the Interstage Management Console and select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] then select [List] tab and delete the repository server (reference system).
2. se [Authentication infrastructure Settings] tab to build the repository server (reference system).

\*7 The following procedure is used to rebuild the authentication server.

1. Open the Interstage Management Console and select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] then select [List] tab and delete the authentication server.
2. Use [Authentication infrastructure Settings] tab to build the authentication server.

\*8 For details on implementing combinations of versions, refer to "Notes on Interstage Single Sign-on" - "Notes about Setting up Single Sign-on Systems Containing Mixed Versions and Editions" in the "Product Notes".

## 21.17.3 sso12003

---

**SSO: WARNING: sso12003: An invalid request was received. It is possible that there is an inconsistency in the environment settings of the server from which the request originated. IPAddr=(%s1) Detail=(%s2) Code=(%s3)**

### Variable Information

%s1 = IP address or host name from which the request originated

%s2 = Maintenance information

%s3 = Maintenance information

### Explanation

The Interstage single sign-on authentication server received an unknown request. Because the unknown request was ignored, processing may have malfunctioned. Possible causes are shown below.

- There may be an error in the form tag settings in a message file displayed in a Web browser.
- There may be an error in the sign-off URL or the URL used to check the time of the previous Sign-on.
- An Interstage single sign-on business server with different settings or of a different version is operating.
- The system may be under attack from outside the network.

### User Action

Take any of the following actions:

- Check for errors in the following form tag settings:
  - Form tag for authentication (\*1)
  - Form tag of the forced sign-on confirmation window (\*2)
  - Form tag of the sign-off confirmation window (\*3)
- Check for errors in the sign-off URL or the URL used to check the time of the previous Sign-on.

For information about the URL used to confirm the date and time of the previous sign-on operation, refer to "Checking the Time of the Previous Sign-on" in "User Related Operation" in "Operation and Maintenance" in the Single Sign-on Operator's Guide.

For information about the sign-off URL, refer to "Customizing Web Pages for Sign-off" in "Single Sign-on Customization" in the Single Sign-on Operator's Guide.
- If an Interstage single sign-on business server is operating on the machine indicated by %s1 (IP address or host name from which the request originated), check if the session management settings of the business server and the authentication server match. (\*4) (\*5)
  - If the session management settings match:

Stop and then restart the business server and the authentication server. (\*6) (\*7)
  - If the session management settings do not match:
    - If session management is to be performed:

Change the settings of the business server or the authentication server to perform session management. (\*8)
    - If session management is not to be performed:

Rebuild the business server or the authentication server. (\*9) (\*10)
- If an Interstage single sign-on business server is not operating on the machine indicated by %s1 (IP address or host name from which the request originated), ask the business server administrator where the request originated to check for errors at the connection destination.
- Check the combination of versions that can be implemented (\*11)

- If none of the above applies, the system may be under attack from outside the network. Use the IP address or host name (%s1) from which the request originated to investigate a possible attack.

\*1 Refer to "Authentication Form Tag Specifications" in "Customizing Messages Displayed on a Web Browser" in "Single Sign-on Customization" in the Single Sign-on Operator's Guide for information about authentication form tags.

\*2 Refer to "Forced Sign-on Confirmation Window Form Tag Specifications" in "Customizing Messages Displayed on a Web Browser" in "Single Sign-on Customization" in the Single Sign-on Operator's Guide for information about the form tags of forced sign-on prompts.

\*3 Refer to "Sign-off Confirmation Window Form Tag Specifications" in "Customizing Messages Displayed on a Web Browser" in "Single Sign-on Customization" in the Single Sign-on Operator's Guide for information about form tags of sign-off prompts

\*4 On a business server, ask the business server administrator to open the Interstage Management Console and select [System] > [Security] > [Single Sign-on] > [Business System] > [Business System Name] then select [Settings] tab and click [Detailed Settings [Show]] and check [Use Session management?] under [Authentication Infrastructure Information Settings].

\*5 On the authentication server, open the Interstage Management Console and select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Authentication server] then select [Settings] tab and click [Detailed Settings [Show]] and check [Use Session management?] under [Authentication infrastructure Information].

\*6 Ask the administrator of the business server to restart the business server. For information about stopping the business server, refer to "Stopping a Business Server" in "Stopping Single Sign-on" in "Operation and Maintenance" in the Single Sign-on Operator's Guide. For information about starting the business server, refer to "Starting a Business Server" in "Starting Single Sign-on" in "Operation and Maintenance" in the Single Sign-on Operator's Guide.

\*7 For information about stopping the authentication server, refer to "Stopping an Authentication Server" in "Stopping Single Sign-on" in "Operation and Maintenance" in the Single Sign-on Operator's Guide. For information about starting the authentication server, refer to "Starting an Authentication Server" in "Starting Single Sign-on" in "Operation and Maintenance" in the Single Sign-on Operator's Guide.

\*8 For information about switching to session management operation, refer to "Switching to an Application to Perform Session Management" in "Notes on Previous Versions" in the Single Sign-on Operator's Guide. For business server migration, ask the business server administrator.

\*9 Ask the administrator of the business server to rebuild the business server using the following procedure.

1. Open the Interstage Management Console and select [System] > [Security] > [Single Sign-on] > [Business system] then select [List] tab and delete the business server.
2. Use [Addition of Business server] tab to add the business server.

\*10 The following procedure is used to rebuild the authentication server.

1. Open the Interstage Management Console and select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] then select [List] tab and delete the authentication server.
2. Use [Authentication infrastructure Settings] tab to build the authentication server.

\*11 For details on implementing combinations of versions, refer to "Notes on Interstage Single Sign-on" - "Notes about Setting up Single Sign-on Systems Containing Mixed Versions and Editions" in the "Product Notes".

## 21.17.4 sso12004

---

**SSO: WARNING: sso12004: An invalid response was received. It is possible that there is an inconsistency in the environment settings of the server from which the response originated. Host=(%s1) Detail=(%s2) Code=(%s3)**

### Variable Information

%s1 = IP address or host name of the repository server

%s2 = Maintenance information

%s3 = Maintenance information

## Explanation

The Interstage single sign-on authentication server received an unknown response from the repository server. Because the unknown response was ignored, processing may have malfunctioned. Possible causes are shown below.

- The Interstage single sign-on authentication server is communicating with the wrong repository server.
- An Interstage single sign-on repository server with different settings or of a different version may be in use.
- The authentication server environment is damaged.

## User Action

Take any of the following actions:

- If there is an error in the IP address or host name (%s1) of the repository server, open the Interstage Management Console and select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Authentication server] then select [Settings] tab and click [Detailed Settings [Show]] and use [Repository Server (reference system) URL] under [Communication Settings with Repository server (reference system)] to correct the error.
- Note that it will not be possible to make any changes if there is an error in the repository server (update system) URL, so rebuild all the servers making up the Interstage single sign-on system.
- Check if the session management settings of the authentication server and the repository server match. (\*1) (\*2)
  - If the session management settings match:
    - Stop and then restart the authentication server and the repository server. (\*3) (\*4)
  - If the session management settings do not match:
    - If session management is to be performed:
      - Change the settings of the authentication server or the repository server to perform session management. (\*5)
    - If session management is not to be performed:
      - Rebuild the authentication server or the repository server. (\*6) (\*7)
- Check the combination of versions that can be implemented (\*8)
- If none of the above conditions exists, rebuild the authentication server. (\*7)

\*1 On the repository server, open the Interstage Management Console and select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Repository server] then select [Settings] tab and click [Session management detailed settings [Show]] and check [Use Session management?] under [Session management Setting]. Alternatively, open the Interstage Management Console and select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Repository server (reference system)] then select [Settings] tab and click [Detailed Settings [Show]] and check [Use Session management?] under [Authentication Infrastructure Information Settings].

\*2 On the authentication server, open the Interstage Management Console and select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Authentication server] then select [Settings] tab and click [Detailed Settings [Show]] and check [Use Session management?] under [Authentication infrastructure Information].

\*3 For information about stopping the authentication server, refer to "Stopping an Authentication Server" in "Stopping Single Sign-on" in "Operation and Maintenance" in the Single Sign-on Operator's Guide. For information about starting the authentication server, refer to "Starting an Authentication Server" in "Starting Single Sign-on" in "Operation and Maintenance" in the Single Sign-on Operator's Guide.

\*4 For information about stopping the repository server, refer to "Stopping a Repository Server" in "Stopping Single Sign-on" in "Operation and Maintenance" in the Single Sign-on Operator's Guide. For information about starting the repository server, refer to "Starting a Repository Server" in "Starting Single Sign-on" in "Operation and Maintenance" in the Single Sign-on Operator's Guide.

\*5 For information about switching to session management operation, refer to "Switching to an Application to Perform Session Management" in "Notes on Previous Versions" in the Single Sign-on Operator's Guide.

\*6 In the case of the repository server (update system), rebuild all the servers making up the Interstage single sign-on system. The following procedure is used to rebuild the repository server (reference system).

1. Open the Interstage Management Console and select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] then select [List] tab and delete the repository server (reference system).
2. Use [Authentication infrastructure Settings] tab to build the repository server (reference system).

\*7 The following procedure is used to rebuild the authentication server.

1. Open the Interstage Management Console and select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] then select [List] tab and delete the authentication server.
2. Use [Authentication infrastructure Settings] tab to build the authentication server.

\*8 For details on implementing combinations of versions, refer to "Notes on Interstage Single Sign-on" - "Notes about Setting up Single Sign-on Systems Containing Mixed Versions and Editions" in the "Product Notes".

## 21.17.5 sso12005

---

### SSO: ERROR: sso12005: Request data is broken. IPAddr=(%s1) Detail=(%s2) Code=(%s3)

#### Variable Information

%s1 = IP address or host name from which the request originated

%s2 = Maintenance information

%s3 = Maintenance information

#### Explanation

The request data received by the Interstage single sign-on authentication server was corrupt or could not be interpreted. Possible causes are shown below.

- There may be a problem with the communication path, or the request data may be corrupt.
- An Interstage single sign-on business server with different settings or of a different version is operating.
- An Interstage single sign-on authentication server with different settings or of a different version is operating.
- In the Microsoft(R) Internet Explorer 7.0 or later Internet Options Security settings, the "Protected Mode" settings registered for each zone, such as the Internet and Local intranet zones, for the Interstage Single Sign-on Business server and the Interstage Single Sign-on Authentication server may be different.
- The system may be under attack from outside the network.

#### User Action

Take any of the following actions:

- Ask the network administrator to verify that the environment allows normal communications between the machine with the IP address (%s1) of the requesting server and the authentication server.
- Check if the session management settings of the business server and the authentication server match. (\*1) (\*2)
  - If the session management settings match:
    - Stop and then restart the business server and the authentication server. (\*3) (\*4)
  - If the session management settings do not match:
    - If session management is to be performed:
      - Change the settings of the business server or the authentication server to perform session management. (\*5)
    - If session management is not to be performed:
      - Rebuild the business server or the authentication server. (\*6) (\*7)
- If more than one authentication server is installed, check that the environment settings of all authentication servers match. If they do not match, either change the settings or, if this is not possible, rebuild the relevant authentication servers. (\*7)
- Check the combination of versions that can be implemented (\*8)

- In the Microsoft(R) Internet Explorer 7.0 Internet Options Security settings, make the "Protected Mode" settings for the business server and the authentication server the same.
- If none of the above apply, the system may be under attack from outside the network. Use the IP address or host name (%s1) from which the request originated to investigate a possible attack.

\*1 On the authentication server, open the Interstage Management Console and select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Authentication server] then select [Settings] tab and click [Detailed Settings [Show]] and check [Use Session management?] under [Authentication infrastructure Information].

\*2 On a business server, ask the business server administrator to open the Interstage Management Console and select [System] > [Security] > [Single Sign-on] > [Business System] > [Business System Name] then select [Settings] tab and click [Detailed Settings [Show]] and check [Use Session management?] under [Authentication Infrastructure Information Settings].

\*3 Ask the administrator of the business server to restart the business server. For information about stopping the business server, refer to "Stopping a Business Server" in "Stopping Single Sign-on" in "Operation and Maintenance" in the Single Sign-on Operator's Guide. For information about starting the business server, refer to "Starting a Business Server" in "Starting Single Sign-on" in "Operation and Maintenance" in the Single Sign-on Operator's Guide.

\*4 For information about stopping the authentication server, refer to "Stopping an Authentication Server" in "Stopping Single Sign-on" in "Operation and Maintenance" in the Single Sign-on Operator's Guide. For information about starting the authentication server, refer to "Starting an Authentication Server" in "Starting Single Sign-on" in "Operation and Maintenance" in the Single Sign-on Operator's Guide.

\*5 For information about switching to session management operation, refer to "Switching to an Application to Perform Session Management" in "Notes on Previous Versions" in the Single Sign-on Operator's Guide.

\*6 Ask the administrator of the business server to rebuild the business server using the following procedure.

1. Open the Interstage Management Console and select [System] > [Security] > [Single Sign-on] > [Business system] then select [List] tab and delete the business server.
2. Use [Addition of Business server] tab to add the business server.

\*7 The following procedure is used to rebuild the authentication server.

1. Open the Interstage Management Console and select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] then select [List] tab and delete the authentication server.
2. Use [Authentication infrastructure Settings] tab to build the authentication server.

\*8 For details on implementing combinations of versions, refer to "Notes on Interstage Single Sign-on" - "Notes about Setting up Single Sign-on Systems Containing Mixed Versions and Editions" in the "Product Notes".

## 21.17.6 sso12006

**SSO: ERROR: sso12006: Response data is broken. Host=(%s1) Detail=(%s2) Code=(%s3)**

### Variable Information

%s1 = IP address or host name of the repository server

%s2 = Maintenance information

%s3 = Maintenance information

### Explanation

The Interstage single sign-on authentication server could not interpret the response from the repository server. Possible causes are shown below.

- There is a problem with the communication path and the response data is corrupt.
- The Interstage single sign-on authentication server is communicating with the wrong repository server.
- An Interstage single sign-on repository server with different settings or of a different version may be in use.
- The authentication server environment is damaged.

## User Action

Take any of the following actions:

- Ask the network administrator to verify that the environment allows normal communications between the repository server (%s1) and the authentication server.
- If there is an error in the IP address or host name (%s1) of the repository server, open the Interstage Management Console and select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Authentication server] then select [Settings] tab and click [Detailed Settings [Show]] and use [Repository Server (reference system) URL] under [Communication Settings with Repository server (reference system)] to correct the error.

Note that it will not be possible to make any changes if there is an error in the repository server (update system) URL, so rebuild all the servers making up the Interstage single sign-on system.

- Check if the session management settings of the authentication server and the repository server match. (\*1) (\*2)
  - If the session management settings match:

Stop and then restart the authentication server and the repository server. (\*3) (\*4)
  - If the session management settings do not match:
    - If session management is to be performed:

Change the settings of the authentication server or the repository server to perform session management. (\*5)
    - If session management is not to be performed:

Rebuild the authentication server or the repository server. (\*6) (\*7)
- Check the combination of versions that can be implemented (\*8)
- If none of the above conditions exists, rebuild the authentication server. (\*7)

\*1 On the repository server, open the Interstage Management Console and select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Repository server] then select [Settings] tab and click [Session management detailed settings [Show]] and check [Use Session management?] under [Session management Setting]. Alternatively, open the Interstage Management Console and select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Repository server (reference system)] then select [Settings] tab and click [Detailed Settings [Show]] and check [Use Session management?] under [Authentication Infrastructure Information Settings].

\*2 On the authentication server, open the Interstage Management Console and select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Authentication server] then select [Settings] tab and click [Detailed Settings [Show]] and check [Use Session management?] under [Authentication infrastructure Information].

\*3 For information about stopping the authentication server, refer to "Stopping an Authentication Server" in "Stopping Single Sign-on" in "Operation and Maintenance" in the Single Sign-on Operator's Guide. For information about starting the authentication server, refer to "Starting an Authentication Server" in "Starting Single Sign-on" in "Operation and Maintenance" in the Single Sign-on Operator's Guide.

\*4 For information about stopping the repository server, refer to "Stopping a Repository Server" in "Stopping Single Sign-on" in "Operation and Maintenance" in the Single Sign-on Operator's Guide. For information about starting the repository server, refer to "Starting a Repository Server" in "Starting Single Sign-on" in "Operation and Maintenance" in the Single Sign-on Operator's Guide.

\*5 For information about switching to session management operation, refer to "Switching to an Application to Perform Session Management" in "Notes on Previous Versions" in the Single Sign-on Operator's Guide.

\*6 In the case of the repository server (update system), rebuild all the servers making up the Interstage single sign-on system. The following procedure is used to rebuild the repository server (reference system).

1. Open the Interstage Management Console and select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] then select [List] tab and delete the repository server (reference system).
2. Use [Authentication infrastructure Settings] tab to build the repository server (reference system).

\*7 The following procedure is used to rebuild the authentication server.

1. Open the Interstage Management Console and select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] then select [List] tab and delete the authentication server.

2. Use [Authentication infrastructure Settings] tab to build the authentication server.

\*8 For details on implementing combinations of versions, refer to "Notes on Interstage Single Sign-o" - "Notes about Setting up Single Sign-on Systems Containing Mixed Versions and Editions" in the "Product Notes".

## 21.17.7 sso12007

---

### SSO: sso12007: Analysis of request data failed. IPAddr=(%s1) Detail=(%s2) Code=(%s3)

#### Variable Information

%s1 = IP address or host name from which the request originated

%s2 = Maintenance information

%s3 = Maintenance information

#### Explanation

Analysis of request data received by the Interstage single sign-on authentication server failed. Possible causes are shown below.

- The request was received from an Interstage single sign-on business server created using a different authentication infrastructure.
- After the authentication infrastructure was rebuilt, a request was received from an Interstage single sign-on business server that was created before the authentication infrastructure was rebuilt.
- An inconsistency may have occurred in the encryption information (service ID) within the servers making up the Interstage single sign-on system.
- The system may be under attack from outside the network.

#### User Action

Take any of the following actions:

- Contact the user indicated by the IP address or host name (%s1) from which the request originated to identify the business server, and then ask the administrator of that business server to check for errors at the connection destination.
- If the authentication infrastructure has been rebuilt, ask the administrator of the business server to rebuild the Interstage single sign-on business server as well. (\*1)
- Check for inconsistencies in the encryption information (service ID) in the servers making up the Interstage single sign-on system. (\*2)
- If none of the above applies, or if the above checks do not indicate any problems, the system may be under attack from outside the network. Use the IP address or host name (%s1) from which the request originated to investigate a possible attack.

\*1 Ask the administrator of the business server to rebuild the business server using the following procedure.

1. Open the Interstage Management Console and select [System] > [Security] > [Single Sign-on] > [Business system] then select [List] tab and delete the business server.
2. Use [Addition of Business server] tab to add the business server.

\*2 For information about checking the consistency of encryption information (service ID), refer to "Threats when a business server or authentication server is located within a DMZ" in "Possible Threats" in "Interstage Single Sign-on" in "Security Risks" in the Security System Guide.

## 21.17.8 sso12008

---

### SSO: ERROR: sso12008: Analysis of response data failed. Host=(%s1) Detail=(%s2) Code=(%s3)

#### Variable Information

%s1 = IP address or host name of the repository server

%s2 = Maintenance information

%s3 = Maintenance information

## Explanation

The Interstage single sign-on authentication server failed to analyze the response from the repository server. Possible causes are shown below.

- The Interstage single sign-on authentication server is communicating with the wrong repository server.
- Communication could not be performed because the repository server (update system) was rebuilt.
- An inconsistency may have occurred in the encryption information (service ID) within the servers making up the Interstage single sign-on system.
- The authentication server environment is damaged.

## User Action

Take any of the following actions:

- If there is an error in the IP address or host name (%s1) of the repository server, open the Interstage Management Console and select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Authentication server] then select [Settings] tab and click [Detailed Settings [Show]] and use [Repository Server (reference system) URL] under [Communication Settings with Repository server (reference system)] to correct the error.

Note that it will not be possible to make any changes if there is an error in the repository server (update system) URL, so rebuild all the servers making up the Interstage single sign-on system.

- If the repository server (update system) is rebuilt, rebuild the following servers as well:
  - Repository server (reference system) (\*1)
  - Authentication server (\*2)
  - Business server (\*3)
- Check for inconsistencies in the encryption information (service ID) in the servers making up the Interstage single sign-on system. (\*4)
- If none of the above applies, rebuild the authentication server. (\*2)

\*1 If more than one repository server is being used, use the following procedure to rebuild the repository server (reference system):

1. Open the Interstage Management Console and select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] then select [List] tab and delete the repository server (reference system).
2. Use [Authentication infrastructure Settings] tab to build the repository server (reference system).

\*2 The following procedure is used to rebuild the authentication server.

1. Open the Interstage Management Console and select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] then select [List] tab and delete the authentication server.
2. Use [Authentication infrastructure Settings] tab to build the authentication server.

\*3 Ask the administrator of the business server to rebuild the business server using the following procedure.

1. Open the Interstage Management Console and select [System] > [Security] > [Single Sign-on] > [Business system] then select [List] tab and delete the business server.
2. Use [Addition of Business server] tab to add the business server.

\*4 For information about checking the consistency of encryption information (service ID), refer to "Threats when a business server or authentication server is located within a DMZ" in "Possible Threats" in "Interstage Single Sign-on" in "Security Risks" in the Security System Guide.

## 21.17.9 sso12010

---

**SSO: ERROR: sso12010: There is an inconsistency in the environment settings of one of the Authentication server Federation service. IPAddr=(%s1) Detail=(%s2) Code=(%s3)**

## Variable Information

%s1 = Request source IP address, or host name

%s2 = Maintenance information

%s3 = Maintenance information

## Explanation

The Interstage Single Sign-on Authentication server received an illegal request. Possible causes are shown below.

- An external security breach may be taking place.

## User Action

Take the following action:

- Verify this by checking the request source IP address or host name (%s1).

## 21.17.10 sso12011

---

**SSO: WARNING: sso12011: The environment settings of the running SSO Authentication server Federation service may contain an inconsistency. IPAddr=(%s1) Detail=(%s2) Code=(%s3)**

## Variable Information

%s1 = IP address or host name request source

%s2 = Maintenance information

%s3 = Maintenance information

## Explanation

The Interstage Single Sign-on Authentication server may have received an invalid request. Possible causes are shown below.

- An external security breach may be taking place.

## User Action

Take any of the following actions:

- Investigate the possibility of a security breach based on the request source IP address or the host name (%s1).

## 21.18 sso13001 to sso13008

---

### 21.18.1 sso13001

---

**SSO: ERROR: sso13001: Invalid request was received. Name=(%s1) IPAddr=(%s2) Detail=(%s3) Code=(%s4)**

## Variable Information

%s1 = Business system name

%s2 = IP address or host name from which the request originated (\*1)

%s3 = Maintenance information

%s4 = Maintenance information

## Explanation

The Interstage single sign-on business server (business system name (%s1)) received an illegal request. Possible causes are shown below.

- A string not conforming to RFC 2616 or RFC 2396 has been used in the URL. For details on these RFCs, refer to the following:
  - RFC 2616: <http://www.ietf.org/rfc/rfc2616.txt>
  - RFC 2396: <http://www.ietf.org/rfc/rfc2396.txt>
- The URL requested of the Interstage single sign-on business server used a query string beginning with "fj-is-sso".
- A POST request with empty BODY data may have been used at authentication time.
- When the Maintenance information (%s3) is "Invalid Content-Type" something other than "application/x-www-form-urlencoded" may have been set as the content-type of the data transmitted by the POST request at authentication time.
- The name and value of the BODY data transmitted by the POST request at authentication time may not have been delimited with "=".
- A name beginning with "fj-is-sso" may have been used in the BODY data transmitted by the POST request at authentication time.
- The "<!--SSO\_POST\_REQUEST\_AUTH\_TARGET-->" section of the message file used for the following non-authentication windows may have been changed.
  - 200postauth\_en.template or 403postauth\_en.template
- If different content such as an image to be displayed or a hyperlink to another page is specified in the message file used for the following non-authentication windows, a file located in the protected path of the active business server may have been specified.
  - 200postauth\_en.template or 403postauth\_en.template
- The POST request size might have exceeded the maximum size of the request message body set in Interstage HTTP Server.
- An error might have occurred in communication.
- There might be insufficient memory.
- The system may be under attack from outside the network.

## User Action

Take any of the following actions:

- Check if a string not conforming to RFC 2616 or RFC 2396 has been used in the URL.
- Check if the URL requested of the Interstage single sign-on business server uses a query string beginning with "fj-is-sso".
- Check if empty BODY data was sent in the POST request at authentication time.
- If Maintenance information (%s3) is "Invalid Content-Type", specify "application/x-www-form-urlencoded" as the content-type of the data transmitted by the POST request at authentication time.
- Check if the name and value of the BODY data transmitted by the POST request at authentication time are delimited with "=".
- Check if a name beginning with "fj-is-sso" was used in the BODY data transmitted by the POST request at authentication time.
- If the "<!--SSO\_POST\_REQUEST\_AUTH\_TARGET-->" section of the message file used for the following non-authentication windows has been changed, specify "<!--SSO\_POST\_REQUEST\_AUTH\_TARGET-->" correctly. (\*2)
  - 200postauth\_en.template or 403postauth\_en.template
- If a file located in the protected path of the active business server is specified as a hyperlink to another page or as an image to be displayed in the message file used for the following non-authentication windows, correct the specification so that a file located in the protected path is not specified.
  - 200postauth\_en.template or 403postauth\_en.template
- Increase the maximum size of the Interstage HTTP Server request message body. Alternatively, check the POST request size, and change it if necessary.
- Check whether the user exited from the Web browser while the POST request was being sent. Additionally, check whether there is a problem with communication between the user and the Interstage Single Sign-On business server.
- Make sure that sufficient memory was reserved to run the Interstage Single Sign-On business server. (\*3)

- If the above checks do not reveal any problems, the system may be under attack from outside the network. Use the IP address or host name (%s1) from which the request originated to investigate a possible attack.

\*1 If the server from which the request originated cannot be identified, the string "unknown" will be output.

\*2 Refer to "Single Sign-on Customization" - "Customizing Messages Displayed on a Web Browser" - "Unauthenticated Window Tag Specifications" in the Single Sign-on Operator's Guide for information about customizing the message files used for non-authentication windows.

\*3 For details on the required memory, refer to "Resource Requirements" - "Memory Requirements" in the Tuning Guide.

## 21.18.2 sso13002

**SSO: ERROR: sso13002: An invalid response was received. There is an inconsistency in the environment settings of the server from which the response originated. Name=(%s1) Host=(%s2) Detail=(%s3) Code=(%s4)**

### Variable Information

%s1 = Business system name

%s2 = IP address or host name from which the request originated (\*1)

%s3 = Maintenance information

%s4 = Maintenance information

### Explanation

The Interstage single sign-on business server (business system name (%s1)) received an invalid response from the Interstage single sign-on authentication server. Possible causes are shown below.

- The Interstage single sign-on business server is communicating with the wrong Interstage single sign-on authentication server.
- The settings or versions differ between the Interstage single sign-on business server and authentication server.

### User Action

Take any of the following actions:

- Open the Interstage Management Console and select [System] > [Security] > [Single Sign-on] > [Business System] > [Business system Name] and then select [Settings] tab and click [Detailed Settings [Show]]. Check [Authentication infrastructure URL] and [Authentication server URL] under [Authentication Infrastructure Information Settings] and ask the SSO administrator if this information is correct.
  - If the [Authentication server URL] is incorrect:
    - Set the correct URL provided by the SSO administrator then click the 'Update' button and restart the business server. (\*2)
  - If the [Authentication infrastructure URL] is incorrect:
    - Rebuild the business server. (\*3)
- Check if the session management settings of the Interstage single sign-on business server and authentication server match. (\*4) (\*5)
  - If the session management settings match:
    - Stop and then restart the business server. (\*2)
  - If the session management settings do not match:
    - If session management is to be performed:
      - Change the settings of the business server or authentication server to perform session management. (\*6)
    - If session management is not to be performed:
      - Rebuild the business server and the authentication server. (\*3) (\*7)
- Check the combination of versions that can be implemented (\*8)

\*1 If the server from which the request originated cannot be identified, the string "unknown" will be output.

\*2 For information about stopping a business server, refer to "Stopping a business server" in "Stopping single sign-on" in "Operation and maintenance" in the Single Sign-on Operator's Guide. For information about starting a business server, refer to "Starting a business server" in "Starting single sign-on" in "Operation and maintenance" in the Single Sign-on Operator's Guide.

\*3 Use the following procedure to rebuild a business server.

1. Select [System] > [Security] > [Single Sign-on] > [Business system] on the Interstage Management Console, then delete the business server on the [List] tab.
2. Select [System] > [Security] > [Single Sign-on] > [Business system] on the Interstage Management Console, then add the business server from the [Addition of Business Server] tab.

\*4 On a business server, open the Interstage Management Console and select [System] > [Security] > [Single Sign-on] > [Business System] > [Business system Name] and then select [Settings] tab and click [Detailed Settings [Show]] and check [Use Session management?] under [Authentication Infrastructure Information Settings].

\*5 On the authentication server, open the Interstage Management Console and select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Authentication Server] and then select the [Settings] tab and click [Detailed Settings [Show]] and check [Use Session management?] under [Authentication Infrastructure Information Settings].

\*6 For information about session management operation, refer to "Switching to an application to perform session management" in "Notes on previous versions" in the Single Sign-on Operator's Guide. For authentication server migration, ask the SSO administrator.

\*7 Ask the SSO administrator to rebuild the authentication server.

\*8 For details on implementing combinations of versions, refer to "Notes on Interstage Single Sign-on" - "Notes about Setting up Single Sign-on Systems Containing Mixed Versions and Editions" in the "Product Notes".

## 21.18.3 sso13005

---

**SSO: ERROR: sso13005: Request data is broken. Name=(%s1) IPAddr=(%s2) Detail=(%s3) Code=(%s4)**

### Variable Information

%s1 = Business system name

%s2 = IP address or host name from which the request originated (\*1)

%s3 = Maintenance information

%s4 = Maintenance information

### Explanation

The request data received by the Interstage single sign-on business server (business system name (%s1)) was corrupt or could not be interpreted. Possible causes are shown below.

- There may be a problem with the communication path, or the request data may be corrupt.
- The system may be under attack from outside the network.

### User Action

Take any of the following actions:

- Ask the network administrator to verify that the environment allows normal communications between the server from which the request originated and the Interstage single sign-on business server.
- If the above checks do not reveal any problems, the system may be under attack from outside the network. Use the IP address or host name (%s1) from which the request originated to investigate a possible attack.

\*1 If the server from which the request originated cannot be identified, the string "unknown" will be output.

## 21.18.4 sso13006

---

**SSO: ERROR: sso13006: Response data is broken. Name=(%s1) Host=(%s2) Detail=(%s3) Code=(%s4)**

## Variable Information

%s1 = Business system name

%s2 = IP address or host name from which the request originated (\*1)

%s3 = Maintenance information

%s4 = Maintenance information

## Explanation

The Interstage single sign-on business server (business system name (%s1)) could not interpret the response from the Interstage single sign-on authentication server.

There may be a problem with the communication path, or the response data may be corrupt.

## User Action

Ask the network administrator to verify that the environment allows normal communications between the Interstage single sign-on business server and the authentication server.

\*1 If the server from which the request originated cannot be identified, the string "unknown" will be output.

## 21.18.5 sso13007

---

**SSO: ERROR: sso13007: Analysis of request data failed. Name=(%s1) IPAddr=(%s2) Detail=(%s3) Code=(%s4)**

## Variable Information

%s1 = Business system name

%s2 = IP address or host name from which the request originated (\*1)

%s3 = Maintenance information

%s4 = Maintenance information

## Explanation

Analysis of request data received by the Interstage single sign-on business server (business system name (%s1)) failed. Possible causes are shown below.

- Session information that cannot currently be used was sent from the users Web browser.
- The system may be under attack from outside the network.
- The Interstage single sign-on business server environment is damaged.

## User Action

Take any of the following actions:

- Close the Web browser and then reexecute the operation.
- Use the IP address or host name (%s1) from which the request originated to investigate a possible attack.
- If the above investigations reveal no problems, the environment of the business server is damaged. Rebuild the business server. (\*2)

\*1 If the server from which the request originated cannot be identified, the string "unknown" will be output.

\*2 Use the following procedure to rebuild a business server.

1. Select [System] > [Security] > [Single Sign-on] > [Business system] on the Interstage Management Console, then delete the business server on the [List] tab.
2. Select [System] > [Security] > [Single Sign-on] > [Business system] on the Interstage Management Console, then add the business server from the [Addition of Business Server] tab.

## 21.18.6 sso13008

---

**SSO: ERROR: sso13008: Analysis of response data failed. Name=(%s1) Host=(%s2) Detail=(%s3) Code=(%s4)**

### Variable Information

- %s1 = Business system name
- %s2 = IP address or host name from which the request originated (\*1)
- %s3 = Maintenance information
- %s4 = Maintenance information

### Explanation

The Interstage single sign-on business server (business system name (%s1)) failed to analyze the response from the Interstage single sign-on authentication server. The business server environment is damaged.

- The system may be under attack from outside the network.
- The Interstage single sign-on business server environment is damaged.

### User Action

Rebuild the business server. (\*2)

\*1 If the server from which the request originated cannot be identified, the string "unknown" will be output.

\*2 Use the following procedure to rebuild a business server.

1. Select [System] > [Security] > [Single Sign-on] > [Business system] on the Interstage Management Console, then delete the business server on the [List] tab.
2. Select [System] > [Security] > [Single Sign-on] > [Business system] on the Interstage Management Console, then add the business server from the [Addition of Business Server] tab.

## 21.19 sso16001 to sso16007

---

### 21.19.1 sso16001

---

**SSO: ERROR: sso16001: An invalid request was received. It is possible that there is an inconsistency in the environment settings of the server from which the request originated. IPAddr=(%s1) Detail=(%s2) Code=(%s3)**

### Variable Information

- %s1 = IP address or host name from which the request originated
- %s2 = Maintenance information
- %s3 = Maintenance information

### Explanation

The Interstage single sign-on session management server received an illegal request. Possible causes are shown below.

- The repository server was not restarted after encryption information (the service ID) was updated.
- The system may be under attack from outside the network.

### User Action

Take any of the following actions:

- Stop and then restart the session management server. (\*1)

- If the above measures do not resolve the problem, the system may be under attack from outside the network. Use the IP address or host name (%s1) from which the request originated to investigate a possible attack.

\*1 The session management server can be started or stopped by starting or stopping the repository server.

## 21.19.2 sso16005

---

**SSO: ERROR: sso16005: Request data is broken. IPAddr=(%s1) Detail=(%s2) Code=(%s3)**

### Variable Information

%s1 = IP address or host name from which the request originated

%s2 = Maintenance information

%s3 = Maintenance information

### Explanation

The request data received by the Interstage single sign-on session management server was corrupt or could not be interpreted. Possible causes are shown below.

- A problem in the network environment may have corrupted the request data.
- The system may be under attack from outside the network.

### User Action

Check if an Interstage single sign-on repository server is operating at the IP address or host name (%s1) from which the request originated.

- If a repository server is operating at the IP address or host name (%s1) from which the request originated

There may be a problem with the network environment settings. Ask the network administrator or other responsible party to reexamine the network environment (including hosts file settings, DNS server specification and the settings of the DNS server itself). If there is a problem with the network environment, review and reset the network environment and run the process again.

- If a repository server is not operating at the IP address or host name (%s1) from which the request originated

The system may be under attack from outside the network. Use the IP address or host name (%s1) from which the request originated to investigate a possible attack.

## 21.19.3 sso16007

---

**SSO: ERROR: sso16007: Analysis of request data failed. IPAddr=(%s1) Detail=(%s2) Code=(%s3)**

### Variable Information

%s1 = IP address or host name from which the request originated

%s2 = Maintenance information

%s3 = Maintenance information

### Explanation

Analysis of request data received by the Interstage single sign-on session management server failed. Possible causes are shown below.

- If this message is output when the Interstage single sign-on command (*ssosignoff*) is executed, the session management server has not been restarted even though the encryption information (service ID) has been updated.
- The system may be under attack from outside the network.
- There is an error in the environment of the Interstage single sign-on repository server that is managing the session management server.

## User Action

If this message is output when the Interstage single sign-on command (*ssosignoff*) is executed, stop and then restart the session management server. (\*1)

If this message is output at any other time, check that a repository server is operating at the IP address or host name (%s1) from which the request originated.

If no repository server is operating at the IP address or host name (%s1) from which the request originated, the system may be under attack from outside the network. Use the IP address or host name (%s1) from which the request originated to investigate a possible attack.

If none of the above applies, rebuild the repository server that is managing the session management server. (\*2)

\*1 The session management server can be started or stopped by starting or stopping the repository server.

\*2 To rebuild the repository server, open the Interstage Management Console and select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] then select [List] tab and delete the repository server, then use [Authentication Infrastructure Settings] tab and rebuild the repository server again.

---

## 21.20 sso20000 to sso20914

---

### 21.20.1 sso20000

---

**SSO: INFO: sso20000: The SSO log daemon process started. ServerKind=(%s1)**

#### Variable Information

%s1 = Server name

#### Explanation

The Interstage Single Sign-on log daemon process started.

---

### 21.20.2 sso20001

---

**SSO: INFO: sso20001: The SSO log daemon process stopped. ServerKind=(%s1)**

#### Variable Information

%s1 = Server name

#### Explanation

The Interstage Single Sign-on log daemon process stopped.

---

### 21.20.3 sso20002

---

**SSO: ERROR: sso20002: Failed to start the SSO log daemon process. ServerKind=(%s1)**

#### Variable Information

%s1 = Server name

#### Explanation

Failed to start the Interstage Single Sign-on log daemon process.

#### User Action

Check the message output immediately before this message and fix the error.

---

### 21.20.4 sso20003

---

---

**SSO: ERROR: sso20003: Invalid environment. Detail=(%s1) Code=(%s2)****Variable Information**

%s1 = Maintenance information

%s2 = Maintenance information

**Explanation**

Failed to read the environment variable or the registry required for starting the Interstage Single Sign-on log daemon process.

Possible causes are shown below.

- The Interstage Single Sign-on operating environment has been corrupted.
- Interstage Single Sign-on was not installed correctly.

**User Action**

If data containing the environment variable or registry was evacuated, restore it.

If there is no evacuated data, or this message is still output after the environment variable or the registry is restored, reinstall Interstage Single Sign-on.

---

**21.20.5 sso20004**

---

**SSO: ERROR: sso20004: There is no authority for starting the SSO log daemon process.****Explanation**

There is no authorization for starting the Interstage Single Sign-on log daemon process.

**User Action**

Execute the Interstage Single Sign-on log daemon process using administrator authorization.

---

**21.20.6 sso20005**

---

**SSO: ERROR: sso20005: The SSO log daemon process was already started. ServerKind=(%s1)****Variable Information**

%s1 = Server name

**Explanation**

Start processing was attempted when the Interstage Single Sign-on log daemon process was already started.

**User Action**

If it is necessary to restart the log daemon process, first stop the log daemon process and then restart it.

The log daemon process can be started or stopped by starting or stopping the server (%s1).

---

**21.20.7 sso20007**

---

**SSO: ERROR: sso20007: Start processing is not complete. ServerKind=(%s1) Reason=(%s2) Detail=(%s3) Code=(%s4)****Variable Information**

%s1 = Server name

%s2 = Cause of the error

%s3 = Detailed information

%s4 = Maintenance information

## Explanation

Failed to start the Interstage Single Sign-on log daemon process. Possible causes are shown below.

Table 21.91 Errors and Possible Causes

Error Cause (%s2)	Cause
4	The Interstage Single Sign-on log daemon process environment has been corrupted, or Interstage Single Sign-on was not installed correctly.
5	
Other	An internal error occurred in the log daemon process.

## User Action

Take one of the following actions:

Table 21.92 Errors and User Actions

Error Cause (%s2)	Action
4	Reinstall Interstage Single Sign-on.
5	
Other	Immediately after the message is output, use the iscollectinfo command to collect investigation information, then contact your service engineer.

## 21.20.8 sso20008

**SSO: ERROR: sso20008: The exclusion control file can not be accessed. ServerKind=(%s1) Reason=(%s2) Filename=(%s3)**

## Variable Information

%s1 = Server name

%s2 = Cause of the error

%s3 = Name of the file used for locking

## Explanation

Failed to access the file (%s3) used for locking in the Interstage Single Sign-on log daemon process. Possible causes are shown below.

Table 21.93 Errors and Possible Causes

Error Cause (%s2)	Cause
4	The Interstage Single Sign-on log daemon process environment has been corrupted, or Interstage Single Sign-on was not installed correctly.
5	
Other	An internal error occurred in the log daemon process.

## User Action

Take one of the following actions:

Table 21.94 Errors and User Actions

Error Cause (%s2)	Action
4	Reinstall Interstage Single Sign-on.
5	
Other	Immediately after the message is output, use the iscollectinfo command to collect investigation information, then contact your service engineer.

## 21.20.9 sso20009

**SSO: ERROR: sso20009: Failed to lock the exclusion control file. ServerKind=(%s1) Reason=(%s2) Filename=(%s3)**

### Variable Information

%s1 = Server name

%s2 = Cause of the error

%s3 = File name

### Explanation

Failed to lock the file (%s3) in the Interstage Single Sign-on log daemon process. Possible causes are shown below.

Table 21.95 Errors and Possible Causes

Error Cause (%s2)	Cause
0	The Interstage Single Sign-on log daemon process environment has been corrupted, or Interstage Single Sign-on was not installed correctly.
Other	An internal error occurred in the log daemon process.

### User Action

Take one of the following actions:

Table 21.96 Errors and User Actions

Error Cause (%s2)	Action
0	Reinstall Interstage Single Sign-on.
Other	Immediately after the message is output, use the iscollectinfo command to collect investigation information, then contact your service engineer.

## 21.20.10 sso20010

**SSO: ERROR: sso20010: Failed to initialize the exclusion control. ServerKind=(%s1) Detail=(%s2) Code=(%s3)**

### Variable Information

%s1 = Server name

%s2 = Maintenance information

%s3 = Maintenance information

### Explanation

**Windows32/64**

Failed to get the exclusion control resources required to run the Interstage Single Sign-on log daemon process. There may not be sufficient memory to run the Interstage Single Sign-on log daemon process.

**Solaris32/64 Linux32/64**

Failed to get the exclusion control resources required to run the Interstage Single Sign-on log daemon process. There may not be sufficient memory/exclusion control resources (semaphore) to run the Interstage Single Sign-on log daemon process.

### User Action

**Windows32/64**

Close unnecessary programs and check that there is sufficient memory to run the Interstage Single Sign-on server (%s1).

For details about memory requirements, refer to "Memory Requirements" in the "Resource Requirements" chapter of the Tuning Guide.

If there is sufficient available memory, immediately after the message is output, use the `iscollectinfo` command to collect investigation information, and then contact your service engineer.

**Solaris32/64 Linux32/64**

Close unnecessary programs and check that there is sufficient memory to run Interstage Single Sign-on. Check that the size set for the exclusion control resources (semaphore) was set correctly.

For details about memory requirements, refer to "Memory Requirements" in the "Resources Requirements" chapter of the Tuning Guide. For details about the size set for the exclusion control resources (semaphore), refer to the "System Tuning" chapter of the Tuning Guide.

If there is sufficient memory available, and the size set for the exclusion control resources (semaphore) was set correctly, immediately after the message is output, use the `iscollectinfo` command to collect investigation information, then contact your service engineer.

## 21.20.11 sso20011

---

**SSO: ERROR: sso20011: The exclusion control failed. ServerKind=(%s1) Detail=(%s2) Code=(%s3)**

### Variable Information

%s1 = Server name

%s2 = Maintenance information

%s3 = Maintenance information

### Explanation

**Windows32/64**

The Interstage Single Sign-on log daemon process failed to operate the exclusion control resources. There may not have been sufficient memory to run the Interstage Single Sign-on log daemon process.

**Solaris32/64 Linux32/64**

The Interstage Single Sign-on log daemon process failed to operate the exclusion control resources. There may not have been sufficient memory/exclusion control resources (semaphore) required to run the Interstage Single Sign-on log daemon process.

### User Action

**Windows32/64**

Close unnecessary programs and check that there is sufficient memory to run the Interstage Single Sign-on server (%s1).

For details about memory requirements, refer to "Memory Requirements" in the "Resources Requirements" chapter of the Tuning Guide.

If there is sufficient memory, immediately after the message is output, use the `iscollectinfo` command to collect investigation information, then contact your service engineer.

**Solaris32/64 Linux32/64**

Close unnecessary programs and check that there is sufficient memory available for running Interstage Single Sign-on. Check that the size set for the exclusion control resources (semaphore) was set correctly.

For details about memory requirements, refer to "Memory Requirements" in the "Resources Requirements" chapter of the Tuning Guide. For details about the size set for the exclusion control resources (semaphore), refer to the "System Tuning" chapter in the Tuning Guide.

If there is sufficient memory, and the size set for the exclusion control resources (semaphore) was set correctly, immediately after the message is output, use the `iscollectinfo` command to collect investigation information, and then contact your service engineer.

## 21.20.12 sso20012

---

**SSO: ERROR: sso20012: A Service that is using SSO log daemon process is started. ServerKind=(%s1)**

### Variable Information

%s1 = Server name

### Explanation

Startup of the Interstage Single Sign-on log daemon process failed because startup of the server (%s1) is in progress.

### User Action

Execute the operation again after the server (%s1) is stopped.

## 21.20.13 sso20102

---

**SSO: ERROR: sso20102: Allocation of memory failed. Detail=(%s1) Code=(%s2)**

### Variable Information

%s1 = Detailed information

%s2 = Maintenance information

### Explanation

Failed to allocate memory required for running the Interstage Single Sign-on log daemon process.

### User Action

Close unnecessary programs. Check that there is sufficient memory available to run Interstage Single Sign-on.

For details about memory requirements, refer to "Memory Requirements" in the "Resource Requirements" chapter of the Tuning Guide.

## 21.20.14 sso20104

---

**SSO: ERROR: sso20104: Failed to initialize the thread exclusion control. Reason=(%s1)**

### Variable Information

%s1 = Error cause

### Explanation

Failed to initialize the exclusion resources in the Interstage Single Sign-on log daemon process. Possible causes are shown below.

Table 21.97 Errors and Possible Causes

Error Cause (%s1)	Cause
12	There was not enough memory.
Other	Another error occurred.

### User Action

Take one of the following actions:

Table 21.98 Errors and User Actions

Error Cause (%s1)	Action
12	Close unnecessary programs. Check that there is sufficient memory available to run Interstage Single Sign-on. For details about the memory that is required, refer to "Memory Requirements" in the "Resource Requirements" chapter of the Tuning Guide.
Other	Immediately after the message is output, use the iscollectinfo command to collect investigation information, then contact your service engineer.

## 21.20.15 sso20105

---

**SSO: ERROR: sso20105: Failed to get the thread exclusion. Reason=(%s1) Code=(%s2)**

### Variable Information

%s1 = Cause of the error

%s2 = Maintenance information

### Explanation

Failed to get the exclusion in the Interstage Single Sign-on log daemon process.

### User Action

Immediately after the message is output, use the iscollectinfo command to collect investigation information, then contact your service engineer.

## 21.20.16 sso20106

---

**SSO: ERROR: sso20106: Failed to release the thread exclusion. Reason=(%s1) Code=(%s2)**

### Variable Information

%s1 = Cause of the error

%s2 = Maintenance information

### Explanation

Failed to release the exclusion in the Interstage Single Sign-on log daemon process.

### User Action

Immediately after the message is output, use the iscollectinfo command to collect investigation information, then contact your service engineer.

## 21.20.17 sso20108

---

**SSO: ERROR: sso20108: Failed to create the thread. Reason=(%s1)**

### Variable Information

%s1 = Cause of the error

### Explanation

Failed to create the thread used in the Interstage Single Sign-on log daemon process. Generation of the thread may have failed because of insufficient memory.

## User Action

Close unnecessary programs and check that there is sufficient memory available to run Interstage Single Sign-on.

For details about the memory that is required, refer to "Memory Requirements" in the "Resource Requirements" chapter of the Tuning Guide.

## 21.20.18 sso20300

---

**SSO: ERROR: sso20300: Failed to initialize the maintenance log. ServerKind=(%s1) Reason=(%s2) Detail=(%s3) Code=(%s4)**

### Variable Information

%s1 = Server name

%s2 = Cause of the error

%s3 = Detailed information

%s4 = Maintenance information

### Explanation

**Windows32/64**

Initialization failed for the maintenance log of the Interstage Single-Sign-on log daemon process. There may be less memory than required for this operation.

**Solaris32/64 Linux32/64**

Initialization failed for the maintenance log of the Interstage Single-Sign-on log daemon process. There may be less memory than required for this operation, or the shared memory/exclusion control resource (semaphore) settings are incorrect.

### User Action

**Windows32/64**

Close unnecessary programs, or check that sufficient memory is available to meet the memory requirements of Interstage Single-Sign-on.

For details about the memory that is required, refer to "Memory Requirements" in the "Resource Requirements" chapter of the Tuning Guide.

If there is sufficient memory, immediately after the message is output, use the `iscollectinfo` command to collect investigation information, then contact your service engineer.

**Solaris32/64 Linux32/64**

Close unnecessary programs. Check that there is sufficient memory available to run Interstage Single Sign-on, and that the shared memory/size for the exclusion control resources (semaphore) is correctly set.

For details about the memory that is required, refer to "Memory Requirements" in the "Resource Requirements" chapter of the Tuning Guide. For details about the shared memory/size for the exclusion control resources (semaphore) that is required, refer to the "System Tuning" chapter in the Tuning Guide.

If the problem is still not resolved, the IPC resources required for running Interstage Single Sign-on and the IPC resources being used by another application may overlap. For this reason, the IPC resources must be customized. For details, refer to the Appendix 'Setting IPC Resources' of the Tuning Guide.

If there is sufficient memory available, and the shared memory/size for the exclusion control resources (semaphore) is correctly set, immediately after the message is output, use the `iscollectinfo` command to collect investigation information, then contact your service engineer.

## 21.20.19 sso20301

---

**SSO: ERROR: sso20301: Failed to output the maintenance log. ServerKind=(%s1) Reason=(%s2) Detail=(%s3) Code=(%s4)**

### Variable Information

%s1 = Server name

%s2 = Cause of the error

%s3 = Detailed information

%s4 = Maintenance information

### Explanation

Failed to output the Interstage Single Sign-on log daemon process maintenance log.

### User Action

Immediately after the message is output, use the iscollectinfo command to collect investigation information, then contact your service engineer.

## 21.20.20 sso20302

---

**SSO: ERROR: sso20302: Failed to initialize the log. ServerKind=(%s1) LogFile=(%s2) Reason=(%s3)**

### Variable Information

%s1 = Server name

%s2 = Log output file name

%s3 = Error cause

### Explanation

Failed to initialize the following logs in the Interstage Single Sign-on log daemon process.

Table 21.99 Logs that Failed to Initialize

Server Name (%s1)	Log
Authentication server	Access log of Authentication server

Possible causes are shown below.

Table 21.100 Errors and Possible Causes

Error Cause(%s3)	Cause
Permission denied	Access authority has not been set for the log output file (%s2) directory.
	Access authority has not been set for the log output file (%s2).
	The log output file(%s2) may be in use by another application.
Directory not found	Cannot find the log output file (%s2) directory.
Filename is directory	A directory has been set for the log output file (%s2).
Not enough disk space	There is not enough disk space.
Not enough memory	There was not enough memory for running the Interstage Single Sign-on log daemon process.
Acquisition of shared memory failed	There was not enough shared memory for running the Interstage Single Sign-on log daemon process.

Error Cause(%s3)	Cause
Operation of shared memory failed	
Acquisition of exclusive lock resource failed	There were not enough exclusion control resources (semaphore) required for running the Interstage Single Sign-on log daemon process.
Exclusive lock failed	
System error	There were not enough exclusion control resources (semaphore) required for running the Interstage Single Sign-on log daemon process.

## User Action

Take one of the following actions:

Table 21.101 Errors and User Actions

Cause of error(%s3)	Action
Permission denied	Check whether access authority has been set correctly for the log output file (%s2) directory, and correct it if necessary. (*1)
	If the log output file (%s2) exists, check whether access authority has been set correctly it (%s2), and correct it if necessary. (*1)
	Check if the log output file (%s2) is in use by another application. Close the application if necessary.
Directory not found	Check whether the directory in the log output file (%s2) and the directory in the output file name exist.
Filename is directory	Set a file name for the log output file. (*2)
Not enough disk space	Delete unnecessary files to secure available disk space.
Not enough memory	<p><b>Windows32/64</b></p> <p>Close unnecessary programs. Check that there is sufficient memory available to run Interstage Single Sign-on. For details about memory requirements, refer to "Memory Requirements" in the "Resource Requirements" chapter of the Tuning Guide.</p> <p><b>Solaris32/64 Linux32/64</b></p> <p>Close unnecessary programs. Check that there is sufficient memory available to run Interstage Single Sign-on, and that the shared memory size is correctly set. For details about memory requirements, refer to "Memory Requirements" in the "Resource Requirements" chapter of the Tuning Guide. For details about the required shared memory size, refer to the chapter "System Tuning" of the Tuning Guide.</p>
	<p><b>Solaris32/64 Linux32/64</b></p> <p>Check the system parameters. For details about system parameters, refer to the chapter "System Tuning" of the Tuning Guide.</p>
Acquisition of shared memory failed	<p><b>Solaris32/64 Linux32/64</b></p> <p>Check the system parameters. For details about system parameters, refer to the chapter "System Tuning" of the Tuning Guide.</p>
Operation of shared memory failed	
Acquisition of exclusive lock resource failed	
Exclusive lock failed	
System error	Immediately after the message is output, use the iscollectinfo command to collect investigation information, then contact your service engineer.

\*1 For details about the access authority settings, refer to 'Changing Environment Settings' - 'Changing Effective User for Web Server' in the chapter 'Operation and Maintenance' of the Single Sign-on Operator's Guide.

\*2 For details about the log output file for each server, refer to the chapter 'Messages Logged and Output in Single Sign-on' in 'Messages'.

## 21.20.21 sso20303

### SSO: ERROR: sso20303: Can not write log. ServerKind=(%s1) LogFile=(%s2) Reason=(%s3)

#### Variable Information

%s1 = Server name

%s2 = Access log output file name

%s3 = Cause of the error

#### Explanation

Failed to write the following logs in the Interstage Single Sign-on log daemon process.

Table 21.102 Logs that could not be written

Server Name (%s1)	Log
Authentication server	Authentication server access log

Possible causes are shown below.

Table 21.103 Errors and Possible Causes

Error cause (%s3)	Cause
Permission denied	Access authority has not been set for the log output file (%s2) directory.
	Access authority has not been set for the log output file (%s2).
	The log output file (%s1), or the evacuation file used when the log was switched (%s1.last, or %s1.YYYYMMDDHHMMSS (the string used for saving the YearMonthDayHoursMinutesSeconds) may be in use by another application.
Not enough disk space	There was not enough disk space.
Not enough memory	There was not enough memory for running the Interstage Single Sign-on log daemon process.
Acquisition of shared memory failed	There was not enough shared memory for running the Interstage Single Sign-on log daemon process.
Operation of shared memory failed	
Acquisition of exclusive lock resource failed	There were not enough exclusion control resources (semaphore) required for running the Interstage Single Sign-on log daemon process.
Exclusive lock failed	
System error	An internal conflict occurred in the Interstage Single Sign-on log daemon process application.
	<div style="border: 1px solid black; padding: 2px; display: inline-block;">Solaris32/64 Linux32/64</div> There is a possibility that the log daemon process log output file is a symbolic link.

#### User Action

Take one of the following actions:

Table 21.104 Errors and Possible Causes

Error Cause(%s3)	Action
Permission denied	Ensure that access authority has been set correctly for the log output file (%s2) directory, and correct it if necessary. (*1)
	If the log output file (%s2) exists, check whether access authority has been set correctly for it (%s2), and correct it if necessary. (*1)

Error Cause(%s3)	Action
	Check that the log output file (%s1), or the evacuation file used when the log was switched (%s1.last, or %s1.YYYYMMDDHHMMSS (the string used for saving the YearMonthDayHoursMinutesSeconds) is not being used by another application. If the file is being used by another application, close the other application.
Not enough disk space	Delete unnecessary files to secure available disk space.
Not enough memory	Close unnecessary programs. Check that there is also enough required memory secured for running Interstage Single Sign-on. For details about the memory that is required, refer to "Memory Requirements" in the "Resource Requirements" chapter of the Tuning Guide.
Acquisition of shared memory failed	<a href="#">Solaris32/64</a> <a href="#">Linux32/64</a> Check the system parameters. For details about system parameters, refer to the "System Tuning" chapter in the Tuning Guide.
Operation of shared memory failed	
Acquisition of exclusive lock resource failed	
Exclusive lock failed	
System error	Immediately after the message is output, use the iscollectinfo command to collect investigation information, and then contact your service engineer.  <a href="#">Solaris32/64</a> <a href="#">Linux32/64</a>  Check that the log daemon process log output file (%s1) symbolic link does not exist.

\*1 For details on the access authority settings, refer to 'Changing Environment Settings' - 'Changing Effective User for Web Server' in the chapter 'Operation and Maintenance' of the Single Sign-on Operator's Guide.

## 21.20.22 sso20400

---

**SSO: ERROR: sso20400: Illegal data was received. ServerKind=(%s1) Detail=(%s2) Code=(%s3)**

### Variable Information

%s1 = Server name

%s2 = Maintenance information

%s3 = Maintenance information

### Explanation

The Interstage Single Sign-on log daemon process received illegal data.

### User Action

Stop the log daemon process, then restart it. If the problem is still not resolved, immediately after the message is output, use the iscollectinfo command to collect investigation information, then contact your service engineer.

## 21.20.23 sso20900

---

**SSO: ERROR: sso20900: Can not start the SSO log daemon process. ServerKind=(%s1) Reason=(%s2)**

### Variable Information

%s1 = Server name

%s2 = Cause of the error

## Explanation

Cannot start the Interstage Single Sign-on log daemon process. Possible causes are shown below.

Table 21.105 Errors and Possible Causes

Error Cause (%s2)	Cause
4	A signal was received during processing.
11	There were insufficient resources temporarily.
12	There was not enough memory.
Other	Interstage Single Sign-on may not have been installed correctly.

## User Action

Take one of the following actions:

Table 21.106 Errors and User Actions

Error Cause (%s2)	Action
4	Stop the log daemon process, and then restart it. (*1)
11	
12	Close unnecessary programs. Check that there is sufficient memory available to run Interstage Single Sign-on. For details about the memory that is required, refer to "Memory Requirements" in the "Resource Requirements" chapter of the Tuning Guide
Other	Reinstall Interstage Single Sign-on.

\*1 The log daemon process can be started or stopped by starting or stopping the server (%s1).

## 21.20.24 sso20901

---

**SSO: INFO: sso20901: The SSO log daemon process was restarted. ServerKind=(%s1)**

### Variable Information

%s1 = Server name

### Explanation

The Interstage Single Sign-on log daemon process was starting, so it restarts.

## 21.20.25 sso20902

---

**SSO: WARNING: sso20902: The SSO log daemon process was already stopped. ServerKind=(%s1)**

### Variable Information

%s1 = Server name

### Explanation

An attempt was made to perform Interstage Single Sign-on log daemon process stop processing, but the log daemon process was already stopped. For this reason, stop processing is not performed.

## 21.20.26 sso20903

---

**SSO: ERROR: sso20903: Failed to start the SSO log daemon process. ServerKind=(%s1)**

### Variable Information

%s1 = Server name

### Explanation

Failed to start the Interstage Single Sign-on log daemon process.

### User Action

Check the message output immediately before this message and fix the error.

## 21.20.27 sso20904

---

**SSO: ERROR: sso20904: There is no authority for operating exclusion control files. ServerKind=(%s1)**

### Variable Information

%s1 = Server name

### Explanation

There is no authorization for the file operation required to start the Interstage Single Sign-on log daemon process. Possible causes are shown below.

- The Interstage Single Sign-on environment has been corrupted.
- Interstage Single Sign-on was not installed correctly.

### User Action

Reinstall Interstage Single Sign-on.

## 21.20.28 sso20905

---

**SSO: ERROR: sso20905: SSO log daemon process is busy. ServerKind=(%s1)**

### Variable Information

%s1 = Server name

### Explanation

The Interstage Single Sign-on log daemon process cannot receive the start request.

### User Action

Wait for a while and then start the server (%s1).

## 21.20.29 sso20906

---

**SSO: ERROR: sso20906: A timeout occurred while the SSO log daemon process was starting. ServerKind=(%s1)**

## Variable Information

%s1 = Server name

## Explanation

A timeout occurred while the Interstage Single Sign-on log daemon process was starting.

## User Action

Wait for a while and then reexecute processing.

If the problem is still not resolved, immediately after the message is output, use the iscollectinfo command to collect investigation information, then contact your service engineer.

## 21.20.30 sso20910

---

### **SSO: ERROR: sso20910: Failed to stop the SSO log daemon process. ServerKind=(%s1)**

## Variable Information

%s1 = Server name

## Explanation

Failed to stop the Interstage Single Sign-on log daemon process.

## User Action

Check the message output immediately before this message and fix the error.

If the problem is still not resolved, immediately after the message is output, use the iscollectinfo command to collect investigation information, then contact your service engineer.

## 21.20.31 sso20911

---

### **SSO: ERROR: sso20911: There is no authority for operating exclusion control files. ServerKind=(%s1)**

## Variable Information

%s1 = Server name

## Explanation

There is no authorization for the file operation required to stop the Interstage Single Sign-on log daemon process. Possible causes are shown below.

- The Interstage Single Sign-on environment has been corrupted.
- Interstage Single Sign-on was not installed correctly.

## User Action

Reinstall Interstage Single Sign-on.

## 21.20.32 sso20912

---

### **SSO: ERROR: sso20912: SSO log daemon process is busy. ServerKind=(%s1)**

## Variable Information

%s1 = Server name

## Explanation

The Interstage Single Sign-on log daemon process cannot receive the stop request. The log daemon process will stop after a short period.

## User Action

If the log daemon process does not stop after a short period, immediately after the message is output, use the `iscollectinfo` command to collect investigation information, then contact your service engineer.

## 21.20.33 sso20913

---

**SSO: WARNING: sso20913: The SSO log daemon process is stopping. ServerKind=(%s1)**

## Variable Information

%s1 = Server name

## Explanation

The Interstage Single Sign-on log daemon process is stopping. The log daemon process will stop after a short period.

## User Action

If the log daemon process does not stop after a short period, immediately after the message is output, use the `iscollectinfo` command to collect investigation information, then contact your service engineer.

## 21.20.34 sso20914

---

**SSO: ERROR: sso20914: A timeout occurred while the SSO log daemon process was stopping. ServerKind=(%s1)**

## Variable Information

%s1 = Server name

## Explanation

A timeout occurred while the Interstage Single Sign-on log daemon process was stopping.

## User Action

Wait for a while and then reexecute processing.

If the problem is still not resolved, immediately after the message is output, use the `iscollectinfo` command to collect investigation information, then contact your service engineer.

# Chapter 22 Messages Beginning with 'SSQCARM'

## 22.1 SSQCARM 1000 to SSQCARM 1099

---

This section details messages numbered between SSQCARM1000 and SSQCARM1099.

### 22.1.1 SSQCARM1001

---

#### **SSQCARM1001: ArmTransaction initialization successful.**

##### Explanation

The ArmTransaction initialization when transaction breakdown analysis was used completed normally.

### 22.1.2 SSQCARM1002

---

#### **SSQCARM1002: Failed to initialize the ArmTransaction. DETAIL={0}**

##### Variable Information

{0} = Error details

##### Explanation

Failed to initialize the ArmTransaction.

##### System Action

Processing is continued.

Transaction breakdown analysis cannot be used.

##### User Action

Based on the error details, take the following action:

- If "System property is null. property name=com.sun.aas.instanceName" was output to the detail error message, check whether the target associated with the application exists.

If the associated target does not exist, execute the create-application-ref subcommand to add the application and target association, and then re-execute the operation.

If the associated target exists, execute the *iscollectinfo* command to collect the diagnostic information, and then contact Fujitsu technical support.

- If "A library required for transaction analysis cannot be used." was output to the detail error message, check whether the Systemwalker Service Quality Coordinator Agent product has been installed.

If the problem continues, execute the *iscollectinfo* command to collect the diagnostic information and then contact Fujitsu technical support.

- For all other errors:

Execute the *iscollectinfo* command to collect the diagnostic information, and then contact Fujitsu technical support.

### 22.1.3 SSQCARM1003

---

#### **SSQCARM1003: ArmTransaction start successful.**

##### Explanation

Collection of the application performance information started normally.

## 22.1.4 SSQCARM1004

---

### SSQCARM1004: ArmTransaction start failed with exception: {0}

#### Variable Information

{0} = Exception information

#### Explanation

An error occurred when the ArmTransaction was executed.

#### System Action

Processing is continued.

Transaction breakdown analysis does not save the current process information.

#### User Action

Execute the *iscollectinfo* command to collect the diagnostic information, and then contact Fujitsu technical support.

## 22.1.5 SSQCARM1005

---

### SSQCARM1005: ArmTransaction stop successful.

#### Explanation

Collection of the application performance information stopped normally.

## 22.1.6 SSQCARM1006

---

### SSQCARM1006: ArmTransaction stop failed with exception: {0}

#### Variable Information

{0} = Exception information

#### Explanation

An error occurred when the ArmTransaction was stopped.

#### System Action

Processing is continued.

Transaction breakdown analysis does not save the current process information.

#### User Action

Execute the *iscollectinfo* command to collect the diagnostic information, and then contact Fujitsu technical support.

# Chapter 23 Messages Beginning with 'SvMon'

This chapter explains the messages starting with 'SvMon'.

## 23.1 SvMon1000 to SvMon1999

This section details messages numbered between SvMon1000 and SvMon1999.

### 23.1.1 SvMon1001

**SvMon: ERROR: SvMon1001: Not a root user.**

#### Explanation

The *svmondspstat* command was executed by a user without root authority.

#### User Action

Re-execute the command by a user with root authority.

### 23.1.2 SvMon1002

**SvMon: ERROR: SvMon1002: Internal error occurred. (%s1)**

#### Variable Information

%s1 = Location in which the error occurred

#### Explanation

An internal error occurred when the *svmondspstat* command was executed.

#### User Action

**Windows32/64**

If "log" is displayed in the variable information, files that were installed on product installation may have been deleted. Check that the following file exists. If it does not exist, re-install the product.

C:\Interstage\bin\i3fmsvmonmsg.dll

**Solaris32/64 Linux32/64**

If a message with another number is displayed in the system log, take the action indicated by that message.

If the above does not apply, use the *iscollectinfo* command to collect diagnostic information. Send this information to a Systems Engineer.

### 23.1.3 SvMon1003

**SvMon: ERROR: SvMon1003: Shared memory access init error. (%d1,%d2)**

#### Variable Information

%d1 = Error information

%d2 = System error information

#### Explanation

An initialization error occurred in the shared memory access library.

#### System Action

Processing stops.

#### User Action

Use the *iscollectinfo* command to collect diagnostic information. Send this information to a Systems Engineer.

---

### 23.1.4 SvMon1004

---

**SvMon: ERROR: SvMon1004: Internal error occurred(Shm already init).**

#### Explanation

The shared memory access library has already been initialized.

#### System Action

Processing stops.

#### User Action

Use the *iscollectinfo* command to collect diagnostic information. Send this information to a Systems Engineer.

---

### 23.1.5 SvMon1005

---

**SvMon: ERROR: SvMon1005: Internal error occurred(Shm not init).**

#### Explanation

The shared memory access library has not been initialized.

#### System Action

Processing stops.

#### User Action

Use the *iscollectinfo* command to collect diagnostic information. Send this information to a Systems Engineer.

---

### 23.1.6 SvMon1006

---

**SvMon: ERROR: SvMon1006: Server Monitor is not started.**

#### Explanation

The fault monitoring function did not start normally.

#### System Action

Processing stops.

#### User Action

Stop the fault monitoring function service manually, and then re-start the machine.

If the above does not apply, use the *iscollectinfo* command to collect diagnostic information. Send this information to a Systems Engineer.

---

### 23.1.7 SvMon1007

---

**SvMon: ERROR: SvMon1007: Shared memory access lock error. (%d1,%d2)**

#### Variable Information

%d1 = Error information

%d2 = System error information

## Explanation

A lock error occurred in the shared memory access library.

## System Action

Processing stops.

## User Action

Use the *iscollectinfo* command to collect diagnostic information. Send this information to a Systems Engineer.

---

## 23.1.8 SvMon1008

---

**SvMon: ERROR: SvMon1008: Shared memory access attach error. (%d1,%d2)**

## Variable Information

%d1 = Error information

%d2 = System error information

## Explanation

A memory acquisition error occurred in the shared memory access library.

## System Action

Processing stops.

## User Action

Use the *iscollectinfo* command to collect diagnostic information. Send this information to a Systems Engineer.

---

## 23.1.9 SvMon1009

---

**SvMon: ERROR: SvMon1009: Shared memory access unlock error. (%d1,%d2)**

## Variable Information

%d1 = Error information

%d2 = System error information

## Explanation

An unlock error occurred in the shared memory access library.

## System Action

Processing stops.

## User Action

Use the *iscollectinfo* command to collect diagnostic information. Send this information to a Systems Engineer.

---

## 23.1.10 SvMon1010

---

**SvMon: ERROR: SvMon1010: Failed in the access to the event log.**

## Explanation

Write authority for the event log was not set for the user that executed the *svmondspstat* command.

## System Action

Processing stops.

#### User Action

Set write authority for the event log for the user that executed the *svmondspstat* command.

### 23.1.11 SvMon1011

---

#### **SvMon: ERROR: SvMon1011: Specified WorkUnit does not exist.**

#### Explanation

The WorkUnit specified in the -i option argument for the *svmondspstat* command does not exist.

#### System Action

Processing stops.

#### User Action

Specify a correct WorkUnit name, then re-execute the *svmondspstat* command.

### 23.1.12 SvMon1012

---

#### **SvMon: ERROR: SvMon1012: Specified WebServer does not exist.**

#### Explanation

The Web server specified by the -s option of the *svmondspstat* command does not exist.

Alternatively, fault monitoring settings have not been configured.

#### System Action

Processing stops.

#### User Action

Specify a correct Web server name, then re-execute the *svmondspstat* command.

### 23.1.13 SvMon1020

---

#### **SvMon: ERROR: SvMon1020: Memory allocate error.**

#### Explanation

There was insufficient memory when the *svmondspstat* command was executed.

#### System Action

Processing stops.

#### User Action

Check that there is available memory, then re-execute the *svmondspstat* command. If this happens often, increase the memory.

If this message is output regardless of whether or not there is sufficient memory, use the *iscollectinfo* command to collect diagnostic information. Send this information to a Systems Engineer.

### 23.1.14 SvMon1103

---

#### **SvMon: WARNING: SvMon1103: WorkUnit name length error.**

#### Explanation

The string for the WorkUnit name specified in the -i option argument for the *svmondspstat* command was too long.

#### User Action

Specify a correct WorkUnit name, then re-execute the *svmondspstat* command.

---

### 23.1.15 SvMon1104

---

#### **SvMon: WARNING: SvMon1104: WorkUnit name character error.**

#### Explanation

An illegal character was included in the WorkUnit name specified in the *-i* option argument for the *svmondspstat* command.

#### User Action

Specify a correct WorkUnit name, then re-execute the *svmondspstat* command.

---

### 23.1.16 SvMon1105

---

#### **SvMon: WARNING: SvMon1105: WebServer name length error.**

#### Explanation

The Web server name specified in the *-s* option argument for the *svmondspstat* command is too long.

#### User Action

Specify a correct Web server name, then re-execute the *svmondspstat* command.

---

### 23.1.17 SvMon1201

---

#### **SvMon: INFO: SvMon1201: WorkUnit is not defined.**

#### Explanation

The definition of fault monitoring for the WorkUnit specified in the *-i* option argument for the *svmondspstat* command has not been performed.

---

### 23.1.18 SvMon1202

---

#### **SvMon: INFO: SvMon1202: WebServer is not defined.**

#### Explanation

A WebServer that uses fault monitoring has not been defined.

---

## 23.2 SvMon2000 to SvMon2999

---

This section details messages numbered between SvMon2000 and SvMon2999.

---

### 23.2.1 SvMon2001

---

#### **SvMon: ERROR: SvMon2001: Not a root user.**

#### Explanation

*svmonobservd* was executed by a user without root authority.

#### System Action

Processing stops.

#### User Action

This command is executed to start the daemon when the machine starts up.

Do not execute this command manually.

## 23.2.2 SvMon2002

---

### SvMon: ERROR: SvMon2002: Logfile init error. (errno = %d1)

#### Variable Information

%d1 = System error information

#### Explanation

Failed to initialize the log file.

#### System Action

Processing stops.

#### User Action

##### Windows32/64

Files that were installed on product installation may have been deleted. Check that the following files exist. If they do not exist, re-install the product.

C:\Interstage\bin\f3fmsvmonmsg.dll

If the above does not apply, use the *iscollectinfo* command to collect diagnostic information. Send this information to a Systems Engineer.

##### Solaris32/64 Linux32/64

Use the *iscollectinfo* command to collect diagnostic information. Send this information to a Systems Engineer.

## 23.2.3 SvMon2003

---

### SvMon: ERROR: SvMon2003: pidfile open error. (errno = %d1)

#### Variable Information

%d1 = System error information

#### Explanation

Failed to open the double startup check file.

#### System Action

Processing stops.

#### User Action

Use the *iscollectinfo* command to collect diagnostic information. Send this information to a Systems Engineer.

## 23.2.4 SvMon2004

---

### SvMon: ERROR: SvMon2004: pidfile read error. (errno = %d1)

#### Variable Information

%d1 = System error information

#### Explanation

Failed to read the double startup check file.

#### System Action

Processing stops.

## User Action

Use the *iscollectinfo* command to collect diagnostic information. Send this information to a Systems Engineer.

### 23.2.5 SvMon2005

---

#### **SvMon: ERROR: SvMon2005: pidfile fputs error.(errno = %d1)**

##### Variable Information

%d1 = System error information

##### Explanation

Failed to write the double startup check file.

##### System Action

Processing stops.

##### User Action

Use the *iscollectinfo* command to collect diagnostic information. Send this information to a Systems Engineer.

### 23.2.6 SvMon2006

---

#### **SvMon: ERROR: SvMon2006: procfile open error.(errno = %d1)**

##### Variable Information

%d1 = System error information

##### Explanation

Failed to open the proc file using the double startup check file.

##### System Action

Processing stops.

##### User Action

Use the *iscollectinfo* command to collect diagnostic information. Send this information to a Systems Engineer.

### 23.2.7 SvMon2007

---

#### **SvMon: ERROR: SvMon2007: procfile read error.(errno = %d1)**

##### Variable Information

%d1 = System error information

##### Explanation

Failed to read the proc file using the double startup check file.

##### System Action

Processing stops.

##### User Action

Use the *iscollectinfo* command to collect diagnostic information. Send this information to a Systems Engineer.

### 23.2.8 SvMon2008

---

---

**SvMon: ERROR: SvMon2008: f3fmsvmonobserved already active.(%d1)****Variable Information**

%d1 = System error information

**Explanation**

The process was started twice, so the second process has been closed.

**System Action**

Processing continues.

**User Action**

No action is required.

---

**23.2.9 SvMon2009**

---

**SvMon: ERROR: SvMon2009: mkfifo error.(errno = %d1)****Variable Information**

%d1 = System error information

**Explanation**

Failed to create the pipe file.

**System Action**

Processing stops.

**User Action**

Use the *iscollectinfo* command to collect diagnostic information. Send this information to a Systems Engineer.

---

**23.2.10 SvMon2010**

---

**SvMon: ERROR: SvMon2010: pthread\_create error.(errno = %d1)****Variable Information**

%d1 = System error information

**Explanation**

Failed to start the thread.

**System Action**

Processing stops.

**User Action**

Use the *iscollectinfo* command to collect diagnostic information. Send this information to a Systems Engineer.

---

**23.2.11 SvMon2011**

---

**SvMon: ERROR: SvMon2011: pipe open error.(errno = %d1)****Variable Information**

%d1 = System error information

#### Explanation

Failed to open the pipe file.

#### System Action

Processing stops.

#### User Action

Use the *iscollectinfo* command to collect diagnostic information. Send this information to a Systems Engineer.

---

### 23.2.12 SvMon2012

---

#### **SvMon: ERROR: SvMon2012: stop f3fmsvmond by kill.**

#### Explanation

The fault monitoring process (f3fmsvmond) was shut down.

#### System Action

Processing continues.

#### User Action

Use the *iscollectinfo* command to collect diagnostic information. Send this information to a Systems Engineer.

---

### 23.2.13 SvMon2013

---

#### **SvMon: ERROR: SvMon2013: Stop f3fmsvmonobservd timeout error.**

#### Explanation

A timeout occurred when the survival monitoring process (f3fmsvmonobservd) was closed.

#### System Action

Processing stops.

#### User Action

Use the *iscollectinfo* command to collect diagnostic information. Send this information to a Systems Engineer.

---

### 23.2.14 SvMon2014

---

#### **SvMon: ERROR: SvMon2014: Stop f3fmsvmond timeout error.**

#### Explanation

A timeout occurred when the fault monitoring process (f3fmsvmond) was closed.

#### System Action

Processing continues.

#### User Action

No action is required.

---

### 23.2.15 SvMon2015

---

#### **SvMon: ERROR: SvMon2015: Error stop send to f3fmsvmonobservd. (errno = %d1)**

#### Variable Information

%d1 = System error information

### Explanation

Failed to send the stop instruction to the survival monitoring process (f3fmsvmonobsrvd).

### System Action

Processing stops.

### User Action

Use the *iscollectinfo* command to collect diagnostic information. Send this information to a Systems Engineer.

---

## 23.2.16 SvMon2016

---

### SvMon: ERROR: SvMon2016: Error stop send to f3fmsvmond. (errno = %d1)

#### Variable Information

%d1 = System error information

### Explanation

Failed to send the stop instruction to the fault monitoring process (f3fmsvmond).

### System Action

Processing stops.

### User Action

Use the *iscollectinfo* command to collect diagnostic information. Send this information to a Systems Engineer.

---

## 23.2.17 SvMon2017

---

### SvMon: ERROR: SvMon2017: f3fmsvmond exec error. (errno = %d1)

#### Variable Information

%d1 = System error information

### Explanation

Failed to start the fault monitoring process (f3fmsvmond).

### System Action

Processing stops.

### User Action

Files installed on product installation may have been deleted. Check that the following files exist. If they do not exist, re-install the product.

**Windows32/64**

C:\Interstage\bin\f3fmsvmond.exe

**Solaris32/64** **Linux32/64**

/opt/FJSVsvmon/lib/f3fmsvmond

If the above does not apply, use the *iscollectinfo* command to collect diagnostic information. Send this information to a Systems Engineer.

---

## 23.2.18 SvMon2018

---

### SvMon: ERROR: SvMon2018: f3fmsvmond failure was detected. (errno = %d1)

## Variable Information

%d1 = System error information

## Explanation

An abnormality was detected in the fault monitoring process (f3fmsvmond).

## System Action

Processing stops.

## User Action

Use the *iscollectinfo* command to collect diagnostic information. Send this information to a Systems Engineer.

---

## 23.2.19 SvMon2019

---

### **SvMon: ERROR: SvMon2019: Config file read error.**

## Explanation

Failed to read a file that is required to start the service.

## System Action

Processing stops.

## User Action

Use the *iscollectinfo* command to collect diagnostic information. Send this information to a Systems Engineer.

---

## 23.2.20 SvMon2020

---

### **SvMon: ERROR: SvMon2020: Retry count exceeded exec\_retry.**

## Explanation

The retry count for restarting the fault monitoring process (f3fmsvmond) was exceeded.

## System Action

Processing stops.

## User Action

Take the action indicated by the message starting with 'SvMon' displayed before this message.

If no message starting with 'SvMon' was displayed before this message, use the *iscollectinfo* command to collect diagnostic information. Send this information to a Systems Engineer.

---

## 23.2.21 SvMon2021

---

### **SvMon: ERROR: SvMon2021: Failed in acquisition of f3fmsvmond status. (errno = %d1)**

## Variable Information

%d1 = System error information

## Explanation

Failed to get the fault monitoring process (f3fmsvmond) status.

## System Action

Processing continues.

## User Action

No action is required.

## 23.3 SvMon4000 to SvMon4999

---

This section details messages numbered between SvMon4000 and SvMon4999.

### 23.3.1 SvMon4001

---

**SvMon: ERROR: SvMon4001: An error was detected. '%d1 %d2 %d3'**

#### Variable Information

%d1 = The location at which the error occurred

%d2 = Details of the location at which the error occurred

%d3 = System error information

#### Explanation

An unexpected abnormality occurred in the fault monitoring process (f3fmsvmond).

#### System Action

Processing stops.

#### User Action

Use the *iscollectinfo* command to collect diagnostic information. Send this information to a Systems Engineer.

### 23.3.2 SvMon4002

---

**SvMon: ERROR: SvMon4002: A balancing target server failure was detected. '%s1 %s2 % s3 %s4'**

#### Variable Information

%s1 = Web server name

%s2 = IJServer name

%s3 = IP address of the IJServer machine in which the fault was detected

%s4 = Port number of the Servlet container in which the fault was detected (this is '-----' when the fault monitoring method is ping monitoring.)

#### Explanation

A fault was detected in the IJServer machine with the IP address displayed in the variable information, or in the Servlet container displayed in the port number.

The name of the Web server belonging to the machine in which the fault was detected is displayed as the Web server in the variable information.

#### System Action

Stops the IJServer machine or Servlet container in which the fault was detected from being sorted.

#### User Action

If the ping or connect response is delayed or lost because of high-intensity networking equipment along the route between the Web server machine and the IJServer machine, the IJServer might in fact determine that a fault has occurred. Set appropriate values for 'Response Wait Time' and 'Retry Count' according to the status of the route between the Web server and the IJServer machine.

If the Web server connector settings information for the server to be sorted (set in 'Servlet container IP address : Port number') is incorrect, correct it.

### 23.3.3 SvMon4004

---

**SvMon: ERROR: SvMon4004: A load balancing target server was not found.'%s1 %s2'**

#### Variable Information

%s1 = Web server name(s)

%s2 = IJServer name

#### Explanation

All of the IJServer machines or Servlet containers to be sorted have a fault status.

The names of all of the Web servers to be sorted which have a fault status are displayed as the Web servers in the variable information.

#### System Action

Stops Web server connector sorting.

#### User Action

Take the action indicated by SvMon4002, and try to find the cause of the fault.

### 23.3.4 SvMon4201

---

**SvMon: INFO: SvMon4201: The balancing target server started.'%s1 %s2 %s3 %s4'**

#### Variable Information

%s1 = Web server name

%s2 = IJServer name

%s3 = IP address of the IJServer machine in which the recovery was detected

%s4 = Port number of the Servlet container in which the recovery was detected (this is '-----' when the fault monitoring method is ping monitoring.)

#### Explanation

A recovery was detected in the IJServer machine with the IP address displayed in the variable information, or in the Servlet container displayed in the port number.

Sorting for the IJServer machine or Servlet container in which the recovery was detected is started again.

The name of the Web server belonging to the machine in which the recovery was detected is displayed as the Web server in the variable information.

### 23.3.5 SvMon4202

---

**SvMon: INFO: SvMon4202: The service started.**

#### Explanation

The fault monitoring process (f3fmsvmond) started processing.

### 23.3.6 SvMon4203

---

**SvMon: INFO: SvMon4203: The service stopped.**

#### Explanation

The fault monitoring process (f3fmsvmond) stopped processing.

### 23.3.7 SvMon4204

---

---

**SvMon: INFO: SvMon4204: The balancing target server was built in. '%s1 %s2 %s3 %s4'****Variable Information**

%s1 = Web server name

%s2 = IJServer name

%s3 = The IP address embedded in the IJServer target machine for sorting

%s4 = The port number of the Servlet container embedded in the target for sorting (this is '-----' when the fault monitoring method is ping monitoring.)

**Explanation**

The IJServer machine with the IP address displayed in the variable information or the Servlet container displayed in the port number is embedded in the target for sorting.

It is displayed when the fault monitoring process (f3fmsvmond) starts, when the definition variable is modified, or when a new server is added for sorting.

The name of the Web server belonging to the embedded machine is displayed as the Web server in the variable information.

# Chapter 24 Messages Beginning with 'td'

This chapter describes the messages displayed by the TransactionDirector (TD).

## 24.1 td11000 to td11999

---

This section details the messages with message numbers between td11000 and td11999.

### 24.1.1 td11001

---

**TD: INFO: td11001:TD started normally**

Explanation

Normal component transaction service started.

### 24.1.2 td11002

---

**TD: ERROR: td11002:TD terminated abnormally**

Explanation

The component transaction service has terminated abnormally.

System Action

The component transaction service terminated abnormally.

User Action

Collect the userdump and Dr. Watson log, use the *iscollectinfo* command to collect diagnostic information, and then contact a Fujitsu service engineer.

### 24.1.3 td11003

---

**TD: INFO: td11003:TD terminated normally**

Explanation

Normal component transaction service termination.

### 24.1.4 td11004

---

**TD: ERROR: td11004:TD did not start**

Explanation

The component transaction service has not started.

System Action

Makes the stop of the component transaction service fail.

User Action

No action is required since the component transaction service has already stopped.

### 24.1.5 td11005

---

**TD: ERROR: td11005:TD unable to start Reason code(%x)**

## Variable Information

%x = Reason code

## Explanation

Failed to start the component transaction service due to the reason codes shown in the following table.

Table 24.1 td11005 Reason Codes

Reason code	Explanation and Action
1	Failed to stop the component transaction service since the WorkUnit is being processed. Stop the WorkUnit first, and stop the component transaction service.
2	The specified WorkUnit is being processed. Stop the WorkUnit after the WorkUnit processing has done. Or stop the WorkUnit with forced stop mode.
3	An error was detected in the specified WorkUnit name, or it has stopped or does not exist. Confirm the specified WorkUnit name, and re-enter the command.
4	An error was detected in the definition of the specified WorkUnit name. Confirm the WorkUnit definition, and then reexecute the command.
5	The specified WorkUnit has already started. Confirm the specified WorkUnit name, and then reexecute the command.
6	The specified WorkUnit has either stopped, or does not exist.
7	<b>Windows32/64 Solaris32/64</b> An activation change cannot be done for wrapper WorkUnit. Confirm the specified WorkUnit name is not wrapper WorkUnit, and then reexecute the command.
8	The WorkUnit application type cannot be modified. Confirm the WorkUnit application type, and then reexecute the command.
9	The specified WorkUnit (or the WorkUnit to which the object belongs) is already being started. Confirm the specified WorkUnit name, and then reexecute the command.
10	The specified WorkUnit (or the WorkUnit to which the object belongs) is performing WorkUnit activation processing. Reexecute the command after the WorkUnit activation processing has done.
11	The object that was designated does not exist. Confirm the object name, and then reexecute the command.
12	Cannot process because the component transaction service is prestarted. Activates the Prestarted component transaction service, and then reexecute the command.
13	The component transaction service is not already being started. Start the component transaction service, and then reexecute the command.
14	<b>Windows32/64 Solaris32/64</b> The designated DPCF communication path does not exist. Confirm the DPCF communication path, and then reexecute the command.
15	<b>Solaris32/64 Linux32/64</b> The login user name of the person who executed the command exceeds eight bytes. The login name must be eight bytes or less. Execute the command by the login name length is eight bytes or less.

Reason code	Explanation and Action
20	<p>Insufficient system resources.</p> <p>In this case, reexecute the processing later. If this message is generated frequently, refer to the Tuning Guide, re-estimate the memory required to run Interstage, and check whether there is enough memory.</p> <p>If there is enough memory to run Interstage, there may be inadequate memory to run other applications. Re-estimate the amount of memory required for the other applications running on the same machine to determine if there is an appropriate amount of memory.</p> <p>Contact your system administrator if the re-estimation indicates that the memory is insufficient. Ask the system administrator to either increase the size of the main memory or to increase the size of the page file.</p>
21	<p>An I/O error occurred.</p> <p>For the root cause, see the console message. If there is no message on the console, use the <i>iscollectinfo</i> command to collect diagnostic information, and then contact a Fujitsu service engineer.</p>
22	<p>A system error occurred.</p> <p><b>Solaris32/64</b></p> <p>The pkginfo command may not exist.</p> <p>Confirm the pkginfo command is exist or not. If the pkginfo command is exist, use the <i>iscollectinfo</i> command to collect diagnostic information, and then contact a Fujitsu service engineer.</p> <p><b>Linux32/64</b></p> <p>The rpm command may not exist.</p> <p>Confirm the rpm command is exist or not. If the rpm command is exist, use the <i>iscollectinfo</i> command to collect diagnostic information, and then contact a Fujitsu service engineer.</p>
30	<p>Failed to execute the system function.</p> <p>For the root cause, see the console message. If there is no message on the console, use the <i>iscollectinfo</i> command to collect diagnostic information, and then contact a Fujitsu service engineer.</p>
31	<p>The EXTP is not installed properly.</p> <p>Confirm the EXTP has installed properly. See the console message. If there is no message on the console, use the <i>iscollectinfo</i> command to collect diagnostic information, and then contact a Fujitsu service engineer.</p>
32	<p>The component transaction service is not installed properly.</p> <p>Confirm the component transaction service has installed properly. See the console message. If there is no message on the console, use the <i>iscollectinfo</i> command to collect diagnostic information, and then contact a Fujitsu service engineer.</p>
3c	<p><b>Windows32/64</b></p> <p>The process of stopping a started component transaction was delayed. Wait a while, and then restart Component Transaction Service.</p>
40	<p>The user's User ID is not registered properly in the system.</p> <p>Register the user's User ID properly.</p>
41	<p>Case of a CORBA WorkUnit:</p> <p>The CORBA WorkUnit (associated with the specified implementation repository ID or the interface name in the implementation repository ID) is stopped or not defined.</p> <p>Case of an EJB WorkUnit:</p> <p>The EJB WorkUnit (associated with the specified EJB application) is stopped or not defined.</p> <p>Case of the transaction application WorkUnit or wrapper WorkUnit:</p>

Reason code	Explanation and Action
	<p>The WorkUnit (associated with the specified object) is stopped or not defined.</p> <ul style="list-style-type: none"> <li>- Confirm the implementation repository ID, specified EJB application name and object name, reexecute the command.</li> </ul>
42	<p>Case of a CORBA WorkUnit:</p> <p>The CORBA WorkUnit (associated with the specified implementation repository ID or the interface name in the implementation repository ID) is in cancel closure state.</p> <p>Case of an EJB WorkUnit:</p> <p>The EJB WorkUnit (associated with the specified EJB application) is in cancel closure state.</p> <p>Case of the transaction application WorkUnit or wrapper WorkUnit:</p> <p>The WorkUnit (associated with the specified object) is in cancel closure state.</p> <p>Confirm the implementation repository ID, specified EJB application name and object name, reexecute the command.</p>

44	<p>The specified WorkUnit or object type cannot be used with this function.</p>
50	<p>There were insufficient resources available during the command initialization process.</p> <p><b>Solaris32/64 Linux32/64</b></p> <p>Alternatively, in the case of enhanced security operation, an access permission error may have occurred. Check the command executor's access permission, and then execute the command again.</p>
51 to ff	<p><b>Windows32/64</b></p> <p>Failed to execute the command for an unknown reason. For details of the main reasons, refer to the event log message.</p>
51	<p><b>Solaris32/64 Linux32/64</b></p> <p>Command execution failed because a signal was received, or the IPC resource (message queue) was insufficient.</p> <p>If no signal was generated (a signal can be generated, for example, by pressing Ctrl + C from the terminal), msgtql (for Solaris) or kernel.msgmnb (for Red Hat) of the system parameter (Solaris: /etc/system, Red Hat: /etc/sysctl.conf) may be insufficient.</p> <p>Check the system parameter value by referring to "Setting the System Environment for a Component Transaction Service" in the Tuning Guide.</p>
53 to ff	<p><b>Solaris32/64 Linux32/64</b></p> <p>Execution of the command failed for some reason. For the root cause, see the console message.</p> <p>Alternatively, the required package (FJSVisas package (Interstage management function)), may not be installed. In this case, "is20159" is output to the system log. If the FJSVisas package is not installed, install it and then reexecute processing.</p>
52	<p><b>Solaris32/64</b></p>

Reason code	Explanation and Action
	/opt/FSUNod/lib/nt is specified in the LD_LIBRARY_PATH environment variable.  /opt/FJSVod/lib/nt is specified in the LD_LIBRARY_PATH environment variable.
a	The specified WorkUnit (or the WorkUnit to which the object belongs) is being started. Confirm the WorkUnit name, and then reexecute the command.
b	The specified WorkUnit is being stopped. Confirm the WorkUnit name, and then reexecute the command.
c	This is not the user who started the WorkUnit. Login by the user who started the WorkUnit, and then reexecute the command.
d	The Process Binding Function is used for the specified object. The WorkUnit activation change is not support the Process Binding Function. Specify the object that is not use the Process Binding Function for the WorkUnit activation change.
e	The number of concurrent processes is being changed for the specified WorkUnit. Reexecute the command after the number of concurrent processes change has done.
f	The WorkUnit definitions are being changed for the specified WorkUnit. Reexecute the command after the WorkUnit definition change has done.

### System Action

Causes component transaction service stop to fail.

### User Action

Confirm that the component transaction service has already started. Apply the countermeasure as directed by the other message if component transaction service has not started. . Use the *iscollectinfo* command to collect diagnostic information, and contact a Fujitsu service engineer if no other message has been output.

## 24.1.6 td11006

**TD: ERROR: td11006:TD unable to terminate Reason code(%x)**

### Variable Information

%x = Reason code

### Explanation

Failed to start the component transaction service due to the reason codes shown in [Table 24.1 td11005 Reason Codes](#).

### System Action

Continues the processing of the component transaction service.

### User Action

If the reason code is 1, and the work unit is being started, stop the work unit, and then either reexecute the command or forcibly stop Interstage.

If the component transaction service still has not stopped, and the reason code is other than 1, carry out the actions described in messages displayed at the same time. If no other messages are displayed, use the *iscollectinfo* command to collect diagnostic information, and contact your software supplier

## 24.1.7 td11007

---

**TD: ERROR: td11007: An internal error was detected Error information(%d-%x1- %x2)**

### Variable Information

%d = Error Information 1

%x1 = Error Information 2

%x2 = Error Information 3

### Explanation

A contradiction was detected in the component transaction service system.

### System Action

The component transaction service terminated abnormally.

### User Action

When error information is "30085215-e8-c1" the command processing results failed to be obtained. Examine the processing results of the executed command in the event log. If the event log indicates that the processing failed, execute the command again.

When the error information is "300850000-c-3", the possible causes are as follows:

- Information differs between the stub or skeleton being used and the registered interface repository.

In this situation, use the tdc command to compile the latest IDL definition and recreate a stub and skeleton. At the same time, update the interface repository information. Once this has been done, use the created stub or skeleton to recreate an application.

- When WebGateway was used, it was not restarted after the IDL definition was changed.

In this situation, restart WebGateway.

- The CORBA service is stopped in advance

In this case, od10003 message is output before this message.

When the CORBA service is stopped in advance, check how Interstage is stopped.

When error information 1 is one of the following, check each item and take the required action.

If error information 1 is "300821318" there is insufficient memory. In this case, reexecute the processing later. If this message is generated frequently, refer to the Tuning Guide, re-estimate the memory required to run Interstage, and check whether there is enough memory.

If there is enough memory to run Interstage, there may be inadequate memory to run other applications. Re-estimate the amount of memory required for the other applications running on the same machine to determine if there is an appropriate amount of memory.

Contact your system administrator if the re-estimation indicates that the memory is insufficient. Ask the system administrator to either increase the size of the main memory or to increase the size of the page file.

If error information 1 is "300850000" or "300850250" the CORBA service may have been stopped. If the CORBA service is found to be stopped, determine the error, eliminate the cause, and then restart Interstage.

For other error information, use the *iscollectinfo* command to collect diagnostic information, and contact your software supplier.

## 24.1.8 td11008

---

**TD: INFO: td11008:Work unit started normally**

### Explanation

Normal WorkUnit initiation.

## 24.1.9 td11009

---

---

**TD: INFO: td11009:Work unit terminated normally****Explanation**

Normal WorkUnit termination.

---

**24.1.10 td11010**

---

**TD: ERROR: td11010:Work unit unable to start Reason code(%x)****Variable Information**

%x = Reason code

**Explanation**

Failed to start the WorkUnit.

**System Action**

Continues the processing of the component transaction service.

**User Action**

Carry out all actions appropriate for the specified Reason code, and then reexecute the command.

For other Reason Codes, carry out the actions described in messages displayed at the same time. If no other messages are displayed, or if the error cannot be resolved, use the *iscollectinfo* command to collect diagnostic information, and contact your software supplier.

---

**24.1.11 td11011**

---

**TD: ERROR: td11011:Work unit unable to terminate Reason code(%x)****Variable Information**

%x = Reason code

**Explanation**

Failed to stop the WorkUnit reason code.

**System Action**

Continues the processing of the component transaction service.

**User Action**

Carry out all actions appropriate for the specified Reason code, and then reexecute the command.

If the WorkUnit is processing, wait until it completes, and then terminate or manually stop the WorkUnit.

For other Reason Codes, carry out the actions described in messages displayed at the same time. If no other messages are displayed, or if the error cannot be resolved, use the *iscollectinfo* command to collect diagnostic information, and contact your software supplier.

---

**24.1.12 td11012**

---

**TD: ERROR: td11012:A related application is not installed(%s)****Variable Information**

%s = Application name

**Explanation**

The component transaction service cannot be started since the related applications are not installed.

#### System Action

Stops the processing.

#### User Action

Install the related applications, and then reexecute the command.

### 24.1.13 td11013

---

#### **TD: ERROR: td11013:An effective time limit of the evaluation version is set**

#### Explanation

Because the evaluation version has expired, the component transaction service cannot be started.

#### System Action

Stops the processing.

### 24.1.14 td11014

---

#### **TD: INFO: td11014:Work unit modified normally**

#### Explanation

The WorkUnit activation change was modified successfully.

### 24.1.15 td11015

---

#### **TD: INFO: td11015:Work unit started beforehand**

#### Explanation

The WorkUnit started successfully.

### 24.1.16 td11016

---

#### **TD: INFO: td11016:Work unit activated normally**

#### Explanation

Successful WorkUnit activation.

### 24.1.17 td11017

---

#### **TD: ERROR: td11017:Work unit could not modify Reason code(%x)**

#### Variable Information

%x = Reason code

#### Explanation

Activation change of WorkUnit failed.

#### System Action

Continues the processing of the component transaction service.

#### User Action

Carry out all actions appropriate for the specified Reason code (%x), and then reexecute the command.

For other Reason Codes, carry out the actions described in messages displayed at the same time. If no other messages are displayed, or if the error cannot be resolved, use the *iscollectinfo* command to collect diagnostic information, and contact your software supplier.

## 24.1.18 td11018

---

**TD: ERROR: td11018:Work unit could not start beforehand Reason code(%x)**

### Variable Information

%x = Reason code

### Explanation

Failed to start the WorkUnit as per cause stated in Reason code.

### System Action

Continues the processing of the component transaction service.

### User Action

Carry out all actions appropriate for the specified Reason code (%x), and then reexecute the command.

For other Reason Codes, carry out the actions described in messages displayed at the same time. If no other messages are displayed, or if the error cannot be resolved, use the *iscollectinfo* command to collect diagnostic information, and contact your software supplier.

## 24.1.19 td11019

---

**TD: ERROR: td11019:Work unit could not activate Reason code(%x)**

### Variable Information

%x = Reason code

### Explanation

WorkUnit start activation failed due to the cause stated in Reason code.

### System Action

Continues the processing of the component transaction service.

### User Action

Carry out all actions appropriate for the specified Reason code (%x), and then reexecute the command.

For other Reason Codes, carry out the actions described in messages displayed at the same time. If no other messages are displayed, or if the error cannot be resolved, use the *iscollectinfo* command to collect diagnostic information, and contact your software supplier.

## 24.1.20 td11020

---

**TD: INFO: td11020: The multiple degree of the process was changed**

### Explanation

The process concurrency change was successful.

## 24.1.21 td11021

---

**TD: ERROR: td11021: The multiple degree of the process was not changed Reason code(%x)**

### Variable Information

%x = Reason Code

### Explanation

Process concurrency change failed for the reason shown in the reason code.

## System Action

Continues the processing of the component transaction service.

## User Action

Take action according to the Reason Code (%x) and execute the command again.

If the reason code is not listed and another message was output at the same time, take action accordingly. Contact your system administrator IF there is no other message and if the reason cannot be eliminated.

## 24.1.22 td11022

---

**TD: INFO: td11022: The number of event stays was able to be acquired**

### Explanation

The number of event holds has been successfully.

## 24.1.23 td11023

---

**TD: ERROR: td11023: The number of event stays was not able to be acquired Reason code(%x)**

### Variable Information

%x = Reason Code

### Explanation

There was a failure in getting the number of event holds for the reason shown in the reason code.

## System Action

Continues the processing of the component transaction service.

## User Action

Take action according to the Reason Code (%x) and execute the process again. If the reason code is not listed, then if another message was output at the same time, take action accordingly. If there is no other message, or if the reason cannot be eliminated, contact your system administrator.

## 24.1.24 td11024

---

**TD: INFO: td11024: TD activated normally**

### Explanation

The component transaction service pre startup activation was successful.

## 24.1.25 td11025

---

**TD: ERROR: td11025: TD could not activate Reason code(%x)**

### Variable Information

%x = Reason Code

### Explanation

The component transaction service pre startup activation failed for the reason shown in the reason code.

## System Action

Continues the processing of the component transaction service.

## User Action

Take action appropriate to the reason code (%x), and execute the command again. If the reason code is not listed, and if another message was output at the same time, take action accordingly. If there is no other message, or if the reason cannot be eliminated, contact your system administrator.

## 24.1.26 td11026

---

**TD: ERROR: td11026: A system error occurred(%d1-%d2-%d3)**

### Variable Information

%d1 = Error Information1

%d2 = Error Information2

%d3 = Error Information3

### Explanation

A system error has occurred.

### System Action

Stops processing.

### User Action

If the system is shut down during Interstage operation, a message in which "1115" is set in Error Information3 may be output. In this case, no action needs to be taken.

In other cases, record the error information, use the *iscollectinfo* command to collect diagnostic information, and contact your software supplier.

## 24.1.27 td11027

---

**TD: ERROR: td11027: A resource recovery failure occurred(%d1-%d2-%d3)**

### Variable Information

%d1 = Error Information1

%d2 = Error Information2

%d3 = Error Information3

### Explanation

Resource recovery failed.

### System Action

Stops processing.

### User Action

Resource recovery may not have been performed correctly. Check the state of the component transaction service, and stop the component transaction service if it is active. Then, execute the command again.

If the value indicated as Error Information 3 is 8, 14, or 1455, there is a memory shortage. In this case, reexecute the processing later. If this message is generated frequently, refer to the Tuning Guide, re-estimate the memory required to run Interstage, and check whether there is enough memory.

If there is enough memory to run Interstage, there may be inadequate memory to run other applications. Re-estimate the amount of memory required for the other applications running on the same machine to determine if there is an appropriate amount of memory.

Contact your system administrator if the re-estimation indicates that the memory is insufficient. Ask the system administrator to either increase the size of the main memory or to increase the size of the page file.

If there is no problem with the estimated memory capacity, use the *iscollectinfo* command to collect diagnostic information, and contact your software supplier.

## 24.1.28 td11028

---

**TD: INFO: td11028: Work unit started normally (%s)**

Variable Information

%s = WorkUnit name

Explanation

The WorkUnit has been started normally.

## 24.1.29 td11029

---

**TD: INFO: td11029: Work unit terminated normally (%s)**

Variable Information

%s = WorkUnit name

Explanation

The WorkUnit has been terminated normally.

## 24.1.30 td11030

---

**TD: INFO: td11030: Work unit terminated abnormally (%s)**

Variable Information

%s = WorkUnit name

Explanation

The WorkUnit has been terminated abnormally.

## 24.1.31 td11031

---

**TD: INFO: td11031: Work unit was modified on active(%s)**

Variable Information

%s = WorkUnit Name

Explanation

The dynamic modification of the WorkUnit was performed normally.

## 24.1.32 td11032

---

**TD: INFO: td11032: The multiple degree of the process was changed(%s1-%s2-%s3)**

Variable Information

%s1 = WorkUnit Name

%s2 = Object Name

%s3 = Number of Concurrent Processes

Explanation

The number of concurrent processes in the WorkUnit was changed successfully.

## 24.1.33 td11033

---

**TD: INFO: td11033:Object inhibition succeeded(%s1-%s2)**

### Variable Information

%s1 = WorkUnit Name

%s2 = Object Name

### Explanation

Object inhibition succeeded.

## 24.1.34 td11034

---

**TD: ERROR: td11034:Object inhibition failed(%x)**

### Variable Information

%x = Reason Code

### Explanation

The object inhibition failed for the reason shown in the reason code.

### System Action

Continues the processing of the component transaction service.

### User Action

Carry out the actions described for the displayed Reason code (see [Table 24.1 td11005 Reason Codes](#)), and then reexecute the command.

For other Reason Codes, carry out the actions described in messages displayed at the same time. If no other messages are displayed, or if the error cannot be resolved, use the *iscollectinfo* command to collect diagnostic information, and contact your software supplier.

## 24.1.35 td11035

---

**TD: INFO: td11035:Object inhibition was released normally(%s1-%s2)**

### Variable Information

%s1 = WorkUnit Name

%s2 = Object Name

### Explanation

Object inhibition was released normally.

## 24.1.36 td11036

---

**TD: ERROR: td11036:Object inhibition was released abnormally(%x)**

### Variable Information

%x = Reason Code

### Explanation

The object inhibition failed to be released for the reason shown in the reason code.

### System Action

Continues the processing of the component transaction service.

## User Action

Carry out the actions described for the displayed Reason code (see [Table 24.1 td11005 Reason Codes](#)), and then reexecute the command.

For other Reason Codes, carry out the actions described in messages displayed at the same time. If no other messages are displayed, or if the error cannot be resolved, use the *iscollectinfo* command to collect diagnostic information, and contact your software supplier.

## 24.1.37 td11037

---

**TD: ERROR: td11037:A system call error was detected(%d1-%d2-%d3)**

### Variable Information

%d1 = Error information 1

%d2 = Error information 2

%d3 = Error information 3

### Explanation

An error was detected in the system call issued within the component transaction service.

### System Action

Stops processing.

### User Action

**Windows32/64**

If the value indicated as error information 3 is 8, 14, or 1455, there is a memory shortage.

**Solaris32/64 Linux32/64**

If the value indicated as error information 3 is 12, there is insufficient memory.

In this case, reexecute the processing later. If this message is generated frequently, refer to the Tuning Guide, re-estimate the memory required to run Interstage, and check whether there is enough memory.

If there is enough memory to run Interstage, there may be inadequate memory to run other applications. Re-estimate the amount of memory required for the other applications running on the same machine to determine if there is an appropriate amount of memory.

Contact your system administrator if the re-estimation indicates that the memory is insufficient. Ask the system administrator to either increase the size of the main memory or to increase the size of the page file.

If there is no problem with the estimated memory capacity, use the *iscollectinfo* command to collect diagnostic information, and contact your software supplier.

**Windows32/64**

If the value indicated as error information 3 is 1055, services other than Interstage services were being processed. Enter the *isstart* command to reexecute the start process.

If the value indicated as error information 3 is not 8, 12, 14, 1455, or 1055, and if other messages have been output at the same time, take the actions indicated in those messages. If no other messages have been output, use the *iscollectinfo* command to collect diagnostic information, and contact your software supplier.

## 24.1.38 td11038

---

**Solaris32/64 Linux32/64**

**TD: ERROR: td11038: Could not get IPC resource due to duplicated key(key=%x path=%s)**

### Variable Information

%x = Key value

%s = Path name

## Explanation

Failed to obtain the IPC resources because they were in use.

## System Action

Stops processing.

## User Action

Since the IPC key value overlaps, it is necessary to customize an IPC key value. Refer to "Customizing IPC Resources" in the Tuning Guide. Perform again after deleting the IPC resources of the key value which stopped Interstage at once or was shown in variable information, when 255 or more commands are supplied simultaneously.

## 24.1.39 td11040

---

### TD: ERROR: td11040:TD detected an error(%s)

#### Variable Information

%s = Error information

#### Explanation

Internal error is detected inside the component transaction service.

#### System Action

Stops the processing.

#### User Action

Take the following measures in accordance with the error information.

##### [no memory]

Memory space is insufficient. After a short period of time reexecute the process. If this message is output frequently, re-estimate the memory space that is required for running Interstage by referring to the Tuning Guide, and confirm that sufficient memory space is available.

If sufficient memory space is available for Interstage, the memory space for other applications is possibly insufficient. Re-estimate the memory space that is necessary for other applications that are running on the same machine, and determine if sufficient memory space is provided or not.

If insufficient memory space is found as the result of the re-estimation, contact a system administrator. System administrator should increase the main memory or extend the swap area.

If sufficient memory space is found as the result of the re-estimation, contact an engineer.

If the error information %s is other than 12, and if any other message is output at the same time, take corrective measures accordingly. If there is no other message that is output at the same time, contact an engineer.

##### [parameter error]

If there is any other message that is output at the same time, take corrective measures accordingly. If there is no other message that is output at the same time, contact an engineer.

##### [system error]

If there is any other message that is output at the same time, take corrective measures accordingly. If there is no other message that is output at the same time, contact an engineer.

##### [interface error]

If there is any other message that is output at the same time, take corrective measures accordingly. If there is no other message that is output at the same time, contact an engineer.

##### [some error]

If there is any other message that is output at the same time, take corrective measures accordingly. If there is no other message that is output at the same time, contact an engineer.

**[invalid system name]**

If there is any other message that is output at the same time, take corrective measures accordingly. If there is no other message that is output at the same time, contact an engineer.

**[not started]**

Start Interstage and execute the command again.

**[related application error]**

Install the related packages having the correct versions. After that, execute the command again.

**[workunit active]**

Stop the WorkUnit and execute the command again.

**Windows32/64**

**[already started]**

Check whether the "TransactionDirector" service Startup Type option has been set to "Automatic". If it is set to "Automatic", change it to "Manual". If this condition does not apply, stop Interstage and then reexecute the command.

**[no rights]**

The "TransactionDirector" service logon account may have been changed from a local system account. If the "TransactionDirector" service logon account was changed, check whether there are privileges to start the logon account that was changed as a service.

## 24.1.40 td11041

---

**TD: WARNING: td11041:TD was stopped during operation of INTERSTAGE.**

### Explanation

The component transaction service is stopped while Interstage operation is in progress. If this operation is executed while Interstage is started up by the Interstage integration command or by the Interstage running operation tool, Interstage is stopped.

### System Action

The processing is continued.

### User Action

If you want to continue running Interstage, start Interstage using the Interstage integration command or the Interstage running operation tool.

## 24.1.41 td11043

---

**TD: ERROR: td11043:A system call error occurred(%s1-%s2)**

### Variable Information

%s1 = System call name

%s2 = Error information1

### Explanation

An error was detected in the system call issued by the component transaction service.

One of the following causes is assumed:

- The Component Transaction Service has not been installed correctly.
- The system parameter that was specified may be incorrect.
- There is insufficient memory.

## System Action

Continues processing.

## User Action

Take one of the following actions:

- Verify that the Component Transaction Service is installed correctly.
- Review the system parameter value.
- Reexecute processing after a moment.

If this message is output frequently, refer to the Tuning Guide to determine the memory required to operate Interstage. Ensure that this memory is available in the system.

If the problem persists, verify that sufficient memory is available for other applications on this machine.

If there is insufficient memory, contact your system administrator to increase the main memory or to extend the swap area.

If sufficient memory space is found as the result of the re-estimation, use the *iscollectinfo* command to collect diagnostic information, and contact your software supplier.

If none of the above apply, take the action described in the table below, according to System call (%s1) and Error information (%s2).

System call (%s1)	Error information (%s2)	Action
<b>Windows32/64</b> Invalid auto-start file found	-	The WorkUnit automatic startup settings file may be incorrect. Check if the WorkUnit automatic startup settings file is incorrect.
<b>Solaris32/64</b> <b>Linux32/64</b> msgsnd Or, msgrcv	errno=22(Invalid argument) Or, errno=36(Identifier removed)	Interstage may have been stopped by force (isstop -f), or the command may have been killed. Check if Interstage has been stopped by force, or if the kill operation has been performed for the command. If the kill operation has been performed for the command, the IPC resources may still be remaining. If message td11038 is output when the command operation is performed, the IPC resources will still remain. Therefore, delete the IPC resources of the key that is output to message td11038 using the ipcrm command.
<b>Solaris32/64</b> <b>Linux32/64</b> msgsnd	errno=22(Invalid argument) Or, errno=43(Identifier removed)	Ctrl+C may have been pressed on the terminal while the command was running. If the execution of the command has failed, reexecute the command.
<b>Linux32/64</b> pthread_create	errno=11	The number of threads in the system may have reached the upper limit. The upper limit for the number of threads in the system is determined by the value for the "kernel.threads-max" parameter in the "/etc/sysctl.conf" file. Estimate the number of threads in the system, and then increase the upper limit if required.
All other cases		Use the <i>iscollectinfo</i> command to collect diagnostic information, and then contact your software supplier.

## 24.1.42 td11044

**TD: WARNING: td11044:The request delayed due to the message queue shortage(%s)**

## Variable Information

%s = Message queue ID that waits for being sent.

## Explanation

The system message queue is too short, causing a delay in processing.

## System Action

Retries until the insufficiency of the message queue is resolved and the queue can be used.

## User Action

Check the system's message queue status using the *ipcs* command. Messages reside in the message queue for which the QNUM field value is non zero.

Over the entire system, the number of message queues on which messages can reside is 'msgtql', defined in the /etc/system file.

Determine which applications use message queues, and check the estimation of IPC system resource. Check whether the estimate of the IPC resources of a system is appropriate. If there are insufficient message queues, increase the msgtql value of the /etc/system file and reboot the computer.

When there is no problem in the estimated value of IPC resources, use the *iscollectinfo* command to collect diagnostic information, and contact your software supplier.

## 24.1.43 td11045

---

**TD: ERROR: td11045: An internal process terminated abnormally(%s-%d)**

## Variable Information

%s = Process name

%d = Process ID

## Explanation

An internal process of the Component Transaction Service caused an abnormal termination.

## System Action

The Component Transaction Service is stopped.

## User Action

If the system is otherwise operating normally, use the *iscollectinfo* command to collect diagnostic information, and contact your software supplier.

## 24.1.44 td11046

---

**TD: WARNING: td11046: IP version definition was ignored**

## Explanation

An IPv6 network has been specified in the IP version definition statement, but the environment does not support IPv6.

## System Action

Continues the start process of the Component Transaction Service.

## 24.1.45 td11050

---

**TD: ERROR: td11050:A system error occured while creating system(%d1-%d2)**

## Variable Information

%d1 = Error information 1

%d2 = Error information 2

### Explanation

The system of the component transaction service could not be created using the *iscreatesys* command. Refer to the reason codes of the following table to determine why.

Table 24.2 td11050 Reason Codes

Item no.	Reason code	Explanation
1	800	An I/O error occurred.
2	900	The specified system name is incorrect.
3	901	An access permission error occurred.
4	1000	Since the Component Transaction Service is active, the system could not be deleted.
5	1101	There is insufficient memory.
6	1102	There are insufficient disk resources.
7	1999	A system error occurred.

### System Action

Stops the processing.

### User Action

If other messages have been output at the same time, take the actions indicated in those messages. If no other messages have been output, use the *iscollectinfo* command to collect diagnostic information, and contact your software supplier.

## 24.1.46 td11051

---

**TD: ERROR: td11051:A system error ocured while deleting system(%d1-%d2)**

### Variable Information

%d1 = Error information 1

%d2 = Error information 2

### Explanation

The system of the component transaction service could not be deleted using the *isdeletesys* command. Refer to the reason codes of [Table 24.2 td11050 Reason Codes](#) to determine why.

### System Action

Stops the processing.

### User Action

Check that the component transaction service is not active.

If it is active, stop the component transaction service, and then reexecute the command.

If it is not active, and other messages have been output at the same time, take the actions indicated in those messages.

If no other messages have been output, use the *iscollectinfo* command to collect diagnostic information, and contact your software supplier.

## 24.1.47 td11052

---

**TD: WARNING: td11052: Automatic startup of work unit failed(%s1-%s2)**

## Variable Information

%d1 = WorkUnit name

%d2 = Error information

## Explanation

The automatic startup process of WorkUnit failed.

## System Action

The WorkUnit auto-start process continues.

## User Action

Take the following measures in accordance with the error information.

### [no memory]

Memory space is insufficient. After a short period of time reexecute the process. If this message is output frequently, re-estimate the memory space that is required for running Interstage by referring to the Tuning Guide, and confirm that sufficient memory space is available.

If sufficient memory space is available for Interstage, the memory space for other applications is possibly insufficient. Re-estimate the memory space that is necessary for other applications that are running on the same machine, and determine if sufficient memory space is provided or not.

If insufficient memory space is found as the result of the re-estimation, contact a system administrator. System administrator should increase the main memory or extend the swap area.

If sufficient memory space is found as the result of the re-estimation, contact an engineer.

If the error information %s is other than 12, and if any other message is output at the same time, take corrective measures accordingly. If there is no other message that is output at the same time, contact an engineer.

### [system call error]

Take appropriate action indicated by any associated messages. If there are no other messages, use the *iscollectinfo* command to collect diagnostic information, and contact your software supplier.

### [internal error]

Take appropriate action indicated by any associated messages. If there are no other messages, use the *iscollectinfo* command to collect diagnostic information, and contact your software supplier.

### [no environment variable]

An environment variable required for Interstage is not specified. Install the correct version and level of Interstage, and then reexecute the command.

### [invalid file]

The auto-start file contains a syntax error. Correct the error, and then reexecute the command.

### [already started]

The specified WorkUnit is already started or active. Check whether a WorkUnit name is duplicated in the automatic start file.

### [definition error]

Either the specified WorkUnit is not registered, or its definition is incorrect. Alternatively, WorkUnits other than a pair of CORBA and EJB WorkUnits (delimited by a colon (:)) were specified in the auto-start file.

## 24.1.48 td11053

---

**TD: INFO: td11053: Work unit was not started automatically because no applications have been deployed(%s)**

## Variable Information

%s = WorkUnit name

## Explanation

The automatic startup process of WorkUnit failed. Because no applications have been deployed.

## System Action

The WorkUnit auto-start process continues.

## User Action

Deploy applications to the WorkUnit, and then start the WorkUnit.

## 24.1.49 td11054

---

**TD: INFO: td11054: The related package is not installed (%s)**

### Variable Information

%s = Package name

## Explanation

The automatic startup process of WorkUnit failed since the related package is not installed.

## System Action

The WorkUnit auto-start process continues.

## User Action

Install the related package, and then start the WorkUnit.

## 24.2 td12000 to td12999

---

This section details the messages with message numbers between td12000 and td12999.

### 24.2.1 td12001

---

**TD: ERROR: td12001:A resource shortage occurred(%s)**

### Variable Information

%s = Error Information

## Explanation

Failed to obtain the resource necessary for the operation.

## System Action

Failed to start the component transaction service or process the command.

## User Action

Execute the process again later. If this message is generated frequently, refer to the Tuning Guide, re-estimate the memory required to run Interstage and confirm that there is enough memory.

If there is enough memory to run Interstage, there may be inadequate memory to run other applications. Re-estimate the amount of memory required for the other applications running on the same machine to determine if there is an appropriate amount of memory.

Contact your system administrator if the re-estimation indicates that the memory is insufficient. Ask the system administrator to either increase the size of the main memory or to increase the size of the page file.

If the error information is "tdqffrsend", "tdqffrtsnd", or "tdqffrsendORB", this message may be output if the system has a large load.

## 24.2.2 td12002

---

**TD: ERROR: td12002:A system resource shortage occurred(%s1-%s2-%s3)**

### Variable Information

%s1 = System call name

%s2 = Error number for system call

%s3 = Error information

### Explanation

Failed to obtain the resource necessary for the operation.

### System Action

Failed to start the component transaction service or the WorkUnit.

### User Action

Execute the process again later. If this message is generated frequently, refer to the Tuning Guide, re-estimate the memory required to run Interstage, and confirm that there is enough memory.

If there is enough memory (relative to the amount of memory needed to run Interstage), it may be that there is inadequate memory to run other applications. Re-estimate the amount of memory needed for the other applications running on the same machine as well to determine if there is an appropriate amount of memory.

Contact your system administrator if the re-estimation indicates that the memory is insufficient. Ask the system administrator to either increase the size of the main memory or to increase the size of the page file.

If there is no problem with the estimated memory capacity, use the *iscollectinfo* command to collect diagnostic information, and contact your software supplier.

## 24.2.3 td12003

---

**TD: ERROR: td12003:Abnormality notified from OD(%s1-%s2-%s3)**

### Variable Information

%s1 = Error Information1

%s2 = Error Information2

%s3 = Error Information3

### Explanation

The CORBA Service reported an error.

### System Action

Failed to start the component transaction service or the WorkUnit

### User Action

Carry out the actions described in the following table, according to Error Information codes 1 & 2, and then restart the WorkUnit. If the value indicated as Error Information 2 is IDL:CORBA/StExcep/COMM\_FAILURE:1.0, the CORBA service communication environment contains an error. Review the CORBA service communication environment. If the error information is different from the above, use the *iscollectinfo* command to collect diagnostic information, and contact your software supplier.

Table 24.3 Error Information

Error information 1 (%s1)	Error information 2 (%s2)	Actions
ISOD_LBG_resolve_on_a_server or	IDL:ISOD/LBO/ NotFound:1.0	When using the load balance function, verify that the load balance object group name for the specified

Error information 1 (%s1)	Error information 2 (%s2)	Actions
ISOD_LBO_resolve_LBG		destination name (destination statement) of the WorkUnit definition is registered correctly.

For other Error Information codes, use the *iscollectinfo* command to collect diagnostic information, and contact your software supplier.

## 24.2.4 td12004

### TD: ERROR: td12004:OD did not start

#### Explanation

Either the CORBA service has not started, or the CORBA service reported insufficient resources.

#### System Action

Failed to start the component transaction service.

#### User Action

Restart the component transaction service, and then reexecute the command. If the CORBA service D is already initiated, check the resource required.

## 24.2.5 td12005

### TD: ERROR: td12005:Object reference could not be acquired(%s1-%s2-%s3)

#### Variable Information

%s1 = Type

%s2 = Error Explanation (the cause of the error reported on completion)

%s3 = Error information

#### Explanation

Abnormal end of service occurred while the object reference request was issued from CORBA service.

#### System Action

Failed to start the WorkUnit

#### User Action

Carry out the action described in the following table, according to the Type and Error Explanation, and then restart the WorkUnit.

If %s1 and %s2 are other than the following, use the *iscollectinfo* command to collect diagnostic information, and contact your software supplier.

Table 24.4 Type and Error

Type (%s1)	Error explanation (%s2)	Action
Interface Repository	IDL:CORBA/StExcep/NO_IMPLEMENT	If the Interface Repository Cache Server is not started, start it.
Naming Service	IDL:CORBA/StExcep/NO_IMPLEMENT	If the Naming Service or load balance function are not started, start them.

For other return codes, use the *iscollectinfo* command to collect diagnostic information, and contact your software supplier.

## 24.2.6 td12006

### TD: ERROR: td12006:Too many number of OD server applications(%s)

## Variable Information

%s = Error Information

## Explanation

Since the number of server applications registered in the CORBA service has exceeded the maximum limit, the component transaction service cannot be registered in the CORBA service.

## System Action

Failed to start the component transaction service.

## User Action

Correct the number of server applications operating under the CORBA service, reset the CORBA service operating environment, a memory or the amount of swaps is added, and then reexecute the command.

## 24.2.7 td12007

---

### TD: ERROR: td12007:OD resource shortage occurred(%s)

## Variable Information

%s = Service name

## Explanation

The CORBA Service reported insufficient resources.

## System Action

Failed to start the component transaction service or WorkUnit.

## User Action

Restart the CORBA service, and then reexecute the command.

## 24.2.8 td12008

---

### TD: ERROR: td12008:Implementation Repository ID registration failed

## Explanation

The Implementation Repository ID used by the component transaction service is already registered.

## System Action

Failed to start the component transaction service.

## User Action

Check whether another application is using the Implementation Repository ID used by the component transaction service. If so, close the application, and then restart Interstage.

This message is displayed when the component transaction service terminates abnormally, or the CORBA service is forcibly terminated while the component transaction service is running. In that case, delete the object with the *OD\_impl\_inst* command, and then restart Interstage.

## 24.2.9 td12009

---

### TD: ERROR: td12009:Work unit is in operation

## Explanation

Failed to stop the component transaction service since the WorkUnit is activated.

## System Action

Cannot stop the component transaction service.

## User Action

Stop the WorkUnit, and then stop Interstage. The WorkUnit can be referred to by the *islistwu* command then stopped, or stopped by executing the *isstop* command in force mode.

## 24.2.10 td12010

---

**TD: ERROR: td12010: Work unit did not start because the required software is not installed(%s)**

### Variable Information

%s = WorkUnit name

### Explanation

The WorkUnit for wrapping cannot be started since the IDCM or NETSTAGE Internet WWW Gateway has not been installed.

### System Action

Failed to start the WorkUnit.

### User Action

Install NETSTAGE Director or IDCM and the NETSTAGE Internet WWW Gateway, and then restart the WorkUnit.

## 24.2.11 td12011

---

**TD: ERROR: td12011:Work unit did not start because IDCM has not been started(%s)**

### Variable Information

%s = WorkUnit name

### Explanation

Cannot start the WorkUnit for wrapping since the IDCM has not been started.

### System Action

Failed to start the WorkUnit.

### User Action

Start the IDCM, and then restart the WorkUnit.

## 24.2.12 td12012

---

**TD: ERROR: td12012:Object is already registered in the naming service(%s1-%s2)**

### Variable Information

%s1 = WorkUnit name

%s2 = Object name

### Explanation

Failed to register object specified in the WorkUnit in the Naming Service, since the object has already been registered. If the load balance function is used, the object is already registered in the load balance object group.

### System Action

Failed to start the WorkUnit.

## User Action

Check whether other applications are using the object specified in the WorkUnit definition. Stop the application, or use the *OD\_or\_adm* command to delete the object from the Naming Service, and then restart the WorkUnit.

If the load balance function is used, delete the object from the load balance object group with the *odadministerlb* command, and then start the WorkUnit.

If another application results in the object being duplicated, and then correct the situation. If the component transaction service has terminated abnormally for any reason, this message may be output when the WorkUnit starts. In that case, the object can remain registered in the Naming Service. Use the *OD\_or\_adm* command to delete it from the Naming Service, and then restart the WorkUnit.

## 24.2.13 td12013

---

**TD: ERROR: td12013:Object is not registered in the Interface Repository(%s1-%s2)**

### Variable Information

%s1 = WorkUnit name

%s2 = Object name

### Explanation

The object specified in the WorkUnit is not registered in the Interface Repository.

### System Action

Failed to start the WorkUnit.

### User Action

Specify the correct object name, since the object name specified in the WorkUnit definition may not match the module name:interface name specified in the IDL definition. The object may not have been registered in the Interface Repository by TD compiler specification. In this case, register it in the Interface Repository by TD compiler specification.

## 24.2.14 td12014

---

**TD: ERROR: td12014:Operation contains an unsupported type(%s1-%s2-%s3-%s4)**

### Variable Information

%s1 = WorkUnit name

%s2 = Object name

%s3 = Operation name

%s4 = Type/variable value

### Explanation

The operation return value and argument type specified in IDL are not supported by the component transaction service.

### System Action

Failed to start the WorkUnit.

### User Action

Define the correct type in the IDL definition, design the application, and then restart the WorkUnit.

## 24.2.15 td12015

---

**TD: WARNING: td12015:Object could not be deleted from the naming service(%s1- %s2)**

## Variable Information

%s1 = WorkUnit name

%s2 = Object name

## Explanation

The object specified in the WorkUnit could not be deleted from the Naming Service. The following causes are possible:

- The *OD\_or\_adm* command may have been used to delete the object.
- The Naming Service stopped, or is not ready for communication.

## System Action

Results in the WorkUnit termination.

## User Action

When using other applications, verify that the delete method for object deletion is correct. Verify the cause of the Naming Service termination, and prevent the Naming Service from stopping during component transaction service operation.

## 24.2.16 td12016

---

### **TD: ERROR: td12016:Attribute information contains an abnormality(%s1-%s2)**

## Variable Information

%s1 = Object name

%s2 = Operation name

## Explanation

Attribute Information does not exist, or there is an error in the attribute information.

## System Action

Failed to start the WorkUnit.

## User Action

Use the TD compiler to create attribute information.

## 24.2.17 td12017

---

### **TD: ERROR: td12017:Attribute information directory could not be accessed**

## Explanation

Cannot access the attribute information folder.

## System Action

Failed to start the WorkUnit.

## User Action

Confirm the folder where attribute information is stored.

## 24.2.18 td12018

---

### **TD: ERROR: td12018:There are no operations at all(%s1-%s2)**

## Variable Information

%s1 = WorkUnit name

%s2 = Object name

#### Explanation

The operation has not been defined for the object defined in the WorkUnit.

#### System Action

Failed to start the WorkUnit.

#### User Action

Describe the operation in the IDL definition, start compilation, and then reexecute the command.

## 24.2.19 td12019

---

### **TD: INFO: td12019:Unable to delete repository ID from implementation repository**

#### Explanation

The repository ID could not be deleted from the Implementation Repository.

#### System Action

Normal command processing.

#### User Action

Check if the Implementation Repository ID was deleted.

## 24.2.20 td12020

---

### **TD: ERROR: td12020:An OTS initialization processing error occurred**

#### Explanation

A system error occurred during the transaction service initialization process.

#### System Action

Failed to start the component transaction service

#### User Action

Improve a system tuning parameter, and then reexecute the command. If there is no problem with the estimated system resource values, use the *iscollectinfo* command to collect diagnostic information, and contact your software supplier.

## 24.2.21 td12021

---

### **TD: INFO: td12021:Error log file was changed**

#### Explanation

Since the number of stored error logs equals the number of error logs switched, the save file (.old) is generated.

#### System Action

Continues collecting error logs.

#### User Action

If necessary, backup the save file (.old).

## 24.2.22 td12022

---

### **TD: WARNING: td12022:Error log acquisition could not begin due to insufficient disk space**

## Explanation

Could not start error log collection while starting the component transaction service, due to insufficient disk space.

## System Action

Terminates error log collection, however, it automatically restarts collecting the error log when the required disk space is restored.

## User Action

Check the disk space.

## 24.2.23 td12023

---

### **TD: WARNING: td12023:Error log acquisition terminated due to insufficient disk space**

## Explanation

Insufficient disk space for error log collection.

## System Action

Stops collecting the error log, however, it automatically restarts collecting the error log when the required disk space is restored.

## User Action

Check the disk space.

## 24.2.24 td12024

---

### **TD: WARNING: td12024:Error log file acquisition terminated because there is no log file**

## Explanation

The error log file has been moved or deleted during error log collection.

## System Action

Stops collecting the error log, however, it automatically restarts collecting the error log and generates a new error log file.

## User Action

If necessary, check the moved or deleted error logs.

## 24.2.25 td12025

---

### **TD: WARNING: td12025:Failed to start internal TD process partly (%s1-%d-%s2)**

## Variable Information

%s1 = Linkage Format

ORB: Component transaction service Server Application Linkage Internal Process

Wrapper: AIM Linkage Internal Process

%d = Percentage

Indicates, as a percentage rate, the number of clients that can be connected concurrently to the Component transaction service. This rate assumes the situation where all internal Component transaction service processes are operating to be 100%.

%s2 = Internal Information

## Explanation

Partly failed to start the Component transaction service internal process.

## System Action

Reduces its concurrent processing capability because the number of clients that can be connected concurrently to the Component transaction service is %d%.

## User Action

After waiting for a while, rerun the job.

If this message is output frequently, refer to the Tuning Guide to re-estimate the amount of memory required for Interstage operation, and determine whether the current memory space is sufficient.

If enough memory is allocated to Interstage, the memory space for other applications may be insufficient. Re-estimate the amount of memory required for other applications running on the same machine, and determine whether the current memory space is sufficient for these applications.

If the memory space is insufficient, contact your system administrator. The system administrator should expand the main memory or extend the page file. If there is no problem with the estimated system resource values, use the *iscollectinfo* command to collect diagnostic information, and contact your software supplier.

## 24.2.26 td12026

---

**TD: ERROR: td12026:Error occurred in AIM linkage function(%s1-%s2)**

### Variable Information

%s1 = Abnormality Reason

1: IDCM forced stop

2: Other

%s2 = Internal Information

### Explanation

An internal error has occurred in the AIM linkage functionality.

### System Action

Terminates the AIM linkage processing.

### User Action

Determine the cause shown in [Variable information]. In the case of an IDCM forced stop, restart both the IDCM and the AIM linkage WorkUnit.

## 24.2.27 td12027

---

**TD: ERROR: td12027:AIM linkage Work Unit has stopped forcibly (%s1-%s2-%s3)**

### Variable Information

%s1 WorkUnit Name

%s2 Stop Reason

1: Abnormality in mandatory product (IDCM)

2: Other

%s3 Internal Information

### Explanation

Because an error occurred in a mandatory product, the AIM linkage WorkUnit was forcibly stopped.

### System Action

The AIM linkage WorkUnit is forcibly stopped.

## User Action

Resolve the abnormality in the mandatory product to start the WorkUnit. This message appears even when the IDCM is forcibly stopped by command. In that case, check that the operation is correct.

## 24.2.28 td12028

---

**TD: ERROR: td12028: Object is not registered in the naming service (%s1-%s2-%s3)**

### Variable Information

%s1 WorkUnit name

%s2 Object Name

%s3 Error Information

### Explanation

The object defined manually in the WorkUnit is not defined in the Naming Service.

### System Action

Failed to start the WorkUnit.

### User Action

Register the object in the Naming Service with the *OD\_or\_adm* command, and then restart the WorkUnit.

If load balance is used, the address of the server specified when the object was manually registered (with the *odadministerlb* command) and the host name of the server where the WorkUnit is operating, may be different. Check the host name with the *oddisplaylboj* command.

## 24.2.29 td12029

---

**TD: ERROR: td12029: Invalid method name to begin session (%s1-%s2-%s3)**

### Variable Information

%s1 = WorkUnit Name

%s2 = Object Name

%s3 = Method name

### Explanation

The session start method name noted in the WorkUnit definition is not registered in the Interface Repository.

### System Action

There was a failure in starting work.

### User Action

Check the details of the WorkUnit definition and IDL definition. After correcting errors, register the IDL definition and WorkUnit again using the TD compiler and *tdaddddef* command and restart the WorkUnit.

## 24.2.30 td12030

---

**TD: ERROR: td12030: Invalid SessionID param type (%s1-%s2-%s3)**

### Variable information

%s1 = WorkUnit Name

%s2 = Object Name

%s3 = Operation Name

### Explanation

Either the session ID notification parameter noted in the WorkUnit definition is not in a 48-element octet array, or the session ID notification parameter in the session start method is not defined in an in/out format.

### System Action

The WorkUnit startup failed.

### User Action

Check the details of the WorkUnit definition and the IDL definition. After correcting errors, register the IDL definition and WorkUnit again using the TD compiler and tdaddddef command and restart the WorkUnit.

## 24.2.31 td12031

---

**TD: WARNING: td12031: Object is already registered in the naming service (%s1-%s2)**

### Variable Information

%s1 = WorkUnit Name

%s2 = Object Name

### Explanation

When, in the WorkUnit, an attempt was made to register the specified object to the Naming service, the object was already registered. When the load balance function was used, the object was already registered in the load balance object group.

### System Action

Forcibly reregisters the specified object to the Naming Service using the WorkUnit while the WorkUnit startup process continues.

### User Action

Even when this message is output, it is not applicable if, for any reason, a Component transaction service had ended in error.

If no Component transaction service has ended with an error, and then confirm that the object specified by the WorkUnit definition is not used by any other application.

Review the objects if there are any redundancies in applications and objects.

## 24.2.32 td12032

---

**TD: ERROR: td12032: Invalid User DN or Password param type (%s1-%s2-%s3)**

### Variable Information

%s1 = WorkUnit Name

%s2 = Object Name

%s3 = Operation Name

### Explanation

The parameters that define the user identification name or password in the WorkUnit definition user password are not in the format of strings.

### System Action

The WorkUnit startup failed.

### User Action

Examine the details of the WorkUnit definition and the IDL definition. After correcting errors, register the IDL definition and WorkUnit again using the TD compiler and tdaddddef command and restart the WorkUnit.

## 24.2.33 td12033

---

**TD: WARNING: td12033: The number of waiting message became to the monitoring queuing number(%s1-%s2-%s3)**

### Variable Information

%s1 = WorkUnit Name

%s2 = Object Name

%s3 = Monitoring Queuing Count

### Explanation

The number of queued messages for the object has reached the monitoring queuing count that is specified in the WorkUnit definitions.

### System Action

Continues queuing processing for the object.

### User Action

If this message appears frequently, review the WorkUnit definitions. If you change the work definitions, register the WorkUnit again using the *tdadddef* command and restart the WorkUnit.

## 24.2.34 td12034

---

**TD: WARNING: td12034: The number of waiting message exceeded the maximum queuing number(%s1-%s2-%s3)**

### Variable Information

%s1 = WorkUnit Name

%s2 = Object Name

%s3 = Maximum Queuing Count

### Explanation

The number of queued messages for the object has reached the maximum queuing count set in the WorkUnit definitions.

In the case of wrapper linkage, the number of queued messages for the object has reached the maximum number of held system sessions specified in the component transaction environment definition file.

### System Action

Returns a return value of 10008 to the client if the number of queued messages for the object has exceeded the maximum queuing count.

In the case of wrapper linkage, returns a return value of 10002 to the client and outputs an error log 3301.

### User Action

If this message appears frequently, review the WorkUnit definitions. If you change the work definitions, register the WorkUnit again using the *tdadddef* command and re-start the WorkUnit.

## 24.2.35 td12035

---

**TD: INFO: td12035: The number of waiting message became to restart monitoring queuing number(%s1-%s2-%s3)**

### Variable Information

%s1 = WorkUnit Name

%s2 = Object Name

%s3 = Monitoring Restart Queuing Count

#### Explanation

The number of queued messages for the object has reached the monitoring restart queuing count specified in the WorkUnit definitions.

#### System Action

Continues queuing processing for the object.

#### User Action

If this message appears frequently, review the WorkUnit definitions. If you change the work definitions, register the WorkUnit again using the *tdadddef* command and restart the WorkUnit.

## 24.2.36 td12036

---

**TD: ERROR: td12036:Invalid relation between the number of maximum session and the work unit definition(%s1-%s2)**

#### Variable Information

%s1 = WorkUnit Name

%s2 = Object Name

#### Explanation

In the wrapper, there is an error in the relationship between the maximum number of held system sessions (equivalent to the maximum queuing count) specified in the component transaction service environment definition file and the monitoring queuing count specified in the WorkUnit definitions.

#### System Action

The WorkUnit startup fails.

#### User Action

Review the component transaction service environment definition file or the WorkUnit definitions. If the component transaction service environment definition file has to be changed, restart the component transaction service once the changes have been made. If the WorkUnit definitions are changed, register the WorkUnit again using the *tdadddef* command and restart the WorkUnit.

## 24.2.37 td12037

---

**TD: ERROR: td12037:Could not start internal TD process(%s1-%s2)**

#### Variable Information

%s1 = Internal process name

%s2 = Reason for start failure

#### Explanation

The internal component transaction service process could not be started.

#### System Action

Processing continues.

#### User Action

When the reason for start failure is "NoMemory", the memory area is insufficient.

When the reason for start failure is "NoSharedMemory", the shared memory area is insufficient.

When the reason for start failure is other than the above, the number of processes that can be started in the system may have reached the maximum value.

After waiting for a while, rerun the job.

If this message is output frequently, refer to the Tuning Guide to re-estimate the amount of memory required for Interstage operation, and determine whether the current memory space is sufficient.

If enough memory is allocated to Interstage, the memory space for other applications may be insufficient. Re-estimate the amount of memory required for other applications running on the same machine, and determine whether the current memory space is sufficient for these applications.

If the memory space is insufficient, contact your system administrator. The system administrator should expand the main memory or extend the page file. If there is no problem with the estimated system resource values, use the *iscollectinfo* command to collect diagnostic information, and contact your software supplier.

## 24.2.38 td12038

---

**TD: WARNING: td12038: Reached to the maximum number of clients connected(%s1-%s2)**

### Variable Information

%s1 = Workunit type

%s2 = The number of clients

### Explanation

The number of clients reached upper limit.

### System Action

The new clients may wait in a CORBA service queue.

### User Action

If this message is output frequently, the system scale should be rechecked.

## 24.3 td13000 to td13999

---

This section details the messages with message numbers between td13000 and td13999.

### 24.3.1 td13001

---

**TD: ERROR: td13001: System contradiction detected Error information(%s1-%s2- %s3-% d1-%d2)**

### Variable Information

%s1 = Error information 1

%s2 = Error information 2

%s3 = Error information 3

%d1 = Error information 4

%d2 = Error information 5

### Explanation

A contradiction was found in the system.

### System Action

Stops the processing.

### User Action

Use the *iscollectinfo* command to collect diagnostic information, and contact your software supplier.

## 24.3.2 td13002

---

**TD: ERROR: td13002:A resource shortage occurred(%s1-%s2-%s3-% d1-%d2)**

### Variable Information

%s1 = Error information 1  
%s2 = Error information 2  
%s3 = Error information 3  
%d1 = Error information 4  
%d2 = Error information 5

### Explanation

An error occurred while retrieving the necessary resources for the operation.

### System Action

Stops the processing.

### User Action

After waiting for a while, rerun the job. If this message is output frequently, refer to the Tuning Guide to re-estimate the amount of memory space required for Interstage operation, and determine whether the current memory space is sufficient for the operation.

If enough memory space is allocated to Interstage, the memory space for other applications may be insufficient. Re-estimate the amount of memory space required for other applications running on the same machine, and determine whether the current memory space is sufficient for these applications. If the memory space is found to be insufficient, contact your system administrator. The system administrator should expand the main memory or extend the page file. If there is no problem with the estimated system resource values, use the *iscollectinfo* command to collect diagnostic information, and contact your software supplier.

## 24.3.3 td13003

---

**TD: ERROR: td13003: : Error occurred when access to database (%s1-%s2-%s3-%d1-%d2)**

### Variable Information

%s1 = XA Processing Status  
%s2 = Database Name  
%s3 = Resource Definition Name  
%d1 = Resource Manager Name  
%d2 = Resource Manager Name

### Explanation

An error was found in the resource manager.

### System Action

Stops the processing.

### User Action

The following are the possible causes of this error. Determine and correct the error, and then rerun the job.

- The OPENINFO character string in the resource definition file is incorrect.
- The environment variables required for the database have not been set.
- The database is not active.
- An error has occurred in the database.

If the database displays a message, take the action indicated by the message. For the messages output by the database, refer to the manual appropriate to the database management system used.

## 24.3.4 td13004

---

**TD: ERROR: td13004:OTS system or resource management was not available(%s1-%s2-%s3-%d1-%d2)**

### Variable Information

%s1 = XA Processing Status

%s2 = Error information 1

%s3 = Error information 2

%d1 = Error information 3

%d2 = Error information 4

### Explanation

The OTS system or resource manager is not started or cannot be used.

### System Action

Stops the processing.

### User Action

If the OTS system or resource manager is not started, start Interstage, start the resource manager corresponding to the resource definition name specified in the WorkUnit definition, and then reexecute the process.

If the OTS system and resource manager are started, the setting of `period_receive_timeout` in the CORBA service environment definition file (config file) may be smaller than the `TRAN_TIME_OUT` setting in the Database Linkage Service environment definition file (config file). If the value is smaller, set it to a value larger than the `TRAN_TIME_OUT` value. Then restart Interstage, restart the resource manager corresponding to the resource definition name specified in the WorkUnit definition and reexecute processing.

If a message is generated that includes "begin-Current\_begin:IDL:CORBA/StExcep/COMM\_FAILURE" in its variable information area, there may be a problem processing a client request. Examine the operating environment of the client. In addition, if the client uses Java language, ensure that the environment variable `CLASSPATH` is correct.

**Windows32/64**

Confirm that the name of a WorkUnit using OTS is specified as WorkUnit name in the WorkUnit auto-start file.

WorkUnit auto-start processing is available only for a WorkUnit without global transaction linkage.

## 24.3.5 td13005

---

**TD: ERROR: td13005:Transaction was rolled back(%s1-%s2-%s3)**

### Variable Information

%s1 = XA Processing Status

%s2 = Error information 1

%s3 = Error information 2

### Explanation

The transaction has been rolled backed.

### System Action

Stops the processing.

User Action

None.

### 24.3.6 td13006

---

**TD: ERROR: td13006:One part of the transaction committed, but another part rolled back(%s1-%s2-%s3)**

Variable Information

%s1 = XA Processing Status

%s2 = Error information 1

%s3 = Error information 2

Explanation

Part of the transaction was committed and part of the transaction was rolled back.

System Action

Stops the processing.

User Action

None.

### 24.3.7 td13007

---

**TD: ERROR: td13007:Resource definition file does not exist(%s1-%s2-%s3)**

Variable Information

%s1 = XA Processing Status

%s2 = Resource manager name

%s3 = Resource definition name

Explanation

The resource definition file, corresponding to the resource definition name that is written in the Name in [Resource Manager] section of the Work Unit definition, is not registered.

System Action

Stops the processing.

User Action

If the resource definition name specified in the Work Unit definition is correct, create a resource definition file and reexecute the processing.

### 24.3.8 td13008

---

**TD: ERROR: td13008:Resource definition file reading failed(%s1-%s2-%s3-%d1-%d2)**

Variable Information

%s1 = XA Processing Status

%s2 = Resource manager name

%s3 = Resource definition name

%d1 = Error information 1

%d2 = Error information 2

## Explanation

Failed to read the resource definition file corresponding to the resource definition name that is written in the Name in [Resource Manger] section of the Work Unit definition.

## System Action

Stops the processing.

## User Action

If the resource definition name specified in the Work Unit definition is correct, check that the contents of the resource definition file corresponding to the resource definition name is correct, and then reexecute the processing.

In addition, the operating environment may have been built to limit user access according to the Security System Guide. Carry out the process again as a specific user.

## 24.3.9 td13009

---

**TD: ERROR: td13009: Information of file was not obtained(%s1-%s2-%d)**

### Variable Information

%s1 = XA Processing Status

%s2 = Error information 1

%d = Error information 2

### Explanation

The file information has not been obtained.

### System Action

Stops the processing.

### User Action

Use the *iscollectinfo* command to collect diagnostic information, and contact your software supplier.

## 24.3.10 td13010

---

**TD: ERROR: td13010: : OD is unavailable now(%s1-%s2-%s3-%d)**

### Variable Information

%s1 = XA Processing Status

%s2 = Error information 1

%s3 = Error information 2

%d = Error information 3

### Explanation

Either the OD is not started, or the number of OD processes (number of activated clients/servers) may have exceeded the maximum limit.

### System Action

Stops the processing.

### User Action

Start the OD, and then restart the process.

If the OD is already started, then the number of OD processes (number of activated clients/servers) may have exceeded the maximum limit. Increase the OD maximum process number, and then reexecute the process.

### 24.3.11 td13011

---

**TD: ERROR: td13011:The communication error with naming service occurred(%s1-%s2-%s3)**

#### Explanation

A communications error has occurred while accessing the Naming Service.

#### System Action

Stops the processing.

#### User Action

Check that the Naming Service has started and is accessible. If there is no problem with the Naming Service, then the number of OD processes (number of activated clients/servers) may have been exceeded. Increase the OD maximum process number, and then reexecute the process.

### 24.3.12 td13012

---

**TD: ERROR: td13012:Resource management program did not register(%s1-%s2-%s3-%d)**

#### Variable Information

%s1 = XA Processing Status

%s2 = Resource manager name

%s3 = Resource definition name

%d = Error information

#### Explanation

Either the resource manager corresponding to the resource definition name specified in the WorkUnit definition is not registered, or the number of OD processes (number of activated clients/servers) may have exceeded the maximum limit.

#### System Action

Stops the processing.

#### User Action

Register the resource manager corresponding to the resource definition name specified in the WorkUnit definition, and then reexecute the process.

If the resource manager is already registered, the number of OD processes (number of activated clients/servers) may have exceeded the maximum limit. Increase the OD maximum process number, and then reexecute the process.

### 24.3.13 td13013

---

**TD: ERROR: td13013:Resource manager information specified by the work unit definition, and the required XA linkage program dose not compatible(%s1-%s2-%d)**

#### Variable Information

%s1 = XA Processing Status

%s2 = Error information 1

%d = Error information 2

## Explanation

Either the number for the resource manager information specified in the WorkUnit definition is invalid, or the XA linkage program corresponding to the resource manager is not used.

## System Action

Stops the processing.

## User Action

Either specify the correct number for the resource manager information of the WorkUnit definition, or use the XA linkage program corresponding to the resource manager, and then reexecute the process.

**Windows32/64**

If the message contains "(before xa\_open-OTS-setsw-1)" in the variable information "(%s1-%s2-%d)", fjotsld.obj may not be linked. Ensure that the compile option is correct, and then re-compile and reexecute the process.

## 24.3.14 td13014

---

**TD: ERROR: td13014:Resource manager name specified by the work unit definition does not exist(%s1-%s2-%s3)**

### Variable Information

%s1 = XA Processing Status

%s2 = Resource manager name

%s3 = Resource definition name

### Explanation

The resource manager name specified in the WorkUnit definition does not exist.

### System Action

Stops the processing.

### User Action

Set the correct resource manager name specified in the WorkUnit definition, and then reexecute the process.

## 24.3.15 td13015

---

**TD: WARNING: td13015:The transaction timeout occurred(%s1-%s2-%s3)**

### Variable Information

%s1 = XA Processing Status

%s2 = Error information1

%s3 = Resource definition name

### Explanation

A transaction timeout has occurred.

### System Action

Processing continues.

### User Action

Set period\_receive\_timeout in the ObjectDirector environment setup file (config file) to a value greater than TRN\_TIME\_OUT in the ObjectTransactionService environment setup file (config file), and then restart the process.

## 24.3.16 td13016

---

**TD: ERROR: td13016: Resource management program is stopping or has stopped(%s1-%s2-%s3)**

### Variable Information

%s1 = XA Processing Status

%s2 = Resource Definition Name

%s3 = Error information

### Explanation

The resource control program is stopping or has stopped.

### System Action

Stops processing.

### User Action

Start Interstage, then start the resource control program corresponding to the resource definition name specified by the WorkUnit definition, and perform the processing again.

## 24.3.17 td13017

---

**TD: ERROR: td13017: A system resource shortage occurred (%s1-%s2-%s3-%d d1-%d2)**

### Variable Information

%s1 = Error Information 1

%s2 = Error Information 2

%s3 = Error Information 3

%d1 = Error Information 4

%d2 = Error Information 5

### Explanation

The system resources required for operation failed to be allocated.

### System Action

Stops processing.

### User Action

Quit any unnecessary programs, and then rerun the job.

If this message is output even after this action is taken, use the *iscollectinfo* command to collect diagnostic information, and contact your software supplier.

## 24.3.18 td13018

---

**TD: ERROR: td13018: A system error occurred (%s1-%s2-%s3-%d1-%d2)**

### Variable Information

%s1 = Error Information 1

%s2 = Error Information 2

%s3 = Error Information 3

%d1 = Error Information 4

%d2 = Error Information 5

#### Explanation

A system error has occurred.

#### System Action

Stops processing.

#### User Action

Use the *iscollectinfo* command to collect diagnostic information, and contact your software supplier.

### 24.3.19 td13019

---

**TD: ERROR: td13019: Invalid environment variable is specified(%s1-%s2-%d)**

#### Variable Information

%s1 = XA Processing Status

%s2 = Environment variable name

%d = Error information1

#### Explanation

The environment variable is incorrect.

#### System Action

Stops processing.

#### User Action

Correct the environment variable and reexecute processing.

### 24.3.20 td13020

---

**TD: ERROR: td13020: Request made to transactional object outside transaction(%s1-%s2-%s3)**

#### Variable Information

%s1 = XA Processing Status

%s2 = Error information 1

%s3 = Error information 2

#### Explanation

A request has been made to the transactional object outside transaction.

#### System Action

Stops processing.

#### User Action

Check that the request is issued to the transactional object, from the thread where a begin request was issued.

### 24.3.21 td13021

---

**TD: ERROR: td13021: ObjectTransactionService is unavailable now. : %s1 %s2 %s3**

#### Variable Information

%s1 = Error Information 1

%s2 = Error Information 2

%s3 = Error Information 3

#### Explanation

The database linkage service cannot be used.

#### System Action

Stops processing.

#### User Action

If the string "SYSTEMNAME=" is output to Error Information 1, the database linkage service is trying to operate in the extended system. Operate the database linkage service only in the default system.

Otherwise, record the error information, use the *iscollectinfo* command to collect diagnostic information, and contact your software supplier.

## 24.4 td14000 to td14999

---

This section details the messages with message numbers between td14000 and td14999.

### 24.4.1 td14001

---

**TD: ERROR: td14001:A resource shortage occurred(%s)**

#### Variable Information

%s = Error Information

#### Explanation

Failed to retrieve the resources necessary for the operation.

#### System Action

Failed to start the component transaction service.

#### User Action

Execute the process again later. If this message is generated frequently, refer to the Tuning Guide, re-estimate the memory required to run Interstage, and confirm that there is enough memory.

If there is enough memory (relative to the amount of memory needed to run Interstage), it may be that there is inadequate memory to run other applications. Re-estimate the amount of memory needed for the other applications running on the same machine as well to determine if there is an appropriate amount of memory.

Contact your system administrator if the re-estimation indicates that the memory is insufficient. Ask the system administrator to either increase the size of the main memory or to increase the size of the page file.

### 24.4.2 td14002

---

**TD: ERROR: td14002:A system resource shortage occurred(%s1-%s2-%s3)**

#### Variable Information

%s1 = System Call Name

%s2 = System Call Error No.

%s3 = Error Information

#### Explanation

Failed to retrieve the resources necessary for the operation.

### System Action

Failed to start the component transaction service.

### User Action

Use the *iscollectinfo* command to collect diagnostic information, and contact your software supplier.

## 24.4.3 td14003

---

**TD: ERROR: td14003:Abnormality notified from OD(%s1-%s2-%s3)**

### Variable Information

%s1 = Error information 1

%s2 = Error information 2

%s3 = Error information 3

### Explanation

The CORBA Service reported an abnormality.

### System Action

If the component transaction service is being started, the system stops it. If the component transaction service is running or being stopped, it does not have an impact on the system.

### User Action

Carry out the actions shown in Table the following table, according to the Error information 1

Table 24.5 Error Information

Error information1(%s1)	Actions
ISTD_SMO_EXP_stop_smo	Failed to stop the session information control object. Stop the session information control process (smo).
CORBA_ORB_string_to_object	
ISTD_SMO_LISTENER_timeout	The Object of the status notification listener registered in the session information control object is not implemented correctly, or is not operating correctly. Check that it is implemented and operating correctly.

For abnormalities other than those described above, use the *iscollectinfo* command to collect diagnostic information, and contact your software supplier.

## 24.4.4 td14004

---

**TD: ERROR: td14004:OD did not start**

### Explanation

Either the CORBA service is not started, or the CORBA service reported insufficient system resources.

### System Action

Failed to start the component transaction service.

### User Action

Start the CORBA service, and then reexecute the command. If the CORBA service D is already started, check that there are sufficient resources for the operation.

## 24.4.5 td14005

---

**TD: ERROR: td14005:Object reference could not be acquired(%s1-%s2-%s3)**

### Variable Information

%s1 = Service name

%s2 = Abnormality Reason (Notified at the time of completion)

%s3 = Error Information

### Explanation

Abnormal end of service occurred while the object reference request was issued from the CORBA Service.

### System Action

Failed to start the component transaction service.

### User Action

Carry out the actions shown in the following table, according to the Service name and abnormality reason, and then restart Interstage.

Table 24.6 Service Action

Service name (%s1)	Abnormality Reason (%s2)	Actions
Interface Repository	IDL:CORBA/StExcep/NO_IMPLEMENT	Check the status of the Interface Repository Cache Server. If it is not started, start it.
Naming Service	IDL:CORBA/StExcep/NO_IMPLEMENT	Check the status of the naming server. If it is not started, start it.

For abnormalities other than those described above, use the *iscollectinfo* command to collect diagnostic information, and contact your software supplier.

## 24.4.6 td14006

---

**TD: ERROR: td14006:Too many number of OD server applications(%s)**

### Variable Information

%s = Error Information

### Explanation

The number of server applications registered in the CORBA service has exceeded the maximum limit. The session information control object cannot be registered in the CORBA service.

### System Action

Failed to start the component transaction service.

### User Action

Either correct the number of server applications running under the CORBA service, correct the operating environment setting, or add memory or swap area, and then restart Interstage.

## 24.4.7 td14007

---

**TD: ERROR: td14007:OD resource shortage occurred(%s)**

### Variable Information

%s = Service Name

#### Explanation

The CORBA service reported insufficient resources.

#### System Action

Failed to start the component transaction service.

#### User Action

Correct the CORBA service operating environment, and then restart Interstage.

### 24.4.8 td14008

---

#### **TD: ERROR: td14008:System information directory could not be accessed**

#### Explanation

Cannot access the system information folder:

Interstage install folder\td\sys\smo

#### System Action

Failed to start the component transaction service.

#### User Action

Check the system information folder.

### 24.4.9 td14009

---

#### **TD: ERROR: td14009:Session information management object did not start due to insufficient disk space**

#### Explanation

The session information control object cannot be started due to insufficient disk space in the system information folder:

Interstage install folder\td\sys\smo

#### System Action

Failed to start the component transaction service.

#### User Action

Check the disk capacity.

### 24.4.10 td14010

---

#### **TD: ERROR: td14010:A system error occurred(%s1-%s2-%s3)**

#### Variable Information

%s1 = Error information 1

%s2 = Error information 2

%s3 = Error information 3

#### Explanation

A system error occurred in the session information control object.

#### System Action

Stops the component transaction service abnormally.

## User Action

If the value indicated as error information 2 is 8, 14, or 1455, there is a memory shortage. In this case, reexecute the processing later. If this message is generated frequently, refer to the Tuning Guide, re-estimate the memory required to run Interstage, and check whether there is enough memory.

If there is enough memory to run Interstage, there may be inadequate memory to run other applications. Re-estimate the amount of memory required for the other applications running on the same machine to determine if there is an appropriate amount of memory.

Contact your system administrator if the re-estimation indicates that the memory is insufficient. Ask the system administrator to either increase the size of the main memory or to increase the size of the page file.

In other cases, use the *iscollectinfo* command to collect diagnostic information, and contact your software supplier.

## 24.4.11 td14011

---

**TD: ERROR: td14011:Object is already registered in the naming service(%s)**

### Variable Information

%s1 = Object Name

### Explanation

The session information control object to be registered with the object name defined in the system environment definition could not be registered in the Naming Service, because it is already registered.

### System Action

Failed to start the TD.

### User Action

Check if the object name specified in the system environment definition is used by other application. If it is duplicated in another application, correct the object name.

If the component transaction service has previously terminated due to an unknown cause, this message will appear when starting the component transaction service, and indicates that the object name of the session information control object may still be registered in the Naming Service. Delete the object from the Naming Service with the *OD\_or\_adm* command, and then restart Interstage.

## 24.5 td16000 to td16999

---

This section details the messages with message numbers between td16000 and td16999.

### 24.5.1 td16001

---

**TD: INFO: td16001:Log file was changed**

### Explanation

A storage file (asolog.old) has been generated because the number of items in the authentication object log file (Interstage install folder \td\trc\aso\asolog ) has reached the switching number (10000 items).

### System Action

Logging continues

### User Action

If necessary, make and archive a copy of the storage file (.old).

### 24.5.2 td16002

---

**TD: WARNING: td16002:Log acquisition could not begin due to insufficient disk space**

## Explanation

Logging could not be started because there is not enough room on the authentication object log storage disk.

## System Action

Starts the component transaction service without logging.

Logging is started automatically when the required disk space is restored.

## User Action

Check the required disk capacity.

## 24.5.3 td16003

---

### **TD: WARNING: td16003:Log acquisition terminated due to insufficient disk space**

## Explanation

There is not enough room on the authentication object log storage disk.

## System Action

Stops authentication object logging.

Logging is started automatically when the required disk space is restored.

## User Action

Check the required disk capacity.

## 24.5.4 td16004

---

### **TD: WARNING: td16004:Log file acquisition terminated because there is no log file**

## Explanation

The authentication object log file (Interstage install folder\td\trc\aso\asolog) has been moved or deleted.

## System Action

Generates a new log file.

## User Action

Although logging restarts automatically, if necessary, check for the moved or deleted file.

## 24.5.5 td16009

---

### **TD: ERROR: td16009:InfoDirectory manager information contains an abnormality(%s)**

## Variable Information

*%d* = Error Information

## Explanation

There is an error in InfoDirectory administrator information controlled by the component transaction service.

## System Action

The WorkUnit startup fails.

## User Action

Run the `tdsetauthmanager` command to reset the InfoDirectory administrator information. If running the `tdsetauthmanager` command does not solve the problem, note the error information and contact your system administrator.

## 24.5.6 td16010

---

**TD: ERROR: td16010:Abnormality notified from InfoDirectory(%s-0x%x)**

### Variable Information

%s = Name of subject of Access Control

%x = LDAP Error Code

### Explanation

There was a notification of error from InfoDirectory.

### System Action

Failure in starting the WorkUnit.

### User Action

Note the error code in the notification from InfoDirectory, and make adjustments on the InfoDirectory side. For details of the error codes, refer to InfoDirectory User's Manual Part 3 LDAP SDK, LDAP Error Codes.

Contact your system administrator if the investigation into error codes does not solve the problem.

## 24.5.7 td16011

---

**TD: ERROR: td16011:The target of access check is not registered in InfoDirectory(%s1-%s2)**

### Variable Information

%s1 = Name of the subject of access control

%s2 = base DN

### Explanation

Either the WorkUnit or object specified by the subject of access control is not registered into InfoDirectory, or the DN for the InfoDirectory administrator controlled by the component transaction service cannot access the subject of access control.

### System Action

The WorkUnit startup fails.

### User Action

Check the status of the subject of access control. If it is not registered, register the subject of access control into InfoDirectory and restart the WorkUnit.

If it is registered, confirm that the DN for the administrator for InfoDirectory controlled by the component transaction service has authority for accessing the subject of access control. If there is no access authority, either setup the access authority and restart the WorkUnit or use the *tdsetauthmanager* command to setup an administrator DN able to access all subject of access control, and then and restart the WorkUnit.

## 24.5.8 td16012

---

**TD: ERROR: td16012:Work unit did not start because InfoDirectory is not installed**

### Explanation

A WorkUnit could not be started because InfoDirectory is not installed.

### System Action

WorkUnit startup fails.

## User Action

Install InfoDirectory and restart the WorkUnit.

## 24.5.9 td16013

---

**TD: ERROR: td16013:A resource shortage occurred(%s)**

### Variable Information

%s = Error Information

### Explanation

There was a failure to get the resources required for operation.

### System Action

The component transaction service startup fails or WorkUnit startup fails.

### User Action

Add memory and/or swap space as required for operation. If there is no problem with the estimates for the system, contact your system administrator.

## 24.5.10 td16014

---

**TD: ERROR: td16014:A system resource shortage occurred(%s1-%s2-%s3)**

### Variable Information

%s1 = System Call Name

%s2 = System Call Error Number

%s3 = Error Information

### Explanation

There was a failure to get the resources required for operation.

### System Action

Component transaction service startup fails or WorkUnit startup fails.

### User Action

Review the system-estimated value and restart the component transaction service. If there is no problem with the estimates for the system, contact your system administrator.

## 24.5.11 td16015

---

**TD: ERROR: td16015:Abnormality notified from OD(%s1-%s2-%s3)**

### Variable Information

%s1 = Error Information 1

%s2 = Error Information 2

%s3 = Error Information 3

### Explanation

There has been an error notification from the COBRA Service.

### System Action

The component transaction service startup or WorkUnit startup fails.

### User Action

Error may have occurred in CORBA Service. Confirm the condition of CORBA Service. Make contact with the system administrator when there is no wrong point in the condition of CORBA Service.

## 24.5.12 td16016

---

### TD: ERROR: td16016:OD did not start

#### Explanation

Either the COBRA Service is not started or there has been a resource shortage notification from the COBRA Service.

#### System Action

Fails the component transaction service startup.

#### User Action

Start the CORBA Service, and then restart the component transaction service. If the COBRA Service has been started already, check for a shortage of resources required for operation.

## 24.5.13 td16017

---

### TD: ERROR: td16017:Object reference could not be acquired(%s1-%s2-%s3)

#### Variable Information

%s1 = Type

%s2 = Error Reason (Error reason in the notification at completion)

%s3 = Error Information

#### Explanation

When the service was issued to the COBRA Service, it was terminated with an error.

#### System Action

The component transaction service startup fails.

#### User Action

If %s1 and %s2 are as shown in the following table, take the appropriate action and restart the component transaction service.

If %s1 and %s2 are not listed below, contact your system administrator.

Table 24.7 TD Error Reasons

Service name (%s1)	Error reason (%s2)	Action
Naming Service	IDL: CORBA/StExcep/NO_IMPLEMENT	Check the Naming Service status. If it is not started already, start the Naming Service.

## 24.5.14 td16018

---

### TD: ERROR: td16018:OD resource shortage occurred(%s)

#### Variable Information

%s = Error Information

## Explanation

There has been a resource shortage notification from the CORBA Service.

## System Action

The component transaction service startup or WorkUnit startup fails.

## User Action

Re-examine the CORBA service operating environment and restart the component transaction service.

## 24.5.15 td16019

---

### **TD: ERROR: td16019:Implementation Repository ID registration failed**

## Explanation

There was a failure in the authentication object Implementation Repository ID (FUJITSU- Interstage-TDASO) registration.

## System Action

The component transaction service startup fails.

## User Action

Check for other applications using the same Implementation Repository ID as the authentication object uses.

If used by another application, terminate that application and restart the component transaction service. If the Implementation Repository ID is not used by another application, contact your system administrator.

## 24.5.16 td16020

---

### **TD: INFO: td16020:Authentication Object could not be deleted from the naming service**

## Explanation

When the component transaction service that uses the authentication object was stopped the authentication object could not be deleted from the Naming Service.

## System Action

The command is processed normally. The next component transaction service startup is also performed normally.

## User Action

Confirm that no other application is using the same Naming Service registration name as the authentication object.

## 24.5.17 td16021

---

### **TD: INFO: td16021:Unable to delete repository ID from implementation repository**

## Explanation

When the component transaction service that was using the authentication object was shut down, the authentication object repository ID (FUJITSU-Interstage-TDASO) could not be deleted from the Implementation Repository .

## System Action

The command is processed normally. The next component transaction service startup is also performed normally.

## User Action

Confirm that the authentication object Implementation Repository ID has not been deleted.

## 24.5.18 td16022

---

### **TD: ERROR: td16022:TD did not start because InfoDirectory is not installed**

#### Explanation

When the authentication object is used, the component transaction service could not be started because InfoDirectory is not installed.

#### System Action

The component transaction service startup fails.

#### User Action

If the authentication object is used, restart the component transaction service after installing InfoDirectory.

## 24.5.19 td16023

---

### **TD: ERROR: td16023:Work unit did not start because InfoDirectory is not started**

#### Explanation

A WorkUnit that specifies the use of access could not be started because InfoDirectory is not started.

#### System Action

WorkUnit startup fails.

#### User Action

Determine the InfoDirectory startup status. If it is not started, start InfoDirectory and then restart the WorkUnit. If it has been started already, check the InfoDirectory server host name and port number specified by the system environment definitions, specify a correct host name and port number. Restart the component transaction service, and then restart the WorkUnit.

## 24.5.20 td16024

---

### **TD: ERROR: td16024:Invalid InfoDirectory manager information credentials(%s)**

#### Variable Information

%s = InfoDirectory Administrator DN

#### Explanation

There was a failure in authorization for the InfoDirectory administrator information controlled by the component transaction service.

#### System Action

Fails the WorkUnit startup.

#### User Action

Run the tdsetauthmanager command to reset the InfoDirectory administrator Information.

## 24.5.21 td16025

---

### **TD: ERROR: td16025:Invalid InfoDirectory manager DN syntax(%s)**

#### Variable Information

%s = InfoDirectory Administrator DN

#### Explanation

There is a format error in InfoDirectory administrator DN controlled by the component transaction service.

## System Action

The WorkUnit startup fails.

## User Action

Run the `tdsetauthmanager` command to reset the InfoDirectory administrator Information.

## 24.5.22 td16026

---

### **TD: ERROR: td16026:Base DN does not exist in InfoDirectory(%s1-%s2)**

#### Variable Information

%s1 = Name of subject of access control

%s2 = Base DN

#### Explanation

Either the base DN specified in the WorkUnit definition does not exist in InfoDirectory or the DN for the administrator for InfoDirectory controlled by the component transaction service cannot access the base DN.

#### System Action

The WorkUnit startup fails.

#### User Action

Check whether or not the base DN exists in InfoDirectory. If it does not exist, specify the correct base DN in the WorkUnit definition and restart the WorkUnit. If it does exist, check whether or not the DN for the administrator for InfoDirectory controlled by the component transaction service has the authority to access the base DN. If there is no access authority, either setup the access authority and then restart the WorkUnit, or use the `tdsetauthmanager` command to set an administrator DN that can access the base DN and then restart the WorkUnit.

## 24.5.23 td16027

---

### **TD: ERROR: td16027:Invalid Base DN syntax(%s1-%s2)**

#### Variable Information

%s1 = Name of subject of access control

%s2 = Base DN

#### Explanation

There is a syntax error in the base DN specified by the WorkUnit definition.

#### System Action

The WorkUnit startup fails.

#### User Action

Specify the correct base DN using the WorkUnit definition and restart the WorkUnit.

## 24.5.24 td16028

---

### **TD: ERROR: td16028:WorkUnit for Access Control can not be used on extended system**

#### Explanation

On an extended system, the WorkUnit for access control cannot be started.

## System Action

The WorkUnit startup fails.

## User Action

Use access control on the default system.

## 24.6 td17000 to td17999

---

This section details the messages with message numbers between td17000 and td17999.

### 24.6.1 td17001

---

#### **TD:INFO:td17001:Backup process is starting**

#### Explanation

Backup process of the Component Transaction Service has started.

### 24.6.2 td17002

---

#### **TD:INFO:td17002:Restore process is starting**

#### Explanation

Restore process of the Component Transaction Service has started.

### 24.6.3 td17003

---

#### **TD:INFO:td17003:Backup process ended normally**

#### Explanation

Backup process of the Component Transaction Service ended normally.

### 24.6.4 td17004

---

#### **TD:INFO:td17004:Restore process ended normally**

#### Explanation

Restore process of the Component Transaction Service ended normally.

### 24.6.5 td17005

---

#### **TD:ERROR:td17005:Backup terminated abnormally**

#### Explanation

Backup process terminated abnormally.

#### User Action

Refer to the error message displayed at the same time, eliminate the cause of the error and reexecute the command.

### 24.6.6 td17006

---

#### **TD:ERROR:td17006:Restore terminated abnormally**

#### Explanation

Restore process terminated abnormally.

#### User Action

Refer to the error message displayed at the same time, eliminate the cause of the error and reexecute the command.

### 24.6.7 td17007

---

#### **TD:ERROR:td17007:The number of option is incorrect**

##### Explanation

The number of options specified to the command is incorrect.

##### System Action

Command processing stops.

##### User Action

Specify the correct options and reexecute the command.

### 24.6.8 td17008

---

#### **TD:ERROR:td17008:The option specification is incorrect**

##### Explanation

The option specified to the command is incorrect.

##### System Action

Command processing stops.

##### User Action

Specify the correct options and reexecute the command.

### 24.6.9 td17009

---

#### **TD:ERROR:td17009:The backup directory is not specified**

##### Explanation

The backup directory is not specified to the command option.

##### System Action

Command processing stops.

##### User Action

Specify the correct backup directory to the command option and reexecute the command.

### 24.6.10 td17010

---

#### **TD:ERROR:td17010:The specified backup directory is not exist (PATH=%s)**

##### Variable Information

%s = Backup folder

##### Explanation

The backup folder specified to the command option does not exist.

##### System Action

Command processing stops.

#### User Action

Specify the correct backup folder to the command option and reexecute the command.

### 24.6.11 td17011

---

#### **TD:ERROR:td17011:The backup resources already exist in the specified directory (PATH=%s)**

#### Variable Information

%s = Backup folder

#### Explanation

Since the backup resources already exist in the backup folder specified by the command, the process is stopped.

#### System Action

Command processing stops.

#### User Action

You cannot backup a folder more than one time. Specify the correct backup folder for the command option, and then reexecute the command.

### 24.6.12 td17012

---

#### **TD:ERROR:td17012:Permission denied**

#### Explanation

The user does not have permission to execute the command.

#### System Action

Command processing stops.

#### User Action

Only the user who has Administrator permission can execute the backup/restore commands. Reexecute the command as a user with Administrator permission.

### 24.6.13 td17013

---

#### **TD:ERROR:td17013:INTERSTAGE started**

#### Explanation

Command execution failed because Interstage is starting.

#### System Action

Command processing stops.

#### User Action

Only administrators can execute a backup restoration command. Reexecute the command logged in as an administrator.

### 24.6.14 td17014

---

#### **TD:ERROR:td17014:A necessary file does not exist Error information(%s)**

#### Variable Information

%s = Object Resource Name

## Explanation

Command execution failed because the object resource required to backup or restore the environment does not exist.

## System Action

Command processing stops.

## User Action

If this error occurred during the execution of backup processing, the environment may have already been destroyed. In this case, re-install the Component Transaction Service.

If this error occurred during the execution of restore processing, the backup resource may have been destroyed. Reexecute backup to restore the correct object resource.

## 24.6.15 td17015

---

### TD:ERROR:td17015:An internal error was detected Error information(%s)

## Variable Information

%s = Error information

## Explanation

A contradiction inside the system was detected during command processing.

## System Action

Command processing stops.

## User Action

Take a note of the error information and use the *iscollectinfo* command to collect diagnostic information, contact your software supplier.

## 24.6.16 td17016

---

### TD:ERROR:td17016:A memory shortage occurred

## Explanation

Memory shortage occurred.

## System Action

Command processing stops.

## User Action

Reexecute the processing later. If this message is generated frequently, refer to the Tuning Guide, re-estimate the memory required to run Interstage, and check whether there is enough memory.

If there is sufficient memory to run Interstage, there may be inadequate memory to run other applications. Re-estimate the amount of memory required for the other applications running on the same machine to determine that there is an appropriate amount of memory.

Contact your system administrator if the re-estimation indicates that the memory is insufficient. Ask the system administrator to either increase the size of the main memory or increase the size of the page file.

## 24.6.17 td17017

---

### TD: ERROR:td17017:A disk resource shortage occurred

## Explanation

There is insufficient disk space in the backing up or restoring destination.

### System Action

Command processing stops.

### User Action

Reserve sufficient disk space and reexecute the command.

## 24.6.18 td17018

---

### **TD:ERROR:td17018:An I/O error occurred Error information(%d)**

#### Variable Information

%d = Error information

#### Explanation

An I/O error has occurred.

#### System Action

Command processing stops.

#### User Action

Check the disk unit and media where the backup resources of Interstage have been installed.

## 24.6.19 td17019

---

### **TD:ERROR:td17019:A system error occurred Error information(%d)**

#### Variable Information

%d = Error information

#### Explanation

A system error occurred.

#### System Action

Command processing stops.

#### User Action

If the error information is 0, the message indicating a radical cause is output. Refer to the messages displayed at the same time in order to execute the actions.

If the error information value is other than 0, take a note of the error information and use the *iscollectinfo* command to collect diagnostic information, contact your software supplier.

## 24.6.20 td17020

---

### **TD:ERROR:td17020:The specified system name does not exist or it is a reserved word**

#### Explanation

The command cannot be executed because the system name specified in the option of the command is incorrect or is a reserved word.

#### System Action

Command processing stops.

#### User Action

Specify a valid system name, and execute the command again.

Note: The following system names are reserved words that cannot be specified: 'td001' and 'ec001'

## 24.6.21 td17021

---

### **TD:ERROR:td17021:The specified system name is incorrect**

#### Explanation

The system name specified in the option includes an invalid character. The command cannot be executed.

#### System Action

Command processing stops.

#### User Action

Specify the correct system name, and execute the command again.

**Note:** Only alphanumeric (**A to Z**; and **a to z** and **0 to 9**) characters can be used for the system name. However, the first character cannot be numeric.

## 24.6.22 td17022

---

### **TD:ERROR:td17022:The specified system name is too long**

#### Explanation

The system name specified in the option exceeds eight bytes. The command cannot be executed.

#### System Action

Command processing stops.

#### User Action

Specify a system name of eight or fewer bytes.

## 24.6.23 td17023

---

### **TD:ERROR:td17023:The specified backup resource can not restore to the specified system name**

#### Explanation

The backup resource cannot be restored.

#### System Action

Command processing stops.

#### User Action

Refer to the Interstage Operator's Guide to check the combination of the backup resource and restore destination. Restore the backup resource with the correct combination.

## 24.6.24 td17024

---

### **TD:ERROR:td17024: Required component is not installed Error Information(%s)**

#### Variable Information

%s = Component name

#### Explanation

The component files required for command operation is insufficient.

## System Action

Command processing stops.

## User Action

A required component may not be installed. Install the component indicated on the message and execute the command again.

If this message is output even though the component indicated on the message has been installed, the file may be damaged. In this case, install the component indicated on the message again, and execute the command again.

## 24.6.25 td17025

---

**TD:ERROR:td17025: The backup resources not exist in the specified directory (PATH=%s)**

### Variable Information

%s = Backup folder

### Explanation

Since no backup resource is found in the specified backup folder, restoration cannot be performed.

### System Action

Command processing stops.

### User Action

Specify the backup folder that includes the backup resource for the option of the command, and execute the command again.

## 24.6.26 td17026

---

**TD:ERROR:td17026: Permission to access the file or directory is not granted (%d)**

### Variable Information

%s = Error information

### Explanation

There is no access permission to the backup resource or the installation resource.

### System Action

Command processing stops.

### User Action

Other processes may use the backup resource or the installation resource. Check again whether no command or service of Interstage is executed.

In this case, note the error information and contact the service engineer.

## 24.7 td21000 to td21999

---

This section details the messages with message numbers between td21000 and td21999.

### 24.7.1 td21001

---

**Command Name:INFO:td21001:The command was processed normally**

#### Explanation

The command executed successfully.

## 24.7.2 td21002

---

**Command Name:** ERROR:td21002:An abnormality occurred in the command Reason code(%x)

### Variable Information

%x = Reason code

### Explanation

An explanation of the abnormal command execution is given in the Reason code.

### System Action

Command processing stops.

### User Action

Carry out the actions described in the Reason Codes table (located in the description of td11005), according to the specified Reason Code, and then reexecute the command.

For other Reason Codes, carry out the actions described in messages displayed at the same time. If no other messages are displayed, or if the error cannot be resolved, use the *iscollectinfo* command to collect diagnostic information, and contact your software supplier.

## 24.7.3 td21003

---

**Command Name:** ERROR:td21003:A definite option is not specified

### Explanation

The command cannot be executed, because a mandatory option is not specified..

### System Action

Stops command processing

### User Action

Specify the mandatory option, and then reexecute the command.

## 24.7.4 td21004

---

**Command Name:** ERROR:td21004:-%s option is specified in duplicate

### Variable Information

%s = Option name

### Explanation

The option has been duplicated.

### System Action

Stops command processing

### User Action

Remove the duplicated option, and then reexecute the command.

## 24.7.5 td21005

---

**Command Name:** ERROR:td21005:There is no -%s option

### Variable Information

%s = Option name

#### Explanation

An invalid option has been specified.

#### System Action

Stops command processing

#### User Action

Specify a valid option, and then reexecute the command.

### 24.7.6 td21006

---

**Command Name:** `ERROR:td21006:No parameter for the -%s option`

#### Variable Information

%s = Option name

#### Explanation

The parameters are not specified against an option.

#### System Action

Command processing stops.

#### User Action

Specify the option arguments, and then reexecute the command.

### 24.7.7 td21007

---

**Command Name:** `ERROR:td21007:No operand for the -%s option`

#### Variable Information

%s = Option name

#### Explanation

An operand is not specified for the option

#### System Action

Command processing stops.

#### User Action

Specify the operand, and then reexecute the command.

### 24.7.8 td21008

---

**Command Name:** `ERROR:td21008:The command cannot be executed because TD is not started up`

#### Explanation

Since the component transaction service is not started, the command cannot be executed.

#### System Action

Command processing stops.

#### User Action

Start Interstage, and then reexecute the command.

## 24.7.9 td21009

---

**Command Name:** ERROR:td21009:TD is already started up

### Explanation

Since the component transaction service is already started, the command cannot be executed.

### System Action

Command processing stops.

### User Action

Stop Interstage, and then reexecute the command.

## 24.7.10 td21010

---

**Command Name:** ERROR:td21010:TD is not started up

### Explanation

Since the component transaction service is not started, the command cannot be executed.

### System Action

Command processing stops.

### User Action

Start Interstage, and then reexecute the command.

## 24.7.11 td21011

---

**Command Name:** ERROR:td21011:The correct version of the related package is not installed(%s)

### Variable Information

%s = Package name

### Explanation

Since the correct version of the related package is not installed, the command cannot be executed.

### System Action

Command processing stops.

### User Action

Install the correct version of the related package, and then reexecute the command.

## 24.7.12 td21012

---

**Command Name:** ERROR:td21012:Too many specifications for an operand

### Explanation

Since too many operands are specified, the command cannot be executed.

### System Action

Command processing stops.

### User Action

Specify the correct operand, and then reexecute the command.

## 24.7.13 td21013

---

**Command Name:** ERROR:td21013:The work unit name is not specified

### Explanation

Since the WorkUnit name is not specified, the command cannot be executed.

### System Action

Command processing stops.

### User Action

Specify the WorkUnit name, and then reexecute the command.

## 24.7.14 td21014

---

**Command Name:** ERROR:td21014:The operand specification contains an error

### Explanation

Since the operand specification is invalid, the command cannot be executed.

### System Action

Command processing stops.

### User Action

Specify a valid operand, and then reexecute the command.

## 24.7.15 td21015

---

**Command Name:** ERROR:td21015:The command execution failed Reason code(%x)

### Variable Information

%x = Reason code

### Explanation

An abnormal error occurred in the command.

### System Action

Command processing stops.

### User Action

Carry out the actions described in the Reason Codes table (located in the description of td11005), according to the specified Reason Code, and then reexecute the command.

For other Reason Codes, carry out the actions described in messages displayed at the same time. If no other messages are displayed, or if the error cannot be resolved, use the *iscollectinfo* command to collect diagnostic information, and contact your software supplier.

## 24.7.16 td21016

---

**Command Name:** ERROR:td21016:The option can not be specified in duplicate

### Explanation

Since a combined option is specified, the command cannot be executed.

### System Action

Command processing stops.

## User Action

Specify a valid option, and then reexecute the command.

## 24.7.17 td21017

---

### Command Name: ERROR:td21017:The option specification is incorrect

#### Explanation

Since the option specification is invalid, the command cannot be executed.

#### System Action

Command processing stops.

#### User Action

Specify the correct option, and then reexecute the command

## 24.7.18 td21019

---

### TD: ERROR:td21019:TD detected an error(%s)

#### Variable Information

%s = Error information

#### System Action

Internal error is detected inside the component transaction service.

#### User Action

##### [no memory]

Memory space is insufficient. After a short period of time reexecute the process. If this message is output frequently, re-estimate the memory space that is required to run Interstage by referring to the Tuning Guide, and confirm that sufficient memory space is available.

If sufficient memory space is already available for Interstage, the memory space for other applications is possibly insufficient. Re-estimate the memory space that is necessary for other applications that are running on the same machine and determine if sufficient memory space is provided or not.

If insufficient memory space is found as the result of re-estimation, contact a system administrator. The system administrator should increase the main memory or extend the swap area.

If sufficient memory space is found as the result of re-estimation, contact an engineer.

If the error information %s is other than 12, and if any other message is output at the same time, take corrective measures accordingly. If there is no other message that is output at the same time, contact an engineer.

##### [parameter error]

If there is any other message that is output at the same time, take corrective measures accordingly. If there is no other message that is output at the same time, contact an engineer.

##### [system error]

If there is any other message that is output at the same time, take corrective measures accordingly. If there is no other message that is output at the same time, contact an engineer.

##### [interface error]

If there is any other message that is output at the same time, take corrective measures accordingly. If there is no other message that is output at the same time, contact an engineer.

##### [some error]

If there is any other message that is output at the same time, take corrective measures accordingly. If there is no other message that is output at the same time, contact an engineer.

**[invalid system name]**

If there is any other message that is output at the same time, take corrective measures accordingly. If there is no other message that is output at the same time, contact an engineer.

**[already started]**

Stop Interstage and execute the command again.

**[not started]**

Start Interstage and execute the command again.

**[related application error]**

Install the related packages having the correct versions. After that, execute the command again.

**[workunit active]**

Stop the WorkUnit and execute the command again.

## 24.7.19 td21020

---

**Command name: ERROR:td21020:The command cannot be executed**

**Explanation**

The stop process cannot be executed with this command because Interstage has been started with the Interstage integration command or the Interstage operation tool.

**System Action**

Stops the command processing.

**User Action**

Execute the stopping operation of Interstage with the Interstage integration command or with the Interstage running operation tool.

## 24.8 td22000 to td22999

---

This section details the messages with message numbers between td22000 and td22999.

### 24.8.1 td22001

---

**Command Name:INFO:td22001:Attribute information transfer processing is completed**

**Explanation**

The attribute information transfer process is complete.

### 24.8.2 td22002

---

**Command Name: ERROR:td22002:Cannot process because another command is being executed**

**Explanation**

Since other commands (for example, tdc, tdtransfer) are still processing, the command cannot be executed.

**System Action**

Command processing stops.

**User Action**

Reexecute the command when the other commands have completed.

## 24.8.3 td22003

---

**Command Name:** ERROR:td22003:Attribute information for the specified attribute information name(%s) does not exist

### Variable Information

%s = Attribute Information

### Explanation

The attribute information for the specified attribute information name does not exist.

### System Action

Command processing stops.

### User Action

Specify the correct attribute information name, and then reexecute the command.

## 24.8.4 td22004

---

**Command name:** INFO:td22004:usage: tdtransfer {-p DPCF communication path name [-i attribute information name] [-c record information data set name] [-v record information volume serial no.] [-f partner attribute information data set] [-w partner attribute information volume serial no.] [-m|-d] | -l [attribute information name]}

### Explanation

Usage is invalid.

### System Action

Command processing stops.

### User Action

Follow the displayed usage, and then reexecute the command.

## 24.8.5 td22005

---

**Command Name:** ERROR:td22005:The specified DPCF communication path name(%s) contains an error

### Variable Information

%s = DPCF Communication path

### Explanation

Either the DPCF communication path has more than 8 characters, or contains an invalid character.

### System Action

Command processing stops.

### User Action

Specify the correct DPCF communication path, and then reexecute the command.

## 24.8.6 td22006

---

**Command Name:** ERROR:td22006: The specified data set name(%s) contains an error

## Variable Information

%s = Dataset name

## Explanation

The following reasons are possible:

- The dataset name contains more than 8 characters.
- More than five qualifiers were specified.
- An uppercase or non-alphanumeric character is specified.

## System Action

Command processing stops.

## User Action

Specify the correct dataset name, and then reexecute the command.

## 24.8.7 td22007

---

**Command Name:** ERROR:td22007:The specified volume serial no.(%s) contains an error

## Variable Information

%s = Volume serial number

## Explanation

The volume serial number contains more than 8 characters, or an uppercase or non- alphanumeric character.

## System Action

Command processing stops.

## User Action

Specify a valid volume serial number, and then reexecute the command.

## 24.8.8 td22008

---

**Command Name:** ERROR:td22008:The attribute information name(%s) is specified in duplicate

## Variable Information

%s = Attribute Information name

## Explanation

Attribute information is duplicated.

## System Action

Command processing stops.

## User Action

Specify the correct attribute information name, and then reexecute the command.

## 24.8.9 td22009

---

**Command Name:** ERROR:td22009:A system error occurred Error information(%s1- %s2-%x)

### Variable Information

%s1 = Error Information1

%s2 = Error Information2

%x = Error Information3

### Explanation

A system error has occurred while executing the command.

### System Action

Command processing stops.

### User Action

Use the *iscollectinfo* command to collect diagnostic information, and contact your software supplier.

## 24.8.10 td22010

---

**Command Name:** ERROR:td22010:The DPCF communication path(%s) is in an indeterminate state

### Variable Information

%s = DPCF Communication path name

### Explanation

The DPCF communication path has not been established.

### System Action

Command processing stops.

### User Action

Establish the DPCF communication path, and then reexecute the command.

## 24.8.11 td22011

---

**Command Name:** ERROR:td22011:The DPCF communication path(%s) is not defined

### Variable Information

%s = DPCF Communication path name

### Explanation

The DPCF Communication path (%s) of the IDCM definition is not defined.

### System Action

Command processing stops.

### User Action

Specify the correct DPCF communication path, and then reexecute the command.

## 24.8.12 td22012

---

**Command Name:** ERROR:td22012:A communication abnormality occurred Reason code(%s-%x1-%x2)

### Variable Information

%s = IDCM service call identifier

%x1 = Return code

%x2 = Detail code

### Explanation

A communication error has occurred.

### System Action

Command processing stops.

### User Action

Carry out the actions described in the following table, according to the IDCM return codes:

Table 24.8 IDCM Return Codes

No.	Return code	Detail code	Explanation	Actions
1	00000003	00000000	Insufficient resources on the local side.	Check the local system resources.
2	00000040	00000000	Insufficient resources on the local side.	Check the local system resources.
3	00000043	00000000	Insufficient resources on the local side.	Check the local system resources.
4	00000083	00000000	Insufficient resources on the local side.	Check the local system resources.
5	00000041	00000000	Insufficient resources on the partner side.	Check the partner resources.
6	00000044	00000000	Insufficient resources on the partner side.	Check the partner resources.
7	00000084	00000000	Insufficient resources on the partner side.	Check the partner resources.
8	00000091	00000000	Unable to establish a communication connection	Set the number of DPCF communication path connection definitions to the maximum number of session requests in the environment definition, and then reexecute the command.
9	000000a0	00000000	The DPCF communication path is not established, or is being forcibly terminated.	Establish the DPCF communication path, or determine why it was forcibly terminated, and then re-establish the DPCF communication path.
10	000000fe	00020010	The IDCM is not started, or is being forcibly terminated.	Start the IDCM.
11	Other		The IDCM service returned abnormally.	use the <i>iscollectinfo</i> command to collect diagnostic information, and contact your software supplier.

## 24.8.13 td22013

**Command Name:** ERROR:td22013:An error occurred while creating record information Reason code(%x)

### Variable Information

%x = Returned code

## Explanation

An error has occurred while creating record information.

## System Action

Command processing stops.

## User Action

Carry out the actions described in the following table, according to the return codes:

Table 24.9 Return Codes from Partner

Number	Return code	Explanation	Actions
1	00000020	The record information dataset name is invalid.	Specify the correct record information dataset name, and then reexecute the <i>tdtransfer</i> command.
2	00000021	The partner attribute information dataset name is invalid.	Specify the correct partner attribute information dataset name, and then reexecute the <i>tdtransfer</i> command.
3	00000042	The partner side terminated abnormally.	Determine why partner side terminated abnormally.
4	00000080	The partner has not started.	Start the partner side to be linked when the <i>tdtransfer</i> command is executed.
5	000000ff	The record information size has exceeded 32000 bytes.	Check the wrapper definition.
6	Other	An error has occurred on the partner side.	Record the return code and check the partner side. For details, refer to the NETSTAGE/Partner Handbook. If nothing is found, use the <i>iscollectinfo</i> command to collect diagnostic information, and contact your software supplier.

## 24.8.14 td22014

---

**Command Name:** ERROR:td22014:An error occurred while creating partner attribute information Reason code(%x)

### Variable Information

%x = Return code

### Explanation

An error has occurred on the partner side while creating attribute information.

### System Action

Command processing stops.

### User Action

Carry out the actions described in [Table 24.9 Return Codes from Partner](#), according to the specified Return codes from partner.

## 24.8.15 td22015

---

**Command Name:** ERROR:td22015:An abnormality occurred with the partner Reason code(%x)

### Variable Information

%x = Return code from partner

#### Explanation

An error occurred in the partner.

#### System Action

Command processing stops.

#### User Action

Carry out the actions described in [Table 24.9 Return Codes from Partner](#), according to the specified Return codes from partner.

## 24.8.16 td22016

---

### Command Name: **ERROR:td22016:System is short of work area necessary for processing**

#### Explanation

The required processing work area cannot be allocated.

#### System Action

Command processing stops.

#### User Action

Correct the system-estimated value if the work area is insufficient. If the system-estimated value is correct, use the *iscollectinfo* command to collect diagnostic information, and contact your software supplier.

## 24.8.17 td22017

---

### Command Name: **ERROR:td22017:No attribute information**

#### Explanation

Attribute information is not registered.

#### System Action

Command processing stops.

#### User Action

Register the attribute information.

## 24.9 td22100 to td22108

---

This section details the messages with message numbers between td22100 and td22108.

### 24.9.1 td22100

---

#### Command Name: **ERROR:td22100:Inappropriate object length**

#### Explanation

The object name length specified in the `-o` option has exceeded the maximum limit (255 bytes).

#### System Action

Command processing stops.

#### User Action

Specify the correct object, and then reexecute the command.

## 24.9.2 td22101

---

**Command Name:** INFO:td22101:A trace was acquired(%s)

### Variable Information

%s = Linkage mode (local: Basic connection, wrapper: AIM connection)

### Explanation

An internal trace was collected.

## 24.9.3 td22102

---

**Command Name:** ERROR:td22102:Trace acquisition failed due to insufficient disk capacity(%s)

### Variable Information

%s = Linkage mode (local: Basic connection, wrapper: AIM connection)

### Explanation

Insufficient disk capacity for internal trace output.

### System Action

Command processing stops.

### User Action

Delete all unwanted files or expand the disk capacity, and then reexecute the command.

## 24.9.4 td22103

---

**Command Name:** ERROR:td22103:A system error occurred(%s1-%s2)

### Variable Information

%s1 = Linkage mode (local: Basic connection, wrapper: AIM connection)

%s2 = Error information

### Explanation

A system error occurred while the command was executing.

### System Action

Command processing stops.

### User Action

Use the *iscollectinfo* command to collect diagnostic information, and contact your software supplier.

## 24.9.5 td22104

---

**Command Name:** ERROR:td22104:The specified object has no name(%s)

### Variable Information

%s = Linkage mode (local: Basic connection, wrapper: AIM connection)

### Explanation

Information about the object specified in the *-o* option was not collected. Either the specified object name is not defined, or the object specified after starting the component transaction service has never been activated.

## User Action

Either specify the correct object name, or activate the object after starting the component transaction service. Then reexecute the command.

## 24.9.6 td22105

---

**Command Name:** INFO:td22105:The trace acquisition domain was cleared(%s)

### Variable Information

%s = Linkage mode (local: Basic connection, wrapper: AIM connection)

### Explanation

The component transaction service trace storage area has been cleared.

## 24.9.7 td22106

---

**Command Name:** INFO:td22106:The trace acquisition domain block was changed(%s-%d byte)

### Variable Information

%s = Linkage mode (local: Basic connection, wrapper: AIM connection)

%d = Block size

### Explanation

The length of a block in the component transaction service trace storage area is changed to %d byte.

## 24.9.8 td22107

---

**Command Name:** ERROR:td22107:Change of the trace acquisition domain block failed(%s)

### Variable Information

%s = Linkage mode (local: Basic connection, wrapper: AIM connection)

### Explanation

Since the WorkUnit is started, modification of the trace acquisition domain block failed.

### User Action

Stop all WorkUnits, and then reexecute the command.

## 24.9.9 td22108

---

**Command Name:** ERROR:td22108:A resource shortage occurred(%s1-%s2)

### Variable Information

%s1 = Linkage mode (local: Basic connection, wrapper: AIM connection)

%s2 = Error information

### Explanation

An insufficient resources error occurred during command processing.

### User Action

Check the system resources. If the system resources are correct, use the *iscollectinfo* command to collect diagnostic information, and contact your software supplier.

## 24.10 td23000 to td23999

---

This section details the messages with message numbers between td23000 and td23999.

### 24.10.1 td23001

---

**Command Name:** ERROR:td23001:A system error occurred: CODE=%d

#### Variable Information

%d = Error Information

#### Explanation

A system error has occurred.

#### System Action

Command processing stops.

#### User Action

Use the *iscollectinfo* command to collect diagnostic information, and contact your software supplier.

### 24.10.2 td23002

---

**Command Name:** ERROR:td23002:RM library information length(%d) is inappropriate

#### Variable Information

%d = Length of input RM library information

#### Explanation

The length of the argument in the -r option has exceeded the maximum value (2048 bytes).

#### System Action

Command processing stops.

#### User Action

Change the length of the argument in the -r option, and then reexecute the command.

### 24.10.3 td23003

---

**Command Name:** ERROR:td23003:APM name length(%d) is inappropriate

#### Variable Information

%d = Length of input APM name

#### Explanation

The length of the argument in the -o option has exceeded the maximum value (23 bytes).

#### System Action

Command processing stops.

#### User Action

Change the length of the argument in the -o option, and then reexecute the command.

### 24.10.4 td23004

---

---

**Command Name: ERROR:td23004:APM name contains non-alphabetic symbols or characters****Explanation**

A non-alphanumeric character is specified in the argument of the -o option.

**System Action**

Command processing stops.

**User Action**

Specify an alphanumeric character in the argument of the -o option, and then reexecute the command.

---

**24.10.5 td23005**

---

**Command Name: ERROR:td23005:Too many parameters specified****Explanation**

An extra argument is specified.

**System Action**

Command processing stops.

**User Action**

Reexecute the command without specifying the extra argument.

---

**24.10.6 td23006**

---

**Command Name:WARNING:td23006:APM(%s) already exists, Replace ?(y/n, default=n)****Variable Information**

%s : APM name

**Explanation**

The input APM name already exists.

**System Action**

If the user enters "y", continues command processing. If the user enters "n", Command processing stops.

**User Action**

Enter "y" to continue command processing. Enter "n" to stop command processing.

---

**24.10.7 td23007**

---

**Command Name:INFO:td23007:The command was cancelled****Explanation**

The command was cancelled at the user's request (refer to td23006).

**System Action**

None.

**User Action**

Specify a different APM name, and then reexecute the command.

## 24.10.8 td23008

---

**Command Name:** ERROR:td23008:APM creation failed: CODE=%d

### Variable Information

%d = System error code

### Explanation

The APM link failed for an unknown reason.

### System Action

Command processing stops.

### User Action

Refer to the Windows(R) system manual and remove the cause of the error based on the variable information code.

OR

Carry out the actions described in the previous message, if any, and then reexecute the command.

## 24.10.9 td23009

---

**Command Name:** WARNING:td23009:APM(%s) cannot be used

### Variable Information

%s = APM name

### Explanation

Cannot use the specified APM

### System Action

Command processing stops.

### User Action

Specify a different APM name, and then reexecute the command.

## 24.10.10 td23010

---

**Command Name:** WARNING:td23010:APM(%s) cannot be replaced because it is in use

### Variable Information

%s = APM name

### Explanation

The specified APM is in use.

### System Action

Command processing stops.

### User Action

Check that the APM is not in use, and then reexecute the command.

## 24.10.11 td23011

---

**Command Name:** ERROR:td23011:APM did not create because the required software is not installed(%s)

### Variable Information

%s : Related product installed path

### Explanation

The APM could not be created because one of the following related products is not installed:

- CORBA service (OD)
- Component transaction service (TD)
- Database linkage service (OTS)

### System Action

Stops the command processing.

### User Action

Install the related product (ObjectDirector), and then reexecute the command.

## 24.10.12 td23012

---

**Command name:** ERROR:td23012:The specified library information length(%d) by -p option is inappropriate

### Variable Information

%d = Library information length

### Explanation

The library information length has exceeded the maximum value (2048).

### System Action

Command processing stops.

### User Action

Check the library information specified in the -p option.

## 24.10.13 td23013

---

**Command name:** ERROR:td23013:The specified parameter by -%s option contains an error

### Variable Information

%s = Option name

### Explanation

The argument of specified option is invalid.

### System Action

Command processing stops.

## User Action

Specify a valid argument for the option, and then reexecute the command.

## 24.10.14 td23014

---

**Command name:** ERROR:td23014:The specified system name is incorrect

### Explanation

The specified system name is illegal.

### System Action

Command processing stops.

### User Action

Specify a valid system name and reexecute the command.

## 24.10.15 td23015

---

**Command name:** ERROR:td23015:The specified system name is too long

### Explanation

The specified system name is too long.

### System Action

Command processing stops.

### User Action

Specify a valid system name, and then reexecute the command.

## 24.10.16 td23016

---

**Command name:** ERROR:td23016:Error(%s2) occurred in system call(%s1)

### Variable Information

%s1 = System call name

%s2 = Error Information

### Explanation

An error was detected in the system call issued in the command.

### System Action

Command processing stops.

### User Action

Take action in accordance with the error information. If the cause of the error cannot be eliminated with the error information, use the *iscollectinfo* command to collect diagnostic information, and contact your software supplier.

## 24.10.17 td23017

---

**Command name:** ERROR:td23017:A memory shortage occurred

### Explanation

There is a memory shortage.

### System Action

Command processing stops.

### User Action

After a short period of time reexecute the process. If this message is output frequently, determine the memory required for running Interstage. For details, refer to the Tuning Guide. Verify that sufficient memory space is available.

If the error persists, the memory for other applications may be insufficient. Determine the memory required by other applications running on the same machine, and verify that sufficient memory is available.

If there is insufficient memory, contact your system administrator to increase the main memory or extend the swap area.

If sufficient memory is available, but the problem remains, use the *iscollectinfo* command to collect diagnostic information, and contact your software supplier.

## 24.10.18 td23018

---

**Command name:** ERROR:td23018:The command execution failed

### Explanation

Command execution failed.

### System Action

Command processing stops.

### User Action

Use the *iscollectinfo* command to collect diagnostic information, and contact your software supplier.

## 24.11 td24000 to td24999

---

This section details the messages with message numbers between td24000 and td24999.

### 24.11.1 td24000

---

**Command Name:** ERROR:td24000:A memory shortage occurred

### Explanation

Insufficient memory.

### System Action

Command processing stops.

### User Action

Execute the process again later. If this message is generated frequently, refer to the Tuning Guide, re-estimate the memory required to run Interstage, and confirm that there is enough memory.

If there is enough memory (relative to the amount of memory needed to run Interstage), it may be that there is inadequate memory to run other applications. Re-estimate the amount of memory needed for the other applications running on the same machine as well to determine if there is an appropriate amount of memory.

Contact your system administrator if the re-estimation indicates that the memory is insufficient. Ask the system administrator to either increase the size of the main memory or to increase the size of the page file.

## 24.11.2 td24001

---

**Command Name:** ERROR:td24001:An I/O error occurred

### Explanation

An I/O error has occurred.

### System Action

Command processing stops.

### User Action

If the component transaction service system is being operated, stop Interstage and restore the disk to where the I/O error occurred.

## 24.11.3 td24002

---

**Command Name:** ERROR:td24002:A system error occurred: CODE=%s

### Variable Information

%s = Error Information

### Explanation

A system error occurred.

### System Action

Stops command processing

### User Action

Use the *iscollectinfo* command to collect diagnostic information, and contact your software supplier.

## 24.11.4 td24003

---

**Command Name:** ERROR:td24003:A system resource shortage occurred

### Explanation

Insufficient system resources.

### System Action

Stops command processing

### User Action

Wait for a moment, and then reexecute the command. If this message appears frequently, use the *iscollectinfo* command to collect diagnostic information, and contact your software supplier.

## 24.11.5 td24004

---

**Command Name:** INFO: td24004: There are no work units in use

## Explanation

The WorkUnit being used does not exist.

### 24.11.6 td24005

---

**Command Name:** INFO:td24005:The object in use does not exist

## Explanation

The object being used does not exist.

### 24.11.7 td24006

---

**Command Name:** ERROR:td24006:The specified object does not exist

## Explanation

The specified object does not exist.

## System Action

Command processing stops.

## User Action

Check the object name, and then reexecute the command.

### 24.11.8 td24007

---

**Command Name:** ERROR:td24007:The object name is too long

## Explanation

The specified object name is too long.

## System Action

Command processing stops.

## User Action

Check the object name, and then reexecute the command.

### 24.11.9 td24008

---

**Command Name:** ERROR:td24008:The object name is not specified

## Explanation

The object name is not specified.

## System Action

Command processing stops.

## User Action

Specify the object name, and then reexecute the command.

### 24.11.10 td24009

---

**Command Name:** ERROR:td24009:Setup was not done

## Explanation

Setup was not performed.

## System Action

Command processing stops.

## User Action

Perform the setup, and then reexecute the command.

## 24.12 td24500 to td24512

---

This section details the messages with message numbers between td24500 and td24512.

### 24.12.1 td24500

---

**Command Name:** `ERROR:td24500:A system error occurred: CODE=%s`

#### Variable Information

%s = Error Information

#### Explanation

A system error occurred.

#### System Action

Command processing stops.

#### User Action

Use the `iscollectinfo` command to collect diagnostic information, and contact your software supplier

### 24.12.2 td24501

---

**Command Name:** `ERROR:td24501:A memory shortage occurred`

#### Explanation

Insufficient memory.

#### System Action

Command processing stops.

#### User Action

Execute the process again later. If this message is generated frequently, refer to the Tuning Guide, re-estimate the memory required to run Interstage, and confirm that there is enough memory.

If there is enough memory (relative to the amount of memory needed to run Interstage), it may be that there is inadequate memory to run other applications. Re-estimate the amount of memory needed for the other applications running on the same machine as well to determine if there is an appropriate amount of memory.

Contact your system administrator if the re-estimation indicates that the memory is insufficient. Ask the system administrator to either increase the size of the main memory or to increase the size of the page file.

If there is no problem with the estimated system values, use the `iscollectinfo` command to collect diagnostic information, and contact your software supplier.

### 24.12.3 td24502

---

---

**Command Name: ERROR:td24502:TD did not start****Explanation**

The component transaction service is not started.

**System Action**

Command processing stops.

**User Action**

Start the component transaction service, and then reexecute the command.

---

**24.12.4 td24503**

---

**Command Name: ERROR:td24503:Specified work unit did not start****Explanation**

The specified WorkUnit is not started.

**System Action**

Command processing stops.

**User Action**

Start the WorkUnit, and then reexecute the command.

---

**24.12.5 td24504**

---

**Command Name: ERROR:td24504:The mistake is found in the specification of the operand****Explanation**

An invalid operand is specified.

**System Action**

Command processing stops.

**User Action**

Specify the correct operand, and then reexecute the command.

---

**24.12.6 td24505**

---

**Command Name: ERROR:td24505:A snapshot for the specified work unit could not be taken****Explanation**

The snapshot of the WorkUnit specified in the operand was not extracted.

**System Action**

Command processing stops.

**User Action**

Either extract the snapshot then reexecute the command, or specify the correct operand then reexecute the command.

---

**24.12.7 td24506**

---

**Command Name: ERROR:td24506:A snapshot is being taken for the specified work unit**

### Explanation

The WorkUnit specified in the operand is extracting the snapshot.

### System Action

Command processing stops.

### User Action

Either execute the *tdstopsnap* command for the WorkUnit specified in the operand then reexecute the command, or specify the correct operand then reexecute the command.

## 24.12.8 td24507

---

### Command Name:INFO:td24507:The tdstartsnap command is already being executed

### Explanation

The tdstartsnap command is already being executed for the WorkUnit specified in the operand.

## 24.12.9 td24508

---

### Command Name:INFO:td24508:The tdstartsnap command is not executed

### Explanation

The tdstartsnap command was not executed for the WorkUnit specified in the operand.

## 24.12.10 td24509

---

### Command Name: ERROR:td24509:The file failed to open

### Explanation

Unable to open the snapshot output file.

### System Action

Command processing stops.

### User Action

Either add access permissions to the current folder then reexecute the command, or specify a folder with the necessary permissions.

## 24.12.11 td24510

---

### Command Name: ERROR:td24510:The domain for the snapshot capture failed

### Explanation

The snapshot cannot be extracted because the area for snapshot extraction is too small.

### System Action

Command processing stops.

### User Action

Use the *iscollectinfo* command to collect diagnostic information, and contact your software supplier

## 24.12.12 td24511

---

**Command Name:**INFO:td24511:The command was processed normally

### Explanation

The command executed successfully.

## 24.12.13 td24512

---

**Command Name:**INFO:td24512:The work unit which takes the snapshot does not exist

### Explanation

The snapshot extraction WorkUnit does not exist.

## 24.12.14 td24513

---

**Command name:** ERROR:td24513: System does not exist: SYSTEM=%s

### Variable Information

%s = System name

### Explanation

The system name that is specified by the command does not exist.

### System Action

Command processing stops.

### User Action

Either:

- reexecute the command to set the system name, specifying a valid name, or
- set the environment variable 'IS-SYSTEM' to a valid system name and execute the command again.

## 24.12.15 td24514

---

**Command name:** ERROR:td24514: The system name is too long

### Explanation

The system name specified by a command or set in the environment variable IS-SYSTEM is too long.

### System Action

Command processing stops.

### User Action

Specify the right system name and execute a command again.

## 24.13 td25000 to td25999

---

This section details the messages with message numbers between td25000 and td25999.

## 24.13.1 td25001

---

**Command Name:** ERROR: td25001:A system error occurred Error information(%s)

### Variable Information

%s = Error Information

### Explanation

A system error has occurred.

### System Action

Command processing continues.

### User Action

Use the *iscollectinfo* command to collect diagnostic information, and contact your software supplier.

## 24.13.2 td25002

---

**Command Name:** ERROR: td25002:OD did not start

### Explanation

Either the CORBA service is not started, or the CORBA service reported insufficient system resources.

### System Action

Command processing continues.

### User Action

Start the CORBA service, and then reexecute the command. If the CORBA service is already started, check that there are sufficient resources.

## 24.13.3 td25003

---

**Command Name:** ERROR: td25003:OD resource shortage occurred

### Explanation

The CORBA service reported insufficient resources.

### System Action

Command processing continues.

### User Action

Correct the CORBA service operating environment, and check that there are sufficient resources.

## 24.13.4 td25004

---

**Command Name:** ERROR: td25004:Abnormality notified from OD Error information(%s1-%s2-%s3)

### Variable Information

%s1 = Error information 1

%s2 = Error information 2

%s3 = Error information 3

### Explanation

The CORBA service reported an abnormality.

#### System Action

Command processing continues.

#### User Action

Use the *iscollectinfo* command to collect diagnostic information, and contact your software supplier.

### 24.13.5 td25005

---

**Command Name: ERROR: td25005:The command cannot be executed because Session information management object is not started up**

#### Explanation

Since the session information control object is not started, the command cannot be executed.

#### System Action

Command processing continues.

#### User Action

Correct the system environment definition, if necessary, and then restart Interstage.

### 24.13.6 td25006

---

**Command Name: ERROR: td25006:System information directory could not be accessed**

#### Explanation

The following system information folder cannot be accessed:

Interstage install folder \td\sys\sno

#### System Action

Command processing continues.

#### User Action

Check the system information folder.

### 24.13.7 td25007

---

**Command name:ERROR:td25007: The specified system name does not exist or it is a reserved word**

#### Explanation

The system name specified in the command option is invalid or is a reserved word. The command cannot be executed.

#### System Action

Command processing stops.

#### User Action

Specify the correct system name, and then reexecute the command.

Note: The following system names are reserved words that cannot be specified: 'td001' and 'ec001'

### 24.13.8 td25008

---

**Command name:ERROR:td25008: The specified system name is incorrect**

## Explanation

The system name specified in the option contains an invalid character. The command cannot be executed.

## System Action

Command processing stops.

## User Action

Specify a valid system name, and execute the command again.

**Note:** Only alphanumeric (**A to Z**; and **a to z** and **0 to 9**) characters can be used for the system name. However, the first character cannot be numeric.

## 24.13.9 td25009

---

### **Command name:ERROR:td25009: The specified system name is too long**

## Explanation

The system name specified in the option exceeds eight bytes. The command cannot be executed.

## System Action

Command processing stops.

## User Action

Specify a system name in eight or fewer bytes, and then reexecute the command.

## 24.13.10 td25010

---

### **Command name:ERROR:td25010: Required component is not installed Error Information(%s)**

## Variable Information

%s = Component name

## Explanation

A component file required for command operation is not available.

## System Action

Command processing stops.

## User Action

Install the component indicated on the message, and then reexecute the command. If this message is output when the component indicated on the message is installed, the file may have been corrupted. Install the component again, and then reexecute the command.

## 24.14 td26000 to td26100

---

This section details the messages with message numbers between td26000 and td26100.

### 24.14.1 td26002

---

#### **Command name:ERROR:td26002:File write failed due to insufficient disk capacity**

## Explanation

There was a failure in writing a file because of inadequate disk space.

#### System Action

Stops the command processing.

#### User Action

Check the required disk capacity.

### 24.14.2 td26003

---

**Command name:**ERROR:td26003:A system error occurred Error information(%s1- %s2-%s3)

#### Variable Information

%s1 = Error Information 1

%s2 = Error Information 2

%s3 = Error Information 3

#### Explanation

A system error occurred during command processing.

#### System Action

Stops the command processing.

#### User Action

Contact your system administrator.

### 24.14.3 td26004

---

**Command name:**ERROR:td26004:The userDN is too long

#### Explanation

The specified user DN is too long.

#### System Action

Stops the command processing.

#### User Action

Check the user DN and execute the command again.

### 24.14.4 td26005

---

**Command name:**ERROR:td26005:The password is too long

#### Explanation

The specified password is too long.

#### System Action

Stops the command processing.

#### User Action

Check the password and execute the command again.

### 24.15 td27000 to td27999

---

This section details the messages with message numbers between td27000 and td27999.

## 24.15.1 td27001

---

**Command name:INFO:td27001:Command ended normally**

### Explanation

Command processing ended normally.

## 24.15.2 td27002

---

**Command name:ERROR:td27002: The number of option is incorrect**

### Explanation

The number of options specified to the command is incorrect.

### System Action

Command processing stops.

### User Action

Specify the correct options and reexecute the command.

## 24.15.3 td27003

---

**Command name:ERROR:td27003: The option specification is incorrect**

### Explanation

The options specified to the command are incorrect.

### System Action

Command processing stops.

### User Action

Specify the correct options and reexecute the command.

## 24.15.4 td27004

---

**Command name:ERROR:td27004: The backup directory is not specified**

### Explanation

Backup folder for the option specified to the command is not specified.

### System Action

Command processing stops.

### User Action

Specify the correct backup folder for the command option and reexecute the command.

## 24.15.5 td27005

---

**Command name:ERROR:td27005:The backup directory is not exist (PATH=%s)**

### Variable Information

%s = Backup folder

#### Explanation

The backup folder specified for the command options does not exist.

#### System Action

Command processing stops.

#### User Action

Specify the correct backup folder for the command options and reexecute the command.

### 24.15.6 td27006

---

#### **Command name:ERROR:td27006:The backup resources already exist in the specified directory**

#### Explanation

Since backup resources already exist in the backup folder specified by the command, the processing is stopped.

#### System Action

Command processing stops.

#### User Action

You cannot backup a folder more than once. Specify the correct backup folder for the command options, and then reexecute the command.

### 24.15.7 td27007

---

#### **Command name:ERROR:td27007: Permission denied**

#### Explanation

The user does not have permission to execute the command.

#### System Action

Command processing stops.

#### User Action

Only administrators can execute a backup restoration command. Reexecute the command logged in as an administrator.

### 24.15.8 td27008

---

#### **Command name:ERROR:td27008: INTERSTAGE started**

#### Explanation

Command execution failed because Interstage is starting.

#### System Action

Command processing stops.

#### User Action

Stop all the Interstage services, and then reexecute the command.

### 24.15.9 td27009

---

#### **Command name:ERROR:td27009: A necessary file does not exist Error information(%d)**

## Variable Information

%s = Object Resource Name

## Explanation

Command execution failed because the object resources required to backup or restore the environment do not exist.

## System Action

Command processing stops.

## User Action

If this error occurred during execution of backup processing, the environment may have already been destroyed. Re-install the Component Transaction Service in this case.

If this error occurred during execution of restore processing, the backup resources may have been destroyed. Reexecute backup processing and restore the correct resources in this case.

## 24.15.10 td27010

---

### Command name:ERROR:td27010: An internal error was detected Error information(%d)

## Variable Information

%d = Error information

## Explanation

A contradiction inside the system was detected during command processing.

## System Action

Command processing stops.

## User Action

Take a note of the error information and use the *iscollectinfo* command to collect diagnostic information, contact your software supplier.

## 24.15.11 td27011

---

### Command name:ERROR:td27011: A memory shortage occurred

## Explanation

Memory shortage occurred.

## System Action

Command processing stops.

## User Action

Reexecute the processing later. If this message is generated frequently, refer to the Tuning Guide, re-estimate the memory required to run Interstage, and check that there is sufficient memory.

If there is sufficient memory to run Interstage, there may be inadequate memory to run other applications. Re-estimate the amount of memory required for the other applications running on the same machine to determine if there is an appropriate amount of memory.

Contact your system administrator if the re-estimation indicates that the memory is insufficient. Ask the system administrator to either increase the size of the main memory or increase the size of the page file.

## 24.15.12 td27012

---

**Command name:**ERROR:td27012: A disk resource shortage occurred

### Explanation

There is insufficient disk space in the backing up or restoring destination.

### System Action

Command processing stops.

### User Action

Reserve sufficient free disk space and reexecute the command.

## 24.15.13 td27013

---

**Command name:**ERROR:td27013: An I/O error occurred Error information(%d)

### Variable Information

%d = Error information

### Explanation

An I/O error has occurred.

### System Action

Command processing stops.

### User Action

Check the disk unit and media in which the backup resources of Interstage has been installed.

## 24.15.14 td27014

---

**Command name:**ERROR:td27014: A system error occurred Error information(%d)

### Variable Information

%d = Error information

### Explanation

A system error has occurred.

### System Action

Command processing stops.

### User Action

If error information value is other than 0, take a note of the error information and use the *iscollectinfo* command to collect diagnostic information, contact your software supplier.

## 24.15.15 td27015

---

**Command name:**ERROR:td27015: The specified system name does not exist or it is a reserved word

## Explanation

The system name specified in the command option is invalid or is a reserved word. The command cannot be executed.

## System Action

Command processing stops.

## User Action

Specify the correct system name, and then reexecute the command.

Note: The following system names are reserved words that cannot be specified: 'td001' and 'ec001'

## 24.15.16 td27016

---

### Command name:ERROR:td27016: The specified system name is incorrect

## Explanation

The system name specified in the option contains an invalid character. The command cannot be executed.

## System Action

Command processing stops.

## User Action

Specify a valid system name, and execute the command again.

**Note:** Only alphanumeric (**A to Z**; and **a to z** and **0 to 9**) characters can be used for the system name. However, the first character cannot be numeric.

## 24.15.17 td27017

---

### Command name:ERROR:td27017: The specified system name is too long

## Explanation

The system name specified in the option exceeds eight bytes. The command cannot be executed.

## System Action

Command processing stops.

## User Action

Specify a system name in eight or fewer bytes, and then reexecute the command.

## 24.15.18 td27018

---

### Command name:ERROR:td27018: The specified backup resource cannot restore to the specified system name

## Explanation

The backup resource cannot be restored.

## System Action

Command processing stops.

## User Action

Refer to the Interstage Operator's Guide to check the combination of the backup resource and restore destination. Restore the backup resource with the correct combination.

## 24.15.19 td27019

---

**Command name:ERROR:td27019: Required component is not installed Error Information(%s)**

### Variable Information

%d = Component name

### Explanation

The component files required for command operation are insufficient.

### System Action

Command processing stops.

### User Action

A required component may not be installed. Install the component indicated on the message and execute the command again.

If this message is output even though the component indicated on the message has been installed, the file may be destructed. In this case, install the component indicated on the message again, and execute the command again.

## 24.15.20 td27020

---

**Command name:ERROR:td27020: The backup resources not exist in the specified directory (PATH=%s)**

### Variable Information

%d = Backup folder

### Explanation

Since the backup resource is not found in the specified backup folder, restoration cannot be performed.

### System Action

Command processing stops.

### User Action

Specify the backup folder that includes the backup resource for the option of the command, and execute the command again.

## 24.15.21 td27021

---

**Command name:ERROR:td27021: Permission to access the file or directory is not granted (%d)**

### Variable Information

%d = Error information

### Explanation

There is not access permission to the backup resource or the installation resource.

### System Action

Command processing stops.

## User Action

Other processes may use the backup resource or the installation resource. Check again whether no command or service of Interstage is executed.

In this case, note the error information and contact the service engineer.

## 24.15.22 td27022

---

**Command name: ERROR:td27022:Backup terminated abnormally**

### Explanation

The backup processing terminates abnormally.

### User Action

A message indicates the root cause is output to the event log, see the output message to eliminate the cause, and execute the command again.

## 24.15.23 td27023

---

**Command name:ERROR:td27023:Restore terminated abnormally**

### Explanation

The restoration processing terminates abnormally.

### User Action

A message that indicates the root cause is output to the event log, see the output message to eliminate the cause, and execute the command again.

## 24.16 td31000 to td31999

---

This section details the messages with message numbers between td31000 and td31999.

### 24.16.1 td31001

---

**TD: ERROR: td31001:A system error occurred: CODE=%s**

#### Variable Information

%s = Error Information

#### Explanation

A system error has occurred.

#### System Action

Stops processing.

#### User Action

Use the *iscollectinfo* command to collect diagnostic information, and contact your software supplier.

### 24.16.2 td31002

---

**TD: ERROR: td31002:An error occurred at system call: CODE=%s1 SYSTEM CALL=%s2 ERRNO=%d**

### Variable Information

%s1 = Error information

%s2 = System call name

%d :Error number

### Explanation

An error was detected during a system call.

### System Action

Stops processing.

### User Action

Use the *iscollectinfo* command to collect diagnostic information, and contact your software supplier.

## 24.16.3 td31003

---

**TD: ERROR: td31003:An I/O error occurred: FILE=%s**

### Variable Information

%s = File name

### Explanation

An I/O error has occurred

### System Action

Stops processing.

### User Action

Check the disk having the file where the I/O error occurred.

## 24.16.4 td31004

---

**TD: ERROR: td31004:There is no permission to access the parent directory or file: USER=%s1 FILE=%s2**

### Variable Information

%s1 = User name

%s2 = File name

### Explanation

The user does not have permission to access the file or parent folder.

### System Action

Stops processing.

### User Action

Check the file or folder access permissions, or execute the process with the correct access permissions

## 24.16.5 td31005

---

**TD: ERROR: td31005:System memory shortage: CODE=%s**

### Variable Information

%s = Error Information

## Explanation

Insufficient system memory

## System Action

Stops processing.

## User Action

Execute the process again later. If this message is generated frequently, refer to the Tuning Guide, re-estimate the memory required to run Interstage, and check whether there is enough memory.

If there is enough memory to run Interstage, there may be inadequate memory to run other applications. Re-estimate the amount of memory required for the other applications running on the same machine to determine if there is an appropriate amount of memory.

Contact your system administrator if the re-estimation indicates that the memory is insufficient. Ask the system administrator to either increase the size of the main memory or to increase the size of the page file.

## 24.16.6 td31006

---

**TD: ERROR: td31006:System environment definition file does not exist**

## Explanation

The system environment definition file was not created.

## System Action

Stops processing.

## User Action

Create the system environment definition file.

## 24.16.7 td31007

---

**TD: ERROR: td31007:Line %d = Syntax error: FILE=%s**

## Variable Information

%d = Line number

%s = File name

## Explanation

A syntax error exists in the system environment definition file.

## System Action

Stops processing.

## User Action

Correct the syntax in the system environment definition file, and then reexecute the command.

## 24.16.8 td31008

---

**TD: ERROR: td31008:Line %d = The maximum number of specifiable sections has been exceeded: FILE=%s**

## Variable Information

%d = Line number

%s = File name

## Explanation

The number of sections that can be specified has been exceeded.

## System Action

Stops processing.

## User Action

Specify the correct number of sections, and then reexecute the command.

## 24.16.9 td31009

---

**TD: ERROR: td31009:Line %d = The number of specifiable statements has been exceeded: FILE=%s**

## Variable Information

%d = Line number

%s = File name

## Explanation

The number of statements that can be specified has been exceeded.

## System Action

Stops processing.

## User Action

Specify the correct number of statements, and then reexecute the command.

## 24.16.10 td31010

---

**TD: ERROR: td31010:Line %d = "System Scale:" statement not specified in the [SYSTEM ENVIRONMENT] section: FILE=%s**

## Variable Information

%d = Line number

%s = File name

## Explanation

The "System Scale:" statement is not specified in the [SYSTEM ENVIRONMENT] section.

## System Action

Stops processing.

## User Action

Specify the "System Scale:" statement in the [SYSTEM ENVIRONMENT] section, and then reexecute the command.

## 24.16.11 td31011

---

**TD: ERROR: td31011:Line %d = "PSYS Name:" statement not specified in the [WRAPPER] section: FILE=%s**

## Variable Information

%d = Line No.

%s : File Name

#### Explanation

The "PSYS:" statement is not specified in the [WRAPPER] section.

#### System Action

Stops processing.

#### User Action

Specify the "PSYS:" statement in the [WRAPPER] section, and then reexecute the command.

## 24.16.12 td31012

---

**Command Name: ERROR: td31012: Line %d = "Number of Maximum Session:" statement not specified in the [WRAPPER] section: FILE=%s**

#### Variable Information

%d = Line Number

%s = File Name

#### Explanation

The Number of Maximum Session: statement is not specified in the [WRAPPER] section.

#### System Action

Stops processing.

#### User Action

Define the Number of Maximum Session: statement in the [WRAPPER] section and execute the command again.

## 24.16.13 td31013

---

**TD: ERROR:td31013: Disk volume is insufficient**

#### Explanation

There is not enough free disk space.

#### System Action

Stops processing.

#### User Action

Reserve sufficient free disk space, and then reexecute processing.

## 24.17 td32000 to td32999

---

This section details the messages with message numbers between td32000 and td32999.

### 24.17.1 td32001

---

**Command Name: ERROR:td32001:A memory shortage occurred in the system**

## Explanation

Insufficient system memory.

## System Action

Stops command processing

## User Action

Execute the process again later. If this message is generated frequently, refer to the Tuning Guide, re-estimate the memory required to run Interstage, and confirm that there is enough memory.

If there is enough memory (relative to the amount of memory needed to run Interstage), it may be that there is inadequate memory to run other applications. Re-estimate the amount of memory needed for the other applications running on the same machine as well to determine if there is an appropriate amount of memory.

Contact your system administrator if the re-estimation indicates that the memory is insufficient. Ask the system administrator to either increase the size of the main memory or to increase the size of the page file. When there is no problem in the estimated value of a system, use the *iscollectinfo* command to collect diagnostic information, and please inform your software supplier.

## 24.17.2 td32002

---

**Command Name:** ERROR:td32002:A contradiction occurred in the system Error information (%d1-%d2-%d3)

### Variable Information

%d1 = Module code in which contradiction has occurred.

%d2 = Error information 1

%d3 = Error information 2

## Explanation

A contradiction has occurred in the system.

## System Action

Command processing stops.

## User Action

Record the error information, use the *iscollectinfo* command to collect diagnostic information, and contact your software supplier.

## 24.17.3 td32003

---

**Command Name:** ERROR:td32003:A system error occurred Error information (%d1- %d2-%d3)

### Variable Information

%d1 = System error occurred

%d2 = Error information 1

%d3 = Error information 2

## Explanation

A system error has occurred

## System Action

Command processing stops.

## User Action

Record the error information, use the *iscollectinfo* command to collect diagnostic information, and contact your software supplier.

## 24.17.4 td32004

---

**Command Name:** ERROR:td32004:File write failed due to insufficient disk capacity

### Explanation

Failed to write in the file due to insufficient disk space.

### System Action

Command processing stops.

### User Action

Check the required disk size.

## 24.17.5 td32005

---

**Command Name:** ERROR:td32005:Permission to access the file or parent directory is not granted(File name=%s)

### Variable Information

%s = File name

### Explanation

The user does not have permission to access the file or parent folder.

### System Action

Command processing stops.

### User Action

Check the file or folder access permissions.

## 24.17.6 td32006

---

**Command Name:** ERROR:td32006:File name is not correct(File name=%s)

### Variable Information

%s = File name

### Explanation

The filename specified in the argument is incorrect.

### System Action

Command processing stops.

### User Action

Specify the correct filename, and then reexecute the command.

## 24.17.7 td32007

---

**Command Name:** ERROR:td32007:File name is too long to process(File kind=%s1, Scope name=%s2)

### Variable Information

%s1 = File kind

%s2 = Scope name

### Explanation

The filename used by the TD compiler exceeds 255 bytes.

### System Action

Command processing stops.

### User Action

Check the rules governing the filename to be created by the TD compiler. Modify the filename so that it does not exceed 255 bytes, and then reexecute the command.

---

## 24.17.8 td32008

---

**Command Name:** ERROR:td32008:The system name is invalid

### Explanation

The system name was incorrect.

### System Action

Stops Command processing.

### User Action

Specify a system name that is correct, and then reexecute the command.

---

## 24.17.9 td32009

---

**Command Name:** ERROR:td32009:The length of system name is too long

### Explanation

The specified system name was too long.

### System Action

Stops Command processing.

### User Action

Specify a system name that is correct, and then reexecute the command.

---

## 24.17.10 td32010

---

**Command Name:** ERROR:td32010: The system name does not exist or it is a reserved word

### Explanation

The name that was specified for the system does not exist, or the name was reserved.

### System Action

Stops Command processing.

### User Action

Specify a system name that is correct, and then reexecute the command.

---

## 24.17.11 td32011

---

---

**Command Name:** ERROR:td32011 Cannot be used wrapper service on extended system

Explanation

The wrapper service function cannot be used on the extended system.

System Action

Stops Command processing.

User Action

To use the wrapper function, use the default system.

## 24.17.12 td32012

---

**Command Name:** ERROR:td32012: The indispensable package is not installed(Package name=%s)

Variable Information

%s = Package name

Explanation

The essential package shown in the variable information has not been installed.

System Action

Command processing stops.

User Action

Install the essential package, and then reexecute the command.

## 24.18 td32100 to td32163

---

This section details the messages with message numbers between td32100 and td32163.

### 24.18.1 td32101

---

**Command Name:** ERROR:td32101:There is no module declaration(Scope name=%s)

Variable Information

%s = Scope name

Explanation

The module declaration is not specified.

System Action

Command processing stops.

User Action

Describe the module declaration, and then reexecute the command.

### 24.18.2 td32102

---

**Command Name:** ERROR:td32102:A variable is declared(Scope name=%s)

Variable Information

%s = Scope name

#### Explanation

A variable is declared.

#### System Action

Command processing stops.

#### User Action

Delete the variable declaration, and then reexecute the command.

### 24.18.3 td32104

---

**Command Name:** `ERROR:td32104:Context information is specified(Scope name=%s)`

#### Variable Information

%s = Scope name

#### Explanation

Context information is specified.

#### System Action

Stops command processing

#### User Action

Delete the context information, and then reexecute the command.

### 24.18.4 td32106

---

**Command Name:** `ERROR:td32106:A typedef type struct is specified(Scope name=%s)`

#### Variable Information

%s = Scope name

#### Explanation

A typedef structure is specified.

#### System Action

Stops command processing

#### User Action

Delete the description of the typedef structure, and then reexecute the command.

### 24.18.5 td32107

---

**Command Name:** `ERROR:td32107:The module name has more than 255 characters(Scope name=%s)`

#### Variable Information

%s = Scope name

#### Explanation

The number of characters in the specified module name exceeds 255 bytes

#### System Action

Stops command processing

## User Action

Modify the module name so it does not exceed 255 bytes, and then reexecute the command.

## 24.18.6 td32108

---

**Command Name:** ERROR:td32108:Object name has more than 255 characters(Scope name=%s)

### Variable Information

%s = Scope name

### Explanation

The number of characters in the specified object name exceeds 255 bytes.

### System Action

Stops command processing

### User Action

Modify the object name so it does not exceed 255 bytes, and then reexecute the command.

## 24.18.7 td32109

---

**Command Name:** ERROR:td32109:operation name has more than 255 characters(Operation name=%s)

### Variable Information

%s = Operation name

### Explanation

Number of characters designated for the operation name exceeds 255 characters.

### System Action

Stops the command processing.

### User Action

After correcting the operation name, execute the command again.

## 24.18.8 td32152

---

**Command Name:** ERROR:td32152:The parameter data type is outside the support range(Data type=%s1,Scope name=%s2,Parameter name=%s3)

### Variable Information

%s1 = Data type

%s2 = Scope name

%s3 = Parameter name

### Explanation

An unsupported element or member data type is specified for the parameter data type.

### System Action

Command processing stops.

### User Action

Correct the data type, and then reexecute the command.

## 24.18.9 td32153

---

**Command Name:** ERROR:td32153:The reserved word is not specified(Scope name=%s)

### Variable Information

%s = Scope name

### Explanation

A reserved word is specified.

### System Action

Stops command processing

### User Action

Correct the invalid description, and then reexecute the command.

## 24.18.10 td32154

---

**Command Name:** ERROR:td32154:Out of array dimension (Scope name=%s)

### Variable Information

%s = Scope name

### Explanation

An invalid array dimension is specified.

### System Action

Command processing stops.

### User Action

Correct the array dimension, and then reexecute the command.

## 24.18.11 td32155

---

**Command Name:** ERROR:td32155:The data type of member in struct is outside the support range(Data type=%s1, Scope name=%s2, Member name=%s3)

### Variable Information

%s1 = Data type

%s2 = Scope name

%s3 = Member name

### Explanation

An invalid structure member data type is specified.

### System Action

Command processing stops.

### User Action

Correct the structure member data type, and then reexecute the command.

## 24.18.12 td32156

---

**Command Name:** ERROR:td32156:The data type is outside the support range(Data type=%s1, Scope name=%s2)

### Variable Information

%s1 = Data type

%s2 = Scope name

### Explanation

An invalid data type is specified.

### System Action

Command processing stops.

### User Action

Correct the data type, and then reexecute the command.

## 24.18.13 td32157

---

**Command Name:** ERROR:td32157:The data type of array is outside the support range(Data type=%s1, Scope name=%s2)

### Variable Information

%s1 = Data type

%s2 = Scope name

### Explanation

An invalid array element data type is specified.

### System Action

Command processing stops.

### User Action

Correct the array element data type, and then reexecute the command.

## 24.18.14 td32158

---

**Command Name:** ERROR:td32158:The data type of sequence is outside the support range(Data type=%s1, Scope name=%s2)

### Variable Information

%s1 = Data type

%s2 = Scope name

### Explanation

The data type specified for the sequence element is out of range.

## System Action

Stops the command processing.

## User Action

Correct the sequence element data type, and then reexecute the command.

## 24.18.15 td32159

---

**Command Name: ERROR: td32159: The data type of exception is outside the support range (Data type=%s1, Scope name =%s2,Member name =%s3)**

### Variable Information

%s1 = Data type

%s2 = Scope name

%s3 = Member name

### Explanation

An unsupported data type is specified in the exception members.

### System Action

Stops the command processing.

### User Action

Correct the exception member data type and execute the command again.

## 24.18.16 td32160

---

**Command Name: ERROR: td32160: The parameter data type of raises is outside the support range (Scope name =%s1, Parameter name =%s2)**

### Variable Information

%s1 = Scope name

%s2 = Parameter name

### Explanation

An unsupported parameter has been specified in the raises of the operation.

### System Action

Stops the command processing.

### User Action

Correct the parameter specified in the raises and execute the command again.

## 24.18.17 td32161

---

**Command Name: ERROR: td32161: The return data type of operation is outside the support range (Scope name =%s)**

### Variable Information

%s = Scope name

### Explanation

An unsupported format is specified in the operation return format.

### System Action

Stops the command processing.

### User Action

Correct the operation return format and execute the command again.

## 24.18.18 td32162

---

**Command Name:** ERROR: td32162: Inheritance is specified (scope name =%s)

### Variable Information

%s = Scope name

### Explanation

Inheritance is specified in the AIM linkage IDL definition.

### System Action

Stops the command processing.

### User Action

Delete the inheritance statement and execute the command again.

## 24.18.19 td32163

---

**Command Name:** ERROR: td32163: There is an exception declared (scope name =%s)

### Variable Information

%s = Scope name

### Explanation

There is an exception declaration in the AIM linkage IDL definition.

### System Action

Stops the command processing.

### User Action

Delete the exception declaration and execute the command again.

## 24.19 td32200 to td32299

---

This section details the messages with message numbers between td32200 and td32299.

### 24.19.1 td32201

---

---

**Command Name:**WARNING:td32201:The data type could not be converted to create WWW simple application-related information(Data type=%s1, Scope name=%s2)

**Variable Information**

%s1 = Data type

%s2 = Scope name

**Explanation**

A data type exists that cannot be converted to generate Web simple application-related information.

**System Action**

Continues command processing.

**User Action**

Correct the data type, and then reexecute the command if necessary.

---

## 24.20 td32300 to td32362

This section details the messages with message numbers between td32300 and td32362.

---

### 24.20.1 td32301

---

**Command Name:** ERROR:td32301:Wrapper definition file does not exist(File name=%s)

**Variable Information**

%s = File name

**Explanation**

The specified wrapper definition file does not exist.

**System Action**

Stops command processing

**User Action**

Specify the correct wrapper definition file, and then reexecute the command.

---

### 24.20.2 td32302

---

**Command Name:** ERROR:td32302:Attribute information already exists(Attribute information name=%s)

**Variable Information**

%s = Attribute information name

**Explanation**

Attribute information already exists.

**System Action**

Stops command processing

**User Action**

Specify the **-update** option, and then reexecute the command, if necessary.

---

### 24.20.3 td32303

---

**Command Name:** ERROR:td32303:Unable to process because another command is being executed

**Explanation**

Processing has stopped because the exclusive command, tdtransfer, is being executed.

**System Action**

Stops command processing

**User Action**

When tdtransfer terminates, reexecute the command.

---

## 24.20.4 td32351

---

**Command Name:** ERROR:td32351:Line %d = Inappropriate definition document(Definition document name=%s)

**Variable Information**

%d = Invalid line number

%s = Definition document name

**Explanation**

An invalid operand has been specified.

**System Action**

Stops command processing

**User Action**

Correct the invalid definition statement, and then reexecute the command.

---

## 24.20.5 td32352

---

**Command Name:** ERROR:td32352:Line %d = Inappropriate operand(Definition document name =%s1, Operand name=%s2)

**Variable Information**

%d = Invalid line number

%s1 = Definition document name

%s2 = Operand name

**Explanation**

An invalid operand has been specified.

**System Action**

Stops command processing

**User Action**

Correct the invalid operand, and then reexecute the command.

---

## 24.20.6 td32353

---

**Command Name:** ERROR:td32353:Line %d = Operand is duplicated(Definition document name=%s1, Operand name=%s2)

## Variable Information

%d = Invalid line number

%s1 = Definition document name

%s2 = Operand name

## Explanation

A duplicate operand is specified

## System Action

Stops command processing

## User Action

Correct the invalid operand, and then reexecute the command.

## 24.20.7 td32354

---

**Command Name:** ERROR:td32354:Line %d = Required operand is not described(Definition document name=%s1,Operand name=%s2)

## Variable Information

%d = Invalid line number

%s1 = Definition document name

%s2 = Operand name

## Explanation

A mandatory operand has not been described.

## System Action

Stops command processing

## User Action

Describe the mandatory operand, and then reexecute the command.

## 24.20.8 td32355

---

**Command Name:** ERROR:td32355:Line %d = The operand value is not specified(Definition document name=%s1, Operand name=%s2)

## Variable Information

%d = Invalid line number

%s1 = Definition document name

%s2 = Operand name

## Explanation

No value has been specified for the operand.

## System Action

Stops command processing

## User Action

Correct the invalid operand, and then reexecute the command.

## 24.20.9 td32356

---

**Command Name:** ERROR:td32356:Line %d = A character that cannot be described is described

### Variable Information

%d = Invalid line number

### Explanation

The wrapper definition contains invalid characters.

### System Action

Stops command processing

### User Action

Correct the invalid description, and then reexecute the command.

## 24.20.10 td32358

---

**Command Name:** ERROR:td32358:Line %d = No start character

### Variable Information

%d = Invalid line number

### Explanation

The starting character "{" is missing.

### System Action

Stops command processing

### User Action

Add the starting character, and then reexecute the command.

## 24.20.11 td32359

---

**Command Name:** ERROR:td32359:Line %d = No last character

### Variable Information

%d = Invalid line number

### Explanation

The ending character "]" is missing.

### System Action

Stops command processing

### User Action

Add the ending character, and then reexecute the command.

## 24.20.12 td32360

---

---

**Command Name: ERROR:td32360:Line %d = The operand contains a duplicate definition of a value(Definition document name=%s1, Operand name=%s2)**

**Variable Information**

%d = Invalid line number

%s1 = Definition document name

%s2 = Operand name

**Explanation**

Multiple values have been specified in the operand.

**System Action**

Stops command processing

**User Action**

Correct the invalid operand, and then reexecute the command.

## 24.20.13 td32361

---

**Command Name: ERROR:td32361:No description for the required definition document(Definition document name=%s)**

**Variable Information**

%s = Definition document name

**Explanation**

A mandatory definition statement does not exist.

**System Action**

Stops command processing

**User Action**

Describe the mandatory definition statement, and then reexecute the command.

## 24.20.14 td32362

---

**Command Name: ERROR:td32362:Line %d = Reserved word is not specified**

**Variable Information**

%d = Invalid line number

**Explanation**

A reserved word is specified.

**System Action**

Stops command processing

**User Action**

Correct the invalid description, and then reexecute the command.

## 24.21 td32400 to td32436

---

This section details the messages with message numbers between td32400 and td32436.

### 24.21.1 td32401

---

**Command Name:** ERROR:td32401:Line %d = The specified value in the definition document is inappropriate(Definition document name=%s)

#### Variable Information

%d = Invalid line number

%s = Definition document name

#### Explanation

An invalid value is specified in the definition statement.

#### System Action

Stops command processing

#### User Action

Correct the invalid definition statement, and then reexecute the command.

### 24.21.2 td32402

---

**Command Name:** ERROR:td32402:Line %d = No value is specified in the definition document(Definition document name=%s)

#### Variable Information

%d = Invalid line number

%s = Definition document name

#### Explanation

No value is specified in the definition statement.

#### System Action

Stops command processing

#### User Action

Describe a value for the definition statement, and then reexecute the command.

### 24.21.3 td32403

---

**Command Name:** ERROR:td32403:Line %d = The specified value has more than 255 characters(Definition document name=%s)

#### Variable Information

%d = Invalid line number

%s = Definition document name

#### Explanation

The number of characters in the specified definition statement value exceeds 255 bytes.

## System Action

Stops command processing

## User Action

Correct the invalid definition statement, and then reexecute the command.

## 24.21.4 td32404

---

**Command Name:** ERROR:td32404:Line %d = The specified value has more than 255 characters(Definition document name=%s1, Operand name=%s2)

### Variable Information

%d = Invalid line number

%s1 = Definition document name

%s2 = Operand name

### Explanation

The number of characters in the specified operand value exceeds 255 bytes.

## System Action

Stops command processing

## User Action

Correct the invalid operand, and then reexecute the command.

## 24.21.5 td32405

---

**Command Name:** ERROR:td32405:Line %d = The specified value is already defined(Definition document name=%s1, Operand name=%s2, Value =%s3)

### Variable Information

%d = Invalid line number

%s1 = Definition document name

%s2 = Operand name

%s3 = Value

### Explanation

The value specified in the operand is already defined.

## System Action

Stops command processing

## User Action

Correct the invalid operand, and then reexecute the command.

## 24.21.6 td32406

---

**Command Name:** ERROR:td32406:Line %d = The specified value has more than 8 characters(Definition document name= %s1, Operand name=%s2)

### Variable Information

%d = Invalid line number

%s1 = Definition document name

%s2 = Operand name

#### Explanation

The value specified in the operand contains more than 8 characters.

#### System Action

Stops command processing

#### User Action

Correct the invalid operand, and then reexecute the command.

### 24.21.7 td32407

---

**Command Name: ERROR:td32407:Line %d = The specified value contains character which is not an upper case alphabet or number(Definition document name=%s1, Operand name=%s2)**

#### Variable Information

%d = Invalid line number

%s1 = Definition document name

%s2 = Operand name

#### Explanation

The initial character of the specified operand value is not uppercase.

#### System Action

Stops command processing

#### User Action

Correct the invalid operand, and then reexecute the command.

### 24.21.8 td32408

---

**Command Name: ERROR:td32408:Line %d = The first character of the specified value is not an upper case alphabet(Definition document name=%s1, Operand name=%s2)**

#### Variable Information

%d = Invalid line number

%s1 = Definition document name

%s2 = Operand name

#### Explanation

The initial character of the specified operand value is not uppercase.

#### System Action

Stops command processing

#### User Action

Correct the invalid operand, and then reexecute the command.

### 24.21.9 td32409

---

---

**Command Name:** ERROR:td32409:Line %d = Value specified in the inattrib operand is duplicated in the outattrib operand(Definition document name=%s)

**Variable Information**

%d = Invalid line number

%s = Definition document name

**Explanation**

The value specified in the inattrib operand is duplicated in the outattrib operand.

**System Action**

Stops command processing

**User Action**

Correct the invalid operand, and then reexecute the command.

## 24.21.10 td32411

---

**Command Name:** ERROR:td32411:Line %d = The type of value specified is inappropriate(Definition document name=%s1, Operand name=%s2)

**Variable Information**

%d = Invalid line number

%s1 = Definition document name

%s2 = Operand name

**Explanation**

An incorrect value type has been specified.

**System Action**

Stops command processing

**User Action**

Correct the invalid specification value type, and then reexecute the command.

## 24.21.11 td32412

---

**Command Name:** ERROR:td32412:Line %d = The value specified is outside the specifiable range(Definition document name=%s1, Operand name=%s2)

**Variable Information**

%d = Invalid line number

%s1 = Definition document name

%s2 = Operand name

**Explanation**

The value specified is invalid and is not in the type range.

**System Action**

Stops command processing

## User Action

Correct the invalid specification value type, and then reexecute the command.

## 24.21.12 td32414

---

**Command Name:WARNING:td32414:Line %d = The specified value is not defined by the IDL definition(Definition document name=%s1, Value=%s2)**

### Variable Information

%d = Invalid line number

%s1 = Definition document name

%s2 = Value

### Explanation

The specified definition statement value has not been defined in the IDL definition.

### System Action

Continues command processing.

### User Action

Correct the definition statement, and then reexecute the command, if necessary.

## 24.21.13 td32415

---

**Command Name:WARNING:td32415:Line %d = The specified value is not defined by the IDL definition(Definition document name=%s1, Operand name=%s2, Value=%s3)**

### Variable Information

%d :Line number of operand

%s1 = Definition document name

%s2 = Operand name

%s3 = Value

### Explanation

The specified operand value has not been defined in the IDL definition.

### System Action

Continues command processing.

### User Action

Correct the operand, and then reexecute the command, if necessary.

## 24.21.14 td32416

---

**Command Name: ERROR:td32416:Line %d = The specified value is not defined by the IDL definition(Definition document name=%s1, Operand name=%s2, Value=%s3)**

## Variable Information

%d = Invalid line number

%s1 = Definition document name

%s2 = Operand name

%s3 = Value

## Explanation

The specified operand value has not been defined in the IDL definition.

## System Action

Stops command processing

## User Action

Correct the invalid operand, and then reexecute the command.

## 24.21.15 td32420

---

**Command Name: ERROR:td32420:Line %d = The specified value type and specified parameter type do not match(Definition document name=%s1, Operand name=%s2)**

## Variable Information

%d = Invalid line number

%s1 = Definition document name

%s2 = Operand name

## Explanation

The specification value type does not match the parameter data type.

## System Action

Stops command processing

## User Action

Correct the invalid operand, and then reexecute the command.

## 24.21.16 td32421

---

**Command Name: ERROR: td32421:Line %d = The number of parameters defined by the wrapper definition document and the number of parameters defined by IDL definition do not match(Definition document name=%s1, Operand name=%s2)**

## Variable Information

%d = Invalid line number

%s1 = Definition document name

%s2 = Operand name

## Explanation

The number of parameters defined in the wrapper definition statement does not match the number of parameters defined in the IDL definition.

## System Action

Stops command processing

## User Action

Correct the invalid operand, and then reexecute the command.

## 24.21.17 td32422

---

**Command Name: ERROR: td32422:Line %d = The specified parameter data type is outside the support range(Definition document name=%s1, Operand name=%s2)**

### Variable Information

%d = Operand line number

%s1 = Definition document name

%s2 = Operand name

### Explanation

The specified parameter data type is not supported.

### System Action

Stops command processing

### User Action

Correct the IDL definition, and then reexecute the command.

## 24.21.18 td32424

---

**Command Name: ERROR:td32424:Line %d = The specified value type includes nonnumeric characters(Definition document name=%s1, Operand name=%s2)**

### Variable Information

%d = Invalid line number

%s1 = Definition document name

%s2 = Operand name

### Explanation

A non-numeric value is specified for the value type.

### System Action

Stops command processing

### User Action

Correct the invalid operand, and then reexecute the command.

## 24.21.19 td32425

---

**Command Name: ERROR:td32425:Line %d = The specified value is already defined(Definition document name=%s1, Value=%s2)**

### Variable Information

%d = Invalid line number

%s1 = Definition document name

%s2 = Value

### Explanation

The specified value is already defined

### System Action

Stops command processing

### User Action

Correct the invalid definition statement, and then reexecute the command.

## 24.21.20 td32426

---

**Command Name: ERROR:td32426:Line %d = No redefine or parmlst operand is defined under the operation operand(Definition document name=%s1, Operand name=%s2)**

### Variable Information

%d = Invalid line number

%s1 = Definition document name

%s2 = Operand name

### Explanation

No redefine or parmlst operand is defined under operation operand.

### System Action

Stops the command processing.

### User Action

Correct the invalid definition statement, and then reexecute the command.

## 24.21.21 td32427

---

**Command Name: ERROR:td32427:Line %d = No redefine operand is defined under the parmlst operand(Definition document name=%s1, Operand name=%s2)**

### Variable Information

%d = Invalid line number

%s1 = Definition document name

%s2 = Operand name

### Explanation

No redefine operand is defined under the parmlst operand.

### System Action

Stops the command processing.

## User Action

Correct the invalid definition statement, and then reexecute the command.

## 24.21.22 td32428

---

**Command Name:** ERROR:td32428:Line %d = Total data length of the parameter defined under on operation exceeds 32000(Definition document name=%s1, Operand name=%s2, Parameter kind=%s3)

### Variable Information

%d = Operand line number

%s1 = Definition document name

%s2 = Operand name

%s3 = Parameter kind

### Explanation

The total data length of the parameters defined under one operation operand exceeds 32000 bytes.

### System Action

Stops the command processing.

### User Action

Correct the IDL definition, and then reexecute the command.

## 24.21.23 td32429

---

**Command Name:** ERROR:td32429:Line %d = The specified array parameter is defined as OUT in the IDL definition(Definition document name=%s1, Operand name=%s2, Value=%s3)

### Variable Information

%d = Operand line number

%s1 = Definition document name

%s2 = Operand name

%s3 = Value

### Explanation

The specified array parameter is not defined as an OUT parameter in the IDL definition.

### System Action

Stops the command processing.

### User Action

Correct the IDL definition, and then reexecute the command.

## 24.21.24 td32430

---

**Command Name:** ERROR:td32430:Line %d = The specified array parameter is defined other than the final parameter of the operation(Definition document name=%s1, Operand name=%s2, Value=%s3)

### Variable Information

%d = Operand line number

%s1 = Definition document name

%s2 = Operand name

%s3 = Value

### Explanation

The specified array parameter is not defined as the last parameter of the operation.

### System Action

Stops the command processing.

### User Action

Correct the IDL definition, and then reexecute the command.

## 24.21.25 td32431

---

**Command Name:** ERROR:td32431:Line %d = The number of structure member defined in the wrapper definition and the IDL definition does not match(Definition document name=%s1, Operand name=%s2)

### Variable Information

%d = Invalid line number

%s1 = Definition document name

%s2 = Operand name

### Explanation

The number of the structure member specified in the IDL definition does not match the structure member specified in the wrapper definition statement.

### System Action

Stops the command processing.

### User Action

Correct the invalid definition statement, and then reexecute the command.

## 24.21.26 td32432

---

**Command Name:** ERROR:td32432:Line %d = The specified structure parameter is not defined as a structure in the IDL definition(Definition document name=%s1, Operand name=%s2, Value=%s3)

### Variable Information

%d = Operand line number

%s1 = Definition document name

%s2 = Operand name

%s3 = Value

### Explanation

The structure parameter specified in the parmlst operand is not defined in the IDL definition structure.

## System Action

Stops the command processing.

## User Action

Correct the IDL definition, and then reexecute the command.

## 24.21.27 td32433

---

**Command Name:** ERROR:td32433:Line %d = The specified parameter is defined as a structure in the IDL definition(Definition document name=%s1, Operand name=%s2, Value=%s3)

### Variable Information

%d = Operand line number

%s1 = Definition document name

%s2 = Operand name

%s3 = Value

### Explanation

The parameter specified in the redefine operand is defined in the IDL definition structure.

## System Action

Stops the command processing.

## User Action

Correct the IDL definition, and then reexecute the command.

## 24.21.28 td32434

---

**Command Name:** ERROR:td32434:Line %d = The specified value type and the data type of the structure member does not match(Definition document name=%s1, Operand name=%s2)

### Variable Information

%d = Invalid line number

%s1 = Definition document name

%s2 = Operand name

### Explanation

The structure member data type is different to the specification value type.

## System Action

Stops the command processing.

## User Action

Correct the invalid operand, and then reexecute the command.

## 24.21.29 td32435

---

---

**Command Name: ERROR: td32435:Line %d = The specified factor of parameter exceeds 30000 (Definition document name=%s1, Operand name=%s2, Value=%s3)**

**Variable Information**

%d = Invalid line number

%s1 = Definition document name

%s2 = Operand name

%s3 = Value

**Explanation**

The number of specified parameter elements exceeds 30000.

**System Action**

Stops the command processing.

**User Action**

Correct the IDL definition and execute the command again.

## **24.21.30 td32436**

---

**Command Name: WARNING: td32436:Line %d = Specify the maximum number of digits of the data type specified in the IDL definition for the specified type (Definition document name=%s1,Operand name = %s2)**

**Variable Information**

%d = Operand line number

%s1 = Definition document name

%s2 = Operand name

**Explanation**

The maximum number of characters in the data type defined by the IDL definition not defined in the specified value type.

**System Action**

Command processing continues.

**User Action**

Some data may have been lost during application linkage. If necessary, correct the definition and execute the command again.

# Chapter 25 Messages Output during Resource Access Definition

This chapter explains the messages output by the JNDI operation commands or J2EE Resource Access Definition.

## 25.1 Messages of the fjj2eadmin Command

---

### **fjj2eadmin: The property file is not found. : %s**

#### Variable Information

%s = Property file name

#### Explanation

No property file was found. Or, the specified full path is incorrect.

#### User Action

If no property file exists, create a property file and check that the full path to the property file is correct, then re-execute the command.

---

### **fjj2eadmin: Failed to read the property file.**

#### Explanation

An error occurred when reading the property file.

#### User Action

Check the attributes (such as access rights) of the property file.

---

### **fjj2eadmin: -s requires property-file-name.**

#### Explanation

The property file name is not specified.

#### User Action

Specify the property file name and re-execute the command.

---

### **fjj2eadmin: -o requires property-file-name.**

#### Explanation

The property file name is not specified.

#### User Action

Specify the property file name and re-execute the command.

---

### **fjj2eadmin: -d requires resource-name.**

#### Explanation

The resource name is not specified.

#### User Action

Specify the resource name and re-execute the command.

---

### **fjj2eadmin: -g requires resource-name.**

#### Explanation

The resource name is not specified.

## User Action

Specify the resource name and re-execute the command.

---

**fjj2eadmin: Failed to enter the definition.  
The specified resource has been already defined. : %s1 : %s2**

## Variable Information

%s1 = Resource access definition type

%s2 = Resource name

## Explanation

An attempt to register the definition information failed. The specified resource has already been registered.

## User Action

Change the resource name to be specified. Or delete the currently registered resource information of the same name and create the registration again.

---

**fjj2eadmin: Failed to get the definition.  
%s1 : %s2**

## Variable Information

%s1 = Resource access definition type

%s2 = Resource name

## Explanation

An attempt to acquire the definition information failed. The specified resource name is not defined. Or the resource access definition does not exist.

## User Action

Check that the specified resource name exists in the resource access definition. Or check whether the resource access definition exists.

**Solaris32/64**

Check that the specified system name is correct at the time of multi-system application.

---

**fjj2eadmin: Failed to delete the definition.  
%s1 : %s2**

## Variable Information

%s1 = Resource access definition type

%s2 = Resource name

## Explanation

An attempt to delete the definition information failed. The specified resource name is not defined. Or, the resource access definition does not exist.

## User Action

Check whether the specified resource name exists in the resource access definition. Or, check whether the resource access definition exists.

**Solaris32/64**

Check whether the specified system name is correct at the time of multi-system application.

---

**fjj2eadmin: illegal option.**

## Explanation

The specified resource access definition or the resource name is incorrect.

## User Action

Specify the correct resource access definition and resource name and re-execute the command.

---

### **fjj2eadmin: insufficient arguments.**

## Explanation

The resource access definition or the resource name is not specified.

## User Action

Specify the resource access definition and resource name and re-execute the command.

---

### **fjj2eadmin: An indispensable property is not define. : %s**

## Variable Information

%s = Parameter name

## Explanation

The indispensable parameter is not specified.

## User Action

Specify the indispensable parameter and re-execute the command.

---

### **fjj2eadmin: too many arguments.**

## Explanation

Two or more resource access definitions or resource names are specified.

## User Action

Specify one resource access definition and one resource name, then re-execute the command.

---

**Solaris32/64**

### **fjj2eadmin: system name is too long, may be within 8.**

## Explanation

Specified name is too long.

## User Action

Specify the system name **within** eight characters and re-execute the command.

Note - This message is output only at the time of multi-system application.

---

**Solaris32/64**

### **fjj2eadmin: -M requires system-name.**

## Explanation

No system name is specified.

## User Action

Specify the system name and re-execute the command.

Note - This message is output only at the time of multi-system application.

---

**Solaris32/64**

### **fjj2eadmin: 'td001' is a reserved name, may not use.**

**fjj2eadmin: 'ec001' is a reserved name, may not use.**  
**fjj2eadmin: 'default' is a reserved name, may not use.**

#### Explanation

"td001", "ec001", and "default" are reserved words. They cannot be used as system names.

#### User Action

Specify the correct system name and re-execute the command.

Note - This message is output only at the time of multi-system application.

---

**Solaris32/64**

**fjj2eadmin: system name is not valid, may not use numeric character at first. SYSTEM=%s**

#### Variable Information

%s = Invalid system name

#### Explanation

Specified system name is invalid. The system name may not begin with a numeric character.

#### User Action

Specify the correct system name and re-execute the command.

Note: This message is output only at the time of multi-system application.

---

**Solaris32/64**

**fjj2eadmin: system name is not valid, may not use non-alphanumeric characters. SYSTEM=%s**

#### Variable Information

%s = Invalid system name

#### Explanation

Specified system name is invalid. Only alphanumeric characters (A - Z, a - z, and 0 - 9) can be used in the system name.

#### User Action

Specify the correct system name and re-execute the command.

Note: This message is output only at the time of multi-system application.

---

**Solaris32/64**

**fjj2eadmin: The specified system name does not exist: SYSTEM=%s**

#### Variable Information

%s = Invalid system name

#### Explanation

An unsupported extended system was specified. This command cannot be used on an extended multi-system.

#### User Action

Specify a default system Application Server.

---

**fjj2eadmin: may not specify only a password.**

#### Explanation

Cannot specify only a password

#### User Action

Specify the user name and re-execute the command.

---

**fjj2eadmin: No such connector definition. Sorry, may not create a connector definition. : %s**

Variable Information

%s = Resource name

Explanation

The specified resource name is not defined. Connector cannot create a new resource access definition when the -O option is used and a definition does not exist.

User Action

Check whether the specified resource name exists in the resource access definition. Or, check whether the resource access definition exists and re-execute the command.

---

**fjj2eadmin: Sorry, may not change a config-property-name, a config-property-type, and the number of config-properties.**

Explanation

The property name, the class name of a property value, or the number of the config-property information cannot be changed.

User Action

Check whether the config-property information is correct and re-execute the command.

---

**fjj2eadmin: Please check whether the specification form of config-property is right. : %s**

Variable Information

%s = Config-property information parameter

Explanation

The specification form of config-property information is incorrect.

User Action

Check that the config-property information is correct and re-execute the command.

---

**fjj2eadmin: Failed to make .bindings file.**

Explanation

An environment variable required for registering the bindings file is incorrect.

User Action

Check the setting of the CLASSPATH environment variable, or check that a directory in which the .bindings file is to be created exists.

---

**fjj2eadmin: Failed to get the list of definition. : %s**

Variable Information

%s = Detail cause

Explanation

**The fjj2eadmin command has been deprecated.**

Acquisition of the definition list failed because of %s.

User Action

Check the indicated detail cause, and remove the cause of the error, then re-execute processing.

Check also whether the resource access definition file is damaged. If the file is damaged, delete the file, re-register a resource definition file, and re-execute processing.

---

**fjj2eadmin: The value for the following property is not specified. : %s****Variable Information**

%s = Parameter name

**Explanation**

No parameter value is specified.

**User Action**

Specify the parameter value, then re-execute the command.

---

**fjj2eadmin: Wrong kind of database is specified. Check the kind of database.****Explanation**

The specified database type is incorrect.

**User Action**

A value other than 0, 1, 2, and 3 was specified as the database type.

Check whether the specified database type is correct.

---

**fjj2eadmin: The value for kind of database does not match with the value for class name.****Explanation**

The combination of the specified class name and database type is incorrect.

**User Action**

Check whether the combination of the specified class name and database type is correct.

Table 25.1 Database Type and Class Name combinations

Database	INITIAL_CONTEXT_FACTORY	DATABASE_KIND
Symfoware	com.fujitsu.symfoware.jdbc2.jndisp.SYMContextFactory	0
Oracle	com.sun.jndi.fscontext.RefFSContextFactory	1
SQLServer	- When a Microsoft(R) JDBC driver is used com.sun.jndi.fscontext.RefFSContextFactory	4

---

**fjj2eadmin: Wrong class name is specified. Check the class name.****Explanation**

The specified class name is incorrect.

**User Action**

Check whether the specified class name is correct.

---

**fjj2eadmin: The specified property cannot be changed. : %s****Variable Information**

%s = Parameter name

**Explanation**

The specified parameter value cannot be changed.

**User Action**

The class name and the database type value cannot be changed.

Check the specified parameter value, then re-execute the command.

---

**fjj2eeadmin: This operation cannot be executed on the managed server.**

Explanation

This operation cannot be performed by the Managed Server.

User Action

Login to the Interstage Management Console of an Admin Server. Then, perform the same operation on the contents at the time of the command operation.

---

## 25.2 Messages of the j2eejndisetaup Command

---

**j2eejndisetaup: illegal option : %s**

Variable Information

%s = Incorrect option

Explanation

The specified option is invalid.

User Action

Check that the specified option is valid.

---

**Solaris32/64**

**j2eejndisetaup: -M requires system-name.**

Explanation

No system name is specified.

User Action

Specify the system name and restart.

Note: This message is output only at the time of multi-system application.

---

**Solaris32/64**

**j2eejndisetaup: system name is too long, may be within 8.**

Explanation

Specified name is too long.

User Action

Specify the system name within eight characters and restart.

Note: This message is output only at the time of multi-system application.

---

**Solaris32/64**

**j2eejndisetaup: 'td001' is a reserved name, may not use.**

**j2eejndisetaup: 'ec001' is a reserved name, may not use.**

**j2eejndisetaup: 'default' is a reserved name, may not use.**

Explanation

"td001", "ec001", and "default" are reserved words and cannot be used as system names.

User Action

Specify the correct system name and restart.

Note: This message is output only at the time of multi-system application.

---

Solaris32/64

**j2eejndisetaup: system name is not valid, may not use a numeric character at first. SYSTEM=%s**

Variable Information

%s = Invalid system name

Explanation

Specified system name is invalid. The system name may not begin with a numeric character.

User Action

Specify the correct system name and restart.

Note: This message is output only at the time of multi-system application.

---

Solaris32/64

**j2eejndisetaup: system name is not valid, may not use non-alphanumeric characters. SYSTEM=%s**

Variable Information

%s = Invalid system name

Explanation

Specified system name is invalid. Only alphanumeric characters (A - Z, a - z, and 0 - 9) can be used in the system name.

User Action

Specify the correct system name and restart.

Note: This message is output only at the time of multi-system application.

---

Solaris32/64

**j2eejndisetaup: too many arguments.**

Explanation

The -M option is specified multiple times.

User Action

Specify the -M option once and restart.

Note: This message is output only at the time of multi-system application.

---

Solaris32/64

**j2eejndisetaup: The specified system name does not exist: SYSTEM=%s**

Variable Information

%s = Invalid system name

Explanation

An unsupported extended system was specified.

User Action

This command cannot be used in extended systems. Use the default system.

---

## 25.3 Messages of the J2EE Resource Access Definition

---

If the J2EE resource access definition fails to start, the necessary environment variables may not be set correctly. Refer to 'Starting the J2EE resource access definition' in the J2EE User's Guide and set the environment variables correctly.

---

### **Specify [User ID].**

#### Explanation

The [User ID] input field for database connection in the JDBC resource access definition is empty.

#### User Action

Specify [User ID].

---

### **Specify [Password].**

#### Explanation

The [Password] input field for database connection in the JDBC resource access definition is empty.

#### User Action

Specify [Password].

---

### **Specify [Class name].**

#### Explanation

The [Class name] input field of the Naming Service in the JDBC resource access definition is empty.

#### User Action

Specify [Class name].

---

### **Specify [URL]**

#### Explanation

The [URL] input field of the Naming Service in the JDBC resource access definition is empty.

#### User Action

Specify [URL].

---

### **Specify [Data source name].**

#### Explanation

The [Data source name] input field of the Naming Service in the JDBC resource access definition is empty.

#### User Action

Specify [Data source name].

---

### **Specify [Host Name].**

#### Explanation

The [Host name] input field of the Data-input assistant in the JDBC resource access definition is empty.

#### User Action

Specify [Host name].

---

Windows32/64

### **Specify [Path to the PROVIDER URL information folder].**

#### Explanation

The [Path to the PROVIDER URL information folder] input field of the Data-input assistant in the JDBC resource access definition is empty.

## User Action

Specify [Path to the PROVIDER URL information folder].

---

**Solaris32/64** **Linux32/64**

## Specify [Path to the PROVIDER URL information directory].

### Explanation

The [Path to the PROVIDER URL information directory] input field of the Data-input assistant in the JDBC resource access definition is empty.

## User Action

Specify [Path to the PROVIDER URL information directory].

---

## The Specified name of a definition contains an unallowable character.

### Allowable character:

**alphabet (upper case and lower case), numerals, periods (.), colons (:), underscores (\_), hyphens (-), and slashes (/).**

### Explanation

A character that may not be used as a definition name in the JMS resource access definition is specified.

## User Action

Specify definition name using alphabetical characters (both upper- and lower-case), numeric characters, period (.), colon (:), underscore (\_), hyphen (-), or slash (/).

---

## The Specified name of a definition is too long. Specify the name within 255 characters.

### Explanation

A definition name in the JMS resource access definition is too long.

## User Action

Specify the definition name within 255 characters.

---

## Specify [Client ID].

### Explanation

The [Client ID] input field in the JMS resource access definition is empty.

## User Action

Specify [Client ID].

---

## [Client ID] contains an unallowable character.

### Allowable character:

**alphabet (upper case and lower case), numerals, periods(.), colons(:), underscores(\_), hyphens(-), and slashes(/).**

### Explanation

A character that may not be used as [Client ID] in the JMS resource access definition is specified.

## User Action

Specify [Client ID] using alphabetical characters (both upper- and lower-case), numeric characters, period (.), colon (:), underscore (\_), hyphen (-), or slash (/).

---

## [Client ID] is too long. Specify [Client ID] within 255 characters.

#### Explanation

[Client ID] in the JMS resource access definition is too long.

#### User Action

Specify [Client ID] within 255 characters.

---

#### **Specify [Group name].**

#### Explanation

The [Group name] input field of the event channel in the JMS resource access definition is empty.

#### User Action

Specify [Group name].

---

#### **[Group name] contains an unallowable character.**

##### **Allowable character:**

**alphabet (upper case and lower case), numerals, periods(.), colons(:), underscores(\_), hyphens(-), and slashes(/).**

#### Explanation

A character that may not be used as [Group name] in the JMS resource access definition is specified.

#### User Action

Specify [Group name] using alphabetical characters (both upper- and lower-case), numeric characters, period (.), colon (:), underscore (\_), hyphen (-), or slash (/).

---

#### **[Group name] is too long. Specify [Group name] within 255 characters.**

#### Explanation

[Group name] in the JMS resource access definition is too long.

#### User Action

Specify [Group name] within 255 characters.

---

#### **Specify [Channel name].**

#### Explanation

The [Channel name] input field of the event channel in the JMS resource access definition is empty.

#### User Action

Specify [Channel name].

---

#### **[Channel name] contains an unallowable character.**

##### **Allowable character:**

**alphabet (upper case and lower case), numerals, periods (.), colons (:), underscores (\_), hyphens (-), and slashes (/).**

#### Explanation

A character that may not be used as [Channel name] in the JMS resource access definition is specified.

#### User Action

Specify [Channel name] using alphabetical characters (both upper- and lower-case), numeric characters, period (.), colon (:), underscore (\_), hyphen (-), or slash (/).

---

#### **[Channel name] is too long. Specify [Channel name] within 255 characters.**

## Explanation

[Channel name] in the JMS resource access definition is too long.

## User Action

Specify [Channel name] within 255 characters.

---

## JMS is not available.

**Please check whether JMS has been installed and whether the following environment variables are right: CLASSPATH, PATH**

## Explanation

JMS is not available, since JMS has not been installed, and/or the following environment variables are not correct: CLASSPATH, PATH.

## User Action

Check whether JMS has been installed and whether the following environment variables are correct: CLASSPATH, PATH.

---

## You cannot specify only the password.

## Explanation

Only [Password] is specified without specifying [User ID] in the connector resource access definition.

## User Action

[Password] needs to be specified together with [User ID]. Specify [User ID].

---

## The value of [Config-property name] : %s is invalid.

## Variable Information

%s = Property name

## Explanation

The [Value] input field of the [Config property] in the connector resource access definition is invalid (Outside of the range etc.).

## User Action

Specify a suitable value according to the following ranges and the notation for each [Type] information.

Table 25.2 Date Type Range and Notation

Type	Input Format	Input Range
java.lang.Boolean	True or False	Upper case and lower case is possible.
java.lang.String	String	Arbitrary character sequences
java.lang.Byte	Signed integer ( '+' not required)	-128 to 127
java.lang.Short	Signed integer ( '+' not required)	-32768 to 32767
java.lang.Integer	Signed integer ( '+' not required)	-2147483648 to 2147483647 (-2 <sup>31</sup> to (2 <sup>31</sup> -1))
java.lang.Long	Signed integer ( '+' not required)	-9223372036854775808 to 9223372036854775807 (-2 <sup>63</sup> to (2 <sup>63</sup> -1))
java.lang.Float	Signed decimal or exponential expression (IEEE754)	+/-3.40282347e+38f to +/-1.4e-45f and 0

Type	Input Format	Input Range
java.lang.Double	Signed decimal or exponential expression (IEEE754)	+1.79769313486231570e+308d to +4.9e-324d and 0
java.lang.Character	One character	Unicode '\u0000' to '\uffff'

---

### Specify [Sender]

#### Explanation

The [Sender] input field of the common tab in the JavaMail resource access definition is empty.

#### User Action

Specify [Sender].

---

### Specify [User Name].

#### Explanation

The [User Name] input field of the common tab in the JavaMail resource access definition is empty.

#### User Action

Specify [User Name].

---

### Specify [Mail server address].

#### Explanation

The [Mail server address] input field of the common tab in the JavaMail resource access definition is empty.

#### User Action

Specify [Mail server address].

---

### Definition %s has been successfully registered.

#### Variable Information

%s = Definition name

#### Explanation

"Definition name" has been registered successfully.

#### User Action

Click the [OK] button.

---

### The specified name of a definition has been already registered. Specify another name. %s

#### Variable Information

%s = Definition name

#### Explanation

The same name as one that is already registered, is specified in [New definition] or [Clone] when the definition name is specified.

#### User Action

Specify the name that is not registered.

---

### Some values are changed. Apply them and try again.

#### Explanation

The [Clone] instruction was issued without applying the change.

#### User Action

Perform the [Clone] operation after applying the change.

---

**Do you want to apply the changes before moving to another pane?  
To select another definition without applying the changes,  
click on [No, discard the changes].  
To apply the changes and select another definition,  
click on [Yes, apply the changes].**

#### Explanation

Another definition is selected without applying the change.

#### User Action

To move without applying the changes, click [No, discard the changes.]. To move after applying the changes, click [Yes, apply the changes.]. To return to the current window by canceling the selection, click [Cancel, go back.].

---

**Do you want to apply the changes before closing the procedure?  
To quit the procedure without applying the changes,  
click on [No, discard the changes].  
To apply the changes and quit the procedure,  
click on [Yes, apply the changes].**

#### Explanation

An instruction to quit the J2EE Resource Access Definition was instructed without applying the changes.

#### User Action

To quit without applying the changes, click [No, discard the changes.]. To quit after applying the changes, click [Yes, apply the changes.]. To return to the current window by canceling the quit operation, click [Cancel, go back.].

---

**Do you want to delete it/them really?**

#### Explanation

An instruction to delete the selected resource access definition was issued.

#### User Action

To delete, click [Yes]. To cancel the deletion, click [No].

---

**Do you want to close the window and close the procedure?**

#### Explanation

An instruction to quit J2EE Resource Access Definition was issued.

#### User Action

To quit, click [Yes]. To cancel the quit operation, click [No].

---

**Failed to make .bindings file.**

#### Explanation

An environment variable required for registering the .bindings file is incorrect.

#### User Action

Refer to the manual to verify the CLASSPATH environment variable or directory for creating the .bindings file.

---

**Wrong class name is specified. Check the class name.****Explanation**

The naming service [Class Name] is incorrect. Check the [Class Name].

**User Action**

Specify the correct [Class Name].

---

**Specify [Server URL] when JDBC driver is Oracle.****Explanation**

The naming service [Server URL] input field is blank.

**User Action**

Specify [Server URL].

---

**Specify [Sid].****Explanation**

The JDBC input aid [Sid] input field is blank.

**User Action**

Specify the JDBC input aid [Sid].

---

**J2EE Resource Access Definition has already started.****Explanation**

Processing cannot continue because the J2EE resource access definition is being executed.

**User Action**

When the J2EE resource access definition terminates, re-execute the command.

---

**Failed to start J2EE Resource Access Definition. Check the operating environment.****Explanation**

The J2EE resource access definition cannot be used because the setting of the environment variable CLASSPATH or PATH is invalid.

**User Action**

Check whether the setting of the environment variable CLASSPATH or PATH is valid.

# Chapter 26 Messages Output by the Servlet Service of Interstage Management Console

## 26.1 About Messages Output by the Servlet Service of Interstage Management Console

### Output Destination

Messages output by the servlet service of Interstage Management Console are output to the following locations:

- Command execution screen
- System log (event log on Windows(R) systems)
- Log files of the servlet service for the Interstage Management Console

The logs from the Servlet service of Interstage Management Console are saved to the following locations:

**Windows32/64**

C:\Interstage\F3FMjs2su\log

**Solaris32/64** **Linux32/64**

/var/opt/FJSVjs2su/log

The file of each log is shown below.

Log Type	Log File
Servlet service log	jswatch.log
Servlet gateway log	<p><b>Windows32/64</b></p> <p>gateway\jsgw_apapi.log</p> <p><b>Solaris32/64</b> <b>Linux32/64</b></p> <p>gateway/ jsgw_apapi.log</p>
Servlet container start log	opmanager.log
Standard output log and standard error output log of the container	opmanager-std.log
Servlet log	opmanager-servlet.log
Servlet container log	opmanager-container.log

The definition files of the Servlet service for Interstage Management Console are saved to the following locations:

**Windows32/64**

C:\Interstage\F3FMjs2su\conf

**Solaris32/64** **Linux32/64**

/etc/opt/FJSVjs2su

The file name of each definition file is shown below.

Definition File Type	Definition File Name
JServlet environment definition file	jswatch.conf

Definition File Type	Definition File Name
Servlet gateway environment definition file	jsgw_apapi.conf
Servlet container environment definition file	jscontainer.xml

## Message Output Format

Messages are output in the following formats:

```
package name: message type:message ID: message text
```

**Windows32/64**

F3FMjs2su is output as the package name.

**Solaris32/64** **Linux32/64**

FJSVjs2su is output as the package name.

In the following explanations, "Package name:" is omitted.

**Solaris32/64**

The messages are followed by the system name. The system name is output as "SYSTEM=system-name".

## 26.2 1100-1199

---

This section details messages numbered between 1100 and 1199.

### 26.2.1 ERROR: 1101

---

**ERROR: 1101: Cannot open file. (<filename>) errno=<errno>**

#### Explanation

The system could not open the file (<filename>). (Error number: <errno>)

#### Cause

The cause may be one of the following:

1. File does not exist.
2. The user does not have authority to access the file.
3. There is insufficient memory.

#### User Action

1. Check whether the file exists.
2. Check whether the user has authority to access the file.
3. Close any unnecessary applications, apart from the Servlet Service currently active.

Check that sufficient memory has been allocated. If the memory amount is insufficient, expand memory.

### 26.2.2 ERROR: 1102

---

**ERROR: 1102: Cannot close file. (<filename>) errno=<errno>**

#### Explanation

The system could not close the file (<filename>). (Error number: <errno>)

#### Cause

An I/O error occurred in the system.

#### User Action

Stop the Servlet Service and check the system.

### 26.2.3 ERROR: 1103

---

**ERROR: 1103: Servlet gateway environment definition file, Cannot resolve host name. ("`<hostname>`" of `<filename>`)**

#### Explanation

The environment configuration is incorrect.

#### User Action

Collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

### 26.2.4 ERROR: 1104

---

**ERROR: 1104: No such file or directory. (`<filename>`)**

#### Explanation

The environment configuration is incorrect.

#### User Action

Collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

### 26.2.5 ERROR: 1105

---

**ERROR: 1105: Not enough memory.**

#### Explanation

There is insufficient memory.

#### User Action

Close any unnecessary applications, apart from the Servlet Service currently active.

Check that sufficient memory has been allocated. If the memory amount is insufficient, expand memory.

### 26.2.6 ERROR: 1106

---

**ERROR: 1106: Unknown mount for request. "`<URL>`"**

#### Explanation

The ID specified in the Web browser URL (`<URL>`) was for an unknown Web application.

#### User Action

Check the URL Web application identifier specified by the Web browser.

### 26.2.7 ERROR: 1107

---

**ERROR: 1107: Cannot open socket.**

#### Explanation

The system could not create the socket.

## Cause

The reason may be one of the following:

1. The number of files that the system can open has been exceeded.
2. There is insufficient memory.

## User Action

Close any unnecessary applications, apart from the Servlet Service currently active.

If the memory amount is insufficient, expand memory.

---

## 26.2.8 ERROR: 1108

---

**ERROR: 1108: Cannot connect to container. (<hostname>:<port>)**

## Explanation

Could not connect to the Servlet Container.

## User Action

Collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

---

## 26.2.9 ERROR: 1109

---

**ERROR: 1109: Stopped connection before send body completed. HOST=<hostname> PORT=<port> URI=<uri>**

**ERROR: 1109 Stopped connection before send packet completed. HOST=<hostname> PORT=<port> URI=<uri>**

## Explanation

Data transmission to the Servlet Container(IP address=<hostname>,PORT=<port>) failed. It was not possible to send all data required to start the Web application(<uri>).

## Cause

The following causes can be assumed.

1. The Servlet Container cannot be started.
2. An invalid request was received from the Web browser.

## User Action

1. Check whether the Servlet Container has been started. If it has not been started, take the action specified in the message output to the Servlet Container log file.
2. Use the network trace and other data to check the request sent by the Web browser.

If the problem cannot be solved using the information in [Cause] and [User action], collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

---

## 26.2.10 ERROR: 1110

---

**ERROR: 1110: Stopped connection before received servlet header completed. HOST=<hostname> PORT=<port> URI=<uri>**

**ERROR: 1110 Stopped connection before received servlet message completed. HOST=<hostname> PORT=<port> URI=<uri>**

## Explanation

Data transmission from the Servlet Container failed. It was not possible to receive all the execution results from the Web application.

## Cause

1. The servlet container may not have been started.
2. A request from the Web browser failed on the Servlet Container. It was not possible to receive data.

## User Action

1. Check whether the Servlet Container has been started. If it has not been started, take the action specified in the message output to the Servlet Container log file.
2. Check URL of the HTML file that invokes the Servlet or JSP.

If the problem cannot be solved using the information in [Cause] and [User action], collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

---

## 26.2.11 ERROR: 1111

---

### ERROR: 1111: Send timed out. (<time> milliseconds)

#### Explanation

A timeout occurred in the servlet gateway, when sending data to the servlet container.

#### User Action

Collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

---

## 26.2.12 ERROR: 1112

---

### ERROR: 1112: Received timed out. (<time> milliseconds) HOST=<hostname> PORT=<port> URI=<uri>

#### Explanation

The Servlet Gateway encountered a timeout during reception of data from the Servlet Container (IP address: <hostname>, port number: <port>).

#### User Action

Collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

---

## 26.2.13 ERROR: 1113

---

### ERROR: 1113: Cannot scan servlet headers. HEADER="<header>" HOST=<hostname> PORT=<port> URI=<uri>

#### Explanation

The Web application (<uri>) has sent an incorrect HTTP header.

#### User Action

Collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

---

## 26.2.14 ERROR: 1115

---

### ERROR: 1115: An error returned. "<function>(<parameter>)" errno=<errno>

#### Explanation

An error occurred in the function when the Servlet Gateway runs as a Web server extended function. (Function in which the error occurred: <function>; value specified in argument: <parameter>; error number: <errno>)

#### User Action

Collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

---

### 26.2.15 ERROR: 1116

---

**ERROR: 1116: An error returned. "<function>" errno=<errno>**

#### Explanation

An error occurred in calling a system function. (Function in which the error occurred: <function>; error number: <errno>)

#### User Action

Check the network settings. Also check for any faults in the system.

---

### 26.2.16 ERROR: 1117

---

**ERROR: 1117: Unknown query string. "<parameter>"**

#### Explanation

The parameter (QUERY STRING: <parameter>) cannot be acquired by the Servlet Gateway

#### User Action

Collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

---

### 26.2.17 ERROR: 1118

---

**ERROR: 1118: Invalid query string. "<parameter>"**

#### Explanation

The parameter (QUERY STRING: <parameter>) acquired by the Servlet Gateway contains an error.

#### User Action

Collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

---

### 26.2.18 ERROR: 1119

---

**ERROR: 1119: Servlet gateway environment definition file, Syntax error on line <line> of <filename>**

#### Explanation

There is an error in the Servlet Gateway Environment Definition File.

#### User Action

Collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

---

### 26.2.19 ERROR: 1120

---

**ERROR: 1120: Registry does not exist. (key: <keyname>, value: <valuenam>).**

#### Explanation

A registry (<keyname>, <valuenam>) is in an invalid state.

#### Cause

The Servlet Gateway is not installed or it may have broken.

#### User Action

Re-install the Servlet service.

---

### 26.2.20 ERROR: 1121

---

**ERROR: 1121: Required item has not been specified. (file: <filename>).**

#### Explanation

The Servlet Gateway Environment Definition File is incorrect.

#### User Action

Collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

---

### 26.2.21 ERROR: 1122

---

**ERROR: 1122: Premature end of servlet headers. HOST=<hostname> PORT=<port> URI=<uri>**

#### Explanation

The Servlet Gateway failed to receive all data from the Servlet Container (IP address: <hostname>, port number: <port>, Web application: <uri>).

#### User Action

Collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

---

### 26.2.22 ERROR: 1123

---

**ERROR: 1123: Servlet gateway environment definition file, Mounted protocol cannot be found. ("**<protocol>**" of <filename>)**

#### Explanation

The Servlet Gateway Environment Definition File is incorrect.

#### User Action

Collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

---

### 26.2.23 ERROR: 1124

---

**ERROR: 1124: Servlet gateway environment definition file, Mounted host cannot resolve host name. ("**<hostname>**" of <filename>)**

#### Explanation

The Servlet Gateway Environment Definition File is incorrect.

#### User Action

Collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

---

### 26.2.24 ERROR: 1125

---

**ERROR: 1125: Cannot read file. (<filename>) errno=<errno>**

#### Explanation

Failed to read file (<filename>). (Error number:<errno>)

#### Cause

An I/O error has occurred in the system.

#### User Action

Stop the Servlet Service and check the system.

---

### 26.2.25 ERROR: 1126

---

**ERROR: 1126: Servlet gateway environment definition file, HTTP status code is illegal. ("`<code>`" of `<filename>`)**

#### Explanation

The Servlet Gateway Environment Definition File is incorrect.

#### User Action

Collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

---

### 26.2.26 ERROR: 1127

---

**ERROR: 1127: Servlet gateway environment definition file, Port number is illegal. ("`<port>`" of `<filename>`)**

#### Explanation

The Servlet Gateway Environment Definition File is incorrect.

#### User Action

Collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

---

### 26.2.27 ERROR: 1128

---

**ERROR: 1128: Servlet gateway environment definition file, Timeout is illegal. ("`<timeout>`" of `<filename>`)**

#### Explanation

The Servlet Gateway Environment Definition File is incorrect.

#### User Action

Collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

---

### 26.2.28 ERROR: 1129

---

**ERROR: 1129: Servlet gateway environment definition file, Mounted port number is illegal. ("`<port>`" of `<filename>`)**

#### Explanation

The Servlet Gateway Environment Definition File is incorrect.

#### User Action

Collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

---

### 26.2.29 ERROR: 1130

---

**ERROR: 1130: Servlet gateway environment definition file, No such file or directory. ("`<filename1>`" of `<filename2>`)**

#### Explanation

The Servlet Gateway Environment Definition File is incorrect.

#### User Action

Collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

---

### 26.2.30 ERROR: 1131

---

**ERROR: 1131: Servlet gateway environment definition file, The container identifier was not found on "Container" definition. ("`<ContainerID>`" of `<filename>`)**

#### Explanation

The Servlet Gateway Environment Definition File is incorrect.

#### User Action

Collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

---

### 26.2.31 ERROR: 1132

---

**ERROR: 1132: Servlet gateway environment definition file, Container identifier too long. ("`<ContainerID>`" of `<filename>`)**

#### Explanation

The Servlet Gateway Environment Definition File is incorrect.

#### User Action

Collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

---

### 26.2.32 ERROR: 1133

---

**ERROR: 1133: Servlet container sent a container identifier that this Servlet Gateway could not understand. ID=`<ContainerID>` URI=`<uri>`**

#### Explanation

A Servlet container corresponding to the Servlet Container identifier (`<ContainerID>`) sent from the Web browser was not found.

#### User Action

Collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

---

### 26.2.33 ERROR: 1134

---

**ERROR: 1134: Servlet container sent a container identifier is illegal. ID=`<ContainerID>` URI=`<uri>`**

#### Explanation

The Servlet Container identifier (`<ContainerID>`) sent from the Servlet Container is invalid. It is not possible to maintain the session with the Web browser and the Web application(`<uri>`).

#### User Action

Collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

---

### 26.2.34 ERROR: 1139

---

**ERROR: 1139: Unable to create file mapping. errno=`<errno>`**

## Explanation

Failed to secure shared memory. (Error number:<errno>)

## Cause

The cause may be one of the following:

- Memory is insufficient.

## User Action

Close all unnecessary applications, apart from the Servlet service. Determine whether sufficient memory has been allocated. If there is insufficient memory, increase it.

---

## 26.2.35 ERROR: 1140

---

### **ERROR: 1140: Unable to map into memory. errno=<errno>**

## Explanation

Failed to secure shared memory. (Error number:<errno>)

## Cause

The cause may be one of the following:

- Memory is insufficient.

## User Action

Close all unnecessary applications, apart from the Servlet service. Determine whether sufficient memory has been allocated. If there is insufficient memory, increase it.

---

## 26.2.36 ERROR: 1141

---

### **ERROR: 1141: Servlet gateway environment definition file, MaxConnection is illegal. ("<value>" of <filename>)**

## Explanation

The Servlet Gateway Environment Definition File is incorrect.

The maximum number of container connections (<value>) specified for MaxConnection of the Servlet Gateway Environment Definition file (<filename>) is incorrect.

## User Action

Collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

---

## 26.2.37 ERROR: 1142

---

### **ERROR: 1142: Servlet gateway environment definition file, IdleConnectionTimeout is illegal. ("<value>" of <filename>)**

## Explanation

The Servlet Gateway Environment Definition File is incorrect.

## User Action

Collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

---

## 26.2.38 ERROR: 1143

---

---

**ERROR: 1143: Servlet gateway environment definition file, IdleConnectionTimeout cannot be defined. (<filename>)**

Explanation

IdleConnectionTimeout cannot be specified. IdleConnectionTimeout must be specified in combination with MaxConnection.

User Action

Collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

---

### 26.2.39 ERROR: 1144

---

**ERROR: 1144: Servlet gateway environment definition file, Certificate is illegal. ("<value>" of <filename>)**

Explanation

The Servlet Gateway Environment Definition File is incorrect.

User Action

Collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

---

### 26.2.40 ERROR: 1147

---

**INFO: 1147: Response Message could not be received from the Servlet Container. FIELD=<field> HOST=<hostname> PORT=<port> URI=<uri>**

Explanation

The Servlet Container cannot receive the execution results of the Web application.

Cause

Possible causes are as follows:

1. The Web application does not respond. A timeout occurred.
2. The Servlet Container temporarily stopped because of an error in the Web application.
3. The Servlet service or Servlet Container stopped.

<field> is the field of the message that could not be received.

<hostname> is the IP address of the Servlet Container.

<port> is the port number of the Servlet Container.

<uri> is the URI to the Web application.

---

### 26.2.41 INFO: 1149

---

**INFO: 1149: Loading of the Servlet gateway environment definition file is started. pid=<pid> conf="<filename>"**

Explanation

Loading of the Servlet gateway environment definition file has started.

---

### 26.2.42 INFO: 1150

---

**INFO: 1150: The most recent Servlet gateway environment definition file have been loaded. pid=<pid> conf="<filename>"**

Explanation

The most recent Servlet gateway environment definition file was loaded.

## 26.2.43 ERROR: 1151

---

**ERROR: 1151: Servlet gateway environment definition file could not be loaded. pid=<pid> conf="<filename>"**

### Explanation

The most recent Servlet gateway environment definition file could not be loaded.

### User Action

If the problem cannot be resolved, collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

## 26.2.44 ERROR: 1152

---

**ERROR: 1152: Servlet gateway environment definition file, DefinitionRead is illegal. ("<value>" of <filename>)**

### Explanation

The Servlet Gateway Environment Definition File is incorrect.

### User Action

Collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

## 26.2.45 ERROR: 1154

---

**ERROR: 1154: When communicating with Servlet container watch, an error occurred. (information=<info>, function=<function>, errno=<errno>)**

### Explanation

The servlet gateway failed in the communication with the container monitor process (usage information: info, error function: function, error number: errno).

### User Action

Collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

## 26.2.46 ERROR: 1155

---

**ERROR: 1155: When sending the data to Servlet container watch, timeout occurred. (information=<info>, <time> milliseconds)**

### Explanation

A timeout occurred when data was sent from the servlet gateway to the container monitor process (usage information: info, timeout time: <time> ms).

### User Action

Collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

## 26.2.47 ERROR: 1156

---

**ERROR: 1156: Servlet gateway environment definition file, RetryFrequency is illegal. ("<frequency>" of <filename>)**

### Explanation

The Servlet Gateway Environment Definition File is incorrect.

## User Action

Collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

---

### 26.2.48 ERROR: 1157

---

**ERROR: 1157: Servlet gateway environment definition file, RetryInterval is illegal. ("`<interval>`" of `<filename>`)**

## Explanation

The Servlet Gateway Environment Definition File is incorrect.

## User Action

Collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

---

### 26.2.49 ERROR: 1167

---

**ERROR: 1167: Servlet gateway environment definition file, ConnectInterval is illegal. ("`<interval>`" of `<filename>`)**

## Explanation

The Servlet Gateway Environment Definition File is incorrect.

## User Action

Collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

---

## 26.3 1200-1299

---

This section details messages numbered between 1200 and 1299.

---

### 26.3.1 ERROR: 1205

---

**ERROR: 1205: ajp12: can not connect to host `<hostname>`:`<port>`. (errno=`<errno>`)**

## Explanation

Failed to connect to the Servlet Container. (Error number:`<errno>`)

## System Action

The connection to the container is interrupted, and the system returns to the Web server status code 500 (Internal Server Error).

## User Action

Verify the following:

1. Check whether the Servlet Container has already started.

This message is also output if access is made to the Servlet Container during a start sequence of the Servlet Container.

To prevent this event, it is recommended to start the Web server after the Servlet service is started.

2. The TCP/IP resource may be insufficient.

**Windows32/64** **Solaris32/64**

Tune the TCP/IP parameters. For the tuning procedure, refer to "Tuning TCP/IP Parameters" in "System Tuning" in the "Tuning Guide".

**Linux32/64**

Wait for a few moments, and then re-execute the command.

If the problem is not resolved, collect investigation data using the *iscollectinfo* command and contact Fujitsu technical support.

## 26.3.2 ERROR: 1210

---

**ERROR: 1210: ajp12: cannot scan servlet headers (<status>, errno=<errno>).**

### Explanation

The HTTP header cannot be received from the Servlet Container (error number:<errno>).

### Cause

The following lists possible causes:

1. Because the servlet container was stopped with the *jssvstop* command (servlet service stop), the connection with the servlet container was closed.
2. Communication with the Servlet Container failed due to high load.

### System Action

The connection to the container is interrupted, and the system returns to the Web server status code 500 (Internal Server Error).

### User Action

1. Start the stopped servlet container with the *jssvstart* command (servlet service start) or *jscontstart* command (servlet container start).
2. If this error message is output repeatedly, examine the system configuration (hardware/software) and build a system that can work reliably under high load. If necessary, consider the upgrade of CPU.

<status> in messages is internal information within the Servlet Gateway and can be ignored.

If the problem cannot be solved using the information in [Cause] and [User action], refer to "Collected data about the servlet" for details about how to collect necessary data and contact the technician.

## 26.3.3 ERROR: 1217

---

**ERROR: 1217: ajp12: connection fail.**

### Explanation

Connection from the Servlet Gateway to the Servlet Container failed.

### User Action

This message is output together with other messages. Follow the measures indicated in the other messages output together.

When using the load balancer function, this message is output for each Servlet Container that failed in connection for each request.

## 26.3.4 ERROR: 1219

---

**ERROR: 1219: ajp12: Cannot initiate the request.**

### Explanation

The data sent from the client could not be sent to the Servlet Container.

### Cause

Possible causes are as follows:

- Communication with the Servlet Container failed due to high load.

### User Action

If this error occurs frequently, check the system configuration (hardware and software) and ensure that it can handle the load. If necessary, consider upgrading the CPU.

If the problem cannot be resolved, use the `iscollectinfo` command to collect diagnostic information. Send the error information to a Systems Engineer.

## 26.3.5 ERROR: 1221

---

### **ERROR: 1221: ajp12: cannot send headers.**

#### Explanation

The data sent from the client could not be sent to the Servlet Container.

#### Cause

Possible causes are as follows:

- Communication with the Servlet Container failed due to high load.

#### User Action

If this error occurs frequently, check the system configuration (hardware and software) and ensure that it can handle the load. If necessary, consider upgrading the CPU.

If the problem cannot be resolved, use the `iscollectinfo` command to collect diagnostic information. Send the error information to a Systems Engineer.

## 26.3.6 ERROR: 1222

---

### **ERROR: 1222: ajp12: Cannot send end of headers marker.**

#### Explanation

The data sent from the client could not be sent to the Servlet Container.

#### Cause

Possible causes are as follows:

- Communication with the Servlet Container failed due to high load.

#### User Action

If this error occurs frequently, check the system configuration (hardware and software) and ensure that it can handle the load. If necessary, consider upgrading the CPU.

If the problem cannot be resolved, use the `iscollectinfo` command to collect diagnostic information. Send the error information to a Systems Engineer.

## 26.3.7 ERROR: 1244

---

### **ERROR: 1244: an error returned handling request via protocol "<protocol>".**

#### Explanation

Connection from the Servlet Gateway to the Servlet Container failed.

#### User Action

This message is output together with other messages. Follow the measures indicated in the other messages.

<protocol> in the message is "ajpv12" except the cases below.

If settings are made so that requests to the Web applications are assigned to multiple Servlet Containers, this message is output for each Servlet Container that failed to connect for each request. At this point, <protocol> in the message is "ajpv12." If no connection is made to Servlet Container, this message is output one more time and <protocol> in the message at this point is "balance."

## 26.3.8 ERROR: 1261

---

### **ERROR: 1261: host name "<hostname>" can't be resolved.**

#### Explanation

There is an error in the host name (<hostname>) of the Servlet Container.

#### User Action

Check if 'localhost' is registered in the operating system environment.

## 26.3.9 ERROR: 1270

---

### **ERROR: 1270: Cannot get registry. key:<keyname> val:<valuenam>.**

#### Explanation

Acquisition of a registry (<keyname>, <valuenam>) has failed.

#### Cause

The following causes can be assumed:

1. The length of the value of a registry or the value relevant to it is too long.
2. The Servlet gateway is not installed or it has broken.

#### User Action

1. Follow management of the message currently outputted simultaneously.
2. When other messages are not outputted simultaneously, re-install Servlet service.

## 26.3.10 ERROR: 1271

---

### **ERROR: 1271: Cannot open logfile "<filename>" (errno=<errno>).**

#### Explanation

The log file (<filename>) cannot be opened (error number:<errno>).

#### Cause

The following causes can be assumed.

1. The file does not exist.
2. No access rights to the file are granted.
3. A directory is specified.
4. There is insufficient memory space available.

#### User Action

1. Check whether the file exists.
2. Check whether the access right to the file is granted. Permission to read/write log files must be given to the effective user during operation of the Web server.
3. Specify an ordinary file.
4. Terminate any applications that are not required except the currently active Servlet Service. If the memory amount is insufficient, expand memory.

## 26.3.11 ERROR: 1273

---

---

**ERROR: 1273: <directive>: Cannot open log file "<pathname>". (errno=<errno> line <lineno> of <filename>)**

Explanation

The servlet gateway environment definition file is incorrect.

User Action

Use the *iscollectinfo* command to collect diagnostic information. Send the error information to a Systems Engineer.

---

### 26.3.12 ERROR: 1276

---

**ERROR: 1276: <directive>: argument(<argument>) not supported. (line <lineno> of <filename>)**

Explanation

The Servlet Gateway Environment Definition File is incorrect.

User Action

Collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

---

### 26.3.13 ERROR: 1279

---

**ERROR: 1279: <directive>: Invalid argument("&<argument>").(line <lineno> of <filename>)**

Explanation

The Servlet Gateway Environment Definition File is incorrect.

User Action

Collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

---

### 26.3.14 ERROR: 1280

---

**ERROR: 1280: <directive>: the <no> field (<field>) must be specified.(line <lineno> of <filename>)**

Explanation

The Servlet Gateway Environment Definition File is incorrect.

User Action

Collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

---

### 26.3.15 ERROR: 1282

---

**ERROR: 1282: <directive>: Path name ("<pathname>") is invalid.(line <lineno> of <filename>)**

Explanation

The Servlet Gateway Environment Definition File is incorrect.

User Action

Collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

---

### 26.3.16 ERROR: 1284

---

**ERROR: 1284: <directive>: Cannot get log file path.(line <lineno> of <filename>)**

Explanation

The Servlet Gateway Environment Definition File is incorrect.

#### User Action

Collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

---

### 26.3.17 ERROR: 1285

---

**ERROR: 1285: <directive>: "<webapp>" already mounted.(line <lineno> of <filename>)**

#### Explanation

The Servlet Gateway Environment Definition File is incorrect.

#### User Action

Collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

---

### 26.3.18 ERROR: 1286

---

**ERROR: 1286: Balancer <balance> is not defined. (mounted on <webapp>)**

#### Explanation

The Servlet Gateway Environment Definition File is incorrect.

#### User Action

Collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

---

### 26.3.19 ERROR: 1287

---

**ERROR: 1287: Host <containerID> is not defined.**

#### Explanation

The Servlet Gateway Environment Definition File is incorrect.

#### User Action

Collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

---

### 26.3.20 ERROR: 1289

---

**ERROR: 1289: <directive>: Cannot find protocol "<protocol>".(line <lineno> of <filename>)**

#### Explanation

The Servlet Gateway Environment Definition File is incorrect.

#### User Action

Collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

---

### 26.3.21 ERROR: 1290

---

**ERROR: 1290: Cannot get default log file path.**

#### Explanation

Possible causes are as follows:

1. Failed to get the registry.
2. There is insufficient memory.

#### User Action

1. If another message is output at the same time, take action according to this message.
2. Close all unnecessary applications except for the Servlet service that is currently running. If the amount of available memory is insufficient, increase it.

### 26.3.22 ERROR: 1292

---

#### **ERROR: 1292: ajpv12: server cannot flush buffer. (errno=<errno>)**

##### Explanation

Data sent from the client cannot be transmitted to the Servlet Container (error number:<errno>).

##### Cause

The following causes can be assumed:

- Communication with the Servlet Container failed due to high load.

##### User Action

If this message is output repeatedly, examine the system configuration (hardware/software) and build a system that can work reliably under high load. If necessary, consider the upgrade of CPU.

If the problem cannot be solved using the information in [Cause] and [User action], collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

### 26.3.23 ERROR: 1293

---

#### **ERROR: 1293: ajpv12: cannot send the request entity.**

##### Explanation

Transmission of a request entity to the Servlet Container failed.

##### User Action

Follow the measures indicated in the message output to the log file of the Servlet Container. If no message is output to the log file of the Servlet Container, refer to the log of the Web server and follow the indicated measures.

## 26.4 1300-1399

---

This section details messages numbered between 1300 and 1399.

### 26.4.1 ERROR: 1300

---

#### **ERROR: 1300: balance: <pid> internal servlet error in server <containerID>: <protocol>://<hostname>(<ipaddress>):<port>.**

##### Explanation

An error occurred during execution of the Web application on the Servlet Container of the Servlet Container identifier <containerID>.

##### User Action

Remove the cause of the error, referring to the Servlet Container log.

"<protocol>://<hostname>(<ipaddress>):<port>" indicates an item set in the Servlet Gateway Environment Definition File for the relevant Servlet Container. <pid> is internal information and can be ignored.

### 26.4.2 ERROR: 1301

---

---

**ERROR: 1301: balance: PID:<pid> HostID:<containerID> unsuccessfully.****Explanation**

The Servlet Gateway set to assign requests to the Web applications to multiple Servlet Containers failed to connect to the Servlet Container while maintaining a session.

**User Action**

This message is output together with other messages. Follow the measures indicated in the other messages output together. <pid> is internal information and can be ignored.

---

**26.4.3 ERROR: 1304**

---

**ERROR: 1304: balance: PID:<pid> unsuccessfully.****Explanation**

The Servlet Gateway that is set to assign requests to the Web applications to multiple Servlet Containers failed to connect to the Servlet Container.

**User Action**

This message is output together with other messages. Follow the measures indicated in the other messages.

This message is output for each Servlet Container that cannot be connected for each request.

<pid> is internal information and can be ignored.

---

**26.4.4 ERROR: 1305**

---

**ERROR: 1305: balance: host not found or not running.****Explanation**

The Servlet Gateway that is set to assign requests to the Web applications to multiple Servlet Containers failed to connect to any of the specified Servlet Containers.

**User Action**

This message is output together with other messages. Follow the measures indicated in the other messages.

---

**26.4.5 ERROR: 1310**

---

**ERROR: 1310: There is no response form Web application. (host=<hostname>,port=<port>, id=<id>, uri=<uri>)****Explanation**

Web application <uri> is not responding.

**User Action**

Collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

---

**26.5 2000-2099**

This section details messages numbered between 2000 and 2099.

---

**26.5.1 INFO: 2001**

---

**INFO: 2001: Servlet service is starting.**

## Explanation

The Servlet Service is starting.

### 26.5.2 INFO: 2002

---

#### INFO: 2002: Servlet service has been started.

## Explanation

The Servlet Service has started.

### 26.5.3 ERROR: 2003

---

#### ERROR: 2003: Servlet service failed in the start.

## Explanation

The Servlet Service failed to start.

## Cause

If this error occurred in F3FMjs2su or FJSVjs2su, the causes listed below can be considered.

1. An error occurs in the JDK/JRE path of the JServlet environment definition file used with the Interstage Management Console Servlet service.
2. The port number is in use which is used with the Servlet container of the Interstage Management Console Servlet service.

## System Action

The starting process for the Servlet Service stops.

## User Action

Terminate the operation of the Servlet service, and take action as instructed in the message output to the Servlet service log file (jswatch.log).

The Servlet service log file (jswatch.log) is stored in the following:

**Windows32/64**

C:\Interstage\F3FMjs2su\log (In case of Servlet Service for Interstage Management Console)

**Solaris32/64 Linux32/64**

/etc/opt/FJSVjs2su/log (In case of Servlet Service for Interstage Management Console)

### 26.5.4 INFO: 2004

---

#### INFO: 2004: Servlet service is already started.

## Explanation

The Servlet Service is already started.

### 26.5.5 INFO: 2006

---

#### INFO: 2006: <containername> has been started.

## Explanation

The Servlet Container (<containername>) has started.

### 26.5.6 INFO: 2007

---

---

**INFO: 2007: Servlet service is stopping.**

## Explanation

The Servlet Service is stopping.

---

**26.5.7 INFO: 2008**

---

**INFO: 2008: Servlet service has been stopped.**

## Explanation

The Servlet Service has stopped.

---

**26.5.8 ERROR: 2009**

---

**ERROR: 2009: Servlet service failed in the stop.**

## Explanation

The Servlet Service failed to stop.

## User Action

Stop the Servlet Service and take the measures indicated in the message output to the log file.

---

**26.5.9 ERROR: 2010**

---

**ERROR: 2010: Servlet service is not started.**

## Explanation

The Servlet Service is not started.

## User Action

Execute the *jssvstart* command to start the Servlet Service.

---

**26.5.10 INFO: 2012**

---

**INFO: 2012: <containername> has been stopped.**

## Explanation

The Servlet Container (<containername>) has stopped.

---

**26.5.11 ERROR: 2013**

---

**ERROR: 2013: Servlet service is not the condition that a requirement can be accepted.**

## Explanation

The Servlet Service cannot receive commands.

## User Action

Stop the Servlet Service and take the measures indicated in the message output to the log file.

---

**26.5.12 ERROR: 2014**

---

**ERROR: 2014: Other Servlet service commands are being started.**

## Explanation

Another operation command is being executed.

#### User Action

Execute the operation command after the other operation command has finished executing.

---

### 26.5.13 ERROR: 2015

---

#### **ERROR: 2015: Failed in the state display of the Servlet Container.**

#### Explanation

The Servlet Container status display failed.

#### User Action

Stop the Servlet Service and take the measures indicated in the message output to the log file.

---

### 26.5.14 ERROR: 2017

---

#### **ERROR: 2017: <containername> failed in the start.**

#### Explanation

The Servlet Container (<containername>) failed to start.

#### Cause

The cause may be one of the following:

1. The container standard output and standard error log file cannot be created, or the file could not be written.
2. Insufficient memory.

#### User Action

1. Verify that there is sufficient disk space available, and that the files ([containername].log and [containername].log.old) can be written.
2. Close any unnecessary applications, apart from the Servlet Service currently active. If the memory amount is insufficient, expand memory.

---

### 26.5.15 ERROR: 2018

---

#### **ERROR: 2018: <containername> failed in the stop.**

#### Explanation

The Servlet Container (<containername>) failed to stop.

#### User Action

Stop the Servlet Service and take the measures indicated in the message output to the log file.

---

### 26.5.16 INFO: 2020

---

#### **INFO: 2020: Servlet container is not started.**

#### Explanation

The Servlet Container is not started.

---

### 26.5.17 INFO: 2021

---

#### **INFO: 2021: Servlet container watcher process started. (jswatch2: <watcher-pid>)**

#### Explanation

Servlet container watcher process started.

---

### 26.5.18 INFO: 2022

---

#### **INFO: 2022: Servlet container watcher process stopped. (jswatch2: <watcher-pid>)**

#### Explanation

Servlet container watcher process stopped.

---

### 26.5.19 ERROR: 2024

---

#### **ERROR: 2024: Servlet container watcher process was failed in the start.**

#### Explanation

Servlet container watcher process failed during startup.

#### User Action

Follow the measures indicated in the message output to the log file.

---

### 26.5.20 ERROR: 2025

---

#### **ERROR: 2025: Servlet container watcher process was failed in the stop.**

#### Explanation

Servlet container watcher process failed when stopping.

#### User Action

Follow the measures indicated in the message output to the log file.

---

### 26.5.21 INFO: 2026

---

#### **INFO: 2026: Servlet service is a start processing inside.**

#### Explanation

The Servlet Service is starting.

---

### 26.5.22 INFO: 2027

---

#### **INFO: 2027: Servlet service is being terminated.**

#### Explanation

The Servlet Service is terminating.

---

### 26.5.23 ERROR: 2028

---

#### **ERROR: 2028: Permission denied.**

#### Explanation

The user does not have authority to execute.

#### User Action

Execute after obtaining administrator authority.

## 26.5.24 ERROR: 2054

---

### **ERROR: 2054: Servlet container start failed.**

#### Explanation

The Servlet Container cannot be started.

#### User Action

Follow the measures indicated in the message output to the log file.

## 26.5.25 ERROR: 2055

---

### **ERROR: 2055: Servlet container stop failed.**

#### Explanation

The Servlet Container cannot stop.

#### User Action

Follow the measures indicated in the message output to the log file.

## 26.5.26 ERROR: 2056

---

### **ERROR: 2056: <containername> is not found.**

#### Explanation

The Servlet Container with the specified name (<containername>) cannot be found.

## 26.5.27 INFO: 2057

---

### **INFO: 2057: <containername> is already started.**

#### Explanation

The Servlet Container (<containername>) is already started.

## 26.5.28 INFO: 2058

---

### **INFO: 2058: <containername> is already stopped.**

#### Explanation

Stop operation was performed for the Servlet Container (<containername>) that was already stopped.

#### User Action

The *jscontdisp* command can be used to check the status of the Servlet Container.

## 26.5.29 ERROR: 2061

---

### **ERROR: 2061: Parameter error.**

#### Explanation

There is an error in the command parameter.

## 26.5.30 ERROR: 2064

---

### **ERROR: 2064: Required component is not installed. Error Information=<information> errno=<errno>**

#### Cause

The versions of Interstage configuration programs are different. (Error number: <errno>).

#### Cause

For information on the cause, check the error information (<information>).

#### User Action

Unify the versions of the Interstage configuration programs.

---

### 26.5.31 ERROR: 2065

---

**ERROR: 2065: An error occurred in the API library function. Error function=<function> code=<no>**

#### Explanation

An error occurred in the API library function (Error function: <function>, Error code: <no>).

#### User Action

Collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

---

### 26.5.32 ERROR: 2066

---

**ERROR: 2066: A path isn't permitted. Path=<filename>**

#### Explanation

No access permission to directory or file <filename> is granted.

#### User Action

Check the access permission.

---

### 26.5.33 ERROR: 2071

---

**ERROR: 2071: The file mode is different. Path=<filename>**

#### Explanation

Directory or file <filename> has a different attribute.

#### User Action

Delete the directory or file and execute the command again.

---

### 26.5.34 ERROR: 2072

---

**ERROR: 2072: It is lack of the disk capacity. Path=<filename>**

#### Explanation

Disk space is insufficient.

#### User Action

Add disk capacity or delete unnecessary files.

After checking for available disk space, execute the command again.

---

### 26.5.35 ERROR: 2073

---

**ERROR: 2073: An I/O error occurred. Path=<filename>**

## Explanation

An I/O error occurred while directory or file <filename> is accessed.

## User Action

Check the concerned directory or file.

## 26.5.36 ERROR: 2074

---

### **ERROR: 2074: Servlet service is active.**

## Explanation

The Servlet Service is active.

## User Action

After stopping the Servlet Service, re-execute the command.

## 26.6 2100-2199

---

This section details messages numbered between 2100 and 2199.

### 26.6.1 ERROR: 2102

---

#### **ERROR: 2102: It failed in the start of the Servlet service. code=<no>**

## Explanation

The Servlet Service failed to start. (Error number=<no>)

## User Action

Take the measures indicated in the message output to the log file.

### 26.6.2 ERROR: 2103

---

#### **ERROR: 2103: It failed in the stop of the Servlet service. code=<no>**

## Explanation

The Servlet Service failed to stop. (Error number=<no>)

## User Action

Take the measures indicated in the message output to the log file.

### 26.6.3 ERROR: 2104

---

#### **ERROR: 2104: It failed in the acquisition of the installation pass name of the Servlet service. code=<no1>, <no2>**

## Explanation

Acquisition of the installation pass name of the Servlet service failed.(error number:<no1>, row number of program:<no2>)

## User Action

Re-install.

### 26.6.4 ERROR: 2106

---

---

**ERROR: 2106: Servlet service is not the condition that a requirement can be accepted. code=<value>****Explanation**

The Servlet Service cannot receive requests. (Servlet Service status ID:<value>)

Servlet Service status IDs are as follows:

2: Start processing in progress

3: Stop processing in progress

5: Restart processing in progress

6: Temporary stop processing in progress

7: Temporarily stopped

-1: Servlet Service internal error

**User Action**

Wait a short period and then repeat processing. If this message appears frequently, collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

---

**26.6.5 ERROR: 2107**

---

**ERROR: 2107: A Servlet service isn't found. service name=<filename>, code=<no>****Explanation**

The Servlet Service <filename> cannot be found. Detail code=<no>

**User Action**

Reinstall.

---

**26.6.6 ERROR: 2108**

---

**ERROR: 2108: There is a wrong point in the receiving data from the Servlet service. (<value1> <value2> <value3>)****Explanation**

Abnormality in the data received from the Servlet Service. (Receive data1:<value1>, Receive data2:<value2> Receive data3:<value3>)

**User Action**

Stop the Servlet Service and check the system.

---

**26.6.7 ERROR: 2110**

---

**ERROR: 2110: Not enough memory. code=<no1>, <no2>****Explanation**

Insufficient memory. (Error number:<no1>, Program line number (for maintenance): <no2>)

**User Action**

Close any unnecessary applications, apart from the Servlet Service currently active.

If the memory amount is insufficient, expand memory.

---

**26.6.8 ERROR: 2111**

---

**ERROR: 2111: There is no answer from the Servlet service. code=<value>**

## Explanation

No response from the Servlet Service. Error ID:<value>)

The Error ID is the following value:

**Windows32/64**

-10: Timeout

**Solaris32/64 Linux32/64**

0: Servlet Service response timeout

Other data: System error number

## User Action

**Windows32/64**

Stop the servlet service operation and check the system.

**Solaris32/64 Linux32/64**

Take the following actions:

- **When the error number is 0**

There is a possibility that the connection establishment with the servlet container failed due to heavy load.

Stop the servlet service operation and check the system state.

- When using the *jssvstop* command, if the message shown below is output to the container monitoring process log file (*jswatch.log*) immediately before this message.

The Servlet Container stop process is executed. Therefore, it is unnecessary to re-input the *jssvstop* command.

Use the *jscontdisp* command to check the Servlet Container status.

[11/10/2000 13:01:15:022] INFO: 2007: Servlet service is stopping.

Otherwise,

[11/10/2000 13:01:15:022] INFO: 2007: Servlet service is stopping.

[11/10/2000 13:01:16:140] INFO: 2012: <container-name> has been stopped.

If a message other than the above is output, take the action corresponding to the message.

If the error number is not 0, or if the problem cannot be solved using the information in [Cause] and [User action], collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

## 26.6.9 ERROR: 2112

---

**ERROR: 2112: It failed in the acquisition of exclusionism other resources. code=<no1>, <no2>**

### Explanation

Failure to acquire exclusive resources. (Error number:<no1>, Program line number (for maintenance):<no2>)

### User Action

Stop the Servlet Service and check the system.

Alternatively, reinstall the Servlet Service.

## 26.6.10 ERROR: 2113

---

**ERROR: 2113: It failed in the resources acquisition of the communication environment. code=<no1>, <no2>**

## Explanation

Failure to acquire communication environment resources. (Error number:<no1>, Program line number (for maintenance):<no2>)

## User Action

Stop the Servlet Service and check the system.

---

## 26.6.11 ERROR: 2114

---

**ERROR: 2114: It failed in the initialization of the communication environment. code=<no1>, <no2>**

## Explanation

Failure to initialize the communication environment. (Error number:<no1>, Program line number (for maintenance):<no2>)

## User Action

Stop the Servlet Service and check the system.

---

## 26.6.12 ERROR: 2115

---

**ERROR: 2115: It failed in the data reception from the Servlet service. code=<no>**

## Explanation

Failure to receive data from the Servlet Service. (Error number=<no>)

## User Action

Stop the Servlet Service and check the system.

---

## 26.6.13 ERROR: 2116

---

**ERROR: 2116: It failed in the data transmission to the Servlet service. code=<no>**

## Explanation

Failure to transmit data to the Servlet Service. (Error number=<no>)

## User Action

Stop the Servlet Service and check the system.

---

## 26.6.14 ERROR: 2117

---

**ERROR: 2117: Cannot open file. (<filename>) code=<no>**

## Explanation

Failure to open file (<filename>). (Error number=<no>)

## Cause

The cause may be one of the following:

1. The file does not exist.
2. The user does not have access rights to the file.
3. Insufficient memory.

## User Action

1. Verify that the file exists.
2. Verify access rights to the file.

3. Close any unnecessary applications, apart from the Servlet Service currently active. If there is insufficient memory, increase memory.

---

## 26.7 2200-2299

---

This section details messages numbered between 2200 and 2299.

---

### 26.7.1 INFO: 2207

---

**INFO: 2207: Servlet container (<containername>) was started again. <number> times**

#### Explanation

The Servlet Container (<containername>) was restarted. (<number> times).

---

### 26.7.2 INFO: 2208

---

**INFO: 2208: Servlet container (<containername>) died too many times; re-start is stopped.**

#### Explanation

The Servlet Container (<containername>) restart was stopped. Verify that there are no errors in the Servlet Container environment definitions.

#### User Action

Collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

---

### 26.7.3 ERROR: 2209

---

**ERROR: 2209: Servlet container (<containername>) was failed in the start again.**

#### Explanation

The Servlet Container (<containername>) failed to restart.

#### Cause

The cause may be one of the following:

1. The container standard output and standard error log file cannot be created, or the file could not be written.
2. Insufficient memory.

#### User Action

1. Verify that there is sufficient disk space available, and that the files ([containername].log and [containername].log.old) can be written.
2. Close any unnecessary applications, apart from the Servlet Service currently active. If the memory amount is insufficient, expand memory.

---

### 26.7.4 INFO: 2210

---

**INFO: 2210: Servlet container (<containername>) died. pid=<pid>**

#### Explanation

The Servlet Container (<containername>,<pid>) terminated. The Servlet Container is restarted.

#### System Action

Restarts the Servlet Container.

## Cause

The cause of the termination is indicated in the message output immediately before this message.

If no relevant message is output immediately before this message, possible causes are as follows:

1. The Servlet Container process was terminated forcibly from the outside (such as using the *kill* command).
2. An *OutOfMemoryError* may have occurred.

## User Action

Take action as instructed in the message immediately before this message.

If no relevant message is output immediately before this message, do as follows:

1. To stop the Servlet Container, use the Servlet service stop command (*jssvstop*).
2. Follow the action to be taken for *OutOfMemoryError* provided in "Exceptions or Errors Caused by the Servlet Container."

If the problem cannot be solved using the information in [Cause] and [User action], collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

## 26.7.5 INFO: 2211

---

### INFO: 2211: Servlet container (<containername>) exited.

#### Explanation

The Servlet Container (<containername>) is terminated forcibly.

#### System Action

The Servlet Container is terminated forcibly.

#### Cause

There is a possibility that the Web application has not returned from its termination process (destroy).

For the following cases, the forcible stop of the servlet container is performed by the monitor process:

- Connection establishment to the servlet container failed three times. In this case, it is assumed that the servlet container cannot accept the stop request, and it was forcibly stopped immediately.
- When the connection establishment succeeds before it fails three times, the termination of the servlet container is expected.

If the servlet container does not terminate within 10 minutes, it is forcibly stopped.

If the container was terminated with SIGKILL in this 10-minute waiting period, the monitor process considers that the container terminated normally ("INFO: 2211" is not output).

#### User Action

Collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

## 26.7.6 ERROR: 2216

---

### ERROR: 2216: An error occurred. (function=<func>, place=<place>, information=<info>, retcode=<retcode>, errno=<errno>)

#### Explanation

An error occurred during a system function call. (Name of function producing error:<func> Place where error occurred:<place> Information:<info> Return code:<retcode> Error number:<errno>)

#### User Action

Restart the system. If the problem cannot be solved, collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

## 26.7.7 ERROR: 2220

---

### ERROR: 2220: Not enough memory. (errno=<errno>)

#### Explanation

Insufficient memory. (Error number:<errno>)

#### User Action

Close any unnecessary applications, apart from the Servlet Service currently active. If the memory amount is insufficient, expand memory.

## 26.7.8 ERROR: 2224

---

### ERROR: 2224: JServlet environment definition file is an error.

#### Explanation

There is an error in the JServlet Environment Definition File.

#### User Action

Collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

## 26.7.9 ERROR: 2225

---

### ERROR: 2225: Servlet service command is an unjust requirement. (<value1>, <value2>)

#### Explanation

Invalid data was received from an operation command. (Receive data1:<value1>, Receive data2:<value2>)

#### User Action

Collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

## 26.7.10 ERROR: 2226

---

### ERROR: 2226: Internal error. (<func>)

#### Explanation

Internal error occurred in a function (<func>).

#### User Action

Collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

## 26.7.11 ERROR: 2228

---

### ERROR: 2228: Registry error.

#### Explanation

A registry error occurred. Installation was failed.

#### User Action

Re-install.

## 26.7.12 ERROR: 2230

---

### ERROR: 2230: Cannot resolve host name. (<hostname>)

## Explanation

There is an error in the name of the host (<hostname>) of the Servlet Container. A termination notice cannot be sent to the Servlet Container. The Servlet Container is terminated forcibly if it does not stop after three termination notices are sent to it in succession.

## User Action

Collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

---

## 26.7.13 ERROR: 2231

### ERROR: 2231: Cannot open socket.

## Explanation

Failed to create socket. A termination notice cannot be sent to the Servlet Container. The Servlet Container is terminated forcibly if it does not stop after three termination notices are sent to it in succession.

## Cause

The cause may be one of the following:

1. The number of files that the system can open has been exceeded.
2. Insufficient memory.

## User Action

Close any unnecessary applications, apart from the Servlet Service currently active. If the memory amount is insufficient, expand memory.

---

## 26.7.14 ERROR: 2232

### ERROR: 2232: Cannot connect to container. (<hostname>:<port>)

## Explanation

The connection to the servlet container (host name: <hostname>, port number: <port>) failed. A termination notice cannot be sent to the Servlet Container.

## Cause

The following causes are suspected:

- The servlet container was not started with the values set in [containername].ipaddress and [containername].port of the JServlet environment definition file.
- The Servlet Service is stopped when the Servlet Container is started.

## System Action

When sending the termination notification to the servlet container fails three times in a row, the servlet container is terminated forcibly.

## User Action

Eliminate the cause of the error by referring to the Servlet Service messages and the Servlet Container messages.

If the Servlet Service stops when the Servlet Container is started or restarted, the servlet will not have been properly started, and stopping it may fail. In this case, disregard the message.

If the problem cannot be solved using the information in [Cause] and [User action], collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

---

## 26.7.15 INFO: 2233

### INFO: 2233: Send timed out. (<time> milliseconds)

## Explanation

A timeout occurred during a data transmission to the Servlet Container. A termination notice cannot be sent to the Servlet Container. The system may be overloaded. The Servlet Container is terminated forcibly if it does not stop after three termination notices are sent to it in succession.

### 26.7.16 INFO: 2234

---

#### INFO: 2234: Stopped connection before send shutdown signal completed.

## Explanation

Data transmission to the Servlet Container failed. A termination notice cannot be sent to the Servlet Container. The Servlet Container is terminated forcibly if it does not stop after three termination notices are sent to it in succession.

### 26.7.17 INFO: 2238

---

#### INFO: 2238: Watcher process sent the full thread dump demand to Servlet container by the request from gateway or stop function. (container: <containername> pid: < process-id >)

## Explanation

Watcher process sent the full thread dump demand to Servlet container by the request from gateway or stop function. (container: <containername> pid: < process-id >).

This message is output, when a timeout is detected by the servlet gateway, or when forcible stop processing of a servlet container is performed.

## User Action

Collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

### 26.7.18 ERROR: 2239

---

#### ERROR: 2239: When receiving the data from Servlet gateway, timeout occurred.<time>milliseconds)

## Explanation

A timeout occurred in the container monitor process when data was received from the servlet gateway (timeout time: <time> ms).

## System Action

The connection to the container monitor process is discontinued and the automatic collection of full thread dump is not performed.

## User Action

Collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

### 26.7.19 ERROR: 2240

---

#### ERROR: 2240: When communicating with Servlet gateway, an error occurred.(function=<function>, errno=<no>)

## Explanation

The container monitor process failed in the communication with the servlet gateway (error function: <function>, error number: errno).

## System Action

The connection to the container monitor process is discontinued and the automatic collection of full thread dump is not performed.

## User Action

Collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

## 26.8 2500-2599

---

This section details messages numbered between 2500 and 2599.

### 26.8.1 ERROR: 2500

---

#### **ERROR: 2500: Path name is too long. ( path: <filename> )**

##### Explanation

Pathname (<filename>) too long.

##### User Action

Change the pathname.

### 26.8.2 ERROR: 2501

---

#### **ERROR: 2501: Failed to open the file. ( path: <filename>, code: <errno> )**

##### Explanation

Failed to open the file (<filename>). (error number: <errno>)

##### Cause

The following causes can be assumed:

1. The file does not exist.
2. The access right to the file is not granted.
3. Insufficient memory.

##### User Action

1. Check whether the file exists.
2. Check whether the access right to the file is granted.
3. Close active applications that are not needed except for the servlet service.

### 26.8.3 ERROR: 2502

---

#### **ERROR: 2502: No such file or directory. ( path: <filename> )**

##### Explanation

The file (<filename>) or directory does not exist.

##### User Action

Check whether the file or directory exists.

### 26.8.4 ERROR: 2503

---

#### **ERROR: 2503: Not enough disk space.**

##### Explanation

Insufficient free space in the disk.

##### User Action

Delete unnecessary files or reserve sufficient free space.

## 26.8.5 ERROR: 2504

---

**ERROR: 2504: Failed to read the file. ( path: <filename>, code: <errno> )**

### Explanation

Failed to read the file (<filename>). (error number: <errno>)

### Cause

An I/O error occurred in the system.

### User Action

Check for any system failure.

## 26.8.6 ERROR: 2505

---

**ERROR: 2505: Failed to write the file. ( path: <filename>, code: <errno> )**

### Explanation

Failed to write to the file (<filename>). (error number: <errno>)

### Cause

An I/O error occurred in the system.

### User Action

Check for any system failure.

## 26.8.7 ERROR: 2506

---

**ERROR: 2506: Registry is strange. ( key: <key>, code: <errno> )**

### Explanation

Incorrect registry key (key: <key>) (error number: <errno>)

### Cause

Interstage might not have been installed or the registry may be damaged.

### User Action

Reinstall Interstage.

## 26.8.8 ERROR: 2507

---

**ERROR: 2507: Environment variable is not found. (JAVA\_HOME)**

### Explanation

The environmental variable (JAVA\_HOME) is not set.

### User Action

Check the following points:

1. Check whether the environmental variable (JAVA\_HOME) is set.
2. Check whether the JDK or JRE set in the environment variable (JAVA\_HOME) is installed.

## 26.8.9 ERROR: 2508

---

---

**ERROR: 2508: Environment variable is not found. (WINDIR)****Explanation**

The environmental variable (WINDIR) is not set.

**User Action**

Check the following points:

1. Check whether the environmental variable (WINDIR) is set.
2. Check whether the operating system is installed correctly.

---

**26.8.10 ERROR: 2509**

---

**ERROR: 2509: The operating environment of INTERSTAGE Java Server Package is invalid. (path: <filename>)****Explanation**

The operating environment of Java is invalid.

**Cause**

The following causes can be assumed:

1. Incorrect installation directory (<filename>) or environment variable JAVA\_HOME of JDK.
2. Incorrect JDK version
3. Insufficient memory

**User Action**

1. Check whether the JDK or JRE set in the environment variable (JAVA\_HOME) is installed.
2. Make sure that the installation directory (<filename>) or environment variable JAVA\_HOME of JDK is correct.
3. Close active applications that are not needed except for the servlet service.

---

**26.8.11 ERROR: 2510**

---

**ERROR: 2510: Parameter is illegal. ( parameter: <parameter>, value: <value> )****Explanation**

Incorrect parameter (parameter name: <parameter>, value: <value>)

**User Action**

Specify the parameter correctly.

---

**26.8.12 ERROR: 2511**

---

**ERROR: 2511: Not enough memory.****Explanation**

Insufficient memory

**User Action**

Close active applications that are not needed except for the servlet service.

---

**26.8.13 ERROR: 2512**

---

**ERROR: 2512: Failed to make the directory. (path: <filename>, code: <errno>)****Explanation**

Failed to make the directory. (error number: <errno>)

**Cause**

An I/O error occurred in the system.

**User Action**

Check for any system failure.

---

**26.8.14 ERROR: 2513**

---

**ERROR: 2513: Failed to find the file. (path: <filename>, code: <errno>)****Explanation**

Failed to find the file. (error number: <errno>)

**Cause**

An I/O error occurred in the system.

**User Action**

Check for any system failure.

---

**26.8.15 ERROR: 2514**

---

**ERROR: 2514: Failed to remove the file or directory. (path: <filename>, code: <errno>)****Explanation**

Failed to remove the file or directory.

**Cause**

The following causes can be assumed (error number: <errno>):

1. An I/O error occurred in the system.
2. The user does not have access rights to the file (<filename>) or directory.
3. File (<filename>) or directory is currently being used by another application.

**User Action**

1. Check for any system failure.
2. Obtain the access right to the file (<filename>) or directory, or let a user who has the access right perform the operation.
3. Close the other application that is using the file (<filename>) or directory.

---

**26.9 2900-2999**

This section details messages numbered between 2900 and 2999.

---

**26.9.1 ERROR: 2902**

---

**ERROR: 2902: JServlet environment definition file is not found. (filename=<filename>)****Explanation**

There is no JServlet Environment Definition File. (File name:<filename>)

#### User Action

Verify that file <filename> exists.

### 26.9.2 ERROR: 2903

---

**ERROR: 2903: JServlet environment definition file is open failed. (filename=<filename>, errno=<errno>)**

#### Explanation

Failed to open JServlet Environment Definition File. (File name:<filename> Error number:<errno>)

#### User Action

Verify that file <filename> can be read.

### 26.9.3 ERROR: 2904

---

**ERROR: 2904: There is a mistake in the JServlet environment definition file. (filename=<filename>, <number> line(s))**

#### Explanation

The Servlet Gateway Environment Definition File is incorrect.

#### User Action

Collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

### 26.9.4 ERROR: 2905

---

**ERROR: 2905: There is a mistake in the value of the JServlet environment definition file. (filename=<filename>, <number> line(s))**

#### Explanation

The Servlet Gateway Environment Definition File is incorrect.

#### User Action

Collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

### 26.9.5 ERROR: 2906

---

**ERROR: 2906: JServlet environment definition file (<filename>), There is too much number of the definition of the container.**

#### Explanation

The Servlet Gateway Environment Definition File is incorrect.

#### User Action

Collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

### 26.9.6 ERROR: 2907

---

**ERROR: 2907: JServlet environment definition file (<filename>), The container name (<containername>), <name> no definition.**

#### Explanation

The Servlet Gateway Environment Definition File is incorrect.

#### User Action

Collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

---

### 26.9.7 ERROR: 2908

---

**ERROR: 2908: JServlet environment definition file (<filename>), The container name (<containername>), length of the name is too long. (<number> line(s))**

#### Explanation

The Servlet Gateway Environment Definition File is incorrect.

#### User Action

Collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

---

### 26.9.8 ERROR: 2909

---

**ERROR: 2909: JServlet environment definition file (<filename>), The container name (<containername>), too much number of parameter. (<number> line(s))**

#### Explanation

The Servlet Gateway Environment Definition File is incorrect.

#### User Action

Collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

---

### 26.9.9 ERROR: 2910

---

**ERROR: 2910: JServlet environment definition file (<filename>), The container name (<containername>), too much number of environment variable.**

#### Explanation

The Servlet Gateway Environment Definition File is incorrect.

#### User Action

Collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

---

### 26.9.10 ERROR: 2911

---

**ERROR: 2911: JServlet environment definition file (<filename>), The container name (<containername>), length of the number of environment variable.**

#### Explanation

The Servlet Gateway Environment Definition File is incorrect.

#### User Action

Collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

---

### 26.9.11 ERROR: 2914

---

**ERROR: 2914: JServlet environment definition file (<filename>), The container name (<containername>), the pass that it was defined doesn't exist. (<number> line(s))**

#### Explanation

The Servlet Gateway Environment Definition File is incorrect.

#### User Action

Collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

---

### 26.9.12 ERROR: 2915

---

**ERROR: 2915: JServlet environment definition file (<filename>), The container name (<containername>), length of the pass is too long. (<number> line(s))**

#### Explanation

The Servlet Gateway Environment Definition File is incorrect.

#### User Action

Collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

---

### 26.9.13 ERROR: 2916

---

**ERROR: 2916: JServlet environment definition file (<filename>), A container name can't be specified. (<number> line(s))**

#### Explanation

The Servlet Gateway Environment Definition File is incorrect.

#### User Action

Collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

---

### 26.9.14 ERROR: 2917

---

**ERROR: 2917: JServlet environment definition file (<filename>), The container name (<containername>), a specified port number overlaps. (<number> line(s))**

#### Explanation

The Servlet Gateway Environment Definition File is incorrect.

#### User Action

Collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

---

### 26.9.15 ERROR: 2918

---

**ERROR: 2918: JServlet environment definition file (<filename>), There is no definition of the container.**

#### Explanation

The Servlet Gateway Environment Definition File is incorrect.

#### User Action

Collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

---

### 26.9.16 ERROR: 2919

---

**ERROR: 2919: JServlet environment definition file (<filename>), uid (<uid>) doesn't exist.**

#### Explanation

The Servlet Gateway Environment Definition File is incorrect.

#### User Action

Collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

---

### 26.9.17 ERROR: 2920

---

**ERROR: 2920: JServlet environment definition file (<filename>), gid (<gid>) doesn't exist.**

#### Explanation

The Servlet Gateway Environment Definition File is incorrect.

#### User Action

Collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

---

### 26.9.18 ERROR: 2921

---

**ERROR: 2921: JServlet environment definition file (<filename>), The group id of uid and gid doesn't correspond.**

#### Explanation

The Servlet Gateway Environment Definition File is incorrect.

#### User Action

Collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

---

### 26.9.19 ERROR: 2925

---

**ERROR: 2925: The specification method of full thread dump function is logically mistaken. (filename=<filename>, <number1>, <number2> line(s))**

#### Explanation

The Servlet Gateway Environment Definition File is incorrect.

#### User Action

Collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

---

## 26.10 5000-5199

---

This section details messages numbered between 5000 and 5199.

---

### 26.10.1 ERROR: 5101

---

**ERROR: 5101: An extended system name is illegal. SYSTEM=<system>**

#### Explanation

There is an error in the system name specified in the environment variable ("IS\_SYSTEM") or command parameter. If a system name is specified both in the environment variable ("IS\_SYSTEM") and command parameter, the latter system name is valid.

#### Cause

1. A non-alphanumeric character is specified in the system name.
2. The system name starts with a numeric character.
3. One of the following reserved words is specified in the system name.

td001

ec001

## User Action

- For Interstage Application Server Enterprise Edition:

1. Specify a system name using only alphanumeric characters.
2. Specify a system name that starts with an alphabetic character.
3. Change the system name.

- For other Products:

An extended system can be used on Interstage Application Server Enterprise Edition.

Standard-J Edition: Specify "default" for the system name or do not specify the system name for the environmental variable ("IS\_SYSTEM") and the argument of the command.

## 26.10.2 ERROR: 5102

---

### **ERROR: 5102: An extended system name is too long.**

#### Explanation

Too long system name was specified in the environment variable ("IS\_SYSTEM") or command parameter. If a system name is specified both in the environment variable ("IS\_SYSTEM") and command parameter, the latter system name is valid.

#### User Action

- For Interstage Application Server Enterprise Edition:

Specify a system name using up to eight characters.

- For other Products:

An extended system can be used on Interstage Application Server Enterprise Edition.

Standard-J Edition: Specify "default" for the system name or do not specify the system name for the environmental variable ("IS\_SYSTEM") and the argument of the command.

## 26.10.3 ERROR: 5103

---

### **ERROR: 5103: An extended system returned an error. SYSTEM=<system>**

#### Explanation

An extended system returned an error.

#### Cause

Probable causes are shown below.

1. A system error has occurred in the extended system.
2. No permission is granted.
3. The required package is not installed. If "is20159" is output to the system log, the FJSVisas package (Interstage management function) is not installed.
4. The versions of the Interstage configuration programs are not unified.

#### User Action

Take the following action.

1. Follow the message output to the system log.
2. Execute as a superuser.

3. Check whether the required package is installed. If "is20159" is output to the system log, install the FJSVisas package.
4. Unify the versions of the Interstage configuration programs.

## 26.10.4 ERROR: 5104

---

### **ERROR: 5104: An extended system doesn't exist. SYSTEM=<system>**

#### Explanation

A non-existent system was specified in the environment variable ("IS\_SYSTEM") or command parameter. If a system name is specified both in the environment variable ("IS\_SYSTEM") and command parameter, the latter system name is valid.

#### User Action

- For Interstage Application Server Enterprise Edition:

1. Check that the system name is correct. Characters specified in a system name are case-sensitive.
2. Check that the system exists.
3. Check whether the required package is installed.
4. Unify the versions of the Interstage configuration programs.

- For other Products:

An extended system can be used on Interstage Application Server Enterprise Edition.

Standard-J Edition: Specify "default" for the system name or do not specify the system name for the environmental variable ("IS\_SYSTEM") and the argument of the command.

# Chapter 27 Messages Output by Portable-ORB

This chapter describes the messages output by Portable-ORB.

## 27.1 The Messages Output by the *porbeditenv* Command

Messages output by the *porbeditenv* command are shown below.

---

### File write succeed

#### Explanation

Indicates that input to the active environment file was performed normally.

---

### Directory does not exist

#### Explanation

The directory does not exist.

#### User Action

Check whether the directory for the file exists.

---

### Permission denied

#### Explanation

There is no authority for directory.

Or, there is no write authority to the config, initial\_hosts file in the directory.

#### User Action

Check for access authority to the directory for the file.

Or, check for authority to write to the config, initial\_hosts file in the directory

---

### The input data contains an error

#### Explanation

The value set for the input data was not a number.

#### User Action

Set a number for the input data.

## 27.2 The Messages Output by the *porbMngCert* Command

The messages output from the *porbMngCert* command are shown below.

### 27.2.1 PORB0000

---

#### INFO: PORB0000: *porbMngCert* command completed.

#### Explanation

The *porbMngCert* command ended normally.

### 27.2.2 PORB0001

---

#### INFO: PORB0001: Please input keystore path.

## Explanation

This message appears when the keystore destination was not specified in the -kf option. Enter the keystore destination using a relative path or an absolute path.

---

### 27.2.3 PORB0002

---

**INFO: PORB0002: Please input keystore password.**

## Explanation

This message appears when a password for the keystore was not specified in the -p option. Enter a password with six or more characters for accessing the keystore.

---

### 27.2.4 PORB0003

---

**INFO: PORB0003: Please input contract certificate list file path.**

## Explanation

This message appears when the contract certificate list file was not specified in the -rc option. Enter the contract certificate list file using a relative path or an absolute path.

---

### 27.2.5 PORB0004

---

**INFO: PORB0004: Please input removelist directory.**

## Explanation

This message appears when the management directory was not specified in the -rl option. Enter a directory for the CA certificate management using a relative path or an absolute path. If omitted, the management directory is set to the current directory.

---

### 27.2.6 PORB0005

---

**INFO: PORB0005: Certificate with same Nickname already exists. Replace Certificate? default=[NO]**

## Explanation

This message appears when a CA certificate with the same alias has been registered.

To replace the certificate, enter "yes". To not replace the certificate, enter "no".

---

### 27.2.7 PORB0006

---

**INFO: PORB0006: Certificate was removed from keystore. alias=%s1**

## Variable Information

%s1 = Alias name

## Explanation

The CA certificate with the alias %s1 was removed from the keystore.

---

### 27.2.8 PORB0007

---

**INFO: PORB0007: Certificate does not exist to keystore. alias=%s1**

## Variable Information

%s1 = Alias name

## Explanation

There was an attempt to delete the CA certificate with the alias %s1, but the certificate did not exist in the keystore.

### 27.2.9 PORB0008

---

**INFO: PORB0008: removelist deleted.**

## Explanation

The contract certificate in the keystore was deleted normally, and the unnecessary management file was deleted.

### 27.2.10 PORB0009

---

**INFO: PORB0009: Certificate was displaced in keystore. alias=%s1**

## Variable Information

%s1 = Alias name

## Explanation

The CA certificate with the same alias %s1 was displaced in the keystore.

### 27.2.11 PORB0010

---

**INFO: PORB0010: Certificate was added to keystore. alias=%s1**

## Variable Information

%s1 = Alias name

## Explanation

The CA certificate with the same alias %s1 was added to the keystore.

### 27.2.12 PORB0100

---

**ERROR: PORB0100: porbMngCert command failed.**

## Explanation

The porbMngCert command ended abnormally.

## System Action

The processing stops.

### 27.2.13 PORB0101

---

**ERROR: PORB0101: Parameter was not specified. <%s1>**

## Variable Information

%s1 = Parameter name

## Explanation

The parameter %s1 was not specified.

## System Action

The processing stops.

## User Action

Verify the parameter used during the command execution. Then, re-execute the command.

### 27.2.14 PORB0102

---

**ERROR: PORB0102: Invalid parameter.<%s1>**

#### Variable Information

%s1 = Parameter name

#### Explanation

The parameter %s1 is invalid.

#### System Action

The processing stops.

#### User Action

Verify the parameters used at command execution. Then, re-execute the command.

### 27.2.15 PORB0103

---

**ERROR: PORB0103: Parameter was defined duplex.<%s1>**

#### Variable Information

%s1 = Parameter name

#### Explanation

Parameter %s1 was defined more than once.

#### System Action

The processing stops.

#### User Action

Verify the parameters used during command execution. Then, re-execute the command.

### 27.2.16 PORB0104

---

**ERROR: PORB0104: Input data does not exist. <%s1>**

#### Variable Information

%s1 = Parameter name

#### Explanation

The mandatory parameter %s1 was not entered.

#### System Action

The processing stops.

#### User Action

Verify the parameters used at command execution. Then, re-execute the command.

### 27.2.17 PORB0105

---

---

**ERROR: PORB0105: Input data can't be read.:%s1****Variable Information**

%s1 = Exception information

**Explanation**

An exception occurred while reading input data.

**System Action**

The processing stops.

**User Action**

Check the exception information %s1, and take corrective action as necessary. If the error occurs even after the corrective action is taken, contact your Fujitsu engineer.

---

**27.2.18 PORB0106**

---

**ERROR: PORB0106: Contract certificate list file access error:%s1****Variable Information**

%s1 = Exception information

**Explanation**

An exception occurred while reading the contract certificate list file.

**System Action**

The processing stops.

**User Action**

Check the exception information %s1, and verify the contract certificate list file as necessary. If the error occurs even after the contract certificate list file was verified, contact your Fujitsu engineer.

---

**27.2.19 PORB0107**

---

**ERROR: PORB0107: Not contract certificate list file.****Explanation**

The contract certificate list file may have been damaged.

**System Action**

The processing stops.

**User Action**

Verify the contract certificate list file.

---

**27.2.20 PORB0108**

---

**ERROR: PORB0108: removalist directory not found.****Explanation**

The storage directory of the contract certificate management file does not exist.

**System Action**

The processing stops.

#### User Action

Verify the storage directory of the contract certificate management file.

### 27.2.21 PORB0109

---

#### **ERROR: PORB0109: removelist file not found.**

#### Explanation

The contract certificate management file does not exist.

#### System Action

The processing stops.

#### User Action

Verify the storage directory of the contract certificate management file.

### 27.2.22 PORB0110

---

#### **ERROR: PORB0110: Not removelist file.**

#### Explanation

The contract certificate management file may have been damaged.

#### System Action

The processing stops.

#### User Action

Verify the contract certificate management file.

### 27.2.23 PORB0111

---

#### **ERROR: PORB0111: removelist file error:%s1**

#### Variable Information

%s1 = Exception information

#### Explanation

An exception occurred while reading the contract certificate management file.

#### System Action

The processing stops.

#### User Action

Check the exception information %s1, and verify the contract certificate list file as necessary. If the error occurs even after the contract certificate list file was verified, contact your Fujitsu engineer.

### 27.2.24 PORB0112

---

#### **ERROR: PORB0112: Keystore not found.**

#### Explanation

The keystore does not exist.

### System Action

The processing stops.

### User Action

Verify the destination where the keystore is stored.

## 27.2.25 PORB0113

---

### **ERROR: PORB0113: Keystore error Exception information :java.io.IOException: Invalid keystore format**

#### Explanation

The specified file is not in the keystore format.

### System Action

The processing stops.

### User Action

Review the environment of the keystore.

---

### **ERROR: PORB0113: Keystore error Exception information :java.io.IOException: Keystore was tampered with, or password was incorrect**

#### Explanation

The password is incorrect.

### System Action

The processing stops.

### User Action

Enter a correct password, and re-execute the command.

---

### **ERROR: PORB0113: Keystore error %s1**

#### Variable Information

%s1 = Exception information

#### Explanation

An exception occurred while reading the keystore.

### System Action

The processing stops.

### User Action

Check the exception information %s1, and verify the contract certificate list file as necessary. If the error occurs even after the contract certificate list file was verified, contact your Fujitsu engineer.

## 27.2.26 PORB0114

---

### **ERROR: PORB0114: keytool error: Keystore password must be at least 6 characters**

#### Explanation

A password must be entered with six or more characters.

### System Action

The processing stops.

#### User Action

Enter a password of six or more characters, and re-execute the command.

---

#### **ERROR: PORB0114: keytool error:%s1**

#### Variable Information

%s1 = Error information

#### Explanation

An error occurred during *keytool* command execution.

#### System Action

The processing stops.

#### User Action

Check the exception information %s1, and verify the contract certificate list file as necessary. If the error occurs even after the contract certificate list file was verified, contact your Fujitsu engineer.

---

### 27.2.27 PORB0115

---

#### **ERROR: PORB0115: keytool error:%s1**

#### Variable Information

%s1 = Exception information

#### Explanation

An exception occurred during *keytool* command execution.

#### System Action

The processing stops.

#### User Action

Check the exception information %s1, and verify the contract certificate list file as necessary. If the error occurs even after the contract certificate list file was verified, contact your Fujitsu engineer.

---

### 27.2.28 PORB0116

---

#### **ERROR: PORB0116: Certificate was not displaced in keystore.**

#### Explanation

Registration was canceled by a user instruction.

#### System Action

The processing stops.

#### User Action

No action is required.

---

### 27.2.29 PORB0117

---

#### **ERROR: PORB0117: keytool error: unknown error.**

#### Explanation

An undefined error occurred during *keytool* command execution.

#### System Action

The processing stops.

#### User Action

Contact your Fujitsu engineer.

### 27.2.30 PORB0200

---

#### **ERROR: PORB0200: Logical error.**

#### Explanation

An internal consistency of the *porbMngCert* command occurred.

#### System Action

The processing stops.

#### User Action

Contact your Fujitsu engineer.

# Chapter 28 Messages Output by SSL Operation Commands

This chapter explains the following messages.

- [28.1 The Messages Output by the SMEE Command](#)
- [28.2 The Messages Output by the odsetSSL Command](#)
- [28.3 The Messages Output by the odsetpath Command](#)

## 28.1 The Messages Output by the SMEE Command

---

This chapter explains the following SMEE commands:

- cmcrtsslenv
- cmdspcert
- cmentcert
- cmentcrl
- cmenterkey
- cmentpfx
- cmgetcrl
- cmlistcert
- cmlistcrl
- cmmakecsr
- cmmkenv
- cmmkpfx
- cmrmcert
- cmsetenv
- makeslot
- maketoken
- mkslt [Windows32](#)
- mktkn [Windows32](#)

### 28.1.1 0000-0099

---

#### 28.1.1.1 0011

##### [\[0011\]Parameter error: <option>](#)

##### Explanation

A parameter error was detected at command start.

##### User Action

Check the <option> parameter used at command start, and then reexecute the command.

#### 28.1.1.2 0012

##### [\[0012\]Logical error](#)

---

## Explanation

An internal conflict was detected in this product.

## User Action

Use the *iscollectinfo* command to collect investigation information, and then report it to a Fujitsu service engineer together with details of the operation performed when this error occurred.

### 28.1.1.3 0013

---

#### **[0013]System error: <errorcode1>,<errorcode2>**

## Explanation

A system function error occurred during processing.

## User Action

Use the *iscollectinfo* command to collect investigation information, and then report it to a Fujitsu service engineer together with error codes 1 and 2.

### 28.1.1.4 0014

---

#### **[0014]Directory is not found: <directory name>**

## Explanation

A full path has not been specified for the directory. Alternatively, the specified directory cannot be found.

## User Action

Specify the correct directory, and then reexecute.

### 28.1.1.5 0016

---

#### **[0016]Cannot allocate memory**

## Explanation

Memory shortage occurred.

## User Action

Terminate any unnecessary programs. Alternatively, increase the amount of available memory, and then reexecute.

### 28.1.1.6 0017

---

#### **[0017]Disk is full**

## Explanation

Shortage of free disk space occurred.

## User Action

Increase the free disk space, and then reexecute.

### 28.1.1.7 0020

---

#### **[0020]Invalid password**

## Explanation

The input password contains an invalid character. Alternatively, the length is incorrect.

#### User Action

Specify the correct password, and then reexecute.

### 28.1.1.8 0021

---

#### **[0021]Incorrect password**

#### Explanation

Incorrect password.

#### User Action

Specify the correct password, and then reexecute.

### 28.1.1.9 0022

---

#### **[0022>Password not matched**

#### Explanation

The password entered first is different from the password entered second.

#### User Action

Specify the correct password, SO-PIN, or user PIN, and then reexecute the command.

### 28.1.1.10 0023

---

#### **[0023]Slot directory is not found**

#### Explanation

The slot cannot be found in the slot information directory. Alternatively, the slot information directory cannot be found.

#### User Action

Create the slot, and then reexecute. If the slot information directory is not present, create a slot information directory, and then reexecute.

### 28.1.1.11 0024

---

#### **[0024]Invalid token label**

#### Explanation

There is a length error or invalid characters in the token label.

#### User Action

Specify the correct token label, and then reexecute the command.

### 28.1.1.12 0025

---

#### **[0025]Cryptographic error: <errorcode1>,<errorcode2>**

#### Explanation

An error occurred during encryption.

#### User Action

Use the *iscollectinfo* command to collect investigation information, and then report it to a Fujitsu service engineer together with error codes 1 and 2.

### 28.1.1.13 0027

---

#### [0027]Slot is not found

##### Explanation

Slot is not found.

##### User Action

Check the slot ID specification, and then reexecute.

### 28.1.1.14 0028

---

#### [0028]Token is not found

##### Explanation

Token is not found.

##### User Action

Check the token specification, and then reexecute.

### 28.1.1.15 0029

---

#### [0029]Slot directory permission is denied

##### Explanation

Slot information directory permission is denied.

##### User Action

Check the access permission.

### 28.1.1.16 0030

---

#### [0030]Token label already exists [0030]Same labeled token already exists

##### Explanation

A token having the specified label already exists.

##### User Action

Specify another token label.

##### Note

The *makeslot* and *maketoken* commands output the latter message. The other SMEE commands output the former message.

### 28.1.1.17 0031

---

#### [0031]Same labeled tokens exist

##### Explanation

Same-labeled tokens exist.

##### User Action

If multiple tokens of the same label are present, execute with the slot ID specified.

### 28.1.1.18 0032

---

**[0032]Token permission is denied or exclusive error****Explanation**

Access permission to the slot information file and token information file has not been granted. Alternatively, processing cannot be executed because the token information file is busy.

**User Action**

Check the access permission or wait until the file is released. Then, reexecute.

**28.1.1.19 0033**

---

**[0033]File is not found: <file name>****Explanation**

File is not found.

**User Action**

Reexecute with the correct file name specified.

**28.1.1.20 0034**

---

**[0034]File permission is denied: <file name>****Explanation**

File permission is denied. Alternatively, a directory (folder) was specified instead of a file.

**User Action**

Check the access authority of a file. Alternatively, check whether something other than a file was specified.

**28.1.1.21 0035**

---

**[0035]File already exists: <file name>****Explanation**

A file having the same name as that of the specified file already exists.

**User Action**

Check the file name specification.

**28.1.1.22 0040**

---

**[0040]License is not entered****Explanation**

License is not entered.

**User Action**

Obtain and register a license.

**28.1.1.23 0041**

---

**[0041]Cannot connect license server****Explanation**

Cannot connect license server.

#### User Action

Check activation of the license server. If the license server has not been activated, activate the license server.

### 28.1.1.24 0042

---

#### **[0042]Cannot get license file**

#### Explanation

Cannot get license file.

#### User Action

Check the license definition file. If the license definition file is incorrect, re-register the license.

### 28.1.1.25 0049

---

#### **[0049]Invalid key label**

#### Explanation

The character length of the key label is incorrect.

#### User Action

Specify the correct key label, and then reexecute.

### 28.1.1.26 0050

---

#### **[0050]Token already exists**

#### Explanation

A token is already present in the specified slot.

#### User Action

Check the slot specification, and then reexecute.

### 28.1.1.27 0051

---

#### **[0051]Certificate already exists**

#### Explanation

The same certificate is already registered.

Alternatively, a different certificate has already been registered using the specified nickname.

#### User Action

Check whether the nickname specified in the certificate list display command is already registered. If the same nickname is already registered, reexecute the command by specifying a different nickname. If the same nickname is not present, the certificate has been registered using a different nickname. The certificate need not be re-registered. Also, check that the built-in certificate list file is correct.

---

#### **[0051]Slot directory is broken**

#### Explanation

The slot information file or token information file has been corrupted or cannot be found.

#### User Action

Delete all the files under the slot information directory and then re-create the slot and token.

#### **Note**

The *makeslot* and *maketoken* commands output the latter message. The other SMEE commands output the former message.

### 28.1.1.28 0052

---

#### [0052]Cannot open library

##### Explanation

A library required for command execution cannot be found.

##### User Action

Check that the required product has been installed.

### 28.1.1.29 0053

---

#### [0053]Not supported function

##### Explanation

The function is not supported by the specified token.

##### User Action

Check the token specification.

### 28.1.1.30 0054

---

#### [0054]Invalid certification path

##### Explanation

The certificate path is incorrect and was verified unsuccessfully. The causes can be roughly categorized in five ways, as follows:

- A higher-level CA certificate has not been registered (cannot be found).
- A higher-level CA certificate is too old (the key has been renewed).
- The specified certificate or its higher-level CA certificate has expired.
- The information in the specified certificate or its higher-level CA certificate is incorrect.
- The specified certificate or its higher-level CA certificate has been revoked and the revocation list of the certificate is recorded in the CRL.

##### User Action

First, check that the system time is accurate. Use the certificate output command to check the validity period of the certificate. If the validity period of the certificate has not started, wait until the certificate becomes valid, and then reexecute. If the certificate has expired, the certificate can no longer be used. Obtain a new certificate from the CA (certification authority).

If there is no problem in the validity period of the certificate, use the following procedure to check whether a high-level CA certificate up to the root certificate has been registered:

1. Using a certificate contents output command, display the certificate to be registered.
2. Issue a certificate list output command by specifying the certificate issuer information (country name, person name, etc.) of the displayed certificate in the search keys (-cn, -o, -ou, -ea, and -ca).
3. Check that there is a certificate that uses the specified search keys.

If a certificate cannot be found, ask the certificate issuer for the required certificate. If a certificate exists, a higher-level CA certificate may be too old. Obtain the latest higher-level CA certificate.

If verification still fails, use the *iscollectinfo* command to collect investigation information, and then contact a Fujitsu service engineer.

---

#### [0054]Key is not found: <key label>

#### Explanation

The key of the specified label cannot be found.

#### User Action

Check the token and label specifications, and then reexecute.

#### Note

The *makeslot* and *maketoken* commands output the latter message. The other SMEE commands output the former message.

### 28.1.1.31 0055

---

#### [0055]Same labeled key already exists: <key label>

#### Explanation

Same labeled key already exists.

#### User Action

Check the label specifications, and then reexecute.

### 28.1.1.32 0056

---

#### [0056]Cannot extract key

#### Explanation

An attempt was made to extract a key which has FALSE set as the attribute of CKA\_EXTRACTABLE. A key with this attribute cannot be extracted.

#### User Action

Check the key specification.

### 28.1.1.33 0057

---

#### [0057]Not key file

#### Explanation

The file which is not a key file was specified.

#### User Action

Check the key file, and then reexecute.

### 28.1.1.34 0059

---

#### [0059]The same key file

#### Explanation

The same key file has been specified for a key file required for registration.

#### User Action

Check the specified key file, and then reexecute.

### 28.1.1.35 0060

---

#### [0060]Certificate not found

## Explanation

The specified certificate is not registered.

## User Action

Specify the registered certificate identifier or nickname. Use the certificate list output command to check if the certificate is being registered.

## 28.1.1.36 0065

---

### **[0065]File doesn't exist: <filename>**

## Explanation

The file <filename> was not found.

## User Action

Specify the correct file name, and then reexecute the command.

## 28.1.1.37 0071

---

### **[0071]Not token file**

## Explanation

A file that is not a token information file has been specified.

## User Action

Check the specified token information file, and then reexecute.

## 28.1.1.38 0072

---

### **[0072]Token is full**

## Explanation

The area for storing the token objects is insufficient.

## User Action

Register the objects to a different token or delete unnecessary private token objects stored in the token.

## 28.1.1.39 0075

---

### **[0075]Certificate with same Nickname already exists**

## Explanation

A certificate having the same nickname is already registered.

## User Action

Re-enter the command with a different nickname specified. Alternatively, check whether the built-in certificate list file is correct.

## 28.1.1.40 0076

---

### **[0076]Cannot read contract certificate list file**

## Explanation

The specified built-in certificate list file cannot be found, or the read authority is not given.

#### User Action

Check the built-in certificate list file. Alternatively, check if this product is installed correctly.

### 28.1.1.41 0077

---

#### [0077]pfx access error: <errorcode1>,<errorcode2>,<errorcode3>

#### Explanation

An error occurred during an access to the PKCS#12(PFX) data.

#### User Action

Use the *iscollectinfo* command to collect investigation information, and then report it to a Fujitsu service engineer together with error codes 1, 2, and 3.

### 28.1.1.42 0078

---

#### [0078]Invalid Nickname

#### Explanation

The specified nickname has an inappropriate length.

#### User Action

To register a certificate on a smart card token, specify a nickname consisting of 80 bytes or less and retry.

### 28.1.1.43 0079

---

#### [0079]Token access error: <errorcode1>,<errorcode2>

#### Explanation

The specified token cannot be accessed.

#### User Action

If a smart card is used, check that the card reader is correctly connected. If the smart card has not been initialized, initialize the smart card.

If a file token is used, check the token model. No certificate can be stored in a FLM02 token (token created using the *mkslt/mktn* command).

In cases other than the above, use the *iscollectinfo* command to collect investigation information, and then contact a Fujitsu service engineer to report it together with error codes 1 and 2.

### 28.1.1.44 0080

---

#### [0080]Device removed

#### Explanation

If a smart card reader is being used, the card reader has not been connected to the system correctly.

Alternatively, no smart card is inserted to the card reader.

If an encryption processor is being used, the encryption processor has not been connected to the system.

#### User Action

If a smart card reader is being used, check that card reader is correctly connected to the system and that a smart card is inserted in the card reader. If an encryption processor is being used, check that the encryption processor is correctly connected to the system.

### 28.1.1.45 0081

---

**[0081]Token environment destroyed****Explanation**

If a smart card reader is being used, the message indicates that a card reader has not been connected.

Alternatively, the environment of the smart card is corrupt.

**User Action**

Connect the card reader to the system and restart the system.

If the card reader is connected to the system, reinstall the smart card base component and the smart card authentication.

**28.1.1.46 0082**

---

**[0082]Smartcard access error****Explanation**

An unexpected error was posted from the system during smart card access.

**User Action**

Reinsert the smart card and retry.

**28.1.1.47 0083**

---

**[0083]Token not enough memory****Explanation**

The object cannot be registered because the token does not have sufficient memory space.

**User Action**

Either delete an unnecessary object in the token or register the object in another token.

**28.1.1.48 0084**

---

**[0084]Entry of CRL has not been made****Explanation**

The CRL obtained from the LDAP or HTTP could not be registered.

**User Action**

There is a problem in the obtained CRL. Check the acquisition destination of the CRL.

**28.1.1.49 0085**

---

**[0085]Not enough Product: <productname>****Explanation**

The operation is disabled because the product or displayed function <productname>, is not installed.

**User Action**

Install product or displayed function <productname>, and retry.

**28.1.1.50 0086**

---

**[0086]Different VL environment setup information already exist**

#### Explanation

The environment cannot be set because the environment setup information of a different version has already been created.

#### User Action

Check the environment setup information that has already been created.

### 28.1.1.51 0087

---

#### **[0087]Backup file already exist: <filename>**

#### Explanation

Since a backup file already exists, it cannot back up.

#### User Action

If a backup target file has been corrupted, replace the file based on the backup file. If the backup target file has not been corrupted, save the backup file to a location other than the certificate/key management directory.

### 28.1.1.52 0088

---

#### **[0088]Invalid URL: <URL>**

#### Explanation

Invalid URL.

#### User Action

Check whether the information (server name, DN character string, and entry attribute) required for the specified URL is missing. Alternatively, check the specified URL information for errors.

### 28.1.1.53 0089

---

#### **[0089]CRL not found: <URL>**

#### Explanation

CRL does not exist in specified URL.

#### User Action

Check whether the URL specification destination is incorrect.

### 28.1.1.54 0090

---

#### **[0090]Already exist key**

#### Explanation

A key with the same label is already registered.

#### User Action

Change the label, and then reexecute the command.

### 28.1.1.55 0092

---

#### **[0092]Invalid key**

#### Explanation

The key was not found or may be damaged.

#### User Action

Check that the specified key file name is correct. If the specified key file name is correct, the key may be damaged. Use the *iscollectinfo* command to collect investigation information, and then contact a Fujitsu service engineer.

### 28.1.1.56 0093

---

#### [0093]Unsupported key

##### Explanation

The key is not supported.

##### User Action

The key cannot be used to register.

### 28.1.1.57 0094

---

#### [0094]Key not found

##### Explanation

The specified token is not assigned a key with a label.

##### User Action

Specify a correct token label and key label, and then reexecute the command.

### 28.1.1.58 0095

---

#### [0095]Invalid data

##### Explanation

Data to be handled was not found or cannot be handled because it may be damaged.

##### User Action

Check that the data acquisition method is correct. Alternatively, call the data supplier and obtain the correct data.

### 28.1.1.59 0096

---

#### [0096]Already Exist Key Data

##### Explanation

The same key is already registered.

##### User Action

The key need not be registered again.

### 28.1.1.60 0097

---

#### [0097]Invalid Key Label

##### Explanation

The key label contains invalid characters, or the key label length is incorrect.

##### User Action

Specify the correct key label, and then reexecute the command.

## 28.1.1.61 0098

---

### [0098]Cannot get CRL

#### Explanation

Access to the LDAP or HTTP failed.

#### User Action

Check the LDAP or HTTP server specification for errors. If no errors are found, check whether the specified server has been started.

## 28.1.1.62 0099

---

### [0099]There was CRL which is not entered

#### Explanation

Multiple CRLs were obtained from the LDAP server, but some CRLs cannot be registered.

#### User Action

There is a problem in the obtained CRLs. Check the acquisition destination of the CRLs.

## 28.1.2 0100-0199

---

### 28.1.2.1 0101

---

#### [0101]File permission denied: <filename>

#### Explanation

There is no access authority for the file <filename>. Alternatively, the user has no permission to access the directory specified in environment variable CMIPATH.

#### User Action

Check the permission to access the file indicated at <filename> or the directory specified in environment variable CMIPATH.

### 28.1.2.2 0102

---

#### [0102]Work area not allocated

#### Explanation

A memory shortage occurred.

#### User Action

Add usable memory, and then reexecute the command.

### 28.1.2.3 0104

---

#### [0104]No space in disk

#### Explanation

The free area on the disk is insufficient.

#### User Action

Increase the size of the free area on the disk, and then reexecute the command.

### 28.1.2.4 0105

---

**[0105]File already exist: <filename>****Explanation**

The same file already exists.

**User Action**

Save the file that already exists or change the file name specified in the parameter and then reexecute.

### 28.1.2.5 0106

---

**[0106]Logical error****Explanation**

An internal inconsistency was detected in this product.

**User Action**

Use the *iscollectinfo* command to collect investigation information, and then report it to a Fujitsu service engineer together with details of the operation performed when this error occurred.

### 28.1.2.6 0110

---

**[0110]DB connect error: <errorcode1>,<errorcode2>****Explanation**

The system cannot be connected to the certificate/key management environment directory because the certificate/key management environment directory may have been deleted, or the directory name may have been changed.

**User Action**

Check whether the certificate/key management environment exists, or whether the directory name has been changed.

If the directory has been deleted, or the directory name has been changed, recover the directory.

If, the certificate/key management environment directory exists, use the *iscollectinfo* command to collect investigation information, and then report it to a Fujitsu service engineer together with details of error codes 1 and 2.

### 28.1.2.7 0111

---

**[0111]DB access error: <errorcode1>,<errorcode2>,<detail>****Explanation**

An error occurred during an access to the certificate/key management environment.

**User Action**

Use the *iscollectinfo* command to collect investigation information, and then report it to a Fujitsu service engineer together with details of error codes 1 and 2 and detailed error information.

### 28.1.2.8 0113

---

**[0113]Environment file destroyed: <detail>****Explanation**

The certificate/key management environment may have been damaged.

**User Action**

Restore the backed up resources, and then reexecute.

Alternatively, if the current environment can be destroyed, re-create the environment. Otherwise, use the *iscollectinfo* command to collect investigation information, and then report it to a Fujitsu service engineer together with detailed error information.

## 28.1.2.9 0115

---

### [0115]Cryptographic function detect error: <errorcode1>,<errorcode2>

#### Explanation

An error occurred during encryption processing.

#### User Action

The slot/token may not have been created in the slot information directory specified using the *cmsetenv* command -sd parameter. Use the *makeslot* and *maketoken* commands with the slot information directory specified to create the slot/token. Alternatively, the token (IC card) cannot export the security key. Abandon exporting using the PKCS#12 format.

In cases other than the above, use the *iscollectinfo* command to collect investigation information, and then report it to a Fujitsu service engineer together with details of error codes 1 and 2.

## 28.1.2.10 0116

---

### [0116]System function detect error: <errorcode1>,<errorcode2>

#### Explanation

A system call error occurred during encryption processing.

#### User Action

Reexecute. If this message is still output, use the *iscollectinfo* command to collect investigation information, and then report it to a Fujitsu service engineer together with details of error codes 1 and 2.

## 28.1.2.11 0120

---

### [0120]DB lock error

#### Explanation

The certificate/key management environment is in exclusive use.

#### User Action

Wait for a while, and then reexecute the command. If the error recurs, use the *iscollectinfo* command to collect investigation information, and then contact a Fujitsu service engineer.

## 28.1.2.12 0121

---

### [0121]Directory doesn't exist: <dir>

#### Explanation

The directory <dir> is not specified with the full path, or the specified directory was not found. Alternatively, the directory path specified in environment variable CMIPATH is not the full path or the specified directory was not found.

#### User Action

Check the directory indicated at <dir> or the directory specified in environment variable CMIPATH, and re-enter the command with a valid directory that includes <dir>.

## 28.1.3 0200-0299

---

### 28.1.3.1 0200

---

#### [0200]Environment creating information not found

## Explanation

The information created with the certificate/key management environment creation command was not found.

## User Action

If the create command for creating the certificate/key management environment has not been executed, execute it now. If the command has been executed, the information created by the command may have been deleted. Restore the backed-up resources, and then reexecute. Alternatively, if the current environment can be destroyed, re-create the environment.

Otherwise, use the *iscollectinfo* command to collect investigation information, and then contact a Fujitsu service engineer.

### 28.1.3.2 0201

---

#### [0201]Environment setup information not found

## Explanation

The information created with the certificate/key management environment creation command was not found.

## User Action

If the create command for creating the certificate/key management environment has not been executed, execute the create command for creating the certificate/key management environment. If the command has been executed, the information created by the command may have been deleted. Restore the backed up resources, and then reexecute. Alternatively, if the current environment can be destroyed, re-create the environment.

In other than the above, use the *iscollectinfo* command to collect investigation information, and then contact a Fujitsu service engineer.

### 28.1.3.3 0205

---

#### [0205]Environment directory not found

## Explanation

The specified directory is not a certificate/key management directory. Alternatively, the directory specified in environment variable CMIPATH is not a certificate/key management directory.

## User Action

Check the specified directory or the directory specified in environment variable CMIPATH, and re-enter the command with a valid certificate/key management directory specified.

If there is no certificate/key management directory, create one and then reexecute the command.

### 28.1.3.4 0206

---

#### [0206]Environment file permission denied: <detail>

## Explanation

You do not have the access authority for information about the certificate/key management environment. (The detailed error information is <detail>.) The person who created the environment and the person who executed the command may be different.

## User Action

Reexecute with the permission of the person that created the environment.

### 28.1.3.5 0207

---

#### [0207]Certificate information already exists

## Explanation

The certificate/key management environment cannot be created because the certificate/key management environment already exists.

## User Action

Use the existing certificate/key management environment as is, create a new certificate/key management environment under a different directory, or delete the current certificate/key management environment and then create a new certificate/key management environment.

### 28.1.3.6 0209

---

#### **[0209]Specifying the same directory(DB) name is invalid**

##### Explanation

The same directory name has already been specified.

##### User Action

The directory name cannot be assigned to the directory for the information about the certificate/key management environment. Specify a different directory name.

### 28.1.4 0300-0399

---

#### 28.1.4.1 0300

---

##### **[0300]Incorrect password**

##### Explanation

There is an error in the password, SO-PIN, or user PIN.

##### User Action

Specify a correct password, correct SO-PIN, or correct user PIN, and then reexecute the command.

#### 28.1.4.2 0301

---

##### **[0301]Invalid password**

##### Explanation

There is a length error or invalid characters in the password, SO-PIN, or user PIN.

##### User Action

Specify a correct password, SO-PIN, or user PIN, and then reexecute the command.

#### 28.1.4.3 0306

---

##### **[0306]Slot not found**

##### Explanation

The specified slot was not found, or a slot for which a token was generated is specified.

##### User Action

Generate a slot, or specify the identifier of a slot for which no token was generated. Then, reexecute the command.

#### 28.1.4.4 0307

---

##### **[0307]Token not found**

##### Explanation

The specified token was not found. Alternatively, a slot for which a token has not been created was specified.

#### User Action

Specify the correct token label or create a token in the slot, and then reexecute.

### 28.1.4.5 0308

---

#### **[0308]Key not found**

#### Explanation

The specified token has no key with the specified label.

#### User Action

Specify correct token and key labels and retry.

### 28.1.4.6 0309

---

#### **[0309]Already exist key**

#### Explanation

Another key with the same label already exists.

#### User Action

Change the label and retry.

### 28.1.4.7 0313

---

#### **[0313]Invalid key**

#### Explanation

Either the object is not a key or the key is corrupt.

#### User Action

Check that the specified key file name is correct.

If it is correct, the key may be corrupt. Use the *iscollectinfo* command to collect investigation information, and then contact a Fujitsu service engineer.

### 28.1.4.8 0314

---

#### **[0314]Unsupported key**

#### Explanation

The key does not use the PKCS#8 format, which is supported by the SMEE package.

#### User Action

Contact the organization from which the key file was acquired and check the key format.

### 28.1.4.9 0315

---

#### **[0315]Token label duplicated**

#### Explanation

Multiple tokens have the same label.

#### User Action

If this message is output when registering a certificate or PKCS#12(PFX) data, check the slot and token information, and then reexecute the command with slot id specified.

## 28.1.4.10 0316

---

### [0316]Slot directory not found

#### Explanation

The specified directory is not a slot information directory.

The directory is not a slot information directory, or the directory name may have been changed.

#### User Action

Check whether the slot information directory exists, or whether the directory name has been changed.

If the directory is not a slot information directory, specify a valid directory or create a slot information directory.

If the directory name has been changed, recover the directory.

## 28.1.4.11 0317

---

### [0317]Slot directory permission denied

#### Explanation

The access authority for the slot information directory is not defined.

#### User Action

Check the access authority. Alternatively, reexecute with the permission of the person that created the environment.

## 28.1.4.12 0318

---

### [0318]Permission denied or exclusive error for token

#### Explanation

The command was executed without the necessary permission to access either the slot information file or the token information file, or the command could not handle the token information file because it was being used by another session.

#### User Action

Check the permissions or wait until the token information file is released.

## 28.1.5 0500-0599

---

### 28.1.5.1 0506

---

#### [0506]Date in certificate or CRL is out of supported period

##### Explanation

For reasons outside the range of 1950 to 2049, the validity period of a certificate or the update date of CRL cannot process.

##### User Action

Call the certificate or acquisition supplier, and check the validity period of a certificate, or the update date of CRL.

### 28.1.5.2 0507

---

#### [0507]Unsupported certificate

##### Explanation

The command cannot be executed because the certificate version is not X.509 V1, V2, or V3. Alternatively, the certificate cannot be registered because unsupported certificate extensions are set.

#### User Action

Contact the issuer and the receiver of the certificate to check the certificate version and specified information.

### 28.1.5.3 0509

---

#### [0509]Unsupported signature algorithm

##### Explanation

The command cannot be executed because the digital signature was created using a hash or encryption algorithm not supported by the certificate/key management environment.

##### User Action

Contact the issuer and the receiver of the certificate or CRL to obtain the certificate or CRL that was generated using either of the above signature algorithms.

For details on the signature algorithms which are supported by the certificate/key management environment, refer to "Certificate/Key Management Environment" in the Security System Guide.

### 28.1.5.4 0511

---

#### [0511]Invalid certificate

##### Explanation

The command cannot be executed because the information is not a certificate or the certificate may have been damaged.

##### User Action

Contact the issuer and the receiver of the certificate to obtain the correct certificate.

### 28.1.5.5 0520

---

#### [0520]Unsupported CRL

##### Explanation

The command cannot be executed because the CRL version is not X.509 V1 or V2. Alternatively, the CRL cannot be registered because unsupported CRL extensions are set.

##### User Action

Contact the issuer and the receiver of the CRL to check the CRL version and specified information.

### 28.1.5.6 0521

---

#### [0521]Invalid CRL

##### Explanation

CRL verification failed because the CRL is invalid. Possible reasons are classified into the following two categories:

- The specified CRL is not a CRL, or the signature part is damaged.
- The certificate of the specified CRL issuer is too old (the key has been renewed).

##### User Action

The specified CRL may not be a CRL or may be damaged. In this case, contact the issuer of the CRL and obtain a valid CRL.

If the CRL is not damaged, the certificate of the CRL issuer may be too old.

Obtain the latest certificate of the CRL issuer, register it, and then re-enter the command.

### 28.1.5.7 0522

---

#### [0522]CRL already exists

##### Explanation

The same CRL is already registered.

##### User Action

The CRL need not be registered again.

### 28.1.5.8 0523

---

#### [0523]CRL number already exists

##### Explanation

A delta CRL that has the same CRL number is already registered.

##### User Action

This CRL need not be registered again.

### 28.1.5.9 0524

---

#### [0524]BASE CRL not found

##### Explanation

An attempt was made to register a delta CRL, but the base CRL of the delta CRL was not yet registered.

##### User Action

Contact the issuer and the receiver of the delta CRL to obtain the CRL that was the basis of the delta CRL and register the CRL. Then, reexecute.

### 28.1.5.10 0525

---

#### [0525]CRL issuer certificate not found

##### Explanation

The certificate of the CRL issuer was not registered.

##### User Action

Acquire the certificate of the CRL issuer, register it, and then reexecute the command. If the digital signature of the CRL need not be verified during registration, the CRL can be registered without verification.

## 28.2 The Messages Output by the odsetSSL Command

---

#### **Error: A certificate management directory ([dir]) does not exist.**

##### Explanation

The specified directory was not found.

##### User Action

Specify the correct certificate control directory, and then reexecute the command. If there is no correct certificate control directory, create one and then reexecute the command.

---

#### **Error: A slot information directory ([dir]) does not exist.**

## Explanation

The specified directory was not found.

## User Action

Specify the correct slot information directory, and then reexecute the command. If there is no correct slot information directory, create it and then reexecute the command.

---

### **Error: The path name of a certificate management directory is too long.**

## Explanation

The path name of the specified directory is too long.

## User Action

Create the certificate control directory so that its path name consists of 260 characters or less.

---

### **Error: The path name of a slot information directory is too long.**

## Explanation

The path name of the specified directory is too long.

## User Action

Create the slot information directory so that its path name consists of 260 characters or less.

---

### **Error: The installation directory of ObjectDirector is not found.**

## Explanation

The directory in which the CORBA Service (ObjectDirector) was installed was not found.

## User Action

Check if the service was correctly installed.

---

### **Error: A memory is insufficient.**

## Explanation

A memory shortage occurred.

## User Action

Terminate unnecessary applications, and restart the system.

---

### **Error: An error is in a user PIN.**

## Explanation

An incorrect user PIN was entered.

## User Action

Enter the correct user PIN, and then reexecute the command.

---

### **Error: A user PIN cannot be checked.**

## Explanation

There is a length error or invalid characters in the user PIN.

## User Action

Specify the correct user PIN, and then reexecute the command.

---

### **Error: It failed in a user's PIN encipherment.**

#### Explanation

Encrypting a user PIN failed.

#### User Action

Check that the correct slot information directory was set.

---

### **Error: It failed in creation of SSL environmental definition file.**

#### Explanation

Creation of an SSL environment definition file failed.

#### User Action

Check that the CORBA Service was installed.

---

## **28.3 The Messages Output by the odsetpath Command**

---

### **Usage: odsetpath dir1 dir2**

#### Explanation

The specified directory was not found. Specify the correct slot information directory or correct certificate control directory, and then reexecute the command.

# Chapter 29 Exception Information Minor Codes Reported from the CORBA Service

This chapter contains exception information and minor codes that can occur during operation of the CORBA service.

## Note

For exceptions and minor codes generated during application operation, the application and its execution environment may have to be reviewed.

If an exception is notified from the CORBA Service API, check if information about the exception is provided in the API manual, Reference Manual (API Edition).

## 29.1 CORBA Service Exception Information

The following table lists exception information generated by the CORBA Service.

Note that the interface described in the table is the C interface.

Table 29.1 CORBA Service Exception Information - Causes and Countermeasures

System	Meaning	Location / Causes / Countermeasures
BAD_CONTEXT	Failed to search context object	The identifier specified for the Context interface method is incorrect. Check that the identifier specified for the Context interface method is correct.
BAD_INV_ORDER	Routine not called normally	There was an error in the method call sequence. Call the method in the correct sequence
BAD_OPERATION	Incorrect operation	Incorrect operation name requested. Server may not be implementing that operation. Check server IDL and confirm that operation is present.
		If the application is created as a library, or constructed using COBOL, the following may have occurred:  Loading of the library or retrieval of the function symbol failed.  There may be an error in the library path registered in the Implementation Repository. Check the path.  If a relative path is used to specify the library path, check that the relative path from the directory in which the application operates is specified correctly.  For the CORBA WorkUnit, the directory in which the application operates is given by <current directory of the WorkUnit definition>\<WorkUnit name>\<process ID> (for Windows®)\<current directory of the WorkUnit definition>/<WorkUnit name>/<process ID> (for Solaris/Linux). Verify that the relative path from this directory is specified correctly.  The required skeleton file or server source may not be linked, or a functional symbol in the program may be undetermined. Check for any link error or undetermined functional symbol.
		<b>Solaris32/64</b> <b>Linux32/64</b>  The environment variable LD_LIBRARY_PATH may have been incorrectly set. Check the environment variable LD_LIBRARY_PATH.  In the case of a CORBA application, it may not be created with the dynamic link structure (all functions called when loading the main program are loaded). Check the program structure. For details, refer to the Distributed

System	Meaning	Location / Causes / Countermeasures
		Application Development Guide (CORBA Service Edition) for the Interstage Application Server Enterprise Edition.
		<p>If the Any object of Java has been operated, the following causes are possible.</p> <p>The &lt;type&gt; that was specified for (insert_&lt;type&gt;()) method during insertion and &lt;type&gt; (extract_&lt;type&gt;()) method during extraction do not match.</p> <p>Extraction was performed without insertion.</p> <p>Review the processing for the Any object.</p>
		<p>The number of servers/clients connected or the number of requests may have reached the upper limit during execution of an EJB application.</p> <p>Increase the 'max_IIOp_local_init_requests' and 'limit_of_max_IIOp_resp_requests' values of the CORBA service config file, and then stop and restart the CORBA service. If a previous version of Interstage is installed on the server at the connection destination, refer to the manual for the version of Interstage installed on the server and take the action indicated.</p>
		<p><b>Linux32/64</b></p> <p>For a C/C++ application, all symbols may not have been added to the dynamic symbol table to create the application.</p> <p>Check the link options specified when the server application was created. Check whether the '-E' option was specified for executing the <i>ld</i> command and '-Wl, -E' was specified for executing the <i>gcc/g++</i> command.</p>
BAD_PARAM	Parameter is incorrect	<p>The possible reasons are as follows:</p> <p>TypeCode object specified by CORBA_NVList_add_item(),CORBA_Request_add_arg() is NULL object.</p> <p>Operation name specified by CORBA Object_create_request () is NULL text string.</p> <p>NVList is not specified in Request object transferred by CORBA_Request_add_arg().</p> <p>String type parameter is NULL text string.</p> <p>Other specified parameters are incorrect type or value.</p> <p>Check that parameters are correct.</p>
		<p>If this exception occurred using the org.omg.CORBA.ORB.resolve_initial_references() method when the Portable-ORB is used, possible reasons are listed below:</p> <p>Mapping of the Portable-ORB operating environment file on Web server is incorrect.</p> <p>Setting of PORB_HOME specified in the HTML file is incorrect.</p> <p>Failed to set initial_hosts, or the setup information is incorrect.</p> <ul style="list-style-type: none"> <li>- The IPv6 address was set for initial_hosts in an environment that cannot use IPv6. Therefore, the connection with the server failed.</li> </ul> <p>Communication with the server specified for initial_hosts has failed.</p> <p>Check if there is a problem in the Portable-ORB environment setup, in the environment on the server side, and in the network environment setup.</p>

System	Meaning	Location / Causes / Countermeasures
BAD_QOS	An invalid QoS was requested.	Check if the problem occurred when connecting with third party CORBA products.  If you are using the event service, refer to 'Exception Information Minor Codes Reported from the Event Service'.
BAD_TYPECODE	Incorrect TypeCode	Operating error in TypeCode class interface. Interface does not match category of TypeCode object being processed.  Check that correct interface operating method is in use.
CODESET_INCOMPATIBLE	Cord conversion cannot be executed	The method cannot be executed.  Check if the problem has occurred in the connection of the CORBA products of other companies.
COMM_FAILURE	Communication failure	Communication failure  If a communication error occurs in a local machine, use as follows, etc. to check that the server is operating.  Windows®: Task manager etc.  Solaris/Linux: ps command etc.  Use the ping command on client machine to check that there are no problems with connections of host machine which is set in object reference.  Check that there are no problems with network connections.
		A timeout may have been generated for one of the following reasons:  Transmission/reception data volume is large  Server processing is taking a long time  Number of connected servers/clients, or number of requests may be in excess of limit.  Increase the corresponding parameter value ('period_receive_timeout', 'max_IIOp_local_init_con', 'max_IIOp_local_init_requests') in config in CORBA Service, and then terminate and restart CORBA Service.
		An application running in multi-thread mode may include a thread that issued the CORBA_ORB_net_disconnect function. This caused the connection to be lost and this exception to occur in another thread using the same connection.  Do not issue the CORBA_ORB_net_disconnect function on another thread.
		In the client application, the object reference used to call the server application may be invalid.  Check whether you specified an already released object reference.  Example:  CORBA_Environment e;  CORBA_Object obj = CosNaming_NamingContext_resolve(...):/* Acquires the server object. */  ...  CORBA_Object_release(obj, &e); /* Releases the server object. */  test1_intf1_add(obj, ...); /* Error! An already released server object is used. */  If CORBA's Java interface is used, it is likely that CORBA communication processing was performed within the finalize() method overridden by an

System	Meaning	Location / Causes / Countermeasures
		<p>application's user-implemented class and an already released object reference is used there.</p> <p>Do not perform CORBA communication processing within the finalize() method.</p>
		<p>The content specified for ORB is incorrect.</p> <p>In Java applications, the settings for the ORB switch when the Java client application starts up may not have been configured correctly. ORB must be specified using the following methods:</p> <ul style="list-style-type: none"> <li>- Specify the property information in the -D option of the java command when the Java application is executed.</li> <li>- Create the file that the property information is specified in (orb.properties), then store the file in a predefined directory.</li> </ul>
		<p>If SSL communication is used to run applets that use Portable-ORB, there are insufficient permissions for using SSL.</p> <p>Check the environment settings for the applet and the Portable-ORB library that is used.</p>
CONTEXT	Failed to search context object	<p>The identifier specified for the context interface method is incorrect.</p> <p>Check that the identifier specified for the context interface method is correct.</p>
DATA_CONVERSION	Cord conversion failure.	<p>Specified character strings contain a character string, which cannot be applied to cord conversion.</p> <p>Check the specification of character strings and code type.</p> <p>Client side: Setting value of the environment variable OD_CODE_SET.</p> <p>Server side: The <i>OD_or_adm</i> command or the code type specified in the WU definition.</p>
FREE_MEM	Memory cannot be released	<p>Memory could not be released</p> <p>Check memory usage. If there is insufficient memory, terminate unnecessary programs.</p>
IMP_LIMIT	Implementation is limited	<p>Consider the following causes when an interface is being used:</p> <p>CORBA_BOA_impl_is_ready() invoked two or more times by the same program.</p> <p>CORBA_BOA_deactivate_impl() invoked without executing CORBA_BOA_impl_is_ready().</p> <p>Exception ID to be set in CORBA_BOA_set_exception() is too long. (max. 128 characters)</p> <p>Number of items added to NVList by CORBA_NVList_add_item() is too high. Reduce number of items, or create an NVList capable of registering the required number of items.</p> <p>The following unsupported interfaces have been invoked:</p> <ul style="list-style-type: none"> <li>- CORBA_TypeCode_param_count()</li> <li>- CORBA_TypeCode_parameter()</li> </ul> <p>Check that the interface is error-free.</p>
		<p>The number of naming contexts that can be registered to the naming service has reached the upper limit of 128 (including the root context).</p> <p>Delete unnecessary naming contexts using the OD_or_adm command.</p>

System	Meaning	Location / Causes / Countermeasures
		<p>If the naming context cannot be deleted, initialize the Naming Service using the <i>isinit</i> command. This problem might occur if the naming context created in the executed application using <code>CosNaming_NamingContext_new_context()</code> is not registered in <code>CosNaming_NamingContext_bind_context()</code>. In this case, processing is repeated until the value set for the maximum number of naming contexts is reached. Check the processing in the application and make sure that the naming context created using <code>CosNaming_NamingContext_new_context()</code> is registered in <code>CosNaming_NamingContext_bind_context()</code>.</p>
		<p>The number of binding iterators generated by the naming service has reached the upper limit of 256.</p> <p>If <code>CosNaming_NamingContext_list()</code> and the binding iterator interface are being used, use <code>CosNaming_BindingIterator_destroy()</code> to destroy the unnecessary binding iterators.</p>
INITIALIZE	Initialization processing not executed	<p>Initialization process <code>CORBA_ORB_init()</code> not executed.</p> <p>Invoke initialization by <code>CORBA_ORB_init()</code>.</p>
		<p>The Java library of the CORBA client may not have been set correctly or switching of the CORBA environment may not have been set correctly.</p> <p>Review the Java library setting of the CORBA client and review the setting of the CORBA environment switching. For details, refer to the Distributed Application Development Guide (CORBA Service Edition) for the Interstage Application Server Enterprise Edition.</p>
		<p>The setting of the database linkage service may be incorrect in the distributed transaction linkage.</p> <p>Review the setting of the database linkage service.</p>
		<p><b>Solaris32/64 Linux32/64</b></p> <p>There is a possibility that the environment variable <code>LD_LIBRARY_PATH</code> is not set correctly when the pre-installed Java library is used.</p> <p>Check that CORBA Service installation directory/lib is set in the environment variable <code>LD_LIBRARY_PATH</code>.</p>
		<p>If a pre-installed Java library is used, the environment variable <code>CLASSPATH</code> setting may be inconsistent.</p> <p>Check whether "ODjava4.jar" has been set in the environment variable <code>CLASSPATH</code>.</p>
		<p>If an applet is run using a pre-install type Java library, there are insufficient permissions to run the applet.</p> <p>Check the environment settings for the applet and the Java library that is used.</p>
INTERNAL	Internal error in CORBA services.	<p>Error in writing the <code>initial_services</code> file, during <code>odadmin</code> command processing, etc.</p> <p>No communication with CORBA Service. Collect troubleshooting information with the <i>iscollectinfo</i> command, and contact the service engineer.</p> <p>Alternatively, check the capacity of the disk for insufficient disk space.</p>
INTF_REPOS	Error in Interface Repository access	<p>Object reference for Interface Repository cannot be retrieved by <code>CORBA_Object_get_interface()</code> function.</p> <p>Check Interface Repository settings.</p>

System	Meaning	Location / Causes / Countermeasures
INV_FLAG	Incorrect flag setting	<p>Incorrect flag set in one of the following interfaces:</p> <p>CORBA_NVList_add_item()  CORBA_Object_create_request()  CORBA_Request_add_arg()  CORBA_Request_invoke()  CORBA_Request_send()  CORBA_Request_get_response()  CORBA_get_next_response()  Check interface operating method.</p>
INV_IDENT	Invalid identifier syntax	<p>The method cannot be executed.</p> <p>Check if it has occurred in the connection of the CORBA products of other companies.</p>
INV_OBJREF	Incorrect object reference	<p>A NULL object is returned by following functions:</p> <p>CORBA_BOA_get_id()  CORBA_Object_get_implementation()  CORBA_Object_get_interface()  CORBA_Object_duplicate()  Return object other than NULL object.</p>
		<p>Check that there is no error in Repository or object name specifying object.</p> <p>Check that correct object is returned to application.</p>
		<p>The following function was invoked more than once for the same obj:</p> <ul style="list-style-type: none"> <li>- CORBAcell_ORB_net_disconnect()</li> </ul> <p>Check whether the above function was invoked more than once.</p>
		<p>The interface registered using the following function was called even though the object and bind relationship had not been registered.</p> <ul style="list-style-type: none"> <li>- CORBA::ORB::set_unbinded_object_rejecting()</li> </ul> <p>Use an object for which a bind relationship with a process has been registered.</p>
INV_POLICY	Incorrect policy.	<p>The method cannot be executed.</p> <p>Check if the problem has occurred in the connection of the CORBA products of other companies.</p>
MARSHAL	Marshaling error in parameter or return value	<p>Context marshaling failure in CORBA_ServerRequest_ctx().</p> <p>Check the Context data transmitted by the client.</p>
		<p>When the Portable-ORB is used, the character string with the number of characters exceeding that defined for the fixed length character string parameter may be set and transferred.</p> <p>Check the length of the character string set for the fixed length character string parameter.</p>
		<p>When the EJB application is being executed, the class edition of the object to be transferred between the client and server may be different, or the required class may not exist.</p>

System	Meaning	Location / Causes / Countermeasures
		<p>Check whether the correct objects are located in the client and server environments.</p> <p>There is a possibility that the client and the server IDL are not the same. Check that the client and the server IDL are the same.</p> <p>There is a possibility that a NULL object was sent. Check whether a NULL object was sent.</p>
NO_IMPLEMENT	Operation not implemented	<p>Implementation information corresponding to ImplementationDef object returned by CORBA_BOA_impl_is_ready() cannot be found in Implementation Repository. Check registration information in Implementation Repository.</p>
		<p>Initial service LightInterfaceRepository is not implemented. The following functions have been invoked.</p> <p>CORBA_Repository_lookup_id() CORBA_InterfaceDef__get_RepositoryId() CORBA_InterfaceDef_is_a() CORBA_InterfaceDef_contents() CORBA_InterfaceDef_lookup_name() CORBA_Container_contents() CORBA_Container_lookup_name()</p> <p>When using the above functions, use the InterfaceRepository Initial service. In addition, when setting up the initial environment, enable the use of the Interface Repository Service.</p>
		<p>Queue reception terminated. Start queue reception by issuing the <i>odcntlque</i> command. If the server application is running on a WorkUnit, start receipt of the queue using the <i>ispermitque</i> command.</p>
		<p>The following function was called when Interface Repository Service has not been activated. CORBA_Object_get_interface() Check if Interface Repository Service has been activated or not.</p>
		<p>A request was issued to the server application that had not yet been started. Check whether the server application is started.</p>
		<p>An attempt was made to use an unsupported function. Check if the application program is correct.</p>
		<p>The settings of the environment variable CLASSPATH are incorrect. For the Java application, check whether "ODjava4.jar" has been set in the environment variable CLASSPATH.</p>
		<p>An attempt was made to call the application interfaces of the following services although the services are not started:</p> <ul style="list-style-type: none"> <li>- Naming Service</li> <li>- Interface Repository</li> <li>- Load Balance Function</li> </ul>

System	Meaning	Location / Causes / Countermeasures
		<p>Check if the above services are started.</p> <p>Note - The above services are CORBA server applications. When using the application interface for each service, you must start the service that implements the application interface in advance.</p>
		<p>The ORB is specified incorrectly.</p> <p>When the Java server application starts, the ORB switching may not have been set correctly. Check if the setting is set correctly by referring to the Distributed Application Development Guide (CORBA Service Edition) for the Interstage Application Server Enterprise Edition.</p> <p>Before the automatic start of shared or unshared servers is completed, the request message was received from the client.</p> <p>Resend the request from the client.</p>
NO_MEMORY	Dynamic memory not retrieved	<p>Dynamic memory allocation was unsuccessful.</p> <p>Check swap usage and if usage rate is high, expand swap or physical memory.</p>
NO_PERMISSION	No authority to execute method	<p>The method cannot be executed.</p> <p>Check if it has occurred in the connection of the CORBA products of other companies.</p>
NO_RESOURCES	Request cannot be executed due to insufficient resources	<p>Number of interfaces or number of operations has exceeded maximum executable on a single server.</p> <p>Edit IDL and reduce number of interfaces/operations.</p>
		<p>Memory shortage has occurred.</p> <p>Increase physical memory or swap memory.</p>
		<p>Process multilevel concurrency limit exceeded when server started up. The application may be active while the maximum number of concurrent applications has already been reached.</p> <p>Use the odlistproc command to check whether any unintended application remains active.</p> <p>Use the odprtcurparam command to check the current values of max_exec_instance and max_processes. If any of the current values reaches the upper limit, assign a greater value to 'max_exec_instance' or 'max_processes' in the CORBA service's config file, and then stop and restart the CORBA service.</p>
		<p>Semaphore limit reached.</p> <p>Increase semaphore maximum limit in kernel parameters.</p>
		<p>Number of requests received has exceeded queue reception limit.</p> <p>Increase the maximum number of requests that can be received in the queue by the odsetque command.</p>
		<p>Number of file descriptors has exceeded server limit.</p> <p>Increase usable file descriptor limit and restart server (ulimit command), or terminate unnecessary clients.</p>
		<p>For a Java server and pre-install type Java client, the number of servers/clients connected (or the number of requests) has reached the upper limit.</p> <p>Increase the 'max_IIOP_local_init_requests' and 'limit_of_max_IIOP_resp_requests' values of the CORBA service config file, and then stop and restart the CORBA service.</p>

System	Meaning	Location / Causes / Countermeasures
		If a previous version of Interstage is installed on the server at the connection destination, refer to the manual for version of Interstage installed on the server and take the action indicated.
		It is likely that, when CORBA_BOA_impl_is_ready() was executed to activate the server application, the system failed to create an appropriate number of initially concurrent threads.  Check whether an od10916 message is output to the system log. For the action, refer to the description of od10916.
NO_RESPONSE	No response to request	The method cannot be executed.  Check if it has occurred in the connection of the CORBA products of other companies.
OBJ_ADAPTER	Object implementation error	Contradiction between server type and startup method for implementation activated by CORBA_BOA_impl_is_ready().  Use the -p option of the OD_impl_inst command to check registration information in Implementation Repository.
		The startup method conflicts with that of the server type of the implementation attempted to be activated by POAManager.activate().  If the implementation repository ID that uses the OD_IMPLID environment variable is specified, check if the settings of that variable are correct.  Check if the implementation repository ID or interface repository ID specified as the adapter name for POA creation is correct.
		ServantManager, AdapterActivator, or the default server is not registered.  Check whether the POA policy setting is correct in the application program.
		A server process, which differs from the one that created an object reference, was invoked.  Check whether the server process that created an object reference is terminated. If the server process is terminated, recreate an object reference in the new server process.
OBJECT_NOT_EXIST	The object does not exist.	When the Naming Context interface and Naming Context Extension interface are used, the target Naming Context does not exist.  Use the OD_or_adm command (with -z option) to delete the binding of the target Naming Context, and register the Naming Context again.  The object for the Java server application does not exist.  If you are running the default instance format Java server application using process concurrency, check that the following object references are being used in the application program:  - The object reference generated dynamically using POA to specify USE_DEFAULT_SERVANT for the RequestProcessing policy  - The object reference created according to the prior generation method
PERSIST_STORE	Permanent storage failed	The method cannot be executed.  Check if it has occurred in the connection of the CORBA products of other companies.
REBIND	Contradiction against the policy set for RebindPolicy occurred	The method cannot be executed.  Check if the problem has occurred in the connection of the CORBA products of other companies.

System	Meaning	Location / Causes / Countermeasures
TIMEOUT	A timeout is generated	The method cannot be executed. Check if the problem has occurred in the connection of the CORBA products of other companies.
TRANSIENT	Transient error	CORBA_ORB_init() invoked in parallel by several threads of same program. Reinvoke CORBA_ORB_init().
UNKNOWN	Initialization error in the CORBA Service or unknown exception generated	CORBA_ORB_init() has failed. Check that the CORBA Service is started up and that sufficient resources are available to run the CORBA Service. There may be insufficient free memory allocated to the system. Check for sufficient memory. <b>Solaris32/64</b> <b>Linux32/64</b> If "iss_use = yes" has been set in the config file, a user that does not belong to the group specified in iss_group may have executed the function. Check the iss_group value and the group ID of the user that executed the function.
		The possible reasons are as follows: Unknown exception generated in CDR function. Abnormal end of server application. Check that parameters are correct. Check for errors or exceptions occurring during execution of the server application.
		The CORBA Service was terminated and re-started without terminating the CORBA applications. When terminating the CORBA Service, terminate all the CORBA applications beforehand.
		If a pre-installed Java library is used, Default Servant is not registered in the server application. <b>For this reason</b> , register Default Servant, and change the server application processing so that POAManager.activate() is called.
		The config file does not exist. Check the config file.
		If an applet is run using Portable-ORB, there are insufficient permissions to run the applet. Check the environment settings for the applet and the Portable-ORB library that is used.
		The content specified for ORB is incorrect. In Java applications, the settings for the ORB switch when the Java server application starts up may not have been configured correctly.

## 29.2 CORBA Service Minor Codes

The minor code is supplementary information to the exception information.

[Table 29.2 CORBA Service Minor Codes - Causes and Countermeasures](#) lists the CORBA Service minor codes.

### Remarks

- Refer to the minor code by accessing the minor member of the Environment structure.
- When flag 0x00000800 is set (indicating a value of 1179256832 or more in decimal notation), an exception has occurred on the server side.

**Note**

When the Java application is running, the minor code may be output in the following format:

```
vmcid: 0x464a0000 minor code: 2176
```

The methods used to check the minor code which was output in the above format, and examples of the output, are explained below.

**How to check**

1. After "vmcid:", the minor code and the logical product result of "0xffff000" are output. According to this value, the upper 5 digits of the minor code are identified. However in the following cases, the upper 5 digits are fixed.
  - For "vmcid: SUN": upper 5 digits "0x53550"
  - For "vmcid: OMG": upper 5 digits "0x4f4d0"
2. After "minor code", the minor code and the logical product result (Dec) of "0x00000fff" are output. This value is converted to Hex, and the lower 3 digits of the minor code are identified.
3. From the results of 1 and 2, all the digits of the minor code are identified.

**Example**

- When the minor code is 0x464a0123:

```
org.omg.CORBA.NO_MEMORY: Memory Error vmcid: 0x464a0000 minor code: 291 completed: No
```

1. From "vmcid: 0x464a0000", the upper 5 digits of the minor code are "0x464a0".
2. From "minor code: 291", "291" is converted to Hex, and the lower 3 digits are "0x123".
3. From the results of 1 and 2, the minor code is "0x464a0123".

- When the minor code is 0x53550123:

```
org.omg.CORBA.NO_MEMORY: Memory Error vmcid: SUN minor code: 291 completed: No
```

1. From "vmcid: SUN", the upper 5 digits of the minor code are "0x53550".
2. From "minor code: 291", "291" is converted to Hex, and the lower 3 digits are "0x123".
3. From the results of 1 and 2, the minor code is "0x53550123".

- When the minor code is 0x4f4d0123:

```
org.omg.CORBA.NO_MEMORY: Memory Error vmcid: OMG minor code: 291 completed: No
```

1. From "vmcid: OMG", the upper 5 digits of the minor code are "0x4f4d0".
2. From "minor code: 291", "291" is converted to Hex, and the lower 3 digits are "0x123".
3. From the results of 1 and 2, the minor code is "0x4f4d0123".

Table 29.2 CORBA Service Minor Codes - Causes and Countermeasures

Minor Code		Meaning	Causes / Countermeasures
Hexadecimal Notation	Decimal Notation		
0x00000000	0	No minor code information.	Refer to <a href="#">Table 29.1 CORBA Service Exception Information - Causes and Countermeasures</a> .
0x00000800	2048		
0x464a0000	1179254784	No minor code information.	The server object used to call the server application may be null. Review the client
0x464a0800	1179256832		

Minor Code		Meaning	Causes / Countermeasures
Hexadecimal Notation	Decimal Notation		
			application. If the object is not null, refer to <a href="#">Table 29.1 CORBA Service Exception Information - Causes and Countermeasures</a> .
0x464a0001 0x464a0801	1179254785 1179256833	Memory not retrieved.	Resolve memory shortages and terminate unnecessary applications.
0x464a0002 0x464a0802	1179254786 1179256834	Object not created.	Resolve memory shortages and terminate unnecessary applications.
0x464a0003 0x464a0803	1179254787 1179256835	Code conversion not possible using specified code information.  If fail is assigned to the <code>undefined_char_conversion</code> parameter in the config file, an undefined character may be included in the string to be subjected to code conversion.	Revise text string specified in parameter.
0x464a0004 0x464a0804	1179254788 1179256836	Transient error in stub source, or skeleton source.	Resolve memory shortages and terminate unnecessary applications.
0x464a0005 0x464a0805	1179254789 1179256837	Memory not released.	Confirm double release of resources.
0x464a0006 0x464a0806	1179254790 1179256838	Contradiction in encode/decode operating flag.	Stub source and skeleton source do not match.
0x464a0007 0x464a0807	1179254791 1179256839	encode/decode of communication data has failed.	Stub source and skeleton source do not match, or an error has occurred during communications.  If the description above is not the case, collect troubleshooting information with the <code>iscollectinfo</code> command, and contact the service engineer.
0x464a0008 0x464a0808	1179254792 1179256840	There is a possibility that the parameter data delivery between the client and server applications contains a Null object.  Alternatively, there may be an encode/decode problem.	Check if the forwarded application program data contains a Null object.  If the application program data delivery does not contain a Null object, collect troubleshooting information using the <code>iscollectinfo</code> command, and contact the service engineer.
0x464a0009 0x464a0809	1179254793 1179256841	encode/decode operating area not acquired.  The parameter delivery data (forwarded data) between client and server applications contains the Null object.	Resolve memory shortages and terminate unnecessary applications.  Check if the Null object is included in the application program forwarded data.
0x464a000a 0x464a080a	1179254794 1179256842	Error in function issuing sequence.	Revise function issuing sequence in application.
0x464a000b 0x464a080b	1179254795 1179256843	<a href="#">Windows32/64</a>	<a href="#">Windows32/64</a>

Minor Code		Meaning	Causes / Countermeasures
Hexadecimal Notation	Decimal Notation		
		System resource shortage (number of handles) detected.	Close unnecessary applications and increase the number of handles usable by system.
		<p><b>Solaris32/64 Linux32/64</b></p> <p>Number of file descriptors resource shortage detected.</p> <p>Additionally, the number of CORBA application processes might have exceeded 'max_process' in the 'config' file.</p>	<p><b>Solaris32/64 Linux32/64</b></p> <p>Resolve system resource shortage by increasing number of file descriptors usable by system.</p> <p>If the error message od10936 is output, refer to od10936.</p>
0x464a000c 0x464a080c	1179254796 1179256845	There is a possibility that the client and the server IDL is not the same, or that a NULL object was sent.	Check that the client and the server IDL is the same, or check if a NULL object was sent.
0x464a0010 0x464a0810	1179254800 1179256848	Library file defined in implementation is unusable.	<p>1. Check pathname of library.</p> <p><b>Solaris32/64 Linux32/64</b></p> <p>2. Check the LD_LIBRARY_PATH environment variable setting at server startup.</p>
0x464a0011 0x464a0811	1179254801 1179256849	Object invoked by client is not present in specified server.	<p>1. Stub and skeleton in server and client do not match.</p> <p>2. Error in library generation.</p>
0x464a0012 0x464a0812	1179254802 1179256850	Library not read.	No access right to library.
0x464a0013 0x464a0813	1179254803 1179256851	key information for the CORBA Service does not exist.	<p>1. Installed file system is corrupt.</p> <p>2. Reinstall the CORBA Service.</p>
0x464a0014 0x464a0814	1179254804 1179256852	Environment variable OD_HOME not specified.	Set environment variable OD_HOME.
0x464a0015 0x464a0815	1179254805 1179256853	Invalid directory structure for the CORBA Service.	<p>1. Reinstall the CORBA Service.</p> <p>2. Check that the value of the environment variable OD_HOME is valid.</p>
		When using Portable-ORB, a problem exists with the specifications of the environment file.	<p>1. Check that the environment file is being saved.</p> <p>2. Check that the destination directory for the environment file is correct.</p> <p>3. Check that the proxy settings are correct. To run applets without going via a proxy server, the Web server specified in the URL must be set up not to use a proxy server.</p>
		<p><b>Solaris32/64 Linux32/64</b></p> <p>The environment variable LD_LIBRARY_PATH is set incorrectly.</p>	<p><b>Solaris32/64 Linux32/64</b></p> <p>If the error message od10407 is output, refer to od10407 in the Messages manual.</p>
		<b>Solaris32/64</b>	<b>Solaris32/64</b>

Minor Code		Meaning	Causes / Countermeasures
Hexadecimal Notation	Decimal Notation		
		If the multi-system function is used, the specified extended system name may be incorrect.	Check that the specified extended system name is correct.
0x464a0016	1179254806	<b>Windows32/64</b>	<b>Windows32/64</b>
0x464a0816	1179256854	System resource shortage (number of handles).	Close unnecessary applications and increase number of handles usable by system.
		<b>Solaris32/64 Linux32/64</b> Control pipe unusable due to shortage of resources. Alternatively, the CORBA service is not yet started.	<b>Solaris32/64 Linux32/64</b> Increase number of file descriptors usable by system. If the CORBA service is not yet started, start it.
		<b>Solaris32/64 Linux32/64</b> A user that does not belong to the group specified in "iss_group" executed the function.	<b>Solaris32/64 Linux32/64</b> Check the value that was set for "iss_group" in the config file and execute the function as a user that belongs to the specified group.
0x464a0017	1179254807	Error in initial_service (init_svc).	1. Reinstall the CORBA Service.
0x464a0817	1179256855		2. Recover initial_service (init_svc), by using initial_service.default, initial_service.old, etc.
0x464a0018	1179254808	Error in impl.db.	1. Reinstall the CORBA Service.
0x464a0818	1179256856		2. Recover impl.db by using impl.db.default, impl.db.old, etc.
0x464a0019	1179254809	Error in config.	1. Reinstall the CORBA Service.
0x464a0819	1179256857		2. Recover config by using config.default, config.old, etc. 3. If Portable-ORB is being used, issue the porbeditenv command to recreate the operating environment file.
0x464a0030	1179254832	<b>Windows32/64</b>	<b>Windows32/64</b>
0x464a0830	1179256880	Invalid memory status.	A previous area of memory used by CORBA Service exists. The following causes are possible:
		<b>Solaris32/64 Linux32/64</b> Invalid shared memory status.	<b>Solaris32/64 Linux32/64</b> A previous area of shared memory used by CORBA Service exists. The following causes are possible: 1. The CORBA Service is not started. Start the CORBA Service. 2. An attempt was made to start the CORBA Service with the CORBA Service application still existing. Start the CORBA Service after closing all applications.

Minor Code		Meaning	Causes / Countermeasures
Hexadecimal Notation	Decimal Notation		
0x464a0031 0x464a0831	1179254833 1179256881	<b>Windows32/64</b> Usable memory exceeded, or memory shortage occurred.	<b>Windows32/64</b> Close unnecessary applications and increase the amount of free memory.
		<b>Solaris32/64 Linux32/64</b> System parameter shmmax has been exceeded.	<b>Solaris32/64 Linux32/64</b> Increase the value of the system parameter shmmax.
0x464a0032 0x464a0832	1179254834 1179256882	<b>Windows32/64</b> Usable memory exceeded, or memory shortage occurred.	<b>Windows32/64</b> Close unnecessary applications and increase the amount of free memory.
		<b>Solaris32/64 Linux32/64</b> Segment number in system parameter has been exceeded.	<b>Solaris32/64 Linux32/64</b> Increase the value of the system parameter shmseg.
0x464a0033 0x464a0833	1179254835 1179256883	<b>Windows32/64</b> Usable memory exceeded, or memory shortage occurred.	<b>Windows32/64</b> Close unnecessary applications and increase the amount of free memory. For a Java application, the Java VM heap size may be too large. In this case, set the heap size to an appropriate value.
		<b>Solaris32/64 Linux32/64</b> Shared memory cannot be retrieved due to memory shortage.	<b>Solaris32/64 Linux32/64</b> Increase the value of the system parameter shmmax. For a Java application, the Java VM heap size may be too large. In this case, set the heap size to an appropriate value.
0x464a0035 0x464a0835	1179254837 1179256885	<b>Windows32/64</b> Other error in memory. Alternatively, the CORBA service is not yet started.	<b>Windows32/64</b> Use system monitor to check memory status. If the CORBA service is not yet started, start it.
		<b>Solaris32/64 Linux32/64</b> Other error in shared memory.	<b>Solaris32/64 Linux32/64</b> Use ipcs command to check shared memory status.
0x464a0040 0x464a0840	1179254848 1179256896	<b>Windows32/64</b> Invalid handle status. <b>Solaris32/64 Linux32/64</b> Invalid semaphore status.	<b>Windows32/64</b> A previous handle used by CORBA Service exists. The following causes are possible: <b>Solaris32/64 Linux32/64</b> A previous semaphore used by CORBA Service exists. The following causes are possible: 1. The CORBA Service is not started. Start the CORBA Service.

Minor Code		Meaning	Causes / Countermeasures
Hexadecimal Notation	Decimal Notation		
			2. An attempt was made to start the CORBA Service with the CORBA Service application still existing. Start the CORBA Service after closing all applications.
0x464a0041 0x464a0841	1179254849 1179256897	Windows32/64 Shortage of usable handles.	Windows32/64 Close unnecessary applications and increase the number of free handles in the system.
		Solaris32/64 Linux32/64 System parameter semmni is insufficient.	Solaris32/64 Linux32/64 Increase the value of the system parameter semmni.
0x464a0042 0x464a0842	1179254850 1179256898	Windows32/64 Shortage of usable handles.	Windows32/64 Close unnecessary applications and increase the number of free handles in the system.
		Solaris32/64 Linux32/64 Number of usable semaphores is insufficient.	Solaris32/64 Linux32/64 Increase the value of the system parameter semmns.
0x464a0043 0x464a0843	1179254851 1179256899	Windows32/64 Shortage of usable handles.	Windows32/64 Close unnecessary applications and increase the number of free handles in the system.
		Solaris32/64 Linux32/64 System parameter semopm is insufficient.	Solaris32/64 Linux32/64 Increase the value of the system parameter semopm.
0x464a0044 0x464a0844	1179254852 1179256900	Windows32/64 Shortage of usable handles.	Windows32/64 Close unnecessary applications and increase the number of free handles in the system.
		Solaris32/64 Linux32/64 semume, semmnu number has been exceeded.	Solaris32/64 Linux32/64 Increase the value of the system parameter semume, semmnu.
0x464a0045 0x464a0845	1179254853 1179256901	Windows32/64 Other error in handle operation.	Windows32/64 Use system monitor to check memory status and number of handles.
		Solaris32/64 Linux32/64 Other error in semaphore operation.	Solaris32/64 Linux32/64 Use ipcs command to check semaphore status.
0x464a0050 0x464a0850	1179254864 1179256912	Windows32/64 Invalid message resource status. Solaris32/64 Linux32/64	Windows32/64

Minor Code		Meaning	Causes / Countermeasures
Hexadecimal Notation	Decimal Notation		
		Invalid message queue status.	<p>A previous message queue used by CORBA Service exists. The following causes are possible:</p> <p><b>Solaris32/64</b> <b>Linux32/64</b></p> <p>A previous message queue used by CORBA Service exists. The following causes are possible:</p> <ol style="list-style-type: none"> <li>1. The CORBA Service is not started. Start the CORBA Service.</li> <li>2. An attempt was made to start the CORBA Service with the CORBA Service application still existing. Start the CORBA Service after closing all applications.</li> </ol>
0x464a0051 0x464a0851	1179254865 1179256913	<b>Windows32/64</b> No message resource.	<b>Windows32/64</b> The message resource has been deleted by an application other than CORBA Service. Diagnose and revise the corresponding application.
		<b>Solaris32/64</b> <b>Linux32/64</b> No message queue.	<b>Solaris32/64</b> <b>Linux32/64</b> The message queue has been deleted by an application other than CORBA Service. Diagnose and revise the corresponding application.
0x464a0052 0x464a0852	1179254866 1179256914	<b>Windows32/64</b> Insufficient message resources.	<b>Windows32/64</b> Close unnecessary applications and increase system resources.
		<b>Solaris32/64</b> <b>Linux32/64</b> Insufficient resources for creating message queue.	<b>Solaris32/64</b> <b>Linux32/64</b> Increase value of system parameter, msgseg.
0x464a0053 0x464a0853	1179254867 1179256915	<b>Windows32/64</b> Message resources deleted.	<b>Windows32/64</b> The message resources have been deleted by an application other than CORBA Service. Diagnose or revise the corresponding application.
		<b>Solaris32/64</b> <b>Linux32/64</b> Message queue deleted.	<b>Solaris32/64</b> <b>Linux32/64</b> The message queue has been deleted by an application other than CORBA Service. Diagnose or revise the corresponding application.
0x464a0054 0x464a0854	1179254868 1179256916	<b>Windows32/64</b> Other error in message resources.	<b>Windows32/64</b> Use system monitor to check the system resource status.
		<b>Solaris32/64</b> <b>Linux32/64</b>	<b>Solaris32/64</b> <b>Linux32/64</b>

Minor Code		Meaning	Causes / Countermeasures
Hexadecimal Notation	Decimal Notation		
		Other error in message queue.	Use ipcs command to check message queue status.
0x464a0060 0x464a0860	1179254880 1179256928	Thread not generated.  It is likely that, when CORBA_BOA_impl_is_ready() was executed to activate the server application, the system failed to create an appropriate number of initially concurrent threads.	<b>Windows32/64</b>  Revise thread environment.  <b>Solaris32/64</b> <b>Linux32/64</b>  There is an error in the thread environment. Review the setting of the LD_LIBRARY_PATH environment variable.  Check whether an od10916 message is output to the system log. For the action, see the description of od10916.
0x464a0061 0x464a0861	1179254881 1179256929	Thread not generated due to memory shortage.	Close unnecessary applications and resolve memory shortage.
0x464a0062 0x464a0862	1179254882 1179256930	Insufficient number of system-generated threads.	Increase number of threads that can be generated by system.
0x464a0063 0x464a0863	1179254883 1179256931	Thread not operated.	Thread resources are not usable. Collect troubleshooting information with the iscollectinfo command, and contact the service engineer.
0x464a0064 0x464a0864	1179254884 1179256932	Other thread-related error.	Collect troubleshooting information with the iscollectinfo command, and contact the service engineer.
0x464a0070 0x464a0870	1179254896 1179256944	CORBA services already started.	CORBA services already active when startup invoked.
0x464a0071 0x464a0871	1179254897 1179256945	CORBA services terminated.	Start up CORBA services.
0x464a0072 0x464a0872	1179254898 1179256946	Server application terminated.	Restart the server application.
0x464a0073 0x464a0873	1179254899 1179256947	The server startup count has exceeded proc_conc_max (implementation information).  Otherwise, the number of request execution threads of the server application has exceeded max_exec_instance of the config file.	1. Use the OD_impl_inst command with the -p option specified to check whether the server startup count has exceeded proc_conc_max .  The number of active servers can be confirmed using the odlistproc command.  2. If the server startup count has not exceeded proc_conc_max, the number of request execution threads of the server application has exceeded max_exec_instance of the config file. Reestimate max_exec_instance of the config file.
0x464a0080 0x464a0880	1179254912 1179256960	Server application not started up.	Start the server application.

Minor Code		Meaning	Causes / Countermeasures
Hexadecimal Notation	Decimal Notation		
		The queue is blocked.	If the server application is running on a WorkUnit, unblock the queue using the <i>ispermitque</i> command.  In all other cases, begin receiving requests using the <i>odcntlque</i> command.
		The settings of the environment variable CLASSPATH are incorrect.	For the Java application, the CLASSPATH environment variable is invalid.  Check whether "ODjava4.jar" has been set in CLASSPATH environment variable.
		The ORB is specified incorrectly.	When the Java server application starts, the ORB switching may not have been set correctly. Check if the setting is set correctly by referring to the Distributed Application Development Guide (CORBA Service Edition) for the Interstage Application Server Enterprise Edition.
		If you are using the event service, the event channel or event factory did not start.	Start the event channel or event factory.
0x464a0081 0x464a0881	1179254913 1179256961	Database Linkage Service Rollback already completed.	Diagnose cause of Rollback.
0x464a0082 0x464a0882	1179254914 1179256962	Database Linkage Service Commit already completed.	Diagnose cause of plural Commit operations.
0x464a0083 0x464a0883	1179254915 1179256963	impl_is_ready() issue limit has been exceeded, or deactivate operation has been conducted for non-active implementation information.	1. Use the -p option of the OD_impl_inst command to review proc_conc_max (implementation information) on the server.  2. Revise the server application.
0x464a0090 0x464a0890	1179254928 1179256976	EJB processing cannot be performed yet because the CORBA Service is being started.	Retry later.
0x464a0091 0x464a0891	1179254929 1179256977	EJB processing cannot be performed yet because the CORBA Service is being started.	Retry later.
0x464a0092 0x464a0892	1179254930 1179256978	The specified kind of request processing is not being performed on the server.	Retry later.
0x464a0093 0x464a0893	1179254931 1179256979	Failed to reserve memory for fetching the client identifier.	Retry after checking available memory and adding memory or shutting down unnecessary programs.
0x464a0094 0x464a0894	1179254932 1179256980	The number of requests from the client has exceeded queue limit.	Increase the queue limit of the server from which the client issued the method.  Increase the value of 'Maximum Queuing Message' of the WorkUnit definition. Register the WorkUnit definition again when the server application operates

Minor Code		Meaning	Causes / Countermeasures
Hexadecimal Notation	Decimal Notation		
			<p>under the WorkUnit. Afterwards, stop and restart the WorkUnit.</p> <p>After setting the queue limit in [QUEUE] section of the queue_policy file, terminate and restart the CORBA Service.</p>
0x464a0095 0x464a0895	1179254933 1179256981	The request in the queue has been canceled.	Check if the request has been canceled.
0x464a0100 0x464a0900	1179255040 1179257088	Connection with server not established.	<ol style="list-style-type: none"> <li>1. Start the server machine.</li> <li>2. Diagnose reason why connection with communication server was refused.</li> </ol>
0x464a0101 0x464a0901	1179255041 1179257089	Processing time from request to server until completion has exceeded the waiting time for server method's return	<ol style="list-style-type: none"> <li>1. Revise operation of server application.</li> <li>2. Increase the client's server method response time. <ul style="list-style-type: none"> <li>- If the response time was set using the CORBA_ORB_set_client_request_timer or CORBA_ORB_set_client_timer function, specify a longer response time.</li> <li>- If none of the above functions are used, assign a larger value to period_receive_timeout in the config file, and then stop and restart the CORBA service.</li> <li>- When Portable-ORB is used, increase the response time which is set for [Config]-[TimeOut] in the porbeditenv command.</li> </ul> </li> </ol>
0x464a0102 0x464a0902	1179255042 1179257090	Client-to-server requests have exceeded max_IOP_local_init_con.	<p>Revise max_IOP_local_init_con in config.</p> <p>(Retry possible if other client terminates.)</p>
0x464a0104 0x464a0904	1179255044 1179257092	<p>Communication terminated, because prescribed time period has elapsed since last request from client, or because release of connection from server overlaps with client request.</p> <p>Alternatively, because the maximum number of connections the server can receive is exceeded, communication from the server is disconnected.</p> <p>Alternatively, there was an RST notice from the server.</p>	<ol style="list-style-type: none"> <li>1. Revise period_idle_con_timeout in config.</li> <li>2. If message od10918 is displayed on the server system, review the limit_of_max_IOP_resp_con (max_IOP_resp_con if Interstage of the server system is V5 or earlier) value.</li> <li>3. Check whether the server has crashed, or has not restarted.</li> <li>4. When using the IPCOM linkage function, check whether a timeout occurred when monitoring for non-communication while method load balancing is being used.</li> </ol>

0x464a0105 0x464a0905	1179255045 1179257093	<p>End communication message received, and communication terminated, due to termination of CORBA Services or server application.</p> <p>Or, connection closed because the time set for <code>period_idle_con_timeout</code> in the server config file was exceeded, and the client application request was issued at the same time.</p>	<ol style="list-style-type: none"> <li>1. Revise server application.</li> <li>2. Retry it from the client application.</li> <li>3. Reestimate the value specified for <code>period_idle_con_timeout</code> of config on the server side.</li> <li>4. Set a small value to <code>period_client_idle_con_timeout</code> of the config file on the client side at the time set to <code>period_idle_con_timeout</code> of the config file on the server side.</li> <li>5) It is likely that a connection loss due to a non-communication monitor timeout (specified by <code>period_idle_con_timeout</code> in the server-side config file) occurred at the same time as a request by the client application. Review the <code>period_idle_con_timeout</code> value.</li> </ol>
0x464a0106 0x464a0906	1179255046 1179257094	Insufficient system connections reported.	<ol style="list-style-type: none"> <li>1. Revise <code>max_IIOp_local_init_con</code> in config.</li> <li>2. Revise usable number of handles (file descriptors) in system.  (Retry possible if another client terminates.)</li> <li>3. There is an error in the host name in which the object exists, or communication with that host failed. Review the host name of the object by using the <code>odlistns</code> command.</li> <li>4) Communication with the host in which there is the object failed due to the shortage of the resources. Review the resources such as the memory.</li> </ol>
0x464a0107 0x464a0907	1179255047 1179257095	Communication from server ended due to termination of CORBA services or server application.	<ol style="list-style-type: none"> <li>1. Revise <code>max_IIOp_resp_con</code> in config.</li> <li>2. Revise server application.</li> </ol>
0x464a0108 0x464a0908	1179255048 1179257096	Communications connection with server lost.	<ol style="list-style-type: none"> <li>1. Revise server application.</li> <li>2. Diagnose cause of line error.</li> <li>3. When the dial-up connection was set, the request was sent with the network disconnected due to no communication. Implement the setup so that the disconnection due to no communication is disabled or the non-communication monitoring time is increased, by the use of the dial-up connection definition. Alternately, re-send the request.</li> </ol>

Minor Code		Meaning	Causes / Countermeasures
Hexadecimal Notation	Decimal Notation		
			4) If SSL communication is used to run applets that use Portable-ORB, check that permissions for using SSL have been set.
0x464a0109 0x464a0909	1179255049 1179257097	Invalid data received.  Alternatively, because the maximum number of connections the server can receive is exceeded, communication from the server is disconnected.  Alternatively, there was an RST notice from the server.	1. Diagnose communication path.  2. If message od10918 is displayed on the server system, review the <code>limit_of_max_IOP_resp_con</code> ( <code>max_IOP_resp_con</code> if Interstage of the server system is V5 or earlier) value.  3. Check whether the server has crashed, or has not restarted.  4. When using the IPCOM linkage function, check whether a timeout occurred when monitoring for non-communication while method load balancing is being used.
0x464a010a 0x464a090a	1179255050 1179257098	Socket not in usable state.	Take action for the <code>odxxxxx</code> ( <code>xxxxx</code> is a 5-digit number) message that was output at the same time.  Revise network environment.
0x464a010b 0x464a090b	1179255051 1179257099	Error during reception of result message from server, due to line error or shutdown.	1. Diagnose cause of line error.  2. Diagnose cause of shutdown.
0x464a010c 0x464a090c	1179255052 1179257100	Communications error generated upon request from client, due to line error, server shutdown, etc.  Alternatively, because the maximum number of connections the server can receive is exceeded, communication from the server is disconnected.	1. Diagnose cause of line error.  2. Diagnose cause of server shutdown.  3. If message od10918 is displayed on the server system, review the <code>limit_of_max_IOP_resp_con</code> ( <code>max_IOP_resp_con</code> if Interstage of the server system is V5 or earlier) value.  4. When using the IPCOM linkage function, check whether a timeout occurred when monitoring for non-communication while method load balancing is being used.
0x464a010d 0x464a090d	1179255053 1179257101	Data not extracted from communication queue.	Collect troubleshooting information with the <code>iscollectinfo</code> command, and contact the service engineer.
0x464a010e 0x464a090e	1179255054 1179257102	Error in host name specification defined in <code>initial_hosts(inithost)/object</code> reference.	1. Check the <code>initial_hosts</code> ( <code>inithost</code> ) host information.  2. Use the <code>-l</code> option of the <code>odlistns</code> command to check the object reference host information registered in the Naming Service.
0x464a010f 0x464a090f	1179255055 1179257103	socket deadlock status detected.	Revise network environment.
0x464a0110	1179255055	SSL socket cannot be used.	1. Revise the SSL environment setting.

Minor Code		Meaning	Causes / Countermeasures
Hexadecimal Notation	Decimal Notation		
0x464a0910	1179257104	Alternatively, because the maximum number of connections the server can receive is exceeded, communication from the server is disconnected.	2. If message od10918 is displayed on the server system, review the <code>limit_of_max_IIOp_resp_con</code> ( <code>max_IIOp_resp_con</code> if Interstage of the server system is V5 or earlier) value.
0x464a0111 0x464a0911	1179255057 1179257105	An error occurred when sending data to a remote node.	Check that the remote node is ready for data transfer.
0x464a0112 0x464a0912	1179255058 1179257106	The processing of the server application was not completed within the monitoring time.	Re-estimate the monitoring time by considering system performance on the server side and then change the maximum processing time of the application in the WorkUnit definition.  An application error may have caused an increase of application processing time. Check the application. If any error is found, remove the error and retry the processing.
0x464a0113 0x464a0913	1179255059 1179257107	The server application has already been started under control of the WorkUnit.	An attempt was made to restart a server application that had already been started under control of the WorkUnit.  The server application has already been started under control of the WorkUnit, and cannot be started separately.
0x464a0114 0x464a0914	1179255060 1179257108	In IPCOM linkage, request distribution is impossible because all distribution target servers are faulty, too heavily loaded, or under maintenance.	Refer to the manual of the IPCOM.  If the minor code detail viewer function is invalid, only the minor code is output when an abnormality is detected in IPCOM.  Refer to the IPCOM manual for details of the minor code detail viewer function.
0x464a0115 0x464a0915	1179255061 1179257109	After IPCOM sent a request to an application server, no reply came from the application server within the specific period (default: 3 minutes).	Refer to the manual of the IPCOM.
0x464a0116 0x464a0916	1179255062 1179257110	After IPCOM sent a request to an application server, the connection between IPCOM and the application server was lost.  Alternatively, an error other than the above occurred in the IPCOM linkage.	Refer to the manual of the IPCOM.
0x464a0121 0x464a0921	1179255073 1179257121	<code>impl_is_ready()</code> issue limit has been exceeded.	1. Use the <code>-p</code> option of the <code>OD_impl_inst</code> command to review <code>proc_conc_max</code> (implementation information) on the server.  2. Revise server startup of same implementation information.
0x464a0122 0x464a0922	1179255074 1179257122	Max. number of instances executable by server has been exceeded.	Revise <code>max_exec_instance</code> in config.

Minor Code		Meaning	Causes / Countermeasures
Hexadecimal Notation	Decimal Notation		
0x464a0123 0x464a0923	1179255075 1179257123	Max. number of executable processes (max_processes) has been exceeded.  Alternatively, a request was issued to a server that is being stopped.	1. Revise max_processes in config.  2. After starting the server application, reissue the request.
0x464a0124 0x464a0924	1179255076 1179257124	Maximum number of responses from server has been exceeded.	Revise max_IOP_resp_con or max_processes in config.
0x464a0125 0x464a0925	1179255077 1179257125	Failed to get the specified extended system information.	Check that the specified extended system name is correct. If the name is correct, take action according to the odxxxx message output at the same time ('xxxxx' is a 5-digit number).
0x464a0126 0x464a0926	1179255078 1179257126	A bind relationship has already been registered for the object you tried to bind.	Delete the bind relationship and then re-register it. Alternatively, register the bind relationship in another object.
0x464a0127 0x464a0927	1179255079 1179257127	The implementation repository ID is different in the object and server.	Register an object for which the implementation information matches the server application used for registering the bind relationship.
0x464a0128 0x464a0928	1179255080 1179257128	This is an object for which a bind relationship has not been registered.	This minor code is notified in the following cases:  - An interface that has already been registered using the CORBA::ORB::set_unbinded_object_rejecting function, AND  - The object that was used did not have a bind relationship with a process registered for it.  There was no access following the reaching of the time specified in the implementation definition ssn_timeout parameter. Check that a session timeout has not occurred.
0x464a0131 0x464a0931	1179255089 1179257137	Unsupported function.	This function or service is not supported.
0x464a0132 0x464a0932	1179255090 1179257138	Invalid ORB.	Check ORB used.
0x464a0133 0x464a0933	1179255091 1179257139	Failed to read operating environment file.	The operating environment file may be corrupted. If Portable-ORB is being used, recreate the operating environment file using <i>porbeditenv</i> command.
0x464a0134 0x464a0934	1179255092 1179257140	Communication data sent or received is not defined or not supported.  Or, communication data format does not match the definition.	Take either of the following measures.  1. When the CORBA products of other companies are connected, check the range that the communication data format supports.

Minor Code		Meaning	Causes / Countermeasures
Hexadecimal Notation	Decimal Notation		
			<p>2. Check if the version range of the object reference supported by the server is different from one supported by the client. If it differs, re-create an object reference with the range supported by the client, and register it again.</p> <p>3) If none of the above-mentioned is the case, collect troubleshooting information with the iscollectinfo command, and contact the service engineer.</p>
0x464a0135 0x464a0935	1179255093 1179257141	Version number of stub does not agree with the interface information.	<p>IDL file of server application is different from that of the client application.</p> <p>Re-compile applications based on the same IDL file.</p>
0x464a0136 0x464a0936	1179255094 1179257142	The number of requests that can be processed in one client process (max_IIOPIocal_init_requests) is exceeded.	Review 'max_IIOPIocal_init_requests' of the config file.
0x464a0137 0x464a0937	1179255095 1179257143	The number of requests that can be received by the server (limit_of_max_IIOPIresp_requests) is exceeded.	Review 'limit_of_max_IIOPIresp_requests' of the config file.
0x464a0138 0x464a0938	1179255096 1179257144	An expanded area could not be attached.	Take an action according to the message displayed on the server system.
0x464a0139 0x464a0939	1179255097 1179257145	The message was split into fragments that are too small.	Increase the split size of the fragment.
0x464a013a 0x464a093a	1179255098 1179257146	The message was split into fragments that exceed the size of the communication buffer.	Decrease the split size of the fragment so that it is smaller than the size of the communication buffer. The size of the communication buffer is as follows: If the "Buffer Size" statement of the WorkUnit definition is specified, it is that value. In all other cases, 4096 bytes.
0x464a013b 0x464a093b	1179255099 1179257147	A message that was split into fragments could not be received, because the number of communication buffers.	<p>Take the following action:</p> <ol style="list-style-type: none"> <li>1. Increase the number of communication buffers. This value can be specified in the "Buffer Number" statement of the WorkUnit definition or in "number_of_common_buffer" in the config file.</li> <li>2. Wait a few moments, then try again.</li> </ol>
0x464a0180 0x464a0980	1179255168 1179257216	Received data in HTTP tunneling linkage is invalid.	1. The HTTP-IIOPI gateway may not have been started. Check if the Web server environment settings are correct. (Refer to HTTP Tunneling Setup in the Security System Guide.)

Minor Code		Meaning	Causes / Countermeasures
Hexadecimal Notation	Decimal Notation		
			<p>2. Check the '-ORB_FJ_HTTPGW' parameter of HTTP tunneling linkage. (Refer to HTTP Tunneling Setup in the Security System Guide.)</p> <p>3. Check if an HTTP-IIOP gateway timeout occurred (if the od40008 message was output). If an HTTP-IIOP gateway timeout occurs, increase the timeout_response value of gwconfig.</p> <p>4. If the Web server on the HTTP tunneling linkage server machine is configured to request the client certificate, check that the client SSL environment is correct. (See 'Client environment setup' in the Security System Guide.)</p> <p>5. If the Web server is configured to use a proxy, check whether the proxy server has stopped.</p>
0x464a0181 0x464a0981	1179255169 1179257217	An error occurred in the data received in HTTP tunneling linkage.	Check the access log and error log of the Web server on the server machine for HTTP tunneling linkage.
0x464a0182 0x464a0982	1179255170 1179257218	Contradiction in session ID sequence during HTTP tunneling linkage.	Restart the Web server on the server machine for HTTP tunneling linkage.
0x464a0183 0x464a0983	1179255171 1179257219	Cannot connect to HTTP tunneling linkage server application.	<p>1. Check host name and port number registered in object reference of server application, using -I option in odlistns command.</p> <p>2. If the server hosting HTTP tunneling linkage is different to the machine on which the server application is running, then revise the network environment between the two servers.</p> <p>3. Check that the host and port number specified for the URL are correct.</p> <p>4. If a machine name was specified as the host for the URL, check that the specifications in the hosts file and DNS setting are correct on the HTTP tunneling linkage server machine.</p>
0x464a0184 0x464a0984	1179255172 1179257220	Cannot find host information for HTTP tunneling linkage server application.	<p>1. Check host name and port number registered in object reference of server application, using the -l option of the odlistns command.</p> <p>2. Check that a valid host name for the HTTP tunneling linkage server is registered in the object reference of the server application.</p>

Minor Code		Meaning	Causes / Countermeasures
Hexadecimal Notation	Decimal Notation		
0x464a0185 0x464a0985	1179255173 1179257221	Line termination detected in HTTP tunneling linkage server.	<p>1. If the CORBA Service in the machine running the server application has output a message, revise the CORBA Service settings accordingly.</p> <p>2. If the server hosting HTTP tunneling linkage is different to the machine on which the server application is running, then revise the network environment between the two servers.</p>
0x464a0186 0x464a0986	1179255174 1179257222	Memory shortage detected in HTTP tunneling linkage server.	<p>If message od40004 is generated, reestimate the parameter values of the gwconfig file. Otherwise:</p> <p><b>Windows32/64</b></p> <p>Terminate unnecessary applications to increase the amount of free memory.</p> <p><b>Solaris32/64 Linux32/64</b></p> <p>Increase the value of system parameter shmmax.</p>
0x464a0187 0x464a0987	1179255175 1179257223	Thread resource operation error in HTTP tunneling linkage server.	Restart the Web server on the server machine for HTTP tunneling linkage.
0x464a0188 0x464a0988	1179255176 1179257224	Error detected in HTTP tunneling linkage server.	Collect troubleshooting information with the iscollectinfo command, and contact the service engineer.
0x464a0190 0x464a0990	1179255184 1179257232	Cannot connect to HTTP-IIOP gateway.	<p>1. Check the network environment between the server machine for HTTP tunneling linkage and the client.</p> <p>2. Check parameters required for HTTP tunneling linkage.</p> <p>3. Use netstart to check the connection status. If a large number of connections in TIME_WAIT status are left, check whether the HTTP tunneling application is issuing a large number of requests in a short time. If the application exists, extend the request issuance interval so that the number of connections in TIME_WAIT status is reduced. In Windows(R) and Solaris, take the action described in the "Tuning Guide", section "System Tuning", "Tuning TCP/IP Parameters". This may be able to avoid the symptom.</p> <p>4. Check if the Web server is operating.</p> <p>5. Check if the inithost/initial_hosts settings of the client are correct.</p> <p>6. If the system is configured to use a proxy, the proxy settings may be incorrect.</p>

Minor Code		Meaning	Causes / Countermeasures
Hexadecimal Notation	Decimal Notation		
			Check that the http_proxy and http_proxy_port parameters in the CORBA service operating environment file (config file) are correct.
0x464a0191 0x464a0991	1179255185 1179257233	Failed in the SSL communication with HTTP-IIOP gateway.	<ol style="list-style-type: none"> <li>1. Check the SSL environment of the Web server operating on the server for HTTP tunneling linkage.</li> <li>2. Check the SSL environment of the client.</li> <li>3. Check that the Web server is running.</li> </ol>
0x464a0192 0x464a0992	1179255186 1179257234	Threads for HTTP-IIOP gateway connection not generated.	Terminate all browsers used by client, and then restart.
0x464a0193 0x464a0993	1179255187 1179257235	Error in data transmission to HTTP-IIOP gateway.	<ol style="list-style-type: none"> <li>1. Check the network environment between the server machine for HTTP tunneling linkage and the client.</li> <li>2. Check HTTP tunneling linkage parameters.</li> </ol>
0x464a0194 0x464a0994	1179255188 1179257236	Error in data reception from HTTP-IIOP gateway.	<ol style="list-style-type: none"> <li>1. Check network environment between HTTP tunneling linkage server and client.</li> <li>2. Check HTTP tunneling linkage parameters.</li> </ol>
0x464a0195 0x464a0995	1179255189 1179257237	Shutdown from HTTP-IIOP gateway detected.	Restart the Web server on the server machine for HTTP tunneling linkage.
0x464a0196 0x464a0996	1179255190 1179257238	Invalid data received from HTTP-IIOP gateway.	Restart the Web server on the server machine for HTTP tunneling linkage.
0x464a0197 0x464a0997	1179255191 1179257239	Invalid request ID received from HTTP-IIOP gateway.	Restart the Web server on the server machine for HTTP tunneling linkage.
0x464a0198 0x464a0998	1179255192 1179257240	Error detected in HTTP tunneling linkage client.	<p>Confirm that the timeout_response value specified in the HTTP gateway configuration file (gwconfig) of the server of HTTP tunneling linkage does not exceed the server method response time on the client side. If the value exceeding the server method response time is specified, timeout regarding the server method waiting time may have occurred.</p> <p>If it is not, use the iscollectinfo command to collect diagnostic information, and then contact the customer engineer.</p>
0x464a01b0- 0x464a01ee 0x464a09b0- 0x464a09ee	1179255216- 1179255278 1179257264- 1179257326	Minor code output by the event service was reported.	Refer to <a href="#">Table 29.2 CORBA Service Minor Codes - Causes and Countermeasures</a> .

Minor Code		Meaning	Causes / Countermeasures
Hexadecimal Notation	Decimal Notation		
0x464a0200 0x464a0a00	1179255296 1179257344	Request not created.	Request transmission resources could not be acquired, due to resource shortage, etc.
0x464a0201 0x464a0a01	1179255297 1179257345	Request not transmitted.	Failure in communication with server.  Carry out the same measures as indicated for 'COMM_FAILURE' in <a href="#">Table 29.1 CORBA Service Exception Information - Causes and Countermeasures</a> .
0x464a0202 0x464a0a02	1179255298 1179257346	Response to request not received.	Failure to receive results, due to server timeout, or abnormal termination of application.
0x464a0210 0x464a0a10	1179255312 1179257360	Area not acquired.	Terminate unwanted applications and restart program.
0x464a0220 0x464a0a20	1179255328 1179257376	Invalid method.	Check that there is no problem with the application program.
0x464a0230- 0x464a027f 0x464a0a30- 0x464a0a7f	1179255344- 1179255423 1179257392- 1179257471	Error in JNI (Java Native Interface).	<ol style="list-style-type: none"> <li>1. Check if a Java library for other platforms (ODjava4.jar) is being used.</li> <li>2. The Java Heap size may be insufficient. Check if the -Xmx and -Xms options of the java command were specified and specify an appropriate Java Heap size.</li> <li>3. Terminate unwanted applications and restart program.</li> </ol> <p>If the situation does not improve, collect troubleshooting information with the iscollectinfo command, and contact the service engineer.</p>
0x464a0280 0x464a0a80	1179255424 1179257472	Parameter error.	Check that there is no problem with the application program.
0x464a0281 0x464a0a81	1179255425 1179257473	Data not written.	<ol style="list-style-type: none"> <li>1. If the EJB application is being executed, the class edition of the object to be transferred between the client and server may be different or the required class may not exist. Check whether the objects located in the client and server environments are correct.</li> <li>2. The object moved between client and server may not implement java.io.Serializable, or may contain an object that does not implement java.io.Serializable. Check that all objects that are being moved implement java.io.Serializable.</li> <li>3. If a class name with a different class version is displayed after "java.io.InvalidClassException", ensure</li> </ol>

Minor Code		Meaning	Causes / Countermeasures
Hexadecimal Notation	Decimal Notation		
			<p>the client and server use the same version of the class.</p> <p>4. Terminate unwanted applications and restart program.</p> <p>If the problem is not remedied by performing the above step, call a Fujitsu SE.</p>
0x464a0282 0x464a0a82	1179255426 1179257474	Unsupported function invoked.	Check that there is no problem with the application program.
0x464a0283 0x464a0a83	1179255427 1179257475	Data error detected.	Check that there is no problem with the application program.
0x464a0284 0x464a0a84	1179255428 1179257476	Invalid operation invoked.	Check that there is no problem with the application program.
0x464a0285 0x464a0a85	1179255429 1179257477	ORB not initialized.	Check that there is no problem with the application program.
		The Java library of the CORBA client may not have been set correctly or switching of the CORBA environment may not have been set correctly.	Check the Java library setting of the CORBA client and check the setting of the CORBA environment switching. For details, refer to the Distributed Application Development Guide (CORBA Service Edition) for the Interstage Application Server Enterprise Edition.
		The setting of the database linkage service may be incorrect in the distributed transaction linkage.	Check the setting of the database linkage service.
		<p><b>Solaris32/64</b> <b>Linux32/64</b></p> <p>There is a possibility that the environment variable LD_LIBRARY_PATH is not set correctly when the pre-installed Java library is used.</p>	<p><b>Solaris32/64</b> <b>Linux32/64</b></p> <p>Check that CORBA Service installation directory/lib is set in the environment variable LD_LIBRARY_PATH.</p>
		If a pre-installed Java library is used, the environment variable CLASSPATH setting may be inconsistent.	Check whether "ODjava4.jar" has been set in the CLASSPATH environment variable.
0x464a0286 0x464a0a86	1179255430 1179257478	Error in method invocation sequence.	Check that there is no problem with the application program.
0x464a0287 0x464a0a87	1179255431 1179257479	Area not acquired.	Terminate unwanted applications and restart program.
0x464a0288 0x464a0a88	1179255432 1179257480	There is an inconsistency between the server type and the activation method of the implementation to be activated by CORBA_BOA_impl_is_ready().	Use the -p option of the OD_impl_inst command to check the implementation repository registration information.
		The startup method conflicts with that of the server type of the implementation attempted to be activated by POAManager.activate().	1. If the implementation repository ID that uses the OD_IMPLID environment

Minor Code		Meaning	Causes / Countermeasures
Hexadecimal Notation	Decimal Notation		
			variable is specified, check if the settings of that variable are correct. 2. Check if the implementation repository ID or interface repository ID specified as the adapter name for POA creation is correct.
		ServantManager, AdapterActivator or default servant not registered.	Check that the correct POA policy is set in the application program.
		A server process that differs from the one that created an object reference was invoked.	Check whether the server process that created an object reference is terminated. If the server process is terminated, recreate an object reference in the new server process.
0x464a0289 0x464a0a89	1179255433 1179257481	A servant object or POA to be the target was not found.	1. Check whether the servant object and POA are activated. 2. Check for any error in the interface. 3. If you are running the default instance format Java server application using process concurrency, check that the following object references are being used in the application program. <ul style="list-style-type: none"><li>- The object reference generated dynamically using POA to specify USE_DEFAULT_SERVANT for the RequestProcessing policy</li><li>- The object reference created according to the prior generation method</li></ul>
0x464a028a 0x464a0a8a	1179255434 1179257482	POAManager object in discarding state, so request not processed.	Set POAManager to active state by issuing hold_requests() method and activate () method to POAManager.
0x464a0302 0x464a0b02	1179255554 1179257602	ServantManager, AdapterActivator or the default servant is not registered.	Check for any error in the policy setting of POA in the application program.
0x464a0303 0x464a0b03	1179255555 1179257603	The order of calling methods is incorrect.	Check for any error in the application program.
0x464a0304 0x464a0b04	1179255556 1179257604	Failed to acquire an area.	Shut down unnecessary programs and then restart the program.
0x464a0305 0x464a0b05	1179255557 1179257605	The number of executable processes (max_processes) was exceeded.	Review max_processes in the config file.
0x464a0306 0x464a0b06	1179255558 1179257606	An attempt was made to execute an invalid operation.	Check for any error in the application program.
0x464a0307 0x464a0b07	1179255559 1179257607	The unknown_adapter method of the AdapterActivator class returned False.	No measure needs to be applied.

Minor Code		Meaning	Causes / Countermeasures
Hexadecimal Notation	Decimal Notation		
0x4f4d0000- 0x4f4dffff	1330446336- 1330511871	The specified URL schema is incorrect.	Correct the URL schema by referring to the Distributed Application Creation Guide (CORBA Service) for the Interstage Application Server Enterprise Edition.
0x4d4f0000- 0x4d4fffff	1297022976- 1297088511	Minor code was notified from an environment other than a CORBA service environment.	<p>1. The ORB switching may not have been set correctly.</p> <p>Check if the setting is set correctly by referring to the Distributed Application Development Guide (CORBA Service Edition) for the Interstage Application Server Enterprise Edition.</p> <p>2. When Java EE is used, refer to "Exception information during IOP communication", check the meaning of the exception which is output, then take action.</p>
0x53550000- 0x5355ffff	1398079488- 1398145023		

## 29.3 Exceptions Beginning with Java

---

This section explains exception information that is output while the CORBA service Java application is running.

### 29.3.1 java.lang.ClassCastException

---

#### java.lang.ClassCastException

##### Explanation

If java.lang.ClassCastException is thrown, it means that the content specified for ORB (Object Request Broker) may be incorrect.

##### User Action

Check that ORB (Object Request Broker) was specified correctly.

ORB must be specified using the following methods:

- Specify the property information in the -D option of the java command when the Java application is executed.
- Create the file that the property information is specified in (orb.properties), then store the file in a predefined directory.

### 29.3.2 java.lang.IncompatibleClassChangeError

---

#### java.lang.IncompatibleClassChangeError

##### Explanation

The application class was compiled in an incompatible Java version.

When an application compiled using a java compiler of JDK1.3 or earlier is executed, java.lang.IncompatibleClassChangeError occurs in the following methods:

- org.omg.PortableServer.POAManager.activate()
- org.omg.PortableServer.POAManager.hold\_requests()
- org.omg.PortableServer.POAManager.discard\_requests()
- org.omg.PortableServer.POAManager.deactivate()

#### User Action

To migrate from JDK/JRE1.3 or earlier in the Java interface, recompile the application using the JDK/JRE java compiler which is currently used.

### 29.3.3 java.lang.NullPointerException

---

#### [java.lang.NullPointerException](#)

#### Explanation

If java.lang.NullPointerException is thrown in the client system, it may mean that the host name has not been specified in the inithost/initial\_hosts file.

#### User Action

Check that the host name is specified in the inithost/initial\_hosts file.

### 29.3.4 java.lang.UnsupportedClassVersionError

---

#### [java.lang.NullPointerException](#)

#### Explanation

The application class was compiled in a newer Java version than the Java version that was used to execute the application.

#### User Action

Check that the application class is executed in a newer Java version than the Java version that was used to compile the application.

### 29.3.5 java.rmi.RemoteException

---

#### [java.rmi.RemoteException: CORBA %s1 %s2](#)

#### Variable Information

%s1 = Exception Information

%s2 = Minor Code

#### Explanation

An exception occurred in the EJB application.

#### User Action

Check exception information %s1 and minor code %s2, and fix the cause of the error.

### 29.3.6 java.security.AccessControlException

---

#### [java.security.AccessControlException: %s1](#)

#### Variable Information

%s1 = Exception Information

#### Explanation

No access permissions have been set.

#### User Action

Take the following action:

- **Solaris64**

If a string containing "access denied (java.io.SerializablePermission enableSubclassImplementation)" is output to exception information (%s1), take one of the following actions:

- Set the following system property:

```
jdk.corba.allowOutputStreamSubclass=true
```

- Set the SerializablePermission enableSubclassImplementation permission in the following Java libraries:

**For CORBA application**

- /opt/FSUNod/etc/class/ODjava4.jar
- User application classes and libraries

**For Portable-ORB**

- /opt/FJSVporb/lib/ODporb4.jar
- /opt/FJSVporb/lib/InterfaceRep4.jar
- /opt/FJSVporb/lib/CosNaming4.jar
- User application classes and libraries

- Otherwise, after checking exception information (%s1), take the necessary action.

# Chapter 30 Exception Information Reported from Component Transaction Service

This chapter describes the exception information that may occur during operation of the Component Transaction Service.

## Note

For exceptions and minor codes generated during application operation, the application and its execution environment may have to be reviewed.

## 30.1 Component Transaction Service Exception Information

The exception information of the Component Transaction Service is shown in the following table. When an exception occurs, an error log is also output. Refer to Common Error Log information when necessary.

Table 30.1 Component Transaction Service Exception Information - Causes and Countermeasures

System	Meaning	Location / Causes / Countermeasures
NO_MEMORY	Failed to acquire dynamic memory.	Failed to allocate dynamic memory. (Error log: 1005) <div style="border: 1px solid green; padding: 2px; display: inline-block;">Windows32/64</div> Check the used amount of page file. If the use ratio is high, increase the page file or the real memory. <div style="border: 1px solid orange; padding: 2px; display: inline-block;">Solaris32/64</div> <div style="border: 1px solid red; padding: 2px; display: inline-block;">Linux32/64</div> Check the swap area usage. If the usage rate is high, either increase the size of the swap area or increase the amount of on-board memory.
INV_OBJREF	The requested object is not contained in the started WorkUnit.	Either the WorkUnit corresponding to the specified object is not running, or the object name is incorrect. (Error log: 1006)  Start the WorkUnit if it is not running. If the WorkUnit is running, check whether the object name is correct.
INTERNAL	The transaction context set by the client could not be acquired.	The transaction context set by the client cannot be acquired. (Error log: 2001)  Check that the client has set the transaction context correctly.
BAD_PARAM	An invalid parameter was passed from the client.	1. Invalid NULL parameter was detected. (Error log: 1009)  2. Disagreement between the interface information registered in Interface Repository and that of the client stub has been detected by the interface information check function.  The client application may be at fault, or the Interface Repository and client application stubs may not match.  Re-execute IDL compilation, and re-create the client application.
Other	CORBA Service error.	A CORBA Service error occurred. (Error log: 1007).  Refer to CORBA Service Exception Information

# Chapter 31 Exception Information Reported from the Database Linkage Service

This chapter describes the exception information that may occur during operation of the Database Linkage Service.

## Note

For exceptions and minor codes generated during application operation, the application and its execution environment may have to be reviewed.

## 31.1 Database Linkage Service Exception Information

The exception information of the Database Linkage Service is shown in the following table.

Table 31.1 Database Linkage Service Exception Information - Causes and Countermeasures

System	Meaning	Location / Causes / Countermeasures
INVALID_TRANSACTION	Incorrect transaction context sent	The wrong transaction context was passed as an argument. The transaction was unable to reference the resource.  Check for problems in the program that issued begin.
TRANSACTION_MODE	The current transaction mode has no compatibility with the TransactionPolicy in the object reference	The method cannot be executed.  Check if the problem has occurred in the connection of the CORBA products of other companies.
TRANSACTION_REQUIRED	Request made to transactional object outside transaction	No begin request was issued or a request was made to a transactional object by a thread other than the thread that issued begin.  Check that the request to the transactional object was made from the thread that issued begins.
TRANSACTION_ROLLEDBACK	Transaction rolled back	The system rolled back a transaction because it was timed out or a problem occurred. Otherwise, rollback_only may have been specified.  Check for transaction timeout and check the system environment.
TRANSACTION_UNAVAILABLE	Cannot continue processing of the transaction service context due to disconnection to the transaction service	The method cannot be executed.  Check if the problem has occurred in the connection of the CORBA products of other companies.
Other	CORBA Service error.	A CORBA Service error occurred.  Refer to CORBA Service Exception Information.

# Chapter 32 Exception Information Minor Codes Reported from the Event Service

This chapter describes the exception information and minor codes that can occur during operation of the Event Service.

## Note

For exceptions and minor codes generated during application operation, the application and its execution environment may have to be reviewed.

## 32.1 Event Service Exception Information and Minor Codes

The following table lists the minor codes that are posted when the Event Service interface issues system exceptions. Access the minor member of the Environment structure, and refer to the minor code.

Table 32.1 Event Service Minor Codes

System Exception	Minor Code		Meaning/Required Action
	Hexadecimal Notation	Decimal Notation	
BAD_OPERATION	0x464a01e0	1179255264	The called method contradicts the model of the specified Event Channel. Check that there is no problem with the application program.
	0x464a09e0	1179257312	
	0x464a01e1	1179255265	Local transaction processing was performed in a channel not specified for a local transaction operation. Create a channel for the local transaction operation.
	0x464a09e1	1179257313	
	0x464a01e2	1179255266	
	0x464a09e2	1179257314	
0x464a01e9	1179255273	When the supplier pushed or committed the data, the consumer connected to the Event Channel did not exist. After the consumer connects to the Event Channel, re-issue the push method.	
0x464a09e9	1179257321		
0x464a01eb	1179255275	An invalid destroy request was invoked to the static channel of persistent channel operation. When deleting a static channel for persistent channel operation, use the <i>esrmchnl</i> command.	
0x464a09eb	1179257323		
BAD_PARAM	0x464a01e4	1179255268	The parameter that was specified is incorrect. In the application program, check that the correct parameter type and value was used, and check whether NULL or another value, that is outside the range that can be specified, was used.  If this minor code was notified at the time of dynamic generation, it is possible that the name of the specified channel will exceed the maximum length (64 bytes). Check that there are no mistakes in the channel name.
	0x464a09e4	1179257316	
	0x464a01e5	1179255269	An incorrect proxy object reference was specified for the parameter. Specify the correct value for the proxy object reference.  The pull or pull_wait methods were issued twice for the proxy object reference while waiting for pull or pull_wait.  A shorter time than the event data wait time (set by the -wtime option of the <i>esetcnf</i> command or <i>esetcnfchnl</i> command) may have been specified for parameter period_receive_timeout in the CORBA Service operation
0x464a09e5	1179257317		

System Exception	Minor Code		Meaning/Required Action
	Hexadecimal Notation	Decimal Notation	
			environment file (config). Review the event data wait time (for details, refer to the Tuning Guide). If no problem is found, check whether the method is issued twice by the application.
BAD_QOS	0x00000000	0	The specified QoS property item or its value is invalid.  Verify that the QoS property item and the value specified for it in the application program are correct.
COMM_FAILURE	0x464a01c1	1179255233	The event initiated by the pull or pull_wait method timed out. Reissue the pull or pull_wait method when you receive data.
	0x464a09c1	1179257281	
	0x464a01c2	1179255234	During the following operations, a timeout occurs while the pull method is waiting for event data.  - Stop of the event channel  - Connection information recovery using the disconnect or destroy method  - Connection information recovery using the esmonitorchnl command  The Event Channel with the relevant consumer is disconnected.  Check whether the disconnect or destroy method was issued during processing for the wait for event data using the pull or pull_wait methods in the application. If the wait for event data is being processed, cancel it using the pull_cancel method, and then issue the disconnect or destroy method.  To establish communications, perform the following steps:  1. Check the start of the event channel. If it has stopped, start it. When the event channel is stopping, stop it using forced stop mode, and then start it.  2. Re-execute the application, or start by connecting to the Event Channel.
	0x464a09c2	1179257282	
	0x464a01c3	1179255235	
	0x464a09c3	1179257283	
	0x464a01c4	1179255236	
	0x464a09c4	1179257284	
	0x464a01c5	1179255237	
	0x464a09c5	1179257285	
0x464a01c6	1179255238	A pull waiting was cancelled by the pull_cancel method. If you receive the data, re-issue the pull method.	
0x464a09c6	1179257286		
0x464a01c8	1179255240	A commit processing failed because the consumer in pull status exists. After completion of pull, execute the commit processing.  Unit resources may have run out due to continuous transmission exceeding the capacities of the event data file,	
0x464a09c8	1179257288		

System Exception	Minor Code		Meaning/Required Action
	Hexadecimal Notation	Decimal Notation	
			which is a unit definition file. Review the capacity settings in the event data file of the application or the unit definition files.
	0x464a01c9 0x464a09c9	1179255241 1179257289	A pull waiting for local transaction processing was cancelled by the rollback. If you receive the data, re-execute the transaction processing.
	0x464a01ec 0x464a09ec	1179255276 1179257324	<p>It may mean the host name or port number specified for the interfaces shown below is invalid.</p> <p>Verify that the host name and port number specified for the interfaces shown below in the application program are valid.</p> <ul style="list-style-type: none"> <li>- For Event Service <ul style="list-style-type: none"> <li>C: EventFactory_create()</li> <li>C++: EventFactory::create()</li> <li>Java: com.fujitsu.ObjectDirector.EventService.EventFactory.create()</li> <li>COBOL: EVENTFACTORY-CREATE</li> </ul> </li> <li>- For Notification Service <ul style="list-style-type: none"> <li>C: CosNotifyChannelAdmin_EventChannelFactory_create_channel()</li> <li>C++: CosNotifyChannelAdmin::EventChannelFactory::create_channel()</li> <li>Java: org.omg.CosNotifyChannelAdmin.EventChannelFactory.create_channel()</li> <li>COBOL: COSNOTIFYCHANNELADMIN-EVENTCHANNELFACTORY-CREATE-CHANNEL</li> </ul> </li> </ul>
IMP_LIMIT	0x464a01b2 0x464a09b2	1179255218 1179257266	<p>The number of data items queued in the notification service Event Channel has reached the upper limit. Use the <i>esetcnf</i>, <i>esetcnfchnl</i>, and <i>esmonitor</i> commands to verify the number of data items that can be accumulated in the Event Channel, and change the upper limit if necessary.</p> <p>Note that transmitted event data is not accumulated in the Event Channel.</p>
	0x464a01b9 0x464a09b9	1179255225 1179257273	<p>The upper limit has been reached for the following values in the global transaction operation:</p> <ul style="list-style-type: none"> <li>- The number of messages that can be sent or received by a transaction</li> <li>- The transaction concurrency level</li> </ul> <p>Check whether there is a problem with the above values.</p>
INTERNAL	0x464a01d0 0x464a09d0	1179255248 1179257296	An application connected to the EventChannel may have closed without disconnecting from it. Collect unnecessary connection information using the <i>esmonitorchnl</i> command.

System Exception	Minor Code		Meaning/Required Action
	Hexadecimal Notation	Decimal Notation	
			<p>Collect any unnecessary connection information in the application as well.</p> <p>If the above does not apply, an internal Event Service error occurred. Collect diagnostic information using the <i>iscollectinfo</i> command, and then contact your systems engineer.</p>
NO_IMPLEMENT	0x464a01e6	1179255270	An unsupported calculation was tried or function used.
	0x464a09e6	1179257318	
	0x464a01ec	1179255276	<p>The specified EventChannel object reference has not been registered in the naming service of the host accessed by the application. When the EventChannel is created using the <i>esmkchnl</i> command, the EventChannel object reference is registered in the naming service. However, the host set for the application reference destination host might be different to the host for the naming service in which the EventChannel object reference was registered.</p> <p>Make sure that the host for the naming service that obtained the EventChannel object reference matches the application reference destination host, by following the procedure below:</p> <p>When running an Event Service/Notification Service application, check that the following hosts match:</p> <ul style="list-style-type: none"> <li>- The "NameService" host displayed by the <i>OD_or_adm</i> (with the <i>-I</i> option) command in the <i>esmkchnl</i> command runtime environment</li> <li>- When the <i>resolve_initial_references_remote</i> interface is used in the application:  The host specified for the <i>resolve_initial_references_remote</i> interface</li> </ul> <p>Note: When multiple hosts are specified, it might not be possible to obtain the object reference correctly.</p> <p>When the <i>resolve_initial_references</i> interface is used in the application</p> <p>One of the following hosts:</p> <ul style="list-style-type: none"> <li>- When running the application using a server package  The "NameService" naming service host displayed by the <i>OD_or_adm</i> (with the <i>-I</i> option) command in the application operating environment.</li> <li>- When running the application using a client package  The host set in the application operating environment <i>initial_hosts/inithost</i> file</li> </ul> <p>When running an Interstage JMS application, check that the following hosts match:</p> <ul style="list-style-type: none"> <li>- The "NameService" host displayed by the <i>OD_or_adm</i> (with the <i>-I</i> option) command in the <i>mkchnl</i> command runtime environment.</li> </ul>
	0x464a09ec	1179257324	

System Exception	Minor Code		Meaning/Required Action
	Hexadecimal Notation	Decimal Notation	
			<p>- If the naming service IP address or host name (ipaddress) and port number (port) are specified in the <code>java.naming.InitialContext.lookup</code> method and Destination is defined in the application:</p> <p>Naming service IP address or host name specified in the <code>java.naming.InitialContext.lookup</code> method.</p> <p>If the naming service IP address or host name (ipaddress) and port number (port) are not specified in the <code>java.naming.InitialContext.lookup</code> method and Destination is defined in the application</p> <p>One of the following hosts:</p> <ul style="list-style-type: none"> <li>- When running the application using a server package: The "NameService" naming service host displayed by the <i>OD_or_adm</i> (with the <i>-I</i> option) command in the application operating environment</li> <li>- When running the application using a client package: The host set in the application <code>initial_hosts/inithost</code> file.</li> </ul>
			<p>The Event Channel used to register the object reference using the <i>esetchnlior</i> command does not exist.</p> <p>The Event Channel might have been stopped or been recreated after the object reference was registered using the <i>esetchnlior</i> command.</p> <p>If the Event Channel has stopped, start it.</p> <p>To recreate the Event Channel, execute the <i>esgetchnlior</i> and <i>esetchnlior</i> commands again and register the Event Channel object reference.</p>
			<p>The Event Channel does not exist.</p> <p>Take the following actions:</p> <p>Using the Event Service operation command</p> <ol style="list-style-type: none"> <li>1. Check the EventChannel status using the <i>esmonitor</i> command - EventChannels that are not running are not displayed.</li> <li>2. System Exception	Minor Code		Meaning/Required Action
	Hexadecimal Notation	Decimal Notation	
	0x464a01b6 0x464a09b6	1179255222 1179257270	Transaction is not started. Start the transaction.
	0x464a01b7 0x464a09b7	1179255223 1179257271	Unit notified of insufficient resources. Review the system resources.
	0x464a01b8 0x464a09b8	1179255224 1179257272	The maximum number of messages has been reached. Review the number of messages.
	0x464a01b9 0x464a09b9	1179255225 1179257273	The upper limit has been reached for the following values: <ul style="list-style-type: none"> <li>- The number of messages that can be sent or received by a transaction</li> <li>- The transaction concurrency level</li> </ul> Check whether there is a problem with the above values.
	0x464a01bb 0x464a09bb	1179255227 1179257275	The event channel by which the supplier transmitted data (begin/push/commit method) has been blocked or automatically blockaded.  There is an unresolved transaction when this minor code is reported by the commit method after the begin method is issued.  Take the following actions: <ul style="list-style-type: none"> <li>- After block or automatic block is canceled, execute the commit processing again.</li> <li>- Execute the rollback processing. After blockage or automatic blockage is canceled, the begin method is issued, then execute the transaction processing again.</li> </ul> Execute the transmission processing again after block or automatic block is canceled when you push the event data in a case like the above-mentioned.
Others			A CORBA Service error occurred.  Refer to the "Exception Information Minor Codes Reported from the CORBA Service chapter".

# Chapter 33 Status Codes Reported from the Web Server

HTTP/1.1 status codes that are reported from the Web server to the Web client are explained in this chapter.

## Remark

The types of log shown below are output while the Web server (Interstage HTTP Server) is running. Refer to the status code that is reported.

- Access logs

The status of access from the Web client is output.

- Error logs

An error message is output to the error log if an error occurs in the Web server (Interstage HTTP Server).

- Trace logs

Web client input/output information and plug-in module input/output information is output to the trace log.

## 33.1 Successful (Status Codes 200 to 299)

### 33.1.1 200

#### 200 OK

##### Explanation

The request was handled successfully.

##### When Single Sign-on is used

If an additional message is output when Single Sign-on is used

Take action according to the message.

[Authentication information has expired.](#)

##### Explanation

Authentication information has expired, so authentication must be performed again.

##### Explanation when session management is used

Authentication will need to be performed again if session management is disabled for the following reasons:

- The authentication information has expired.
- Another user performed a Forced Sign-on operation, disabling session management.

##### User Action

Perform authentication again if it does not occur automatically.

[Authentication has been expired.](#)

[Do you want to sign on again using Integrated Windows Authentication?](#)

##### Explanation

The authentication operation must be performed again because the validity of the authentication information has expired.

##### User Action

Either sign on again using Integrated Windows Authentication, or select not to sign on.

[Authentication was successful.](#)

##### Explanation

In POST request authentication, authentication completed, but the page did not transition to the protection resource. Probable causes include:

- After the authentication window opened, the authentication operation stopped prior to completion and then restarted.
- The protection resource was accessed with only the host name specified.
- An error occurred when the following message files were customized:
  - 200closeerr\_en.template
- A query string that starts with 'fj-is-sso' was used in the URL for the request to the Interstage Single Sign-on Business server.

**User Action**

Specify FQDN and access the protection resource one more time to then continue to use the business system.

If the protection resource was accessed with FQDN specified, contact the Business server administrator.

**Business Server Administrator Action**

Take the following action:

- Review the content to determine if only the host name was specified and the protection resource has been accessed.
- In the file below, check that neither the JavaScript in the <script> tag within the <head> tag, nor the [onload="close\_sso\_window()"] JavaScript event handler in the <body> tag have been modified or deleted. If they have, return them to their original state.
  - 200closeerr\_en.template
- Ensure that query strings starting with 'fj-is-sso' were not used in the request URL to the Business server.

[Click the link below to open the Authentication window. Check that the authentication server is correct, and then complete the authentication procedure.](#)

**Explanation**

The POST request is authenticated.

**User Action**

Click the link in the window and perform authentication in the displayed Authentication window.

[Do you want to sign on using Integrated Windows Authentication?](#)

**Explanation**

This is the Integrated Windows Authentication sign-on confirmation page.

**User Action**

Select whether or not to sign on using Integrated Windows Authentication.

[Enter your user name and password.](#)

**Explanation**

This page is for form authentication.

**User Action**

Enter your user name and password.

[Last sign-on time : MM/DD/YYYY hh:mm:ss](#)

**Explanation**

The time the previous Sign-on was notified.

[Sign-off?](#)

**Explanation**

This is the Sign-off confirmation page.

**User Action**

Select whether or not to sign off.

[Sign-off succeeded.](#)

**Explanation**

Sign-off was successful.

[Sign on using Integrated Windows Authentication was canceled.](#)

**Explanation**

Integrated Windows Authentication was canceled in the Sign-on confirmation page.

[This user has already signed on. Sign-on again?](#)

**Explanation**

This is the Forced Sign-on confirmation page.

**User Action**

Select whether or not to perform a forced sign-on.

[Timed out, session is unavailable.](#)

**Explanation**

The session is invalid because the Idle Monitoring time was exceeded, causing a timeout. Authentication must be performed again.

**User Action**

Perform authentication again.

[Timed out, session is unavailable.](#)

[Do you want to sign on again using Integrated Windows Authentication?](#)

**Explanation**

The session is invalid because the Idle Monitoring time was exceeded, causing a timeout. Authentication must be performed again.

**User Action**

Either sign on again using Integrated Windows Authentication, or select not to sign on.

[User name or password is incorrect.](#)

**Explanation**

Read "Active Directory" for "SSO repository" and "user logon name" for "user ID" when Active Directory is used in the user information registration destination.

User authentication failed for the following reasons:

- The user did not present his or her certificate or presented an incorrect certificate.
- The identification information (user ID/password) specified by the user is incorrect.
- Certificate-based user authentication succeeded but password authentication was not performed.
- The identification information (user ID) specified by the user is not registered in a user information area in the SSO repository.
- The identification information (user ID) specified by the user is not unique in the SSO repository. (The specified user ID is registered in several user information areas in the SSO repository.)
- The identification information (user ID/password) specified by the user is registered more than once in a single user information area.
- The user corresponding to the presented certificate is not registered in the SSO repository.
- The user corresponding to the presented certificate is not unique in the SSO repository. (The user is registered in several user information areas in the SSO repository.)
- The identification information (user ID) specified by the user and the certificate presented by the user indicate different users.
- Identification information (user ID/password) was specified, but the password is not registered in the user information area in the SSO repository corresponding to the specified user ID.
- When Interstage Directory Service is used as the directory service for registering the user information, the "ssoUser" object class is not set when the user information is created in the SSO repository.

- When Active Directory is used as the directory service for registering the user information, the Single Sign-on extended schema settings may not be performed correctly.
- The specified user is invalid. (\*1)
- The specified user was locked out. (\*1)
- The specified user is in the lockout status. (\*1)

#### **User Action**

Specify the correct user name and password. When using a certificate, ensure that you present the correct certificate.

If this message is still displayed when the correct user name, password, and certificate were specified, contact your business server administrator.

#### **Business Server Administrator Action**

Contact your SSO administrator.

#### **SSO Administrator Action**

<<Password authentication>>

If this message is displayed when the correct user ID and password were specified, confirm the following:

- Confirm that [User Information Registration Entry] is set correctly in the repository server and that the specified user ID includes only valid characters. (\*2) (\*3) (\*9)
- Confirm that the user-specified identification information (user ID) is registered in a user information area in the SSO repository. If it is not registered, register it in the user information area. If it is registered, take the following action:
  - Confirm that the specified user ID is unique in the SSO repository as user information. If the user ID is not unique, update the SSO repository to make it unique. (\*3) (\*4) (\*9)
  - Check if several user IDs/passwords are registered in one user information area. If several user IDs/passwords are registered, reset the SSO repository so that only one user ID/password is registered. (\*3) (\*4) (\*9)
  - Confirm that the 'userPassword' attribute is set as user information in the SSO repository corresponding to the specified user ID. (\*3) (\*4) (\*7)
  - Check the following when Interstage Directory Service is used as the directory service for registering the user information:
    - Check that the "userPassword" password attribute for the specified user ID has been set in the SSO repository user information. (\*3) (\*4) (\*7)
    - Confirm that 'ssoUser' is set in the user information object class. (\*3)
  - Check the following when Active Directory is used as the directory service for registering the user information:
    - Check that the password for the specified user logon name has been set in the Active Directory user information. (\*9)
    - Check that the Single Sign-on extended schema settings were configured correctly. (\*10)
- In all other cases, find out if the user registered in the SSO repository is in the lockout state and confirm that the validity period of the user is set correctly. (\*5) (\*6)
- If the user is not in the lockout status and the validity period is set correctly, register the 'userPassword' attribute (when Active Directory is used in the user information registration destination, refer to the Active Directory manual) of the user as user information again. (\*7) (\*9)

<<Certificate authentication>>

If this message is displayed when the correct certificate was presented, confirm the following:

- Confirm that [User Information Registration Entry] is set correctly in the repository server. (\*2)
- If [User Information Registration Entry] is set correctly, confirm that [Attributes used for Authentication] in the user-presented certificate is registered in a user information area in the SSO repository. (\*8) If [Attributes used for Authentication] is registered, confirm that it is unique in the SSO repository. If it is not unique, update the SSO repository to make it unique. (\*4) (\*9)

- When Interstage Directory Service is used as the directory service for registering the user information, and the [Attribute used for authentication] that is contained in the certificate presented by the user is registered in a user information in the SSO repository and is unique in the SSO repository, check if 'ssoUser' is set in the user information object class. (\*3)
- When Active Directory is used as the directory service for registering the user information, and the [Attribute used for authentication] that is contained in the certificate presented by the user is registered in user information in the Active Directory and is unique, check that the Single Sign-on extended schema settings were configured correctly. (\*9) (\*10)
- Check if a certificate is registered in the SSO repository, or if the user-presented certificate differs from the certificate registered in the SSO repository. (\*9)

\*1 If [Notify Cause of Authentication Failure to user?] is set to 'Yes', this message is never displayed for the reason indicated. To configure [Notify Cause of Authentication Failure to user?], from the Interstage Management Console, click the [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Authentication server] > [Settings] tab. Then from the [Settings] tab, click [Detailed Settings [Show]] > [Setting Communication with Business system] > [Notify Cause of Authentication Failure to user?].

\*2 For more information about [User Information Registration Entry], from the Interstage Management Console, click the [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Repository server], or [Repository server (reference system)] > [Settings] tab. Then from the [Settings] tab, click [Repository server detailed settings [Show]], or [Detailed Settings [Show]] and reference [Repository].

\*3 For more information on how to register user information in the SSO repository, refer to 'Environment Setup (SSO Administrators)' - 'Repository Server Setup' - 'Registering User Information and Role Configuration in the SSO Repository' in the Single Sign-on Operator's Guide.

\*4 When Interstage Directory Service is used in the user information registration destination, use the Entry Administration Tool to operate the SSO repository. For details, refer to 'Entry Management' in the Directory Service Operator's Guide.

\*5 For more information about how to check the user lockout status, see 'Operation and Maintenance' - 'User Related Operation' - 'Checking User Lock Status' in the Single Sign-on Operator's Guide.

\*6 For more information about how to check the validity period of the user, see 'Operation and Maintenance' - 'User Related Operation' - 'Checking and Changing User Validity Period' in the Single Sign-on Operator's Guide.

\*7 For more information about how to register the 'userPassword' attribute as user information, refer to 'Operation and Maintenance' - 'User Related Operation' - 'Changing User Passwords' in the Single Sign-on Operator's Guide.

\*8 For more information about [Attributes used for Authentication], from the Interstage Management Console, click [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Authentication server] > [Settings] tab. Then from the [Settings] tab, click [Detailed Settings [Show]] and reference [Certificate Authentication Settings].

\*9 For details about the method of checking Active Directory, refer to the Active Directory manual.

\*10 For details about checking Single Sign-on extended schema, refer to "Troubleshooting" - "Examples of Errors" - "Errors when using Active Directory in the user Directory Service where the user information is registered" in the Single Sign-on Operator's Guide.

[Waiting for authentication from another window or page...](#)

[If authentication is not already in progress, click the following button to continue authentication processing.](#)

### **Explanation**

Possible causes are as follows:

- Authentication was performed in more than one window at the same time.
- Reauthentication was performed before authentication was complete.

### **User Action**

If authentication has not been performed in another window, there is no need to take action because this window opens the next window automatically.

In the following cases, however, click the button that is displayed in the Web browser to continue authentication.

- Authentication is not in progress in any of the windows.
- Authentication was cancelled in another window.
- Authentication ended abnormally in another window.

[Welcome to Single Sign-on.](#)

**Explanation**

The form was authenticated correctly.

**User Action**

Access the protection resource of the business server.

---

## 33.1.2 201

---

### 201 Created

Explanation

A new resource was created.

---

## 33.1.3 204

---

### 204 No Content

Explanation

The request was accepted but a new entity body has not been returned.

---

## 33.1.4 206

---

### 206 Partial Content

Explanation

A range search was successfully performed.

---

## 33.2 Redirection (Status Codes 300 to 399)

---

---

### 33.2.1 300

---

#### 300 Multiple Choices

Explanation

Information which allows the client to select the best among multiple indications is provided to indicate that the requested resource can be represented in multiple ways.

---

### 33.2.2 301

---

#### 301 Moved Permanently

Explanation

A resource was permanently moved to another place.

---

### 33.2.3 302

---

#### 302 Moved Temporarily

Explanation

A resource was temporarily moved to another place.

## 33.2.4 303

---

### 303 See Other

#### Explanation

The client shall make the GET request in reply to the returned URI to search for a target response.

## 33.2.5 304

---

### 304 Not Modified

#### Explanation

Resources to be handled for the conditional GET request have not been changed.

## 33.3 Client Error (Status Codes 400 to 499)

---

### 33.3.1 400

---

#### 400 Bad Request

##### Explanation

The request contains a syntax error.

When the Servlet service is in use:

When the Servlet service is in use, refer to "[33.6 When Status Codes and Messages are Displayed in the Web Browser at Calling of the Web Application](#)".

If the following message appears, perform the corrective action listed below:

**type** Status report

**message** <message>

**description** The request sent by the client was syntactically incorrect (<message>).

If a method of an unimplemented class was called

##### Variable Information

One of the following messages is output in <Message>:

- The HTTP GET method is not supported in this URL.
- The HTTP POST method is not supported in this URL.
- The HTTP PUT method is not supported in this URL.
- The HTTP DELETE method is not supported in this URL.

##### Explanation

The method of an unimplemented class is being called.

##### User Action

Check the method of calling a Web application and the method of creating it.

If unsupported authentication was used in the Servlet container

##### Variable Information

The following messages is output in <Message>:

- No client certificate chain in this request

##### Explanation

HTTPS client authentication is not supported in the Servlet Service.

#### User Action

Use another method such as HTTP Basic authentication, form based authentication, or Web server authentication.

#### No Host matches server name %s1

#### Variable Information

%s1 : Server name

#### Explanation

The requests could not be processed while the Web server and the WorkUnit were running on separate machines.

#### Cause

The Web application information that has been registered in the Web server connector on the Web server-side machine and the Web application name deployed to the WorkUnit-side machine are different.

#### User Action

Check whether the Web application information of the Web server-side machine and the Web application that was deployed to the WorkUnit match.

## 33.3.2 401

---

### 401 Unauthorized

#### Explanation

Authentication is required for access to the resource.

#### When Single Sign-on is used

If an additional message is output when Single Sign-on is used

Take action according to the message.

[User authentication is required.](#)

#### Explanation

User authentication failed.

Settings for Integrated Windows Authentication have not been configured in the Web browser.

#### User Action

In Microsoft(R) Internet Explorer, click [Tools] - [Internet Options] - [Advanced], and select "Enable Integrated Windows Authentication".

[User name or password is incorrect.](#)

#### Explanation

Read "Active Directory" for "SSO repository" and "user logon name" for "user ID" when Active Directory is used in the user information registration destination.

User authentication failed. The probable causes are described below.

- The user presented no certificate or an incorrect certificate.
- The identification information (user ID) or password specified by the user was not correct.
- Authentication with a certificate succeeded, but password authentication was not performed.
- The identification information (user ID) specified by the user is not registered in the SSO repository user information.
- The identification information (user ID) specified by the user is not unique within the SSO repository.  
(The specified user ID is registered in multiple user information items of the SSO repository.)
- The identification information (user ID)/password specified by the user is registered more than once in a single user information item.

- The user corresponding to the certificate presented by the user is not registered in the SSO repository.
- The user corresponding to the certificate presented by the user is not unique within the SSO repository.  
(Registration of the user corresponding to the presented certificate resulted in duplicated SSO repository user information.)
- The identification information (user ID) specified by the user and the certificate specified by the user indicate different users.
- The user specified the identification information (user ID) and password, but the password is not registered in the SSO repository user information corresponding to the identification information (user ID) specified by the user.
- When Interstage Directory Service is used as the directory service for registering the user information, the "ssoUser" object class is not set when the user information is created in the SSO repository.
- When Active Directory is used as the directory service for registering the user information, the Single Sign-on extended schema settings may not be performed correctly.
- The specified user is invalid. (\*1)
- The specified user became locked out. (\*1)
- The specified user has been locked out. (\*1)

#### **User Action**

Specify the correct user name and password. When using a certificate, be sure to present the correct certificate.

If this message is displayed even though the user name, password, and certificate are correct, notify the business server administrator.

#### **Business Server Administrator Action**

Notify the SSO administrator.

#### **SSO Administrator Action**

<<Password authentication>>

If this message is displayed even though the user specified the correct user ID and password, take the following action.

- Check that the [User Information Registration Entry] setting on the repository server is correct and the specified user ID does not contain prohibited characters. (\*2) (\*3) (\*9)
- Check that the identification information (user ID) specified by the user is registered in the SSO repository user information. If it is not registered, register the specified user ID. If it is registered, take the following action.
  - Check that the specified user ID is unique within the SSO repository user information. If it is not unique, correct it using the SSO repository. (\*3) (\*4) (\*9)
  - Check that multiple sets of user IDs and passwords are not set for one user information item. If multiple sets are registered, change the setting to register only one user ID and password set by using the SSO repository. (\*3) (\*4) (\*9)
  - Check that the userPassword attribute is set for the SSO repository user information corresponding to the specified user ID. (\*3) (\*4) (\*7)
  - Check the following when Interstage Directory Service is used as the directory service for registering the user information:
    - Check that the "userPassword" password attribute for the specified user ID has been set in the SSO repository user information. (\*3) (\*4) (\*7)
    - Check that 'ssoUser' is set as the object class for user information. (\*3)
  - Check the following when Active Directory is used as the directory service for registering the user information:
    - Check that the password for the specified user logon name has been set in the Active Directory user information. (\*9)
    - Check that the Single Sign-on extended schema settings were configured correctly. (\*10)
- In cases other than the above, check that the appropriate user registered in the SSO repository is not locked out and that the term of validity is correctly set for the appropriate user. (\*5) (\*6)
- If the user is not locked out and the term of validity is set correctly, re-register the 'userPassword' attribute (when Active Directory is used in the user information registration destination, refer to the Active Directory manual) of the user information for the appropriate user. (\*7) (\*9)

## <<Certificate authentication>>

If this message is displayed even though the user presented a correct certificate, take the following action.

- Check that the [User Information Registration Entry] setting on the repository server is correct. (\*2)
- If the [User Information Registration Entry] setting is correct, check that the [Attribute used for Authentication] included in the certificate presented by the user is registered in the SSO repository user information. (\*8) If it is registered, check that the [Attribute used for Authentication] included in the certificate presented by the user is unique within the SSO repository. If it is not unique, correct it using the SSO repository. (\*4) (\*9)
- When Interstage Directory Service is used as the directory service for registering the user information, and the [Attribute used for authentication] that is contained in the certificate presented by the user is registered in the SSO repository user information and is unique, check that 'ssoUser' is set as the object class for the user information. (\*3)
- When Active Directory is used as the directory service for registering the user information, check that the Single Sign-on extended schema settings were configured correctly when the [Attribute used for authentication] that is contained in the certificate presented by the user is registered in the Active Directory user information and is unique. (\*9) (\*10)
- Check that the certificate is registered in the SSO repository or that the certificate presented by the user is the same as that registered in the SSO repository. (\*9)

\*1 When [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Authentication server] > [Detailed Settings [Show]] on the [Settings] tab > [Communication Settings with Business system] > [Notify Cause of Authentication Failure to user?] is set to 'Yes' in the Interstage Management Console, the message is not displayed for this reason.

\*2 For [User Information Registration Entry], see [Repository] by clicking [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Repository server], or [Repository server (reference system)] > [Repository server detailed settings [Show]], or [Detailed Settings [Show]] on the [Settings] tab in the Interstage Management Console.

\*3 For information on registering user information in the SSO repository, see 'Environment Setup (SSO Administrators)' - 'Repository Server Setup' - 'Registering User Information and Role Configuration in the SSO Repository' in the Single Sign-on Operator's Guide.

\*4 The entry management tool or other tools are used to operate the SSO repository. For details, see 'Entry Management' in the Directory Service Operator's Guide.

\*5 For information on how to check the lock out state of users, see 'Operation and Maintenance' - 'User Related Operation' - 'Checking User Lock Status' in the Single Sign-on Operator's Guide.

\*6 For information on how to check the term of validity for users, see 'Operation and Maintenance' - 'User Related Operation' - 'Checking and Changing User Validity Period' in the Single Sign-on Operator's Guide.

\*7 For information on how to register the userPassword attribute of the user information, see 'Operation and Maintenance' - 'User Related Operation' - 'Changing User Passwords' in the Single Sign-on Operator's Guide.

\*8 For [Attribute used for Authentication], see [Certificate Authentication Settings] by clicking [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Authentication server] > [Detailed Settings [Show]] on the [Settings] tab in the Interstage Management Console.

\*9 For details about the method to check Active Directory, refer to the Active Directory manual.

\*10 For details about checking Single Sign-on extended schema, refer to "Troubleshooting" - "Examples of Errors" - "Errors when using Active Directory in the user Directory where the user information is registered" in the Single Sign-on Operator's Guide.

## 33.3.3 403

---

### 403 Forbidden

#### Explanation

The server rejected execution of the request.

#### When the Servlet service is in use:

When the Servlet service is in use, there are the following possibilities:

- The IP address of the Web server set up by the WorkUnit environment definition may be wrong.

- Even if you are operating a Web server and a WorkUnit on separate machines, a setting of the WorkUnit may operate a Web server and a WorkUnit on the same machine.
- More than one IP address is set in the Web server, but not all of the Web server IP addresses have been specified in [WorkUnit] > 'WorkUnit Name' > [Environment Definition] tab > [Advanced Settings] > [Web Server Connector(Connector) Settings] > [Web Server IP Address] of the Interstage Management Console.

Refer to 'Preparation for Running Servlet Service' - 'Procedure for Separating and Running IJServer and the Web Server' in the J2EE User's Guide and check the definition.

- There is no authority for access to the contents.
- Check whether the contents of the web.xml <security-constraint> and <security-role> tags are correct. Also check whether the <login-config> tag has been described, and if its contents are correct.
- In the Web application environment settings, [Use Web server authentication information] of [Certification method] may have been selected, and authentication (authentication according to the Servlet specifications defined in web.xml) may have been set in the Web application.

To select [Use Web server authentication information], do not configure the authentication settings in web.xml. Alternatively, to use the authentication set in web.xml, do not select [Use Web server authentication information].

## When Single Sign-on is used

If an additional message is output when Single Sign-on is used

Take action according to the message.

[Access is not allowed.](#)

### **Explanation**

The user cannot access the resource, because they do not have the required role.

### **User Action**

Notify the business server administrator.

### **Notes**

To access the protection resources, restart the Web browser.

### **Business Server Administrator Action**

Notify the SSO administrator.

### **SSO Administrator Action**

Take the following action:

- Check that the name of the role or role set to which the user belongs (set in the SSO repository user information), is the name of the role or role set required to access the resource. (\*1)
- When the system log is output to the repository server, take the action indicated by the User Action of the message.

\*1 For information on how to register user information in the SSO repository, see 'Environment Setup (SSO Administrators)' - 'Repository Server Setup' - 'Registering User Information and Role Configuration in the SSO Repository' in the Single Sign-on Operator's Guide.

[Authentication failed.](#)

### **Explanation**

Read "Active Directory" for "SSO repository" when Active Directory is used in the user information registration destination.

Integrated Windows Authentication failed. Possible causes are as follows:

- The Active Directory user entry and the SSO repository user information were not associated correctly.
- The ID information (\*1) is not registered in the SSO repository user information.
- The ID information (\*1) in the SSO repository is not unique.

The same ID information (\*1) is registered for more than one item of user information in the SSO repository

- The "ssoUser" object class was not set when the user information was created in the SSO repository.
- The Active Directory user logon name is incorrect.
- The Active Directory user information settings are incorrect.
- The user is invalid.
- The user is locked out.

**User Action**

Notify the business server administrator.

**Business Server Administrator Action**

Notify the SSO administrator.

**SSO Administrator Action**

Take the following action:

- Confirm that the association between the Active Directory user entry and the SSO repository user information was created correctly. For details, refer to "Settings for Active Directory linkage" in the Single Sign-on Operator's Guide.
- Confirm that the value set for [User Information Registration Entry] (\*2) in the repository server is correct. (\*3)
- Confirm that the ID information (\*1) is registered in the SSO repository user information. Register the specified ID information (\*1) if it is not registered. If it is already registered, take the following action: (\*3)
  - Confirm that the specified ID information (\*1) is unique in the SSO repository. If it is not, correct the information in the SSO repository.
  - Confirm that the ID information (\*1) is not registered more than once for one item of user information. If it is, reconfigure the settings in the SSO repository so that only one item of ID information (\*1) is registered.
  - Check that the "ssoUser" was not set for the user information object class.
- Change the settings so that the Active Directory user logon name and the user logon name recorded in "user ID information" of the authentication server access log match.
- Make sure that the Active Directory user has been correctly configured. For details, refer to the Single Sign-on Operator's Guide, section "Settings for Active Directory Linkage" > "Using Active Directory as the Directory Service for Registering User Information" > "Setting up User Information for Active Directory".
- Check that the migration procedure is correct when migrating from the system that uses Interstage Directory Service to the system that uses Active Directory. (\*4)
- In all other cases, confirm that the user registered in the SSO repository is not locked out, and that the validity period set for the user is correct.

\*1 To do this, in the Interstage Management Console of the authentication server, click [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Authentication server] > [Settings] > [Detailed Settings[Show]] > [Integrated Windows Authentication Setting] > [Attribute used for authentication].

\*2 For [User Information Registration Entry], view [Repository] by clicking [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Repository server], or [Repository server (reference system)] > [Repository server detailed settings [Show]], or [Detailed Settings [Show]] on the [Settings] tab in the Interstage Management Console.

\*3 For details about the method to check Active Directory, refer to the Active Directory manual.

\*4 For details about how to migrate to the system that uses Active Directory, see 'Notes on Previous Versions' - 'Migrating to a system which uses Active Directory' in the Single Sign-on Operator's Guide.

[Authentication has been expired.](#)

**Explanation**

Authentication information has expired, so authentication must be performed again.

**Explanation when session management is used**

It is necessary to execute the authentication operation again, if session management is disabled for the following reasons:

- The authentication information has expired.
- A different user performed a Forced Sign-on operation, disabling session management.

**User Action**

If authentication is not automatically performed again, perform authentication again.

[Authentication information is invalid.](#)

**Explanation**

Authentication information is invalid. The IP address used to access the authentication server during authentication may differ from that used to access the business server.

**User Action**

Restart the browser and then perform authentication again. If the problem persists, notify the business server administrator.

**Business Server Administrator Action**

Take the following action.

- Either the authentication infrastructure or the business server may be accessed through a proxy due to the proxy settings of the user browser. Change the proxy settings so that the authentication infrastructure and business server are accessed through the same route.
- When the user browser passes through a proxy in which a load balancer or similar is used for load balancing, a client may pass through a different proxy each time it performs access depending on the load balancer settings. Change the load balancer settings so that each client uses a particular proxy during access.
- When a load balancer or similar is used for load balancing in the authentication infrastructure or business server, the load balancer may convert the client IP address. Change the settings to prevent the IP address from being converted.

[Authentication is needed. Try again after authentication.](#)

**Explanation**

There is no authentication information for accessing the resource.

**User Action**

Take the following actions:

- Restart the browser and then perform authentication again.
- Check the form authentication page contents for errors. (\*1)

\*1 For details on the method of customizing form authentication pages, see 'Single Sign-on Customization' - 'Customizing Messages Displayed on a Web Browser' in the Single Sign-on Operator's Guide.

[Authentication is processing.](#)

**Explanation**

The user accessed a protection resource during user authentication.

**User Action**

Take the following action:

- If user authentication was performed with another Web browser frame, perform user authentication with that frame and then access the protection resource.
- If authentication was not performed with another Web browser frame, access the form authentication page directly and then perform user authentication.
- Check whether the URL(\*1) of the form authentication page for errors. When the URL(\*1) of the form authentication page is correct, inquire your business server administrator about this.

**Business Server Administrator Action**

Check whether the user is accessing the URL(\*1) of the correct form authentication page. If an incorrect URL is accessed, advise the user to access correct URL.

\*1 For details on the form authentication page URLs, see 'Overview' - 'Authentication' - 'Password and Certificate Authentication' in Single Sign-on Operator's Guide.

[Authentication was successful.](#)

#### **Explanation**

In POST request authentication, authentication completed, but the page did not transition to the protection resource. Probable causes include:

- After the authentication window opened, the authentication operation stopped prior to completion and then restarted.
- The protection resource was accessed with only the host name specified.
- An error occurred when the following message files were customized:
  - 403closeerr\_en.template
- A query string that starts with 'fj-is-ssso' was used in the URL for the request to the Interstage Single Sign-on Business server.

#### **User Action**

Specify FQDN and access the protection resource one more time to then continue to use the business system.

If the protection resource was accessed with FQDN specified, contact the Business server administrator.

#### **Business Server Administrator Action**

Take the following action:

- Review the content to determine if only the host name was specified and the protection resource has been accessed.
- In the file below, check that neither the JavaScript in the <script> tag within the <head> tag, nor the [onload="close\_sso\_window()"] JavaScript event handler in the <body> tag have been modified or deleted. If they have, return them to their original state.
  - 403closeerr\_en.template
- Ensure that query strings starting with 'fj-is-ssso' were not used in the request URL to the Business server.

[Browser does not accept cookies.](#)

#### **Explanation**

Cookies could not be set for the browser. The probable causes are described below.

- The browser is set not to accept cookies.
- In operation in conjunction with Interstage Portalworks, a business system may be constructed by specifying a domain name with a hierarchical structure that does not accept cookies.

#### **User Action**

Change the browser settings to accept cookies. When the browser is already set in such a way, notify the business server administrator.

#### **Business Server Administrator Action**

If a domain name to be specified has two levels (such as .co.jp), the browser may not accept cookies. Reconstruct the business server by specifying a domain name with three or more levels (such as .fujitsu.co.jp).

Reconfigure the business server by obtaining the business system configuration file and its password. (\*1)

#### **SSO Administrator Action**

Download the business system configuration file by specifying the domain name obtained from the business server administrator and deliver the file together with its password to the business server administrator.

\*1 To reconfigure a business server, delete the business server on the [List] tab that appears by selecting [System] > [Security] > [Single Sign-on] > [Business system] in the Interstage Management Console, and add a business server on the [Addition of Business server] tab.

[Certificate authentication is needed.](#)

#### **Explanation**

Read "Active Directory" for "SSO repository" when Active Directory is used in the user information registration destination.

Certificate authentication failed. The probable causes are described below.

- The user presented no certificate or presented an incorrect certificate.
- The user corresponding to the certificate presented by the user is not registered in the SSO repository.
- The user corresponding to the certificate presented by the user is not unique within the SSO repository.  
(Registration of the user corresponding to the presented certificate resulted in duplicated SSO repository user information.)
- The object class 'ssoUser' was not set when user information was created in the SSO repository.
- The certificate presented by the user is different from that registered in the SSO repository.

#### **User Action**

Check that the presented certificate is correct.

If no certificate is registered in the browser, acquire a certificate and register it in the browser.

If this message appears even though a correct certificate is presented, notify the business server administrator.

#### **Notes**

To access the protection resources, restart the Web browser.

#### **Business Server Administrator Action**

Notify the SSO administrator.

#### **SSO Administrator Action**

If this message appears even though the user presented a correct certificate, take the following action.

- Check that the [User Information Registration Entry] setting at the repository server is correct. (\*1)
- If [User Information Registration Entry] is correctly set, check that [Attributes used for Authentication] (included in the certificate presented by the user), is registered in the SSO repository user information. If it is registered, [Attributes used for Authentication] (included in the certificate presented by the user), is unique within the SSO repository. (\*2)
- If it is registered in the SSO repository user information and is unique, check that 'ssoUser' is set as the object class for the user information. (\*3) (\*4)
- Check that the certificate is registered in the SSO repository and the certificate presented by the user is the same as that registered in the SSO repository.

\*1 For [User Information Registration Entry], see [Repository] by clicking [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Repository server], or [Repository server (reference system)] > [Repository server detailed settings [Show]], or [Detailed Settings [Show]] on the [Settings] tab in the Interstage Management Console.

\*2 For [Attributes used for Authentication], see [Certificate Authentication Settings] by clicking [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Authentication server] > [Detailed Settings [Show]] on the [Settings] tab in the Interstage Management Console.

\*3 For information on how to register user information in the SSO repository, see 'Environment Setup (SSO Administrators)' - 'Repository Server Setup' - 'Registering User Information and Role Configuration in the SSO Repository' in the Single Sign-on Operator's Guide.

\*4 For details about the method to check Active Directory, refer to the Active Directory manual.

[Certificate has been revoked.](#)

#### **Explanation**

The specified certificate was revoked.

#### **User Action**

Acquire a new certificate or select another certificate.

#### **Notes**

To access the protection resources, restart the Web browser.

[Certificate has expired.](#)

**Explanation**

The certificate presented by the user has expired.

**User Action**

Acquire a new certificate or select another certificate.

**Notes**

To access the protection resources, restart the Web browser.

[Certificate is invalid.](#)

**Explanation**

The certificate presented by the user is corrupted or does not contain information for identifying the user.

**User Action**

Acquire a certificate and register it in the browser.

If this message appears even though a correct certificate was used, notify the business server administrator.

**Notes**

To access the protection resources, restart the Web browser.

**Business Server Administrator Action**

Notify the SSO administrator.

**SSO Administrator Action**

Check that the certificate presented by the user contains [Attributes used for Authentication] set on the authentication server. (\*1)

If the certificate does not contain [Attributes used for Authentication], ask the administrator to register a certificate containing [Attributes used for Authentication] in the browser.

\*1 For [Attributes used for Authentication], see [Certificate Authentication Settings] by clicking [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Authentication server] > [Detailed Settings [Show]] on the [Settings] tab in the Interstage Management Console.

[Click the link below to open the Authentication window. Check that the authentication server is correct, and then complete the authentication procedure.](#)

**Explanation**

The POST request is authenticated.

**User Action**

Click the link in the window and perform authentication in the Authentication window that opens.

[Enter your user name and password.](#)

**Explanation**

This page is for form authentication.

**User Action**

Enter your user name and password.

[Failed to Sign-off. Please close web browser.](#)

**Explanation**

Could not sign-off. The probable causes are described below.

- The upper limit for cookies that can be kept in the Web browser was exceeded. Therefore, a cookie that is required for Interstage Single Sign-on processing may have been deleted.

**User Action**

If you receive an explanation that this message is output when Sign-off is performed from the Business Server Administrator, close the Web browser.

If you have not received an explanation from the Business Server Administrator, contact the Business Server Administrator.

**Business Server Administrator Action**

Notify the SSO administrator.

**SSO Administrator Action**

Take the following action:

- If a system log is output, refer to User Action for the message and take action.
- Migration to the system performing session management has been done incorrectly, check that the correct process was used (\*1).
- Check whether there are Web applications running using the same host name or domain that have issued a large number of cookies. If there are, either reduce the amount of cookies that have been issued or use a different host name or domain to the authentication server.

\*1 For details about how to migrate to the system performing session management, see 'Notes on Previous Versions' - 'Switching to an Application to Perform Session Management' in the Single Sign-on Operator's Guide.

[Failed to Sign-on. This user has already signed on.](#)

**Explanation**

A user who is already signed on tried to sign on again. Multiple Sign-on is prohibited. Therefore, the user cannot sign on.

**User Action**

Take the following action:

- Close the Web browser.
- If the user ID was already authenticated in another browser, sign off in the browser and then sign on again.
- If the 'x' (close) button in the Web browser is clicked without performing Sign-off, wait for a while and then perform Sign-on again.
- If the user ID was not authenticated in another browser, contact the Business server administrator.

**Business Server Administrator Action**

Notify the SSO administrator.

**SSO Administrator Action**

Take the following action:

- If this message is output in the Authentication server, Repository server, or session management server system log, take action according to [User action] in the message.
- There is a possibility that there was an external attack. Refer to the Authentication server, Repository server, or session management server system log, and investigate.

[Integrated Windows Authentication failed.](#)

**Explanation**

Integrated Windows Authentication user authentication failed.

**User Action**

Check whether the environment can use Integrated Windows Authentication.

If there is no problem with the environment, take the following action:

- Check whether the Web browser has been correctly configured for Integrated Windows Authentication if the basic authentication dialog is displayed.
- Notify the Business Server Administrator.

**Business Server Administrator Action**

Notify the SSO administrator.

## SSO Administrator Action

Take the following action:

- Check that the settings required for Integrated Windows Authentication that can be federated with Active Directory were configured correctly. (\*1).
- Check "Account Options" of the authentication server account created during registration in Active Directory. (\*1)
- If the encryption cipher cannot be used in Active Directory or the client operating system: (\*2)
  - If the encryption cipher cannot be used in the client operating system:

Instruct the user to access from an operating system in which the used encryption cipher can be used.
  - If the encryption cipher cannot be used in the Active Directory operating system:

Change the system configuration so that Active Directory of an operating system in which the used encryption cipher can be used is used. If the system configuration was changed, delete the authentication server accounts and WorkUnits (to which the Integrated Windows Authentication applications have been deployed) registered in Active Directory, then reconfigure the Active Directory settings and redeploy the Integrated Windows Authentication applications. (\*1)
  - When none of the above can be executed:

Change the encryption cipher used in Integrated Windows Authentication to an encryption cipher that can be used in all operating systems. To do that, delete the authentication server accounts and WorkUnits (to which the Integrated Windows Authentication applications have been deployed) registered in Active Directory, then reconfigure the Active Directory and redeploy the Integrated Windows Authentication applications. (\*1)
- If the problem persists, check that the federated Active Directory can perform Integrated Windows Authentication
  - \*1 For details about the settings that are required for Integrated Windows Authentication, refer to "Settings for Active Directory Linkage" - "Using Active Directory as the Directory Service for Registering User Information" - "Configure Integrated Windows Authentication" in the Single Sign-on Operator's Guide.
  - \*2 For details on which encryption ciphers are used with Integrated Windows Authentication, refer to "Overview" - "Authentication" - "Integrated Windows Authentication" in the Single Sign-on Operator's Guide.

Invalid operation.

### Explanation

The operation is invalid.

### User Action

Re-execute.

If the same problem still occurs, close the Web browser and re-execute. Note the following points:

- When the form authentication page, Sign-off confirmation page, and the page used by the user to perform operations is displayed, only perform the operations that are provided in those contents.

If you want to abort processing, close the Web browser.
- The operations on the form authentication page, Sign-off confirmation page, and the page used by the user to perform operations should be performed quickly.
- Do not perform the following operations at the same time as authentication:
  - Setting the system used to perform authentication
  - Releasing the system used to perform authentication
- When using Microsoft(R) Internet Explorer 7.0 or later and one of the following warning messages is displayed, check the detailed information displayed on the message or Internet Explorer Help to resolve the problem.
  - When the following warning message is displayed in the Web browser window:

"There is a problem with this website's security certificate."

- When the following warning message is displayed on the information bar:  
"To help protect your security, Internet Explorer has blocked this website from displaying content with security certificate errors. Click here for options."
- When the following warning message is displayed on the notification bar:  
"Internet explorer has blocked this website from displaying content with security certificate errors"
- If Mozilla(R) Firefox is used as the Web browser, check the detail information displayed in the message when one of the following warning messages are displayed in the Web browser window to resolve the problem.
  - "Secure Connection Failed"
  - "This Connection is Untrusted"

If the problem is still not resolved, contact the business server administrator.

**Business Server Administrator Action**

Notify the SSO administrator.

**SSO Administrator Action**

Take the following action:

- If a load balancer has been installed and authentication server load balancing has been executed:  
Ensure that the load balancer is correctly configured (for details, refer to "Settings of the Load Balancer" in the Single Sign-on Operator's Guide).
- If Integrated Windows Authentication is used  
The Integrated Windows Authentication application session may be invalid because of the network environment load.  
Correct the session-timeout tag in the environment configuration file of the Integrated Windows Authentication application stored in the directory shown below, and then increase the session timeout time. (\*1)  
Once the environment configuration file has been corrected, restart the Integrated Windows Authentication application.

**Windows32/64**

```
C:\Interstage\F3FMssso\ssoatcag\webapps\winauth\WEB-INF\web.xml
```

**Solaris32/64 Linux32/64**

```
/etc/opt/FJSVsssoac/webapps/winauth/WEB-INF/web.xml
```

\*1 The default session timeout time is 1 minute. If the session timeout time is increased, security may be compromised, so if you must modify this value, set as low a value as possible. Do not configure settings to not use a session timeout.

[Requested path is invalid form.](#)

**Explanation**

The path format of the requested URL is invalid. The probable causes are described below.

- It is impossible to specify a file name in 8.3 format automatically generated from a long file name as a URL path. Windows may automatically generate a file name in 8.3 format from a long file name as shown below.  
(Example) ABCDEFGHIJ.TXT ---> ABCDEF~1.TXT  
In this case, a file name such as ABCDEF~1.TXT, generated automatically, cannot be specified as a URL path.
- A folder name or file name specified as a URL path cannot end with '.' (period).

**User Action**

Take the following action:

- Specify a long file name instead of a name generated automatically as a path.
- If a folder name or file name included in a path ends with a period, delete it.

## Sign-off?

### **Explanation**

This is the Sign-off confirmation page.

### **User Action**

Select whether or not to sign off.

## Sign-off was canceled.

### **Explanation**

Sign-off was canceled in the Sign-off confirmation page.

## Sign-on was canceled.

### **Explanation**

Forced Sign-on was canceled in the Forced Sign-on confirmation page.

The previous session was not released.

Notes

To access the protection resources, restart the Web browser.

## Sign-on was not performed.

### **Explanation**

- A user has requested a service without first performing Sign-on.

Alternatively, the service was requested using a different FQDN or domain to the one used when Sign-on was performed.

### **User Action**

If Sign-on was not performed, perform it.

If Sign-on has been performed and this message is output, contact the Business server administrator.

### **Business Server Administrator Action**

Check that the Sign-off URL or the URL used for confirming the time of the previous Sign-on are correct.

For details about the Sign-off URL, refer to 'Single Sign-on Customization'- 'Customizing Web Pages for Sign-off' - 'Customizing Web Pages' in the 'Single Sign-on Operator's Guide'.

For details about the URL used for confirming the time of the previous Sign-on, refer to 'Operation and Maintenance' - 'User Related Operation' - 'Checking the time of the previous Sign-on' in the 'Single Sign-on Operator's Guide'.

## This user has already signed on. Sign-on again?

### **Explanation**

This is the Forced Sign-on confirmation page.

### **User Action**

Select whether or not to sign on by force.

## Timed out, session is unavailable.

### **Explanation**

The session is invalid because the Idle Monitoring time was exceeded, causing a timeout. The authentication operation must be performed again.

### **User Action**

Perform the authentication operation again.

## User has been locked.

### **Explanation**

The user has been locked out.

**User Action**

Ask the business server administrator to release the lockout.

**Notes**

To access the protection resources, restart the Web browser.

**Business Server Administrator Action**

Notify the SSO administrator.

**SSO Administrator Action**

Release the lockout of the appropriate user.

For information on how to release a lockout, see 'Operation and Maintenance' - 'User Related Operation' - 'Canceling Lockout' in the Single Sign-on Operator's Guide.

[User has not been found.](#)

**Explanation**

The user could not be found. The probable causes are described below.

- Replication of the repository server (reference system) SSO repository may not have been completed successfully.
- The administrator DN password of the SSO repository (slave) may have been changed.
- The SSL configuration and its contents used by the SSO repository (slave) may have been changed.

**User Action**

Restart the browser and then perform authentication again. If the problem persists, notify the business server administrator.

**Business Server Administrator Action**

Notify the SSO administrator.

**SSO Administrator Action**

- Set [Administrator DN password] of a changed SSO repository (slave) for [Password for the connection] of the SSO repository (master). If [Administrator DN password] of the SSO repository (slave) is unknown, set [Administrator DN password] of the SSO repository (slave) again. In addition, set the password that was set for [Administrator DN password] of the SSO repository (slave) for the [Password for the connection] of the SSO repository (master). (\*1) (\*2)

- When using SSL for replication operation, note the following when changing settings.

Select only 'SSL 3.0' as the SSL configuration [Protocol Version] of the SSO repository (master) and SSO repository (slave) and implement the same setting with the exception of the site certificate to be used. (\*3)

When the SSL configuration [Verify Client Certificate?] used for the SSO repository (slave) is set to 'Yes, always verify client certificate', be sure to set [Present client certificate?] for [Replication Connection Settings] of the SSO repository (master) to 'Yes.'(\*3) (\*4)

\*1 For the [Administrator DN password] of the SSO repository (slave), select [System] > [Service] > [Repository] in the Interstage Management Console of the machine that created the slave operation SSO repository and click the slave operation SSO repository on the [Repository: View Status] screen that is displayed for reference.

\*2 For [Password for the connection] of the SSO repository (master), select [System] > [Service] > [Repository] in the Interstage Management Console of the machine that created the master operation SSO repository and click the master operation SSO repository on the [Repository: View Status] screen that is displayed. Then, click [Detailed Settings [Show]], select the check box to the left of [Host name] of the slave operation SSO repository in [Replication destination host list], click the [Edit] button, and see [Replication Connection Settings].

\*3 For [SSL configuration] of the SSO repository (master) and SSO repository (slave), select [System] > [Security] > [SSL] in the Interstage Management Console of each machine. Click the configuration name specified in [SSL configuration] of the SSO repository (master) or SSO repository (slave) on the [SSL: View SSL Configurations] screen that is displayed, and refer to the descriptions.

\*4 For [Present client certificate?] of the SSO repository (master), select [System] > [Service] > [Repository] in the Interstage Management Console of the machine that created the master operation SSO repository, and click the master operation SSO repository on the [Repository: View Status] screen that is displayed. Then, click [Detailed Settings [Show]], select the check box to the left of

[Host name] of the slave operation SSO repository in [Replication destination host list], click the [Edit] button, and see [Replication Connection Settings].

User is duplicated.

#### **Explanation**

Read "Active Directory" for "SSO repository" when Active Directory is used in the user information registration destination.

Registration of user identification information has been duplicated in the SSO repository. The probable causes are described below.

- The specified user ID is not unique within the SSO repository.  
(Registration of the specified user ID is duplicated in the SSO repository user information.)
- The user corresponding to the certificate presented by the user is not unique within the SSO repository.  
(Registration of the user corresponding to the presented certificate resulted in duplicated SSO repository user information.)

#### **User Action**

Notify the business server administrator.

#### **Notes**

To access the protection resources, restart the Web browser.

#### **Business Server Administrator Action**

Notify the SSO administrator.

#### **SSO Administrator Action**

- Check that the user ID specified by the user is unique within the SSO repository. If it is not unique, correct it by using the SSO repository. (\*1) (\*2)
- Check that [Attributes used for Authentication] included in the certificate presented by the user is unique within the SSO repository. (\*3)

If it is not unique, correct it by using the SSO repository.

\*1 When Interstage Directory Service is used in the user information registration destination, SSO repository operations are performed using the entry management tool etc. For details, refer to "Entry Management" in the "Directory Service Operator's Guide".

\*2 For details about the method to check Active Directory, refer to the Active Directory manual.

\*3 For [Attributes used for Authentication], see [Certificate Authentication Settings] by clicking [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Authentication server] > [Detailed Settings [Show]] on the [Settings] tab in the Interstage Management Console.

User is not available.

#### **Explanation**

The time at which an attempt was made to authenticate the user is not within the term of validity.

#### **User Action**

Ask the business server administrator to check the term of validity for the user.

#### **Notes**

To access the protection resources, restart the Web browser.

#### **Business Server Administrator Action**

Notify the SSO administrator.

#### **SSO Administrator Action**

Check the term of validity set in the SSO repository (when Active Directory is used in the user information registration destination, this is the Active Directory) user information. Identify the user and, if necessary, change the term of validity.

For information on checking or changing the term of validity of the user, see 'Operation and Maintenance' - 'User Related Operation' - 'Checking and Changing User Validity Period' in the Single Sign-on Operator's Guide.

User name or password is incorrect.

### **Explanation**

Read "Active Directory" for "SSO repository" and "user logon name" for "user ID" when Active Directory is used in the user information registration destination.

User authentication failed for the following reasons:

- The user did not present his or her certificate or presented an incorrect certificate.
- The identification information (user ID)/password specified by the user is incorrect.
- User authentication based on certificates succeeded but password authentication was not performed.
- The identification information (user ID) specified by the user is not registered in a user information area in the SSO repository.
- The identification information (user ID) specified by the user is not unique in the SSO repository. (The specified user ID is registered in several user information areas in the SSO repository.)
- The identification information (user ID)/password specified by the user is registered more than once in a single user information area.
- The user corresponding to the presented certificate is not registered in the SSO repository.
- The user corresponding to the presented certificate is not unique in the SSO repository. (The user corresponding to the presented certificate is registered in several user information areas in the SSO repository.)
- The identification information (user ID) specified by the user and the certificate presented by the user indicate different users.
- Identification information (user ID)/password was specified but the password is not registered in the user information area in the SSO repository corresponding to the specified user ID.
- When Interstage Directory Service is used as the directory service for registering the user information, the "ssoUser" object class is not set when the user information is created in the SSO repository.
- When Active Directory is used as the directory service for registering the user information, the Single Sign-on extended schema settings may not be performed correctly.
- The specified user is invalid. (\*1)
- The specified user was locked out. (\*1)
- The specified user is in the lockout status. (\*1)

### **User Action**

Specify the correct user name and password. When using a certificate, present the correct certificate.

If this message is still displayed although the correct user name, password, and certificate were specified, contact your business server administrator.

### **Business Server Administrator Action**

Contact your SSO administrator.

### **SSO Administrator Action**

<<Password authentication>>

If this message is displayed although the correct user ID and password were specified, check the following:

- Check if [User Information Registration Entry] is set correctly in the repository server and if the specified user ID includes invalid characters. (\*2) (\*3) (\*9)
- Check if the user-specified identification information (user ID) is registered in a user information area in the SSO repository. If it is not registered, register it in the user information area. If it is registered, take the following action:
  - Check if the specified user ID is unique in the SSO repository as user information. If the user ID is not unique, update the SSO repository to make it unique. (\*3) (\*4) (\*9)
  - Check if several user IDs/passwords are registered in one user information area. If several user IDs/passwords are registered, reset the SSO repository so that only one user ID/password is registered. (\*3) (\*4) (\*9)

- Check if the 'userPassword' attribute is set in the SSO repository corresponding to the specified user ID as user information. (\*3) (\*4) (\*7)
- Check the following when Interstage Directory Service is used as the directory service for registering the user information:
  - Check that the "userPassword" password attribute for the specified user ID has been set in the SSO repository user information. (\*3) (\*4) (\*7)
  - Check if 'ssoUser' is set in the user information object class. (\*3)
- Check the following when Active Directory is used as the directory service for registering the user information:
  - Check that the password for the specified user logon name has been set in the Active Directory user information. (\*9)
  - Check that the Single Sign-on extended schema settings were configured correctly. (\*10)
- In cases other than the above, check if the user registered in the SSO repository is in the lockout state and if the validity period of the user is set correctly. (\*5) (\*6)
- If the user is not in the lockout status and the validity period is set correctly, register the 'userPassword' attribute (when Active Directory is used in the user information registration destination, refer to the Active Directory manual) of the user as user information again. (\*7) (\*9)

<<Certificate authentication>>

If this message is displayed although the correct certificate was presented, check the following:

- Check if [User Information Registration Entry] is set correctly in the repository server. (\*2)
- If [User Information Registration Entry] is set correctly, check if [Attributes used for Authentication] in the user-presented certificate is registered in a user information area in the SSO repository. (\*8) If [Attributes used for Authentication] is registered, check if it is unique in the SSO repository. If [Attributes used for Authentication] is not unique, update the SSO repository to make it unique. (\*4) (\*9)
- When Interstage Directory Service is used as the directory service for registering the user information, and the [Attribute used for authentication] that is contained in the certificate presented by the user is registered in a user information area in the SSO repository and is unique in the SSO repository, check if 'ssoUser' is set in the user information object class. (\*3)
- When Active Directory is used as the directory service for registering the user information, check that the Single Sign-on extended schema settings were configured correctly when the [Attribute used for authentication] that is contained in the certificate presented by the user is registered in the Active Directory user information and is unique. (\*9) (\*10)
- Check if a certificate is registered in the SSO repository or if the user-presented certificate differs from the certificate registered in the SSO repository. (\*9)

\*1 If [Notify Cause of Authentication Failure to user?] is set to 'Yes', this message is never displayed for the reason indicated. To set [Notify Cause of Authentication Failure to user?], use the following procedure: From the Interstage Management Console, click [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Authentication server] > [Settings] tab. Then from the [Settings] tab, click [Detailed Settings [Show]] > [Setting Communication with Business system] > [Notify Cause of Authentication Failure to user?].

\*2 For more information about [User Information Registration Entry], from the Interstage Management Console, click [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Repository server], or [Repository server (reference system)] > [Settings] tab. Then from the [Settings] tab, click [Repository server detailed settings [Show]], or [Detailed Settings [Show]] and reference [Repository].

\*3 For more information on how to register user information in the SSO repository, see 'Environment Setup (SSO Administrators)' - 'Repository Server Setup' - 'Registering User Information and Role Configuration in the SSO Repository' in the Single Sign-on Operator's Guide.

\*4 Use the Entry Administration Tool to operate the SSO repository. For details, see 'Entry Management' in the Directory Service Operator's Guide.

\*5 For more information about how to check the user lockout status, see 'Operation and Maintenance' - 'User Related Operation' - 'Checking User Lock Status' in the Single Sign-on Operator's Guide.

\*6 For more information about how to check the validity period of the user, see 'Operation and Maintenance' - 'User Related Operation' - 'Checking and Changing User Validity Period' in the Single Sign-on Operator's Guide.

\*7 For more information about how to register the 'userPassword' attribute as user information, see 'Operation and Maintenance' - 'User Related Operation' - 'Changing User Passwords' in the Single Sign-on Operator's Guide.

\*8 For more information about [Attributes used for Authentication], from the Interstage Management Console, click [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Authentication server] > [Settings] tab. Then from the [Settings] tab, click [Detailed Settings [Show]] and reference [Certificate Authentication Settings].

\*9 For details about the method to check Active Directory, refer to the Active Directory manual.

\*10 For details about checking Single Sign-on extended schema, refer to "Troubleshooting" - "Examples of Errors" - "Errors when using Active Directory in the user Directory Service where the user information is registered" in the Single Sign-on Operator's Guide.

[User was already authenticated.](#)

#### **Explanation**

Possible causes of this error are as follows:

- The user attempted to perform authentication for a Web browser that is already authenticated.
- The system times of the business server, authentication server, and repository server may not be synchronized.
- The user tried to use a different Web browser to the one already used for the authentication operation, to perform the authentication operation for the POST request.

#### **User Action**

Take the following action:

- Access the protection resource directly.
- To sign on with another user ID, close and reopen the Web browser, and perform user authentication.
- If a message is output in the Authentication window during POST request authentication, close the Authentication window, and then click the link for the Authentication window that is displayed in the Unauthenticated window.

#### **Business Server Administrator Action**

Ask the SSO administrator if the system time of the business server is synchronized with that of the authentication server.

#### **SSO Administrator Action**

Check if the system times of all authentication servers and repository servers are synchronized.

[User was locked out.](#)

#### **Explanation**

The user has been locked out because the password failed to be reentered the specified number of times.

#### **User Action**

Ask the business server administrator to release the lockout.

#### **Notes**

To access the protection resources, restart the Web browser.

#### **Business Server Administrator Action**

Notify the SSO administrator.

#### **SSO Administrator Action**

Release the lockout of the appropriate user.

For information on how to release lockout, see 'Operation and Maintenance' - 'User Related Operation' - 'Canceling Lockout' in the Single Sign-on Operator's Guide.

## **33.3.4 404**

---

### **404 Not Found**

## Explanation

The specified resource could not be found on the server.

## When the Servlet service is in use:

When the Servlet service is in use, refer to "[33.6 When Status Codes and Messages are Displayed in the Web Browser at Calling of the Web Application](#)".

If the following message appears, perform the corrective action listed below:

`type <output-type>`  
`message <URL>`  
`description The requested resource (<URL>) is not available.`

### Variable Information

<Output type> = Status report, etc.

<URL> = URL

### Cause

Possible causes are as follows:

- The URL specified in the Web browser is incorrect.
- A file of the called Web application does not exist.
- The specified init-param tag of the Web application environment definition file is incorrect.
  - The param-name tag is not specified.
  - The coded param-name tag is incorrect.
  - The param-value tag is not specified.
  - The coded param-value tag is incorrect.
- The specified load-on-startup tag of the Web application environment definition file is incorrect.
  - The load-on-startup tag parameter is not specified.
  - A value outside the range is specified in the load-on-startup tag parameter.
- The called servlet is not defined in the servlet mapping of the Web application environment definition file.
- The application with the Web application name defined in the Web server connector does not exist in IJServer.

### User Action

Check the existence of the Web application and the setting of the Web application environment definition file.

If the Web application name for the deployed module is incorrect, specify the correct Web application name and redeploy the application.

[Servlet %s1 is not available](#)

### Variable Information

%s1:Servlet name

### Explanation

The servlet cannot be used.

### Cause

Refer to the message that was output to the container log.

### User Action

Refer to the message that was output to the container log.

## When Single Sign-on is used

Take the following action.

### **User Action**

Take the following action:

- Check that the URL that was accessed is correct.
  - If status code 500 is reported from the Web browser immediately before this message, follow the instructions indicated in the former message.
  - Ask the business server administrator to check that the URL displayed in the address field of the browser exists, and that there are contents under the protection resource.
  - Check whether the URL displayed in the browser address field is the same as the URL that was actually accessed. If it is different, contact the business server administrator and describe the operation.
  - If you are using Integrated Windows Authentication, check whether Microsoft(R) Internet Explorer is used as the Web browser. If it is not, you should switch to use it as the Web browser. If it is, contact the business server administrator.
- To perform the operation again after taking action, close the browser and re-execute.

### **Business Server Administrator Action**

Take the following action:

- Check that the URL indicated by the user is [Public URL] of the business system. (\*1)
- If the resource specified by the user does not exist in the server, or if the URL which has been specified is incorrect, guide the user to access the correct URL.
- If the URL indicated by the user is correct, use the access log of the business server to check whether access from the user was performed.
- If access from the user was performed, notify the SSO administrator.
- Check that there are contents under the protection resource notified by the user.
- When a system that can be accessed only by clients on the Internet is to be configured in cooperation with Application Gateway, check the Application Gateway settings to see if the path section of the request source URL is the same as that of the relay destination URL in the business system reverse settings.
- If the user performed authentication from the form authentication page, ask the SSO administrator if the contents of the form authentication page are correct.
- If the current version was upgraded from a previous version, check that the upgrade procedure was correct.
- If the problem is still not resolved, contact the SSO administrator.

### **SSO Administrator Action**

Check the following:

- Check that the URL indicated by the business server administrator is the authentication infrastructure URL.
- If you are using Integrated Windows Authentication, take the following action:
  - Check whether the Integrated Windows Authentication application has been deployed.
  - Check whether the Integrated Windows Authentication application has started.
- Check whether the Single Sign-on message is output in the system log of the authentication server. If it, an invalid request may be accepted. Take the action indicated by the User Action of the message.
- If the user performed authentication on the form authentication page, check if the contents of the form authentication page are correct. (\*2)
- If the current version was upgraded from a previous version, check that the upgrade procedure was correct.

\*1 For [Public URL], see [Business system Information] by clicking [System] > [Security] > [Single Sign-on] > [Business system] > [Business system Name] > [Detailed Settings [Show]] on the [Settings] tab in the Interstage Management Console.

\*2 For more information about how to customize the form authentication page, see 'Single Sign-on Customization' - 'Customizing Messages Displayed on Web Browser' in the Single Sign-on Operator's Guide.

## 33.3.5 405

---

### 405 Method Not Allowed

#### Explanation

A method specified on the request line is not allowed for the resource.

#### When the Servlet service is in use:

If the following message appears, take the action listed below:

type [Status report](#)

message [<message>](#)

The specified HTTP method is not allowed for the requested resource ([<message>](#)).

#### Variable Information

One of the following messages is output in [<Message>](#):

- The HTTP GET method is not supported in this URL.
- The HTTP POST method is not supported in this URL.
- The HTTP PUT method is not supported in this URL.
- The HTTP DELETE method is not supported in this URL.

#### Cause

The method of an unimplemented class is being called.

#### User Action

Check the method of calling and creating a Web application.

## 33.3.6 406

---

### 406 Not Acceptable

#### Explanation

The response the server returned does not satisfy a requirement specified by the client in the Accept header.

## 33.3.7 407

---

### 407 Proxy Authentication Required

#### Explanation

The client must authenticate itself to the proxy.

## 33.3.8 408

---

### 408 Request Time-out

#### Explanation

The client could not complete issuance of a request, and a server timeout occurred.

When the Servlet service is in use:

If the following message appears, take the action listed below:

The time allowed for the login process has been exceeded. If you wish to continue you must either click back twice and re-click the link you requested or close and re-open your browser

**Explanation**

The time allowed for the login process has been exceeded.

**Cause**

The session timed out during the FORM authentication login process.

**User Action**

Check the client application status. If the client application is normal, check the session timeout value.

---

### 33.3.9 409

---

#### 409 Conflict

Explanation

The request could not be handled because there is an inconsistency in the resource.

---

### 33.3.10 410

---

#### 410 Gone

Explanation

The server cannot handle the requested resource.

---

### 33.3.11 411

---

#### 411 Length Required

Explanation

The client must specify a valid Content-length.

---

### 33.3.12 412

---

#### 412 Precondition Failed

Explanation

The server determined that there is an error in a precondition specified in the request header field.

---

### 33.3.13 413

---

#### 413 Request Entity Too Large

Explanation

The requested entity is too large; the server cannot accept it.

---

### 33.3.14 414

---

#### 414 Request-URI Too Large

Explanation

The request URI is too long; the server cannot accept it.

## 33.3.15 416

---

### 416 Requested Range Not Satisfiable

#### Explanation

The Range header field in the request does not match the current range of the resource, and the request includes no If-Range header field.

## 33.3.16 417

---

### 417 Expectation Failed

#### Explanation

The server cannot accept any expected value in the Expect request header field.

## 33.4 Server Error (Status Codes 500 to 599)

---

### 33.4.1 500

---

#### 500 Internal Server Error

#### Explanation

An error occurred in the server, which prevents execution of the request.

When the Servlet service is in use:

When the Servlet service is in use, refer to "[33.6 When Status Codes and Messages are Displayed in the Web Browser at Calling of the Web Application](#)".

If the following message appears, perform the corrective action listed below:

- type *<output-type>*
- message *<message>*
- description *<description>*
- exception
- *<exception content>*
- *<detail>*
- root cause
- *<error content>*
- *<detail>*

#### Variable Information

*<Output type>*: Exception report, etc.

*<Message>*, *<Explanation>*: Status explanation

*<Exception content>*+*<Detail>*, *<Error content>*+*<Detail>*: Stack trace

#### Cause

1. There is a problem in setting the Web application environment definition file. The possible causes are as follows:
  - An exception occurs in a program (servlet, JSP, filter, etc.) contained in the Web application.
  - Uppercase or lowercase letters of the servlet name are incorrect in the URL specified in the Web browser.

- The specified jsp-file tag is incorrect.  
The jsp-file tag parameter is not specified.  
A JSP file of another Web application is specified in the jsp-file tag parameter.
- The specified error-page tag is incorrect.  
The coded error-code tag is incorrect.  
The exception-type tag is not specified.  
The coded exception-type tag is incorrect.  
The exception-type tag parameter is not specified.  
The location tag is not specified.  
The location tag parameter is not specified.
- 2. If java.lang.OutOfMemoryError is output, the possible causes are as follows:
  - System memory is insufficient.
  - The heap area of Java VM is insufficient.
- 3. The application with the Web application name defined in the Web server connector does not exist in IJServer.

**User Action**

1. Check whether there is no problem in setting the programs (servlet, JSP, filter, etc.) contained in a Web application and the Web application environment definition file. Moreover, a message may be output to the container log of the work unit. In this case, perform a corrective action according to that message.
2. Perform the following corrective actions:
  - Exit the unnecessary applications other than the Servlet service that is currently active. Referring to the 'Tuning Guide,' check whether the necessary memory is sufficient. If the memory amount is not enough, add more memory.
  - Increase the size of the maximum heap area of Java VM.
3. Deploy the Web application. If the Web application name is incorrect, specify the correct Web application name and redeploy the application.

**When Single Sign-on is used**

If an additional message is output when Single Sign-on is used

Take action according to the message.

An internal error has occurred. %s1

**Variable Information**

%s1: Error Detail Code (\*1)

**Explanation**

The probable causes are described below.

- In a high performance system where an SSL accelerator is placed between clients and the authentication server, the user certificate used for certificate authentication expired.
- A server operating Single Sign-on could not successfully process a request from a client because of a temporary overload.
- Active Directory linkage failed.
- An internal error occurred during operation of Single Sign-on.

If variable information was output, an internal error occurred on the Single Sign-on repository server.

**User Action**

Take the following action.

- Check whether the certificate has expired. If it has expired, obtain a new certificate and register it in the browser.
- Reload the Web browser contents.
- Close and restart the Web browser, and access the contents again.
- In Integrated Windows Authentication, briefly log off from the domain, log back on to the domain and access the contents again.
- Notify the business server administrator.

To perform the operation again after taking action, close the browser and re-execute.

**Business Server Administrator Action**

Check that an error message was output to the system log of the business server. If it was output, follow User Action for the error message to correct the error.

If an error message is not output, notify the SSO administrator.

If the problem is not notified by the SSO administrator, restart the business server. If the problem is still not resolved, execute the `iscollectinfo` command to collect investigation information as well as the configuration file of the Web server used to run the business server, and then contact your service engineer.

**SSO Administrator Action**

Follow User Action for the error message output to the system log of the authentication server or repository server to correct the error.

\*1 The error detail code may not be displayed.

[When "Internal Server Error" is output to the Web browser](#)

**Explanation**

Processing could not be performed for the request.

**User Action**

Notify the business server administrator.

To perform the operation again after taking action, close the browser and re-execute.

**Business Server Administrator Action**

Notify the SSO administrator.

**SSO Administrator Action**

Take the following action.

- Check that the Integrated Windows Authentication application is running.

For details about starting Integrated Windows Authentication applications, refer to "Operation and Maintenance" - "Starting Single Sign-on" - "Starting an Authentication Server" in the Single Sign-on Operator's Guide.

[The page would display the status code in white characters on a green background with more specific detail displayed below.](#)

**Explanation**

An internal error occurred in the Single Sign-on application.

**User Action**

Notify the business server administrator.

To perform the operation again after taking action, close the browser and re-execute.

**Business Server Administrator Action**

Notify the SSO administrator.

**SSO Administrator Action**

Fix the error according to [User Action] in the message output to the system log of the authentication server.

If no message is output to the system log of the authentication server, take the following action.

- When Integrated Windows Authentication is used

Check whether a message starting with "SSO: ERROR" was output to the container log of the WorkUnit deployed to the Integrated Windows Authentication application. If a message was output, refer to the message number, and refer to "Messages Beginning with 'sso'" in the Messages Manual, for details on how to fix the error.

[When "The page cannot be displayed" is output to the Web browser](#)

**Explanation**

The Single Sign-on message page could not be displayed.

**User Action**

Notify the business server administrator.

To perform the operation again after taking action, close the browser and re-execute.

**Business Server Administrator Action**

Notify the SSO administrator.

**SSO Administrator Action**

Take the following action.

- The size of the message files, shown below, that are output to the Web browser is less than 512 bytes. Customize the files again so that the file size is at least 512 bytes.
  - When Integrated Windows Authentication is used
    - 500\_internal\_error\_en.html (\*1)
  - An internal error occurs in the Integrated Windows Authentication application. Take action according to "When Single Sign-on is used" and establish the cause of the error.

\*1 For details about the customization of the message that is displayed in the Web browser when Integrated Windows Authentication is used, refer to "Single Sign-on Customization" - "Customizing Messages Displayed on a Web Browser" - "Messages that can be Customized" in the Single Sign-on Operator's Guide.

## 33.4.2 501

---

### 501 Not Implemented

**Explanation**

The server does not support the requested method.

## 33.4.3 502

---

### 502 Bad Gateway

**Explanation**

A server operating as a gateway or proxy received an invalid response from a high-order server when it attempted to handle a request from a client.

## 33.4.4 503

---

### 503 Service Temporarily Unavailable

**Explanation**

Requests could not be handled because the server was being temporarily overloaded or subject to maintenance.

When the Servlet service is in use:

When the Servlet service is in use, refer to "[33.6 When Status Codes and Messages are Displayed in the Web Browser at Calling of the Web Application](#)".

If the following message appears, take the action listed below:

[This application is not currently available](#)

**Explanation**

The requested application cannot currently be used.

**Cause**

Refer to the message that was output to the container log.

**User Action**

Refer to the message that was output to the container log.

---

## 33.4.5 504

---

### 504 Gateway Timeout

**Explanation**

No response was made within the gateway wait time.

---

## 33.4.6 505

---

### 505 HTTP Version Not Supported

**Explanation**

HTTP protocol version used for request is not supported.

---

## 33.5 Other Errors

---

### 33.5.1 Messages Displayed in Internet Explorer

---

[The page cannot be displayed](#)  
[The website declined to show this webpage](#)  
[Internet Explorer cannot display the webpage](#)  
[This page can't be displayed](#)

**Explanation**

The page being searched for cannot be displayed now. A technical problem occurred on the web site or the browser settings must be changed.

Alternatively, communication has been disconnected because certificate selection was canceled.

**When Single Sign-on is used**

Take the following action.

**User Action**

- If certificate selection was canceled, restart the browser and select a certificate.
- Check if the Show friendly HTTP error messages check box is selected on the Advanced page of the Internet Options window. If it is selected, clear it, click OK, and then refresh the browser window.
- If you are using an IC card for authentication, check that the card is correctly inserted then refresh the browser window.
- Ask the business server administrator to check if the URL displayed in the address field of the browser exists.
- Ask the business server administrator to confirm normal operation of the business server.

**Business Server Administrator Action**

- Check that the URL indicated by the user is [Public URL] of the business system. (\*1)

- If the URL indicated by the user is correct, use the access log of the business server to check whether access from the user was performed.
- Check that contents are present at the URL indicated by the user.
- If access from the user was performed, make an enquiry to the SSO administrator.
- Check that the business server is activated.
- Check whether [Web Server used] of the business server is correctly set. (\*2)
- When a system that can be accessed only by clients on the Internet is configured in cooperation with Application Gateway, check that a client on an intranet does not access the system.
- To link with Interstage Security Director and build a system in which only the client on the Internet can be accessed, check whether the access occurred from a client inside an intranet.
- If Interstage Security Director or an SSL Accelerator (such as SSL Accelerator 7117) was used, check whether there is a problem with the settings. If there is no problem with the settings, make an enquiry to the SSO administrator.
- If the Web server containing the business server is Microsoft(R) Internet Information Services 6.0 or later, ensure that the application pool ID configuration is valid (for details, refer to "Environment Setup (Business Server Administrators)" - "Integrating into the Web Server" in the Single Sign-on Operator's Guide).
- If the Web server used to integrate the business server is Microsoft(R) Internet Information Services, check whether the 'fj-is-ss0' virtual directory is integrated into the website used to run the business server:
  - If it is not integrated, then integrate it (for details, refer to "Environment Setup (Business Server Administrators)" - "Integrating into the Web Server" in the Single Sign-on Operator's Guide).
  - If it is integrated, then ensure that the virtual directory execution access authority is set to 'Script and executable files' and that programs in the business server directory (for example, 'C:\Interstage\F3FMss0\ssoatzag\lib\F3FMss0atziis.dll') can be read and executed by the 'fj-is-ss0' virtual directory account.
- Review the network environment.

#### **SSO Administrator Action**

- Check that the URL indicated by the business server administrator is the authentication infrastructure URL
- Check that the authentication server is activated.
- For Integrated Windows Authentication:
  - Check that the Integrated Windows Authentication application is deployed
  - Check that Integrated Windows Authentication application has been started.
- If Interstage Security Director or an SSL Accelerator (such as SSL Accelerator 7117) was used, check whether there is a problem with the settings.
- If the current version was upgraded from a previous version, check that the upgrade procedure was correct.
- Review the network environment.

\*1 For [Public URL], see [Business system Information] by clicking [System] > [Security] > [Single Sign-on] > [Business system] > [Business system Name] > [Detailed Settings [Show]] on the [Settings] tab in the Interstage Management Console. When [Internet Option] - [Detailed Settings] - [Show Friendly HTTP Error Messages] is checked, the correct URL is not indicated in the address field in the web browser. In this case, ensure that the contents are present in the target protection resource.

\*2 For details on [Web Server used], go to Interstage Management Console, select [System]> [Security]> [Single Sign-on] > [Business system] > [Business system Name] > [Settings] tab, click [Detailed Settings [Show]], and see [Web Server Settings].

## **33.5.2 Messages Displayed in Mozilla(R) Firefox**

---

**Unable to connect  
Server not found  
The connection was interrupted**

## The connection was reset The connection has timed out

### Explanation

The page being searched for cannot be displayed now. A technical problem occurred on the web site or the browser settings must be changed.

Alternatively, communication has been disconnected because certificate selection was canceled.

### When Single Sign-on is used

Take the following action.

#### User Action

- If certificate selection was canceled, restart the browser and select a certificate.
- Ask the business server administrator to check if the URL displayed in the address field of the browser exists.
- Ask the business server administrator to confirm normal operation of the business server.

#### Business Server Administrator Action

- Check that the URL indicated by the user is [Public URL] of the business system. (\*1)
- If the URL indicated by the user is correct, use the access log of the business server to check whether access from the user was performed.
- Check that contents are present at the URL indicated by the user.
- If access from the user was performed, make an enquiry to the SSO administrator.
- Check that the business server is activated.
- Check whether [Web Server used] of the business server is correctly set. (\*2)
- To link with Interstage Security Director and build a system in which only the client on the Internet can be accessed, check whether the access occurred from a client inside an intranet.
- If Interstage Security Director or an SSL Accelerator (such as SSL Accelerator 7117) was used, check whether there is a problem with the settings. If there is no problem with the settings, make an enquiry to the SSO administrator.
- If the Web server containing the business server is Microsoft(R) Internet Information Services 6.0 or later, ensure that the application pool ID configuration is valid (for details, refer to "Environment Setup (Business Server Administrators)" - "Integrating into the Web Server" in the Single Sign-on Operator's Guide).
- If the Web server used to integrate the business server is Microsoft(R) Internet Information Services, check whether the 'fj-is-sso' virtual directory is integrated into the website used to run the business server:
  - If it is not integrated, then integrate it (for details, refer to "Environment Setup (Business Server Administrators)" - "Integrating into the Web Server" in the Single Sign-on Operator's Guide).
  - If it is integrated, then ensure that the virtual directory execution access authority is set to 'Script and executable files' and that programs in the business server directory (for example, 'C:\Interstage\F3FMssso\ssoatzag\lib\F3FMsssoatzis.dll') can be read and executed by the 'fj-is-sso' virtual directory account.
- Review the network environment.

#### SSO Administrator Action

- Check that the URL indicated by the business server administrator is the authentication infrastructure URL.
- Check that the authentication server is activated.
- If Interstage Security Director or an SSL Accelerator (such as SSL Accelerator 7117) was used, check whether there is a problem with the settings.
- If the current version was upgraded from a previous version, check that the upgrade procedure was correct.
- Review the network environment.

\*1 For [Public URL], see [Business system Information] by clicking [System] > [Security] > [Single Sign-on] > [Business system] > [Business system Name] > [Detailed Settings [Show]] on the [Settings] tab in the Interstage Management Console.

\*2 For details on [Web Server used], go to Interstage Management Console, select [System]> [Security] > [Single Sign-on] > [Business system] > [Business system Name] > [Settings] tab, click [Detailed Settings [Show]], and see [Web Server Settings].

## 33.6 When Status Codes and Messages are Displayed in the Web Browser at Calling of the Web Application

If the environment setting or the method of calling a Web application is incorrect, the Web browser displays status codes or messages, not the Web application execution results.

Check the pages of the status codes and messages. The user's response depends on the service or component that outputs the status codes and messages.

Table 33.1 Event Status Codes and Messages

Pages of status code and message	Service or component issued
A page is output in which the character string part of the header containing the status code is a blue background and which is displayed in white characters.	Servlet container
A page is displayed which was defined with the error-page tag of the Web application environment definition file.	Servlet container
Other than above	Web server

If the Web server outputs a page referred to in [Table 33.1 Event Status Codes and Messages](#), check the following:

- If 404 Not Found is notified to the Web browser, the Web server integrated with IJServer may not have been selected.

Firstly, in the Interstage Management Console Select [System] > [Settings] > [Update System Settings] > [Servlet Service Settings] > [Run Web server and WorkUnit on the same machine?], and check whether [Yes] has been selected. If [No] has been selected, disregard this check.

Next, in the Interstage Management Console Select [WorkUnit] > "WorkUnit Name" > [Settings] > [Web Server Connector (Connectors) Settings] > [Web Server/Web Server Virtual Host], and check whether the Web server integrated with IJServer has been selected. If it has not been selected, select the Web server integrated with IJServer.

- The Web server connector log may be output.

For the messages output to the log of the Web server connector, see 'IJServer12000 to IJServer12999' in "Messages Beginning with 'IJServer1'".

From the Reference Log tab of Interstage Management Console ([Services] > [Web Server] > "Web Server name" > [Web Server Connector] > [Reference Log]), the Web server connector log can be referenced

- The httpd.conf Web server connector LoadModule definition may have been deleted.

Refer to "Interstage HTTP Server Environment Settings" of "Setting up Web Server Environment" in the J2EE User's Guide, and then redefine the LoadModule definition.

If the Servlet container outputs a page, perform the corrective action for each status code as previously detailed in this chapter.

# Chapter 34 Messages Output by Single Sign-on

This chapter describes the following messages output by Single Sign-on:

- Messages output by Single Sign-on operation commands
- Messages that output commands which perform backup/export and restore/import of Single Sign-on resources
- Messages output when an exception occurs in a Java application that uses Single Sign-on

## 34.1 ssobackup Command Messages

This section describes the messages output by the *ssobackup* command.

### 34.1.1 0001

#### [0001]Parameter error : <option>

##### Explanation

The specified parameter is incorrect.

##### User Action

Check the <option> parameter, and then re-execute the command.

### 34.1.2 0002

#### [0002]Internal error

##### Explanation

An internal error occurred.

##### User Action

Re-execute. If the message is still output, use the *iscollectinfo* command to collect diagnostic information, and then contact your systems engineer.

### 34.1.3 0003

#### [0003]System function detect error

##### Explanation

Possible causes of the error are as follows:

- An error occurred in the system function during processing.

**Windows32/64**

- A file name or directory name consisting of 260 bytes or more exists or a path exceeding 520 bytes exists.

##### User Action

Take the following action:

**Windows32/64**

Check if an incorrect path (such as a file name or directory name of 260 bytes or more or a path exceeding 520 bytes) exists in the following directories:

- The -az option was specified when the command was executed
  - C:\Interstage\F3FMssso\ssoatzag\conf
  - C:\Interstage\F3FMssso\ssoatzag\pub\template
- The -ac option was specified when the command was executed
  - C:\Interstage\F3FMssso\ssoatcag\conf
  - C:\Interstage\F3FMssso\ssoatcag\pub\template
  - C:\Interstage\F3FMssso\ssoatcag\webapps\winauth\custom\page
  - C:\Interstage\F3FMssso\ssoatcag\webapps\winauth\WEB-INF
  - C:\Interstage\F3FMssso\ssofsv\conf
  - C:\Interstage\F3FMssso\ssofsv\webapps\ssofsv\custom
- The -sv option was specified when the command was executed
  - C:\Interstage\F3FMssso\ssoatcsv\conf

If there is an incorrect path, delete it and then re-execute.

If there is not an incorrect path, re-execute. If the message is still output, use the *iscollectinfo* command to collect diagnostic information, and then contact your systems engineer.

**Solaris32/64** **Linux32/64**

Re-execute. If the message is still output, use the *iscollectinfo* command to collect diagnostic information, and then contact your systems engineer.

## 34.1.4 0004

---

### [0004]Invalid file path : <file path>

#### Explanation

The specified Interstage Single Sign-on resource storage file path is invalid. Possible causes of the error are as follows:

- The full path of the Interstage Single Sign-on resource storage file path <file path> was not specified.
- A directory was specified for the Interstage Single Sign-on resource storage file path <file path>.

**Windows32/64**

- The Interstage Single Sign-on resource storage file length has exceeded 259 bytes.

**Solaris32/64** **Linux32/64**

- The Interstage Single Sign-on resource storage file length has exceeded 255 bytes.

#### User Action

Take the following action, and then re-execute.

- Check whether the full path of the Interstage Single Sign-on resource storage file path <file path> was specified.
- Check whether a directory was specified for the Interstage Single Sign-on resource storage file path <file path>.

**Windows32/64**

- Check whether the Interstage Single Sign-on resource storage file length has exceeded 259 bytes.

**Solaris32/64** **Linux32/64**

- Check whether the Interstage Single Sign-on resource storage file length has exceeded 255 bytes.

## 34.1.5 0005

---

### [0005]Allocation of a memory failed

#### Explanation

Memory could not be allocated.

#### User Action

Close all programs no longer needed, and then re-execute the command.

## 34.1.6 0006

---

### [0006]No space in disk

#### Explanation

There is not enough disk space for storing the Interstage Single Sign-on resource storage file specified in the filepath argument.

#### User Action

Delete unnecessary files and then re-execute.

## 34.1.7 0012

---

### [0012]File access denied : <file path>

#### Explanation

Possible causes of the error are as follows:

- There is no access authority for file <file path>.

**Windows32/64**

- A DOS device name may have been used for the specified Interstage Single Sign-on resource storage file.

#### User Action

Take the following action, and then re-execute.

- Check whether the file <file path> is being used by another application.

**Windows32/64**

- If a DOS device name was used for the specified Interstage Single Sign-on resource storage file, specify a different file name.

## 34.1.8 0032

---

### [0032]Execution is not permitted

#### Explanation

You cannot execute the command because you do not have administrator permission.

#### User Action

Re-execute the command as a user with administrator permission.

## 34.1.9 0054

---

### [0054]Authentication server is not created

## Explanation

The Interstage Single Sign-on resource storage file cannot be created because the authentication server has not been set up on the machine used to perform backup/export.

## User Action

Re-execute the command again on the machine where the authentication server is set up.

### 34.1.10 0057

---

#### [0057]Business server is not created

## Explanation

The Interstage Single Sign-on resource storage file cannot be created because the business server has not been set up on the machine used to perform backup/export.

## User Action

Re-execute the command on the machine where only the business server is set up.

### 34.1.11 0091

---

#### [0091]An error occurred using the system function : <detail>

## Explanation

An error occurred in the system function during processing.

## User Action

Re-execute. If the message is still output, use the *iscollectinfo* command to collect diagnostic information, and then contact your systems engineer.

### 34.1.12 0113

---

#### [0113]Repository server was not created

## Explanation

The Interstage Single Sign-on resource storage file cannot be created because the repository server has not been set up on the machine used to perform backup/export.

## User Action

Re-execute the machine that was used to set up the repository server.

### 34.1.13 0133

---

#### [0133]The file already exists : <file path>

## Explanation

Possible causes of the error are as follows:

- The specified Interstage Single Sign-on resource storage file already exists.

**Windows32/64**

- A DOS device name may have been used for the specified Interstage Single Sign-on resource storage file.

## User Action

Take the following action, and then re-execute.

- Specify a different file name to the one specified for the Interstage Single Sign-on resource storage file, or delete the Interstage Single Sign-on resource storage file.

#### Windows32/64

- If a DOS device name was used for the specified Interstage Single Sign-on resource storage file, specify a different file name.

## 34.1.14 0135

---

### [0135]Interstage Single Sign-on package is not installed : <server name>

#### Explanation

The Interstage Single Sign-on package for <server name> was not installed.

#### User Action

Install the package for <server name> and then re-execute.

#### Windows32/64

- Business server
  - Interstage Single Sign-on (business server)
- Authentication server
  - Interstage Single Sign-on (authentication server)
- Repository server
  - Interstage Single Sign-on (repository server)

#### Solaris32/64 Linux32/64

- Business server
  - FJSVsssoaz(Interstage Single Sign-on authorization function)
  - FJSVssocm(Interstage Single Sign-on common library)
- Authentication server
  - FJSVsssoac(Interstage Single Sign-on authentication function)
  - FJSVssocm(Interstage Single Sign-on common library)
- Repository server
  - FJSVssosv(Interstage Single Sign-on repository server function)
  - FJSVssocm(Interstage Single Sign-on common library)

## 34.2 sodeploy Command Messages

---

This section describes the messages output by the *sodeploy* command.

### 34.2.1 0001

---

#### [0001]Parameter error : <option>

#### Explanation

The specified parameter is incorrect.

#### User Action

Check the <option> parameter, and then re-execute the command.

## 34.2.2 0004

---

### [0004]Invalid file path : <file path>

#### Explanation

The path of the specified keytab file is invalid. Possible causes of the error are as follows:

- The keytab file path <file path> does not exist.
- The full path of the keytab file path <file path> was not specified.
- A directory was specified for the keytab file path <file path>.

**Solaris32/64** **Linux32/64**

- The keytab file length has exceeded 255 bytes.

#### User Action

Take the following action:

- Check whether the keytab file path <file path> exists.
- Check whether the full path of the keytab file path <file path> was specified.
- Check whether a directory was specified for the keytab file path <file path>.

**Solaris32/64** **Linux32/64**

- Check whether the keytab file length has exceeded 255 bytes.

## 34.2.3 0012

---

### [0012]File access denied : <file path>

#### Explanation

You are not permitted to access the file indicated by <file path>.

#### User Action

Check if the file indicated by <file path> is being used by another application, and then re-execute the command.

## 34.2.4 0032

---

### [0032]Execution is not permitted

#### Explanation

You cannot execute the command because you do not have administrator permission.

#### User Action

Re-execute the command as a user with administrator permission.

## 34.2.5 0051

---

### [0051]Interstage Single Sign-on package is not installed

#### Explanation

The Interstage Single Sign-on package is not installed.

#### User Action

**Windows32/64**

Install Interstage Single Sign-on (authentication server).

**Solaris32/64** **Linux32/64**

Install the following packages:

- FJSVssoc (Interstage Single Sign-on authentication agent)
- FJSVssocm (Interstage Single Sign-on common library)

## 34.2.6 0054

---

### [0054]Authentication server is not created

#### Explanation

Possible causes of the error are as follows:

- The authentication server may not have been set up, or the environment may have been corrupted.
- The authentication server configuration file may be in use by another application.

#### User Action

Take the following action:

- This command can only be executed on the machine that was used to set up the authentication server. Execute this command on the machine that was used to set up the authentication server.
- Check whether the authentication server configuration file is being used by another application, and if so, close the other application.
- If the authentication server has been set up, perform the following tasks and then re-execute.

- Restore the backed up authentication server resource files. (\*1)

If the authentication server resource files have not been backed up, set up the authentication server again.

- Check whether the Interstage Application Server installation directory has been set correctly in the environment variable (IS\_HOME).

\*1 For details about restoring authentication server resource files, refer to the chapter "Maintenance (Resource Backup)" in the Operator's Guide.

## 34.2.7 0095

---

### [0095]The environment variable (IS\_HOME) is not set

#### Explanation

The environment variable (IS\_HOME) is not set.

#### User Action

Check that the Interstage Application Server installation directory was correctly set in the environment variable (IS\_HOME), and then re-execute.

## 34.2.8 0096

---

### [0096]The environment variable (JAVA\_HOME) is not set

#### Explanation

The environment variable (JAVA\_HOME) is not set.

#### User Action

Check that the JDK or JRE installation directory set for the environment variable (JAVA\_HOME) is correct and then re-execute.

## 34.2.9 0140

---

### [0140]The J2EE operation command was not installed : <file path>

#### Explanation

The J2EE operation command <file path> was not installed.

#### User Action

Check that the J2EE operation command <file path> was installed correctly. If it is not installed, install it.

## 34.2.10 0141

---

### [0141]Failed to create the login configuration file : <file path>

#### Explanation

Failed to create the login configuration file <file path>.

#### User Action

Check that the login configuration file <file path> is not being used by another application, and then re-execute.

## 34.2.11 0142

---

### [0142]Failed to create the IJServer definition file : <file path>

#### Explanation

Failed to create the IJServer definition file <file path>.

#### User Action

Check that the IJServer definition file <file path> is not being used by another application, and then re-execute.

## 34.2.12 0143

---

### [0143]Failed to register IJServer : <ijserver name>

#### Explanation

Failed to register the IJServer created for Interstage Single Sign-on.

#### User Action

Take the following action:

- Ensure that the IJServer name specified for <ijserver name> in the -n option is valid, and then re-execute this command. (\*1)
- Fix the error according to the error message that was output immediately before, delete IJServer <ijserver name>, and then re-execute this command. (\*2)

\*1 For details on the -n option, refer to "Single Sign-on Operation Commands" - "ssodeploy" in the Reference Manual (Command Edition).

\*2 IJServer can be deleted in the Interstage Management Console or by using the isj2eeadmin command. For details about the isj2eeadmin command, refer to "isj2eeadmin" in the "J2EE Operation Commands" chapter of the Reference Manual (Command Edition).

## 34.2.13 0144

---

### [0144]Failed to register the Web application : <ijserver name>

## Explanation

Failed to register the Web application created for Interstage Single Sign-on.

## User Action

Fix the error according to the error message that was output immediately before, delete IJServer <ijserver name>, and then re-execute this command.

IJServer can be deleted in the Interstage Management Console or by using the isj2eeadmin command.

For details about the isj2eeadmin command, refer to "isj2eeadmin" in the "J2EE Operation Commands" chapter of the Reference Manual (Command Edition).

## 34.2.14 0145

---

### [0145]Failed to import the keytab file : <file path>

## Explanation

Failed to import the keytab file <file path>.

## User Action

Check that the keytab file <file path> is not being used by another application, and then re-execute.

## 34.2.15 0146

---

### [0146]The klist command was not installed : <file path>

## Explanation

The klist command <file path> was not installed.

## User Action

Check that the klist command <file path> was installed correctly. If it is not installed, install it.

### Linux32/64

Check whether the following packages have been installed correctly. If they have not, install them.

- Red Hat Enterprise Linux 6(for x86)

Package	Architecture
krb5-workstation	i686

- Red Hat Enterprise Linux 6(for Intel64)

Package	Architecture
krb5-workstation	x86_64

## 34.2.16 0147

---

### [0147]The keytab file is incorrect : <file path>

## Explanation

The keytab file<file path> specified in the "keytab" argument is incorrect.

## User Action

Check the contents of "keytab", correct if necessary, and then re-execute.

## 34.2.17 0149

---

### [0149]The authentication infrastructure URL FQDNs do not match : <FQDN>

#### Explanation

The FQDN<FQDN> of the authentication infrastructure URL set for the key tab file (specified in the "keytab" argument) does not match the FQDN of the authentication infrastructure URL set for the authentication server environment settings.

#### User Action

In the "keytab" argument, set the keytab file to match the value set for the authentication infrastructure URL FQDN in the authentication server environment, and then re-execute.

In the Interstage Management Console, click [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Authentication server] > [Settings] > [Detailed Settings [Show]] > [Authentication infrastructure Information] > [Authentication infrastructure URL].

## 34.3 ssoclonaz Command Messages

---

This section describes the messages output by the *ssoclonaz* command.

### 34.3.1 0001

---

#### [0001]Parameter error: <option>

#### Explanation

The specified parameter is incorrect.

#### User Action

Check the <option> parameter, and then re-execute the command.

### 34.3.2 0002

---

#### [0002]Internal error

#### Explanation

An internal error occurred.

#### User Action

Use the *iscollectinfo* command to collect diagnostic information, and then contact your systems engineer.

### 34.3.3 0003

---

#### [0003]System function detect error

#### Explanation

Possible causes of the error are as follows:

- An error occurred in the system function during processing.

**Windows32/64**

- There is a possibility that the DOS device name was specified as the environment information file of the business server.
- A file name or directory name consisting of 260 bytes or more exists or a path exceeding 520 bytes exists.

#### User Action

Take the following action:

#### Windows32/64

- Check that the DOS device name is not specified as the environment information file of the business server. If it is, specify a different file name to the DOS device name and then re-execute.
- Check if an incorrect path (a file name or directory name of 260 bytes or more or a path exceeding 520 bytes) exists in the following directories:
  - "C:\Interstage\F3FMssossoatzag\conf"
  - "C:\Interstage\F3FMssossoatzag\pub\template"

If an incorrect path exists, delete it, and then re-execute the command.

If no incorrect path exists, use the *iscollectinfo* command to collect diagnostic information, and then contact your systems engineer.

#### Solaris32/64 Linux32/64

Use the *iscollectinfo* command to collect diagnostic information, and then contact your systems engineer.

### 34.3.4 0004

---

#### [0004]Invalid file path:<file path>

##### Explanation

The environment information file path of the specified business server is incorrect. Possible causes of the error are as follows:

- The environment information file path <file path> of the business server does not exist.
- The environment information file path <file path> of the business server is not specified with an absolute path name.
- The directory is specified in the business server environment information file path <file path>.

#### Solaris32/64 Linux32/64

- The size of the environment information file on the business server exceeds 255 bytes.

##### User Action

Take the following action:

- Check that the environment information file path <file path> of the business server exists.
- Check if the environment information file path <file path> of the business server is specified with an absolute path name.
- Check whether the directory is not specified in the business server environment information file path <file path>.

#### Solaris32/64 Linux32/64

- Check if the size of the environment information file on the business server exceeds 255 bytes.

### 34.3.5 0005

---

#### [0005]Allocation of a memory failed

##### Explanation

Memory could not be allocated.

##### User Action

Close all programs no longer needed, and then re-execute the command.

### 34.3.6 0006

---

#### [0006]No space in disk

## Explanation

There is not enough free space on the disk. Possible causes of this error are as follows:

### Windows32/64

- There is not enough free space to store the environment information file of the business server specified in the filepath argument on the disk.
- There is not enough free space on the disk where Interstage Application Server is installed.

### Solaris32/64 Linux32/64

- There is not enough free space to store the environment information file of the business server specified in the filepath argument on the disk.
- There is not enough free space on the disk where /var/opt/FJSVssocm/etc is used as the work area of this command.
- There is not enough free space on the disk where /etc/opt of the machine to which the business server environment is to be replicated exists.

## User Action

Delete unnecessary files, and then re-execute the command.

## 34.3.7 0011

---

### [0011]Failed to write to the file : <directory path>

#### Explanation

A directory <directory path> with the same name as the directory for the replication source file already exists as the replication destination.

#### User Action

Delete the directory <directory path> and then re-execute.

## 34.3.8 0012

---

### [0012]File access denied:<file path>

#### Explanation

You are not permitted to access the file indicated by <file path>.

#### User Action

Check if the file indicated by <file path> is being used by another application, and then re-execute the command.

## 34.3.9 0032

---

### [0032]Execution is not permitted

#### Explanation

You cannot execute the command because you do not have administrator permission.

#### User Action

Re-execute the command as a user with administrator permission.

## 34.3.10 0051

---

### [0051]Interstage Single Sign-on package is not installed

## Explanation

The Interstage Single Sign-on package is not installed.

## User Action

**Windows32/64**

Install Interstage Single Sign-on (business server) package.

**Solaris32/64** **Linux32/64**

Install the following packages:

- FJSVsssoaz (Interstage Single Sign-on authorization agent)
- FJSVssocm (Interstage Single Sign-on common library)

## 34.3.11 0057

---

### [0057]Business server is not created

## Explanation

The environment information file of the business server cannot be created because the business server is not set up on the replicate source machine.

## User Action

Re-execute the command on the machine where the business server is set up.

## 34.3.12 0059

---

### [0059]Servers other than an business server exist

## Explanation

The environment information file of the business server cannot be created because the repository server or authentication server is set up on the replicate source server.

## User Action

Re-execute the command on the machine where only the business server is set up.

## 34.3.13 0060

---

### [0060]Single Sign-on server already exists

## Explanation

The repository server, authentication server, or business server is already set up on the replicate source machine.

## User Action

Re-execute the command on the machine where the repository server, authentication server, and business server have not been set up.

## 34.3.14 0061

---

### [0061]Environment information file is unjust

## Explanation

Possible causes of this error are as follows:

- A file other than the environment information file of the business server is specified.
- The environment information file of the business server is corrupt.

- The environment information file of the Business server was created on a different platform.

**Windows32/64**

- There is a possibility that the DOS device name was specified as the environment information file of the business server.

#### User Action

Take the following action, and then re-execute the command:

- Specify the correct environment information file of the business server.
- Re-create the environment information file of the business server on the replicate source machine.
- Specify the environment information file of the business server created on the same platform.

**Windows32/64**

- If the DOS device name is specified as the environment information file of the business server, specify a different file name to the DOS device name.

### 34.3.15 0063

---

#### [0063]Environment information file not found:<file path>

##### Explanation

The environment information file of the specified business server was not found.

##### User Action

Check if the environment information file of the specified business server exists, then re-execute the command.

### 34.3.16 0064

---

#### [0064]Environment information file already exists:<file path>

##### Explanation

Possible causes of this error are as follows:

- The environment information file of the specified business server already exists.
- The file <file path> in the replication destination has the same name as the file in the replication source directory.

**Windows32/64**

- There is a possibility that the DOS device name was specified as the environment information file of the business server.

##### User Action

Take the following action, and then re-execute the command:

- Specify a file name other than the environment information file of the specified business server or delete the environment information file of the business server.
- Delete the file <file path>.

**Windows32/64**

- If the DOS device name is specified as the environment information file of the business server, specify a different file name to the DOS device name.

### 34.3.17 0068

---

#### [0065]Installation directories differ:<install path>

## Explanation

The Interstage Application Server installation directory differs from the replicate source installation directory indicated by <install path>.

## User Action

Match the Interstage Application Server installation directory with the replicate source installation directory indicated by <install path>, then re-execute the command.

# 34.4 ssoimpac Command Messages

---

This section describes the messages output by the *ssoimpac* command.

## 34.4.1 0001

---

### [0001]Parameter error: <option>

#### Explanation

The specified parameter is incorrect.

#### User Action

Check the <option> parameter, and then re-execute the command.

## 34.4.2 0004

---

### [0004]Invalid file path:<file path>

#### Explanation

The specified file path is incorrect. Possible causes of the error are as follows:

- The absolute path was not specified.
- A directory was specified.
- The specified file path does not exist.

**Solaris32/64** **Linux32/64**

- The file length exceeded 255 characters.

#### User Action

Take the following action:

- Check whether the absolute path was specified.
- Check whether a directory was specified.
- Check that the specified file path exists.

**Solaris32/64** **Linux32/64**

- Check that the specified file path exists, and reduce the file length.

## 34.4.3 0005

---

### [0005]Allocation of a memory failed

#### Explanation

Memory could not be allocated.

#### User Action

Close all programs no longer needed, and then re-execute the command.

### 34.4.4 0006

---

#### [0006]No space in disk

##### Explanation

There is not enough free space on the disk.

##### User Action

Delete unnecessary files, and then re-execute the command.

### 34.4.5 0008

---

#### [0008]Incorrect password

##### Explanation

The entered password was incorrect.

##### User Action

Re-execute the command, specifying the correct password to decrypt the Authentication infrastructure setup file.

### 34.4.6 0012

---

#### [0012]File access denied : <file path>

##### Explanation

There is no access permission for the specified authentication infrastructure setup file, or the Authentication server environment is corrupt.

##### User Action

If the <file path> file specified in the command is the authentication infrastructure setup file, check the following and re-execute the command.

- Check if there is administrator read permission.
- Check if the file is being used by another application.

If the above cases do not apply, the authentication server environment may be corrupt. Restore the resource files backed up for the authentication server and re-execute the command. (\*1)

If the resource files have not been backed up, use the authentication infrastructure setup file specified when this command was executed and set up the authentication server again.

\*1 For details on restoring authentication server resource files, refer to the Operator's Guide.

### 34.4.7 0017

---

#### [0017]File not found : <file path>

##### Explanation

The specified Authentication infrastructure setup file may not exist, or the Authentication server environment may be corrupt.

##### User Action

If the <file path> file specified in the command is the Authentication infrastructure setup file, check that the specified file exists and re-execute the command.

If the specified Authentication infrastructure setup file does not exist, the Authentication server environment may be corrupt. Restore the resource files backed up for the Authentication server and re-execute the command. (\*1)

If the resource files have not been backed up, use the Authentication infrastructure setup file specified when this command was executed and set up the Authentication server again.

\*1 For details on restoring Authentication server resource files, refer to the Operator's Guide.

## 34.4.8 0032

---

### [0032]Execution is not permitted

#### Explanation

You cannot execute the command because you do not have administrator permission.

#### User Action

Re-execute the command as a user with administrator permission.

## 34.4.9 0051

---

### [0051]Interstage Single Sign-on package is not installed

#### Explanation

The Interstage Single Sign-on package is not installed, or the environment is corrupt.

#### User Action

If an environment variable or data containing the registry was saved, restore it. If not, re-install the following packages:

**Windows32/64**

- Interstage Single Sign-on (authentication server).

**Solaris32/64** **Linux32/64**

- FJSVsssoac (Interstage Single Sign-on authentication server function)
- FJSVssocm (Interstage Single Sign-on common library)

## 34.4.10 0054

---

### [0054]Authentication server is not created

#### Explanation

Environment settings could not be imported to the authentication server. The authentication server may not have been set up, or the authentication server environment may be corrupt.

#### User Action

This command can only be executed on the machine used to set up the authentication server.

If the authentication server has been set up, restore the resource files backed up for the authentication server and re-execute the command. (\*1)

If the resource files were not backed up, use the authentication infrastructure setup file specified when this command was executed and set up the authentication server again.

\*1 For details on restoring authentication server resource files, refer to the Operator's Guide.

## 34.4.11 0091

---

### [0091]An error occurred using the system function : <detail>

## Explanation

An error occurred during processing using the system function.

## User Action

Re-execute the command. If the same message is output, use the *iscollectinfo* command to collect diagnostic information, and then contact your systems engineer.

### 34.4.12 0092

---

#### [\[0092\]Internal error : <detail>](#)

## Explanation

An internal error occurred.

## User Action

Use the *iscollectinfo* command to collect diagnostic information, and then contact your systems engineer.

### 34.4.13 0116

---

#### [\[0116\]Authentication infrastructure setup file is invalid : <file path>](#)

## Explanation

The specified Authentication infrastructure setup file is incorrect. Possible causes are as follows:

- The specified file was not the Authentication infrastructure setup file.
- The specified file was obtained from a different Authentication infrastructure Repository server (update system).
- The specified file is corrupt.

## User Action

Re-obtain the correct Authentication infrastructure setup file and re-execute the command.

### 34.4.14 0118

---

#### [\[0118\]Authentication infrastructure setup file could not be imported : <file path>](#)

## Explanation

The specified Authentication infrastructure setup file could not be imported. Possible causes are as follows:

- The specified Authentication infrastructure setup file may have been downloaded from a Repository server (update system) that does not use session management.
- An attempt was made to change the directory service that was used to register user information from "Active Directory" to "Interstage Directory Service".

## User Action

Take the following action:

- Specify an Authentication infrastructure setup file downloaded from a Repository server (update system) that uses session management and re-execute the command.
- Set up the authentication server again using the authentication infrastructure setup file that was specified when this command was executed.

### 34.4.15 0120

---

#### [\[0120\]Failed to get the Authentication infrastructure setup file : <detail>](#)

## Explanation

The specified Authentication infrastructure setup file could not be obtained. The specified Authentication infrastructure setup file may have been in use when the command was executed.

## User Action

Re-execute the command. If the same message is output, re-obtain the Authentication infrastructure setup file and re-execute the command.

If the same message is still output, use the *iscollectinfo* command to collect diagnostic information, and then contact your systems engineer.

## 34.4.16 0123

---

### [\[0123\]Failed to get the configuration file : <detail>](#)

## Explanation

The Authentication server definition file could not be obtained for updating. The Authentication server definition file may have been in use when the command was executed.

## User Action

Re-execute the command. If the same message is output, restore the resource files backed up for the Authentication server and re-execute the command. (\*1)

If the same message is still output, use the Authentication infrastructure setup file specified when this command was executed and set up the Authentication server again.

\*1 For details on restoring Authentication server resource files, refer to the Operator's Guide.

## 34.4.17 0124

---

### [\[0124\]Failed to update the configuration file : <detail>](#)

## Explanation

The definition file could not be updated. The specified Authentication infrastructure setup file or Authentication server definition file may have been in use when the command was executed.

## User Action

Re-execute the command. If the problem persists, re-obtain the Authentication infrastructure setup file and re-execute the command.

If the problem is still not resolved, restore the resource files backed up for the Authentication server and re-execute the command. (\*1)

If the same message is output, use the *iscollectinfo* command to collect diagnostic information, and then contact your systems engineer.

\*1 For details on restoring Authentication server resource files, refer to the Operator's Guide.

## 34.4.18 0125

---

### [\[0125\]Failed to update service ID : <detail>](#)

## Explanation

The service ID file could not be updated. The specified Authentication infrastructure setup file may have been in use when the command was executed.

## User Action

Re-execute the command. If the same message is output, re-obtain the Authentication infrastructure setup file and re-execute the command.

If the same message is still output, use the *iscollectinfo* command to collect diagnostic information, and then contact your systems engineer.

## 34.4.19 0128

---

### [0128]A necessary configuration item does not exist

#### Explanation

An authentication server definition option required for importing environment settings does not exist.

#### User Action

In an environment in which the Authentication server was upgraded from a previous version/level, the upgrade procedure may have been unsuccessful. Check that the correct procedure was used.

If the correct upgrade procedure was used, the authentication server environment may be corrupt. Restore the resource files backed up for the authentication server and re-execute the command. (\*1)

If the resource files have not been backed up, use the authentication infrastructure setup file specified when this command was executed and set up the authentication server again.

\*1 For details on restoring authentication server resource files, refer to the Operator's Guide.

## 34.5 ssoimpaz Command Messages

---

This section describes the messages output by the *ssoimpaz* command.

### 34.5.1 0001

---

#### [0001]Parameter error: <option>

#### Explanation

The specified parameter is incorrect.

#### User Action

Check the <option> parameter, and then re-execute the command.

### 34.5.2 0004

---

#### [0004]Invalid file path:<file path>

#### Explanation

The specified file path is incorrect. Possible causes of the error are as follows:

- The absolute path was not specified.
- A directory was specified.
- The specified file path does not exist.

**Solaris32/64** **Linux32/64**

- The file length exceeded 255 characters.

#### User Action

Take the following action:

- Check whether the absolute path was specified.
- Check whether a directory was specified.
- Check that the specified file path exists.

**Solaris32/64** **Linux32/64**

- Check that the specified file path exists, and reduce the file length.

### 34.5.3 0005

---

#### [0005]Allocation of a memory failed

##### Explanation

Memory could not be allocated.

##### User Action

Close all programs no longer needed, and then re-execute the command.

### 34.5.4 0006

---

#### [0006]No space in disk

##### Explanation

There is not enough free space on the disk.

##### User Action

Delete unnecessary files, and then re-execute the command.

### 34.5.5 0008

---

#### [0008]Incorrect password

##### Explanation

The entered password was incorrect.

##### User Action

Re-execute the command and specify the correct password to decrypt the Business system setup file.

### 34.5.6 0012

---

#### [0012]File access denied : <file path>

##### Explanation

There is no access permission for the specified business system setup file, or the business server environment is corrupt.

##### User Action

If the <file path> file specified in the command is the business system setup file, check the following and re-execute the command.

- Check if there is administrator read permission.
- Check if the file is being used by another application.

If the above cases do not apply, the business server environment may be corrupt. Restore the resource files backed up for the business server and re-execute the command. (\*1)

If the resource files have not been backed up, use the business system setup file specified when this command was executed and set up the business server again.

\*1 For details on restoring business server resource files, refer to the Operator's Guide.

### 34.5.7 0017

---

#### [0017]File not found : <file path>

##### Explanation

The specified business system setup file may not exist, or the business server environment may be corrupt.

#### User Action

If the <file path> file specified in the command is the business system setup file, check that the specified file exists and re-execute the command.

If the specified business system setup file does not exist, the business server environment may be corrupt. Restore the resource files backed up for the business server and re-execute the command. (\*1)

If the resource files have not been backed up, use the business system setup file specified when this command was executed and set up the business server again.

\*1 For details on restoring business server resource files, refer to the Operator's Guide.

## 34.5.8 0032

---

### [0032]Execution is not permitted

#### Explanation

You cannot execute the command because you do not have administrator permission.

#### User Action

Re-execute the command as a user with administrator permission.

## 34.5.9 0051

---

### [0051]Interstage Single Sign-on package is not installed

#### Explanation

The Interstage Single Sign-on package is not installed, or the environment is corrupt.

#### User Action

If an environment variable or data containing the registry was saved, restore it. If not, re-install the following packages:

**Windows32/64**

- Interstage Single Sign-on (business server).

**Solaris32/64** **Linux32/64**

- FJSVsssoaz (Interstage Single Sign-on business server function)
- FJSVssocm (Interstage Single Sign-on common library)

## 34.5.10 0057

---

### [0057]Business server is not created

#### Explanation

The environment settings could not be imported to the business server. The business server may not have been set up, or the business server environment may be corrupt.

#### User Action

This command can only be executed on the machine used to set up the business server.

If the business server has been set up, restore the resource files backed up for the business server and re-execute the command. (\*1)

If the resource files have not been backed up, use the business infrastructure setup file specified when this command was executed and set up the business server again.

\*1 For details on restoring business server resource files, refer to the Operator's Guide.

## 34.5.11 0091

---

### [0091]An error occurred using the system function : <detail>

#### Explanation

An error occurred during processing using the system function.

#### User Action

Re-execute the command. If the same message is output, use the *iscollectinfo* command to collect diagnostic information, and then contact your systems engineer.

## 34.5.12 0092

---

### [0092]Internal error : <detail>

#### Explanation

Possible causes are as follows:

- An internal error occurred.

**Windows32/64**

- There is a possibility that the DOS device name was specified as the output destination file of the service ID file.

#### User Action

Take the following action:

**Windows32/64**

- If the DOS device name is specified as the output destination file of the service ID file, specify a different file name to the DOS device name and then re-execute.

In all other cases, use the *iscollectinfo* command to collect diagnostic information, and then contact your systems engineer.

## 34.5.13 0117

---

### [0117]Business system setup file is invalid : <file path>

#### Explanation

The specified business system setup file is incorrect. Possible causes are as follows:

- The specified file is not the business system setup file.
- The specified file is corrupt.

#### User Action

Re-obtain the correct business system setup file from the SSO administrator and re-execute the command.

## 34.5.14 0119

---

### [0119]Business system setup file could not be imported : <file path>

#### Explanation

The specified business system setup file could not be imported. The specified business system setup file may have been downloaded from a Repository server (update system) that does not use session management.

## User Action

Specify a business system setup file downloaded from a Repository server (update system) that uses session management and re-execute the command.

### 34.5.15 0121

---

#### [\[0121\]Failed to get the Business system setup file : <detail>](#)

##### Explanation

The specified business system setup file could not be obtained. The specified business system setup file may have been in use when the command was executed.

##### User Action

Re-execute the command. If the same message is output, re-obtain the business system setup file and re-execute the command.

If the same message is still output, use the *iscollectinfo* command to collect diagnostic information, and then contact your systems engineer.

### 34.5.16 0122

---

#### [\[0122\]Business server to be updated does not exist](#)

##### Explanation

The Business server for the update target Business system setup file does not exist.

##### User Action

If the environment was upgraded from a previous level or version, check that the upgrade procedure was correct.

If the upgrade procedure was correct, obtain the Business system setup file that matches the public URL for the Business server to be updated from the SSO administrator and re-execute the command.

### 34.5.17 0123

---

#### [\[0123\]Failed to get the configuration file : <detail>](#)

##### Explanation

The business server definition file could not be obtained for updating. The business server definition file may have been in use when the command was executed.

##### User Action

Re-execute the command. If the same message is output, restore the resource files backed up for the business server and re-execute the command. (\*1)

If the same message is still output, use the business system setup file specified when this command was executed and set up the business server again.

\*1 For details on restoring business server resource files, refer to the Operator's Guide.

### 34.5.18 0124

---

#### [\[0124\]Failed to update the configuration file : <detail>](#)

##### Explanation

The definition file could not be updated. The specified business system setup file or business server definition file may have been in use when the command was executed.

## User Action

Re-execute the command. If the problem persists, re-obtain the business system setup file from the SSO administrator and re-execute the command.

If the problem is still not resolved, restore the resource files backed up for the business server and re-execute the command. (\*1)

If the same message is output, use the *iscollectinfo* command to collect diagnostic information, and then contact your systems engineer.

\*1 For details on restoring business server resource files, refer to the Operator's Guide.

## 34.5.19 0125

---

### [0125]Failed to update service ID : <detail>

#### Explanation

The service ID file could not be updated. The specified business system setup file may have been in use when the command was executed.

#### User Action

Re-execute the command. If the same message is output, re-obtain the business system setup file from the SSO administrator and re-execute the command.

If the same message is still output, use the *iscollectinfo* command to collect diagnostic information, and then contact your systems engineer.

## 34.5.20 0126

---

### [0126]Failed to create service ID : <detail>

#### Explanation

The service ID file could not be created. The specified business system setup file may have been in use when the command was executed.

#### User Action

Re-execute the command. If the same message is output, re-obtain the business system setup file from the SSO administrator and re-execute the command.

If the same message is still output, use the *iscollectinfo* command to collect diagnostic information, and then contact your systems engineer.

## 34.5.21 0128

---

### [0128]A necessary configuration item does not exist

#### Explanation

A business server definition option required for importing environment settings does not exist.

#### User Action

If the Business server was upgraded from a previous version/level, check that the upgrade procedure was correct.

If the upgrade procedure was correct, the business server environment may be corrupt. Restore the resource files backed up for the business server and re-execute the command. (\*1)

If the resource files have not been backed up, use the business infrastructure setup file specified when this command was executed and set up the business server again.

\*1 For details on restoring business server resource files, refer to the Operator's Guide.

## 34.6 ssoimpsv Command Messages

---

This section describes the messages output by the *ssoimpsv* command.

### 34.6.1 0001

---

#### [0001]Parameter error: <option>

##### Explanation

The specified parameter is incorrect.

##### User Action

Check the <option> parameter, and then re-execute the command.

### 34.6.2 0004

---

#### [0004]Invalid file path:<file path>

##### Explanation

The specified file path is incorrect. Possible causes of the error are as follows:

- The absolute path was not specified.
- A directory was specified.
- The specified file path does not exist.

**Solaris32/64** **Linux32/64**

- The file length exceeded 255 characters.

##### User Action

Take the following action:

- Check whether the absolute path was specified.
- Check whether a directory was specified.
- Check that the specified file path exists.

**Solaris32/64** **Linux32/64**

- Check that the specified file path exists, and reduce the file length.

### 34.6.3 0005

---

#### [0005]Allocation of a memory failed

##### Explanation

Memory could not be allocated.

##### User Action

Close all programs no longer needed, and then re-execute the command.

### 34.6.4 0006

---

#### [0006]No space in disk

##### Explanation

There is not enough free space on the disk.

## User Action

Delete unnecessary files, and then re-execute the command.

### 34.6.5 0008

---

#### [0008]Incorrect password

##### Explanation

The entered password was incorrect.

##### User Action

Re-execute the command, and specify the correct password to decrypt the Authentication infrastructure setup file.

### 34.6.6 0012

---

#### [0012]File access denied : <file path>

##### Explanation

There is no access permission for the specified authentication infrastructure setup file, or the repository server (reference system) environment is corrupt.

##### User Action

If the <file path> file specified in the command is the authentication infrastructure setup file, check the following and re-execute the command.

- Check if there is administrator read permission.
- Check if the file is being used by another application.

If the above cases do not apply, the repository server (reference system) environment may be corrupt. Restore the resource files backed up for the repository server (reference system) and re-execute the command. (\*1)

If the resource files have not been backed up, use the authentication infrastructure setup file specified when this command was executed and set up the repository server (reference system) again.

\*1 For details on restoring the repository server (reference system) resource files, refer to the Operator's Guide.

### 34.6.7 0017

---

#### [0017]File not found : <file path>

##### Explanation

The specified Authentication infrastructure setup file may not exist, or the repository server (reference system) environment may be corrupt.

##### User Action

If the <file path> file specified in the command is the Authentication infrastructure setup file, check that the specified file exists and re-execute the command.

If the specified Authentication infrastructure setup file does not exist, the repository server (reference system) environment may be corrupt. Restore the resource files backed up for the repository server (reference system) and re-execute the command. (\*1)

If the resource files have not been backed up, use the Authentication infrastructure setup file specified when this command was executed and set up the repository server (reference system) again.

\*1 For details on restoring the repository server (reference system) resource files, refer to the Operator's Guide.

### 34.6.8 0032

---

---

### [0032]Execution is not permitted

#### Explanation

You cannot execute the command because you do not have administrator permission.

#### User Action

Re-execute the command as a user with administrator permission.

---

## 34.6.9 0051

---

### [0051]Interstage Single Sign-on package is not installed

#### Explanation

The Interstage Single Sign-on package is not installed, or the environment is corrupt.

#### User Action

If an environment variable or data containing the registry was saved, restore it. If not, re-install the following packages:

**Windows32/64**

- Interstage Single Sign-on (repository server).

**Solaris32/64** **Linux32/64**

- FJSVssosv (Interstage Single Sign-on repository server function)
- FJSVssocm (Interstage Single Sign-on common library)

---

## 34.6.10 0091

---

### [0091]An error occurred using the system function : <detail>

#### Explanation

An error occurred during processing using the system function.

#### User Action

Re-execute the command. If the same message is output, use the *iscollectinfo* command to collect diagnostic information, and then contact your systems engineer.

---

## 34.6.11 0092

---

### [0092]Internal error : <detail>

#### Explanation

An internal error occurred.

#### User Action

Use the *iscollectinfo* command to collect diagnostic information, and then contact your systems engineer.

---

## 34.6.12 0113

---

### [0113]Repository server was not created

#### Explanation

The environment settings could not be imported to the repository server (reference system). The repository server (reference system) may not have been set up, or the repository server (reference system) environment may be corrupt.

## User Action

This command can only be executed on the machine used to set up the repository server (reference system).

If the repository server (reference system) has been set up, restore the resource files backed up for the repository server (reference system) and re-execute the command. (\*1)

If the resource files have not been backed up, use the authentication infrastructure setup file specified when this command was executed and set up the repository server (reference system) again.

\*1 For details on restoring the repository server (reference system) resource files, refer to the Operator's Guide.

## 34.6.13 0115

---

### [0115]Repository server (update system) was created

#### Explanation

This command was executed on the machine used to set up the repository server (update system).

#### User Action

This command can only be executed on the machine used to set up the repository server (reference system). Re-execute the command on the machine used to set up the repository server (reference system).

## 34.6.14 0116

---

### [0116]Authentication infrastructure setup file is invalid : <file path>

#### Explanation

The specified authentication infrastructure setup file is incorrect. Possible causes are as follows:

- The specified file was not the authentication infrastructure setup file.
- The specified file may have been obtained from a different authentication infrastructure repository server (update system).
- The specified file may be corrupt.

#### User Action

Re-obtain the correct authentication infrastructure setup file and re-execute the command.

## 34.6.15 0118

---

### [0118]Authentication infrastructure setup file could not be imported : <file path>

#### Explanation

The specified authentication infrastructure setup file could not be imported. The specified authentication infrastructure setup file may have been downloaded from a repository server (update system) that does not use session management.

#### User Action

Specify an authentication infrastructure setup file downloaded from a repository server (update system) that uses session management and re-execute the command.

## 34.6.16 0120

---

### [0120]Failed to get the Authentication infrastructure setup file : <detail>

#### Explanation

The specified authentication infrastructure setup file could not be obtained. The specified authentication infrastructure setup file may have been in use when the command was executed.

## User Action

Re-execute the command. If the same message is output, re-obtain the authentication infrastructure setup file and re-execute the command.

If the same message is still output, use the *iscollectinfo* command to collect diagnostic information, and then contact your systems engineer.

## 34.6.17 0123

---

### [\[0123\]Failed to get the configuration file : <detail>](#)

#### Explanation

The repository server (reference system) definition file could not be obtained for updating. The repository server (reference system) definition file may have been in use when the command was executed.

#### User Action

Re-execute the command. If the same message is output, restore the resource files backed up for the repository server (reference system) and re-execute the command. (\*1)

If the same message is still output, use the Authentication infrastructure setup file specified when this command was executed and set up the repository server (reference system) again.

\*1 For details on restoring repository server (reference system) resource files, refer to the Operator's Guide.

## 34.6.18 0124

---

### [\[0124\]Failed to update the configuration file : <detail>](#)

#### Explanation

The definition file could not be updated. The specified authentication infrastructure setup file or repository server (reference system) definition file may have been in use when the command was executed.

#### User Action

Re-execute the command. If the problem persists, re-obtain the authentication infrastructure setup file and re-execute the command.

If the problem is not resolved, restore the resource files backed up for the repository server (reference system) and re-execute the command. (\*1)

If the same message is still output, use the *iscollectinfo* command to collect diagnostic information, and then contact your systems engineer.

\*1 For details on restoring repository server (reference system) resource files, refer to the Operator's Guide.

## 34.6.19 0125

---

### [\[0125\]Failed to update service ID : <detail>](#)

#### Explanation

The service ID file could not be updated. The specified authentication infrastructure setup file may have been in use when the command was executed.

#### User Action

Re-execute the command. If the same message is output, re-obtain the authentication infrastructure setup file and re-execute the command.

If the same message is still output, use the *iscollectinfo* command to collect diagnostic information, and then contact your systems engineer.

## 34.6.20 0128

---

### [0128]A necessary configuration item does not exist

#### Explanation

A repository server (reference system) definition option required for importing the environment settings does not exist.

#### User Action

In an environment in which the repository server (reference system) was upgraded from a previous version/level, check that the upgrade procedure was correct.

If the upgrade procedure was correct, the repository server (reference system) environment may be corrupt. Restore the resource files backed up for the repository server (reference system) and re-execute the command. (\*1)

If the resource files have not been backed up, use the authentication infrastructure setup file specified when this command was executed and set up the repository server (reference system) again.

\*1 For details on restoring repository server (reference system) resource files, refer to the Operator's Guide.

## 34.7 ssomksid Command Messages

---

This section describes the messages output by the *ssomksid* command.

### 34.7.1 0001

---

#### [0001]Parameter error: <option>

#### Explanation

The specified parameter is incorrect.

#### User Action

Check the <option> parameter, and then re-execute the command.

### 34.7.2 0002

---

#### [0002]Internal error

#### Explanation

An internal error occurred.

#### User Action

Collect the repository server configuration file (*ssoatcsv.conf*) and diagnostic information, and then contact your systems engineer. Use the *iscollectinfo* command to collect diagnostic information.

### 34.7.3 0003

---

#### [0003]System function detect error

#### Explanation

An error occurred in the system function during processing.

#### User Action

Collect the repository server configuration file (*ssoatcsv.conf*) and diagnostic information, and then contact your systems engineer. Use the *iscollectinfo* command to collect diagnostic information.

## 34.7.4 0004

---

### [0004]Invalid file path:<file path>

#### Explanation

The specified file path is incorrect. Possible causes of this error are as follows:

- The file path does not exist.
- The file path is not specified with an absolute path name.
- The file length exceeds 255 bytes.

#### User Action

Take the following action:

- Check if the file path exists.
- Check if the file path is specified with an absolute path name.
- Check if the file length exceeds 255 bytes.

## 34.7.5 0005

---

### [0005]Allocation of a memory failed

#### Explanation

Memory could not be allocated.

#### User Action

Close all programs no longer needed, and then re-execute the command.

## 34.7.6 0006

---

### [0006]No space in disk

#### Explanation

There is not enough free disk space.

#### User Action

Delete unnecessary files, and then re-execute the command.

## 34.7.7 0012

---

### [0012]File access denied:<file path>

#### Explanation

You are not permitted to access the specified file path.

#### User Action

Check if the administrator is permitted to access the specified file path, and then re-execute the command.

## 34.7.8 0017

---

### [0017]File not found:<file path>

#### Explanation

The file necessary for processing does not exist.

## User Action

Set up the repository server, and then re-execute the command.

### 34.7.9 0018

---

#### [0018]Get ServiceID failed

##### Explanation

The service ID could not be created. Possible causes of this error are as follows:

- The service ID file of the repository server may have been corrupted.
- This command may have been executed in an environment in which a repository server that performs session management applications has been set up.

##### User Action

Take the following action:

- If backup resources are available, restore them and re-execute the command. (\*1) If backup resources are unavailable, set up the repository server again.
- The service ID file of a business server that does not perform session management applications cannot be created from a repository server that does perform session management applications. To create a service ID file, use the ssoimpaz command.

\*1 For details about restoring repository server resource files, refer to the "Maintenance (Resource Backup)" chapter in the Operator's Guide.

### 34.7.10 0019

---

#### [0019]Invalid domain name: <domain >

##### Explanation

The domain name specified in the -n parameter is incorrect. The format of the domain name is incorrect or the domain name includes characters that do not meet the conditions.

##### User Action

Specify the domain name in the correct format or with specifiable characters in the -n parameter, and then re-execute the command.

For more information about characters and formats that can be specified, refer to "Single Sign-on Operation Commands" - "ssomksid" in the Reference Manual (Command Edition).

### 34.7.11 0031

---

#### [0031]File already exists: <file path>

##### Explanation

Possible causes of this error are as follows:

- The specified output destination file already exists.

 Windows32/64

- There is a possibility that the DOS device name was specified as the output destination file.

##### User Action

Take the following action, and then re-execute the command:

- Either specify a different file name for the output destination file, or delete the output destination file if it already exists.

 Windows32/64

- If the DOS device name is specified as the output destination file, specify a different file name to the DOS device name.

## 34.7.12 0032

---

### [0032]Execution is not permitted

#### Explanation

You cannot execute the command because you do not have administrator permission.

#### User Action

Re-execute the command as a user with administrator permission.

## 34.7.13 0034

---

### [0034]Creating a file is not permitted: <file path>

#### Explanation

The specified output destination file could not be created.

#### User Action

Check if the administrator is permitted to write to the path of the specified output destination file, and then re-execute the command.

## 34.7.14 0043

---

### [0043]Invalid business server FQDN: <FQDN>

#### Explanation

The fully qualified domain name (FQDN) of the business server specified in the -f parameter is incorrect.

#### User Action

Specify the host name of the business server with an FQDN in the -f parameter, then re-execute the command.

## 34.8 ssoreset Command Messages

---

This section describes the messages output by the *ssoreset* command.

### 34.8.1 0001

---

#### [0001]Parameter error : <option>

#### Explanation

The specified parameter is incorrect.

#### User Action

Check the <option> parameter, and then re-execute the command.

### 34.8.2 0002

---

#### [0002]Internal error

#### Explanation

An internal error occurred.

## User Action

Re-execute. If the message is still output, use the *iscollectinfo* command to collect diagnostic information, and then contact your systems engineer.

### 34.8.3 0003

---

#### [0003]System function detect error

##### Explanation

Possible causes of the error are as follows:

- An error occurred in the system function during processing.

Windows32/64

- The DOS device name may have been specified as the Interstage Single Sign-on resource storage file.

##### User Action

Re-execute. If the message is still output, use the *iscollectinfo* command to collect diagnostic information, and then contact your systems engineer.

Windows32/64

If a DOS device name was used for the specified Interstage Single Sign-on resource storage file, specify a different file name and then re-execute.

### 34.8.4 0004

---

#### [0004]Invalid file path : <file path>

##### Explanation

The specified Interstage Single Sign-on resource storage file path is invalid. Possible causes are as follows:

- The Interstage Single Sign-on resource storage file path <file path> does not exist.
- The full path of the Interstage Single Sign-on resource storage file path <file path> was not specified.
- A directory was specified for the Interstage Single Sign-on resource storage file path <file path>.

##### User Action

Take the following action, and then re-execute the command:

- Check whether the Interstage Single Sign-on resource storage file path <file path> exists.
- Check whether the full path of the Interstage Single Sign-on resource storage file path <file path> was specified.
- Check whether a directory was specified for the Interstage Single Sign-on resource storage file path <file path>.

### 34.8.5 0005

---

#### [0005]Allocation of a memory failed

##### Explanation

Memory could not be allocated.

##### User Action

Close all programs no longer needed, and then re-execute the command.

## 34.8.6 0006

---

### [0006]No space in disk

#### Explanation

**Windows32/64**

There is not enough space on the disk that was used to install Interstage Application Server.

**Solaris32/64** **Linux32/64**

There is not enough disk space for the /etc/opt directory on the destination machine used for restoring/importing the Interstage Single Sign-on environment.

#### User Action

Delete unnecessary files, and then re-execute the command.

## 34.8.7 0011

---

### [0011]Failed to write to the file : <directory path>

#### Explanation

A directory <directory path> with the same name as the file to restore/import already exists.

#### User Action

Delete the directory <directory path> and then re-execute.

## 34.8.8 0012

---

### [0012]File access denied:<file path>

#### Explanation

Possible causes of this error are as follows:

- There is no access authority for file <file path>.

**Windows32/64**

- A DOS device name may have been used for the specified Interstage Single Sign-on resource storage file.

#### User Action

Take the following action, and then re-execute the command:

- Check whether the file <file path> is being used by another application.

**Windows32/64**

- If a DOS device name was used for the specified Interstage Single Sign-on resource storage file, specify a different file name.

## 34.8.9 0017

---

### [0017]File not found : <file path>

#### Explanation

The specified Interstage Single Sign-on resource storage file does not exist.

#### User Action

Check whether the specified Interstage Single Sign-on resource storage file exists, and then re-execute.

## 34.8.10 0032

---

### [0032]Execution is not permitted

#### Explanation

You cannot execute the command because you do not have administrator permission.

#### User Action

Re-execute the command as a user with administrator permission.

## 34.8.11 0091

---

### [0091]An error occurred using the system function : <detail>

#### Explanation

An error occurred in the system function during processing.

#### User Action

Re-execute. If the message is still output, use the *iscollectinfo* command to collect diagnostic information, and then contact your systems engineer.

## 34.8.12 0132

---

### [0132]Invalid file format

#### Explanation

Possible causes of this error are as follows:

- The file that was specified was not an Interstage Single Sign-on resource storage file.
- The Interstage Single Sign-on resource storage file is corrupt.
- The Interstage Single Sign-on resource storage file that was specified was created on a different platform.

#### Windows32/64

- A DOS device name may have been used for the specified Interstage Single Sign-on resource storage file.

#### User Action

Take the following action, and then re-execute the command:

- Specify the Interstage Single Sign-on resource storage file correctly.
- Check the backup/export procedure, and create the Interstage Single Sign-on resource storage file on the machine used to perform backup/export again.
- Specify an Interstage Single Sign-on resource storage file that was created on the same platform.

#### Windows32/64

- If a DOS device name was used for the specified Interstage Single Sign-on resource storage file, specify a different file name.

## 34.8.13 0133

---

### [0133]The file already exists : <file path>

#### Explanation

A file with the same name as the directory for restore/import <file path> already exists.

## User Action

Delete the file <file path> and then re-execute.

### 34.8.14 0134

---

**[0134]The installation directory is different to the environment that was backed up : <install path>**

## Explanation

The Interstage Application Server installation directory is different to the installation directory <install path> that was used to perform backup/export.

## User Action

Make the Interstage Application Server installation directory the same as the installation directory <install path> that was used to perform backup/export and then re-execute.

### 34.8.15 0135

---

**[0135]Interstage Single Sign-on package is not installed : <server name>**

## Explanation

The Interstage Single Sign-on package for <server name> is not installed.

## User Action

Install the package for <server name> and then re-execute.

### Windows32/64

- Business server
  - Interstage Single Sign-on (business server)
- Authentication server
  - Interstage Single Sign-on (authentication server)
- Repository server
  - Interstage Single Sign-on (repository server)

### Solaris32/64 Linux32/64

- Business server
  - FJSVsssoaz(Interstage Single Sign-on authorization function)
  - FJSVssocm(Interstage Single Sign-on common library)
- Authentication server
  - FJSVsssoac(Interstage Single Sign-on authentication function)
  - FJSVssocm(Interstage Single Sign-on common library)
- Repository server
  - FJSVssosv(Interstage Single Sign-on repository server function)
  - FJSVssocm(Interstage Single Sign-on common library)

## 34.9 ssoetsvc Command Messages

---

This section describes the messages output by the *ssoetsvc* command.

## 34.9.1 0001

---

### [0001]Parameter error: <option>

#### Explanation

The specified parameter is incorrect.

#### User Action

Check the <option> parameter, and then re-execute the command.

## 34.9.2 0032

---

### [0032]Execution is not permitted

#### Explanation

You cannot execute the command because you do not have administrator permission.

#### User Action

Re-execute the command as a user with administrator permission.

## 34.9.3 0052

---

### [0052]Web Server (Interstage HTTP Server) package is not installed

#### Explanation

The Web server (Interstage HTTP Server) package is not installed.

#### User Action

Install the Web server (Interstage HTTP Server) package.

## 34.9.4 0069

---

### [0069]Abnormality occurred by Web Server (Interstage HTTP Server)

#### Explanation

An error occurred in the Web server (Interstage HTTP Server).

#### User Action

Use the *iscollectinfo* command to collect diagnostic information, and then contact your systems engineer.

## 34.9.5 0070

---

### [0070]Repository name does not exist:<repository name>

#### Explanation

The specified repository name does not exist.

#### User Action

Check the repository name, and then re-execute the command.

## 34.9.6 0071

---

### [0071]Abnormality occurred by Interstage Directory Service

#### Explanation

An error occurred in Interstage Directory Service.

#### User Action

Use the *iscollectinfo* command to collect diagnostic information, and then contact your systems engineer.

---

### 34.9.7 0072

---

#### [0072]Interstage Directory Service package is not installed

#### Explanation

Interstage Directory Service is not installed.

#### User Action

Install Interstage Directory Service.

---

### 34.9.8 0073

---

#### [0073]The specified Web server does not exist : %s

#### Explanation

The specified Web server does not exist.

#### User Action

Check the specified Web server name and then re-execute.

---

## 34.10 ssignoff Command Messages

---

This section describes the messages output by the *ssignoff* command.

---

### 34.10.1 0001

---

#### [0001]Parameter error: <option>

#### Explanation

The specified parameter is incorrect.

#### User Action

Check the <option> parameter, and then re-execute the command.

---

### 34.10.2 0005

---

#### [0005]Allocation of a memory failed

#### Explanation

Memory could not be allocated.

#### User Action

Close all programs no longer needed, and then re-execute the command.

---

### 34.10.3 0010

---

#### [0010]Decrypt failed

## Explanation

The received encryption data could not be decrypted. Possible causes of this error are as follows:

- The session management server was not restarted, regardless of whether or not the encryption information (service ID) was updated.
- There is a problem with the communication path, and the response data is corrupt.

## User Action

Take the following action:

- If a session management server system log was output, take the action indicated in the [User action] section of the message.
- Have the network administrator confirm that the environment allows for communication with the session management server.

## 34.10.4 0012

---

### [0012]File access denied : <file path>

## Explanation

There is no access permission for the <file path> file.

## User Action

Check whether the <file path> file is being used by another application and re-execute the command.

## 34.10.5 0017

---

### [0017]File not found : <file path>

## Explanation

The session management server environment may be corrupt.

## User Action

If there are repository server (update system) backup resources, restore the backed up resources and then re-execute the command. (\*1)

If there are no backup resources, set up the repository server used to manage session management as follows. (\*2)

1. In the Interstage Management Console, click [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [List], and then delete the repository server.
2. Click [Authentication infrastructure Settings] and set up the repository server.

\*1 For details on restoring repository server (update system) resource files, refer to the Operator's Guide.

\*2 For details on setting up the repository server environment, refer to "Environment setup (SSO administrators)" in the Single Sign-on Operator's Guide.

## 34.10.6 0018

---

### [0018]Get ServiceID failed

## Explanation

The session management server environment may be corrupt.

## User Action

If there are repository server (update system) backup resources, restore the backed up resources and then re-execute the command. (\*1)

If there are no backup resources, set up the repository server used to manage session management as follows. (\*2)

1. In the Interstage Management Console, click [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [List], and then delete the repository server.
2. Click [Authentication infrastructure Settings] and set up the repository server.

\*1 For details on restoring repository server (update system) resource files, refer to the Operator's Guide.

\*2 For details on setting up the repository server environment, refer to "Environment setup (SSO administrators)" in the Single Sign-on Operator's Guide.

## 34.10.7 0025

---

### [0025]Connection with specified URL failed : <url>

#### Explanation

Connection to the session management server failed. Possible causes of this error are as follows:

- The session management server was not restarted, regardless of whether or not the session management server environment settings were updated.
- An abnormality occurred in the network environment.

#### User Action

Take the following action:

- Restart the session management server. (\*1)
- Have the network administrator confirm that the environment allows for communication with the session management server.

\*1 The session management server can be started or stopped by starting or stopping the repository server.

## 34.10.8 0026

---

### [0026]Connection with specified URL timeout : <url>

#### Explanation

The session management server connection timed out. Possible causes of this error are as follows:

- The session management server was not restarted, regardless of whether or not the session management server environment settings were updated.
- Processing took a long time because of a heavy session management server load or because a large amount of information was updated.
- There may not be enough memory in the session management server, making it impossible for processing to continue.

#### User Action

Take the following action:

- Restart the session management server. (\*1)
- Wait for a while and then re-execute the command, or increase the response wait time specified in the -tm option and re-execute the command.
- If sso06102 is output to the repository server machine system log, then solve the cause of error sso06102.

If there is no improvement after taking the above action, contact the network administrator.

\*1 The session management server can be started or stopped by starting or stopping the repository server.

## 34.10.9 0032

---

### [0032]Execution is not permitted

#### Explanation

The command could not be executed because the user does not have administrator permission.

#### User Action

Re-execute the command as a user with administrator permission.

### 34.10.10 0046

---

#### [0046]Lock control failed : <detail>

#### Explanation

Lock control failed.

#### User Action

Close unnecessary programs and re-execute the command.

### 34.10.11 0051

---

#### [0051]Interstage Single Sign-on package is not installed

#### Explanation

The Interstage Single Sign-on package is not installed, or the environment is corrupt.

#### User Action

If an environment variable or data containing the registry was saved, restore it. If not, re-install the following packages:

**Windows32/64**

- Interstage Single Sign-on (repository server).

**Solaris32/64** **Linux32/64**

- FJSVssosv (Interstage Single Sign-on repository server function)
- FJSVssocm (Interstage Single Sign-on common library)

### 34.10.12 0074

---

#### [0074]Session management server was not started

#### Explanation

The session management server was not started.

#### User Action

Start the session management server and re-execute the command.

The session management server can be started or stopped by starting or stopping the repository server.

### 34.10.13 0075

---

#### [0075]No permission for accessing lock control file

## Explanation

There was no permission to operate a file that is required to start the session management server. Possible causes of this error are as follows:

- The Repository server environment is corrupt.
- The Repository server environment was not installed correctly.

## User Action

Re-install the repository server environment.

## 34.10.14 0076

---

### [0076]Lock control file was not found

## Explanation

A file that is required to start the session management server does not exist. Possible causes of this error are as follows:

- The Repository server environment is corrupt.
- The Repository server environment was not installed correctly.

## User Action

Re-install the Repository server environment.

## 34.10.15 0077

---

### [0077]Session management server is busy

## Explanation

Requests cannot be received because the session management server is in the process of being started or stopped.

## User Action

Take the following action:

- If the session management server is being started, wait for a while and then re-execute the command.
- If the session management server is being stopped, start the session management server and then re-execute the command.

The session management server can be started by starting the repository server.

## 34.10.16 0078

---

### [0078]Specified session or user ID was not found : <session | user ID | global-session>

## Explanation

The specified session or user ID does not exist. The specified session or user ID may have signed off.

## User Action

Check the session management log.

## 34.10.17 0081

---

### [0081]An error occurred in Session management server

#### Explanation

An abnormality occurred in the session management server.

#### User Action

If a session management server system log was output, take the action indicated in the [User action] section of the message.

## 34.10.18 0082

---

### [0082]System resources are insufficient : <resource>

#### Explanation

**Solaris32/64** **Linux32/64**

There are insufficient system resources. Possible causes of this error are as follows:

- <resource> is "FD"  
There are insufficient file descriptors.
- <resource> is "STREAMS"  
There are insufficient STREAMS resources.

#### User Action

**Solaris32/64** **Linux32/64**

Close other programs and re-execute the command.

## 34.10.19 0090

---

### [0090]A communication error occurred : <detail>

#### Explanation

An abnormality occurred in the connection with the session management server. Possible causes of this error are as follows:

- The session management server was not restarted, regardless of whether or not the session management server environment settings were updated.
- An abnormality occurred in the network environment.

#### User Action

Take the following action:

- Restart the session management server. (\*1)
- Have the network administrator confirm that the environment allows for communication with the session management server.

\*1 The session management server can be started or stopped by starting or stopping the repository server.

## 34.10.20 0091

---

---

**[0091]An error occurred using the system function : <detail>****Explanation**

An error occurred during processing using the system function.

**User Action**

Re-execute the command. If the same message is output, use the *iscollectinfo* command to collect diagnostic information, and then contact your systems engineer.

---

**34.10.21 0092**

---

**[0092]Internal error : <detail>****Explanation**

An internal error occurred.

**User Action**

Use the *iscollectinfo* command to collect diagnostic information, and then contact your systems engineer.

---

**34.10.22 0093**

---

**[0093]Invalid data was received : <detail>****Explanation**

Invalid data was received from the session management server. Possible causes of this error are as follows:

- The session management server was not restarted, regardless of whether or not the session management server environment settings were updated.
- An abnormality occurred in the network environment.

**User Action**

Take the following action:

- Restart the session management server. (\*1)
- Have the network administrator confirm that the environment allows for communication with the session management server.

\*1 The session management server can be started or stopped by starting or stopping the repository server.

---

**34.10.23 0094**

---

**[0094]Failed to resolve the Hostname : <host name>****Explanation**

The hostname could not be resolved.

**User Action**

Take the following action:

- Check that the hostname is correct.
- Check the network environment.

## 34.10.24 0102

---

### [0102]Failed to load the config file : <filename>

#### Explanation

The session management server environment may be corrupt.

#### User Action

If there are repository server (update system) backup resources, restore the backed up resources and then re-execute the command. (\*1)

If there are no backup resources, set up the repository server used to manage session management as follows. (\*2)

1. In the Interstage Management Console, click [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [List], and then delete the repository server.
2. Click [Authentication infrastructure Settings] and set up the repository server.

\*1 For details on restoring repository server (update system) resource files, refer to the Operator's Guide.

\*2 For details on setting up the repository server environment, refer to "Environment setup (SSO administrators)" in the Single Sign-on Operator's Guide.

## 34.10.25 0114

---

### [0114]Repository server (update system) for session management was not created

#### Explanation

The Repository server (update system) used to run session management was not set up, or the command was executed on a Repository server (update system) that does not use session management.

#### User Action

This command can only be executed on a Repository server (update system) that uses session management.

Re-execute the command on a Repository server (update system) that uses session management.

## 34.11 ssounsetsvc Command Messages

---

This section describes the messages output by the *ssounsetsvc* command.

### 34.11.1 0032

---

#### [0032]Execution is not permitted

#### Explanation

You cannot execute the command because you do not have administrator permission.

#### User Action

Re-execute the command as a user with administrator permission.

### 34.11.2 0052

---

#### [0052]Web Server (Interstage HTTP Server) package is not installed

#### Explanation

The Web server (Interstage HTTP Server) package is not installed.

#### User Action

Install the Web server (Interstage HTTP Server) package.

### 34.11.3 0069

---

#### [0069]Abnormality occurred by Web Server (Interstage HTTP Server)

#### Explanation

An error occurred in the Web server (Interstage HTTP Server).

#### User Action

Use the *iscollectinfo* command to collect diagnostic information, and then contact your systems engineer.

### 34.11.4 0073

---

#### [0073]The specified Web server does not exist : %s

#### Explanation

The specified Web server does not exist.

#### User Action

Check the specified Web server name and then re-execute.

## 34.12 ssoupsid Command Messages

---

This section describes the messages output by the *ssoupsid* command.

### 34.12.1 0005

---

#### [0005]Allocation of a memory failed

#### Explanation

Memory could not be allocated.

#### User Action

Close all programs no longer needed, and then re-execute the command.

### 34.12.2 0006

---

#### [0006]No space in disk

#### Explanation

There is insufficient disk capacity. Possible causes of this error are as follows:

**Windows32/64**

There is insufficient capacity on the disk on which Interstage Application Server is installed.

**Solaris32/64** **Linux32/64**

There is insufficient capacity on the "/etc/opt" disk.

## User Action

Delete unnecessary files and re-execute the command.

### 34.12.3 0012

---

#### [0012]File access denied : <file path>

##### Explanation

There is no access permission for the <file path> file that is required to update the encryption information (service ID).

##### User Action

Check whether the <file path> file is being used by another application and re-execute the command.

If the same message is output, restore the resource files backed up for the repository server (update system) and re-execute the command. (\*1)

If there are no backup resources, set up the repository server again.

\*1 For details on restoring repository server (update system) resource files, refer to the Operator's Guide.

### 34.12.4 0017

---

#### [0017]File not found : <file path>

##### Explanation

There is no <file path> file. This file is required to update the encryption information (service ID).

##### User Action

Restore the resource files backed up for the repository server (update system) and re-execute the command. (\*1)

If there are no backup resources, set up the Repository server again.

\*1 For details on restoring repository server (update system) resource files, refer to the Operator's Guide.

### 34.12.5 0032

---

#### [0032]Execution is not permitted

##### Explanation

The command could not be executed because the user does not have administrator permission.

##### User Action

Re-execute the command as a user with administrator permission.

### 34.12.6 0051

---

#### [0051]Interstage Single Sign-on package is not installed

##### Explanation

The Interstage Single Sign-on package is not installed, or the environment is corrupt.

##### User Action

If an environment variable or data containing the registry was saved, restore it. If not, re-install the following packages:

**Windows32/64**

- Interstage Single Sign-on (repository server).

Solaris32/64 Linux32/64

- FJSVssosv (Interstage Single Sign-on repository server function)
- FJSVssocm (Interstage Single Sign-on common library)

## 34.12.7 0091

---

### [0091]An error occurred using the system function : <detail>

#### Explanation

An error occurred during processing using the system function.

#### User Action

Re-execute the command. If the same message is output, use the *iscollectinfo* command to collect diagnostic information, and then contact your systems engineer.

## 34.12.8 0092

---

### [0092]Internal error : <detail>

#### Explanation

An internal error occurred.

#### User Action

Use the *iscollectinfo* command to collect diagnostic information, and then contact your systems engineer.

## 34.12.9 0113

---

### [0113]Repository server was not created

#### Explanation

The encryption information (service ID) could not be updated. The repository server (update system) may not have been set up, or the repository server (update system) environment may be corrupt.

#### User Action

This command can only be executed on a repository server (update system). Re-execute the command on a repository server (update system).

## 34.12.10 0114

---

### [0114]Repository server (update system) for session management was not created

#### Explanation

The Repository server (update system) used to run session management was not set up, or the command was executed on a Repository server (update system) that does not use session management.

#### User Action

This command can only be executed on a Repository server (update system) that uses session management.

Re-execute the command on a Repository server (update system) that uses session management.

## 34.12.11 0123

---

---

**[0123]Failed to get the configuration file : <detail>****Explanation**

The Repository server definition file could not be obtained. The Repository server definition file may have been in use when the command was executed.

**User Action**

Re-execute the command. If the same message is output, restore the resource files backed up for the repository server (update system) and re-execute the command. (\*1)

If there are no backup resources, set up the repository server again.

\*1 For details on restoring repository server (update system) resource files, refer to the Operator's Guide.

---

**34.12.12 0128**

---

**[0128]A necessary configuration item does not exist****Explanation**

The command may not have been executed on the machine used to set up the repository server (update system).

**User Action**

This command can only be executed on a repository server (update system) that uses session management.

Re-execute the command on a repository server (update system) that uses session management.

If the same message is output, restore the resource files backed up for the repository server (update system) and re-execute the command.

For details on restoring repository server (update system) resource files, refer to the Operator's Guide.

---

**34.13 Messages Output When an Exception Occurs in JavaAPI**

This section describes the messages output when an exception occurs in Single Sign-on JavaAPI.

---

**34.13.1 Messages output when  
com.fujitsu.interstage.sso.auth.ISLoginException occurs**

---

**Error: Authentication server is not configured : ConfFile=%s1 ServerPort=%s2****Variable Information**

%s1 = Business server configuration file

%s2 = Port

**Explanation**

The URL of authentication infrastructure information is not specified in business server environment setup.

**User Action**

Set up the business server again.

For more information about [URL] of authentication infrastructure information, select the [System] > [Security] > [Single Sign-on] > [Business system] > [Business system Name] > [Settings] tab from the Interstage Management Console. On the [Settings] tab, click [Detailed Settings [Show]] and refer to [Authentication Infrastructure Information Settings].

---

**Error: Authentication server is not working correctly: %s****Variable Information**

%s = HTTP status code

## Explanation

The authentication server failed in authentication.

## User Action

Authentication server operation error. Collect the following information and contact your SSO administrator:

- HTTP status code
- [Authentication infrastructure URL] of authentication infrastructure information

For more information about [URL] of authentication infrastructure information, select the [System] > [Security] > [Single Sign-on] > [Business system] > [Business system Name] > [Settings] tab from the Interstage Management Console. On the [Settings] tab, click [Detailed Settings [Show]] and refer to [Authentication Infrastructure Information Settings].

---

## Error: Authentication server does not return 401 (Unauthorized) response

### Explanation

The authentication server did not return HTTP status 401.

### User Action

Take the following action:

- Authentication infrastructure information for the business server is incorrect. Review [Authentication infrastructure URL] settings of authentication infrastructure information. If [Authentication infrastructure URL] settings are incorrect, set up the business server again. (\*1)
- Network settings are incorrect. Correct the network environment if incorrect.

\*1 For more information about [Authentication infrastructure URL] of authentication infrastructure information, select the [System] > [Security] > [Single Sign-on] > [Business system] > [Business system Name] > [Settings] tab from the Interstage Management Console. On the [Settings] tab, click [Detailed Settings [Show]] and refer to [Authentication Infrastructure Information Settings].

---

## Error: Authentication server does not return authentication credential

### Explanation

The authentication server did not return authentication information.

### User Action

Authentication server operation error. The authentication was successful in authentication but the authentication server did not return authentication information. Contact your SSO administrator.

---

## Error: Authentication server does not return basic authentication response

### Explanation

The authentication method of the authentication server is not password authentication.

### User Action

Take the following action:

- Authentication infrastructure information for the business server is incorrect. Review [Authentication infrastructure URL] settings of authentication infrastructure information. If [URL] settings are incorrect, set up the business server again. (\*1)
- Network settings are incorrect. Correct the network environment if incorrect.

\*1 For more information about [Authentication infrastructure URL] of authentication infrastructure information, select the [System] > [Security] > [Single Sign-on] > [Business system] > [Business system Name] > [Settings] tab from the Interstage Management Console. On the [Settings] tab, click [Detailed Settings [Show]] and refer to [Authentication Infrastructure Information Settings].

---

## Error: Authentication server does not return cookie value

## Explanation

No cookie is set.

## User Action

Authentication server operation error. The authentication was successful in authentication but the authentication server did not return authentication information. Contact your SSO administrator.

---

## Error: Authentication server does not return correct realm name

### Explanation

The realm name of the authentication server is incorrect.

### User Action

Take the following action:

- Authentication infrastructure information for the business server is incorrect. Review [Authentication infrastructure URL] settings of authentication infrastructure information. If [URL] settings are incorrect, set up the business server again. (\*1)
- Network settings are incorrect. Correct the network environment if incorrect.

\*1 For more information about [Authentication infrastructure URL] of authentication infrastructure information, select the [System] > [Security] > [Single Sign-on] > [Business system] > [Business system Name] > [Settings] tab from the Interstage Management Console. On the [Settings] tab, click [Detailed Settings [Show]] and refer to [Authentication Infrastructure Information Settings].

---

## Error: Authentication server does not return WWW-Authenticate header

### Explanation

The authentication server did not return the WWW-Authenticate header.

### User Action

Take the following action:

- Authentication infrastructure information for the business server is incorrect. Review [Authentication infrastructure URL] settings of authentication infrastructure information. If [Authentication infrastructure URL] settings are incorrect, set up the business server again. (\*1)
- Network settings are incorrect. Correct the network environment if incorrect.

\*1 For more information about [Authentication infrastructure URL] of authentication infrastructure information, select the [System] > [Security] > [Single Sign-on] > [Business system] > [Business system Name] > [Settings] tab from the Interstage Management Console. On the [Settings] tab, click [Detailed Settings [Show]] and refer to [Authentication Infrastructure Information Settings].

---

## Error: Authentication server's URL is malformed : %s

### Variable Information

%s = Authentication infrastructure information of authentication server

### Explanation

The URL of authentication infrastructure information (%s) for the authentication server is incorrect.

### User Action

Take the following action:

Check the [Authentication infrastructure URL] settings in Authentication Infrastructure Information Settings, and then set up the business server again.

The [Authentication infrastructure URL] settings can be checked using the Interstage Management Console. Click [System] > [Security] > [Single Sign-on] > [Business system] > [Business system Name] > [Settings] > [Detailed Settings [Show]] > [Authentication Infrastructure Information Settings].

---

**Error: Authentication server's URL protocol must be http/https : %s****Variable Information**

%s = Authentication infrastructure information of authentication server

**Explanation**

The protocol of authentication infrastructure information (%s) for the authentication server is other than HTTP and HTTPS.

**User Action**

Check the [Authentication infrastructure URL] settings in Authentication Infrastructure Information Settings, and then set up the business server again.

The [Authentication infrastructure URL] settings can be checked using the Interstage Management Console. Click [System] > [Security] > [Single Sign-on] > [Business system] > [Business system Name] > [Settings] > [Detailed Settings [Show]] > [Authentication Infrastructure Information Settings].

---

**Error: Cannot use this option. serverport****Explanation**

The "serverport" option was specified in the login configuration file.

**User Action**

The "serverport" option cannot be specified in the login configuration file because the Interstage Single Sign-on business server is integrated in the virtual host of Interstage HTTP Server. Correct the login configuration file so that the "business-system-name" option is specified, and then restart the servlet application that runs on the JAAS application.

For details about the login configuration file settings, refer to "Developing Java Applications" - "Setting the Application Execution Environment" - "Creating Login Configuration File" in the "Developing Applications" chapter of the Single Sign-on Operator's Guide.

---

**Error: Credential cannot decrypt****Explanation**

Authentication information could not be decrypted.

**User Action**

The Java application is not restarted after the business system has been reconfigured. Restart the Java application (for servlet, IJServer).

---

**Error: Internal error occurred in Authentication server****Explanation**

An error occurred in the authentication server.

**User Action**

Authentication server error. Ask your SSO administrator to take the appropriate action for the error.

---

**Error: IOException occurred when getting information from the CallbackHandler****Explanation**

The callback handler issued IOException.

**User Action**

Check the program according to the contents of the stack trace.

---

**Error: IOException occurred while communicating to Authentication server****Explanation**

IOException occurred during communication with the authentication server. Possible causes of this error are as follows:

- Authentication infrastructure information for the business server is incorrect.
- The authentication server is stopped.
- The host name entered in reply to the message "What is your first and last name?" is incorrect. This message asks you to enter the *scsmakeenv* command used when the authentication server SSL communication environment was set up.
- SSL setting of the Web server that created the authentication server is "Client Certificate Never Fails to be Authenticated."
- Network settings are incorrect.

## User Action

Take the following action:

- Authentication infrastructure information for the business server is incorrect. Review [Authentication infrastructure URL] settings of authentication infrastructure information. If [Authentication infrastructure URL] settings are incorrect, set up the business server again. (\*1)
- The authentication server is stopped. Start the authentication server. (\*2)
- Contact your SSO administrator to check the host name entered in reply to the message "What is your first and last name?" This message asks you to enter the *scsmakeenv* command used when the authentication server SSL communication environment was set up. Match this host name with the URL settings of the authentication infrastructure information. (\*1)
- SSL setting of the Web server that created the authentication server is "Client Certificate Never Fails to be Authenticated." Change this SSL setting to Client Certificate Not Authenticated or Client Certificate Authenticated When Presented. (\*3)
- Network settings are incorrect. Correct the network environment if incorrect.

\*1 For more information about [Authentication infrastructure URL] of authentication infrastructure information, select the [System] > [Security] > [Single Sign-on] > [Business system] > [Business system Name] > [Settings] tab from the Interstage Management Console. On the [Settings] tab, click [Detailed Settings [Show]] and refer to [Authentication Infrastructure Information Settings].

\*2 For more information on how to start the authentication server, refer to "Operation and Maintenance" - "Starting Single Sign-on" - "Starting Authentication Server" in the Single Sign-on Operator's Guide.

\*3 Change the authentication server SSL configuration as follows: From the Interstage Management Console, select the [System] > [Security] > [SSL] > [Configuration Name] > [SSL Settings] tab. From the [SSL Settings] tab, change the authentication server SSL configuration. After changing authentication server SSL configuration, restart the authentication server.

---

## Error: No CallbackHandler is available to garner authentication information from the user

### Explanation

No callback handler is specified.

### User Action

The usage of JAAS is incorrect. Check the program. When using the login module, create a LoginContext instance.

For more information about how to create the LoginContext instance, refer to "Developing Applications" - "Developing Java Applications" - "Developing Programs" - "Converting LoginContext to an Instance" in the Single Sign-on Operator's Guide.

---

## Error: No definition found in Business server configuration file : ConfFile=%s1 %s2=%s3

### Variable Information

%s1 = Business server configuration file

%s2 = Login configuration file option name

%s3 = Login configuration file option value

### Explanation

The business server of Interstage Single Sign-on could not be accessed. Possible causes of the error are as follows:

- The login configuration file contents are different to the business server environment settings.

- The business server for the value (%s3) specified for the "business-system-name" option in the login configuration file has not been created.
- The business server configuration file does not exist.
- Access permission is not set that is required for the business server configuration file.

## User Action

Take the following action:

- If "business-system-name" is displayed for the login configuration file option name (%s2)
  - Check whether the business system name (%s3) specified for the "business-system-name" option in the login configuration file is correct. (\*1)
    - If the name is incorrect
      - Check the settings contents.
    - If the name is correct
      - Check whether the business server for the displayed business system name (%s3) has been set up.
  - Check if the business server configuration file (%s1) exists. If the business server configuration file does not exist, set up a business server again. (\*2)
  - Check if the application execution user is permitted to read the business server configuration file (%s1). If the application execution user is not permitted to read the business server configuration file, permit the application execution user to read it. (\*3)

\*1 For more information about how to set the login configuration file, refer to "Developing Applications" - "Developing Java Applications" - "Setting the Application Execution Environment" - "Creating Login Configuration File" in the Single Sign-on Operator's Guide.

\*2 For more information about how to set up a business server again, select the [System] > [Security] > [Single Sign-on] > [Business system] > [List] tab from the Interstage Management Console. Then delete a business server from the [List] tab and set up another business server from the [Addition of Business server] tab.

\*3 For more information on how to set access permission, refer to "Operation and Maintenance" - "Changing Effective User for Web Server" in the Single Sign-on Operator's Guide. Also refer to "Developing Applications" - "Developing Java Applications" - "Setting the Application Execution Environment" - "Setting Access Permission for Operation Resources" in the Single Sign-on Operator's Guide. If the application to be developed is a servlet application, the effective user of the business server must match the operation user of IJServer.

---

## Error: Option is invalid.

### Explanation

The method to specify the login configuration file option is invalid.

### User Action

Specify the correct option in the login configuration file, and then restart the servlet application that runs on the JAAS application.

For details about the login configuration file settings, refer to "Developing Java Applications" - "Setting the Application Execution Environment" - "Creating Login Configuration File" in the "Developing Applications" chapter of the Single Sign-on Operator's Guide.

---

## Error: Out of memory

### Explanation

A memory shortage occurred during authentication information decryption.

### User Action

Close unused applications or add more virtual memory or memory.

---

## Error: Serviceid is not configured : Serviceid=%s

## Variable Information

%s = Service ID file

## Explanation

The service ID could not be read from the service ID file (%s). Possible causes of the error are as follows:

- The service ID file does not exist.
- Read permission is not set that is required for the service ID.
- The contents of the service ID file are incorrect or the service ID file is corrupt.
- The file encoding format of the login configuration file is incorrect.

### Windows32/64

- Interstage Application Server may have been installed when the Terminal service was in application mode.

## User Action

Take the following action:

- Check if the application execution user is permitted to read the service ID file. If the application execution user is not permitted to read the service ID file, permit the application execution user to read it. (\*1)
- If the error still occurs even after the above user actions have been performed, ask your SSO administrator to re-create the service ID file used by the Java application or to set up a business server again. (\*2)
- When characters other than alphanumeric characters, signs, and symbols are used in the login configuration file

Check if the login configuration file is saved in the UTF-8 encoding format. If the login configuration file is not saved in the UTF-8 encoding format, save it in this format.

### Windows32/64

- If Interstage Application Server was installed when the Terminal service was in application mode, uninstall it, execute [CHANGE USER /INSTALL], and then re-install. After re-installing Application Server, execute [CHANGE USER /EXECUTE].

\*1 For more information about how to set access permission, refer to "Operation and Maintenance" - "Changing Effective User for Web Server" in the Single Sign-on Operator's Guide. Also refer to "Developing Applications" - "Developing Java Applications" - "Setting the Application Execution Environment" - "Setting Access Permission for Operation Resources" in the Single Sign-on Operator's Guide.

\*2 For more information about how to set up a business server again, select the [System] > [Security] > [Single Sign-on] > [Business system] > [List] tab from the Interstage Management Console. Then delete a business server from the [List] tab and set up another business server from the [Addition of Business server] tab.

---

## Error: SSLException occurred while communicating to Authentication server

## Explanation

SSLException occurred during communication with the authentication server.

## User Action

Take the following action:

- Check if a site certificate or a CA certificate is registered in the Interstage certificate environment.
- Check if the term of the certificate registered in the Interstage certificate environment is within the term of validity. If the term of the certificate has expired, register the certificate again.
- In authentication server SSL configuration, only SSL2.0 is selected as the protocol version. Be sure to select SSL3.0 or TLS1.0. If you specify only SSL2.0, Interstage HTTP Server may output the following message:

IHS: ERROR: ihs66999: SSL: unexpected error (SSL\_ServerHandshake,0050000D,FFFFFFFF) (\*1)

- The encryption algorithm is not enough that was specified in the encryption method of authentication server SSL configuration.  
(\*2)

\*1 Change the authentication server SSL configuration as follows: From the Interstage Management Console of the machine where the authentication server was set up, select the [System] > [Security] > [SSL] > [Configuration Name] > [SSL Settings] tab. From the [SSL Settings] tab, change the authentication server SSL configuration. After changing authentication server SSL configuration, restart the authentication server.

\*2 You must select any of the following encryption methods set in authentication server SSL configuration in advance. Change authentication server SSL configuration as follows: From the Interstage Management Console of the machine where the authentication server was set up, select the [System] > [Security] > [SSL] > [Configuration Name] > [SSL Settings] tab. From the [SSL Settings] tab, click [Detailed Settings [Show]] and change the authentication server SSL configuration. After changing the authentication server SSL configuration, restart the authentication server.

- 168-bit triple DES code, SHA-1 MAC
- 128-bit RC4 code, SHA-1 MAC
- 128-bit RC4 code, MD5 MAC
- 56-bit DES code, SHA-1 MAC
- 40-bit RC4 code, MD5 MAC

---

### **Error: This callback did not contain credential value**

#### Explanation

No authentication information character string is specified in ISCredentialCallback.

#### User Action

Take the following action:

- When ISCallbackHandler is used as the callback handler  
Check the program to see if an authentication information character string was specified when the ISCallbackHandler object was created. If no authentication information character string was specified, correct the program, then re-execute the command.
- When ISCallbackHandler is not used as the callback handler  
Check the program to see if an authentication information character string is set in ISCredentialCallback. If no authentication information character string is set, correct the program, and then re-execute the command.

For more information about the API specifications of classes (classes included in the packages under "com.fujitsu.interstage.sso") provided by the Single Sign-on JavaAPI, refer to Javadoc, included in the "ApplicationServer\javadocs" folder in the Manual package.

---

### **Error: UnsupportedCallbackException occurred when getting information from the CallbackHandler**

#### Explanation

The callback handler does not support callback.

#### User Action

Check the program to see if the callback handler supports ISCredentialCallback.

For more information about the API specifications of classes (classes included in the packages under "com.fujitsu.interstage.sso") provided by the Single Sign-on JavaAPI, refer to Javadoc, included in the "ApplicationServer\javadocs" folder in the Manual package.

---

## **34.13.2 Message output when com.fujitsu.interstage.sso.auth.ISLoginTimeoutException occurs**

---

### **Error: Time out occurred**

#### Explanation

A timeout occurred during communication with the authentication server.

## User Action

Take the following action:

- Authentication infrastructure information for the business server is incorrect. Review [Authentication infrastructure URL] settings of authentication infrastructure information. If [Authentication infrastructure URL] settings are incorrect, set up the business server again. (\*1)
- The authentication server is stopped. Start the authentication server. (\*2)
- Network settings are incorrect. Correct the network environment if incorrect.

\*1 For more information about [Authentication infrastructure URL] of authentication infrastructure information, select the [System] > [Security] > [Single Sign-on] > [Business system] > [Business system Name] > [Settings] tab from the Interstage Management Console. On the [Settings] tab, click [Detailed Settings [Show]] and refer to [Authentication Infrastructure Information Settings].

\*2 For more information on how to start the authentication server, refer to "Operation and Maintenance" - "Starting Single Sign-on" - "Starting Authentication Server" in the Single Sign-on Operator's Guide.

### **34.13.3 Messages output when java.lang.ExceptionInInitializerError occurs**

---

Refer to '34.13.6 Messages output when java.security.AccessControlException occurs'.

### **34.13.4 Messages output when java.lang.IllegalArgumentException occurs**

---

#### **Error: Role is null**

##### Explanation

Null is specified in the ISRolePrincipal constructor parameter.

##### User Action

Do not specify null in the ISRolePrincipal constructor parameter.

---

#### **Error: UserID is null**

##### Explanation

Null is specified in the ISUserPrincipal constructor parameter.

##### User Action

Do not specify null in the ISUserPrincipal constructor parameter.

### **34.13.5 Messages output when java.lang.SecurityException occurs**

---

Check the following to determine the possible cause of the exception:

##### Explanation

1. The javax.security.auth.login.config property is specified incorrectly.
2. The syntax of the login configuration file is incorrect.

##### User Action

###### **Action for Explanation Item 1**

Take the following action:

- Check if the javax.security.auth.login.config property is specified correctly.
- Specify the path name of the login configuration file correctly in the javax.security.auth.login.config property.
- Set read permission for the login configuration file in the javax.security.auth.login.config property. (\*1)

### Action for Explanation Item 2

If the syntax of the login configuration file is incorrect, take the following action:

- Check if the login module class name is specified correctly.
- Check if the flag is specified correctly.
- Check if ";" is specified at the end of the module option. Also check if the specification of the login configuration file ends with "};". (\*2)
- When characters other than alphanumeric characters, signs, and symbols are used in the login configuration file  
Check if the login configuration file is saved in the UTF-8 encoding format. If the login configuration file is not saved in the UTF-8 encoding format, save it in this format.
- If entry names in the login configuration file are not enclosed in double quotation marks (") or single quotation marks ('), the signs and symbols that can be used are limited. If signs and symbols are used for entry names, modify the login configuration file so that the entry names are enclosed in double quotation marks (") or single quotation marks ('). (\*2)

## 34.13.6 Messages output when java.security.AccessControlException occurs

---

Check the following to determine the possible cause of the exception:

### Explanation

1. The authenticated user does not have sufficient access permission.
2. The isj2ee.jar class path was set before jsse.jar, jnet.jar, or jcert.jar. Alternatively, jsse.jar, jnet.jar, and jcert.jar have not been specified.
3. The file encoding format of the login configuration file is incorrect.

### User Action

#### Action for Explanation Item 1

Execute the command as a user with all access permissions.

#### Action for Explanation Item 2

Specify jsse.jar, jnet.jar, and jcert.jar as a class path, or set the isj2ee.jar class path after jsse.jar, jnet.jar, and jcert.jar. (\*1)

#### Action for Explanation Item 3

If characters other than alphanumeric characters, signs, and symbols are used in the login configuration file, take the following action:

- Check if the login configuration file is saved in the UTF-8 encoding format. If the login configuration file is not saved, save it again in this format. (\*2)

\*1 For details, refer to "Developing Applications" - "Developing Java Applications" - "Setting the Application Execution Environment" - "Setting Environment Variables" in the Single Sign-on Operator's Guide.

\*2 For more information on how to create a login configuration file, refer to "Developing Applications" - "Developing Java Applications" - "Setting the Application Execution Environment" - "Creating Login Configuration File" in the Single Sign-on Operator's Guide and specify the login module class name of the login configuration file correctly.

## 34.13.7 Message output when javax.security.auth.login.CredentialExpiredException occurs

---

### Error: Credential has expired

### Explanation

Take the following action:

- Confirm that the system time of the server using the JavaAPI matches the system time of the authentication server. If the system times do not match, make them match. (\*1) If the system times match, check the time zone of each server.
- Add re-authentication processing to the program.

\*1 Take care with the time zone settings when setting the system time in each server.

## 34.13.8 Messages output when javax.security.auth.login.FailedLoginException occurs

---

### Error: Authentication failed

#### Explanation

If Active Directory is used in the user information registration entry, read "Active Directory" for "SSO repository" below.

Authentication failed. Possible causes of unsuccessful authentication are as follows:

- The user name or password is incorrect.
- The registration destination entry for user information does not exist.
- User IDs (user identification information) are redundantly registered.
- The SSO repository user has been locked or is locked.
- The term of validity of the user has expired.
- The SSO authentication method of the SSO repository user is certAuth (certificate authentication) or basicAuthAndCertAuth (password authentication and certificate authentication).

#### User Action

Take the following action:

- Specify the correct user name or password.
- [Registration Destination Entry for User Information] does not exist. (\*1)
- If user IDs (user identification information) are redundantly registered in the SSO repository, change them so that each user ID becomes different. (\*2) (\*3)
- Ask your SSO administrator to unlock the SSO repository user.
- Ask your SSO administrator to check the term of validity of the SSO repository user. If the term of validity has already expired, also ask your SSO administrator to change it.
- Ask your SSO administrator to change the SSO authentication method of the SSO repository user to basicAuth (password authentication) or basicAuthOrCertAuth (password authentication or certificate authentication).

Alternatively, specify the user name or password of the SSO repository user whose SSO authentication method is basicAuth (password authentication) or basicAuthOrCertAuth (password authentication or certificate authentication).

\*1 For more information about [User Information Registration Entry], select the [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Repository server] or [Repository server (reference system)] > [Settings] tab from the Interstage Management Console. From the [Settings] tab, click [Repository server detailed settings [Show]] or [Detailed Settings [Show]] and refer to [Repository].

\*2 Use the entry administration tool to set the SSO repository and check the contents of the SSO repository. For details, refer to "Entry Management" in the Directory Service Operator's Guide.

\*3 For details on the method to check for Active Directory, refer to the Active Directory manual.

---

### Error: UID is necessary to authenticate

#### Explanation

No user ID is specified.

## User Action

Take the following action:

- When ISCallbackHandler is used as the callback handler

Check the program to see if a user ID character string was specified when the ISCallbackHandler object was created. (\*1)

- When ISCallbackHandler is not used as the callback handler

Check the program to see if a user ID character string is set in NameCallback. (\*2)

\*1 For more information about the API specifications of classes (classes included in the packages under "com.fujitsu.interstage.sso") provided by the Single Sign-on JavaAPI, refer to Javadoc(javadocs\_sso), included in the "ApplicationServer\javadocs" folder in the Manual package.

\*2 For more information about NameCallback, refer to the JAAS API Reference supplied from Oracle.

## 34.13.9 Messages output when javax.security.auth.login.LoginException occurs

---

Check the following that is possible for cause of the exception:

### Explanation

1. The login configuration file entry names specified in the application are not written in the login configuration file.
2. The login module class name of the login configuration file is specified incorrectly.
3. The application is not restarted after the login configuration file has been updated.
4. **Windows32/64**

Interstage Application Server may have been installed when the Terminal service was in application mode.

### User Action

#### Action for 1 in Explanation

Match the login configuration file entry names specified in the application with the entry names written in the login configuration file. (\*1)

#### Action for 2 in Explanation

Specify the login module class name correctly in the login configuration file. Modify the login configuration file. (\*2)

#### Action for 3 in Explanation

Restart the application (for the servlet, IJServer).

#### **Windows32/64**

#### Action for 4 in Explanation

If Interstage Application Server was installed when the Terminal service was in application mode, uninstall it, execute [CHANGE USER /INSTALL], and then re-install. After re-installing Interstage Application Server, execute [CHANGE USER /EXECUTE].

\*1 For more information about how to instantiate LoginContext, refer to "Developing Applications" - "Developing Java Applications" - "Developing Programs" - "Converting LoginContext to an Instance" in the Single Sign-on Operator's Guide and check if the entry names are specified correctly.

\*2 For more information on how to create a login configuration file, refer to "Developing Applications" - "Developing Java Applications" - "Setting the Application Execution Environment" - "Creating Login Configuration File" in the Single Sign-on Operator's Guide and specify the login module class name of the login configuration file correctly.

# Chapter 35 Messages Output by Interstage Directory Service

This chapter describes the messages output by Interstage Directory Service.

## 35.1 Output Format

The messages are output in the following format:

Message

errmsg: Detailed information 1

matched: Detailed information 2

### 35.1.1 Message Formats

The messages indicate the status of the repository or errors in the repository.

The messages are classified into the following two types:

- Message

Example:

```
/opt/FJSVidsdk/C/bin/ldapsearch -p 389 -h host -b "ou=interstage,o=fujitsu,dc=com" -f aaa "%s"
aaa: No such file or directory
```

- Processing type: Message

Example:

```
/opt/FJSVidsdk/C/bin/ldapsearch -p 389 -D "cn=manager,o=fujitsu,dc=com" -w secret -b
"o=fujitsu,c=com" "*"
ldap_search : Bad search filter
```

The output processing type is shown as follows.

Processing type	Description
ldap_simple_bind	Failed to bind (authentication)
ldap_add	Failed to add (an entry)
ldap_modify	Failed to modify (an entry)
ldap_delete	Failed to delete (an entry)
ldap_rename	Failed to rename (an entry distinguished name)
ldap_search	Failed to search (for an item)
ldap_result(bind)	Failed to bind (authentication)
ldap_result(add)	Failed to add (an entry)
ldap_result(modify)	Failed to modify (an entry)
ldap_result(rename)	Failed to rename (an entry distinguished name)
ldap_result(search)	Failed to search (for an item)
ldmv2 ldmv3	Failed to modify (an entry)
ldsv2 ldsv3	Failed to search (for an entry)

Processing type	Description
lddv2 lddv3	Failed to delete (an entry)

### 35.1.2 Detailed Information 1

Detailed information 1 is additional message information indicating an error in the repository.

errmsg: In some cases, detailed information 1 may not be output.

Example:

```
/opt/FJSDVidsdk/C/bin/ldapsearch -p 389 -D "cn=manager,o=fujitsu,c=com" -w "" -b "o=fujitsu,dc=com"
"objectclass=*"
ldap_result(bind) : DSA is unwilling to perform
  errmsg : unauthenticated bind (DN with no password) disallowed
```

### 35.1.3 Detailed Information 2

Detailed information 2 is DN information which shows a corresponding range to the condition of operating object. In some cases, detailed information 2 may not be output..

Example:

```
adding new entry cn=user01,ou=interstage,o=fujitsu,dc=com
ldap_result(add) : No such object
  matched: o=fujitsu,dc=com
  errmsg : Name Error: No Such Object
```

## 35.2 Messages Output by the ldapsearch Command

This section describes the messages output by the *ldapsearch* command. If executing the *ldapsearch* command outputs a message which is not described in this section, refer to 'Messages Common to the ldapsearch, ldapmodify, and ldapdelete Commands'.

### 35.2.1 alias deref should be never, search, find, or always

#### alias deref should be never, search, find, or always

##### Explanation

There is an incorrect specification in the reference solution for an alias.

##### User Action

Specify 'never', 'search', 'find', or 'always' when using the '-a' option for the reference solution for the alias, then re-execute the command.

If this user action is not successful, use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

### 35.2.2 Bad search filter

#### Bad search filter

##### LDAP Error Code Symbol

LDAP\_FILTER\_ERROR

##### Explanation

The format of a search filter is incorrect.

## User Action

Check the format of the search filter specified, then re-execute the command. For details regarding the search filter, refer to 'Search Filter' in the Directory Service Operator's Guide.

### 35.2.3 ber\_alloc(sort keys) failed

---

#### ber\_alloc(sort keys) failed

## Explanation

The command was aborted because of insufficient memory.

## User Action

Close all programs no longer needed, then re-execute the command.

**Windows32/64**

If there is insufficient memory for the entire system, add memory or increase virtual memory.

**Solaris32/64 Linux32/64**

If there is insufficient memory for the entire system, add memory or increase the swap area.

For details on the memory required for Interstage Directory Service, refer to 'Memory Requirements' in the Tuning Guide.

### 35.2.4 ber\_flatten(sortKeyList) failed

---

#### ber\_flatten(sortKeyList) failed

## Explanation

The command was aborted because of insufficient memory.

## User Action

Close all programs no longer needed, then re-execute the command.

**Windows32/64**

If there is insufficient memory for the entire system, add memory or increase virtual memory.

**Solaris32/64 Linux32/64**

If there is insufficient memory for the entire system, add memory or increase the swap area.

For details on the memory required for Interstage Directory Service, refer to 'Memory Requirements' in the Tuning Guide.

### 35.2.5 ber\_printf(sortKeyList %s1) failed

---

#### ber\_printf(sortKeyList %s1) failed

## Variable Information

%s1 = Sort key list

## Explanation

The command was aborted because of insufficient memory.

## User Action

Close all programs no longer needed, then re-execute the command.

**Windows32/64**

If there is insufficient memory for the entire system, add memory or increase virtual memory.

**Solaris32/64** **Linux32/64**

If there is insufficient memory for the entire system, add memory or increase the swap area.

For details on the memory required for Interstage Directory Service, refer to 'Memory Requirements' in the Tuning Guide.

---

## 35.2.6 Failed base64 encode

---

### Failed base64 encode

#### Explanation

Base64 encoding failed because of insufficient memory.

#### User Action

Close all programs no longer needed, then re-execute the command.

**Windows32/64**

If there is insufficient memory for the entire system, add memory or increase virtual memory.

**Solaris32/64** **Linux32/64**

If there is insufficient memory for the entire system, add memory or increase the swap area.

For details on the memory required for Interstage Directory Service, refer to 'Memory Requirements' in the Tuning Guide.

---

## 35.2.7 Failed to sort entries. Not enough memory

---

### Failed to sort entries. Not enough memory

#### Explanation

The entries could not be sorted because of insufficient memory.

#### User Action

Close all programs no longer needed, then re-execute the command.

**Windows32/64**

If there is insufficient memory for the entire system, add memory or increase virtual memory.

**Solaris32/64** **Linux32/64**

If there is insufficient memory for the entire system, add memory or increase the swap area.

For details on the memory required for Interstage Directory Service, refer to the 'Memory Requirements' in Tuning Guide.

---

## 35.2.8 ldap\_parse\_result failed %s1 : %s2

---

### ldap\_parse\_result failed %s1 : %s2

#### Variable Information

%s1 = Detailed information

%s2 = Error message

#### Explanation

The command failed to search. Interstage Directory Service returned an error message.

#### User Action

Based on error message %s2, check how the command was specified and the Interstage Directory Service status, then re-execute the command.

If this user action is not successful, use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

## 35.2.9 ldap\_search\_ext\_s returned : %s1

---

### ldap\_search\_ext\_s returned : %s1

#### Variable Information

%s1 = Error message

#### Explanation

The command failed to search. Interstage Directory Service returned an error message.

#### User Action

Based on the error message %s1, check how the command was specified and the Interstage Directory Service status, then re-execute the command. If this user action is not successful, use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

## 35.2.10 ldap\_search timed out

---

### ldap\_search timed out

#### Explanation

The command exceeded the Search Timeout out in searching an entry.

#### User Action

Increase the limit search time specified with the -l option or omit the -l option.

If this user action is not successful, change the connection DN to the Administrator DN for the targeted repository, or increase Search Timeout value by using the Settings window for the targeted repository from the Interstage Management Console.

## 35.2.11 Results too large

---

### Results too large

#### LDAP Error Code Symbol

LDAP\_RESULTS\_TOO\_LARGE

#### Explanation

The number of entries the command handled exceeded the maximum number of searchable entries.

#### User Action

Increase the maximum number of searchable entries, by using the Settings window for the targeted repository, from the Interstage Management Console, then re-execute the command.

If this user action is not successful, use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

## 35.2.12 scope should be base, one, or sub

---

### scope should be base, one, or sub

#### Explanation

The range specified for a search is incorrect.

#### User Action

Specify 'base', 'one', or 'sub' with the -s option for the search range, then re-execute the command.

## 35.2.13 Sizelimit exceeded

---

### Sizelimit exceeded

LDAP Error Code Symbol

LDAP\_SIZELIMIT\_EXCEEDED

Explanation

The number of entries located by the command exceeded the maximum number of searchable entries when searching an entry.

User Action

Increase the size restriction specified with the `-z` option or omit the `-z` option.

Increase the maximum number of searchable entries by using the Settings window for the targeted repository from the Interstage Management Console.

If this user action is not successful, use the `iscollectinfo` command to collect diagnostic information, then contact your service engineer.

## 35.2.14 Timelimit exceeded

---

### Timelimit exceeded

LDAP Error Code Symbol

LDAP\_TIMELIMIT\_EXCEEDED

Explanation

The command exceeded the Search Timeout when searching an entry.

User Action

Increase the limit search time specified with the `-l` option or omit the `-l` option.

If this user action is not successful, change the connection DN to the Administrator DN for the targeted repository, or increase the Search Timeout by using the Settings window for the targeted repository from the Interstage Management Console.

If this user action is not successful, use the `iscollectinfo` command to collect diagnostic information, then contact your service engineer.

## 35.2.15 You should specify the sort key.

---

### You should specify the sort key.

Explanation

No attribute was specified for sorting in the repository.

User Action

The specified `-x` option is not supported by Interstage Directory Service.

## 35.3 Messages Output by the `Idapmodify` Command

---

This section describes the messages output by the `Idapmodify` command. If executing the `Idapmodify` command outputs a message which is not described in this section, refer to 'Messages Common to the `Idapsearch`, `Idapmodify`, and `Idapdelete` Commands'.

### 35.3.1 `%s1` : Can't open file

---

`%s1` : Can't open file  
(line `%s2` of entry : `%s3`)

## Variable Information

%s1 = Name of the file

%s2 = Line in question

%s3 = Entry

## Explanation

The command could not open the file %s1 specified by LDIF.

## User Action

Check that file %s1 (indicated by the path specified in line %s2 of the entry %s3) exists and that permission is assigned to the file or specified path, then re-execute the command.

---

## 35.3.2 Affects multiple DSAs

### Affects multiple DSAs

#### LDAP Error Code Symbol

LDAP\_AFFECTS\_MULTIPLE\_DSAS

#### Explanation

Interstage Directory Service does not allow use of the specified function.

#### User Action

This error may occur when Interstage Directory Service does not allow use of the specified function.

Refer to the following manuals to check which functions are allowed by Interstage Directory Service:

'Restrictions on Interstage Directory Service' in the Product Notes

'Notes on Interstage Directory Service' in the Product Notes

---

## 35.3.3 Already exists

### Already exists

#### LDAP Error Code Symbol

LDAP\_ALREADY\_EXISTS

#### Explanation

There is already an entry with the same name.

#### User Action

Check the entries specified with LDIF or changetype of the entries, then re-execute the command. If the entries and changed types specified are correct, use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

---

## 35.3.4 base64 decode err. data length is %s1

### base64 decode err. data length is %s1 (line %s2 of entry : %s3)

#### Variable Information

%s1 = Data length

%s2 = Line in question

%s3 = Entry

## Explanation

The command failed to decode Base64 encoded data.

## User Action

Check the entry %s3 specified in line %s2 is specified as described below, then re-execute the command:

- When its attribute values are specified using an external file

Check that the external file is in Base64 format. If the external file is in Base64 format, check that the external file is a text file before it is encoded and only ASCII characters are used.

- When its attribute values are directly written in the LDIF file

Check that the attributes are in Base64 format.

If the attribute values specified are correct, use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

## 35.3.5 Cannot modify object class

---

### Cannot modify object class

#### LDAP Error Code Symbol

LDAP\_NO\_OBJECT\_CLASS\_MODS

#### Explanation

The value of an object class on which required attributes depend cannot be modified

#### User Action

Check that the object classes are correctly specified, then re-execute the command. For details of object classes, refer to 'List of Object Classes' in the Interstage Directory Service Operator's Guide.

If the object class is correctly specified, use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

## 35.3.6 Constraint violation

---

### Constraint violation

#### LDAP Error Code Symbol

LDAP\_CONSTRAINT\_VIOLATION

#### Explanation

A constraint violation occurred.

#### User Action

Check that the attributes are correctly specified, then re-execute the command. For details of attributes, refer to 'List of Attributes' in the Interstage Directory Service Operator's Guide.

If the attributes are correctly specified, use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

## 35.3.7 invalid base64 code

---

### invalid base64 code

#### Explanation

The specified data is not in Base64 format.

## User Action

Check that the specified data is in Base64 format. Additionally, check the Base64 format data modification method. For information on modifying data, refer to 'Using the Command to Manage Entries-Standard and Modification formats of LDIF' in the Interstage Directory Service Operator's Guide.

If the data is specified in the correct format and the data modification method is correct, use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

---

### 35.3.8 Idmv3: expecting "%s1" but saw "%s2" (line %s3 of entry %s4)

---

#### Idmv3: expecting "%s1" but saw "%s2" (line %s3 of entry %s4)

##### Variable Information

%s1 = Value expected for the type of attribute to be changed

%s2 = Value specified for the type of attribute to be changed

%s3 = Line in question

%s4 = Entry

##### Explanation

The specified type '%s2' of the attribute to be changed is incorrect.

##### User Action

Move the line specified for the type %s2 of attribute to be changed for the entry %s4 in the line %s3 to the line indicated by %s1. If the line for %s1 is not specified, add the line for %s1 above the line for %s2.

For information on changing an attribute type, refer to 'Using the Command to Manage Entries'-'Addition, Deletion, and Modification of Entries and Identifier Changes by LDIF, and Unsupported LDIF Description' in the Interstage Directory Service Operator's Guide.

---

### 35.3.9 Idmv3: extra lines at end (line %s1 of entry %s2)

---

#### Idmv3: extra lines at end (line %s1 of entry %s2)

##### Variable Information

%s1 = Line in question

%s2 = Entry

##### Explanation

The entry modification format ends with an invalid line.

##### User Action

Check the format in line %s1 in the entry %s2. For entry modification format details, refer to 'Using the Command to Manage Entries - Standard and Modification formats of LDIF' in the Interstage Directory Service Operator's Guide.

If the format is correctly specified, use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

---

### 35.3.10 Idmv3: invalid format (line %s1 of entry: %s2)

---

#### Idmv3: invalid format (line %s1 of entry: %s2)

##### Variable Information

%s1 = Line in question

%s2 = Entry

## Explanation

The entry modification format is incorrect.

## User Action

Check the format in line %s1 in the entry %s2. For entry modification format details, refer to 'Using the Command to Manage Entries - Standard and Modification formats of LDIF' in the Interstage Directory Service Operator's Guide.

If the format is correctly specified, use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

### 35.3.11 Idmv3: invalid Idif format (line %s1 of entry: %s2)

---

#### Idmv3: invalid Idif format (line %s1 of entry: %s2)

## Variable Information

%s1 = Line in question

%s2 = Entry

## Explanation

The entry modification format is incorrect.

## User Action

Check the format in line %s1 in the entry %s2. For entry modification format details, refer to 'Using the Command to Manage Entries - Standard and Modification formats of LDIF' in the Interstage Directory Service Operator's Guide.

If the format is correctly specified, use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

### 35.3.12 Idmv3: invalid Michigan format. missing value on line %s1 (attr is %s2)

---

#### Idmv3: invalid Michigan format. missing value on line %s1 (attr is %s2)

## Variable Information

%s1 = Line in question

%s2 = Attribute

## Explanation

The entry modification format for attributes is incorrect.

## User Action

Check the format in line %s1 in the attribute %s2. For details on the entry modification format for attributes, refer to 'Using the Command to Manage Entries - Standard and Modification formats of LDIF' in the Interstage Directory Service Operator's Guide.

If the format is correctly specified, use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

### 35.3.13 Idmv3: no attributes to change or add (entry %s1)

---

#### Idmv3: no attributes to change or add (entry %s1)

## Variable Information

%s1 = Entry

## Explanation

Nothing is specified for an attribute to be changed.

## User Action

Check that the attributes to be changed for the entry %s1 are correctly specified, then re-execute the command. For details on modifying an entry, refer to 'Using the Command to Manage Entries - Standard and Modification formats of LDIF' in the Interstage Directory Service Operator's Guide.

### 35.3.14 Idmv3: unknown changetype "%s1" (line %s2 of entry %s3)

---

#### Idmv3: unknown changetype "%s1" (line %s2 of entry %s3)

##### Variable Information

%s1 = Value specified for a changetype

%s2 = Object line

%s3 = Entry

##### Explanation

The specified changetype '%s1' is incorrect.

##### User Action

Check the changetype specified in line %s2 for the entry %s3, then re-execute the command. For details on specifying a changetype, refer to 'Using the Command to Manage Entries - Standard and Modification formats of LDIF' in the Interstage Directory Service Operator's Guide.

### 35.3.15 Naming violation

---

#### Naming violation

##### LDAP Error Code Symbol

LDAP\_NAMING\_VIOLATION

##### Explanation

An RDN is incorrectly handled.

##### User Action

Check RDN handling to confirm that attribute values specified for deletion or change are valid, or that specified DN and RDN values are different. Then, execute the command again.

If RDN handling is correct, use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

### 35.3.16 Object class violation

---

#### Object class violation

##### LDAP Error Code Symbol

LDAP\_OBJECT\_CLASS\_VIOLATION

##### Explanation

An object class specified is incorrect. An attribute required for the object class is not designated or an attribute that cannot be used by the object class is designated.

##### User Action

Designate the attributes required for the object class specified or only attributes usable for it. For details of object classes and their attributes, refer to 'List of Object Classes' and 'List of Attributes' in the Interstage Directory Service Operator's Guide.

This error may occur if a function is used that Interstage Directory Service does not support. Refer to the following manuals to check that functions not supported by Interstage Directory Service are not used:

'Restrictions on Interstage Directory Service in the Product Notes

'Notes on Interstage Directory Service in the Product Notes

If the object classes specified are correct, use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

---

### 35.3.17 Type or value exists

---

#### Type or value exists

LDAP Error Code Symbol

LDAP\_TYPE\_OR\_VALUE\_EXISTS

Explanation

A specified attribute already exists.

User Action

Check the names of attributes specified, then re-execute the command. If the specified attribute names are correct, there is already an attribute with an identical name.

If the attribute names specified are correct and their names are unassigned to any existing attributes, use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

---

### 35.3.18 Undefined attribute type

---

#### Undefined attribute type

LDAP Error Code Symbol

LDAP\_UNDEFINED\_TYPE

Explanation

An attribute name, not defined in the schema, is incorrectly specified.

User Action

Check the names of attributes specified, then re-execute the command.

An attribute specified for the search filter may have no matching rule. Check the search filter specification, and then re-execute. For details on attributes, refer to 'List of Attributes' in the Interstage Directory Service Operator's Guide.

If the attribute names specified are correct, use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

---

## 35.4 Messages Output by the *Idapdelete* Command

---

For details on the messages output by the *Idapdelete* command, refer to "[35.5 Messages Common to the \*Idapsearch\*, \*Idapmodify\*, and \*Idapdelete\* Commands](#)".

---

## 35.5 Messages Common to the *Idapsearch*, *Idapmodify*, and *Idapdelete* Commands

---

This section describes the messages common to the commands *Idapsearch*, *Idapmodify*, and *Idapdelete*.

---

### 35.5.1 %s1: line %s2: bad config line (ignored)

---

**%s1: line %s2: bad config line (ignored)**

## Variable Information

%s1 = Name of an SSL environment definition file

%s2 = Line in question

## Explanation

Because line %s2 in the SSL environment definition file %s1 is incorrect; the command replaced its values with default. The default values are 0 for ssl\_verify and 3600 for ssl\_timer.

## User Action

Check line %s2 in the SSL environment definition file %s1. For details on SSL environment definition files, refer to 'Setting up an Environment for SSL Communication - Setting an SSL Environment Definition File (Client)' in the Interstage Directory Service Operator's Guide.

---

## 35.5.2 %s1: line %s2: missing path-name in %s3 <path-name> line

---

### %s1: line %s2: missing path-name in %s3 <path-name> line

## Variable Information

%s1 = Name of an SSL environment definition file

%s2 = Line in question

%s3 = Tag

## Explanation

On line %s2 in the SSL environment definition file %s1, a path in the tag %s3 is incorrect.

## User Action

Check line %s2 in the SSL environment definition file %s1, then re-execute the command. For details on SSL environment definition files, refer to 'Setting up an Environment for SSL Communication - Setting an SSL Environment Definition File (Client)' in the Interstage Directory Service Operator's Guide.

---

## 35.5.3 %s1: line %s2: missing string in %s3 <string> line

---

### %s1: line %s2: missing string in %s3 <string> line

## Variable Information

%s1 = Name of an SSL environment definition file

%s2 = Line in question

%s3 = Tag

## Explanation

On line %s2 in the SSL environment definition file %s1, a character string in the tag %s3 is incorrect.

## User Action

Check line %s2 in the SSL environment definition file %s1, then re-execute the command. For details on SSL environment definition files, refer to 'Setting up an Environment for SSL Communication - Setting an SSL Environment Definition File (Client)' in the Interstage Directory Service Operator's Guide.

---

## 35.5.4 %s1: line %s2: missing token-passwd in %s3 <token-passwd> line

---

### %s1: line %s2: missing token-passwd in %s3 <token-passwd> line

## Variable Information

%s1 = Name of an SSL environment definition file

%s2 = Line in question

%s3 = Tag

### Explanation

On line %s2 in the SSL environment definition file %s1, a user PIN (tkn\_pwd) in the tag %s3 is incorrect. Alternatively, the user PIN is not encrypted.

### User Action

Check line %s2 in the SSL environment definition file %s1, then re-execute the command. If this error message occurs again, execute the *irepencupin* command to encrypt the password in the SSL environment definition file. For details on SSL environment definition files, refer to 'Setting up an Environment for SSL Communication - Setting an SSL Environment Definition File (Client)' in the Interstage Directory Service Operator's Guide. For details on the *irepencupin* command, refer to 'Interstage Directory Service Operation Commands' in the Reference Manual (Command Edition).

## 35.5.5 %s1: No such file or directory

---

### %s1: No such file or directory

#### Variable Information

%s1 = Name of a specified file

#### Explanation

The specified file %s1, or a directory related to it, does not exist.

#### User Action

Check that the specified file %s1, or a directory related to it, exists.

## 35.5.6 Admin limit exceeded

---

### Admin limit exceeded

#### LDAP Error Code Symbol

LDAP\_ADMINLIMIT\_EXCEEDED

#### Explanation

The request exceeded a limit of the Interstage Directory Service server.

#### User Action

Check the Repository server system logs for messages and take action accordingly. Otherwise, check and correct invalid settings by using the Settings window for the targeted repository from the Interstage Management Console.

If no problem is detected after taking the above action, refer to the Tuning Guide to check whether memory or disk capacity is insufficient. If this is the case, increase the memory or disk capacity. If the cause of the error cannot be determined, use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

## 35.5.7 Alias dereferencing problem

---

### Alias dereferencing problem

#### LDAP Error Code Symbol

LDAP\_ALIAS\_DEREF\_PROBLEM

#### Explanation

A specified alias could not be referenced.

## User Action

Check the aliases specified, then re-execute the command. If the aliases specified are correct, use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

## 35.5.8 Alias problem

---

### Alias problem

#### LDAP Error Code Symbol

LDAP\_ALIAS\_PROBLEM

#### Explanation

A specified alias is invalid.

#### User Action

Check the aliases specified, then re-execute the command. If the aliases specified are correct, use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

## 35.5.9 A secret key doesn't exist %s1 ( %s2 )

---

### A secret key doesn't exist %s1 ( %s2 )

#### Variable Information

%s1 = SSL error code

%s2 = SSL detail code

#### Explanation

There is no private-key corresponding to a site certificate in the Interstage Certificate Environment or certificate/private-key control environment.

#### User Action

Take either measure below depending on your certificate or private-key control environment established for SSL encrypted communication:

- Interstage Certificate Environment:

It is possible to restore the Interstage Certificate Environment while the Interstage Management Console is operating. If necessary stop the Interstage Management Console, then restart it. For details on how to start up/stop the Interstage Management Console, refer to:

'Starting the Interstage Management Console' or 'Stopping the Interstage Management Console' in the Operator's Guide.

If this user action is not successful, it is possible that the Interstage Certificate Environment is damaged. Restore the Interstage Certificate Environment by referring to 'Broken Certificate Environments - Interstage Certificate Environments' in 'Error Codes to be Reported from Interstage Directory Service'.

- Certificate/key control environment:

Register a private-key corresponding to the site certificate in the certificate/key control environment. For details on how to register a private-key, refer to the following:

'SSL Environment Setting Commands'-'cmenterkey' in the Reference Manual (Command Edition)

If this user action is not successful, the certificate/key control environment may be damaged. Restore the certificate/key control environment by referring to 'Broken Certificate Environments - Certificate/Key Control Environment' in 'Error Codes to be Reported from Interstage Directory Service'.

For details on the SSL error code, refer to 'SSL Error Code' in 'Error Codes to be Reported from Interstage Directory Service'.

## 35.5.10 Because encountered an incomplete character, the iconv stopped converting.(EBADE)

---

### Because encountered an incomplete character, the iconv stopped converting.(EBADE)

#### Explanation

An unsupported character code is included or incorrect data is specified.

#### User Action

Check the character codes and data specified in the command. If the specified character codes and data are correct, use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

## 35.5.11 Can't connect to the LDAP server

---

### Can't connect to the LDAP server

#### LDAP Error Code Symbol

LDAP\_CONNECT\_ERROR

#### Explanation

A connection to the repository could not be established.

#### User Action

Check that the repository is activated from the Interstage Management Console:

- If the repository is deactivated, start it.
- If the repository is activated, stop it and then restart it.
- If the repository is unstable, stop it and then restart it.

**Solaris32/64** **Linux32/64**

If a standard database is used for the repository database, check that the omsservd process is activated by executing the *ps* command. If the omsservd process is not activated, execute the *enablerstart* command to start it. After the omsservd process is started up, restart the repository, and perform the entry operation again.

If an RDB is used as the repository database, check the system log (event log) of the machine used to install the connection destination Interstage Directory Service and check whether an RDB error has occurred.

If this user action is not successful, use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

## 35.5.12 Can't contact LDAP server

---

### Can't contact LDAP server

#### LDAP Error Code Symbol

LDAP\_SERVER\_DOWN

#### Explanation

Cannot communicate with the repository.

#### User Action

Take the following measures, then re-execute the command:

- Check that the specified method of the command option is correct.
- Check the name of the host or port number specified for the connection.

- Check that the repository is activated from the Interstage Management Console:
  - If the repository is deactivated, start it.
  - If the repository is activated, stop and then restart it.
  - If the repository is unstable, stop and then restart it.
- To make a connection with the repository using the SSL port number, the `-Z` option needs to be specified. If the `-Z` option is not specified, specify the SSL environment definition file using the `-Z` option, then re-execute the command.
- If the network environment has incorrect settings (for example, settings in the hosts file, specifications of the DNS server/DHCP server to be used, or settings of the DNS server/DHCP server to be used), contact the network administrator, then review and re-set the network environment.
- The physical memory capacity required for operating Interstage Directory Service may be insufficient. Stop any unnecessary programs, and ensure there is sufficient memory to operate Interstage Directory Service. Also ensure that all repositories and Interstage data store have been stopped if usable physical memory capacity is less than the required memory capacity of Interstage Directory Service, then you may need to obtain more memory. For memory capacity required for Interstage Directory Service, refer to 'Memory Requirements' in the Tuning Guide.

If all unnecessary programs have been stopped, and memory is still insufficient, add more memory.

- When the repository is activated, check the access log for any timeout recorded. If the access log has a timeout record, a timeout has occurred. For further information regarding the access log, refer to 'Log' in the Interstage Directory Service Operator's Guide.

Check that an extremely short time is not set for the connection idle timeout by using the Settings window for the targeted repository from the Interstage Management Console.

Another possible cause of a timeout is network congestion (large amount of communications traffic which prevents regular data transfer), high load in the machine running the repository, or high load in the machine running the application.

If Interstage Directory Service has a high load, apply load balancing using replication. If the client has a high load, review the runtime environment in the client and set it to an appropriate state.

Execute the command again.

When SSL is used in the connection with the repository server, and if there is a large number of clients and frequent access to Interstage Directory Service, the above user action may not resolve the error. If this user action does not solve the error, consider reducing load to the server by using SSL accelerator or taking other measures.

**Solaris32/64 Linux32/64**

- There may be insufficient usable file descriptors (`fd`) for the command. Use `ulimit(1)` or `setrlimit(2)` to increase the number of usable file descriptors, then re-execute the command.
- If a standard database is used for the repository database, check that the `omsservd` process is activated by executing the `ps` command. If the `omsservd` process is not activated, execute the `enablerstart` command to start it. After the `omsservd` process has started, restart the repository, and then perform the entry operation again.

If this user action is not successful, use the `iscollectinfo` command to collect diagnostic information, then contact your service engineer.

## 35.5.13 Control not found

---

### Control not found

LDAP Error Code Symbol

LDAP\_CONTROL\_NOT\_FOUND

Explanation

The specified function is not supported.

User Action

Interstage Directory Service does not support the requested function.

## 35.5.14 Could not open SSL env file %s1 - absolute path?

---

### Could not open SSL env file %s1 - absolute path?

#### Variable Information

%s1 = Name of an SSL environment definition file.

#### Explanation

The specified SSL environment definition file could not be opened.

#### User Action

Check that the specified SSL environment definition file exists or check your permission to reference the SSL environment definition file. If the specified SSL environment definition file exists and permission to reference the SSL environment definition file is assigned, use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

## 35.5.15 Decoding error

---

### Decoding error

#### LDAP Error Code Symbol

LDAP\_DECODING\_ERROR

#### Explanation

An error occurred when received data was being decoded.

#### User Action

The error may have occurred due to protocol expansion which can result in insufficient memory. Close all unnecessary programs to secure sufficient memory, and then re-execute the command.

**Windows32/64**

If the error still occurs after closing all unnecessary programs and re-executing the command, add memory or increase virtual memory.

**Solaris32/64 Linux32/64**

If the error still occurs after closing all unnecessary programs and re-executing the command, add memory or increase the swap area.

For the memory required for Interstage Directory Service operation refer to 'Memory Requirements' in the Tuning Guide.

## 35.5.16 DSA is busy

---

### DSA is busy

#### LDAP Error Code Symbol

LDAP\_BUSY

#### Explanation

There are too many requests to the repository and it cannot accept any more, or an error occurred in Interstage data store.

#### User Action

Possible causes of the error are as follows:

- The server running the repository has a heavy load, so wait for a while and then re-execute the command.
- Two or more clients attempted to update the same attribute or entry at the same time. Wait a moment and then re-execute the command.

- When an attempt is made to add or modify an entry with too many attributes (for example more than 1000 attributes). Check the number of attributes. If too many attributes are included, reduce the number, restart the repository from the Interstage Management Console, and then re-execute the command.

The number of attributes allowed to be added or modified per entry depends on the capability of the server machine and the data sizes of the attribute values. Therefore, gradually reduce the number of attributes per entry until re-executing the command does not generate the error.

If this user action is not successful, use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

## 35.5.17 DSA is unavailable

---

### DSA is unavailable

#### LDAP Error Code Symbol

LDAP\_UNAVAILABLE

#### Explanation

The repository cannot handle the request. Alternatively, the repository is not in service.

#### User Action

Possible causes of the error are as follows:

- When the -Y option is specified.  
Interstage Directory Service does not support the -Y option. To use SSL, specify the -Z option to enable SSL communication.
- When the repository is not activated.

Check that the repository is activated from the Interstage Management Console:

- If the repository is deactivated, start it.
- If the repository is activated, stop and then restart it.
- If the repository is unstable, stop and then restart it.

**Solaris32/64** **Linux32/64**

If a standard database is used for the repository database, check that the omsservd process is activated by executing the *ps* command. If the omsservd process is not activated, execute the *enablerstart* command to start it. After the omsservd process has started, restart the repository and then perform the entry operation again.

If this user action is not successful, use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

## 35.5.18 DSA is unwilling to perform

---

### DSA is unwilling to perform

#### LDAP Error Code Symbol

LDAP\_UNWILLING\_TO\_PERFORM

#### Explanation

The repository rejected the request.

#### User Action

Possible causes of the error are:

- When access is made to an entry which includes no public directory.  
It is not permitted to execute a command in this manner.

- When an instruction is made to delete a public directory (top entry) or change a distinguished name.  
It is not permitted to execute a command in this manner.
  - When an attempt is made to log in without a DN password.  
Enter the password, then re-execute the command.
  - There is possibility that this error is indicated when 1999 or more bytes are specified for a DN or a binary attribute of 200 kilobytes or more is specified for one attribute.
  - When a request is made to a slave for modification.  
No slave is allowed to modify data. Make a request to the master repository for modification.
  - When the -b option is not specified for the *ldapsearch* command.  
A search base is always required for the command. Specify a search base using the -b option, then re-execute the command.
  - When an attempt is made to register an entry which has the same distinguished name as that of an Administrator DN, or an attempt is made to set the distinguished name of an entry to the distinguished name of an Administrator DN.  
It is not permitted to execute a command in this manner.
  - If the command was issued with a function not supported by Interstage Directory Service.  
Refer to the following manuals to check that no functions not supported by Interstage Directory Service were used:  
'Restrictions on Interstage Directory Service' in the Product Notes  
'Notes on Interstage Directory Service' in the Product Notes
- If this user action is not successful, use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

## 35.5.19 Encoding error

---

### Encoding error

#### LDAP Error Code Symbol

LDAP\_ENCODING\_ERROR

#### Explanation

An error occurred while transmission data was being encoded.

#### User Action

The error may have occurred due to protocol expansion which can result in insufficient memory. Close all unnecessary programs to secure sufficient memory, and then re-execute the command.

**Windows32/64**

If the error still occurs after closing all unnecessary programs and re-executing the command, add memory or increase virtual memory.

**Solaris32/64 Linux32/64**

If the error still occurs after closing all unnecessary programs and re-executing the command, add memory or increase the swap area.

For details on the memory required for Interstage Directory Service operation, refer to 'Memory Requirements' in the Tuning Guide.

## 35.5.20 Encountered an incomplete character or shift sequence at the end of the input buffer.(EINVAL)

---

### Encountered an incomplete character or shift sequence at the end of the input buffer.(EINVAL)

#### Explanation

The specified data is incorrect or not correctly terminated.

## User Action

Check that the data is correctly specified. If the data is correctly specified, use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

### 35.5.21 Encountered an input byte not belonging to the input codeset. (EILSEQ)

---

#### Encountered an input byte not belonging to the input codeset.(EILSEQ)

##### Explanation

An unsupported character code is included or incorrectly specified.

##### User Action

Check that no unusable character code is included in data of any entry.

Alternatively, the character code of the CSV file or LDIF file is the same as that specified by the -C option.

### 35.5.22 Failed to convert character code(%s1)

---

#### Failed to convert character code(%s1)

##### Variable Information

%s1 = Detailed information

##### Explanation

Character code conversion failed.

##### User Action

Assess the detailed information %s1 displayed with the message, then re-execute the command.

### 35.5.23 Failed to convert from %s1 to %s2 : %s3

---

#### Failed to convert from %s1 to %s2 : %s3

##### Variable Information

%s1 = Character code to be converted

%s2 = Target character code

%s3 = Detailed information

##### Explanation

The character code %s1 could not be converted to %s2.

##### User Action

Assess the detailed information %s3 displayed with the message, then re-execute the command.

### 35.5.24 illegal option -- %s1

---

#### illegal option -- %s1

##### Variable Information

%s1 = Option

##### Explanation

The command does not support the specified option %s1.

#### User Action

Check the options specified, then re-execute the command. For details of command options, refer to 'Interstage Directory Service Operation Commands' in the Reference Manual (Command Edition).

### 35.5.25 Inappropriate authentication

---

#### Inappropriate authentication

##### LDAP Error Code Symbol

LDAP\_INAPPROPRIATE\_AUTH

##### Explanation

Authentication is rejected. The specified DN has no userPassword attribute.

##### User Action

Using the Administrator DN, check that the specified DN has a userPassword attribute, then re-execute the command.

### 35.5.26 Inappropriate matching

---

#### Inappropriate matching

##### LDAP Error Code Symbol

LDAP\_INAPPROPRIATE\_MATCHING

##### Explanation

There is a mismatch.

##### User Action

Check the attributes specified.

### 35.5.27 incorrect ssl environment value

---

#### incorrect ssl environment value

##### Explanation

The SSL environment definition file has an error.

##### User Action

Check the SSL environment definition file, then re-execute the command.

For SSL environment definition file details, refer to 'Setting up an Environment for SSL Communication - Setting an SSL Environment Definition File (Client)' in the Interstage Directory Service Operator's Guide.

### 35.5.28 Insufficient access

---

#### Insufficient access

##### LDAP Error Code Symbol

LDAP\_INSUFFICIENT\_ACCESS

##### Explanation

The specified operation does not have appropriate permission.

#### User Action

Check the Administrator DN is used to operate the entry, then re-execute the command.

### 35.5.29 Insufficient space in the buffer.(ENOMEM)

---

#### Insufficient space in the buffer.(ENOMEM)

##### Explanation

Insufficient memory for the character code conversion.

##### User Action

Close all programs no longer needed, then re-execute the command.

**Windows32/64**

If there is insufficient memory for the entire system, add memory or increase virtual memory.

**Solaris32/64 Linux32/64**

If there is insufficient memory for the entire system, add memory or increase the swap area.

For details on the memory required for Interstage Directory Service, refer to 'Memory Requirements' in the Tuning Guide.

### 35.5.30 Insufficient space in the output buffer.(E2BIG)

---

#### Insufficient space in the output buffer.(E2BIG)

##### Explanation

Insufficient memory for the character code conversion.

##### User Action

Close all programs no longer needed, then re-execute the command.

**Windows32/64**

If there is insufficient memory for the entire system, add memory or increase virtual memory.

**Solaris32/64 Linux32/64**

If there is insufficient memory for the entire system, add memory or increase the swap area.

For details on the memory required for Interstage Directory Service, refer to 'Memory Requirements' in the Tuning Guide.

### 35.5.31 Invalid credentials

---

#### Invalid credentials

##### LDAP Error Code Symbol

LDAP\_INVALID\_CREDENTIALS

##### Explanation

Authentication failed due to an incorrect specified DN or password.

##### User Action

Check the DN specified, then re-execute the command. When a correct DN is specified, the password is invalid. Enter the correct password, then re-execute the command.

Note that the Interstage Management Console has a feature to automatically add a public directory to a DN. For instance, when an appropriate cn for a connection, cn=manager, is set but delete if an inappropriate public directory is set for the connection, it is regarded as incorrect for the DN.

In addition to `cn=manager`, be sure to specify the DN, including the upper entry (tree). Some frequent typing mistakes may cause this error message:

- Do not mistake a comma for a period or vice versa.
- Do not type uppercase for lowercase or vice versa; the password authentication is case-sensitive.

#### Windows32/64

- An attempt might have been made to connect with a DN which has a password encrypted by means of an unsupported user password encryption method. Check that the password of the DN has not been encrypted by an unsupported user password encryption method.

For details on user password encryption methods, refer to 'Major Functions of Interstage Directory Service - Automatic Encoding' in the Interstage Directory Service Operator's Guide.

## 35.5.32 Invalid DN syntax

---

### Invalid DN syntax

LDAP Error Code Symbol

LDAP\_INVALID\_DN\_SYNTAX

Explanation

The DN is specified in an invalid form.

User Action

Check the DN specified, then re-execute the command. For details of DNs, refer to 'Entry Management ' in the Interstage Directory Service Operator's Guide.

## 35.5.33 Invalid syntax

---

### Invalid syntax

LDAP Error Code Symbol

LDAP\_INVALID\_SYNTAX

Explanation

A specified attribute value is contrary to the attribute syntax.

User Action

Check the attribute values specified, then re-execute the command. For details of attributes, refer to 'List of Attributes' in the Interstage Directory Service Operator's Guide.

If the attribute values specified are correct, use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

## 35.5.34 ldap\_init failed

---

### ldap\_init failed

Explanation

A connection to the repository could not be established.

User Action

Check that the repository is specified correctly, then re-execute the command.

## 35.5.35 ldap\_parse\_result: Bad parameter to an ldap routine

---

### ldap\_parse\_result: Bad parameter to an ldap routine

#### Explanation

A specified parameter is incorrect.

#### User Action

Use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

## 35.5.36 ldapssl\_init failed

---

### ldapssl\_init failed

#### Explanation

A connection to the repository could not be established with SSL or a required parameter of the SSL environment definition file has not been specified.

#### User Action

Check that the repository is specified correctly, then re-execute the command.

Also check that the required parameter of the SSL environment definition file is specified correctly. For SSL environment definition file details, refer to 'Setting up an Environment for SSL Communication - Setting an SSL Environment Definition File (Client)' in the Interstage Directory Service Operator's Guide.

## 35.5.37 Local error

---

### Local error

#### LDAP Error Code Symbol

LDAP\_LOCAL\_ERROR

#### Explanation

The *ldap* command was aborted because of an error in processing.

#### User Action

Execute the command again. If this error message is displayed again, use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

## 35.5.38 Loop detected

---

### Loop detected

#### LDAP Error Code Symbol

LDAP\_LOOP\_DETECT

#### Explanation

A loop was detected while a referral was being handled.

#### User Action

Notify the system administrator of this error message.

## 35.5.39 No such attribute

---

### No such attribute

## LDAP Error Code Symbol

LDAP\_NO\_SUCH\_ATTRIBUTE

## Explanation

No matching attribute could be found.

## User Action

Check the name of the attribute specified, then re-execute the command. If the specified attribute name is correct, it is possible that the attribute is already deleted. If so, re-executing the command will not be successful. If the attribute remains undeleted and if re-executing the command displays this error message again, use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

For details of object classes or attributes, refer to 'List of Object Classes' or 'List of Attributes' in the Interstage Directory Service Operator's Guide.

## 35.5.40 No such object

---

### No such object

## LDAP Error Code Symbol

LDAP\_NO\_SUCH\_OBJECT

## Explanation

No matching entry could be found.

## User Action

Check the entry specified, then re-execute the command. If there is no upper entry, create an upper entry then re-execute the command.

When the entry specified is correct and there is an upper entry, use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

## 35.5.41 Not completed exchange

---

### Not completed exchange

## Explanation

Character code conversion was terminated halfway.

## User Action

Refer to the detailed information displayed together with this error message.

## 35.5.42 Not enough memory

---

### Not enough memory

## Explanation

Insufficient memory.

## User Action

Close all programs no longer needed, then re-execute the command.

**Windows32/64**

If there is insufficient memory for the entire system, add memory or increase virtual memory.

**Solaris32/64 Linux32/64**

If there is insufficient memory for the entire system, add memory or increase the swap area.

For details on the memory required for Interstage Directory Service, refer to 'Memory Requirements' in the Tuning Guide.

---

### 35.5.43 Not enough memory by SSL %s1 ( %s2 )

---

#### Not enough memory by SSL %s1 ( %s2 )

##### Variable Information

%s1 = SSL error code

%s2 = SSL detail code

##### Explanation

Insufficient memory for the SSL libraries.

##### User Action

Close all programs no longer needed. Alternatively, secure sufficient memory to operate Interstage Directory Service. For the amount of memory required to operate Interstage Directory Service, refer to 'Memory Requirements' in the Tuning Guide.

For details on the SSL error code, refer to 'SSL Error Code' in 'Error Codes to be Reported from Interstage Directory Service'.

---

### 35.5.44 Not enough stream by SSL %s1 ( %s2 )

---

#### Not enough stream by SSL %s1 ( %s2 )

##### Variable Information

%s1 = SSL error code

%s2 = SSL detail code

##### Explanation

Insufficient memory for the SSL libraries.

##### User Action

Close all programs no longer needed. Alternatively, secure sufficient memory to operate Interstage Directory Service. For the amount of memory required to operate Interstage Directory Service, refer to 'Memory Requirements' in the Tuning Guide.

For details on the SSL error code, refer to 'SSL Error Code' in 'Error Codes to be Reported from Interstage Directory Service'.

---

### 35.5.45 Not support code

---

#### Not support code

##### Explanation

The character code or transmission code specified is not supported.

##### User Action

Check the character code or transmission code specified, then re-execute the command.

---

### 35.5.46 Not supported

---

#### Not supported

##### Explanation

Interstage Directory Service does not support the requested function.

## 35.5.47 Not support version

---

### Not support version

#### Explanation

The specified version of LDAP is not supported.

#### User Action

Check the LDAP version specified with the -V argument, then re-execute the command.

## 35.5.48 Object is a leaf

---

### Object is a leaf

#### LDAP Error Code Symbol

LDAP\_IS\_LEAF

#### Explanation

The specified operation cannot be performed on a leaf entry.

#### User Action

This error message may be displayed by attempting to move the specified tree to its current location or a location of its sub-entry. Specify the correct destination and re-execute the command.

## 35.5.49 Operation not allowed on nonleaf

---

### Operation not allowed on nonleaf

#### LDAP Error Code Symbol

LDAP\_NOT\_ALLOWED\_ON\_NONLEAF

#### Explanation

The specified operation can only be performed on a leaf entry.

#### User Action

It is not permitted to delete an entry with subordinate entries or change a DN (distinguished name). Delete leaf (bottom) entries or change the DN (distinguished name). If the entry has no subordinate entries, use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

## 35.5.50 Operation not allowed on RDN

---

### Operation not allowed on RDN

#### LDAP Error Code Symbol

LDAP\_NOT\_ALLOWED\_ON\_RDN

#### Explanation

The specified request is not executable for any RDN.

#### User Action

Check that the request specified is not made to an RDN, then re-execute the command. If the request specified is not made to an RDN but this error message is displayed again, use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

## 35.5.51 Operations error

---

### Operations error

#### Explanation

The requested operation is not executable in the current status. The specified objectclass does not exist.

#### User Action

Check that the specified objectclass is correct.

If the objectclass is incorrect, specify a correct one and then re-execute.

If the objectclass is correct, use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

## 35.5.52 Out of memory

---

### Out of memory

#### LDAP Error Code Symbol

LDAP\_NO\_MEMORY

#### Explanation

Insufficient memory

#### User Action

Close all unnecessary programs to secure sufficient memory, then re-execute the command.

[Windows32/64](#)

If the error still occurs after closing all unnecessary programs and re-executing the command, add memory or increase virtual memory.

[Solaris32/64](#) [Linux32/64](#)

If the error still occurs after closing all unnecessary programs and re-executing the command, add memory or increase the swap area.

For details on the memory required for Interstage Directory Service operation, refer to 'Memory Requirements' in the Tuning Guide.

## 35.5.53 Protocol error

---

### Protocol error

#### LDAP Error Code Symbol

LDAP\_PROTOCOL\_ERROR

#### Explanation

The operation which violated the LDAP protocol was demanded.

#### User Action

An attempt was made to use a function Interstage Directory Service does not support.

Refer to the following manuals to check that Interstage Directory Service allows the use of the requested function.

'Restrictions on Interstage Directory Service' in the Product Notes

'Notes on Interstage Directory Service' in the Product Notes

## 35.5.54 realloc of %s1 bytes failed

---

### realloc of %s1 bytes failed

## Variable Information

%s1 = Memory size acquired

## Explanation

Insufficient memory.

## User Action

Close all programs no longer needed, then re-execute the command.

**Windows32/64**

If there is insufficient memory for the entire system, add memory or increase virtual memory.

**Solaris32/64 Linux32/64**

If there is insufficient memory for the entire system, add memory or increase the swap area.

For details on the memory required for Interstage Directory Service, refer to 'Memory Requirements' in the Tuning Guide.

## 35.5.55 SSL connect error %s1 ( %s2 )

---

### SSL connect error %s1 ( %s2 )

## Variable Information

%s1 = SSL error code

%s2 = SSL detail code

## Explanation

Cannot communicate with the repository.

## User Action

Take the following measures, then re-execute the command:

- Correct the name of the host or port number specified for the connection.
- Check the information about the repository to be connected and command parameters.
- To make an SSL connection, check the repository to be connected and ensure that command parameters for a host name or port number are not incorrectly set.
- To make a connection without SSL, check that no SSL environment definition file is specified with the `-Z` option. The `-Z` option is not required to make a connection without SSL.
- If the network environment has incorrect settings (for example, settings in the hosts file, specifications of the DNS server/DHCP server to be used, or settings of the DNS server/DHCP server to be used), contact the network administrator, then review and re-set the network environment.
- When the SSL error code 0x00400004 and SSL detail code 145(0x91) are indicated, the repository server may be under a heavy load. Execute the command again.

When SSL is used in the connection with the repository server, and there are a large number of clients with frequent access to Interstage Directory Service, re-executing the command may not work. If user action in this case is not successful, consider reducing load to the server by using SSL accelerator.

For details on the SSL error code, refer to 'SSL Error Code' in the Interstage Directory Service Operator's Guide.

**Solaris32/64 Linux32/64**

If a standard database is used for the repository database, check that the `omsservd` process is activated by executing the `ps` command. If the `omsservd` process is not activated, execute the `enablerstart` command to start it. After the `omsservd` process has started, restart the repository, then reform the entry operation again.

If this user action is not successful, use the `iscollectinfo` command to collect diagnostic information, then contact your service engineer.

## 35.5.56 Strong authentication not supported

---

### Strong authentication not supported

#### LDAP Error Code Symbol

LDAP\_STRONG\_AUTH\_NOT\_SUPPORTED

#### Explanation

Interstage Directory Service does not support the specified authentication type.

#### User Action

Simple authentication or client authentication with SSL applied is acceptable. To use client authentication with SSL applied, refer to 'Setting up an Environment for SSL Communication' in the Interstage Directory Service Operator's Guide.

## 35.5.57 Strong authentication required

---

### Strong authentication required

#### LDAP Error Code Symbol

LDAP\_STRONG\_AUTH\_REQUIRED

#### Explanation

The requested operation is subject to authentication. Alternatively, Interstage Directory Service does not support the authentication type.

#### User Action

Authenticated anonymous users cannot change or delete any entry. Specify a DN to bind (using the -D option) and password (using the -W or -w option), then re-execute the command.

Simple authentication or client authentication with SSL applied is acceptable. To use client authentication with SSL applied, refer to 'Setting up an Environment for SSL Communication' in the Interstage Directory Service Operator's Guide.

## 35.5.58 The attribute value of the %s1 character code is not correct. (EBADRQC)

---

### The attribute value of the %s1 character code is not correct.(EBADRQC)

#### Variable Information

%s1 = Character code

#### Explanation

The specified data is not of the character code %s1.

#### User Action

Specify the correct character code.

## 35.5.59 The certificate of the client isn't correct %s1 ( %s2 )

---

### The certificate of the client isn't correct %s1 ( %s2 )

#### Variable Information

%s1 = SSL error code

%s2 = SSL detail code

## Explanation

A received site certificate could not be verified.

## User Action

Register CA Certificates for verifying the site certificates of the connections to the Interstage Certificate Environment or certificate/key control environment on the local host from those of route CAs. Refer to 'When the Certificate Registration Order is Incorrect' in 'Error Codes to be Reported from Interstage Directory Service' for information on how to reregister certificates.

For SSL error code details, refer to 'SSL Error Code' in 'Error Codes to be Reported from Interstage Directory Service'.

## **35.5.60 The certificate of the client or the server is not correct %s1 ( %s2 )**

---

### **The certificate of the client or the server is not correct %s1 ( %s2 )**

#### Variable Information

%s1 = SSL error code

%s2 = SSL detail code

## Explanation

A CA certificate or site certificate could not be verified.

## User Action

There is an error in the order in which the certificates for verifying nicknamed certificates are registered. Register the certificates to the Interstage Certificate Environment or certificate/key control environment from those of route CAs. Refer to 'When the Certificate Registration Order is Incorrect' in 'Error Codes to be Reported from Interstage Directory Service' for information on how to reregister certificates.

For details on the SSL error code, refer to 'SSL Error Code' in 'Error Codes to be Reported from Interstage Directory Service'.

## **35.5.61 The certificate of the server isn't correct %s1 ( %s2 )**

---

### **The certificate of the server isn't correct %s1 ( %s2 )**

#### Variable Information

%s1 = SSL error code

%s2 = SSL detail code

## Explanation

A site certificate for a connection could not be verified.

## User Action

To check that connection destination information is correct, it is necessary to register the CA certificate (used to verify the site certificate of the connection destination) to the local host's Interstage Certificate Environment. Certificate registration begins at the CA certificate of the Route CA. Refer to 'When the Certificate Registration Order is Incorrect' in 'Error Codes to be Reported from Interstage Directory Service' for information on how to reregister certificates.

For details on the SSL error code, refer to 'SSL Error Code' in 'Error Codes to be Reported from Interstage Directory Service'.

## **35.5.62 The error concerning SSL occurred %s1 ( %s2 )**

---

### **The error concerning SSL occurred %s1 ( %s2 )**

#### Variable Information

%s1 = SSL error code

%s2 = SSL detail code

## Explanation

An SSL-related error occurred.

## User Action

Refer to the user action of the SSL error code of %s1. For details on the SSL error code, refer to 'SSL Error Codes' in 'Error Codes to be Reported from Interstage Directory Service'.

If this user action is not successful, use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

## **35.5.63 The file converting the user definition code could not open. (ENOENT)**

---

### **The file converting the user definition code could not open.(ENOENT)**

## Explanation

An internal error occurred.

## User Action

Use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

## **35.5.64 The format of table converting the user definition code which was not supporting was specified.(ENOEXEC)**

---

### **The format of table converting the user definition code which was not supporting was specified. (ENOEXEC)**

## Explanation

An internal error occurred.

## User Action

Use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

## **35.5.65 The SSL environment isn't correct %s1 ( %s2 )**

---

### **The SSL environment isn't correct %s1 ( %s2 )**

## Variable Information

%s1 = SSL error code

%s2 = SSL detail code

## Explanation

There is an error in the operation management directory.

## User Action

Take either measure below depending on your certificate or private-key control environment established for SSL encrypted communication:

- Interstage Certificate Environment:

The Interstage Certificate Environment may have been damaged. Restore the Interstage Certificate Environment by referring to 'Broken Certificate Environments - Interstage Certificate Environments' in 'Error Codes to be Reported from Interstage Directory Service'.

- Certificate/key control environment:

Set the operation management directory (cert\_path) for the SSL environment definition file or operation management directory for the certificate/key control environment which uses cert\_path for SSLENV structure, then re-execute the command.

For details on the operation management directory (cert\_path) for the SSL environment definition file, refer to 'Setting up an Environment for SSL Communication - Setting an SSL Environment Definition File (Client)' in the Interstage Directory Service Operator's Guide.

For details on the SSL error code, refer to 'SSL Error Code' in 'Error Codes to be Reported from Interstage Directory Service'.

## **35.5.66 The table address converting the user definition code was not specified.(ENODATA)**

---

### **The table address converting the user definition code was not specified.(ENODATA)**

#### Explanation

An internal error occurred.

#### User Action

Use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

## **35.5.67 The time limit of the CA bureau certificate is set %s1 ( %s2 )**

---

### **The time limit of the CA bureau certificate is set %s1 ( %s2 )**

#### Variable Information

%s1 = SSL error code

%s2 = SSL detail code

#### Explanation

A certificate issued by a CA (certification authority) has expired.

#### User Action

Refer to 'When the CA Certificate has Expired', obtain a new CA certificate from the CA, and register it with the Interstage Certificate Environment or certificate/key management environment.

For details on the SSL error code, refer to 'SSL Error Code' in 'Error Codes to be Reported from Interstage Directory Service'.

## **35.5.68 The time limit of the certificate of the client is set %s1 ( %s2 )**

---

### **The time limit of the certificate of the client is set %s1 ( %s2 )**

#### Variable Information

%s1 = SSL error code

%s2 = SSL detail code

#### Explanation

An expired site certificate was received from a connection so access is rejected.

#### User Action

Obtain a new site certificate from the CA, and register it with the Interstage Certificate Environment or certificate/key management environment. Refer to 'When the Site Certificate has Expired' for information on how to obtain and register new site certificates.

For details on the SSL error code, refer to 'SSL Error Code' in 'Error Codes to be Reported from Interstage Directory Service'.

## 35.5.69 The time limit of the certificate of the client or the server is set %s1 ( %s2 )

---

### The time limit of the certificate of the client or the server is set %s1 ( %s2 )

#### Variable Information

%s1 = SSL error code

%s2 = SSL detail code

#### Explanation

A site certificate has expired.

#### User Action

Refer to 'When the Site Certificate has Expired', obtain a new site certificate from the CA, and register it with the Interstage Certificate Environment or certificate/key management environment.

For details on the SSL error code, refer to 'SSL Error Code' in 'Error Codes to be Reported from Interstage Directory Service'.

## 35.5.70 The time limit of the certificate of the server is set %s1 ( %s2 )

---

### The time limit of the certificate of the server is set %s1 ( %s2 )

#### Variable Information

%s1 = SSL error code

%s2 = SSL detail code

#### Explanation

A site certificate has expired on the connection.

#### User Action

On the connection, refer to 'When the Site Certificate has Expired', obtain a new site certificate from the CA, and register it with the Interstage Certificate Environment or certificate/key management environment.

For details on the SSL error code, refer to 'SSL Error Code' in 'Error Codes to be Reported from Interstage Directory Service'.

## 35.5.71 Timed out

---

### Timed out

#### LDAP Error Code Symbol

LDAP\_TIMEOUT

#### Explanation

A timeout occurred.

#### User Action

Increase the limit search time, for a search option on the client side.

If this user action is not successful, change the connection DN to the Administrator DN for the targeted repository, or increase the Search Timeout from the Settings window for the targeted repository by using the Interstage Management Console.

## 35.5.72 timeout by SSL %s1 ( %s2 )

---

### timeout by SSL %s1 ( %s2 )

## Variable Information

%s1 = SSL error code

%s2 = SSL detail code

## Explanation

A timeout occurred in an SSL connection.

## User Action

If the connection is not operating normally, take action accordingly.

When the connection is operating normally:

- The repository server is heavily loaded.

Execute the command again.

When SSL is used in the connection with the repository server, and if there is a large number of clients and frequent access to Interstage Directory Service, the above user action may not solve the error. If this user action is not successful, consider reducing the load to the server by using SSL accelerator.

- Otherwise:

It is possible that too short a time is specified in a timer. Increase the value of the timer `ssl_timer` in the SSL environment definition file, then re-execute the command.

For details on the value of the timer `ssl_timer` in the SSL environment definition file, refer to the following:

'Setting up an Environment for SSL Communication - Setting an SSL Environment Definition File (Client)' in the Interstage Directory Service Operator's Guide.

If this user action is not successful, use the `iscollectinfo` command to collect diagnostic information, then contact your service engineer.

For details on the SSL error code, refer to 'SSL Error Code' in 'Error Codes to be Reported from Interstage Directory Service'.

## 35.5.73 Too many tokens (max %s1)

---

### Too many tokens (max %s1)

## Variable Information

%s1 = Number of tokens per line

## Explanation

The SSL environment definition file has an invalid setting.

## User Action

Check the settings in the SSL environment definition file. For details on the SSL environment definition file, refer to 'Setting up an Environment for SSL Communication - Setting an SSL Environment Definition File (Client)' in the Interstage Directory Service Operator's Guide.

## 35.5.74 Unavailable critical extension

---

### Unavailable critical extension

## Explanation

Interstage Directory Service does not allow use of the specified function.

## User Action

Possible causes of the error are:

- This error occurs when Interstage Directory Service does not allow use of the specified function.

Refer to the following manuals to check which functions are allowed by Interstage Directory Service:

'Restrictions on Interstage Directory Service' in the Product Notes

'Notes on Interstage Directory Service' in the Product Notes

**Windows32/64**

- An environment definition of the repository has been manually modified after it was created.

Restore the environment definition, restart the repository, then re-execute the command.

## 35.5.75 Unknown authentication method

---

### Unknown authentication method

LDAP Error Code Symbol

LDAP\_AUTH\_UNKNOWN

Explanation

An undefined authentication method is specified.

User Action

It is possible that the specified authentication method is unsupported.

Refer to the following manuals to check that Interstage Directory Service allows the use of the requested function:

'Restrictions on Interstage Directory Service' in the Product Notes

'Notes on Interstage Directory Service' in the Product Notes

## 35.5.76 Unknown error

---

### Unknown error

Explanation

A non LDAP error code is detected.

User Action

This error may occur when the command is issued to Interstage Directory Service to handle a transaction exceeding its capacity or the command is issued with a function not supported by Interstage Directory Service.

Refer to the following manuals to check which functions are allowed by Interstage Directory Service:

'Restrictions on Interstage Directory Service' in the Product Notes

'Notes on Interstage Directory Service' in the Product Notes

If re-executing the command displays this error message again, use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

## 35.5.77 version error

---

### version error

Explanation

There is an incorrect specification in the version line for LDIF.

## User Action

Check the version line for LDIF, then re-execute the command. For LDIF, refer to 'Using the Command to Manage Entries - Standard and Modification formats of LDIF' in the Interstage Directory Service Operator's Guide.

## 35.6 Messages Output by the *irepencupin* Command

---

This section describes the messages output by the *irepencupin* command.

### 35.6.1 *irepencupin* : illegal option -- %s

---

#### **irepencupin : illegal option -- %s**

##### Variable Information

%s = Option

##### Explanation

An option is not specified correctly.

##### User Action

Specify the SSL environment definition file using the -f option, then re-execute the command.

### 35.6.2 Error : No authority to execute the program

---

#### **Error : No authority to execute the program**

##### Explanation

The command was terminated due to a lack of permission.

##### User Action

Execute the command with administrator permission.

### 35.6.3 Error : SSL environmental file does not exist (%s)

---

#### **Error : SSL environmental file does not exist (%s)**

##### Variable Information

%s = Name of an SSL environment definition file

##### Explanation

The specified SSL environment definition file could not be found.

##### User Action

Check that the specified SSL environment definition file exists. Specify the correct name of an existing file using the full path name, then re-execute the command.

### 35.6.4 Error : The specified file is a directory (%s)

---

#### **Error : The specified file is a directory (%s)**

##### Variable Information

%s = Name of an SSL environment definition file

##### Explanation

The name of the specified SSL environment definition file is a directory.

#### User Action

Check the path to the SSL environment definition file, then re-execute the command.

### 35.6.5 Error : Unexpected (%s)

---

#### Error : Unexpected (%s)

#### Variable Information

%s = Detailed information

#### Explanation

An error was found in a function.

#### User Action

Check the following points:

- The command is executed with permission to write to the file or directory.
- There is sufficient unused space on the disk.

If this user action is not successful, use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

### 35.6.6 Error : User PIN is not defined

---

#### Error : User PIN is not defined.

#### Explanation

No user PIN is defined. This error may also occur if a blank is entered before or after the '=' sign in 'tkn\_pwd=password'.

#### User Action

Define a user PIN correctly in the specified SSL environment definition file, then re-execute the command.

Example:

```
tkn_pwd=slot123
```

### 35.6.7 irepencupin is complete

---

#### irepencupin is complete.

#### Explanation

User PIN encryption was successfully completed.

# Chapter 36 Error Codes to be Reported from Interstage Directory Service

This chapter describes error codes via Interstage Directory Service from the Interstage Directory Service Server to the Interstage Directory Service Client.

LDAP error codes represent an error in LDAP.

An SSL error code represents an error detected in the SSL library, if SSL is being used.

## 36.1 LDAP Error Codes

This section describes the meanings of the LDAP error codes and the required action.

Error code symbol	Message	Decimal	Hexadecimal
LDAP_SUCCESS 0 (0x00)	Success	0	0x00
LDAP_OPERATIONS_ERROR 1 (0x01)	Operations error	1	0x01
LDAP_PROTOCOL_ERROR 2 (0x02)	Protocol error	2	0x02
LDAP_TIMELIMIT_EXCEEDED 3 (0x03)	Timelimit exceeded	3	0x03
LDAP_SIZELIMIT_EXCEEDED 4 (0x04)	Sizelimit exceeded	4	0x04
LDAP_COMPARE_FALSE 5 (0x05)	Compare false	5	0x05
LDAP_COMPARE_TRUE 6 (0x06)	Compare true	6	0x06
LDAP_STRONG_AUTH_NOT_SUPPORTED 7 (0x07)	Strong authentication not supported	7	0x07
LDAP_STRONG_AUTH_REQUIRED 8 (0x08)	Strong authentication required	8	0x08
LDAP_PARTIAL_RESULTS 9 (0x09)	Partial results and referral received	9	0x09
LDAP_REFERRAL 10 (0x0a)	Referral	10	0x0a
LDAP_ADMINLIMIT_EXCEEDED 11 (0x0b)	Admin limit exceeded	11	0x0b
LDAP_UNAVAILABLE_CRITICAL_EXTENSION 12 (0x0c)	Unavailable critical extension	12	0x0c
LDAP_CONFIDENTIALITY_REQUIRED 13 (0x0d)	Confidentiality required	13	0x0d
LDAP_SASL_BIND_IN_PROGRESS 14 (0x0e)	SASL bind in progress	14	0x0e
LDAP_NO_SUCH_ATTRIBUTE 16 (0x10)	No such attribute	16	0x10
LDAP_UNDEFINED_TYPE 17 (0x11)	Undefined attribute type	17	0x11
LDAP_INAPPROPRIATE_MATCHING 18 (0x12)	Inappropriate matching	18	0x12
LDAP_CONSTRAINT_VIOLATION 19 (0x13)	Constraint violation	19	0x13
LDAP_TYPE_OR_VALUE_EXISTS 20 (0x14)	Type or value exists	20	0x14
LDAP_INVALID_SYNTAX 21 (0x15)	Invalid syntax	21	0x15
LDAP_NO_SUCH_OBJECT 32 (0x20)	No such object	32	0x20
LDAP_ALIAS_PROBLEM 33 (0x21)	Alias problem	33	0x21
LDAP_INVALID_DN_SYNTAX 34 (0x22)	Invalid DN syntax	34	0x22
LDAP_IS_LEAF 35 (0x23)	Object is a leaf	35	0x23
LDAP_ALIAS_DEREF_PROBLEM 36 (0x24)	Alias dereferencing problem	36	0x24

Error code symbol	Message	Decimal	Hexadecimal
LDAP_INAPPROPRIATE_AUTH 48(0x30)	Inappropriate authentication	48	0x30
LDAP_INVALID_CREDENTIALS 49 (0x31)	Invalid credentials	49	0x31
LDAP_INSUFFICIENT_ACCESS 50 (0x32)	Insufficient access	50	0x32
LDAP_BUSY 51 (0x33)	DSA is busy	51	0x33
LDAP_UNAVAILABLE 52 (0x34)	DSA is unavailable	52	0x34
LDAP_UNWILLING_TO_PERFORM 53 (0x35)	DSA is unwilling to perform	53	0x35
LDAP_LOOP_DETECT 54 (0x36)	Loop detected	54	0x36
LDAP_NAMING_VIOLATION 64 (0x40)	Naming violation	64	0x40
LDAP_OBJECT_CLASS_VIOLATION 65 (0x41)	Object class violation	65	0x41
LDAP_NOT_ALLOWED_ON_NONLEAF 66 (0x42)	Operation not allowed on nonleaf	66	0x42
LDAP_NOT_ALLOWED_ON_RDN 67 (0x43)	Operation not allowed on RDN	67	0x43
LDAP_ALREADY_EXISTS 68 (0x44)	Already exists	68	0x44
LDAP_NO_OBJECT_CLASS_MODS 69 (0x45)	Cannot modify object class	69	0x45
LDAP_RESULTS_TOO_LARGE 70 (0x46)	Results too large	70	0x46
LDAP_AFFECTS_MULTIPLE_DSAS 71 (0x47)	Affects multiple DSAs	71	0x47
LDAP_OTHER 80 (0x50)	Unknown error	80	0x50
LDAP_SERVER_DOWN 81 (0x51)	Can't contact LDAP server	81	0x51
LDAP_LOCAL_ERROR 82 (0x52)	Local error	82	0x52
LDAP_ENCODING_ERROR 83 (0x53)	Encoding error	83	0x53
LDAP_DECODING_ERROR 84 (0x54)	Decoding error	84	0x54
LDAP_TIMEOUT 85 (0x55)	Timed out	85	0x55
LDAP_AUTH_UNKNOWN 86 (0x56)	Unknown authentication method	86	0x56
LDAP_FILTER_ERROR 87 (0x57)	Bad search filter	87	0x57
LDAP_USER_CANCELLED 88 (0x58)	User cancelled operation	88	0x58
LDAP_PARAM_ERROR 89 (0x59)	Bad parameter to an ldap routine	89	0x59
LDAP_NO_MEMORY 90 (0x5a)	Out of memory	90	0x5a
LDAP_CONNECT_ERROR 91 (0x5b)	Can't connect to the LDAP server	91	0x5b
LDAP_NOT_SUPPORTED 92 (0x5c)	Not supported	92	0x5c
LDAP_CONTROL_NOT_FOUND 93 (0x5d)	Control not found	93	0x5d
LDAP_NO_RESULTS_RETURNED 94 (0x5e)	No results returned	94	0x5e
LDAP_MORE_RESULTS_TO_RETURN 95 (0x5f)	More result to return	95	0x5f
LDAP_CLIENT_LOOP 96 (0x60)	Client loop	96	0x60
LDAP_REFERRAL_LIMIT_EXCEEDED 97 (0x61)	Referral limit exceeded	97	0x61

### 36.1.1 LDAP\_SUCCESS 0 (0x00)

---

---

## Success

### Explanation

Processing completed normally.

---

## 36.1.2 LDAP\_OPERATIONS\_ERROR 1 (0x01)

---

### Operations error

#### Explanation

An object class may have been specified incorrectly.

#### User action

Specify a correct object class. For details of the object classes, refer to "Interstage Directory Service Object Classes" or "Interstage Directory Service Attributes" appendixes in the Directory Service Operator's Guide.

---

## 36.1.3 LDAP\_PROTOCOL\_ERROR 2 (0x02)

---

### Protocol error

#### Explanation

An operation request violated the LDAP protocol.

#### User Action

If this error occurs after creating an API and executing it, correct the API by referring to the Interstage Directory Service samples and then re-execute.

This error may also occur if an extended function (or a function that cannot be used in Interstage Directory Service) is used.

Refer to the following manuals to check whether any functions that cannot be used in Interstage Directory Service were used:

"Restrictions on Interstage Directory Service" in Product Notes

"Notes on Interstage Directory Service" in Product Notes

---

## 36.1.4 LDAP\_TIMELIMIT\_EXCEEDED 3 (0x03)

---

### Timelimit exceeded

#### Explanation

The search timeout was exceeded while searching for entries.

#### User Action

Increase the specified search time limit as a client search option.

If there is no improvement, use the Interstage Management Console to increase the value of 'Search Timeout' from the Settings window of the target repository.

---

## 36.1.5 LDAP\_SIZELIMIT\_EXCEEDED 4 (0x04)

---

### Sizelimit exceeded

#### Explanation

The maximum number of searchable entries was exceeded.

#### User Action

Increase the size limit as a client search option.

If there is no improvement, use the Interstage Management Console to increase the value of 'Maximum number of searchable entries' from the Settings window of the target repository.

### 36.1.6 LDAP\_COMPARE\_FALSE 5 (0x05)

---

#### Compare false

##### Explanation

In a comparison operation, there was no match with the specified attribute value.

### 36.1.7 LDAP\_COMPARE\_TRUE 6 (0x06)

---

#### Compare true

##### Explanation

In a comparison operation, there was a match with the specified attribute value.

### 36.1.8 LDAP\_STRONG\_AUTH\_NOT\_SUPPORTED 7 (0x07)

---

#### Strong authentication not supported

##### Explanation

Interstage Directory Service does not support the specified authentication method.

##### User Action

In Interstage Directory Service, simple authentication or client authentication using SSL can be used. To use client authentication using SSL, refer to "Setting up an Environment for SSL Communication" - "Setup of an SSL Communication Environment (Between Client and Server)" in "Environment Setup (Using the Standard Database)" in the Directory Service Operator's Guide.

### 36.1.9 LDAP\_STRONG\_AUTH\_REQUIRED 8 (0x08)

---

#### Strong authentication required

##### Explanation

Authentication is required for the requested operation, or an authentication method not supported by Interstage Directory Service was used.

##### - Examples of error occurrence

An entry operation is performed by anonymous authentication.

##### LDIF

```
dn:o=SR,o=fujitsu,dc=com
changetype: add
objectclass: top
objectclass: organization
o: SR
```

##### User Action

No entry can be modified or deleted when anonymous authentication is used. Re-execute after specifying the DN to be bound and the password.

Simple authentication or client authentication using SSL can be used. To use client authentication using SSL, refer to "Setting up an Environment for SSL Communication" - "Setup of an SSL Communication Environment (Between Client and Server)" in "Environment Setup (Using the Standard Database)" in the Directory Service Operator's Guide.

## 36.1.10 LDAP\_PARTIAL\_RESULTS 9 (0x09)

---

### Partial results and referral received

#### Explanation

Part of the processing results has been received.

#### User Action

This message may be output when a search within a repository with which entry referrals are registered is performed. Since the referral function cannot be used in Interstage Directory Service, the directory server of another product may be connected. Check whether the connection destination is correct and then specify the correct server to Interstage Directory Service.

## 36.1.11 LDAP\_REFERRAL 10 (0x0a)

---

### Referral

#### Explanation

A repository where referrals are registered was referenced.

#### User Action

Interstage Directory Service never returns this code.

Since the referral function cannot be used in Interstage Directory Service, the directory server of another product may be connected. Check whether the connection destination is correct and then specify the correct server to Interstage Directory Service.

## 36.1.12 LDAP\_ADMINLIMIT\_EXCEEDED 11 (0x0b)

---

### Admin limit exceeded

#### Explanation

An Interstage Directory Service server limit has been exceeded.

#### User Action

Check whether a target repository message exists by referring to the system log of the repository server. If a message exists, take the action indicated by that message. If there is no message, use the Interstage Management Console to confirm that all settings in the Settings window of the target repository are correct, and correct any incorrect settings.

If this does not resolve the error, use the *iscollectinfo* command to collect diagnostic information and then contact your service engineer.

## 36.1.13 LDAP\_UNAVAILABLE\_CRITICAL\_EXTENSION 12 (0x0c)

---

### Unavailable critical extension

#### Explanation

The specified function cannot be used in Interstage Directory Service.

#### User Action

The following causes can be assumed:

- A function that cannot be used in Interstage Directory Service was used.

Refer to the following manuals to check whether any functions that cannot be used in Interstage Directory Service were used:

"Restrictions on Interstage Directory Service" in Product Notes

"Notes on Interstage Directory Service" in Product Notes

Windows32/64

- After creating a repository, the environment definition of the repository was modified manually.

Restore the environment definition to its state before modification and then restart the repository for re-execution.

### 36.1.14 LDAP\_CONFIDENTIALITY\_REQUIRED 13 (0x0d)

---

#### Confidentiality required

##### Explanation

There is an error in a specified attribute.

##### User Action

Check for errors in the specified attributes.

For attribute details, refer to "Interstage Directory Service Attributes" appendix in the Directory Service Operator's Guide.

It is also possible that a function that cannot be used in Interstage Directory Service was used.

Refer to the following manuals to check whether any functions that cannot be used in Interstage Directory Service were used:

"Restrictions on Interstage Directory Service" in Product Notes

"Notes on Interstage Directory Service" in Product Notes

### 36.1.15 LDAP\_SASL\_BIND\_IN\_PROGRESS 14 (0x0e)

---

#### SASL bind in progress

##### Explanation

There is an error in a specified attribute.

##### User Action

Check for errors in the specified attributes.

For attribute details, refer to "Interstage Directory Service Attributes" appendix in the Directory Service Operator's Guide.

It is also possible that a function that cannot be used in Interstage Directory Service was used.

Refer to the following manuals to check whether any functions that cannot be used in Interstage Directory Service were used:

"Restrictions on Interstage Directory Service" in Product Notes

"Notes on Interstage Directory Service" in Product Notes

### 36.1.16 LDAP\_NO\_SUCH\_ATTRIBUTE 16 (0x10)

---

#### No such attribute

##### Explanation

There is no applicable attribute.

##### - Examples of error occurrence

An object that is not defined in the object class was specified.

##### User Action

Check whether the specified attribute name is correct. If there are any errors, correct the attribute name and then re-execute. If no error is found, the attribute name may have been deleted, in which case re-execution is not required.

If this message is still output even if the attribute exists, use the *iscollectinfo* command to collect diagnostic information and then contact your service engineer.

For details of object classes or attributes, refer to - "Interstage Directory Service Object Classes" or "Interstage Directory Service Attributes" appendixes in the Directory Service Operator's Guide.

## 36.1.17 LDAP\_UNDEFINED\_TYPE 17 (0x11)

---

### Undefined attribute type

#### Explanation

An attribute name not defined in the schema was specified.

#### - Examples of error occurrence

If an attribute (aaa) that is not defined in the schema is added by LDIF.

LDIF

```
dn: cn=User001,o=fujitsu,dc=com
changetype: add
objectclass: top
objectclass: person
objectclass: organizationalPerson
cn: User001
sn: Fujitsu
aaa: User001
```

#### User Action

Check the attribute name for errors. If an error is found, correct it and then re-execute.

An attribute specified for the search filter may have no matching rule. Check the search filter specification, and then re-execute.

For details of object classes and attributes, refer to "Interstage Directory Service Object Classes" and "Interstage Directory Service Attributes" appendixes in the Directory Service Operator's Guide respectively.

## 36.1.18 LDAP\_INAPPROPRIATE\_MATCHING 18 (0x12)

---

### Inappropriate matching

#### Explanation

An inappropriate combination was used.

#### User Action

Check the specified attributes.

## 36.1.19 LDAP\_CONSTRAINT\_VIOLATION 19 (0x13)

---

### Constraint violation

#### Explanation

A restriction was violated.

#### - Examples of error occurrence

An attribute (ssoPortNumber) whose single flag is true is specified multiple times.

LDIF

```
dn: dc=my-domain,o=fujitsu,dc=com
objectClass: top
objectClass: ssoSite
objectClass: domain
dc: my-domain
ssoPortNumber: 12345678
ssoPortNumber: 87654321
```

## User Action

Check whether the operation on the specified attribute is correct. For details of the attributes, refer to "Interstage Directory Service Attributes" appendix in the Directory Service Operator's Guide.

If the operation on the specified attribute is correct, use the *iscollectinfo* command to collect diagnostic information and then contact your service engineer.

## 36.1.20 LDAP\_TYPE\_OR\_VALUE\_EXISTS 20 (0x14)

---

### Type or value exists

#### Explanation

The specified attribute already exists.

#### - Examples of error occurrence

If an attribute (sn:Fujitsu) with the same attribute value is added multiple times.

LDIF

```
dn: cn=User001,o=fujitsu,dc=com
changetype: add
objectclass: top
objectclass: person
cn: User001
sn: Fujitsu
sn: Fujitsu
```

## User Action

Check whether the attribute name is specified correctly when adding an attribute. If the specified attribute name is correct, the name cannot be added because an attribute of the same name already exists. Check whether the attribute value of the attribute name is correct. If the value is different from the attribute value to be added, modify the attribute value.

## 36.1.21 LDAP\_INVALID\_SYNTAX 21 (0x15)

---

### Invalid syntax

#### Explanation

The content of the specified attribute value contradicts the attribute syntax.

#### - Examples 1 of error occurrence

An invalid attribute (x121Address:aaa) is registered with the attribute syntax.

LDIF

```
dn: o=SR,o=fujitsu,dc=com
changetype: add
objectclass: top
objectclass: organization
o: SR
x121Address: aaa
```

#### - Example 2 of error occurrence

Specifying a binary file for the text attribute

## User Action

Fix the problem by referring to "Interstage Directory Service Attributes" appendix in the Directory Service Operator's Guide and then re-execute.

Check that the DN or attribute character code and the character code specified in the command or API option are the same. If they are different, make them the same and re-execute the command.

## 36.1.22 LDAP\_NO\_SUCH\_OBJECT 32 (0x20)

---

### No such object

#### Explanation

There is no applicable entry.

#### - Examples of error occurrence

An entry (cn=User001,o=fujitsu,dc=com) that does not exist in the repository is modified.

#### LDIF

```
dn: cn=User001,o=fujitsu,dc=com
changetype: modify
add: givenName
givenName: User001
```

#### User Action

Check for errors in the specified object name (entry), and check whether an upper tree exists. To add an entry when there is no upper tree, first create an upper tree and then re-execute.

Check that the DN or attribute character code and the character code specified in the command or API option are the same. If they are different, make them the same and re-execute the command.

Check whether the entry has been deleted by another user or is referencing the access log.

If there is still no improvement, the data in the database may have been deleted by mistake, or initialized. Restart the repository.

## 36.1.23 LDAP\_ALIAS\_PROBLEM 33 (0x21)

---

### Alias problem

#### Explanation

There is an error in the alias.

#### User Action

Check the specified alias. If it contains an error, correct the alias and then re-execute.

For details of object classes and attributes, refer to "Interstage Directory Service Object Classes" and "Interstage Directory Service Attributes" appendixes in the Directory Service Operator's Guide.

## 36.1.24 LDAP\_INVALID\_DN\_SYNTAX 34 (0x22)

---

### Invalid DN syntax

#### Explanation

There is an error in the DN (identification name) format.

#### - Example 1 of error occurrence

If an attempt is made to modify the identification name by specifying an undefined attribute name (a).

Entry state within the repository (LDIF)

```
dn: cn=User001,o=fujitsu,dc=com
objectclass: top
objectclass: person
objectclass: organizationalPerson
```

```
objectclass: inetOrgPerson
cn: User001
sn: Fujitsu
```

LDIF

```
dn: cn=User001,o=fujitsu,dc=com
changetype: modrdn
newrdn: a=User001
deleteoldrdn: 1
```

#### - Example 2 of error occurrence

If an attempt is made to modify the identification name by incorrectly specifying newrdn.

Entry state within the repository (LDIF)

```
dn:cn=User001,o=fujitsu,dc=com
objectclass:top
objectclass:person
objectclass:organizationalPerson
objectclass:inetOrgPerson
cn:User001
sn:Fujitsu
```

LDIF

```
dn:cn=User001,o=fujitsu,dc=com
changetype:modrdn
newrdn:User001
deleteoldrdn:1
```

newrdn must be correctly specified as newrdn:cn=User001

#### User Action

Check for errors in the specified DN. If an error is found, correct it and then re-execute. For details of the DN, refer to "Basic Knowledge of Directory Services and LDAP" - "LDAP" or "Major Functions of Interstage Directory Service" - "Entry Administration" in "Overview" in the Directory Service Operator's Guide.

If the DN is incorrect, check that the DN character code and the character code specified in the command or API option are the same. If they are different, make them the same and re-execute the command.

## 36.1.25 LDAP\_IS\_LEAF 35 (0x23)

---

### Object is a leaf

#### Explanation

The requested processing cannot be performed on a leaf entry.

#### User Action

This message may be displayed if an attempt is made to move the specified tree to the same location or to a location under a specified tree. Re-execute after specifying the correct destination.

## 36.1.26 LDAP\_ALIAS\_DEREF\_PROBLEM 36 (0x24)

---

### Alias dereferencing problem

#### Explanation

No alias can be referenced.

## User Action

Check for errors in the specified alias. If an error is found, correct it and then re-execute. For details of the attributes, refer to "Interstage Directory Service Attributes" appendix in the Directory Service Operator's Guide.

---

### 36.1.27 LDAP\_INAPPROPRIATE\_AUTH 48(0x30)

---

#### Inappropriate authentication

##### Explanation

Authentication was rejected. This message is output if the specified DN has no userPassword attribute.

##### User Action

It is not possible to access the specified DN. Use the administrator DN for connection and then add the userPassword attribute to the specified DN.

---

### 36.1.28 LDAP\_INVALID\_CREDENTIALS 49 (0x31)

---

#### Invalid credentials

##### Explanation

Authentication failed because there is an error in the specified DN or password or port number.

##### User Action

Check whether the specified DN is correct. If the DN is correct, there is an error in the password. Specify the correct password and then re-execute.

Note that there is a function in the addition of a replication host on the Interstage Management Console to automatically add a public directory to DN. For example, if cn for connection is correct with cn=manager, but the connected public directory is different, DN is determined to be incorrect.

The following examples show some other possible errors:

- The comma or the period of DN is specified incorrectly.
- Upper-case and lower-case alphabetical characters are distinguished, so if they are not specified correctly in the password, the password will be determined incorrect.

If the DN and password are correct, check whether the specified port number is being used by a non-Interstage Directory Service directory server. If the port number is omitted in the *ldapdelete*, *ldapmodify*, or *ldapsearch* commands, or [0] is specified, the connection is made using [389].

---

### 36.1.29 LDAP\_INSUFFICIENT\_ACCESS 50 (0x32)

---

#### Insufficient access

##### Explanation

There is no permission granted for the specified request.

##### User Action

Check whether the specification of the connected DN (such as a tree) is correct. If correct, the connected DN has no permission for the operation. Perform only permitted operations. For example, if connected as a general user user01, modification operations of user01 can be performed, but if a modification operation of a User02 entry is performed, this message is displayed.

---

### 36.1.30 LDAP\_BUSY 51 (0x33)

---

#### DSA is busy

## Explanation

There are too many requests to the repository to be accepted. Alternatively, an unrecoverable error may have occurred in Interstage data store.

## User Action

The following causes can be assumed:

- If the repository server load is heavy

Re-execute after waiting for a while.

- Two or more clients attempted to update the same attribute or entry at the same time. Wait a moment and then re-execute the command.
- If an attempt was made to add or modify an inappropriate entry that contains an extremely large number of attributes (for example, more than 1000 attributes)

Check whether the number of attributes of the entry to be added or modified is extremely large. If this is the case, reduce the number of attributes and then restart the relevant repository from the Interstage Management Console for re-execution.

The number of attributes that can be added or modified for each entry depends on the performance of the server machine and the data size of the attribute values set to each attribute of an entry. Repeat re-execution, reducing the number of attributes per entry, until this phenomenon does not occur.

- If an RDB is used as the repository database, check whether a RDB error occurred in the system log (event log) of the machine used to install the Interstage Directory Service for connection.

If there is no improvement, collect diagnostic information by executing the *iscollectinfo* command and then contact your service engineer.

## 36.1.31 LDAP\_UNAVAILABLE 52 (0x34)

---

### DSA is unavailable

## Explanation

The repository service is currently not available.

## User Action

Use the Interstage Management Console to check whether the repository is active.

- If the repository is stopped, activate it.
- If the repository is active, stop it and then restart it.
- If the repository is in an abnormal state, stop it and then activate it.

**Solaris32/64 Linux32/64**

If the standard database is used as the Repository server database, use the *ps* command to check whether the *omsservd* process is active. If the *omsservd* process is inactive, activate it by using the *enablerstart* command.

After executing the *enablerstart* command, restart the repository to perform the entry operation again.

For details on how to use the *enablerstart* command, refer to "Interstage Directory Service Operation Commands" in the Reference Manual (Command Edition) provided with products that offer the Interstage Directory Service Server function.

If an RDB is used as the repository database, check the system log (event log) of the machine used to install the Interstage Directory Service for connection to see if an RDB error occurred.

If functions that are incompatible with Interstage Directory Service are called, this error also occurs.

If there is no improvement, collect diagnostic information by executing the *iscollectinfo* command and then contact your service engineer.

## 36.1.32 LDAP\_UNWILLING\_TO\_PERFORM 53 (0x35)

---

### DSA is unwilling to perform

#### Explanation

The repository rejected a request.

#### User Action

Possible causes are shown below. Check that the specified DN is correct.

- Either a public directory that does not contain a DN or the top directory for the public directory was specified.
- A public directory that does not contain entries was accessed.
- The public directory (top entry) was deleted, or the identifier was changed. The top entry cannot be deleted, and the identifier cannot be changed.
- An attempt was made to register an entry with the same DN as the administrator DN, or to change an entry to the same DN as the administrator DN. Neither of these actions is possible.

The above actions are not permitted.

- In cases other than the above, the error occurs when adding a replication host using the Interstage Management Console
  - If the repository name of a slave is different, specify the same repository name for both the master and slave repositories.
  - If a host name that is different from the master host name is set for a slave, the connection destination may be incorrect or the setting for the slave may be incorrect. Implement the correct setting for the slave and then re-execute. If the setting is correct, check for errors in the network settings (IP address acquisition, host file description, DNS server/DHCP server specifications, DNS server/DHCP server settings, etc.) by contacting and checking with the network administrator. Examine the network environment, and re-execute after setting the network again.
  - If performed on a non-slave repository (started in standalone operation), re-execute after switching the repository in standalone operation to a repository in slave operation.
  - The master DN for the connection may not fit in with the slave administrator DN. Specify the master DN for the connection so that it fits in with the slave administrator DN and re-execute.
  - The master Password for the connection may not fit in with the slave administrator DN password. Specify the master Password for the connection so that it fits in with the slave administrator DN password and re-execute.
- If a login operation was performed without specifying the DN password, re-execute by specifying the correct password.
- This might occur if the specified value exceeds the maximum length that can be registered for the DN or attribute value.
- Refer to 'Notes about use' - 'Interstage Directory Service restrictions' - 'Capacity restrictions', and check the length that can be registered for the DN and attribute value.
- If a modification request to a slave has been performed, perform the modification request to the master repository.
- If no search base was specified for a search, re-execute by specifying the base parameter.
- Check whether any functions that cannot be used in Interstage Directory Service were used by referring to the following manuals:
  - "Restrictions on Interstage Directory Service" in Product Notes
  - "Notes on Interstage Directory Service" in Product Notes
- Check that the DN character code and the character code specified in the command or API option are the same. If they are different, make them the same and re-execute the command.

If an RDB is used as the repository database, check whether a RDB error occurred in the system log (event log) of the machine used to install the Interstage Directory Service for connection.

## 36.1.33 LDAP\_LOOP\_DETECT 54 (0x36)

---

### Loop detected

## Explanation

A loop was detected during referral processing.

## User Action

Interstage Directory Service never returns this code. The directory server of another product may be connected. Check whether the connection destination is correct and then specify the correct server to Interstage Directory Service.

## 36.1.34 LDAP\_NAMING\_VIOLATION 64 (0x40)

---

### Naming violation

#### Explanation

If the specified attribute is RDN (relative identification name), it cannot be deleted or modified.

This message is also output if the RDN value specified in the DN is different from the attribute value specified when adding an entry.

Alternatively, a request that could damage the directory information tree may have been received.

#### - Example 1 of error occurrence

If an attempt is made to delete an attribute (cn) related to RDN

LDIF

```
dn: cn=User002,o=fujitsu,dc=com
changetype: modify
delete: cn
```

#### - Example 2 of error occurrence

If the RDN specified in DN and that specified in the attribute value are different (cn)

LDIF

```
dn: cn=aaa,o=fujitsu,c=jp
objectclass: top
objectclass: person
objectclass: organizationalPerson
cn: bbb
```

#### User Action

If special characters are used in the DN, verify that special characters specified in the RDN were escaped correctly (special characters need only be considered for the DN). For detail of the special character, refer to "Main Interstage Directory Service functions" - "Entry management" in the Directory Service Operator's Guide.

For details of the attributes, refer to "Interstage Directory Service Attributes" appendix in the Directory Service Operator's Guide.

Check that the DN character code and the character code specified in the command or API option are the same. If they are different, make them the same and re-execute the command.

## 36.1.35 LDAP\_OBJECT\_CLASS\_VIOLATION 65 (0x41)

---

### Object class violation

#### Explanation

There is an error in the specified object class. Alternatively, a required attribute is not specified in the object class or an attribute that cannot be used is specified.

#### - Example 1 of error occurrence

An attempt is made to add an attribute (sn) that is not defined in the schema as an attribute of the specified object class (organization)

LDIF

```
dn: o=SR,o=fujitsu,dc=com
changetype: add
objectClass: top
objectClass: organization
o: SR
sn: Fujitsu
```

#### - Example 2 of error occurrence

If an attempt is made to add an entry by simultaneously specifying object classes (person and organization) that have no inheritance relationship.

LDIF

```
dn: cn=aaa,o=fujitsu,dc=com
objectclass: top
objectclass: person
objectclass: organization
cn: aaa
sn: aaaa
```

#### User Action

The following causes can be assumed:

- An object class that is not supported by Interstage Directory Service is specified.
- Object classes that have no inheritance relationship are specified simultaneously.
- A required attribute of an object class is not specified.
- An attribute that cannot be specified in an object class is specified.

Check whether the object classes and attributes are specified correctly and then re-execute.

For details of the object classes and attributes, refer to "Interstage Directory Service Object Classes" and "Interstage Directory Service Attributes" appendixes in the Directory Service Operator's Guide respectively.

For information on how to specify an LDIF file, refer to "Using the Command to Manage Entries" - "Using the LDIF file" in "Entry Management" in the Directory Service Operator's Guide.

This message may also be output if a function that cannot be used in Interstage Directory Service is used.

Check whether any functions that cannot be used in Interstage Directory Service were used by referring to the following manuals:

"Restrictions on Interstage Directory Service" in Product Notes

"Notes on Interstage Directory Service" in Product Notes

## 36.1.36 LDAP\_NOT\_ALLOWED\_ON\_NONLEAF 66 (0x42)

---

### Operation not allowed on nonleaf

#### Explanation

The requested processing can only be performed on leaf entries. Deletion or DN modification (identification name renaming) of an entry with a subordinate entry cannot be performed in one operation.

#### User Action

Perform deletion or DN modification of entries one by one from a leaf (lowest) entry.

## 36.1.37 LDAP\_NOT\_ALLOWED\_ON\_RDN 67 (0x43)

---

### Operation not allowed on RDN

## Explanation

The requested processing cannot be performed on a relative identification name (RDN).

### 36.1.38 LDAP\_ALREADY\_EXISTS 68 (0x44)

---

#### Already exists

## Explanation

There is already an entry with the same name as that of the entry to be added.

#### - Example 1 of error occurrence

An attempt is made to add an entry that already exists.

#### LDIF

```
dn: cn=User001,o=fujitsu,dc=com
objectclass: top
objectclass: person
cn: User001
sn: Fujitsu
```

#### User Action

Check for errors in the specified entry. If no error is found, refer to the entry attributes and make any required corrections.

### 36.1.39 LDAP\_NO\_OBJECT\_CLASS\_MODS 69 (0x45)

---

#### Cannot modify object class

## Explanation

The specified object class is a structure type class that required attributes depend on, so it is not possible to delete or modify its values.

#### - Example of error occurrence

If an attempt is made to delete the object class attribute (inetOrgPerson) that determines the entry type

Entry state within the repository (LDIF)

Inheritance relationship: top < person < organizationalPerson < inetOrgPerson

```
dn:cn=User001,o=fujitsu,dc=com
changetype:add
objectclass:top
objectclass:person
objectclass:organizationalPerson
objectclass:inetOrgPerson
cn:User001
sn:Fujitsu
```

#### LDIF

```
dn:cn=User001,o=fujitsu,dc=com
changetype:modify
delete:objectclass
objectclass:inetOrgPerson
```

### 36.1.40 LDAP\_RESULTS\_TOO\_LARGE 70 (0x46)

---

#### Results too large

## Explanation

The number of processing result entries exceeds the maximum number of searchable entries.

## User Action

Use the Interstage Management Console to increase the value of 'Maximum number of searchable entries' from the Settings window of the target repository.

### 36.1.41 LDAP\_AFFECTS\_MULTIPLE\_DSAS 71 (0x47)

---

#### Affects multiple DSAs

## Explanation

The specified function cannot be used in Interstage Directory Service.

## User Action

This error may occur if a function that cannot be used in Interstage Directory Service is used.

Check whether any functions that cannot be used in Interstage Directory Service were used by referring to the following manuals:

"Restrictions on Interstage Directory Service" in Product Notes

"Notes on Interstage Directory Service" in Product Notes

### 36.1.42 LDAP\_OTHER 80 (0x50)

---

#### Unknown error

## Explanation

An error that does not have an LDAP error code was detected.

## User Action

- Communication with the repository is not possible. Check for errors in the host name and port number of the connection destination.
- Connections to the SSL port are not supported when the Entry Management Tool is used, therefore check whether this connection exists and if so, specify a communication (non-SSL) port number.
- Check whether the repository is active by using the Interstage Management Console.
  - If the repository is stopped, activate the repository.
  - If the repository is active, stop it and then restart it.
  - If the repository is in an abnormal state, stop it and then activate it.
- This error may occur if a processing request that exceeds the system scale supported by Interstage Directory Service is made or a function that cannot be used in Interstage Directory Service is used.

Use the following manuals to check whether the supported system scale was exceeded or a function that cannot be used in Interstage Directory Service was used.

- "Restrictions on Interstage Directory Service" in Product Notes
- "Notes on Interstage Directory Service" in Product Notes

If an RDB is used as the repository database, check the system log (event log) of the machine used to install the Interstage Directory Service for connection to see if an RDB error occurred.

#### Solaris32/64 Linux32/64

- If a standard database is used as the repository database, use the `ps` command to check whether the `omsservd` process is active. If the `omsservd` process is inactive, activate it using the `enablerstart` command. After executing the `enablerstart` command, restart the repository to perform the entry operation again.

For details on how to use the `enablerstart` command, refer to "Interstage Directory Service Operation Commands" in the Reference Manual (Command Edition).

If there is no improvement, collect diagnostic information by executing the *iscollectinfo* command and then contact your service engineer.

## 36.1.43 LDAP\_SERVER\_DOWN 81 (0x51)

---

### Can't contact LDAP server

#### Explanation

Communication with the repository is not possible.

#### User Action

- It is not possible to communicate with the repository. Check for errors in the host name and port number of the connection destination.
- Contact the network administrator to check for errors in the network environment settings (for example, host file setting, DNS server/DHCP server specifications, DNS server/DHCP server settings, etc.). If any errors are found, correct the network environment and then reset it.
- There is insufficient physical memory for Interstage Directory Service operation. End any unnecessary programs and secure sufficient memory for Interstage Directory Service.

If a standard database is used as the repository database, the standard database (Interstage data store) and all repository operations are stopped, and there is less physical memory capacity available than that required by Interstage Directory Service, the physical memory capacity is insufficient.

Refer to "Memory Requirements" in the Tuning Guide for details on the memory capacity required by Interstage Directory Service. Extend the memory if it is still insufficient after ending unnecessary programs.

- If the repository is active, check whether a timeout has occurred by referring to the access log. If TIMEOUT is recorded in the access log, a timeout has occurred.

For information on the access log, refer to "Logs" in "Operation and Maintenance" in the Directory Service Operator's Guide.

Use the Interstage Management Console to check whether the value of 'Connection Idle Timeout' is too short from the environment settings window of the target repository.

Other possible causes of timeout include network congestion (where normal communication cannot be conducted due to an increased communication volume); heavy load on the machine on which the repository is active; and heavy load on the machine on which applications are operating.

If Interstage Directory Service is overloaded, distribute the load by using the replication mode. If the load on the client side is heavy, lighten the load.

- For user applications, retry can avoid this error.

If SSL is used for communication with the repository server (and the number of clients is large and the frequency of access to Interstage Directory Service is high) the above actions may not result in any improvement. In this case, consider lightening the server load by, for example, using the SSL accelerator.

- Use the Interstage Management Console to check whether the repository is active.
  - If the repository is stopped, activate the repository.
  - If the repository is active, stop it and then restart it.
  - If the repository is in an abnormal state, stop it and then activate it.
- Connection has been closed because the request sent to the repository is too large. Resolve the problem by a workaround such as reducing the size of the registering data, and retry the operation.

For details on the Interstage Directory Service's maximum size, refer to "Restrictions on Capacity" under "Restrictions on Interstage Directory Service" in the Product Notes manual.

**Solaris32/64 Linux32/64**

- The file descriptor (fd) that can be used by client applications may be insufficient. Use `ulimit(1)` or `setrlimit(2)` to increase the available file descriptor and then re-execute.

- If a standard database is used as the repository database, Use the `ps` command to check whether the `omsservd` process is active. If the `omsservd` process is inactive, activate it using the `enablerstart` command. After executing the `enablerstart` command, restart the repository to perform the entry operation again.

For details on how to use the `enablerstart` command, refer to "Interstage Directory Service Operation Commands" in the Reference Manual (Command Edition).

If there is no improvement, collect diagnostic information by executing the `iscollectinfo` command and then contact your service engineer.

## 36.1.44 LDAP\_LOCAL\_ERROR 82 (0x52)

---

### Local error

#### Explanation

There is a client program error.

#### User Action

This message may be output when using a protocol extension.

Check whether any functions that cannot be used in Interstage Directory Service were used by referring to the following manuals:

"Restrictions on Interstage Directory Service" in Product Notes

"Notes on Interstage Directory Service" in Product Notes

If there is no improvement, collect diagnostic information by executing the `iscollectinfo` command and then contact your service engineer.

## 36.1.45 LDAP\_ENCODING\_ERROR 83 (0x53)

---

### Encoding error

#### Explanation

An error was detected while encoding the sent data.

#### User Action

This error may occur with a protocol extension memory shortage. Terminate unnecessary programs to secure the required memory space and then re-execute.

**Windows32/64**

If there is no improvement after terminating unnecessary programs, increase the memory or extend the virtual memory.

**Solaris32/64 Linux32/64**

If there is no improvement after terminating unnecessary programs, increase the memory or extend the swap area.

For the amount of memory space required for Interstage Directory Service operation, refer to "Memory Requirements" in the Tuning Guide.

**Windows32/64 Solaris32/64 Linux32/64**

If SDK has been used, the parameter of API is wrong. Correct the parameter.

## 36.1.46 LDAP\_DECODING\_ERROR 84 (0x54)

---

### Decoding error

#### Explanation

An error was detected while decoding the received data.

## User Action

This error may occur if memory is exhausted using, for example, protocol extensions. Terminate unnecessary programs to secure the required memory space and then re-execute.

**Windows32/64**

If there is no improvement after terminating unnecessary programs, increase the memory or extend the virtual memory.

For the amount of memory space required for Interstage Directory Service operation, refer to "Memory Requirements" in the Tuning Guide.

**Solaris32/64 Linux32/64**

If there is no improvement after terminating unnecessary programs, increase the memory or extend the swap area.

For the amount of memory space required for Interstage Directory Service operation, refer to "Memory Requirements" in the Tuning Guide.

---

## 36.1.47 LDAP\_TIMEOUT 85 (0x55)

---

### Timed out

#### Explanation

A timeout occurred.

#### User Action

Increase the specified search time limit as a client search option.

If there is no improvement, change the connected DN to the administrator DN of the target repository or use the Interstage Management Console to increase the value of 'Search Timeout' from the Settings window of the target repository.

---

## 36.1.48 LDAP\_AUTH\_UNKNOWN 86 (0x56)

---

### Unknown authentication method

#### Explanation

An undefined authentication method was specified.

#### User Action

Functions created by API may not be supported. Alternatively, a function that cannot be used in Interstage Directory Service may have been used.

Check whether any functions that cannot be used in Interstage Directory Service were used by referring to the following manuals:

"Restrictions on Interstage Directory Service" in Product Notes

"Notes on Interstage Directory Service" in Product Notes

---

## 36.1.49 LDAP\_FILTER\_ERROR 87 (0x57)

---

### Bad search filter

#### Explanation

There is an error in the search filter format.

#### User Action

'Entry management' - 'Search filters' in the Directory Service Operator's Guide and then re-execute.

---

## 36.1.50 LDAP\_USER\_CANCELLED 88 (0x58)

---

---

### User cancelled operation

#### Explanation

Processing was canceled by a user request.

---

## 36.1.51 LDAP\_PARAM\_ERROR 89 (0x59)

---

### Bad parameter to an ldap routine

#### Explanation

There is an error in the specified parameter.

#### User Action

Correct the API used in the created applications. For details of the API functions, refer to "Creating an Application (JNDI)" in the Directory Service Operator's Guide.

---

## 36.1.52 LDAP\_NO\_MEMORY 90 (0x5a)

---

### Out of memory

#### Explanation

A memory shortage occurred.

#### User Action

Terminate unnecessary programs to secure the required memory space and then re-execute.

**Windows32/64**

If there is no improvement after terminating unnecessary programs, increase the memory or extend the virtual memory.

For the amount of memory space required for Interstage Directory Service operation, refer to "Memory Requirements" in the Tuning Guide.

**Solaris32/64 Linux32/64**

If there is no improvement after terminating unnecessary programs, increase the memory or extend the swap area.

For the amount of memory space required for Interstage Directory Service operation, refer to "Memory Requirements" in the Tuning Guide.

---

## 36.1.53 LDAP\_CONNECT\_ERROR 91 (0x5b)

---

### Can't connect to the LDAP server

#### Explanation

Failed to establish a connection with the repository.

#### User Action

- Communication with the repository is not possible. Check for errors in the host name and port number of the connection destination.
- Contact the network administrator to check for errors in the network environment settings (for example, host file setting, DNS server/DHCP server specifications, DNS server/DHCP server settings, etc). If any errors are found, correct the network environment and then reset it.
- This message may be generated when the load of a network or a repository server is high.
  - In the case of a user application, it is avoidable by retrying at the time of error generation.

When SSL is being used between repository servers, and there are many clients or a high access frequency to Interstage Directory Service, the above action may not resolve the error. In this case, try lightening the server load by using an SSL accelerator.

- Use the Interstage Management Console to check whether the repository is active.
  - If the repository is stopped, activate the repository.
  - If the repository is active, stop it and then restart it.
  - If the repository is in an abnormal state, stop it and then activate it.

**Solaris32/64 Linux32/64**

- Contact the network administrator to check for errors in the network environment settings (for example, host file setting, DNS server/DHCP server specifications, DNS server/DHCP server settings, etc.). If any errors are found, correct the network environment and then reset it.
- If a standard database is used as the repository database, use the *ps* command to check whether the *omsservd* process is active. If the *omsservd* process is inactive, activate it using the *enablerstart* command. After executing the *enablerstart* command, restart the repository to perform the entry operation again.
- If an RDB is used as the repository database, check the system log (event log) of the machine on which the connection destination Interstage Directory Service is installed to see whether an RDB error has occurred.

For details on how to use the *enablerstart* command, refer to "Interstage Directory Service Operation Commands" in the Reference Manual (Command Edition).

If there is still no improvement, collect diagnostic information by executing the *iscollectinfo* command and then contact your service engineer.

### 36.1.54 LDAP\_NOT\_SUPPORTED 92 (0x5c)

---

#### Not supported

##### Explanation

The specified function is not supported.

##### User Action

Check whether any functions that cannot be used in Interstage Directory Service were used by referring to the following manuals:

"Restrictions on Interstage Directory Service" in Product Notes

"Notes on Interstage Directory Service" in Product Notes

If LDAP V3 extended function has been used, check whether the protocol version setting is correct.

### 36.1.55 LDAP\_CONTROL\_NOT\_FOUND 93 (0x5d)

---

#### Control not found

##### Explanation

There is no applicable control.

##### User Action

The specified function cannot be used.

### 36.1.56 LDAP\_NO\_RESULTS\_RETURNED 94 (0x5e)

---

#### No results returned

##### Explanation

No result was notified.

### 36.1.57 LDAP\_MORE\_RESULTS\_TO\_RETURN 95 (0x5f)

---

---

### More result to return

#### Explanation

There are still results to be notified.

---

## 36.1.58 LDAP\_CLIENT\_LOOP 96 (0x60)

---

### Client loop

#### Explanation

A loop was detected on the client.

#### User Action

Interstage Directory Service never returns this code. The directory server of another product may be connected. Check whether the connection destination is correct and then specify the correct server to Interstage Directory Service.

---

## 36.1.59 LDAP\_REFERRAL\_LIMIT\_EXCEEDED 97 (0x61)

---

### Referral limit exceeded

#### Explanation

This message may be output when a repository where referrals are registered is referenced.

#### User Action

Since the referral function cannot be used in Interstage Directory Service, the directory server of another product may be connected. Check whether the connection destination is correct and then specify the correct server to Interstage Directory Service.

---

## 36.2 SSL Error Codes

---

This section describes the meanings of the SSL error code and the required action.

---

### 36.2.1 0x00000000

---

#### Explanation

The process ended normally.

#### User action

Continue with processing.

---

### 36.2.2 0x00010001

---

#### Explanation

A timeout occurred during SSL connection.

#### User Action

- LDAP client (ldapmodify, ldapsearch, ldapdelete, user applications)

If the connection destination is not operating correctly, take action to resolve the connection destination issue.

If the connection destination is operating correctly:

- The load of the repository server is heavy

For user applications, retry can avoid the error.

If SSL is used for communication with the repository server, and the number of clients is large and the frequency of access to Interstage Directory Service is high, the above action may not resolve the error. If there is no improvement, consider lightening the server load by, for example, using the SSL accelerator.

- Otherwise

The timer value may be too short. Increase the timer value (`ssl_timer`) in the SSL environment definition file or the value of `ssl_timer` in the `SSENV` structure and then re-execute.

For information about the timer value (`ssl_timer`) in the SSL environment definition file, refer to "Setting an SSL Environment Definition File (Client)" in the 'Directory Service Operator's Guide'.

- If there is no improvement, collect diagnostic information by executing the `iscollectinfo` command and then contact your service engineer.

- Other than LDAP client

Use the `iscollectinfo` command to collect diagnostic information and then contact your service engineer.

### 36.2.3 0x00020001

---

#### Explanation

A memory shortage occurred in the SSL library.

#### User Action

Terminate unnecessary programs or secure sufficient memory for Interstage Directory Service operation. For the memory capacity required for Interstage Directory Service operation, see the following:

'Memory Requirements' in the Tuning Guide.

### 36.2.4 0x00020002

---

#### Explanation

A memory shortage occurred in the SSL library.

#### User Action

Terminate unnecessary programs or secure sufficient memory for Interstage Directory Service operation. For the memory capacity required for Interstage Directory Service operation, see the following:

"Memory Requirements" in the Tuning Guide.

### 36.2.5 0x00100001

---

#### Explanation

There is a certificate verification method error.

#### User Action

Take the following action depending on the certificate and private key management environment that has been set up to conduct encrypted communication via SSL.

- Interstage Certificate Environment

The Interstage Certificate Environment may have been damaged. Refer to "[36.4.4 Broken Certificate Environments](#)" - 'Interstage Certificate Environment' and correct the Interstage Certificate Environment.

- Certificate/key management environment

Re-execute processing after correctly setting the certificate verification method (`ssl_verify`) in the SSL environment definition file or `ssl_verify` in the `SSENV` structure. For the certificate verification method (`ssl_verify`), refer to "Setting up an Environment for SSL

Communication' - 'Setting an SSL Environment Definition File (Client)' in "Environment Setup" in the Directory Service Operator's Guide.

## 36.2.6 0x00100002

---

### Explanation

Cannot find the SSL environment definition file. Alternatively, the setting for the encryption method is incorrect.

### User Action

If the *JNDI* or *ldap* commands are used with the user application, check whether the specified SSL environment file exists. The SSL environment definition file is specified by the following methods.

- JNDI  
system property 'user.sslenvfile'
- LDAP command  
-Z option

If the interface is a C interface, or the SSL environment definition file exists, take the action described below. This action is dependant on the certificate and private key management environment that has been set up to conduct encrypted communication via SSL:

- Interstage Certificate Environment  
The Interstage Certificate Environment may have been damaged. Refer to "[36.4.4 Broken Certificate Environments](#)" - 'Interstage Certificate Environment' and correct the Interstage Certificate Environment.
- Certificate/key management environment

Re-execute processing after correctly setting the encryption algorithm (crypt) in the SSL environment definition file or crypt in the SLENV structure.

For the encryption algorithm (crypt) in the SSL environment definition file, refer to "Setting up an Environment for SSL Communication" - 'Setting an SSL Environment Definition File (Client)' in "Environment Setup" in the Directory Service Operator's Guide.

## 36.2.7 0x00100008

---

### Explanation

The site certificate has expired.

### User Action

Refer to '[36.4.1 When the Site Certificate has Expired](#)', obtain the new Site certificate from the CA, and register it in the Interstage certificate environment or certificate/key management environment.

## 36.2.8 0x00100009

---

### Explanation

The CA Certificate has expired.

### User Action

Refer to '[36.4.2 When the CA Certificate has Expired](#)', obtain the new CA certificate from the CA, and register it in the Interstage certificate environment or certificate/key management environment.

## 36.2.9 0x0010000C

---

## Explanation

CA Certificate or site certificate verification failed.

## User Action

There is an error in the registration order of the certificates required to verify the certificate indicated by the certificate nickname. Refer to ['36.4.3 When the Certificate Registration Order is Incorrect'](#), and re-register the CA certificate in the Interstage certificate environment or certificate/key management environment, starting with the root certificate.

## 36.2.10 0x0010000D

---

## Explanation

An unsupported encryption method is specified.

## User Action

Take the following action depending on the certificate and private key management environment that has been set up to conduct encrypted communication via SSL:

- Interstage Certificate Environment

The Interstage Certificate Environment may have been damaged. Refer to ['36.4.4 Broken Certificate Environments'](#) and correct the Interstage certificate environment.

- Certificate/key management environment

Re-execute processing after setting the encryption algorithm (crypt) in the SSL environment definition file or crypt in the SLENV structure.

For the encryption algorithm (crypt) in the SSL environment definition file, refer to "Setting an SSL Environment Definition File (Client)" in the 'Directory Service Operator's Guide'.

## 36.2.11 0x00100012

---

## Explanation

Decryption of the private key failed.

## User Action

Refer to ['36.4.4 Broken Certificate Environments'](#) and correct the Interstage Certificate Environment or certificate/key management environment.

## 36.2.12 0x00100016

---

## Explanation

Analysis of the site certificate failed.

## User Action

Refer to ['36.4.4 Broken Certificate Environments'](#) and correct the Interstage Certificate Environment or certificate/key management environment.

## 36.2.13 0x00100017

---

## Explanation

Analysis of the CA Certificate failed.

## User Action

Refer to '[36.4.4 Broken Certificate Environments](#)' and correct the Interstage Certificate Environment or certificate/key management environment.

## 36.2.14 0x00100018

---

### Explanation

The site certificate of the connection destination has expired.

### User Action

Refer to '[36.4.4 Broken Certificate Environments](#)', obtain the new Site certificate from the connection CA, and register it in the connection Interstage certificate environment or certificate/key management environment.

## 36.2.15 0x00100019

---

### Explanation

Analysis of the connection destination site certificate failed.

### User Action

The Interstage Certificate Environment of the connection destination may have been damaged. Refer to '[36.4.4 Broken Certificate Environments](#)' - 'Interstage Certificate Environment' and correct the Interstage Certificate Environment or certificate/key management environment connection.

## 36.2.16 0x0010001A

---

### Explanation

Verification of the connection destination site certificate failed.

### User Action

To verify that the connection destination is correct, register the CA Certificates required to verify the connection destination site certificate for the Interstage Certificate Environment of the local host one by one from the CA Certificate of the root CA.

Refer to '[36.4.3 When the Certificate Registration Order is Incorrect](#)' - 'Interstage certificate environments', and take the required action.

## 36.2.17 0x00100020

---

### Explanation

No nickname was specified for the site certificate.

### User Action

Take the following action depending on the certificate and private key management environment that has been set up to conduct encrypted communication via SSL:

- Interstage Certificate Environment

The Interstage Certificate Environment may have been damaged. Refer to '[36.4.4 Broken Certificate Environments](#)' - 'Interstage Certificate Environment' and correct the Interstage certificate environment.

- Certificate/key management environment

Although it is possible to omit the user certificate nickname (user\_cert\_name) in the SSL environment definition file or user\_cert in the SLENV structure, the manner in which it was omitted is incorrect.

To omit the user certificate nickname (`user_cert_name`) from the SSL environment definition file, do not describe the `user_cert_name` line or insert '#' at the beginning of the line.

To omit `user_cert` from the `SSLENV` structure, set `NULL` to `user_cert`.

If the user certificate nickname (`user_cert_name`) in the SSL environment definition file or `user_cert` in the `SSLENV` structure is omitted, all site certificates registered for the certificate/key management environment are assumed.

For information on the user certificate nickname (`user_cert_name`), refer to "Setting an SSL Environment Definition File (Client)" in the 'Directory Service Operator's Guide'.

## 36.2.18 0x0010002A

---

### Explanation

There is an error in the CRL management directory.

### User Action

Refer to '[36.4.4 Broken Certificate Environments](#)' and correct the Interstage Certificate Environment or certificate/key management environment.

## 36.2.19 0x0010002B

---

### Explanation

No site certificate could be received due to either of the following reasons:

- No site certificate was registered at the connection destination.
- The connection destination rejected the transmission of the site certificate.

### User Action

The connection destination must acquire site certificates from the CA and register the site certificates for the Interstage Certificate Environment or certificate/key management environment one by one from the CA Certificate of the root CA, and then send them.

It is also necessary to register the CA Certificates required to verify the connection destination site certificate for the Interstage Certificate Environment or certificate/key management environment of the local host one by one from the CA Certificate of the root CA.

For details on re-registering certificates, refer to '[36.4.3 When the Certificate Registration Order is Incorrect](#)'.

If there is still no improvement, collect diagnostic information by executing the `iscollectinfo` command and then contact your service engineer.

## 36.2.20 0x0010002C

---

### Explanation

There is an error in the SSL protocol version setting.

### User Action

Take the following action depending on the certificate and private key management environment that has been set up to conduct encrypted communication via SSL:

- Interstage Certificate Environment

The Interstage Certificate Environment may have been damaged. Refer to '[36.4.4 Broken Certificate Environments](#)' - 'Interstage Certificate Environment' and correct the Interstage certificate environment.

- Certificate/key management environment

Re-execute processing after setting a value that can be set as an SSL version (`ssl_version`) in the SSL environment definition file.

If a value that cannot be set to `ssl_verify` in the `SSENV` structure is set, it is assumed that SSL should not be used (the same processing as `ldap_init()`).

For information on the SSL version (`ssl_version`) in the SSL environment definition file, refer to "Setting up an Environment for SSL Communication" - "Setting an SSL Environment Definition File (Client)" in "Environment Setup" in the Directory Service Operator's Guide.

## 36.2.21 0x0010002D

---

### Explanation

The CA Certificate or site certificate has been canceled.

### User Action

Acquire a new CA Certificate or site certificate from the CA and then register it for the Interstage Certificate Environment or certificate/key management environment.

Check the serial number of the canceled certificate using either of the following methods:

- Save CRL in a file with the extension 'crl' in the Windows(R) environment and right-click the saved file. After a menu is displayed, click [Open] in the menu to display the [Certificate revocation list] window. Click the [Revocation list] tab in the [Certificate revocation list] window to check the serial number of the canceled certificate.
- Register CRL with an entry using the Entry Management Tool and then check the serial number of the canceled certificate from the Invalid certificates list viewer.

Confirm the canceled certificate as described below and then acquire and register a new certificate to take the place of the canceled certificate.

- Interstage Certificate Environment

Check the canceled certificate using the following procedure:

1. On the Interstage Management Console, select [System] > [Security] > [Certificates] > [Site Certificates] (If on the Admin Server, select [Application Management] > [Interstage] > [Interstage Application Server] > [Security] > [Certificates] > [Site Certificates]), and then click the [Refresh] button on the [List] tab to acquire the latest information. Then, reference the serial number of the site certificate to check the canceled site certificate.
2. On the Interstage Management Console, select [System] > [Security] > [Certificates] > [CA Certificates] (If on the Admin Server, select [Application Management] > [Interstage] > [Interstage Application Server] > [Security] > [Certificates] > [CA Certificates]), and then click the [Refresh] button on the [List] tab to acquire the latest information. Then, reference the serial number of the CA Certificate to check the canceled CA Certificate.

To acquire and register a certificate, use either of the following methods:

- 'Setting and Use of an Interstage Certificate Environment' in the Security System Guide - 'Configuring the Interstage Certificate Environment with CSR'
- 'Setting and Use of an Interstage Certificate Environment' in the Security System Guide - 'Configuring the Interstage Certificate Environment with PKCS#12'
- Certificate/key management environment

Check the canceled certificate using the following procedure:

1. Use the `cmlistcert` command to check the certificates registered in the certificate/key management environment.
2. Use the `cmdspcert` command to check the canceled certificate by referencing the serial number of each registered certificate.

For details of the `cmlistcert` and `cmdspcert` commands, see the following:

'SSL Environment Setting Commands' in the Reference Manual (Command Edition)

For the methods of acquiring and registering certificates, see the following in the indicated order and take the required action:

1. 'Setting and Use of the Certificate/Key Management Environment Using the SMEE Command' in the Security System Guide - 'Environment Setting for Certificate/Key Management Environment' - 'Creating a Secret Key and Acquiring a Certificate'

2. 'Setting and Use of the Certificate/Key Management Environment Using the SMEE Command' in the Security System Guide - 'Environment Setting for Certificate/Key Management Environment' - 'Registering the Certificate and CRL'

## 36.2.22 0x0010002E

---

### Explanation

Access from the connection destination was rejected because an expired site certificate was received.

### User Action

Acquire a new site certificate from the CA at the connection destination and then register it for the Interstage Certificate Environment or certificate/key management environment of the connection destination. For details on how to obtain and register the Site certificate, refer to "[36.4 When the Certificate has Expired](#)".

## 36.2.23 0x00100035

---

### Explanation

Verification of the received site certificate failed.

### User Action

Register the CA Certificates required to verify the connection destination site certificate for the Interstage Certificate Environment or certificate/key management environment of the local host one by one from the CA Certificate of the root CA. For details on re-registering certificates, refer to "[36.4.3 When the Certificate Registration Order is Incorrect](#)".

## 36.2.24 0x00100036

---

### Explanation

There is an error in the operation control directory.

### User Action

Take the following action depending on the certificate and private key management environment that has been set up to conduct encrypted communication via SSL:

- Interstage Certificate Environment

The Interstage Certificate Environment may have been damaged. Refer to '[36.4.4 Broken Certificate Environments](#)' - 'Interstage Certificate Environments' and correct the Interstage Certificate Environment.

- Certificate/key management environment

Re-execute processing after setting the operation control directory of the certificate/key management environment to be used to the operation control directory (cert\_path) in the SSL environment definition file or cert\_path in the SLENV structure.

For information on the operation control directory (cert\_path) in the SSL environment definition file, refer to "Setting up an Environment for SSL Communication" - 'Setting an SSL Environment Definition File (Client)' in "Environment Setup" in the Directory Service Operator's Guide.

## 36.2.25 0x0010003B

---

### Explanation

No private key corresponding to the site certificate could be found in the Interstage Certificate Environment or certificate/key management environment.

## User Action

Take the following action depending on the certificate and private key management environment that has been set up to conduct encrypted communication via SSL:

- Interstage Certificate Environment

The Interstage Certificate Environment may have been restored while the Interstage Management Console was operating. Stop the Interstage Management Console and then restart it. For information on starting and stopping the Interstage Management Console, see the following:

'Interstage Operation Using the Interstage Management Console' in the Interstage Operator's Guide - 'Starting and Stopping the Interstage Management Console'

If there is no improvement, the Interstage Certificate Environment may have been damaged. Refer to '[36.4.4 Broken Certificate Environments](#)' - 'Interstage Certificate Environment' and correct the Interstage Certificate Environment.

- Certificate/key management environment

Register the private key corresponding to the site certificate for the certificate/key management environment.

For the registration of private keys, see the following:

'SSL Environment Setting Commands' in the Reference Manual (Command Edition) - 'cmenterkey'

If there is no improvement, the certificate/key management environment may have been damaged. Refer to '[36.4.4 Broken Certificate Environments](#)' - 'Certificate/key management environments' and correct the certificate/key management environment.

## 36.2.26 0x0010003D

---

### Explanation

There is an error in the token label.

### User Action

Take the following action depending on the certificate and private key management environment that has been set up to conduct encrypted communication via SSL:

- Interstage Certificate Environment

The Interstage Certificate Environment may have been damaged. Refer to '[36.4.4 Broken Certificate Environments](#)' - 'Interstage Certificate Environment' and correct the Interstage Certificate Environment.

- Certificate/key management environment

Re-execute processing after setting the token label of the certificate/key management environment to be used to the token label (tkn\_lbl) in the SSL environment definition file or tkn\_lbl in the SLENV structure. For information on the token label (tkn\_lbl) in the SSL environment definition file, refer to "Setting up an Environment for SSL Communication" - "Setting an SSL Environment Definition File (Client)" in "Environment Setup" in the Directory Service Operator's Guide.

## 36.2.27 0x0010003E

---

### Explanation

There is an error in the nickname of the site certificate.

### User Action

Take the following action depending on the certificate and private key management environment that has been set up to conduct encrypted communication via SSL:

- Interstage Certificate Environment

Specify the required site certificate in the SSL configuration used by the repository according to the following procedure:

1. If the repository is already active, stop the repository using the Interstage Management Console.

2. Click the [Refresh] button in the following window to check the SSL configuration used by the repository:

On the Interstage Management Console, select [System] > [Service] > [Repository] (If on the Admin Server, select [Application Management] > [Interstage] > [Interstage Application Server] > [Security] > [Repository]), and then click [General Settings] on the [View Status] tab of the repository in use.

If the repository is a master, also check the SSL configuration used by the repository for replication by clicking the [Refresh] button in the following window:

On the Interstage Management Console, select [System] > [Service] > [Repository] (If on the Admin Server, select [Application Management] > [Interstage] > [Interstage Application Server] > [Security] > [Repository]), and then click [Replication connection settings] in [Detailed setting [View]] on the [View Status] tab of the repository in use.

3. Click the [Refresh] button in the following window and then specify the site certificate required for the SSL configuration. If no site certificate is registered, acquire and register a site certificate.

On the Interstage Management Console, select [System] > [Security] > [SSL] (If on the Admin Server, select [Application Management] > [Interstage] > [Interstage Application Server] > [Security] > [SSL]), and then click [Environment setup] in the SSL configuration of the used repository on the [List] tab.

4. Start the repository.

To acquire and register a certificate, use either of the following methods:

- 'Setting and Use of an Interstage Certificate Environment' in the Security System Guide - 'Configuring the Interstage Certificate Environment with CSR'
  - 'Setting and Use of an Interstage Certificate Environment' in the Security System Guide - 'Configuring the Interstage Certificate Environment with PKCS#12'
- Certificate/key management environment

Check whether the user certificate nickname of the SSL environment definition file corresponds to the site certificate nickname in use.

- The nickname does not correspond:

Ensure that the user certificate nickname (`user_cert_name`) of the SSL environment definition file corresponds with the site certificate nickname in use, and then re-execute the process.

- The nickname corresponds:

The certificate of the nickname specified in the user certificate nickname (`user_cert_name`) of the SSL environment definition file may not have been registered as a site certificate.

Specify `-own` option for `cmntcert` command to register the site certificate.

For detail of user certificate nickname, refer to "Setting up an Environment for SSL Communication" - "Setting an SSL Environment Definition File (Client)" in "Environment Setup" in the Directory Service Operator's Guide.

## 36.2.28 0x0010003F

---

### Explanation

There is an error in the nickname of the client CA certificate.

### User Action

Refer to '[36.4.4 Broken Certificate Environments](#)' and correct the Interstage Certificate Environment or certificate/key management environment.

## 36.2.29 0x00100040

---

### Explanation

There is no path list for the site certificate.

## User Action

There is an error in the registration order of the certificates required to verify the certificate indicated by the certificate nickname. Correct and register the certificates in the Interstage Certificate Environment or certificate/key management environment one by one from the CA certificate of the root CA. For details on re-registering certificates, refer to '[36.4.3 When the Certificate Registration Order is Incorrect](#)'.

### **36.2.30 0x00100041**

---

## Explanation

There is no path list for the CA Certificates.

## User Action

The registration order of the certificates is invalid. Correct and register certificates in the Interstage certificate environment or certificate/key management environment one by one from the CA certificate of the root CA. For details on re-registering certificates, refer to '[36.4.3 When the Certificate Registration Order is Incorrect](#)'.

### **36.2.31 0x00100042**

---

## Explanation

No path list exists in the received site certificate.

## User Action

Register the certificates required to verify the connection destination site certificate for the Interstage Certificate Environment or certificate/key management environment of the local host one by one from the CA Certificate of the root CA. For details on re-registering certificates, refer to '[36.4.3 When the Certificate Registration Order is Incorrect](#)'.

### **36.2.32 0x00100043**

---

## Explanation

No path list exists for the CA Certificates.

## User Action

To verify that the connection destination is correct, register the CA Certificates required to verify the connection destination site certificate for the Interstage Certificate Environment of the local host one by one from the CA Certificate of the root CA. Refer to '[36.4.3 When the Certificate Registration Order is Incorrect](#)' - 'Interstage Certificate Environment', and take the required action.

### **36.2.33 0x00100044**

---

## Explanation

The path of the received certificate is incomplete.

## User Action

Register the CA Certificates required to verify the certificate received from the connection destination for the Interstage Certificate Environment or certificate/key management environment of the local host one by one from the CA Certificate of the root CA. For details on re-registering certificates, refer to '[36.4.3 When the Certificate Registration Order is Incorrect](#)'.

### **36.2.34 0x00100045**

---

## Explanation

The path of the connection destination site certificate is incomplete.

## User Action

If the connection destination uses a certificate for testing, stop using the certificate for testing at the connection destination. Instead, site certificates must be acquired from the CA at the connection destination and certificates for the Interstage Certificate Environment of the connection destination registered one by one from the CA Certificate of the root CA.

Whether or not the connection destination uses a certificate for testing, to verify that the connection destination is correct it is necessary to register the CA Certificates required to verify the connection destination site certificate for the Interstage Certificate Environment of the local host one by one from the CA Certificate of the root CA.

Refer to '[36.4.3 When the Certificate Registration Order is Incorrect](#)' - 'Interstage Certificate Environment', and take the required action.

## 36.2.35 0x00100046

---

### Explanation

The path of the site certificate is incomplete.

### User Action

The registration order of the certificates required to verify the certificate indicated by the certificate nickname is invalid. Correct and register the certificates in the Interstage Certificate Environment or certificate/key management environment one by one from the CA certificate of the root CA. For details on re-registering certificates, refer to '[36.4.3 When the Certificate Registration Order is Incorrect](#)'.

## 36.2.36 0x00100047

---

### Explanation

The path of the CA Certificate is incomplete.

### User Action

The registration order of certificates is invalid. Correct and register certificates in the Interstage certificate environment or certificate/key management environment one by one from the CA certificate of the root CA. For details on re-registering certificates, refer to '[36.4.3 When the Certificate Registration Order is Incorrect](#)'.

## 36.2.37 0x00100048

---

### Explanation

Analysis of the received certificate failed.

### User Action

Refer to '[36.4.4 Broken Certificate Environments](#)' and correct the Interstage certificate environment or certificate/key management environment.

## 36.2.38 0x00100049

---

### Explanation

Verification of the CA Certificate failed.

### User Action

The registration order of certificates is invalid. Correct and register certificates in the Interstage certificate environment or certificate/key management environment one by one from the CA certificate of the root CA. For details on re-registering certificates, refer to '[36.4.3 When the Certificate Registration Order is Incorrect](#)'.

## 36.2.39 0x0010004A

---

## Explanation

The CA Certificate has been canceled.

## User Action

Acquire a new CA Certificate from the CA and then register it for the Interstage Certificate Environment or certificate/key management environment.

After opening CRL in Internet Explorer, the serial number of the canceled certificate can be referenced. Check the serial number of the canceled certificate using the following procedure and then acquire and register a new certificate to replace the canceled certificate.

- Interstage Certificate Environment

Check the canceled certificate using the following procedure:

On the Interstage Management Console, select [System] > [Security] > [Certificates] > [CA Certificates] (If on the Admin Server, select [Application Management] > [Interstage] > [Interstage Application Server] > [Security] > [Certificates] > [CA Certificates]), and then reference the serial number of the CA Certificate on the [List] tab to check the canceled CA Certificate.

To acquire and register a certificate, use either of the following methods:

- 'Setting and Use of an Interstage Certificate Environment' in the Security System Guide - 'Configuring the Interstage Certificate Environment with CSR'
- 'Setting and Use of an Interstage Certificate Environment' in the Security System Guide - 'Configuring the Interstage Certificate Environment with PKCS#12'
- Certificate/key management environment

Check the canceled certificate using the following procedure:

1. Use the *cmlistcert* command to check the certificates registered for the certificate/key management environment.
2. Use the *cmdspcert* command to check the canceled certificate by referencing the serial number of each registered certificate.

For *cmlistcert* and *cmdspcert* command details, see the following:

'SSL Environment Setting Commands' in the Reference Manual (Command Edition)

For the methods of acquiring and registering certificates, see the following in the order indicated and take the required action:

1. 'Setting and Use of the Certificate/Key Management Environment Using the SMEE Command' in the Security System Guide - 'Environment Setting for Certificate/Key Management Environment' - 'Creating a Secret Key and Acquiring a Certificate'
2. 'Setting and Use of the Certificate/Key Management Environment Using the SMEE Command' in the Security System Guide - 'Environment Setting for Certificate/Key Management Environment' - 'Registering the Certificate and CRL'

## 36.2.40 0x0010004B

---

## Explanation

There is an error in the slot information directory.

## User Action

Take the following action depending on the certificate and private key management environment that has been set up to conduct encrypted communication via SSL.

- Interstage Certificate Environment

The Interstage Certificate Environment may have been damaged. Refer to '[36.4.4 Broken Certificate Environments](#)' and correct the Interstage Certificate Environment.

- Certificate/key management environment

Re-execute processing after setting the slot information directory name of the certificate/key management environment to be used to the slot information directory (slot\_path) in the SSL environment definition file or slot\_path in the SLENV structure. For information

on the slot information directory (slot\_path) in the SSL environment definition file, refer to "Setting an SSL Environment Definition File (Client)" in "Environment Setup" in the Directory Service Operator's Guide.

For information on slot\_path in the SLENV structure, refer to the following:

'Interstage Directory Service Interface' - 'Interface for Opening and Closing Sessions' - 'ldapssl\_init' in 'C Interface' in the 'Reference Manual (API Edition)'

'Interstage Directory Service Interface' - 'Configuring the Structure' - 'SLENV Structure' in 'C Interface' in the 'Reference Manual (API Edition)'

If this error occurs when Interstage Directory Service is used as the user repository for the Interstage Management Console, complete the following steps:

1. On the [Environment Settings] tab of the [Login User Authentication] node, in "User Repository" select "OS", and then click the "Update" button.
2. Log out from the Interstage Management Console.
3. Restart the Interstage Management Console. For details on starting/stopping the Interstage Management Console, refer to "Starting the Interstage Management Console" and "Stopping the Interstage Management Console" in the Operator's Guide.
4. Log in to the Interstage Management Console.
5. On the [Environment Settings] tab of the [Login User Authentication] node, in "User Repository" select "LDAP Server", and then click the "Update" button.

## 36.2.41 0x0010004C

---

### Explanation

There is an error in the token label.

### User Action

Take the following action depending on the certificate and private key management environment that has been set up to conduct encrypted communication via SSL:

- Interstage Certificate Environment

The Interstage Certificate Environment may have been damaged. Refer to '[36.4.4 Broken Certificate Environments](#)' - 'Interstage Certificate Environment' and correct the Interstage Certificate Environment.

- Certificate/key management environment

Re-execute processing after setting the token label of the certificate/key management environment to be used to the token label (tkn\_lbl) in the SSL environment definition file or tkn\_lbl in the SLENV structure. For information on the token label (tkn\_lbl) in the SSL environment definition file, refer to "Setting up an Environment for SSL Communication" - "Setting an SSL Environment Definition File (Client)" in "Environment Setup" in the Directory Service Operator's Guide.

For information on tkn\_lbl in the SLENV structure, see the following:

'Interstage Directory Service Interface' - 'Interface for Opening and Closing Sessions' - 'ldapssl\_init' in 'C Interface' in the 'Reference Manual (API Edition)'

'Interstage Directory Service Interface' - 'Configuring the Structure' - 'SLENV Structure' in 'C Interface' in the 'Reference Manual (API Edition)'

If this error occurs when Interstage Directory Service is used as the user repository for the Interstage Management Console, complete the following steps:

1. On the [Environment Settings] tab of the [Login User Authentication] node, in "User Repository" select "OS", and then click the "Update" button.
2. Log out from the Interstage Management Console.
3. Restart the Interstage Management Console. For details on starting/stopping the Interstage Management Console, refer to "Starting the Interstage Management Console" and "Stopping the Interstage Management Console" in the Operator's Guide.

4. Log in to the Interstage Management Console.
5. On the [Environment Settings] tab of the [Login User Authentication] node, in "User Repository" select "LDAP Server", and then click the "Update" button.

## 36.2.42 0x0010004D

---

### Explanation

There is an error in the user PIN. Alternatively, the user PIN may not be encrypted.

### User Action

Take the following action depending on the certificate and private key management environment that has been set up to conduct encrypted communication via SSL:

#### - Interstage Certificate Environment

The Interstage Certificate Environment may have been restored while the Interstage Management Console was operating. Stop the Interstage Management Console and then restart it. For information on starting and stopping the Interstage Management Console, see the following:

'Interstage Operation using the Interstage Management Console' in the Interstage Operator's Guide - 'Starting and Stopping the Interstage Management Console'

If there is no improvement, the Interstage Certificate Environment may have been damaged. Refer to '[36.4.4 Broken Certificate Environments](#)' - 'Interstage Certificate Environment' and correct the Interstage Certificate Environment.

#### - Certificate/key management environment

Re-execute processing after setting the user PIN of the certificate/key management environment to be used to the user PIN (tkn\_pwd) in the SSL environment definition file.

Encrypt the user PIN (tkn\_pwd) in the SSL environment definition file after correcting it. There is no need to encrypt tkn\_pwd of the SLENV structure.

If there is an error with the user PIN (tkn\_pwd) specified in the SSL environment definition file, the user PIN (tkn\_pwd) may not be encrypted. Encrypt the user PIN (tkn\_pwd) using the *irepencupin* command.

For information on the user PIN (tkn\_pwd) in the SSL environment definition file, refer to "Setting up an Environment for SSL Communication" - 'Setting an SSL Environment Definition File (Client)' in "Environment Setup" in the Directory Service Operator's Guide. For details of the user PIN (tkn\_pwd) encryption of the SSL environment definition file, refer to "Setting up an Environment for SSL Communication" - 'Encrypting the User PIN (Client)' in "Environment Setup" in the Directory Service Operator's Guide.

For information on tkn\_pwd in the SLENV structure, see the following:

- 'Interstage Directory Service Interface' - 'Interface for Opening and Closing Sessions' - 'ldapssl\_init' in 'C Interface' in the 'Reference Manual (API Edition)'
- 'Interstage Directory Service Interface' - 'Configuring the Structure' - 'SLENV Structure' in 'C Interface' in the 'Reference Manual (API Edition)'

If this error occurs when Interstage Directory Service is used as the user repository for the Interstage Management Console, take complete the following steps:

1. On the [Environment Settings] tab of the [Login User Authentication] node, in "User Repository" select "OS", and then click the "Update" button.
2. Log out from the Interstage Management Console.
3. Restart the Interstage Management Console. For details on starting/stopping the Interstage Management Console, refer to "Starting the Interstage Management Console" and "Stopping the Interstage Management Console" in the Operator's Guide.
4. Log in to the Interstage Management Console.
5. On the [Environment Settings] tab of the [Login User Authentication] node, in "User Repository" select "LDAP Server", and then click the "Update" button.

## 36.2.43 0x0010004E

---

### Explanation

SSL environment definition file may have been destroyed. Alternatively, the operating management directory is incorrect.

### User Action

If the JNDI user application or LDAP command is used, check the content of the specified SSL environment definition file. For details of the content of the SSL environment definition file, refer to "Setting up an Environment for SSL Communication" - "Setting an SSL Environment Definition File (Client)" in "Environment Setup" in the Directory Service Operator's Guide.

If the SSL environment definition file has not been destroyed, take the action described below. The action taken is dependant on the certificate and private key management environment that has been set up to conduct encrypted communication via SSL:

#### - Interstage Certificate Environment

The Interstage Certificate Environment may have been damaged. Refer to '[36.4.4 Broken Certificate Environments](#)' - 'Interstage Certificate Environment' and correct the Interstage Certificate Environment.

#### - Certificate/key management environment

Re-execute processing after setting the operation control directory of the certificate/key management environment to be used to the operation control directory (cert\_path) in the SSL environment definition file or cert\_path in the SLENV structure. For information on the operation control directory (cert\_path) in the SSL environment definition file, refer to "Setting up an Environment for SSL Communication" - "Setting an SSL Environment Definition File (Client)" in "Environment Setup" in the Directory Service Operator's Guide.

For information on cert\_path in the SLENV structure, refer to:

- 'Interstage Directory Service Interface' - 'Interface for Opening and Closing Sessions' - 'ldapsl\_init' in 'C Interface' in the Reference Manual (API Edition)
- 'Interstage Directory Service Interface' - 'Configuring the Structure' - 'SLENV Structure' in 'C Interface' in the 'Reference Manual (API Edition)'

If this error occurs when Interstage Directory Service is used as the user repository for the Interstage Management Console, complete the following steps:

1. On the [Environment Settings] tab of the [Login User Authentication] node, in "User Repository" select "OS", and then click the "Update" button.
2. Log out from the Interstage Management Console.
3. Restart the Interstage Management Console. For details on starting/stopping the Interstage Management Console, refer to "Starting the Interstage Management Console" and "Stopping the Interstage Management Console" in the Operator's Guide.
4. Log in to the Interstage Management Console.
5. On the [Environment Settings] tab of the [Login User Authentication] node, in "User Repository" select "LDAP Server", and then click the "Update" button.

## 36.2.44 0x0010005A

---

### Explanation

The file descriptors (fd) that can be used by the client may be insufficient.

### User Action

If any of the following errors is returned together with this error, take the action indicated by that error number:

- 0x00300017
- 0x00300022
- [0x9001013E](#)

- 0x90020068
- 0x90030068
- 0x90040068
- 0x90050068
- 0x90060068
- 0x900B0074
- 0x9011013E
- 0x90130068
- 0x90140068
- 0x90150068
- 0x9016013E

If there is no improvement after taking the indicated action or if this error occurs alone, collect diagnostic information by executing the *iscollectinfo* command and then contact your service engineer.

## 36.2.45 0x00150001

---

### Explanation

The connection was broken while processing a request with the connection destination.

### User Action

- Replication operation

Match the settings of the following items in the SSL configuration used by the master repository with those used by the slave repository.

- SSL protocol version
- Encryption method

Check for errors in the host name and port number of the connection destination.

- Connection between the LDAP client (ldapmodify, ldapsearch, ldapdelete, user application) and repository

Match the following settings:

- The SSL version (`ssl_version`) in the SSL environment definition file used by the LDAP client and the SSL protocol version of the SSL configuration used by the repository
- The encryption algorithm (`crypt`) in the SSL environment definition file used by the LDAP client and the encryption method of the SSL configuration used by the repository

Check for errors in the host name and port number of the connection destination.

- Common items

After correcting the SSL configuration, restart the repository that uses the SSL configuration so that it is reflected in the repository.

Check the connection destination system log for any recorded messages. If a message was recorded, take the indicated action at the connection destination.

For information on the SSL version (`ssl_version`) and encryption algorithm (`crypt`) in the SSL environment definition file, refer to "Setting up an Environment for SSL Communication" - "Setting an SSL Environment Definition File (Client)" in "Environment Setup" in the Directory Service Operator's Guide.

For information on `ssl_version` and `crypt` in the SLENV structure, see the following:

- 'Interstage Directory Service Interface' - 'Interface for Opening and Closing Sessions' - 'ldapsl\_init' in 'C Interface' in the 'Reference Manual (API Edition)'

- 'Interstage Directory Service Interface' - 'Configuring the Structure' - 'SSENV Structure' in 'C Interface' in the 'Reference Manual (API Edition)'

If there is no improvement, collect diagnostic information by executing the *iscollectinfo* command and then contact your service engineer.

## 36.2.46 0x00200001

---

### Explanation

An internal conflict occurred inside the SSL library.

### User Action

Collect diagnostic information by executing the *iscollectinfo* command and then contact your service engineer.

## 36.2.47 0x00200002

---

### Explanation

The number of sessions in one process has exceeded the allowable maximum of 1024.

### User Action

On the application side, limit the number of session in one process to less than 1024. For details, refer to the following manual.

'How to Use JNDI' - 'Procedure for Application Processing' - 'Opening the Session/Default Settings and User Authentication' - 'Maximum Number of Sessions' in 'Creating an Application (JNDI)' in the 'Directory Service Operator's Guide'

## 36.2.48 0x00300004

---

### Explanation

The directory specified in the SSL environment definition file is incorrect.

### User Action

If the specified directory on the slot information directory (*slot\_path*) or operation control directory (*cert\_path*) is a read-only device (or other reason), specify a correct directory and then re-execute.

For details of the SSL environment definition file, refer to "Setting up an Environment for SSL Communication" - "Setting an SSL Environment Definition File (Client)" in "Environment Setup" in the Directory Service Operator's Guide.

For information on the SSENV structure, see the following:

- 'Interstage Directory Service Interface' - 'Interface for Opening and Closing Sessions' - 'ldapssl\_init' in 'C Interface' in the 'Reference Manual (API Edition)'
- 'Interstage Directory Service Interface' - 'Configuring the Structure' - 'SSENV Structure' in 'C Interface' in the 'Reference Manual (API Edition)'

If there is no improvement, collect diagnostic information by executing the *iscollectinfo* command and then contact your service engineer.

## 36.2.49 0x00300017, 0x00300022

---

### Explanation

The file descriptors (*fd*) that can be used by the client may be insufficient.

### User Action

Refer to '[36.4.5 When the File Descriptors \(fd\) that Can be Used in the Client are Insufficient](#)' and take the required action.

## 36.2.50 0x00300021

---

### Explanation

The specified user PIN is incorrect.

### User Action

Make the SSL environment definition file user PIN (tkn\_pwd) or SLENV structure 'tkn\_pwd' the user PIN for the certificate/key management environment and re-execute processing.

Encrypt the SSL environment definition file user PIN (tkn\_pwd) after correcting it.

If the user PIN (tkn\_pwd) specified in the SSL environment definition file is correct, it is possible that the user PIN (tkn\_pwd) was not encrypted. Use the *irepencupin* command to encrypt the user PIN (tkn\_pwd).

For details on the SSL environment definition file user PIN (tkn\_pwd), refer to "Setting up an Environment for SSL Communication" - "Setting an SSL Environment Definition File (Client)" in "Environment Setup" in the Directory Service Operator's Guide. For details about encrypting the user PIN (tkn\_pwd), refer to "Setting up an Environment for SSL Communication" - "Encrypting the User PIN (Client)" in "Environment Setup" in the Directory Service Operator's Guide.

For information on tkn\_pwd in the SLENV structure, refer to the following:

- 'Interstage Directory Service Interface' - 'Interface for Opening and Closing Sessions' - 'ldapssl\_init' in 'C Interface' in the Reference Manual (API Edition)
- 'Interstage Directory Service Interface' - 'Configuring the Structure' - 'SLENV Structure' in 'C Interface' in the Reference Manual (API Edition)

## 36.2.51 0x00400001 to 0x0040000E

---

### Explanation

A socket access error occurred while using SSL.

### User Action

- Communication with the connection destination repository is not possible. Check for errors in the host name and port number of the connection destination.
- Use the Interstage Management Console to check whether the repository is active.
  - If the repository is stopped, activate the repository.
  - If the repository is active, stop it and then restart it.
  - If the repository is in an abnormal state, stop it and then activate it.
- Contact the network administrator to check for network environment setting errors (for example, host file setting, DNS server/DHCP server specifications, DNS server/DHCP server settings). If an error is found, correct the network environment and then reset it.
- Error code: 0x00400004, detail code: 145(0x91)

This error code may be output if the repository server load is heavy.

- For user applications, retry can avoid the error.
- For the *ldapmodify*, *ldapsearch*, and *ldapdelete* commands, re-execute the command.
- For replication connection checks, recheck the connection.
- For replication operations, check whether the connection destination repository is active using the above method.

If SSL is used for communication with the repository server, and the number of clients is large and the frequency of access to Interstage Directory Service is high, there may be no improvement. In this case, consider lightening the server load by, for example, using the SSL accelerator.

If there is still no improvement, collect diagnostic information by executing the *iscollectinfo* command and then contact your service engineer.

## 36.2.52 0x00500003

---

### Explanation

The SSL protocol version does not match that of the connection destination.

### User Action

- Replication operation

Match the SSL protocol version of the master repository SSL configuration to the version of the slave repository.

- Connection between the LDAP client (ldapmodify, ldapsearch, ldapdelete, user application) and repository

Match the SSL version (ssl\_version) of LDAP client's SSL environment definition file to the SSL protocol version of the repository's SSL configuration.

- Common items

After correcting the SSL configuration, restart the repository that uses the SSL configuration so that it is reflected in the repository.

Check the connection destination system log for any recorded messages. If a message was recorded, take the indicated action at the connection destination.

For information on the SSL version (ssl\_version) and encryption algorithm (crypt) in the SSL environment definition file, refer to "Setting up an Environment for SSL Communication" - "Setting an SSL Environment Definition File (Client)" in "Environment Setup" in the Directory Service Operator's Guide.

If there is no improvement, collect diagnostic information by executing the *iscollectinfo* command and then contact your service engineer.

## 36.2.53 0x00500004

---

### Explanation

The SSL protocol version or encryption method does not match that of the connection destination.

### User Action

- Replication operation

Match the settings of the following items in the SSL configuration used by the master repository with those used by the slave repository.

- SSL protocol version
- Encryption method

- Connection between the LDAP client (ldapmodify, ldapsearch, ldapdelete, user application) and repository

Match the following settings:

- The SSL version (ssl\_version) in the SSL environment definition file used by the LDAP client and the SSL protocol version of the SSL configuration used by the repository
- The encryption algorithm (crypt) in the SSL environment definition file used by the LDAP client and the encryption method of the SSL configuration used by the repository

- Common items

After correcting the SSL configuration, restart the repository that uses the SSL configuration so that the SSL configuration is reflected in the repository.

Check the connection destination system log for any recorded messages. If a message was recorded, take the indicated action at the connection destination.

For information on the SSL version (`ssl_version`) and encryption algorithm (`crypt`) in the SSL environment definition file, refer to "Setting up an Environment for SSL Communication" - "Setting an SSL Environment Definition File (Client)" in "Environment Setup" in the Directory Service Operator's Guide.

If there is no improvement, collect diagnostic information by executing the `iscollectinfo` command and then contact your service engineer.

## **36.2.54 0x0050000D**

---

### Explanation

Non-SSL data or data not based on the SSL protocol attempted to access the SSL port.

### User Action

A protocol other than SSL may have been used for access. Check whether the protocol, connection destination host name, or port number is correct.

If there is no improvement, collect diagnostic information by executing the `iscollectinfo` command and then contact your service engineer.

## **36.2.55 0x0050000F**

---

### Explanation

The SSL protocol version or encryption method does not match that of the connection destination.

### User Action

- Replication operation

Match the settings of the following items in the SSL configuration used by the master repository with those used by the slave repository.

- SSL protocol version
- Encryption method

- Connection between the LDAP client (`ldapmodify`, `ldapsearch`, `ldapdelete`, user application) and repository

Match the following settings:

- The SSL version (`ssl_version`) in the SSL environment definition file used by the LDAP client and the SSL protocol version of the SSL configuration used by the repository
- The encryption algorithm (`crypt`) in the SSL environment definition file used by the LDAP client and the encryption method of the SSL configuration used by the repository

- Common items

After correcting the SSL configuration, restart the repository that uses the SSL configuration so that it is reflected in the repository.

Check the connection destination system log for any recorded messages. If a message was recorded, take the indicated action at the connection destination.

For information on the SSL version (`ssl_version`) and encryption algorithm (`crypt`) in the SSL environment definition file, refer to "Setting up an Environment for SSL Communication" - "Setting an SSL Environment Definition File (Client)" in "Environment Setup" in the Directory Service Operator's Guide.

If there is no improvement, collect diagnostic information by executing the `iscollectinfo` command and then contact your service engineer.

## **36.2.56 0x00600001**

---

### Explanation

The specified encryption algorithm is incorrect, or the client and server encryption algorithms do not match.

## User Action

Check the contents specified for the encryption algorithm and set a correct value.

After correcting the settings for the SSL environment definition file encryption algorithm (crypt) or SLENV structure crypt, re-execute processing.

For details on the SSL environment definition file encryption algorithm (crypt), refer to "Setting up an Environment for SSL Communication" - "Setting an SSL Environment Definition File (Client)" in "Environment Setup" in the Directory Service Operator's Guide.

For information on crypt in the SLENV structure, refer to the following:

- 'Interstage Directory Service Interface' - 'Interface for Opening and Closing Sessions' - 'ldapssl\_init' in 'C Interface' in the Reference Manual (API Edition)
- 'Interstage Directory Service Interface' - 'Configuring the Structure' - 'SLENV Structure' in 'C Interface' in the Reference Manual (API Edition)

Check that the client encryption algorithm and the SSL definition encryption method used by the repository are the same. If they are different, correct the encryption method and re-execute processing.

## 36.2.57 0x00700001, 0x00700002

---

The meaning and action to be taken vary according to the detail code.

The detail codes are shown below:

- ldapmodify, ldapsearch, and ldapdelete

Within the parentheses () of the displayed message

- C API

The memory address pointed to by the ssl\_err\_detail parameter of the ldapssl\_init() function.

- JNDI

Since the detail code cannot be obtained, check the items shown below. After correcting the SSL definition, the repository that uses the SSL definition must be restarted before the changes are effective in the repository.

1. Make the following settings the same.
  - The version of the SSL environment definition file used by the JNDI application (ssl\_version), and the protocol version of the SSL definition used by the repository
  - The encryption algorithm of the SSL environment definition file used by the JNDI application (crypt), and the SSL definition encryption method used by the repository
2. Check whether the Site certificate has expired.

If it has expired, obtain a new Site certificate from the CA and register it in the certificate/key management environment. For details on obtaining and registering new Site certificates, refer to '[36.4.1 When the Site Certificate has Expired](#)'.
3. Check whether the CA certificate has expired.

If it has expired, obtain a new CA certificate from the CA and register it in the certificate/key management environment. For details on obtaining and registering new CA certificates, refer to '[36.4.2 When the CA Certificate has Expired](#)'.
4. Refer to '[36.4.3 When the Certificate Registration Order is Incorrect](#)' - 'Certificate/key management environments', and re-register the certificate.

### Detail code

- [0x00020028](#)
- [0x00020029](#)
- [0x0002002a](#)
- [0x0002002b](#)

- 0x0002002d
- 0x0002002e
- Others

---

## 0x00020028

### Explanation

The SSL connection failed or was terminated.

### User Action

- Replication operation

Match the settings of the following items in the SSL configuration used by the master repository with those used by the slave repository.

- SSL protocol version
- Encryption method

- Connection between the LDAP client (ldapmodify, ldapsearch, ldapdelete, user application) and repository

Match the following settings:

- The SSL version (`ssl_version`) in the SSL environment definition file used by the LDAP client and the SSL protocol version of the SSL configuration used by the repository
- The encryption algorithm (`crypt`) in the SSL environment definition file used by the LDAP client and the encryption method of the SSL configuration used by the repository

- Common items

After correcting the SSL configuration, restart the repository that uses the SSL configuration so that the SSL configuration is reflected in the repository.

Check the connection destination system log for recorded messages. If a message was recorded, take the indicated action at the connection destination.

For information on the SSL version (`ssl_version`) and encryption algorithm (`crypt`) in the SSL environment definition file, refer to "Setting up an Environment for SSL Communication" - "Setting an SSL Environment Definition File (Client)" in "Environment Setup" in the Directory Service Operator's Guide.

If there is no improvement, collect diagnostic information by executing the `iscollectinfo` command and then contact your service engineer.

---

## 0x00020029

### Explanation

Verification of the connection destination site certificate failed. A CA Certificate required for verification is not registered.

### User Action

Take the following action depending on the certificate and private key management environment that has been set up to conduct encrypted communication via SSL:

- Interstage Certificate Environment

If the local host uses a certificate for testing, stop using the certificate for testing. Instead, acquire site certificates from the CA at the local host and register the certificates for the Interstage Certificate Environment of the local host one by one from the CA Certificate of the root CA.

Regardless of whether the local host uses a certificate for testing, register the CA Certificates required to verify the connection destination site certificate for the Interstage Certificate Environment of the local host one by one from the CA Certificate of the root CA.

For details on re-registering certificates, refer to '[36.4.3 When the Certificate Registration Order is Incorrect](#)' - 'Interstage Certificate Environments'.

- Certificate/key management environment

Register the CA Certificates required to verify the connection destination site certificate for the Interstage Certificate Environment or certificate/key management environment of the local host one by one from the CA Certificate of the root CA.

For details on re-registering certificates, refer to '[36.4.3 When the Certificate Registration Order is Incorrect](#)' - 'Certificate/key management environment'.

If there is no improvement, collect diagnostic information by executing the *iscollectinfo* command and then contact your service engineer.

---

## 0x0002002a

### Explanation

Failed to verify the CA Certificate or site certificate.

### User Action

The registration order of the certificates required to verify the certificate indicated by the certificate nickname is invalid. Correct and register the certificates in the Interstage certificate environment or certificate/key management environment one by one from the CA certificate of the root CA.

For details on re-registering certificates, refer to '[36.4.3 When the Certificate Registration Order is Incorrect](#)' - 'Certificate/key management environment'.

---

## 0x0002002b

### Explanation

An unsupported site certificate has been received.

### User Action

Acquire supported site certificates from the CA at the connection destination and then register them for the Interstage Certificate Environment or certificate/key management environment one by one from the CA Certificate of the root CA.

Also register the CA Certificates required to verify the connection destination site certificate for the Interstage Certificate Environment or certificate/key management environment of the local host one by one from the CA Certificate of the root CA.

For details on re-registering certificates, refer to '[36.4.3 When the Certificate Registration Order is Incorrect](#)'.

For information on supported certificates, see the following:

'Setting and Use of an Interstage Certificate Environment' in the Security System Guide - 'Certificates and Private Keys'

If there is no improvement, collect diagnostic information by executing the *iscollectinfo* command and then contact your service engineer.

---

## 0x0002002c

### Explanation

A CA Certificate or site certificate has been canceled.

### User Action

Acquire a new CA Certificate or site certificate from the CA and then register it for the Interstage Certificate Environment or certificate/key management environment.

After opening CRL in Internet Explorer, the serial number of the canceled certificate can be referenced. Check the serial number of the canceled certificate using the following procedure and then acquire and register a new certificate to replace the canceled certificate.

- Interstage Certificate Environment

Check the canceled certificate using the following procedure:

1. On the Interstage Management Console, select [System] > [Security] > [Certificates] > [Site Certificates] (If on the Admin Server, select [Application Management] > [Interstage] > [Interstage Application Server] > [Security] > [Certificates] > [Site Certificates]), and then reference the serial number of the site certificate on the [List] tab to check the canceled site certificate.
2. On the Interstage Management Console, select [System] > [Security] > [Certificates] > [CA Certificates] (If on the Admin Server, select [Application Management] > [Interstage] > [Interstage Application Server] > [Security] > [Certificates] > [CA Certificates]), and then reference the serial number of the CA Certificate on the [List] tab to check the canceled CA Certificate.

To acquire and register a certificate, use either of the following methods:

- 'Setting and Use of an Interstage Certificate Environment' in the Security System Guide - 'Configuring the Interstage Certificate Environment with CSR'
- 'Setting and Use of an Interstage Certificate Environment' in the Security System Guide - 'Configuring the Interstage Certificate Environment with PKCS#12'
- Certificate/key management environment

Check the canceled certificate using the following procedure:

- Use the *cmlistcert* command to check the certificates registered for the certificate/key management environment.
- Use the *cmdspcert* command to check the canceled certificate by referencing the serial number of each registered certificate.

For *cmlistcert* and *cmdspcert* command details, see the following:

'SSL Environment Setting Commands' in the Reference Manual (Command Edition)

For the methods of acquiring and registering certificates, see the following in the order indicated and take the required action:

- 'Setting and Use of the Certificate/Key Management Environment Using the SMEE Command' in the Security System Guide - 'Environment Setting for Certificate/Key Management Environment' - 'Creating a Secret Key and Acquiring a Certificate'
- 'Setting and Use of the Certificate/Key Management Environment Using the SMEE Command' in the Security System Guide - 'Environment Setting for Certificate/Key Management Environment' - 'Registering the Certificate and CRL'

## 0x0002002d

### Explanation

Connection destination access was denied because an expired site certificate was received.

### User Action

Acquire a new site certificate from the CA at the connection destination and then register it for the Interstage Certificate Environment or certificate/key management environment of the connection destination. For details on obtaining and registering new Site certificates, refer to '[36.4.1 When the Site Certificate has Expired](#)'.

## 0x0002002e

### Explanation

Verification of the connection destination site certificate failed. A CA Certificate required for verification is not registered.

### User Action

Take the following action depending on the certificate and private key management environment that has been set up to conduct encrypted communication via SSL:

- Interstage Certificate Environment

If the local host uses a certificate for testing, stop using the certificate for testing. Instead, acquire site certificates from the CA at the local host and register the certificates for the Interstage Certificate Environment of the local host one by one from the CA Certificate of the root CA.

Regardless of whether the local host uses a certificate for testing, register the CA Certificates required to verify the connection destination site certificate for the Interstage Certificate Environment of the local host one by one from the CA Certificate of the root CA.

For details on registering certificates, refer to '[36.4.3 When the Certificate Registration Order is Incorrect](#)' - 'Interstage Certificate Environments'.

- Certificate/key management environment

Register the CA Certificates required to verify the connection destination site certificate for the Interstage Certificate Environment or certificate/key management environment of the local host one by one from the CA Certificate of the root CA.

For details on re-registering certificates, refer to '[36.4.3 When the Certificate Registration Order is Incorrect](#)' - 'Certificate/key management environment'.

If there is no improvement, collect diagnostic information by executing the *iscollectinfo* command and then contact your service engineer.

---

## Others

### Explanation

An unexpected error was detected in an SSL function.

### User Action

Collect diagnostic information by executing the *iscollectinfo* command and then contact your service engineer.

---

## 36.2.58 0x00700003

The meaning and action to be taken vary according to the detail code.

The detail codes are shown below:

- ldapmodify, ldapsearch, and ldapdelete

Within the parentheses () of the displayed message

- C API

The memory address pointed to by the *ssl\_err\_detail* parameter of the *ldapssl\_init()* function.

- JNDI

Since the detail code cannot be obtained, check the items shown below. After correcting the SSL definition, the repository that uses the SSL definition must be restarted before the changes are effective in the repository.

1. Make the following settings the same.

- The version of the SSL environment definition file used by the JNDI application (*ssl\_version*), and the protocol version of the SSL definition used by the repository
- The encryption algorithm of the SSL environment definition file used by the JNDI application (*crypt*), and the SSL definition encryption method used by the repository

2. Refer to '[36.4.3 When the Certificate Registration Order is Incorrect](#)' - 'Certificate/key management environment', and re-register the certificate.

### Detail Code

- [0x0001](#)
- [0x0004](#)
- [0x0005](#)
- [Others](#)

---

## 0x0001

## Explanation

The SSL protocol version or encryption method does not match that of the connection destination.

## User Action

- Replication operation

Match the settings of the following items in the SSL configuration used by the master repository with those used by the slave repository.

- SSL protocol version
- Encryption method
- Connection between the LDAP client (ldapmodify, ldapsearch, ldapdelete, user application) and repository

Match the following settings:

- The SSL version (ssl\_version) in the SSL environment definition file used by the LDAP client and the SSL protocol version of the SSL configuration used by the repository
- The encryption algorithm (crypt) in the SSL environment definition file used by the LDAP client and the encryption method of the SSL configuration used by the repository
- Common items

After correcting the SSL configuration, restart the repository that uses the SSL configuration so that the SSL configuration is reflected in the repository.

Check the connection destination system log for any recorded messages. If a message was recorded, take the indicated action at the connection destination.

For information about the SSL version (ssl\_version) and encryption algorithm (crypt) in the SSL environment definition file, refer to "Setting up an Environment for SSL Communication" - "Setting an SSL Environment Definition File (Client)" in "Environment Setup" in the Directory Service Operator's Guide.

If there is no improvement, collect diagnostic information by executing the *iscollectinfo* command and then contact your service engineer.

---

## 0x0004

## Explanation

No site certificate could be received for either of the following reasons:

- No site certificate was registered at the connection destination.
- The connection destination rejected the transmission of the site certificate.

## User Action

The connection destination must acquire site certificates from the CA, register site certificates for the Interstage Certificate Environment or certificate/key management environment one by one from the CA Certificate of the root CA, and then send them.

It is also necessary to register the CA Certificates required to verify the connection destination site certificate for the Interstage Certificate Environment or certificate/key management environment of the local host one by one from the CA Certificate of the root CA.

For details on registering certificates, refer to '[36.4.3 When the Certificate Registration Order is Incorrect](#)'.

If there is no improvement, collect diagnostic information by executing the *iscollectinfo* command and then contact your service engineer.

---

## 0x0005

## Explanation

Verification of the connection destination site certificate failed. A CA Certificate required for verification is not registered.

## User Action

Register the CA Certificates required to verify the connection destination site certificate for the Interstage Certificate Environment or certificate/key management environment of the local host one by one from the CA Certificate of the root CA.

For details on registering certificates, refer to '[36.4.3 When the Certificate Registration Order is Incorrect](#)'.

If there is no improvement, collect diagnostic information by executing the *iscollectinfo* command and then contact your service engineer.

---

## Others

### Explanation

An unexpected error was detected in an SSL function.

### User Action

Collect diagnostic information by executing the *iscollectinfo* command and then contact your service engineer.

---

## 36.2.59 0x9001013E

### Explanation

The file descriptors (fd) that can be used by the client may be insufficient.

### User Action

Refer to '[36.4.5 When the File Descriptors \(fd\) that Can be Used in the Client are Insufficient](#)' and take the required action.

---

## 36.2.60 0x90020068

### Explanation

The file descriptors (fd) that can be used by the client may be insufficient.

### User Action

Refer to '[36.4.5 When the File Descriptors \(fd\) that Can be Used in the Client are Insufficient](#)' and take the required action.

---

## 36.2.61 0x90030068

### Explanation

The file descriptors (fd) that can be used by the client may be insufficient.

### User Action

Refer to '[36.4.5 When the File Descriptors \(fd\) that Can be Used in the Client are Insufficient](#)' and take the required action.

---

## 36.2.62 0x90040068

### Explanation

The file descriptors (fd) that can be used by the client may be insufficient.

### User Action

Refer to '[36.4.5 When the File Descriptors \(fd\) that Can be Used in the Client are Insufficient](#)' and take the required action.

---

## 36.2.63 0x90050068

## Explanation

The file descriptors (fd) that can be used by the client may be insufficient.

## User Action

Refer to '[36.4.5 When the File Descriptors \(fd\) that Can be Used in the Client are Insufficient](#)' and take the required action.

## **36.2.64 0x90060068**

---

## Explanation

The file descriptors (fd) that can be used by the client may be insufficient.

## User Action

Refer to '[36.4.5 When the File Descriptors \(fd\) that Can be Used in the Client are Insufficient](#)' and take the required action.

## **36.2.65 0x900B0065**

---

## Explanation

A user other than the user who created the certificate/key management environment used the certificate/key management environment.

## User Action

A certificate/key management environment must be used by the user who created it. Alternatively, create and use a new certificate/key management environment. For information on the creation of a certificate/key management environment, refer to "Setting up an Environment for SSL Communication" - 'Setup of an SSL Communication Environment (Between Client and Server)' - 'Client' in 'Environment Setup (Using the Standard Database)' in the Directory Service Operator's Guide.

If there is no improvement, collect diagnostic information by executing the *iscollectinfo* command and then contact your service engineer.

## **36.2.66 0x900B0074**

---

## Explanation

The file descriptors (fd) that can be used by the client may be insufficient.

## User Action

Refer to '[36.4.5 When the File Descriptors \(fd\) that Can be Used in the Client are Insufficient](#)' and take the required action.

## **36.2.67 0x9011013E**

---

## Explanation

The file descriptors (fd) that can be used by the client may be insufficient.

## User Action

Refer to '[36.4.5 When the File Descriptors \(fd\) that Can be Used in the Client are Insufficient](#)' and take the required action.

## **36.2.68 0x90130068**

---

## Explanation

The file descriptors (fd) that can be used by the client may be insufficient.

## User Action

Refer to '[36.4.5 When the File Descriptors \(fd\) that Can be Used in the Client are Insufficient](#)' and take the required action.

## 36.2.69 0x90140068

---

### Explanation

The file descriptors (fd) that can be used by the client may be insufficient.

### User Action

Refer to '[36.4.5 When the File Descriptors \(fd\) that Can be Used in the Client are Insufficient](#)' and take the required action.

## 36.2.70 0x90150068

---

### Explanation

An authority error occurred when referencing the CA Certificates.

### User Action

Refer to '[36.4.4 Broken Certificate Environments](#)' and correct the Interstage Certificate Environment or certificate/key management environment.

The file descriptors (fd) that can be used by the client may be insufficient.

Refer to '[36.4.5 When the File Descriptors \(fd\) that Can be Used in the Client are Insufficient](#)' and take the required action.

## 36.2.71 0x9016013E

---

### Explanation

The file descriptors (fd) that can be used by the client may be insufficient.

### User Action

Refer to '[36.4.5 When the File Descriptors \(fd\) that Can be Used in the Client are Insufficient](#)' and take the required action.

## 36.2.72 Others

---

### Explanation

An unexpected error was detected in an SSL function.

### User Action

Collect diagnostic information by executing the *iscollectinfo* command and then contact your service engineer.

## 36.3 SSLException Error Types

---

The SSL Exception error types are shown in the table below.

SSL Exception error types	Error type values (int)
CERT_EXPIRED	1
CA_CERT_EXPIRED	2
VERIFY_CERT_ERROR	3
DEC_PRIKEY_ERROR	4
SVR_CERT_EXPIRED	5
VERIFY_SVR_CERT_ERROR	6
CLNT_CERT_EXPIRED	7

SSL Exception error types	Error type values (int)
VERIFY_CLNT_CERT_ERROR	8
NOT_EXIST_SECRETKEY	9
PARAM_ERROR	10
MEMORY_ERROR	11
TIME_OUT	12
OTHER_ERROR	13
CONNECT_ERROR	14
INVALID_ENVFILE	15
LINK_ERROR	16
RETRY	17
UNKNOWN_HOST	18
NOT_SSL_ENVFILE	20
SSL_VERSION_INVALID	21
INTERNAL_ERROR	99

### 36.3.1 CERT\_EXPIRED 1

---

#### Explanation

The site certificate has expired.

#### User Action

Take the user action described for SSL error code, 0x00100008.

### 36.3.2 CA\_CERT\_EXPIRED 2

---

#### Explanation

The certificate of the certificate authority (issuing authority certificate) has expired.

#### User Action

Take the user action described for SSL error code, 0x00100009.

### 36.3.3 VERIFY\_CERT\_ERROR 3

---

#### Explanation

Verification of the certificate authority certificate or site certificate failed.

#### User Action

Take the user action described for SSL error code, 0x0010000C.

### 36.3.4 DEC\_PRIKEY\_ERROR 4

---

#### Explanation

Decryption of the private key failed.

#### User Action

Take the user action described for SSL error code, 0x00100012.

### **36.3.5 SVR\_CERT\_EXPIRED 5**

---

#### Explanation

The site certificate of the connection destination has expired.

#### User Action

Take the user action described for SSL error code, 0x00100018.

### **36.3.6 VERIFY\_SVR\_CERT\_ERROR 6**

---

#### Explanation

Verification of the site certificate of the connection destination failed.

#### User Action

Take the user action described for SSL error code, 0x0010001A.

### **36.3.7 CLNT\_CERT\_EXPIRED 7**

---

#### Explanation

This site certificate has expired.

#### User Action

Take the user action described for SSL error code, 0x0010002E.

### **36.3.8 VERIFY\_CLNT\_CERT\_ERROR 8**

---

#### Explanation

Verification of the site certificate failed.

#### User Action

Take the user action described for SSL error code, 0x00100035.

### **36.3.9 NOT\_EXIST\_SECRETKEY 9**

---

#### Explanation

There is no private key for the site certificate.

#### User Action

Take the user action described for SSL error code, 0x0010003B.

### **36.3.10 PARAM\_ERROR 10**

---

#### Explanation

There is an error in the settings of the SSL environment definition file.

#### User Action

Take the user action described for each SSL error code.

### **36.3.11 MEMORY\_ERROR 11**

---

#### Explanation

There was insufficient memory.

#### User Action

Take the user action described for each SSL error code.

### **36.3.12 TIME\_OUT 12**

---

#### Explanation

There was a timeout.

#### User Action

Take the user action described for SSL error code, 0x00010001.

### **36.3.13 OTHER\_ERROR 13**

---

#### Explanation

Another type of error has occurred.

#### User Action

Take the user action described for each SSL error code.

### **36.3.14 CONNECT\_ERROR 14**

---

#### Explanation

An error occurred during connection with the server.

#### User Action

Take the user action described for SSL error codes, 0x00400001 to 0x0040000E.

### **36.3.15 INVALID\_ENVFILE 15**

---

#### Explanation

The environment file has a format error.

#### User Action

Check the format of the environment file.

### **36.3.16 LINK\_ERROR 16**

---

#### Explanation

Loading of a library failed.

#### User Action

Refer to "How to Use JNDI" - 'Application Development Notes' in 'Creating an Application (JNDI)' in the Directory Service Operator's Guide and check that the required library is stored in the correct directory.

### **36.3.17 RETRY 17**

---

#### Explanation

Reception is disabled because transmission is in progress.

#### User Action

Try again after a while.

### **36.3.18 UNKNOWN\_HOST 18**

---

#### Explanation

The host IP address could not be identified.

#### User Action

Check that the host name and the IP address are correct.

### **36.3.19 NOT\_SSL\_ENVFILE 20**

---

#### Explanation

No environment file is specified or exists.

#### User Action

Specify a correct environment file.

### **36.3.20 SSL\_VERSION\_INVALID 21**

---

#### Explanation

There is an error in the specification of the SSL version.

#### User Action

Check the value of the SSL version.

### **36.3.21 INTERNAL\_ERROR 99**

---

#### Explanation

A session has been opened when the number of sessions in the process has exceeded the allowable maximum of 1024.

#### User Action

Refer to "How to Use JNDI" - 'Procedure for Application Processing' - 'Opening the Session/Default Settings and User Authentication' - 'Maximum Number of Sessions' in 'Creating an Application (JNDI)' in the Directory Service Operator's Guide.

## 36.4 When the Certificate has Expired

---

### 36.4.1 When the Site Certificate has Expired

---

Obtain a new Site certificate from the CA, and register it in the Interstage certificate environment or certificate/key management environment.

- Interstage Certificate Environments

For details on obtaining and registering the certificate, refer to the following:

- 'Configuring Environments' - 'Using a CSR (Certificate Signing Request)' in 'Setting and Use of the Interstage Certificate Environment' in the Security System Guide
- 'Configuring Environments' - 'Using PKCS#12 Data' in 'Setting and Use of the Interstage Certificate Environment' in the Security System Guide

- Certificate/key management environments

For details on obtaining and registering the certificate, refer to the following:

1. 'Environment Setting for Certificate/Key Management Environment' - 'Creating a Private Key and Acquiring a Certificate' in 'Setting and Use of the Certificate/Key Management Environment Using the SMEE Command' in the Security System Guide
2. 'Environment Setting for Certificate/Key Management Environment' - 'Registering the Certificate and CRL' in 'Setting and Use of the Certificate/Key Management Environment Using the SMEE Command' in the Security System Guide

### 36.4.2 When the CA Certificate has Expired

---

Obtain the new CA certificate from the CA, and register it in the Interstage certificate environment or certificate/key management environment.

- Interstage Certificate Environment

Check the CA certificate validity according to the following procedure.

In the Interstage Management Console, click [System] > [Security] > [Certificates] > [CA Certificates] > [List].

(In the Admin Server, click [Application Management] > [Interstage Management Console] > [Interstage Application Server] > [Security] > [Certificates] > [CA Certificates] > [List].

For details on obtaining and registering the certificate, refer to the following:

- 'Configuring Environments' - 'Using a CSR (Certificate Signing Request)' in 'Setting and Use of the Interstage Certificate Environment' in the Security System Guide
- 'Configuring Environments' - 'Using PKCS#12 Data' in 'Setting and Use of the Interstage Certificate Environment' in the Security System Guide

- Certificate/key management environment

Take the following action.

1. Check the CA certificate validity using the `cmdspcert` command.
2. Obtain and register a new CA certificate in place of the expired CA certificate.
3. Re-register the CA certificate and Site certificate issued by the CA.

The method of obtaining the certificate depends on the CA. For details on the `cmdspcert` and `cmrmcert` commands, refer to "SSL Environment Setting Commands" in the Reference Manual (Command Edition).

For details on registering certificates, refer to "Environment Setting for Certificate/Key Management Environment" - 'Registering the Certificate and CRL' in 'Setting and Use of the Certificate/Key Management Environment Using the SMEE Command' in the Security System Guide.

## 36.4.3 When the Certificate Registration Order is Incorrect

---

Re-register the CA certificate in the Interstage certificate environment or certificate/key management environment, starting with the root certificate.

### - Interstage Certificate Environment

For details on obtaining and registering the certificate, refer to the following:

- 'Configuring Environments' - 'Using a CSR (Certificate Signing Request)' in 'Setting and Use of the Interstage Certificate Environment' in the Security System Guide
- 'Configuring Environments' - 'Using PKCS#12 Data' in 'Setting and Use of the Interstage Certificate Environment' in the Security System Guide

Note the following points when deleting a certificate to correct the certificate registration order.

- When a Site certificate is deleted, the corresponding private key is also deleted. Even if only the Site certificate is left behind as a file, the Site certificate in the file cannot be re-registered.
- When a CA certificate is deleted, the CA certificate issued by the CA and the Site certificate can no longer be used.

For details on deleting certificates, refer to "SSL Environment Setting Commands" - 'scsdelete' in the Reference Manual (Command Edition).

### - Certificate/key management environment

For details on obtaining and registering the certificate, refer to the following:

1. 'Environment Setting for Certificate/Key Management Environment' - 'Creating a Private Key and Acquiring a Certificate' in 'Setting and Use of the Certificate/Key Management Environment Using the SMEE Command' in the Security System Guide
2. 'Environment Setting for Certificate/Key Management Environment' - 'Registering the Certificate and CRL' in 'Setting and Use of the Certificate/Key Management Environment Using the SMEE Command' in the Security System Guide

Note the following points when deleting a certificate to correct the certificate registration order.

- When a Site certificate is deleted, the corresponding private key is also deleted. Even if only the Site certificate is left behind as a file, the Site certificate in the file cannot be re-registered.
- When a CA certificate is deleted, the CA certificate issued by the CA and the Site certificate can no longer be used.

For details on deleting certificates, refer to "SSL Environment Setting Commands" - 'cmrmcert' in the Reference Manual (Command Edition).

## 36.4.4 Broken Certificate Environments

---

### - Interstage Certificate Environment

1. Check that all services and server applications have stopped. For details on stopping and starting services and server applications, refer to the appropriate service/application manual.
2. Restore the backed up Interstage certificate environment

Restore the Interstage certificate environment from the backed up resources. For details on backing up Interstage certificate environment resources, refer to the following:

- 'Backing Up and Restoring Resources' - 'Restore Procedure (for Systems Other than the Admin Server)' - 'Restoring Interstage Certificate Environment Resources' in 'Maintenance (Resource Backup)' in the Operator's Guide
- If there is no improvement after taking the above action, or the resources are not backed up, set up the Interstage certificate environment again. For details on setting up the Interstage certificate environment, refer to "Configuring Environments" in 'Setting and Use of the Interstage Certificate Environment' in the Security System Guide.

### - Certificate/key management environment

1. Stop any programs using the certificate/key management environment.  
Check that all programs using the certificate/key management environment have stopped.

2. Restore the backed up certificate/key management environment.

Restore the backed up certificate/key management environment. To restore the certificate/key management environment, use the same method as for creating the backup.

If there is no improvement after taking the above action, or the resources are not backed up, set up the certificate/key management environment again. For details on setting up the certificate/key management environment, refer to "Environment Setting for Certificate/Key Management Environment" in 'Setting and Use of the Certificate/Key Management Environment Using the SMEE Command' in the Security System Guide.

If there is still no improvement, collect diagnostic information by executing the *iscollectinfo* command and then contact your service engineer.

## 36.4.5 When the File Descriptors (fd) that Can be Used in the Client are Insufficient

---

Solaris32/64 Linux32/64

Use *ulimit(1)* or *setrlimit(2)* to increase the file descriptors that can be used. Add the values calculated according to the following formula to the current value.

$21 + (5 \times \text{number of SSL sessions open at the same time})$

For details about opening the session, refer to the following:

- JNDI

'How to Use JNDI' - 'Procedure for Application Processing' - 'Opening a Session and Performing Initial Setup and User Authentication' in 'Creating an Application (JNDI)' in the Directory Service Operator's Guide

- C API

'How to Use C API' - 'Procedure for Application Processing' - 'Opening the Session/Default Settings' in 'Creating an Application (C API)' in the Directory Service Operator's Guide

If there is still no improvement, collect diagnostic information by execute the *iscollectinfo* command and then contact your service engineer.

# Chapter 37 Messages Output by Interstage HTTP Server

This chapter describes the messages output by Interstage HTTP Server.

## 37.1 Error Log of Interstage HTTP Server

Interstage HTTP Server error messages are output to error log files as follows (default setting):

### Output Directory

Error logs are generated in the following directory:

**Windows32/64** (The installation path is the default path.)

```
C:\Interstage\F3FMIhs\servers\  
(Web Server name)\logs\errorlog
```

**Solaris32/64** (The installation path is the default path.)

```
/var/opt/FJSVihs/servers/  
(Web Server name)/logs/errorlog
```

**Linux32/64**

```
/var/opt/FJSVihs/servers/  
(Web Server name)/logs/errorlog
```

### Output Timing

The error log is output when an error occurs in the Web Server.

### Output Format

The output format of an error log is as follows:

```
[Date-and-Time] [Log-level] [client IP-address] (Error-number) Error-explanation: Message-body
```

### Output Items

The details of each output item are as follows:

#### Date-and-Time

Indicates the date and time at which the error occurred.

#### Log-level

Table 37.1 Log Levels

Log level	Severity of the error	Output with the default settings
emerg	Emergency error	The error is output.
alert	Fatal error that must be resolved immediately	The error is output.
crit	Error that must be resolved immediately	The error is output.
error	Insignificant error, ignorable	The error is output.
warn	Warning for an ignorable error	The error is output.
notice	Common event to be specially reported	The error is output.
info	Event not reported by notice (output only when the environment definition is modified)	The error is not output.
debug	Event logged during development or debug of a module (output only when the environment definition is modified)	The error is not output.

client IP-address

IP address of systems such as client or proxy server.

This item is output only when an error occurred on the client during access to Interstage HTTP Server. This item may be omitted.

Error-number

Indicates the number of an error as assigned in the operating system.

This item may be omitted.

Error-explanation

Brief description of an error.

This item may be omitted.

Message-body

Body of an error message.

For details about the bodies of error messages, refer to the Messages manual.

The meaning and user response for each log level is explained in this chapter.

## 37.1.1 Messages Whose Log Levels are emerg

---

### Explanation and User action of Messages

---

**(%s1)%s2: apr\_accept: giving up.**

Variable Information

%s1 = Error details number

%s2 = Error details context

Explanation

An error was detected in the communication process network.

System Action

The communication process is closed. The Web Server continues to operate.

User Action

Resolve the cause of the error according to the error details context (%s2).

---

**(%s1)%s2: Couldn't create accept lock**

Variable Information

%s1 = Error details number

%s2 = Error details context

Explanation

Exclusive resources for connection could not be created.

System Action

The Web Server start processing is cancelled.

User Action

Resolve the cause of the error according to the error details context (%s2).

---

**(%s1)%s2: couldn't grab the accept mutex**

## Variable Information

%s1 = Error details number

%s2 = Error details context

## Explanation

Exclusive resources for connection could not be locked.

## System Action

The Web Server is stopped.

## User Action

Resolve the cause of the error according to the error details context (%s2).

---

## **(%s1)%s2: Couldn't initialize cross-process lock in child**

## Variable Information

%s1 = Error details number

%s2 = Error details context

## Explanation

Exclusive resources for connection could not be initialized.

## System Action

The Web Server is stopped.

## User Action

Resolve the cause of the error according to the error details context (%s2).

---

## **(%s1)%s2: couldn't release the accept mutex**

## Variable Information

%s1 = Error details number

%s2 = Error details context

## Explanation

The lock on exclusive resources for connection could not be released.

## System Action

The Web Server is stopped.

## User Action

Resolve the cause of the error according to the error details context (%s2).

---

## **(%s1)%s2: Couldn't set permissions on cross-process lock; check User and Group directives**

## Variable Information

%s1 = Error details number

%s2 = Error details context

## Explanation

The authority for exclusive resources for connection could not be set.

## System Action

The Web Server start processing is cancelled.

## User Action

Resolve the cause of the error according to the error details context (%s2).

---

### (%s1)%s2: OpenEvent on %s3 event

#### Variable Information

%s1 = Error details number

%s2 = Error details context

%s3 = Event object name

#### Explanation

Event object (%s3) could not be opened.

## System Action

The Web Server program execution processing is continued.

## User Action

Collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

---

### (%s1)%s2: SetEvent on %s3 event

#### Variable Information

%s1 = Error details number

%s2 = Error details context

%s3 = Event object name

#### Explanation

The signal status for event object (%s3) could not be set.

## System Action

The Web Server program execution processing is continued.

## User Action

Collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

## 37.1.2 Messages Whose Log Levels are alert

---

### Explanation and User action of Messages

---

#### %s1: Could not determine the server's fully qualified domain name, using %s2 for ServerName

#### Variable Information

%s1 = Web Server execution program name

%s2 = Web Server name

#### Explanation

The fully qualified domain name (FQDN) could not be detected.

## System Action

The Web Server start processing is continued.

## User Action

Check the ServerName directive in the environment definition file (httpd.conf). If the ServerName directive has been set correctly, collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

---

## **(%s1)%s2: getpwuid: couldn't determine user name from uid %s3, you probably need to modify the User directive**

### Variable Information

%s1 = Error details number

%s2 = Error details context

%s3 = User ID

Note: The error details number (%s1) and the error details context (%s2) may not be output.

### Explanation

The User ID (%s3) entry specified for the User directive in the environment definition file (httpd.conf) could not be obtained.

### System Action

The Web Server is stopped.

### User Action

Take one of the following actions:

- Resolve the cause of the error according to the error details context (%s2).
- Check User ID (%s3) specified by the User directive in the environment definition file (httpd.conf).

---

## **(%s1)%s2: initgroups: unable to set groups for User %s3 and Group %s4**

### Variable Information

%s1 = Error details number

%s2 = Error details context

%s3 = User ID

%s4 = Group ID

### Explanation

The group access list could not be initialized.

### System Action

The Web Server is stopped.

### User Action

Resolve the cause of the error according to the error details context (%s2).

---

## **(%s1)%s2: set dumpable failed - this child will not coredump after software errors**

### Variable Information

%s1 = Error details number

%s2 = Error details context

### Explanation

The core dump could not be set.

## System Action

The Web Server program execution processing is continued.

## User Action

Resolve the cause of the error according to the error details context (%s2).

---

### **(%s1)%s2: setuid: unable to change to uid: %s3**

## Variable Information

%s1 = Error details number

%s2 = Error details context

%s3 = User ID

## Explanation

The User ID (%s3) specified for the User directive in the environment definition file (httpd.conf) could not be set.

## System Action

The Web Server is stopped.

## User Action

Take one of the following actions:

- Resolve the cause of the error according to the error details context (%s2).
- Check User ID (%s3) specified by the User directive in the environment definition file (httpd.conf).

---

### **(%s1)%s2: setgid: unable to set group id to Group %s3**

## Variable Information

%s1 = Error details number

%s2 = Error details context

%s3 = Group ID

## Explanation

The Group ID (%s3) specified for the Group directive in the environment definition file (httpd.conf) could not be set.

## System Action

The Web Server is stopped.

## User Action

Take one of the following actions:

- Resolve the cause of the error according to the error details context (%s2).
- Check Group ID (%s3) specified by the Group directive in the environment definition file (httpd.conf).

---

### **[client %s1] %s2: %s3**

## Variable Information

%s1 = IP address of systems (such as client or proxy server)

%s2 = Access control definition file name

%s3 = Reason for the syntax error in the definition statement

## Explanation

A syntax error was detected in a definition statement of access control definition file (%s2).

### System Action

A response is given using status code "500" (Internal Server Error).

### User Action

Correct definition file (%s2) by referring to the reason for the syntax error in definition statement (%s3).

---

## Child %s1: returned a Fatal error... Apache is exiting!

### Variable Information

%s1 = Process ID of the communication process

### Explanation

An error occurred in Process ID (%s1).

### System Action

The Web Server is stopped.

### User Action

Refer to the message that was output at the same time and fix the error.

---

## no listening sockets available, shutting down

### Explanation

A valid Listen directive has not been set in the environment definition file (httpd.conf).

### System Action

The Web Server program execution processing is aborted.

### User Action

If the Listen directive has not been set in the environment definition file (httpd.conf), set it. If the Listen directive has been set, refer to the message that was output at the same time and fix the error.

---

## 37.1.3 Messages Whose Log Levels are crit

### Explanation and User action of Messages

---

#### %s1: Failed to start the service process.

### Variable Information

%s1 = Service name

### Explanation

An error occurred during startup of the Web Server service (%s1).

### System Action

The Web Server start processing is cancelled.

### User Action

Refer to the message that was output at the same time and fix the error.

---

#### (%s1)%s2: %s3: Unable to start the service manager.

### Variable Information

%s1 = Error details number

%s2 = Error details context

%s3 = Service name

#### Explanation

The service control manager could not be started.

#### System Action

The Web Server start processing is cancelled.

#### User Action

Resolve the cause of the error according to the error details context (%s2).

---

### **(%s1)%s2: alloc\_listener: failed to get a socket for %s3**

#### Variable Information

##### User Action

%s1 = Error details number

%s2 = Error details context

%s3 = Host name

#### Explanation

The communication socket could not be created.

#### System Action

The Web Server program execution processing is aborted.

#### User Action

Resolve the cause of the error according to the error details context (%s2).

---

### **(%s1)%s2: alloc\_listener: failed to set up sockaddr for %s3**

#### Variable Information

%s1 = Error details number

%s2 = Error details context

%s3 = Host name

#### Explanation

The Host (%s3) information specified for the Listen directive in the environment definition file (httpd.conf) could not be obtained.

#### System Action

The Web Server program execution processing is aborted.

#### User Action

Resolve the cause of the error according to the error details context (%s2).

---

### **(%s1)%s2: apr\_proc\_detach failed**

#### Variable Information

%s1 = Error details number

%s2 = Error details context

#### Explanation

A daemon process could not be generated.

## System Action

The Web Server start processing is cancelled.

## User Action

Resolve the cause of the error according to the error details context (%s2).

---

### **(%s1)%s2: cannot allocate scoreboard**

## Variable Information

%s1 = Error details number

%s2 = Error details context

## Explanation

The dynamic memory that is used in the scoreboard could not be acquired.

## System Action

The Web Server start processing is cancelled.

## User Action

Resolve the cause of the error according to the error details context (%s2).

---

### **(%s1)%s2: Child %s3: \_beginthreadex failed. Unable to create all worker threads. Created %s4 of the %s5 threads requested with the ThreadsPerChild configuration directive.**

## Variable Information

%s1 = Error details number

%s2 = Error details context

%s3 = Process ID of the daemon process

%s4 = The number of communication threads that have been created

%s5 = The value set for the ThreadsPerChild directive in the environment definition file (httpd.conf)

## Explanation

The communication thread could not be created.

## System Action

The Web Server is stopped.

## User Action

Resolve the cause of the error according to the error details context (%s2).

---

### **(%s1)%s2: Child %s3: Failed to create a max\_requests event.**

## Variable Information

%s1 = Error details number

%s2 = Error details context

%s3 = Process ID

## Explanation

The event could not be created.

## System Action

The Web Server program execution processing is aborted.

## User Action

Resolve the cause of the error according to the error details context (%s2).

---

### **(%s1)%s2: Child %s3: Failed to create a qwait event.**

## Variable Information

%s1 = Error details number

%s2 = Error details context

%s3 = Process ID

## Explanation

The event could not be created.

## System Action

The Web Server program execution processing is aborted.

## User Action

Resolve the cause of the error according to the error details context (%s2).

---

### **(%s1)%s2: Child %s3: setup\_inherited\_listeners(), WSASocket failed to open the inherited socket.**

## Variable Information

%s1 = Error details number

%s2 = Error details context

%s3 = Process ID

## Explanation

The communication socket could not be created.

## System Action

The daemon process is restarted.

## User Action

Resolve the cause of the error according to the error details context (%s2).

---

### **(%s1)%s2: Child %s3: Unable to %s4**

## Variable Information

%s1 = Error details number

%s2 = Error details context

%s3 = Process ID

%s4 = Erroneous processing contents

## Explanation

Processing (%s4) failed.

## System Action

The Web Server start processing is cancelled.

## User Action

Resolve the cause of the error according to the error details context (%s2).

---

**(%s1)%s2: Child %s3: WAIT\_FAILED -- shutting down server****Variable Information**

%s1 = Error details number  
%s2 = Error details context  
%s3 = Process ID

**Explanation**

An error occurred during wait processing.

**System Action**

The Web Server is stopped.

**User Action**

Resolve the cause of the error according to the error details context (%s2).

---

**(%s1)%s2: Could not open pipe-of-death.****Variable Information**

%s1 = Error details number  
%s2 = Error details context

**Explanation**

A pipe could not be created.

**System Action**

The Web Server start processing is cancelled.

**User Action**

Resolve the cause of the error according to the error details context (%s2).

---

**(%s1)%s2: Failed to get the full path of %s3****Variable Information**

%s1 = Error details number  
%s2 = Error details context  
%s3 = Web Server program name

**Explanation**

The full path of the Web Server program (%s3) could not be found.

**System Action**

The Web Server program execution processing is aborted.

**User Action**

Resolve the cause of the error according to the error details context (%s2).

---

**(%s1)%s2: Fatal error: Invalid Scoreboard path %s3****Variable Information**

%s1 = Error details number  
%s2 = Error details context  
%s3 = Scoreboard file path

### Explanation

The full path of the scoreboard file (%s3) could not be found.

### System Action

The Web Server start processing is cancelled.

### User Action

Resolve the cause of the error according to the error details context (%s2).

---

## **(%s1)%s2: Fatal error: unable to create global pool for use with by the scoreboard**

### Variable Information

%s1 = Error details number

%s2 = Error details context

### Explanation

The memory management area that is used in scoreboard management could not be created.

### System Action

The Web Server start processing is cancelled.

### User Action

Resolve the cause of the error according to the error details context (%s2).

---

## **(%s1)%s2: ihs\_inc\_retry\_connection: failed to set up sockaddr for %s3**

### Variable Information

%s1 = Error details number

%s2 = Error details context

%s3 = Host name

### Explanation

Failed to get the information for host name (%s3) that was set for the Listen directive in the environment definition file (httpd.conf).

### System Action

The Web Server program execution processing is aborted.

### User Action

Resolve the cause of the error according to the error details context (%s2).

---

## **(%s1)%s2: Invalid -E error log file %s3**

### Variable Information

%s1 = Error details number

%s2 = Error details context

%s3 = File name

### Explanation

The error log file path is incorrect.

### System Action

The Web Server program execution processing is aborted.

## User Action

Check the name of the error log file that was specified using the -E option.

---

### (%s1)%s2: Invalid config file path %s3

#### Variable Information

%s1 = Error details number

%s2 = Error details context

%s3 = Environment definition file path

#### Explanation

The specified environment definition file (httpd.conf) (%s3) path is incorrect.

#### System Action

The Web Server program execution processing is aborted.

#### User Action

Check the path of the specified environment definition file (httpd.conf) (%s3).

---

### (%s1)%s2: Invalid PID file path %s3, ignoring.

#### Variable Information

%s1 = Error details number

%s2 = Error details context

%s3 = Process management file name

#### Explanation

The full path of the process management file (%s3) could not be found.

#### System Action

The Web Server start processing is continued.

#### User Action

Resolve the cause of the error according to the error details context (%s2).

---

### (%s1)%s2: make\_sock: could not bind to address %s3

#### Variable Information

%s1 = Error details number

%s2 = Error details context

%s3 = IP address:Port number

#### Explanation

The address could not be assigned to the socket.

One of the following causes is assumed:

#### Windows32/64

- If error detail context (%s2) is "The requested address is not valid in its context.", then an invalid address was specified.
- If error details content (%s2) is "Only one usage of each socket address (protocol/network address/port) is normally permitted." during Web Server startup, consider the following causes:
  - The IP address and port number (%s3) are being used by another service.

- The port number (%s3) is being used by another service.

#### Solaris32/64

- If error detail context (%s2) is "Cannot assign requested address", then an invalid address was specified.
- If error details content (%s2) is "Address already in use" during Web Server startup, consider the following causes:
  - The IP address and port number (%s3) are being used by another service.
  - The port number (%s3) is being used by another service.

#### Linux32/64

- If error detail context (%s2) is "Cannot assign requested address", consider the following causes:
  - An invalid address was specified.
  - The network interface that IP address (%3) was mapped to may be invalid.
- If error detail context (%s2) is "Address already in use" during Web Server startup, consider the following causes:
  - The IP address and port number (%s3) are being used by another service.
  - The port number (%s3) is being used by another service.

### System Action

The Web Server start processing is cancelled.

### User Action

Take one of the following actions:

- If an invalid address is specified, check the following:
  - When setting up a virtual host from the Interstage Management Console of a Standalone Server:
    1. Open the Virtual Host list by clicking [System] > [Services] > [Web Server] > [Web Server name] > [Virtual Hosts]. From the list, click the virtual host name corresponding to the IP address and port number in %s3.
    2. Check the [IP Address] settings on the [Virtual Host Name: Configuration] page.
  - When setting up a virtual host from the Interstage Management Console of the Admin Server:
    1. Open the Virtual Host list by clicking [Application Management] > [Interstage] > [Interstage Application Server] > [Services] > [Web Server] > [FJapache(Server Group name or Server name)] > [Virtual Hosts]. From the list, click the virtual host name corresponding to the IP address and port number in %s3.
    2. Check the [IP Address] settings on the [Virtual Host Name: Configuration] page.
  - When setting an IP address in the Listen directive of the environmental definition file (httpd.conf)
    1. Check Listen directive settings in the environment definition file (httpd.conf).
- If the IP address and port number (%s3), or just the port number (%s3) is being used by another service:
  - Check if the IP address and port number specified for the Web Server is also specified for another service.
  - Check if the port number specified for the Web Server is also specified for another service.

If so, terminate that service, or specify a different IP address and/or port number.

If the IP address and port number settings are valid, collect diagnostic information with the *iscollectinfo* command, and then contact your systems engineer.

#### Linux32/64

- If there is a possibility that the network interface is invalid. Check the settings of the network interface to which the IP address (%3) was mapped.

If the network interface card settings are valid, collect diagnostic information with the *iscollectinfo* command, and then contact your systems engineer.

- In all other cases, remove the cause of error by referring to the error details context (%s2).

---

**(%s1)%s2: make\_sock: for address %s3, apr\_socket\_opt\_set: (IPV6\_V6ONLY)****Variable Information**

%s1 = Error details number

%s2 = Error details context

%s3 = IP address:Port number

**Explanation**

The socket option could not be set.

**System Action**

The Web Server program execution processing is aborted.

**User Action**

Resolve the cause of the error according to the error details context (%s2).

---

**(%s1)%s2: make\_sock: for address %s3, apr\_socket\_opt\_set: (SO\_KEEPALIVE)****Variable Information**

%s1 = Error details number

%s2 = Error details context

%s3 = IP address:Port number

**Explanation**

The socket option could not be set.

**System Action**

The Web Server program execution processing is aborted.

**User Action**

Resolve the cause of the error according to the error details context (%s2).

---

**(%s1)%s2: make\_sock: for address %s3, apr\_socket\_opt\_set: (SO\_REUSEADDR)****Variable Information**

%s1 = Error details number

%s2 = Error details context

%s3 = IP address:Port number

**Explanation**

The socket option could not be set.

**System Action**

The Web Server program execution processing is aborted.

## User Action

Resolve the cause of the error according to the error details context (%s2).

---

**(%s1)%s2: master\_main: create child process failed. Exiting.**

## Variable Information

%s1 = Error details number

%s2 = Error details context

Note: The error details number (%s1) and the error details context (%s2) may not be output.

## Explanation

An error occurred in daemon process create processing.

## System Action

The Web Server start processing is cancelled.

## User Action

Refer to the message that was output at the same time and fix the error.

---

**(%s1)%s2: master\_main: WaitForMultipleObjects WAIT\_FAILED -- doing server shutdown**

## Variable Information

%s1 = Error details number

%s2 = Error details context

## Explanation

An error occurred in daemon process status monitoring.

## System Action

The Web Server is stopped.

## User Action

Resolve the cause of the error according to the error details context (%s2).

---

**(%s1)%s2: Parent: Cannot create restart event %s3**

## Variable Information

%s1 = Error details number

%s2 = Error details context

%s3 = Event object name

## Explanation

The event object for restart (%s3) could not be created.

## System Action

The Web Server start processing is cancelled.

## User Action

Resolve the cause of the error according to the error details context (%s2).

---

**(%s1)%s2: Parent: Cannot create shutdown event %s3**

## Variable Information

%s1 = Error details number

%s2 = Error details context

%s3 = Event object name

## Explanation

The event object for stopping (%s3) could not be created.

## System Action

The Web Server start processing is cancelled.

## User Action

Resolve the cause of the error according to the error details context (%s2).

---

## **(%s1)%s2: Parent: Could not create %s3 event for child process**

## Variable Information

%s1 = Error details number

%s2 = Error details context

%s3 = Event type

## Explanation

The event object could not be created.

## System Action

The Web Server start processing is cancelled.

## User Action

Resolve the cause of the error according to the error details context (%s2).

---

## **(%s1)%s2: Parent: Failed to create the child process.**

## Variable Information

%s1 = Error details number

%s2 = Error details context

## Explanation

A daemon process could not be generated.

## System Action

The Web Server start processing is cancelled.

## User Action

Resolve the cause of the error according to the error details context (%s2).

---

## **(%s1)%s2: Parent: Failed to get full path of %s3**

## Variable Information

%s1 = Error details number

%s2 = Error details context

%s3 = Web Server program name

## Explanation

The full path of the Web Server program (%s3) could not be obtained.

## System Action

The Web Server start processing is cancelled.

## User Action

Resolve the cause of the error according to the error details context (%s2).

---

## **(%s1)%s2: Parent: Failed to get the current path**

### Variable Information

%s1 = Error details number

%s2 = Error details context

## Explanation

The current path could not be found.

## System Action

The Web Server start processing is continued.

## User Action

Resolve the cause of the error according to the error details context (%s2).

---

## **(%s1)%s2: Parent: Unable to %s3**

### Variable Information

%s1 = Error details number

%s2 = Error details context

%s3 = Erroneous processing contents

## Explanation

Processing (%s3) failed.

## System Action

The Web Server start processing is cancelled.

## User Action

Resolve the cause of the error according to the error details context (%s2).

---

## **(%s1)%s2: Parent: WSADuplicateSocket failed for socket %s3. Check the FAQ.**

### Variable Information

%s1 = Error details number

%s2 = Error details context

%s3 = Socket descriptor

## Explanation

The socket could not be duplicated.

## System Action

The Web Server start processing is cancelled.

## User Action

Resolve the cause of the error according to the error details context (%s2).

---

## **(%s1)%s2: read: rfc1413: error reading response**

### Variable Information

%s1 = Error details number

%s2 = Error details context

### Explanation

Response reception from the socket failed in the RFC1413 user identifier search.

### System Action

User identifier information get processing is stopped.

## User Action

Resolve the cause of the error according to the error details context (%s2).

---

## **(%s1)%s2: rfc1413: apr\_sockaddr\_info\_get(%s3) failed**

### Variable Information

%s1 = Error details number

%s2 = Error details context

%s3 = IP address of systems such as client or proxy server

### Explanation

Socket information could not be found in the RFC1413 user identifier search.

### System Action

User identifier information get processing is stopped.

## User Action

Resolve the cause of the error according to the error details context (%s2).

---

## **(%s1)%s2: rfc1413: Error binding query socket to local port**

### Variable Information

%s1 = Error details number

%s2 = Error details context

### Explanation

The socket could not be allocated in the RFC1413 user identifier search.

### System Action

User identifier information get processing is stopped.

## User Action

Resolve the cause of the error according to the error details context (%s2).

---

## **(%s1)%s2: rfc1413: error creating query socket**

### Variable Information

%s1 = Error details number

%s2 = Error details context

#### Explanation

A socket could not be created in the RFC1413 user identifier search.

#### System Action

User identifier information get processing is stopped.

#### User Action

Resolve the cause of the error according to the error details context (%s2).

---

### **(%s1)%s2: rfc1413: error setting query socket timeout**

#### Variable Information

%s1 = Error details number

%s2 = Error details context

#### Explanation

The socket timeout could not be set in the RFC1413 user identifier search.

#### System Action

User identifier information get processing is stopped.

#### User Action

Resolve the cause of the error according to the error details context (%s2).

---

### **(%s1)%s2: setup\_inherited\_listeners: Unable to read socket data from parent**

#### Variable Information

%s1 = Error details number

%s2 = Error details context

#### Explanation

Socket information from the start process could not be read.

#### System Action

The daemon process is restarted.

#### User Action

Resolve the cause of the error according to the error details context (%s2).

---

### **(%s1)%s2: unable to create scoreboard "%s3" (name-based shared memory failure)**

#### Variable Information

%s1 = Error details number

%s2 = Error details context

%s3 = Scoreboard name

#### Explanation

The shared memory that is used in the scoreboard (%s3) could not be acquired.

#### System Action

The Web Server start processing is cancelled.

## User Action

Resolve the cause of the error according to the error details context (%s2).

---

## **(%s1)%s2: Unable to create scoreboard (anonymous shared memory failure)**

### Variable Information

%s1 = Error details number

%s2 = Error details context

### Explanation

The shared memory that is used in the scoreboard could not be acquired.

### System Action

The Web Server start processing is cancelled.

## User Action

Resolve the cause of the error according to the error details context (%s2).

---

## **(%s1)%s2: unable to replace stderr with /dev/null**

### Variable Information

%s1 = Error details number

%s2 = Error details context

### Explanation

The standard error output could not be reopened.

### System Action

The Web Server program execution processing is aborted.

## User Action

Resolve the cause of the error according to the error details context (%s2).

---

## **(%s1)%s2: unable to replace stderr with error\_log**

### Variable Information

%s1 = Error details number

%s2 = Error details context

### Explanation

The error log message output destination could not be changed.

### System Action

The Web Server program execution processing is aborted.

## User Action

Resolve the cause of the error according to the error details context (%s2).

---

## **(%s1)%s2: write: rfc1413: error sending request**

### Variable Information

%s1 = Error details number

%s2 = Error details context

## Explanation

There was a failure in the transmission request to the socket in the RFC1413 user identifier search.

## System Action

User identifier information get processing is stopped.

## User Action

Resolve the cause of the error according to the error details context (%s2).

---

## **[%s1] file %s2, line %s3, assertion "%s4" failed**

### Variable Information

%s1 = Time of occurrence

%s2 = Source file name

%s3 = Source file line number

%s4 = Detailed information

## Explanation

An error occurred in the Web Server.

## System Action

The Web Server program execution processing is aborted.

## User Action

Collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

---

## **[client %s1] (%s2)%s3: %s4 pcfg\_openfile: unable to check htaccess file, ensure it is readable**

### Variable Information

%s1 = IP address of systems such as client or proxy server

%s2 = Error details number

%s3 = Error details context

%s4 = Access control definition file name

## Explanation

Access control using the access control definition file (%s4) failed.

## System Action

The Web Server program execution processing is aborted.

## User Action

Correct the access control definition file (%s4) by referring to the messages output before this message.

---

## **[client %s1] configuration error: couldn't %s2: %s3**

### Variable Information

%s1 = IP address of systems such as client or proxy server

%s2 = Phase in which the internal error occurred

%s3 = Request URI

## Explanation

Request processing could not be performed because an internal error occurred.

### System Action

A response is given using status code "500" (Internal Server Error).

### User Action

Collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

---

### Fatal error: shared scoreboard too small for child!

### Explanation

Failed to open the scoreboard because the shared memory that is used in the scoreboard is too small.

### System Action

The Web Server start processing is cancelled.

### User Action

Refer to the message that was output at the same time and fix the error.

---

## 37.1.4 Messages Whose Log Levels are error

### Note

Messages output by the CGI program to the standard error output use the format below (this message is not in "Explanation and User action of Messages", therefore take action according to the CGI program specification):

---

### [client %s1] %s2

### Variable Information

%s1 = IP address of systems such as client or proxy server

%s2 = Message output by the CGI program to the standard error output

---

### Explanation and User action of Messages

---

### %s1 not supported on this platform

### Variable Information

%s1 = Directive name

### Explanation

Directive (%s1) is not supported.

### System Action

The Web Server continues to operate.

### User Action

Do not use directive (%s1).

---

### (%s1)%s2: %s3: could not log pid to file %s4

### Variable Information

%s1 = Error details number

%s2 = Error details context

%s3 = Web Server program name

%s4 = Process management file name

## Explanation

The process management file (%s4) could not be opened.

## System Action

The Web Server start processing is cancelled.

## User Action

Resolve the cause of the error according to the error details context (%s2).

---

## **(%s1)%s2: %s3: Failed to open the service.**

### Variable Information

%s1 = Error details number

%s2 = Error details context

%s3 = Service name

## Explanation

The Web Server service could not be opened.

## System Action

The Web Server start processing is cancelled.

## User Action

Resolve the cause of the error according to the error details context (%s2).

---

## **(%s1)%s2: %s3: getrlimit failed**

### Variable Information

%s1 = Error details number

%s2 = Error details context

%s3 = Directive name

## Explanation

The limit for the system resource could not be obtained.

## System Action

The Web Server continues to operate.

## User Action

Resolve the cause of the error according to the error details context (%s2).

---

## **(%s1)%s2: %s3: Unable to create the start\_mutex.**

### Variable Information

%s1 = Error details number

%s2 = Error details context

%s3 = Service name

## Explanation

The exclusive resources for the daemon process could not be created.

## System Action

The Web Server start processing is cancelled.

## User Action

Resolve the cause of the error according to the error details context (%s2).

---

**(%s1)%s2: %s3: Unable to start the service manager.**

## Variable Information

%s1 = Error details number

%s2 = Error details context

%s3 = Service name

## Explanation

The service control manager failed to start.

## System Action

The Web Server start processing is cancelled.

## User Action

Resolve the cause of the error according to the error details context (%s2).

---

**(%s1)%s2: ap\_listen\_open: unable to make socket non-blocking**

## Variable Information

%s1 = Error details number

%s2 = Error details context

## Explanation

An attempt to make the socket non-blocking failed.

## System Action

The Web Server start processing is cancelled.

## User Action

Resolve the cause of the error according to the error details context (%s2).

---

**(%s1)%s2: apr\_accept: (client socket)**

## Variable Information

%s1 = Error details number

%s2 = Error details context

## Explanation

An attempt to connect to the client socket failed.

## System Action

The communication process is closed. The Web Server continues to operate.

## User Action

Resolve the cause of the error according to the error details context (%s2).

---

**(%s1)%s2: apr\_poll: (listen)**

## Variable Information

%s1 = Error details number

%s2 = Error details context

## Explanation

An error occurred while waiting for the connection from the client.

## System Action

The communication process is closed. The Web Server continues to operate.

## User Action

Resolve the cause of the error according to the error details context (%s2).

---

## **(%s1)%s2: Cannot resolve host name %s3 --- ignoring!**

## Variable Information

%s1 = Error details number

%s2 = Error details context

%s3 = Host name

## Explanation

The name of the virtual host (%s3) could not be resolved.

## System Action

The Web Server continues to operate.

## User Action

Refer to Error details number (%s2) and check the host name specified for the <VirtualHost> section or NameVirtualHost directive in the environment definition file (httpd.conf).

---

## **(%s1)%s2: Child %s3: Encountered too many errors accepting client connections. Possible causes: %s4 Try using the Win32DisableAcceptEx directive.**

## Variable Information

%s1 = Error details number

%s2 = Error details context

%s3 = Process ID of the daemon process

%s4 = Reason information

## Explanation

An error occurred in the communication socket wait status transition.

## System Action

The Web Server continues to operate.

## User Action

Resolve the cause of the error according to the error details context (%s2).

---

## **(%s1)%s2: Child %s3: Failed to acquire the start\_mutex. Process will exit.**

## Variable Information

%s1 = Error details number

%s2 = Error details context

%s3 = Process ID of the daemon process

#### Explanation

The exclusive resources for the daemon process could not be acquired.

#### System Action

The daemon process is restarted.

#### User Action

Resolve the cause of the error according to the error details context (%s2).

---

### (%s1)%s2: Child %s3: Failure releasing the start mutex

#### Variable Information

%s1 = Error details number

%s2 = Error details context

%s3 = Process ID of the daemon process

#### Explanation

The exclusive resources for the daemon process could not be released.

#### System Action

The daemon process is closed.

#### User Action

Resolve the cause of the error according to the error details context (%s2).

---

### (%s1)%s2: could not open transfer log file %s3.

#### Variable Information

%s1 = Error details number

%s2 = Error details context

%s3 = Access log file name

#### Explanation

Failed to open access log file (%s3).

#### System Action

The Web Server start processing is cancelled.

#### User Action

Check the error details context (%s2) that are output, and take the action described in the following table.

Error Details Context (%s2)	Meaning / Required Action
Value too large for defined data type	Failed to open access log file name (%s3) because the file size was at least 2Gbyte. In the environment definition file (httpd.conf) access log settings, specify a file size less than 2Gbyte for the log file.
All other cases	Resolve the cause of the error according to the error details context (%s2).

---

### (%s1)%s2: Failed to create the named pipe. pipe=%s3

## Variable Information

%s1 = Error details number

%s2 = Error details context

%s3 = Named pipe

## Explanation

The named pipe (%s3) could not be created.

## System Action

**Windows32/64**

The status display daemon closes. The Web Server continues to operate.

**Solaris32/64** **Linux32/64**

The Web Server start processing is cancelled.

## User Action

Refer to the error details content (%s2), resolve the error, and then restart the Web Server.

---

**(%s1)%s2: Failed to create the status display daemon. func=%s3**

## Variable Information

%s1 = Error details number

%s2 = Error details context

%s3 = Function name

## Explanation

The status display daemon could not be created.

## System Action

The Web Server start processing is cancelled.

## User Action

Refer to the error details content (%s2), resolve the error, and then restart the Web Server.

---

**(%s1)%s2: Failed to open the named pipe. pipe=%s3**

## Variable Information

%s1 = Error details number

%s2 = Error details context

%s3 = Named pipe

## Explanation

The named pipe (%s3) could not be opened.

## System Action

The status display daemon closes. The Web Server continues to operate.

## User Action

Refer to the error details content (%s2), resolve the error, and then restart the Web Server.

---

**(%s1)%s2: Failed to open the WinNT service manager**

### Variable Information

%s1 = Error details number

%s2 = Error details context

### Explanation

A connection could not be established with the service control manager.

### System Action

The Web Server start processing is cancelled.

### User Action

Resolve the cause of the error according to the error details context (%s2).

---

## **(%s1)%s2: Failed to resolve server name for %s3 (check DNS) -- or specify an explicit ServerName**

### Variable Information

%s1 = Error details number

%s2 = Error details context

%s3 = IP address

### Explanation

The name of IP address (%s3) could not be resolved.

### System Action

The Web Server continues to operate.

### User Action

Resolve the cause of the error according to the error details context (%s2).

---

## **(%s1)%s2: fork: Unable to fork new process**

### Variable Information

%s1 = Error details number

%s2 = Error details context

### Explanation

The communication process could not be created.

### System Action

The Web Server continues to operate.

### User Action

Resolve the cause of the error according to the error details context (%s2).

---

## **(%s1)%s2: make\_sock: unable to listen for connections on address %s3**

### Variable Information

%s1 = Error details number

%s2 = Error details context

%s3 = IP address:Port number

## Explanation

Socket wait status transition failed.

## System Action

The Web Server start processing is cancelled.

## User Action

Resolve the cause of the error according to the error details context (%s2).

---

**(%s1)%s2: Parent: ResetEvent(restart\_event) failed.**

## Variable Information

%s1 = Error details number

%s2 = Error details context

## Explanation

The event object for restart could not be reset.

## System Action

The Web Server is restarted.

## User Action

Resolve the cause of the error according to the error details context (%s2).

---

**(%s1)%s2: Parent: SetEvent for child process %s3 failed.**

## Variable Information

%s1 = Error details number

%s2 = Error details context

%s3 = Daemon process handle

## Explanation

The signal status for the event object for stopping the daemon process could not be set.

## System Action

The Web Server is restarted.

## User Action

Resolve the cause of the error according to the error details context (%s2).

---

**(%s1)%s2: proxy: HTTP: attempt to connect to %s3:%s4 (%s5) failed**

## Variable Information

%s1 = Error details number

%s2 = Error details context

%s3 = IP address of remote server

%s4 = Port number of remote server

%s5 = Host name of remote server

## Explanation

The remote server connection failed.

## System Action

A response is given using status code "502" (Bad Gateway).

## User Action

Resolve the cause of the error according to the error details context (%s2).

---

### **(%s1)%s2: proxy: prefetch request body failed to %s3 from %s4 (%s5)**

## Variable Information

%s1 = Error details number

%s2 = Error details context

%s3 = Host name or IP address of remote server

%s4 = IP address of systems such as client or proxy server

%s5 = Host name of systems such as client or proxy server

Note: The host name or IP address of remote server (%s3) and the host name of systems such as client or proxy server (%s5) may not be output.

## Explanation

Failed to receive the request body from the client or proxy server.

## System Action

A response is given using status code "500" (Internal Server Error).

## User Action

Resolve the cause of the error according to the error details context (%s2).

---

### **(%s1)%s2: ResetEvent(shutdown\_event)**

## Variable Information

%s1 = Error details number

%s2 = Error details context

## Explanation

The event object for stopping could not be reset.

## System Action

The Web Server is stopped.

## User Action

Resolve the cause of the error according to the error details context (%s2).

---

### **(%s1)%s2: set\_listeners\_noninheritable: SetHandleInformation failed.**

## Variable Information

%s1 = Error details number

%s2 = Error details context

## Explanation

The communication socket handle property information could not be set.

## System Action

The Web Server continues to operate.

## User Action

Resolve the cause of the error according to the error details context (%s2).

---

## **[%s1]%s2: SSL: Failed to generate the certificate monitoring daemon. func=%s3 [%s4]**

### Variable Information

%s1 = Error details number

%s2 = Error details context

%s3 = Function name

%s4 = Web Server name

### Explanation

Failed to generate the certificate monitoring daemon.

### System Action

The Web Server start processing is cancelled.

### User Action

Refer to the error details content (%s2), resolve the error, and then restart the Web Server.

---

## **[client %s1] (%s2)%s3: access to %s4 denied**

### Variable Information

%s1 = IP address of systems such as client or proxy server

%s2 = Error details number

%s3 = Error details context

%s4 = Request URI

### Explanation

Access to the directory that was used to store the contents is not allowed.

### System Action

A response is given using status code "403" (Forbidden).

### User Action

To allow access, check the directory access authority.

---

## **[client %s1] (%s2)%s3: access to %s4 failed**

### Variable Information

%s1 = IP address of systems such as client or proxy server

%s2 = Error details number

%s3 = Error details context

%s4 = Request URI

### Explanation

The directory or file in which the contents have been stored could not be accessed.

### System Action

A response is given using status code "403" (Forbidden).

## User Action

Check the error details context (%s3) that are output, and take the action described in the following table.

Error Details Context (%s3)	Meaning / Required Action
Value too large for defined data type	A file bigger than 2GB was accessed - such files cannot be used as content. Ensure that the files are smaller than 2GB.
All other cases	Resolve the cause of the error according to the error details context (%s3).

---

## [client %s1] (%s2)%s3: ap\_content\_length\_filter: apr\_bucket\_read() failed

### Variable Information

%s1 = IP address of systems such as client or proxy server

%s2 = Error details number

%s3 = Error details context

### Explanation

The data during output filter processing could not be read.

### System Action

A response is given using status code "500" (Internal Server Error).

### User Action

Resolve the cause of the error according to the error details context (%s2).

---

## [client %s1] (%s2)%s3: copy\_brigade\_range() failed [%s4-%s5,%s6]

### Variable Information

%s1 = IP address of systems such as client or proxy server

%s2 = Error details number

%s3 = Error details context

%s4 = Specified range starting point

%s5 = Specified range ending point

%s6 = Context size

### Explanation

Failed to create the response data from starting point %s4 to ending point %s5 that are specified in the Range or Request-Range header field.

### System Action

One of the following processing types will be performed:

- If the processing for all the specified ranges that are specified in the request fails, a reply using status code "416" (Requested Range Not Satisfiable) is returned.
- If the processing for some of the specified ranges that are specified in the request fails, a reply using status code "206" (Partial Content), and the response data for the specified range content for which processing succeeded is returned.

### User Action

Resolve the cause of the error according to the error details context (%s3).

---

## [client %s1] (%s2)%s3: core\_output\_filter: Error reading from bucket.

## Variable Information

%s1 = IP address of systems such as client or proxy server

%s2 = Error details number

%s3 = Error details context

## Explanation

The data during output filter processing could not be read.

## System Action

A response is given using status code "500" (Internal Server Error).

## User Action

Resolve the cause of the error according to the error details context (%s2).

---

## [client %s1] (%s2)%s3: dir\_walk error, %s4

## Variable Information

%s1 = IP address of systems such as client or proxy server

%s2 = Error details number

%s3 = Error details context

%s4 = Details information

## Explanation

An error occurred in directory section processing.

## System Action

A response is given using status code "500" (Internal Server Error).

## User Action

Resolve the cause of the error according to the error details context (%s2).

---

## [client %s1] (%s2)%s3: Error reading request entry data

## Variable Information

%s1 = IP address of systems such as client or proxy server

%s2 = Error details number

%s3 = Error details context

## Explanation

Failed to read the request body.

## System Action

A response is given using status code "500" (Internal Server Error).

## User Action

Take the following actions:

- Request that the user of the client (%s1) specify a correct request body.
- A timeout may have occurred while the request body was being received. Check the value set for the Timeout directive in the environment definition file (httpd.conf).

---

## [client %s1] (%s2)%s3: file permissions deny server access: %s4

## Variable Information

%s1 = IP address of systems such as client or proxy server

%s2 = Error details number

%s3 = Error details context

%s4 = File name of the requested content

## Explanation

Access to the requested contents (%s2) is not allowed.

## System Action

A response is given using status code "403" (Forbidden).

## User Action

To allow access, check the file authority.

---

## **[client %s1] access to %s2 failed, reason: user %s3 not allowed access**

## Variable Information

%s1 = IP address of systems such as client or proxy server

%s2 = URI name

%s3 = User name

## Explanation

The user (%s3) that made the request for the URI (%s2) is not allowed access.

## System Action

A response is given using status code "401" (Authorization Required).

## User Action

Take the following actions:

- If "user userid" is specified for Require directive in the environment definition file (httpd.conf), then make sure that the user (%s3) was set for userid.
- If "group group-name" is specified for Require directive in the environment definition file (httpd.conf), then make sure that it is also set in the file specified in the AuthGroupFile directive and that the user (%s3) was set in the group. If the group/user (%s3) was not set in the file, then set it, so that he is given access.

---

## **[client %s1] Attempt to serve directory: %s2**

## Variable Information

%s1 = IP address of systems such as client or proxy server

%s2 = Requested content

## Explanation

The requested content (%s2) is a directory.

## System Action

A response is given using status code "404" (Not Found).

## User Action

Request that the user of the client specifies a correct URI.

---

**[client %s1] client sent HTTP/1.1 request without hostname (see RFC2616 section 14.23): %s2****Variable Information**

%s1 = IP address of systems such as client or proxy server

%s2 = Request URI

**Explanation**

The Host header that is essential for HTTP/1.1 has not been specified.

**System Action**

A response is given using status code "400" (Bad Request).

**User Action**

Request that the user of the client specifies a correct Host header.

---

**[client %s1] client sent invalid HTTP/0.9 request: HEAD %s2****Variable Information**

%s1 = IP address of systems such as client or proxy server

%s2 = Request URI

**Explanation**

The required HTTP version has not been specified for the HEAD method.

**System Action**

A response is given using status code "400" (Bad Request).

**User Action**

Request that the user of the client specifies the HTTP version on the request line.

---

**[client %s1] Client sent malformed Host header****Variable Information**

%s1 = IP address of systems such as client or proxy server

**Explanation**

The specified Host header is incorrect.

**System Action**

A response is given using status code "400" (Bad Request).

**User Action**

Request that the user of the client specifies the Host header using the correct format.

---

**[client %s1] client used wrong authentication scheme: %s2****Variable Information**

%s1 = IP address of systems such as client or proxy server

%s2 = Request URI

**Explanation**

An incorrect authentication type was specified in the request header.

## System Action

A response is given using status code "401" (Authorization Required).

## User Action

Request that the user of the client specifies the correct authentication type.

---

## [client %s1] Could not get next bucket brigade [500, #0]

### Variable Information

%s1 = IP address of system such as client or proxy server

### Explanation

Failed to read the request body of the WebDAV request.

## System Action

A response is given using status code "500" (Internal Server Error).

## User Action

Take the following actions:

- Request that the user of the client (%s1) specify a correct request body.
- A timeout may have occurred while the request body was being received. Check the value set for the Timeout directive in the environment definition file (httpd.conf).

---

## [client %s1] Directory index forbidden by rule: %s2

### Variable Information

%s1 = IP address of systems such as client or proxy server

%s2 = Requested path name

### Explanation

A forward slash (/) was specified at the end of the URI, however in this case the file set as the search target (the value set for the DirectoryIndex directive) did not exist. Additionally, the setting for the automatic generation of the directory list (the list of directory content) was disabled.

Note: Even if the forward slash (/) has not been specified at the end of the URI, it still might have been added automatically.

## System Action

A response is given using status code "403" (Forbidden).

## User Action

Take the following actions:

- Instruct the user to add the file name to the request to the specified client.
- If the forward slash (/) was specified at the end of the requested URI and there is a response from the search target file, then place the file specified in the environment definition file (httpd.conf) DirectoryIndex directive in %s2.
- To display the directory list, specify the Indexes (or All) option in the environment definition file (httpd.conf) Options directive so that the setting for the automatic generation of the directory list will be enabled.

---

## [client %s1] File does not exist: %s2

### Variable Information

%s1 = IP address of systems such as client or proxy server

%s2 = Requested content

## Explanation

The requested content (%s2) does not exist.

## System Action

A response is given using status code "404" (Not Found).

## User Action

Check the requested content (%s2) that are output, and take the action described in the following table.

Requested Content (%s2)	Meaning / Required Action
favicon.ico	An icon required on the Web browser (Favorites, Address Bar, Tab) does not exist. To display the icon on the Web browser, place the "favicon.ico" icon in the directory specified in the environment definition file (httpd.conf) DocumentRoot directive. No action is necessary if the icon does not need to be displayed.
All other cases	The URI specified in the client may be incorrect. Request that the user of the client specifies the correct URI. A URI that does not exist may have been accessed because of the search engine information collection program (crawler), a client feature (such as the browser), or a program used to launch attacks, even if the URI specified in the client is correct. Check that there are no problems in the URI and client (%s1) environment.

---

## [client %s1] Forbidden: %s2 doesn't point to a file or directory

### Variable Information

%s1 = IP address of systems such as client or proxy server

%s2 = Requested content

### Explanation

The requested content (%s2) is not a file or directory.

### System Action

A response is given using status code "403" (Forbidden).

### User Action

Check the content storage directory.

---

## [client %s1] Invalid method in request %s2

### Variable Information

%s1 = IP address of systems such as client or proxy server

%s2 = Request line

### Explanation

The specified request method is incorrect.

### System Action

A response is given using status code "501" (Method Not Implemented).

### User Action

Request that the user of the client specifies the correct method.

---

## [client %s1] Invalid URI in request %s2

### Variable Information

%s1 = IP address of systems such as client or proxy server

%s2 = Request line

### Explanation

The specified URI is incorrect.

### System Action

A response is given using status code "400" (Bad Request).

### User Action

Request that the user of the client specifies a correct URI.

---

## **[client %s1] invalid request-URI %s2**

### Variable Information

%s1 = IP address of systems such as client or proxy server

%s2 = Request URI

### Explanation

The specified request URI is incorrect.

### System Action

A response is given using status code "400" (Bad Request).

### User Action

Request that the user of the client specifies a correct URI.

---

## **[client %s1] LDAP search for %s2 failed: LDAP error: %s3; URI %s4**

### Variable Information

%s1 = IP address of systems such as client or proxy server

%s2 = Search filter

%s3 = LDAP error message

%s4 = URI

### Explanation

The entry in the directory server could not be found.

### User Action

Instruct Web browser users on how to specify the user ID correctly.

If this error message continues to be displayed, refer to LDAP error message (%s3) and remove the cause of the failure. For details of the LDAP error messages, refer to "LDAP Error Codes" in the "Error Codes to be Reported from Interstage Directory Service" chapter.

---

## **[client %s1] LDAP search for %s2 failed: SSL error: (%s3, %s4); URI %s5**

### Variable Information

%s1 = IP address of systems such as client or proxy server

%s2 = Search filter

%s3 = SSL error code

%s4 = SSL error detail code

%s5 = URI

#### Explanation

The entry in the directory server could not be found.

#### User Action

Refer to SSL error code (%s3) and remove the cause of the failure. For details of SSL error codes, refer to "SSL Error Codes" in the "Error Codes to be Reported from Interstage Directory Service" chapter.

---

### **[client %s1] malformed header from script. Bad header=%s2: %s3**

#### Variable Information

%s1 = IP address of systems such as client or proxy server

%s2 = Header in the response from CGI

%s3 = CGI program path name

#### Explanation

There is no colon (:) in the response header (%s2) that was returned from the CGI program (%s3).

#### System Action

A response is given using status code "500" (Internal Server Error).

#### User Action

Check that the response header (%s2) that was returned from the CGI program (%s3) is correct.

---

### **[client %s1] need AuthName: %s2**

#### Variable Information

%s1 = IP address of systems such as client or proxy server

%s2 = Request URI

#### Explanation

The AuthName directive must be specified.

#### System Action

A response is given using status code "500" (Internal Server Error).

#### User Action

Set the AuthName directive in the environment definition file (httpd.conf).

---

### **[client %s1] Negotiation: discovered file(s) matching request: %s2 (None could be negotiated).**

#### Variable Information

%s1 = IP address of systems such as client or proxy server

%s2 = Request content

#### Explanation

The request content (%s2) does not exist. An invalid URI may have been specified in the client.

#### System Action

A response is given using status code "403" (Not Found).

#### User Action

Ensure that the client specifies a valid URI.

---

## **[client %s1] Premature end of script headers: %s2**

### Variable Information

%s1 = IP address of systems such as client or proxy server

%s2 = CGI program name

### Explanation

Not all of the header information output by the CGI program could be received.

### System Action

A response is given using status code "500" (Internal Server Error).

### User Action

Take one of the following actions:

- Check the CGI program.
- A timeout may have occurred while the CGI program was running. Check the value set for the Timeout directive in the environment definition file (httpd.conf).

---

## **[client %s1] proxy: %s2 returned by %s3**

### Variable Information

%s1 = IP address of systems such as client or proxy server

%s2 = Detail information

%s3 = Request URI

### Explanation

One of the following causes is assumed:

- When the detail information (%s2) is "user credentials contained invalid character", it means that the user name/password for the request (%s3) contains invalid characters.
- In all other cases, an error has occurred in the request (%s3).

### System Action

A response is made with the following status codes:

- When %s2 is "user credentials contained invalid character": "400" (Proxy Error)
- In all other cases: "400"/"401"/"403"/"404"/"501"/"502"/"503" (Proxy Error)

### User Action

Take one of the following actions:

- When %s2 is "user credentials contained invalid character", instruct the user to specify the correct user name/password for %s1.
- In all other case, resolve the cause of the error according to %s2.

---

## **[client %s1] proxy: error reading status line from remote server %s2**

### Variable Information

%s1 = IP address of systems such as client or proxy server

%s2 = Host name or IP address of remote server

Note: When the referrer header is received from the client or proxy server, ", referrer: %s3" (%s3: referrer header value) is output after %s2.

## Explanation

Failed to read the status line in the response from the remote server.

## System Action

A response is given using status code "502" (Bad Gateway).

## User Action

Check the following values:

- The value set for the Timeout directive in the environment definition file (httpd.conf).
- The output results for the item "Duration from acceptance of a request to completion of processing", which is output to the access log at the time of the response from the remote server.

If the above values match, a timeout may have occurred during the wait for the response from the remote server. Check whether an error has occurred in the network or remote server.

If the above values do not match, check whether there is a problem in the response from the remote server.

---

## **[client %s1] read request line timed out**

### Variable Information

%s1 = IP address of systems such as client or proxy server

### Explanation

Failed to read the request line.

### System Action

Communication is closed.

### User Action

A timeout may have occurred while the request line was being received. Check the value set for the Timeout directive in the environment definition file (httpd.conf).

---

## **[client %s1] Request exceeded the limit of %s2 internal redirects due to probable configuration error. Use 'LimitInternalRecursion' to increase the limit if necessary. Use 'LogLevel debug' to get a backtrace.**

### Variable Information

%s1 = IP address of systems such as client or proxy server

%s2 = Limit for the number of internal directories

### Explanation

The number of internal directories has exceeded limit (%s2).

### System Action

A response is given using status code "500" (Internal Server Error).

### User Action

Take the following actions:

- Check the definition to ensure that the number of internal redirects does not exceed the limit.
- An illegal request may have been received. In the IP access control settings, set the IP address of the client recorded in the error log to deny access.

---

## **[client %s1] Request exceeded the limit of %s2 subrequest nesting levels due to probable configuration error. Use 'LimitInternalRecursion' to increase the limit if necessary. Use 'LogLevel debug' to get a backtrace.**

## Variable Information

%s1 = IP address of systems such as client or proxy server

%s2 = Limit for the number of subrequests

## Explanation

The number of subrequests has exceeded limit (%s2).

## System Action

A response is given using status code "500" (Internal Server Error).

## User Action

Take the following actions:

- Check the definition to ensure that the number of subrequests does not exceed the limit.
- An illegal request may have been received. In the IP access control settings, set the IP address of the client recorded in the error log to deny access.

---

## [client %s1] request failed: error reading the headers

## Variable Information

%s1 = IP address of systems such as client or proxy server

## Explanation

The request header could not be read.

## System Action

A response is given using status code "400" (Bad Request).

## User Action

Take one of the following actions:

- Request that the user of the client specifies the correct request header.
- A timeout may have occurred while the request header was being received. Check the value set for the Timeout directive in the environment definition file (httpd.conf).

---

## [client %s1] request failed: URI too long (longer than %s2)

## Variable Information

%s1 = IP address of systems such as client or proxy server

%s2 = Maximum size of the request line

## Explanation

The length of the request line has exceeded the maximum size (%s2).

## System Action

A response is given using status code "414" (Request-URI Too Large).

## User Action

Take one of the following actions:

- Request that the user of the client specifies a request line that does not exceed the maximum size.
- Check the value set for the LimitRequestLine directive in the environment definition file (httpd.conf).

---

## [client %s1] script not found or unable to stat: %s2

## Variable Information

%s1 = IP address of systems such as client or proxy server

%s2 = Request CGI program

## Explanation

%s2 does not exist - an invalid URI might have been specified in %s1.

## System Action

A response is given using status code "404" (Not Found).

## User Action

Request that the user of the client (%s1) specify a correct URI.

---

## **[client %s1] Secure LDAP requested, but no AuthLDAPCertPath directive in config**

### Variable Information

%s1 = IP address of systems such as client or proxy server

### Explanation

A value has not been specified for the AuthLDAPCertPath directive in the environment definition file (httpd.conf).

### User Action

Specify the full path of the application management directory that was specified when the certificate/CRL management environment was created for the AuthLDAPCertPath directive in the environment definition file (httpd.conf).

---

## **[client %s1] Secure LDAP requested, but no AuthLDAPSLOTPath directive in config**

### Variable Information

%s1 = IP address of systems such as client or proxy server

### Explanation

A value has not been specified for the AuthLDAPSLOTPath directive in the environment definition file (httpd.conf).

### User Action

Specify the full path of the slot information directory that was specified when the security key management environment was created for the AuthLDAPSLOTPath directive in the environment definition file (httpd.conf).

---

## **[client %s1] Secure LDAP requested, but no AuthLDAPTknLbl directive in config**

### Variable Information

%s1 = IP address of systems such as client or proxy server

### Explanation

A value has not been specified for the AuthLDAPTknLbl directive in the environment definition file (httpd.conf).

### User Action

Specify the token label that was specified when the security key was created for the AuthLDAPTknLbl directive in the environment definition file (httpd.conf).

---

## **[client %s1] Secure LDAP requested, but no AuthLDAPTknPwd directive in config**

### Variable Information

%s1 = IP address of systems such as client or proxy server

## Explanation

A value has not been specified for the AuthLDAPTknPwd directive.

## User Action

Specify the user PIN that was specified when the security key was created for the AuthLDAPTknPwd directive.

---

## **[client %s1] SSL: Alert message(what?).(%s2,%s3,%s4)**

### Variable Information

%s1 = IP address of systems such as client or proxy server

%s2 = Function name

%s3 = Error code

%s4 = Detail code

## Explanation

An Alert message was received from client (%s1) because an error occurred in the client (%s1).

## System Action

Communication is closed.

## User Action

Check whether the status of the client (%s1) is an error status.

---

## **[client %s1] SSL: apr\_base64\_encode error.(%s2,%s3)**

### Variable Information

%s1 = IP address of systems such as client or proxy server

%s2 = Detail information 1

%s3 = Detail information 2

## Explanation

The client certificate could not be launched.

## System Action

Communication is closed.

## User Action

The data received from the client may be corrupt. Check whether there is a problem in the network or client.

---

## **[client %s1] SSL: apr\_base64\_encode\_len error.(%s2)**

### Variable Information

%s1 = IP address of systems such as client or proxy server

%s2 = Detail information

## Explanation

The client certificate could not be launched.

## System Action

Communication is closed.

## User Action

The data received from the client may be corrupt. Check whether there is a problem in the network or client.

---

### [client %s1] SSL: Authority error.(%s2,%s3,%s4)

#### Variable Information

%s1 = IP address of systems such as client or proxy server

%s2 = Function name

%s3 = Error code

%s4 = Detail code

#### Explanation

Due to one of the following reasons, an authentication error occurred when the Web Server tried to reference the client CA certificate on the server.

1. Environment setting of SSL (creation of a certificate and key control environment, creation of a private key and acquisition of a certificate, registration of a certificate and CRL) was executed with administrator authority.
2. The user who set up the SSL environment (other than administrator authority) is not specified in the User/Group directive in the environment setting file (httpd.conf) of the Web Server (Interstage HTTP Server).

#### System Action

Communication is closed.

#### User Action

Take one of the following actions:

1. Environment setting of SSL (creation of a certificate and key control environment, creation of a private key and acquisition of a certificate, and registration of a certificate and CRL) should be performed by a user other than one with administrator authority.

If an Interstage certificate environment is used, then specify the -g option and make sure that the Interstage certificate environment owner group has been set when the Interstage certificate environment is built using the scsmakeenv command. For details on the Interstage certificate environment privileges settings, refer to the Security System Guide.

After that, take the action shown in Item 2.

2. Specify the user who setup the SSL environment (other than administrator authority) in the User/Group directive in the environment setting file (httpd.conf).

---

### [client %s1] SSL: Certificate is invalid.(%s2,%s3,%s4)

#### Variable Information

%s1 = IP address of systems such as client or proxy server

%s2 = Function name

%s3 = Error code

%s4 = Detail code

#### Explanation

A problem occurred in the client (%s1) and the client (%s1) then sent an Alert message.

#### System Action

Communication is closed.

#### User Action

Check whether the client (%s1) has a normal status.

---

**[client %s1] SSL: Certificate\_unknown alert message was received. (%s2,%s3,%s4)****Variable Information**

%s1 = IP address of systems such as client or proxy server

%s2 = Function name

%s3 = Error code

%s4 = Detail code

**Explanation**

The certificate\_unknown Alert message was received from the client (%s1).

**System Action**

Communication is closed.

**User Action**

An error, such as failure to validate the site certificate, may have occurred in the client (%s1), therefore communication from the client (%s1) was disconnected.

Check that the Web Server CA certificate was registered correctly in the client (%s1).

If the Web Server CA certificate was registered correctly in the client (%s1), investigate the cause of the sending of the certificate\_unknown Alert message to the client (%s1).

---

**[client %s1] SSL: Cipher handshake error.(%s2,%s3,%s4)****Variable Information**

%s1 = IP address of systems such as client or proxy server

%s2 = Function name

%s3 = Error code

%s4 = Detail code

**Explanation**

The connection was not received because the encryption method for the request sent from the client (%s4) is not allowed in the Web Server.

**System Action**

Communication is closed.

**User Action**

Take one of the following actions:

- Check whether the encryption method set in the Web Server can be used in the client (%s4).
- Perform the following steps to check whether the encryption method for allowing the connection has been set correctly.
  - For the Interstage certificate environment:
    1. In the Interstage Management Console, click [Security] > [SSL] > [SSL definition].
    2. Click the [SSL Detailed Settings] button on the displayed [SSL definition: SSL Configuration Settings] page, and check the [Encryption Method].
  - For a certificate/key management environment configured with the SMEE command:

Check the SSLCipherSuite directive that is set in the environment definition file (httpd.conf).

---

**[client %s1] SSL: Couldn't analyze the client CA certificate.(%s2,%s3,%s4)**

## Variable Information

%s1 = IP address of systems such as client or proxy server

%s2 = Function name

%s3 = Error code

%s4 = Detail code

## Explanation

Analysis of the client CA certificate failed.

## System Action

Communication is closed.

## User Action

Obtain a new CA certificate from the CA, and reregister the newly obtained CA certificate

---

## **[client %s1] SSL: Couldn't analyze the client certificate.(%s2,%s3,%s4)**

## Variable Information

%s1 = IP address of systems such as client or proxy server

%s2 = Function name

%s3 = Error code

%s4 = Detail code

## Explanation

Analysis of the client certificate failed. The client certificate sent from the client may have been damaged.

## System Action

Communication is closed.

## User Action

Connection to the client on which this client certificate is registered cannot be established.

To connect to this client, request that the CA issue a client certificate, and register the obtained certificate on this client.

---

## **[client %s1] SSL: Couldn't get client cert.**

## Variable Information

%s1 = IP address of systems such as client or proxy server

## Explanation

The client certificate could not be obtained.

## System Action

Communication is closed.

## User Action

Collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

---

## **[client %s1] SSL: Couldn't verify the client CA certificate.(%s2,%s3,%s4)**

## Variable Information

%s1 = IP address of systems such as client or proxy server

%s2 = Function name

%s3 = Error code

%s4 = Detail code

#### Explanation

Verification of the client CA certificate failed.

#### System Action

Communication is closed.

#### User Action

Verify that the client CA certificate relationship for this route is correct.

---

### **[client %s1] SSL: Couldn't verify the client certificate.(%s2,%s3,%s4)**

#### Variable Information

%s1 = IP address of systems such as client or proxy server

%s2 = Function name

%s3 = Error code

%s4 = Detail code

#### Explanation

Detection of the client certificate and client CA certificate registered on the client and in the key management environment failed.

#### System Action

Communication is closed.

#### User Action

Verify that the relationship between the client certificate and the client CA certificate is correct.

If the client CA certificate is incorrect, obtain a new CA certificate from the CA, and reregister the newly obtained CA certificate.

If the client certificate is incorrect, request that the CA issue the client certificate, and reregister the obtained client certificate

---

### **[client %s1] SSL: Error message received(illegal certificate).(%s2,%s3,%s4)**

#### Variable Information

%s1 = IP address of systems such as client or proxy server

%s2 = Function name

%s3 = Error code

%s4 = Detail code

#### Explanation

A problem occurred in the client (%s1) and the client (%s1) sent an Alert message.

#### System Action

Communication is closed.

#### User Action

Check whether the client (%s1) has a normal status.

---

### **[client %s1] SSL: Illegal access protocol.(%s2,%s3,%s4)**

#### Variable Information

%s1 = IP address of systems such as client or proxy server

%s2 = Function name

%s3 = Error code

%s4 = Detail code

### Explanation

The SSL port was accessed using a protocol that is not SSL.

### System Action

Communication is closed.

### User Action

Check whether there is a problem with the specified protocol in client (%s1).

---

## [client %s1] SSL: MAC verify error.(%s2,%s3,%s4)

### Variable Information

%s1 = IP address of systems such as client or proxy server

%s2 = Function name

%s3 = Error code

%s4 = Detail code

### Explanation

Failed to verify the client data.

### System Action

Communication is closed.

### User Action

The data received from the client may be corrupt. Check whether there is an error in the network or client.

---

## [client %s1] SSL: No client certificate.(%s2,%s3,%s4)

### Variable Information

%s1 = IP address of systems such as client or proxy server

%s2 = Function name

%s3 = Error code

%s4 = Detail code

### Explanation

The client certificate cannot be received from the client (%s1) because either:

- The client certificate is not registered on the client (%s1).
- The client operator refused to send the client certificate.

### System Action

Communication is closed.

### User Action

Take one of the following actions:

- To connect to this client (%s1), request that the CA issue a client certificate, and register the obtained certificate on this client.
- If the client operator refused to send the client certificate, no action is required.

---

**[client %s1] SSL: Not enough memory for base64 encoding.(%s2)****Variable Information**

%s1 = IP address of systems such as client or proxy server

%s2 = Detail information

**Explanation**

The client certificate could not be launched.

**System Action**

Communication is closed.

**User Action**

Check that there is enough memory. If there is not enough memory, close unnecessary programs and secure the required memory capacity for running the Web Server.

---

**[client %s1] SSL: SCMI Insufficient memory****Variable Information**

%s1 = IP address of systems such as client or proxy server

**Explanation**

The client certificate could not be launched.

**System Action**

Communication is closed.

**User Action**

Check that there is enough memory. If there is not enough memory, close unnecessary programs and secure the required memory capacity for running the Web Server.

---

**[client %s1] SSL: SCMI\_Expand failed.(%s2,...%sn)****Variable Information**

%s1 = IP address of systems such as client or proxy server

%s2 - %sn = Extra information

**Explanation**

An error occurred while calling the SCMI function. An error may have occurred for the certificate and key control environment.

**System Action**

Communication is closed.

**User Action**

Check the certificate and key control environment.

If this error message continues to be displayed, collect diagnostic information using the iscollectinfo command, and then contact your systems engineer.

---

**[client %s1] SSL: SCMI\_Login failed.(%s2,...%sn)****Variable Information**

%s1 = IP address of systems such as client or proxy server

%s2 - %sn = Extra information

## Explanation

An error occurred while calling the SCMI function. An error may have occurred for the certificate and key control environment.

## System Action

Communication is closed.

## User Action

Check the certificate and key control environment.

If this error message continues to be displayed, collect diagnostic information using the `iscollectinfo` command, and then contact your systems engineer.

---

## [client %s1] SSL: SCMI\_Logout failed.(%s2,...%sn)

### Variable Information

%s1 = IP address of systems such as client or proxy server

%s2 - %sn = Extra information

## Explanation

An error occurred while calling the SCMI function. An error may have occurred for the certificate and key control environment.

## System Action

Communication is closed.

## User Action

Check the certificate and key control environment.

If this error message continues to be displayed, collect diagnostic information using the `iscollectinfo` command, and then contact your systems engineer.

---

## [client %s1] SSL: Socket access error(%s2).(%s3,%s4,%s5)

### Variable Information

%s1 = IP address of systems such as client or proxy server

%s2 = Socket function name

%s3 = SSL function name

%s4 = Error code

%s5 = Detail code

## Explanation

An error occurred accessing the socket during the SSL application.

## System Action

Communication is closed.

## User Action

Check the SSL function (%s3), the error code (%s4), and the detail code (%s5) that are output, and take the action described in the following table.

SSL function (%s3)	Error code (%s4)	Detail code (%s5)	Meaning / Required Action
SSL_ServerHandshake	Windows32/64	00002745	The connection to the client (%s1) may have been lost. Check the status of the connection to the client (%s1).
	00400006		
	Solaris32/64	00000020	

SSL function (%s3)	Error code (%s4)	Detail code (%s5)	Meaning / Required Action
	00400006		
	Solaris32/64	00000083	
	00400007		
All other cases			Collect diagnostic information using the <i>iscollectinfo</i> command, and then contact your systems engineer.

---

### [client %s1] SSL: The client CA certificate has been revoked.(%s2,%s3,%s4)

#### Variable Information

%s1 = IP address of systems such as client or proxy server

%s2 = Function name

%s3 = Error code

%s4 = Detail code

#### Explanation

The client CA certificate is revoked.

#### System Action

Communication is closed.

#### User Action

Obtain a new CA certificate from the CA, and reregister the newly obtained CA certificate.

---

### [client %s1] SSL: The client CA certificate has no path list.(%s2,%s3,%s4)

#### Variable Information

%s1 = IP address of systems such as client or proxy server

%s2 = Function name

%s3 = Error code

%s4 = Detail code

#### Explanation

The certificate pathway for the client CA certificate does not exist.

#### System Action

Communication is closed.

#### User Action

Register the client CA certificate in the certificate/key management environment starting with the root CA.

---

### [client %s1] SSL: The client CA certificate path is invalid.(%s2,%s3,%s4)

#### Variable Information

%s1 = IP address of systems such as client or proxy server

%s2 = Function name

%s3 = Error code

%s4 = Detail code

## Explanation

The certificate pathway for the client CA certificate is incomplete.

## System Action

Communication is closed.

## User Action

Register the client CA certificate in the certificate/key management environment starting with the root CA.

---

## **[client %s1] SSL: The client certificate has been revoked.(%s2,%s3,%s4)**

### Variable Information

%s1 = IP address of systems such as client or proxy server

%s2 = Function name

%s3 = Error code

%s4 = Detail code

## Explanation

Client access was rejected because a client certificate that had been invalidated by the CA was received.

## System Action

Communication is closed.

## User Action

Connection cannot be established with the client to which this client certificate is registered. To connect to this client, request that the CA issue a client certificate, and register the obtained certificate on the client.

---

## **[client %s1] SSL: The client certificate has expired.(%s2,%s3,%s4)**

### Variable Information

%s1 = IP address of systems such as client or proxy server

%s2 = Function name

%s3 = Error code

%s4 = Detail code

## Explanation

Client access was rejected because an expired client certificate was received.

## System Action

Communication is closed.

## User Action

Connection cannot be established with the client to which this client certificate is registered. To connect to this client, request that the CA issue a client certificate, and register the obtained certificate on this client (%s1).

---

## **[client %s1] SSL: The client certificate has no path list.(%s2,%s3,%s4)**

### Variable Information

%s1 = IP address of systems such as client or proxy server

%s2 = Function name

%s3 = Error code

%s4 = Detail code

## Explanation

The certificate pathway for the client certificate does not exist.

## System Action

Communication is closed.

## User Action

Register the client CA certificate in the certificates and key management environment sequentially from the root CA.

---

### **[client %s1] SSL: The client certificate path is invalid.(%s2,%s3,%s4)**

## Variable Information

%s1 = IP address of systems such as client or proxy server

%s2 = Function name

%s3 = Error code

%s4 = Detail code

## Explanation

The certificate pathway for the client certificate is incomplete.

## System Action

Communication is closed.

## User Action

Register the client CA certificate in the certificates and key management environment sequentially from the root CA.

---

### **[client %s1] SSL: Timeout.(%s2,%s3,%s4)**

## Variable Information

%s1 = IP address of systems such as client or proxy server

%s2 = Function name

%s3 = Error code

%s4 = Detail code

## Explanation

A timeout occurred in SSL communication.

## System Action

Communication is closed.

## User Action

Check the client status.

If this message is output frequently, increase the value for the Timeout directive in the environment definition file (httpd.conf).

---

### **[client %s1] SSL: Unacceptable client certificate.(%s2,%s3,%s4)**

## Variable Information

%s1 = IP address of systems such as client or proxy server

%s2 = Function name

%s3 = Error code

%s4 = Detail code

## Explanation

Client access was rejected because the CA certificate of the client certificate sent from the client was not registered in the certificates and key management environment.

## System Action

Communication is closed.

## User Action

Register the CA certificate of the client certificate in the certificates and key management environment using the certificate and CRL management command.

---

## [client %s1] SSL: Unexcepted error.(%s2,%s3,%s4)

## Variable Information

%s1 = IP address of systems such as client or proxy server

%s2 = Function name

%s3 = Error code

%s4 = Detail code

## Explanation

An unexpected error occurred in the SSL function.

## System Action

Communication is closed.

## User Action

Check the function name (%s2) and error code (%s3) that are output, and take the action described in the following table.

Function Name (%s2)	Error Code (%s3)	Meaning / Required Action
SSL_ServerHandshake	0030001D	The client certificate, or signature information of the client certificate, sent from the client (%s1) is invalid. Check whether there is a problem with the client certificate used in the client (%s1).
	00500002	Invalid data was received from the client (%s1).
	00500009	Check if there is a problem with the data sent from the client (%s1).
	0050000B	
	0050000C	
	0050001C	
	0050000D	Access from the client (%s1) may have used a protocol other than "https". Check if there is a problem with the protocol used.
	00700001	An error occurred in the client (%s1), therefore the Alert message was received from the client (%s1). Check whether the client (%s1) has error status.
00700002	Illegal data was received from the client (%s1), therefore the Alert message was sent to the client (%s1). Check whether there is a problem with the data that was sent from the client (%s1).	
00800002	The connection may have been closed by the client (%s1).	

Function Name (%s2)	Error Code (%s3)	Meaning / Required Action
		Check the state of the connection with the client (%s1).
SSL_Read SSL_Write	00700001	An error occurred in the client (%s1), therefore the Alert message was received from the client (%s1).  Check whether there is a problem with the data that was sent from the client (%s1).
	00700002	Illegal data was received from the client (%s1), therefore the Alert message was sent to the client (%s1).  Check whether there is a problem with the data that was sent from the client (%s1).
	00800002	The connection may have been closed by the client (%s1).  Check the state of the connection with the client (%s1).
All other cases		Collect diagnostic information using the <i>iscollectinfo</i> command, and then contact your systems engineer.

---

### [client %s1] SSL: Unsupported client certificate.(%s2,%s3,%s4)

#### Variable Information

%s1 = IP address of systems such as client or proxy server

%s2 = Function name

%s3 = Error code

%s4 = Detail code

#### Explanation

An unsupported client certificate was received.

#### System Action

Communication is closed.

#### User Action

A connection cannot be established with the client on which this certificate is registered. To connect to this client, request that the CA issue the client certificate, and register the obtained certificate on this client.

---

### [client %s1] SSL: Version negotiation error.(%s2,%s3,%s4)

#### Variable Information

%s1 = IP address of systems such as client or proxy server

%s2 = Function name

%s3 = Error code

%s4 = Detail code

#### Explanation

The connection to the SSL protocol versions requested from the client (%s1) was not received.

#### System Action

Communication is closed.

#### User Action

Perform the following steps to check whether SSL protocol versions have been configured to allow connection to the Web Server. Change the SSL protocol version settings to allow connection.

- For the Interstage certificate environment:
  1. In the Interstage Management Console, click [Security] > [SSL] > [SSL definition].
  2. Check [Protocol Version] in the [SSL definition: SSL Configuration Settings] page.
- For a certificate/key management environment configured with the SMEE command:

Check the SSLVersion directive that is set in the environment definition file (httpd.conf).

---

### **[client %s1] Symbolic link not allowed: %s2**

#### Variable Information

%s1 = IP address of systems such as client or proxy server

%s2 = Symbolic link path

#### Explanation

Access to symbolic link (%s2) is not allowed.

#### System Action

A response is given using status code "403" (Forbidden).

#### User Action

If the link destination for the symbolic link does not exist, deploy a link destination.

To allow access to the symbolic link, set FollowSymLinks in the Options directive of the environment definition file (httpd.conf).

---

### **[client %s1] This resource does not accept the %s2 method.**

#### Variable Information

%s1 = IP address of systems such as client or proxy server

%s2 = Request method

#### Explanation

The request method (%s2) is not allowed.

#### System Action

A response is given using status code "405" (Method Not Allowed).

#### User Action

Ask the user of the client to specify a method that is allowed.

---

### **[client %s1] Unable to set LDAP\_OPT\_REFERRALS option to Off: %s2**

#### Variable Information

%s1 = IP address of systems such as client or proxy server

%s2 = Detail information

#### Explanation

There is insufficient memory available.

#### System Action

The Web Server continues to operate.

#### User Action

Check that there is enough memory. If there is not enough memory, close unnecessary programs and secure the required memory capacity for running the Web Server.

---

## **[client %s1] User bind as %s2 failed: LDAP error: %s3; URI %s4**

### Variable Information

%s1 = IP address of systems such as client or proxy server

%s2 = DN for binding

%s3 = LDAP error message

%s4 = URI

### Explanation

The simple certificate request to the directory server failed.

### User Action

Instruct Web browser users how to specify the user ID or password correctly.

If this error message continues to be displayed, refer to LDAP error message (%s3) and remove the cause of the failure. For the LDAP error message, refer to "LDAP Error Codes" in the "Error Codes to be Reported from Interstage Directory Service" chapter.

---

## **[client %s1] User bind as %s2 failed: SSL error: (%s3, %s4); URI %s5**

### Variable Information

%s1 = IP address of systems such as client or proxy server

%s2 = DN for binding

%s3 = SSL error code

%s4 = SSL error detail code

%s5 = URI

### Explanation

The SSL simple certificate request to the directory server failed.

### User Action

Refer to SSL error code (%s3) to resolve the error. For SSL error code details, refer to "SSL Error Codes" in the "Error Codes to be Reported from Interstage Directory Service" chapter.

---

## **Access to file %s1 denied by server: not a regular file**

### Variable Information

%s1 = File name

### Explanation

Access to the file (%s1) is not allowed.

### User Action

To allow access, check the file access authority.

---

## **An error occurred in status display processing. detail=%s1**

### Variable Information

%s1 = Detail information

### Explanation

An error occurred in status display processing.

## System Action

Status display processing is aborted. The Web Server continues to operate.

## User Action

Re-execute the operating status display command (ihdisp).

---

## An internal error occurred during status display daemon initialization processing. detail=%s1

### Variable Information

%s1 = Detail information

### Explanation

An internal error occurred in status display daemon initialization processing.

## System Action

The Web Server start processing is cancelled.

## User Action

Collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

---

## Cannot remove module %s1: not found in module list

### Variable Information

%s1 = Plug-in module name

### Explanation

The plug-in module (%s1) cannot be deleted because it is not in the module list.

## System Action

The Web Server start or stop processing is continued.

## User Action

Collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

---

## child process %s1 still did not exit, sending a SIGKILL

### Variable Information

%s1 = Process ID of the communication process

### Explanation

The communication process does not close.

## System Action

The communication process is closed by force.

## User Action

This message does not require any action.

---

## Configuration Failed

### Explanation

An error occurred in initialization processing.

## System Action

The Web Server program execution processing is aborted.

#### User Action

Refer to the message that was output at the same time and fix the error.

---

### could not make child process %s1 exit, attempting to continue anyway

#### Variable Information

%s1 = Process ID of the communication process

#### Explanation

The expected communication process close is not performed.

#### System Action

Communication process close processing is aborted.

#### User Action

Collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

---

### Internal error: pcfg\_openfile() called with NULL filename

#### Explanation

An internal error occurred in file open processing.

#### User Action

Refer to the message that was output at the same time and fix the error.

---

### Invalid parameters for %s1

#### Variable Information

%s1 = Directive name

#### Explanation

The directive (%s1) parameter is incorrect.

#### System Action

The Web Server continues to operate.

#### User Action

Check the parameter of directive (%s1).

---

### Parent: child process exited with status %s1 -- Aborting.

#### Variable Information

%s1 = Daemon process exit code

#### Explanation

An error occurred in the daemon process.

#### System Action

The daemon process is restarted.

#### User Action

Refer to the message or error log that was output at the same time and fix the error.

---

### Pre-configuration failed

## Explanation

An error occurred in initialization preprocessing.

## System Action

The Web Server program execution processing is aborted.

## User Action

Refer to the message that was output at the same time and fix the error.

---

## server reached MaxClients setting, consider raising the MaxClients setting

## Explanation

The number of communication processes has reached the number of simultaneous connections limit set for the MaxClients directive in the environment definition file (httpd.conf).

This message is output the first time the number of requests reaches the upper limit for the number of simultaneous connections after the Web Server starts up. Once this message is output, it is not output again until the Web Server restarts.

## System Action

The Web Server continues to operate.

## User Action

Check the value set for the MaxClients directive if necessary.

---

## SSL: An error has occurred in the SCMI library function.(%s1,%s2) [%s3]

## Variable Information

%s1 = SCMI library function name

%s2 = Additional information

%s3 = Web Server name

## Explanation

An error occurred in the SCMI library function (%s1). The certificate/key management environment may be invalid.

## System Action

The Web Server start processing is cancelled.

## User Action

Check whether the certificate/key management environment settings are valid. If the certificate/key management environment settings are valid, collect diagnostic information using the iscollectinfo command, and then contact your systems engineer.

---

## SSL: Not enough memory in the SCMI library. [%s1]

## Variable Information

%s1 = Web Server name

## Explanation

The SCMI library memory became insufficient.

## System Action

The Web Server start processing is cancelled.

## User Action

Check that there is enough memory. If there is not enough memory, close unnecessary programs and secure the required memory capacity for running the Web Server.

---

**The number of requests received simultaneously reached the value set in the MaxClients directive.****Explanation**

The number of simultaneous connection requests from the client has exceeded the value set for the MaxClients directive in the environment definition file (httpd.conf) (maximum number of requests).

This message is output the first time the number of requests exceeds the maximum value for the number of simultaneous connections after the Web Server starts up. Once this message is output, it is not output again until the Web Server restarts.

**System Action**

Web Server processing is continued.

**User Action**

If necessary, check the value set for the MaxClients directive in the environment definition file (httpd.conf) (maximum number of requests).

---

**There is already a path with the same name as the named pipe. path=%s1****Variable Information**

%s1 = Path name

**Explanation**

There is already a path with the same name as the named pipe.

**System Action**

The Web Server start processing is cancelled.

**User Action**

Change the name of the file or directory in path (%s1) or delete it, and then restart the Web Server.

---

**Unable to open logs****Explanation**

An error occurred in log initialization processing.

**System Action**

The Web Server program execution processing is aborted.

**User Action**

Refer to the message that was output at the same time and fix the error.

---

**VirtualHost %s1:%s2 -- mixing \* ports and non-\* ports with a NameVirtualHost address is not supported, proceeding with undefined results****Variable Information**

%s1 = Virtual host name

%s2 = Port number

**Explanation**

Asterisks (\*) and non-asterisks cannot be specified together in the namebase virtual host port number settings.

**System Action**

The Web Server continues to operate.

## User Action

Check the port number specified for the <VirtualHost> section and the NameVirtualHost directive in the environment definition file (httpd.conf).

## 37.1.5 Messages Whose Log Levels are warn

---

### Explanation and User action of Messages

---

#### **%s1: gethostname() failed to determine ServerName**

##### Variable Information

%s1 = Name of Web Server execution program

##### Explanation

The local host name could not be obtained.

##### System Action

The Web Server program execution processing is continued.

##### User Action

This message does not require any action.

---

#### **(%s1)%s2: apr\_socket\_opt\_set: (TCP\_NODELAY)**

##### Variable Information

%s1 = Error details number

%s2 = Error details context

##### Explanation

The socket option could not be set.

##### System Action

The Web Server program execution processing is continued.

##### User Action

Resolve the cause of the error according to the error details context (%s2).

---

#### **(%s1)%s2: get socket to connect to listener**

##### Variable Information

%s1 = Error details number

%s2 = Error details context

##### Explanation

A socket could not be created.

##### System Action

The Web Server program execution processing is aborted.

##### User Action

Resolve the cause of the error according to the error details context (%s2).

---

#### **(%s1)%s2: killpg SIGHUP**

## Variable Information

%s1 = Error details number

%s2 = Error details context

## Explanation

The SIGHUP signal could not be transmitted to a communication process.

## System Action

The Web Server program execution processing is continued.

## User Action

Resolve the cause of the error according to the error details context (%s2).

---

## **(%s1)%s2: killpg SIGTERM**

## Variable Information

%s1 = Error details number

%s2 = Error details context

## Explanation

The SIGTERM signal could not be transmitted to a communication process

## System Action

The Web Server program execution processing is continued.

## User Action

Resolve the cause of the error according to the error details context (%s2).

---

## **(%s1)%s2: make\_sock: failed to set ReceiveBufferSize for address %s3, using default**

## Variable Information

%s1 = Error details number

%s2 = Error details context

%s3 = IP address

## Explanation

The receive buffer size settings failed. The value set for the system parameter of the operating system is used.

## System Action

The Web Server program execution processing is continued.

## User Action

Resolve the cause of the error according to the error details context (%s2).

---

## **(%s1)%s2: make\_sock: failed to set SendBufferSize for address %s3, using default**

## Variable Information

%s1 = Error details number

%s2 = Error details context

%s3 = IP address

## Explanation

The send buffer size settings failed. The value set for the system parameter of the operating system is used.

## System Action

The Web Server program execution processing is continued.

## User Action

Resolve the cause of the error according to the error details context (%s2).

---

**(%s1)%s2: mpm\_get\_completion\_context: CreateEvent failed.**

## Variable Information

%s1 = Error details number

%s2 = Error details context

## Explanation

The event could not be created.

## System Action

The Web Server program execution processing is continued.

## User Action

This message does not require any action.

---

**(%s1)%s2: mpm\_get\_completion\_context: Failed to create the transaction pool.**

## Variable Information

%s1 = Error details number

%s2 = Error details context

## Explanation

The memory management area could not be created.

## System Action

The Web Server program execution processing is continued.

## User Action

Resolve the cause of the error according to the error details context (%s2).

---

**(%s1)%s2: No installed ConfigArgs for the service "%s3", using Apache defaults.**

## Variable Information

%s1 = Error details number

%s2 = Error details context

%s3 = Service name

## Explanation

The value set for initialization is used because the installation parameter has not been set.

## System Action

The Web Server program execution processing is continued.

## User Action

Collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

---

### (%s1)%s2: set timeout on socket to connect to listener

#### Variable Information

%s1 = Error details number

%s2 = Error details context

#### Explanation

The listener socket timer could not be set.

#### System Action

The Web Server program execution processing is aborted.

#### User Action

Resolve the cause of the error according to the error details context (%s2).

---

### (%s1)%s2: setsockopt(SO\_UPDATE\_ACCEPT\_CONTEXT) failed.

#### Variable Information

%s1 = Error details number

%s2 = Error details context

#### Explanation

The socket option could not be set.

#### System Action

The Web Server program execution processing is continued.

#### User Action

Check the error details number (%s1) output, and take the action described below:

Error Details Number (%s1)	Meaning / Required Action
OS 10038	The Web Server might have stopped when the request was received from the client - if this is the case, then no action is necessary.
All other cases	Resolve the cause of the error according to the error details context (%s2).

### (%s1)%s2: sigaction(SIGABORT)

#### Variable Information

%s1 = Error details number

%s2 = Error details context

#### Explanation

The SIGABORT signal handler could not be set.

#### System Action

The Web Server program execution processing is continued.

#### User Action

Resolve the cause of the error according to the error details context (%s2).

---

**(%s1)%s2: sigaction(SIGABRT)****Variable Information**

%s1 = Error details number

%s2 = Error details context

**Explanation**

The SIGABRT signal handler could not be set

**System Action**

The Web Server program execution processing is continued.

**User Action**

Resolve the cause of the error according to the error details context (%s2).

---

**(%s1)%s2: sigaction(SIGBUS)****Variable Information**

%s1 = Error details number

%s2 = Error details context

**Explanation**

The SIGBUS signal handler could not be set

**System Action**

The Web Server program execution processing is continued.

**User Action**

Resolve the cause of the error according to the error details context (%s2).

---

**(%s1)%s2: sigaction(SIGHUP)****Variable Information**

%s1 = Error details number

%s2 = Error details context

**Explanation**

The SIGHUP signal handler could not be set

**System Action**

The Web Server program execution processing is continued.

**User Action**

Resolve the cause of the error according to the error details context (%s2).

---

**(%s1)%s2: sigaction(SIGILL)****Variable Information**

%s1 = Error details number

%s2 = Error details context

**Explanation**

The SIGILL signal handler could not be set

## System Action

The Web Server program execution processing is continued.

## User Action

Resolve the cause of the error according to the error details context (%s2).

---

## **(%s1)%s2: sigaction(SIGINT)**

### Variable Information

%s1 = Error details number

%s2 = Error details context

### Explanation

The SIGINT signal handler could not be set

## System Action

The Web Server program execution processing is continued.

## User Action

Resolve the cause of the error according to the error details context (%s2).

---

## **(%s1)%s2: sigaction(SIGPIPE)**

### Variable Information

%s1 = Error details number

%s2 = Error details context

### Explanation

The SIGPIPE signal handler could not be set

## System Action

The Web Server program execution processing is continued.

## User Action

Resolve the cause of the error according to the error details context (%s2).

---

## **(%s1)%s2: sigaction(SIGSEGV)**

### Variable Information

%s1 = Error details number

%s2 = Error details context

### Explanation

The SIGSEGV signal handler could not be set

## System Action

The Web Server program execution processing is continued.

## User Action

Resolve the cause of the error according to the error details context (%s2).

---

## **(%s1)%s2: sigaction(SIGTERM)**

## Variable Information

%s1 = Error details number

%s2 = Error details context

## Explanation

The SIGTERM signal handler could not be set

## System Action

The Web Server program execution processing is continued.

## User Action

Resolve the cause of the error according to the error details context (%s2).

---

## **(%s1)%s2: sigaction(SIGUSR1)**

## Variable Information

%s1 = Error details number

%s2 = Error details context

## Explanation

The SIGUSR1 signal handler could not be set

## System Action

The Web Server program execution processing is continued.

## User Action

Resolve the cause of the error according to the error details context (%s2).

---

## **(%s1)%s2: sigaction(SIGXCPU)**

## Variable Information

%s1 = Error details number

%s2 = Error details context

## Explanation

The SIGXCPU signal handler could not be set.

## System Action

The Web Server program execution processing is continued.

## User Action

Resolve the cause of the error according to the error details context (%s2).

---

## **(%s1)%s2: sigaction(SIGXFSZ)**

## Variable Information

%s1 = Error details number

%s2 = Error details context

## Explanation

The SIGXFSZ signal handler could not be set

## System Action

The Web Server program execution processing is continued.

## User Action

Resolve the cause of the error according to the error details context (%s2).

---

**(%s1)%s2: winnt\_accept: Asynchronous AcceptEx failed.**

## Variable Information

%s1 = Error details number

%s2 = Error details context

## Explanation

The network connection was not accepted.

## System Action

The Web Server continues to operate.

## User Action

Check the error details number (%s1) that are output, and take the action described in the following table.

Error Details Number (%s1)	Meaning / Required Action
OS 64	A request put in a queue in the operating system was disconnected from the client - there is no need to take action.  However, the request was put in the queue because the number of simultaneous connections with the client has exceeded the upper limit. If necessary, check the value set in the environment definition file (httpd.conf) ThreadsPerChild directive.
All other cases	Resolve the cause of the error according to the error details context (%s2).

---

**(%s1)%s2: winnt\_accept: Failed to allocate an accept socket. Temporary resource constraint? Try again.**

## Variable Information

%s1 = Error details number

%s2 = Error details context

## Explanation

A socket could not be created. Another attempt will be made in 0.1 seconds.

## System Action

The Web Server program execution processing is continued.

## User Action

Resolve the cause of the error according to the error details context (%s2).

---

**(%s1)%s2: write\_pipe\_of\_death**

## Variable Information

%s1 = Error details number

%s2 = Error details context

## Explanation

An attempt to write to the pipe failed.

## System Action

The Web Server continues to operate.

## User Action

Resolve the cause of the error according to the error details context (%s2).

---

**[client %s1] [%s2] authenticate: user %s3 authentication failed; URI %s4 [%s5][%s6]**

## Variable Information

%s1 = IP address of systems such as client or proxy server

%s2 = Process ID of the communication process

%s3 = User name

%s4 = URI

%s5 = Error reason

%s6 = LDAP error message

## Explanation

The specified user name (%s3) could not be authenticated.

## System Action

Communication is closed.

## User Action

Take the following action:

- Check whether the user name and password are correct, and correct them if necessary.
- If SSL is used for communication with the directory server, confirm that the user who set up the certificate environment and the user specified for the User/Group directive in the environment definition file (httpd.conf) match. If they do not match, specify the user again so that they do match.

If the above settings are correct, refer to the table below and take action according to the error reason (%s5).

Error Reason (%s5)	User Action
Could not connect to LDAP server: SSL error (%s7, %s8) (See Note)	Refer to SSL error code (%s7) and remove the cause of the failure. For SSL error code details, refer to "SSL Error Codes" in the "Error Codes to be Reported from Interstage Directory Service" chapter.
LDAP compare failed: SSL error: (%s7, %s8)	
Could not bind to LDAP server '%s9' as %s10: SSL error (%s7, %s8)	
LDAP search for %s11 failed: SSL error: (%s7, %s8)	
User bind as %s10 failed: SSL error: (%s7, %s8)	
Could not connect to LDAP server: %s12	Refer to SSL error code (%s12) and remove the cause of the failure.
Other	Refer to LDAP error message (%s6) and remove the cause of the failure. For LDAP error message details, refer to "LDAP Error Codes" in the "Error Codes to be Reported from Interstage Directory Service" chapter.

Note: Variable Information

%s7 = SSL error code

%s8 = SSL error detail code

%s9 = Host name of the directory server

%s10 = DN for binding

%s11 = Search filter

%s12 = Error details context

If the message continues to be output, collect diagnostic information using the `iscollectinfo` command, and then contact your systems engineer.

---

### **[client %s1] handler "%s2" not found for: %s3**

#### Variable Information

%s1 = IP address of systems such as client or proxy server

%s2 = Handler name

%s3 = File name

#### Explanation

The handler for the content file (%s3) does not exist.

#### System Action

A response is given using status code "500" (Internal Server Error).

#### User Action

Check the MIME settings and handler definition.

---

### **\_default\_ VirtualHost overlap on port %s1, the first has precedence**

#### Variable Information

%s1 = Port number

#### Explanation

In the <VirtualHost> section `_default_` settings in the environment definition file (`httpd.conf`), port number (%s1) overlaps with another host.

#### System Action

The Web Server program execution processing is continued.

#### User Action

Check the <VirtualHost> section settings in the environment definition file (`httpd.conf`).

---

### **child process %s1 still did not exit, sending a SIGTERM**

#### Variable Information

%s1 = Process ID

#### Explanation

SIGTERM is sent because the communication process (%s1) did not close.

#### System Action

The Web Server program execution processing is aborted.

#### User Action

This message does not require any action.

---

### **httpd (pid %s1) already running**

## Variable Information

%s1 = Process ID

## Explanation

The Web Server is already running.

## System Action

The Web Server start processing is cancelled.

## User Action

This message does not require any action.

---

## httpd (pid %s1?) not running

## Variable Information

%s1 = Process ID

## Explanation

The Web Server process (%s1) does not exist.

## System Action

The Web Server stop processing is cancelled.

## User Action

This message does not require any action.

---

## integer overflow or out of memory condition.

## Explanation

The length of the environment variable value configured in the environment definition file (httpd.conf) directives given below has exceeded 4294967295 bytes. The request is processed by treating these directive configurations as invalid.

- SetEnvIf
- SetEnvIfNoCase

## System Action

Web server execution processing is continued.

## User Action

Check the environment variable value configured in the environment definition file (httpd.conf). If the length of the configured environment variable value has exceeded 4294967295 bytes, reconfigure the value and ensure that this length does not exceed 4294967295 bytes.

- SetEnvIf
- SetEnvIfNoCase

---

## Limiting internal redirects to very low numbers may cause normal requests to fail.

## Explanation

The value that was set for the maximum number of internal redirects for the LimitInternalRecursion directive in the environment definition file (httpd.conf) was less than 4.

## System Action

The Web Server program execution processing is continued.

## User Action

It is recommended that a value of 4 or more is set for the `LimitInternalRecursion` directive in the environment definition file (`httpd.conf`).

---

## Limiting the subrequest depth to a very low level may cause normal requests to fail.

### Explanation

The value that was set for the maximum number of subrequests for the `LimitInternalRecursion` directive in the environment definition file (`httpd.conf`) was less than 4.

### System Action

The Web Server program execution processing is continued.

## User Action

It is recommended that a value of 4 or more is set for the `LimitInternalRecursion` directive in the environment definition file (`httpd.conf`).

---

## NameVirtualHost %s1:%s2 has no VirtualHosts

### Variable Information

%s1 = Virtual host name

%s2 = Port number

### Explanation

The host name (%s1) set for the `NameVirtualHost` directive in the environment definition file (`httpd.conf`) is not a virtual host.

### System Action

The Web Server program execution processing is continued.

## User Action

Check host name (%s1) that was set for the `NameVirtualHost` directive in the environment definition file (`httpd.conf`).

---

## pid file %s1 overwritten -- Unclean shutdown of previous Apache run?

### Variable Information

%s1 = File name

### Explanation

The process ID assigned to the control process and the contents of the file used to manage the process ID of the control process (%s1) are different.

### System Action

The Web Server program execution processing is continued.

## User Action

This message does not require any action.

---

## Server ran out of threads to serve requests. Consider raising the ThreadsPerChild setting

### Explanation

The number of simultaneous connection requests from the client has exceeded the limit for the number of simultaneous connections set in the `ThreadsPerChild` directive in the environment definition file (`httpd.conf`).

This message is output the first time the number of requests exceeds the upper limit for the number of simultaneous connections after the Web Server starts up. Once this message is output, it is not output again until the Web Server restarts.

## System Action

The Web Server continues to operate.

## User Action

Check the limit for the number of clients that can be connected simultaneously set in the ThreadsPerChild directive in the environment definition file (httpd.conf).

---

## SSL: The CA certificate validity term has expired.(%s1,%s2) [%s3]

### Variable Information

%s1 = CA certificate serial number

%s2 = CA certificate validity term (Format: "YYYY/MM/DD hh:mm:ss")

%s3 = Web Server name

### Explanation

The validity term (%s2) of the CA certificate has expired.

If a Web Server operation is continued even though the CA certificate's validity term has already expired, the following problems will occur:

- Communication with the client fails.
- The Web Server cannot be restarted.

## System Action

The processing is continued.

## User Action

Take action according to the following procedure:

1. Make a request to the CA (certificate issuer) to issue a new CA certificate.
2. Re-register a new CA certificate.
3. Restart the Web Server.

---

## SSL: The CA certificate will expire in %s1 days.(%s2,%s3) [%s4]

### Variable Information

%s1 = Number of days left until the CA certificate's validity term will expire

%s2 = CA certificate serial number

%s3 = CA certificate validity term (Format: "YYYY/MM/DD hh:mm:ss")

%s4 = Web Server name

### Explanation

The validity term (%s3) of the CA certificate will expire in %s1 days.

## System Action

The processing is continued.

## User Action

Before the validity term of the CA certificate expires, take action according to the following procedure:

1. Make a request to the CA (certificate issuer) to issue a new CA certificate.
2. Re-register a new CA certificate.
3. Restart the Web Server.

---

## SSL: The site certificate validity term has expired.(%s1,%s2) [%s3]

### Variable Information

%s1 = site certificate nickname

%s2 = site certificate validity term (Format: "YYYY/MM/DD hh:mm:ss")

%s3 = Web Server name

### Explanation

The validity term (%s2) of the site certificate (%s1) has expired.

If a Web Server operation is continued even though the site certificate's validity term has already expired, the following problems will occur:

- Communication with the client fails.
- The Web Server cannot be restarted.

### System Action

The processing is continued.

### User Action

Take action according to the following procedure:

1. Make a request to the CA (certificate issuer) to issue a new site certificate.
2. Re-register a new site certificate.
3. Restart the Web Server.

---

## SSL: The site certificate will expire in %s1 days.(%s2,%s3) [%s4]

### Variable Information

%s1 = Number of days left until the site certificate's validity term will expire

%s2 = site certificate nickname

%s3 = site certificate validity term (Format: "YYYY/MM/DD hh:mm:ss")

%s4 = Web Server name

### Explanation

The validity term (%s3) of the site certificate (%s2) will expire in %s1 days.

### System Action

The processing is continued.

### User Action

Before the validity term of the site certificate expires, take action according to the following procedure:

1. Make a request to the CA (certificate issuer) to issue a new site certificate.
2. Re-register a new site certificate.
3. Restart the Web Server.

---

## VirtualHost %s1:%s2 overlaps with VirtualHost %s3:%s4, the first has precedence, perhaps you need a NameVirtualHost directive

### Variable Information

%s1 = Virtual host name

%s2 = Port number

%s3 = Virtual host name

%s4 = Port number

#### Explanation

In the <VirtualHost> section settings in the environment definition file (httpd.conf), the virtual host name and port number overlap.

#### System Action

The Web Server program execution processing is continued.

#### User Action

Check the <VirtualHost> section settings in the environment definition file (httpd.conf).

---

### **WARNING: Attempt to change ServerLimit ignored during restart**

#### Explanation

The ServerLimit directive settings in restart are ignored.

#### System Action

The Web Server program execution processing is continued.

#### User Action

This message does not require any action.

---

### **WARNING: Attempt to change ThreadLimit ignored during restart**

#### Explanation

The ThreadLimit directive settings in restart are ignored.

#### System Action

The Web Server program execution processing is continued.

#### User Action

This message does not require any action.

---

## **37.1.6 Messages Whose Log Levels are notice**

### **Explanation and User action of Messages**

---

#### **%s1 configured -- resuming normal operations**

##### Variable Information

%s1 = Server information

##### Explanation

Initialization processing was completed normally.

---

#### **cannot use a full URL in a 401 ErrorDocument directive --- ignoring!**

##### Explanation

An external URL cannot be specified in the error document if status code "401" is specified for the ErrorDocument directive in the environment definition file (httpd.conf).

Note: User authentication cannot be used because the client cannot accept status code "401".

## System Action

The ErrorDocument directive settings in the environment definition file (httpd.conf) are disabled and processing is continued.

## User Action

If status code "401" is specified for the ErrorDocument directive in the environment definition file (httpd.conf), specify the text message or internal URL in the error document.

---

### caught SIGTERM, shutting down

#### Explanation

The Web Server was stopped.

---

### Child %s1: Acquired the start mutex.

#### Variable Information

%s1 = Process ID of the daemon process

#### Explanation

Exclusive resources were acquired.

---

### Child %s1: All worker threads have exited.

#### Variable Information

%s1 = Process ID of the daemon process

#### Explanation

All communication threads have closed.

---

### Child %s1: Child process is exiting

#### Variable Information

%s1 = Process ID of the daemon process

#### Explanation

The daemon process is stopping.

---

### Child %s1: Child process is running

#### Variable Information

%s1 = Process ID of the daemon process

#### Explanation

The daemon process is starting.

---

### Child %s1: Exit event signaled. Child process is ending.

#### Variable Information

%s1 = Process ID of the daemon process

#### Explanation

A stop event was received. The daemon process (%s1) starts close processing.

---

### Child %s1: Process exiting because it reached MaxRequestsPerChild. Signaling the parent to restart a new child process.

## Variable Information

%s1 = Process ID of the daemon process

## Explanation

The number of requests processed in daemon process (%s1) has reached the value set for the MaxRequestsPerChild directive in the environment definition file (httpd.conf).

## System Action

The daemon process is restarted.

---

## **Child %s1: Released the start mutex**

### Variable Information

%s1 = Process ID of the daemon process

### Explanation

Exclusive resources were released.

---

## **Child %s1: Starting %s2 worker threads.**

### Variable Information

%s1 = Process ID of the daemon process

%s2 = The value set for the ThreadsPerChild directive in the environment definition file (httpd.conf)

### Explanation

Communication threads are created.

---

## **Child %s1: Terminating %s2 threads that failed to exit.**

### Variable Information

%s1 = Process ID of the daemon process

%s2 = The number of communication threads that could not close

### Explanation

The communication threads were stopped by force because they could not stop within the allowed time.

---

## **Child %s1: Waiting for %s2 worker threads to exit.**

### Variable Information

%s1 = Process ID of the daemon process

%s2 = The value set for the ThreadsPerChild directive in the environment definition file (httpd.conf)

### Explanation

The promised communication thread close is performed.

---

## **child pid %s1 exit signal %s2 (%s3)**

### Variable Information

%s1 = Process ID of the communication process

%s2 = Error details context

%s3 = Received signal number

### Explanation

Signal (%s3) was received in communication process (%s1).

## User Action

If the error details context (%s2) is "Segmentation fault" and there is no response to any of the requests that used a web server connector, the web server connector operations may become unstable due to instances of insufficient disk space in the past.

Refer to the event log (Windows(R)) or the system log (Solaris/Linux) to check if there is sufficient disk space. If an instance of insufficient disk space did occur, check if the web server was restarted after the occurrence. If the web server was not restarted, secure the required disk space and restart the web server.

---

### child pid %s1 exit signal %s2 (%s3), possible coredump in %s4

#### Variable Information

%s1 = Process ID of the communication process

%s2 = Error details context

%s3 = Output signal number

%s4 = Output core file name

#### Explanation

A signal (%s3) was received in the communication process (%s1). The core file (%s4) is output.

---

### Graceful restart requested, doing restart

#### Explanation

The Web Server restart processing is started.

---

### Parent: Child process exited successfully.

#### Explanation

The daemon process closed normally.

---

### Parent: child process exited with status %s1 -- Restarting.

#### Variable Information

%s1 = Daemon process exit code

#### Explanation

The daemon process is closed.

#### System Action

The daemon process is restarted.

---

### Parent: Created child process %s1

#### Variable Information

%s1 = Process ID of the daemon process

#### Explanation

The daemon process was created.

---

### Parent: Forcing termination of child process %s1

#### Variable Information

%s1 = Daemon process handle number

#### Explanation

The daemon process could not be closed within the allowed time. The corresponding process is closed by force.

---

**Parent: Received restart signal -- Restarting the server.****Explanation**

The Web Server restart processing is started.

---

**Parent: Received shutdown signal -- Shutting down the server.****Explanation**

The Web Server stop processing is started.

---

**seg fault or similar nasty error detected in the parent process****Explanation**

The monitoring process received one of the following signals:

- SIGSEGV
  - SIGBUS
  - SIGABORT
  - SIGABRT
  - SIGILL
- 

**Server built: %s1****Variable Information**

%s1 = Build time

**Explanation**

This is the Interstage HTTP Server compile time.

---

**SIGHUP received. Attempting to restart****Explanation**

The Web Server restart processing is started.

# Chapter 38 Exceptions Output during J2EE Usage

This chapter explains the exceptions output during operation of a J2EE Application.

If a stack trace was output in the exception information, another exception may be output as "Caused by:" following the stack trace. This shows the primary cause, and should also be checked.

## 38.1 Exceptions Beginning with com.microsoft

### 38.1.1 com.microsoft.sqlserver.jdbc.SQLServerException

#### [com.microsoft.sqlserver.jdbc.SQLServerException: %s](#)

##### Variable Information

%s = JDBC driver's error message

##### Explanation

An error occurred in the JDBC driver.

##### User Action

Refer to "%s" in the SQL Server documentation to fix the driver problem.

If the error message is "User 'NT AUTHORITY\ANONYMOUS LOGON' could not log on." it means that Integrated Authentication (Windows Authentication) has been set. Integrated Authentication is not supported, so use SQL Server authentication.

## 38.2 Exceptions Beginning with java.io

### 38.2.1 java.io.FileNotFoundException

#### [java.io.FileNotFoundException](#)

##### Explanation

The possible causes are:

1. A file which was attempted to be accessed does not exist.
2. File access authorization is not assigned.

##### User Action

1. Check whether the file exists in the path that follows "FileNotFoundException:".
2. When the file exists, check whether the file access authorization is assigned.
3. Check whether the file is used by another software product.

If the file is used by another software product, FileNotFoundException might be output.

### 38.2.2 java.io.IOException

#### [java.io.IOException](#)

##### Explanation

For a Web application, the possible cause is as follows:

A client application such as a Web browser stopped processing for the following reasons:

- Stopped by a user operation

- Stopped automatically by cache control of a client.

### User Action

Stopping is initiated from the client application. It does not indicate a server error. In this case, `IOException` is output by the following factors:

- Ending the client application
- Pressing the stop button without waiting for a request completion
- Pressing the reload button repeatedly
- Double-clicking the link and post destinations
- Making a transition to another link without waiting for the completion of the previous request

`IOException` caused from the above factors does not always occur because it depends on the following:

- timing of detecting a socket disconnection of the client application by the Web server (this timing differs depending on the network status) and
- timing of writing to the socket by the container.

## 38.3 Exceptions Beginning with `java.lang`

---

### 38.3.1 `java.lang.ClassCastException`

---

The exception was thrown to indicate that an attempt was made to cast a certain object to a class that is not in an inheritance relationship. For example, J2EE only supports JDBC API, but an attempt was made to cast the object to a database-specific class (such as `oracle.jdbc.driver.OracleConnection`).

#### `java.lang.ClassCastException`

##### Explanation

If an error occurs in the Java applet in the EJB application and the relevant exception is output to the Java console, authorization may not be set correctly.

**Solaris32/64 Linux32/64**

The module access authorization set in the `IJServer` class path may not include the user who starts the `IJServer`.

##### User Action

If the exception is output to the Java console due to a Java applet error, authorization may not be set correctly. For information about how to set the authorization correctly, refer to "Using Java Applets" in the J2EE User's Guide.

Note that the stack trace might not be output.

**Solaris32/64 Linux32/64**

- Check if the user who starts the `IJServer` has access authorization for the module set in the `IJServer` class path. If that user has no access authorization, assign it to the user.

#### `java.lang.ClassCastException: %s`

---

##### Variable Information

`%s` = Data source type name

##### Explanation

A data source that cannot be used has been specified.

##### User Action

Check that a data source (XA data source) specified in the resource access definition is usable by client applications or web applications.

Note that the stack trace might not be output.

---

### **java.lang.ClassCastException: [narrow()]**

#### User Action

If the exception occurs during narrow processing made from a client in the EJB application, check the following. Additionally, check whether there is an error in "Separate Class Loader" of the IJServer environment definition settings.

Note that the stack trace might not be output.

- Check whether the following types are correct:
  - Home interface class type (specified in the second parameter of the narrow processing) of the EJB application that performs narrow processing, and
  - Home interface class type of the EJB application that performs lookup processing.
- Check whether the client distribution data set in the client application environment belongs to the EJB application that performs lookup processing.
- Check whether the client environment is set correctly.
- Check whether narrow processing is being performed in the lookup processing of the EJB application that uses a local interface.
- Check whether reference LocalEJB (ejb-local-ref tag) is coded in the deployment descriptor of the EJB application that uses a local interface. If it is coded, check whether the EJB application name to be referenced is coded correctly.
- If an EJB application class is included in the WAR, and the Home/Remote interface is referenced in the Application or Webapp class loaders, ClassCastException may occur if the settings cause client distribution to be loaded using an Interstage class loader.

Change the class or jar storage directory so that classes with the same name are not loaded in multiple class loaders. Alternatively, select "Do not Separate" for the class loader separation.

For details of class loaders, refer to "Class Loader" in the J2EE User's Guide.

---

### **java.lang.ClassCastException: [writeRemoteObject()] Specified object type is invalid.**

#### User Action

If the EJB application uses the distributed transaction function, check whether "Yes" is specified for "Local Calling" of Interstage Management Console. If "Yes" is specified, specify "No", then restart IJServer.

Note that the stack trace might not be output.

---

### **java.lang.ClassCastException: com.fujitsu.ObjectDirector.CORBA.ObjectImpl**

#### Explanation

The Home interface of EJB is directly casted.

#### User Action

If the Home interface was subjected to lookup processing, it cannot be directly casted.

Cast the Home interface using the narrow method of the PortableRemoteObject class.

Note that the stack trace might not be output.

---

### **java.lang.ClassCastException: While loading stub, Exception occurred. narrow from %s1 to %s2.**

#### Variable Information

%s1 = Home interface class type that performs lookup processing

%s2 = Home interface class type (specified in the second parameter of narrow processing)

#### Explanation

Failed to load the class during lookup or narrow processing.

## User Action

In the EJB application deployed in IJServer that runs in the same JavaVM, check whether the following types are correct:

- Home interface class type (specified in the second parameter of the narrow processing) that performs narrow processing, and
- Home interface class type that performs lookup processing.

Moreover, check whether the client distribution data set in the client application environment is deployed in IJServer that runs in the same JavaVM and it belongs to the EJB application that performs lookup processing.

If the version of the Java that calls the EJB application is earlier than the deployed IJServer's, use the client distribution data that was deployed to the previous version/level (compatible) IJServer and make sure that the version of Java that calls the EJB application and the version of Java that generated the client distribution data match.

Note that due the stack trace might not be output.

---

### **java.lang.ClassCastException: com.sun.corba.se.impl.orb.ORBImpl cannot be cast to com.fujitsu.ObjectDirector.CORBA.ORB**

#### Explanation

The ORB was not correctly configured or JDK6/JRE6 may have been used.

#### User Action

JDK 6/JRE 6 may not have been used. Run the J2EE application client using JDK 6/JRE 6.

If ORB was not specified, then configure it. For details, refer to "Using Java Applets" > "Setting Client Environment (Portable-ORB)" in the J2EE User's Guide.

---

## **38.3.2 java.lang.ClassNotFoundException**

---

### **java.lang.ClassNotFoundException**

#### Explanation

ClassNotFoundException is thrown when JVM or the class loader attempts to load the class definition at calling of the forName method of java.lang.Class and the class definition is not found.

#### User Action

- Perform the corrective action indicated by java.lang.NoClassDefFoundError.
- Additionally, check whether there is an error in "Separate Class Loader" of the IJServer environment definition settings.
- To call EJB applications that have been deployed to different IJServers, it is necessary to set client distribution data in the class path. However, if the IJServer type is "Run Web and EJB applications in the same JavaVM", EJB applications deployed to one IJServer cannot be called from another IJServer.
- The method used to set the JDBC driver may be invalid, or a different JDBC driver from the defined JDBC data source may have been set. For details on how to configure the JDBC driver, refer to "Environment Setup when JDBC (Database) is Referenced" in the "JNDI" chapter of the J2EE User's Guide. Make sure that the JDBC driver version is correct, and use a Microsoft JDBC driver if you are using SQL Server.
- If the thread was generated in the application, make sure that the thread has closed when application close processing is complete. Application close processing examples are shown below.
  - The servlet destroy method (If the thread was generated using the init method)
  - The ServletContextListener contextDestroyed method (If the thread was generated using the contextInitialized method)
  - The executable class when the WorkUnit was not running (If the thread was generated using the executable class when the WorkUnit was running)

If the thread still runs even after close processing, this message may be output if a class loader that has already been stopped is used.

---

**java.lang.ClassNotFoundException: java.io.FileNotFoundException: %s****Variable Information**

%s = URL

**User Action**

Check each of the following:

- The necessary jar file may not correctly be stored in the Web server.
- The necessary jar file may not be coded in the HTML file.

---

**38.3.3 java.lang.Exception**

---

**java.lang.Exception: java.lang.NumberFormatException: %s****Variable Information**

%s = Value or "multiple points"

**Explanation**

An error exists in the <env-entry> tag in the deployment descriptor file.

**User Action**

Check that the values specified in <env-entry-type> and <env-entry-value> are consistent.

---

**java.lang.Exception: JDBC DataSource not found!!!****Explanation**

The specified data source does not exist.

**User Action**

Check that the data source is registered in the naming service of the JDBC driver to be used.

---

**38.3.4 java.lang.ExceptionInInitializerError**

---

**java.lang.ExceptionInInitializerError: java.security.AccessControlException: access denied****Explanation**

A security error occurred because proper authorization is not set in a Java applet file in the EJB application.

**User Action**

Check each of the following:

- The digital signature of the downloaded jar file may not be valid. Reimport the certificate signed in the jar file, to the client. For details, refer to "Using Java Applets" in the J2EE User's Guide.
- The codebase specified at setting of authorization may differ from the location for storing the file to be downloaded. Specify the correct location in codebase.
- The policy file having information in which authorization is set may not be valid at execution. Check the setting of the policy file.
- An applet might be stored in the Web server without making it a jar file. For details, refer to "Using Java Applets" in the J2EE User's Guide.

---

**java.lang.ExceptionInInitializerError: org.omg.CORBA.INITIALIZE****Explanation**

An error occurred during setup of the operation environment of the J2EE application client.

## User Action

- Check that the following CORBA service (ObjectDirector) library path (LD\_LIBRARY\_PATH) has been specified.

**Solaris32/64**

```
/opt/FSUNod/lib
```

**Linux32/64**

```
/opt/FJSVod/lib
```

- For the J2EE application client, check whether the client environment is correctly set, in addition to the above check.
- For the EJB application, check whether the client application environment is correctly set, in addition to the above check.

---

### **java.lang.ExceptionInInitializerError: org.omg.CORBA.INITIALIZE: cannot instantiate %s**

#### Variable Information

%s = Class name

#### Explanation

If an error occurs in a Java applet in the EJB application, it is displayed on the Java console.

#### User Action

- A necessary jar file may not be coded in the HTML file. Check whether the required jar file is coded in the HTML file. For details, refer to "Using Java Applets" in the J2EE User's Guide.
- Object Request Broker (ORB) might be specified incorrectly. For details, refer to "Using Java Applets" in the J2EE User's Guide.

---

### **java.lang.ExceptionInInitializerError: org.omg.CORBA.INITIALIZE: can't instantiate default ORB implementation com.fujitsu.ObjectDirector.CORBA.SingletonORB minor code: 0 completed: No**

#### Explanation

If an error occurs in a Java applet in the EJB application, it is displayed on the Java console.

#### User Action

Object Request Broker (ORB) might be specified incorrectly.

---

### **java.lang.ExceptionInInitializerError: org.omg.CORBA.INITIALIZE: JNDI lookup error.**

#### User Action

In the EJB application, check whether the environment for using the distributed transaction function is correctly configured.

---

## **38.3.5 java.lang.IllegalStateException**

---

### **java.lang.IllegalStateException: UserTransaction does not exist**

#### Explanation

The possible causes are:

[For the EJB application]

- If the transaction management type is "Container," UserTransaction is being acquired using the `getUserTransaction()` method of `EJBContext` (`SessionContext` or `EntityContext`).
- If the transaction management type is "Bean," `getUserTransaction()` is called with a method of Bean for which the `getUserTransaction()` method of `SessionContext` cannot be used.

#### User Action

Correct the application.

## 38.3.6 java.lang.InternalError

---

**java.lang.InternalError: Can't connect to X11 window server using ':0.0' as the value of the DISPLAY variable.**

### Explanation

Enterprise Bean must not be used to output information in windows using the AWT function or to enter information from the keyboard.

### User Action

Do not use "javax.swing" and "java.awt" in EJB applications.

## 38.3.7 java.lang.LinkageError

---

**java.lang.LinkageError**

### Explanation

The LinkageError subclass indicates the fact that, when a class has a dependency to another, and the former is compiled, then the compatibility is lost when the latter class is modified.

### User Action

This only occurs when some classes are compiled separately, so recompile the entire application. If an error is output as a result, then take action indicated by the message.

**java.lang.LinkageError: Class oracle/sql/converter/CharacterConverters violates loader constraints**

### Explanation

The JDBC driver set in the J2EE properties classpath or IJServer classpath is deployed to the "WEB-INF/lib" Web application directory configuration.

### User Action

If the JDBC driver set in the J2EE properties classpath or IJServer classpath is deployed to the "WEB-INF/lib" Web application directory configuration, then delete it.

Then, if the JDBC driver is not set in the J2EE properties classpath or IJServer classpath, set it.

## 38.3.8 java.lang.NoClassDefFoundError

---

**java.lang.NoClassDefFoundError**

### Explanation

When JVM or the class loader attempts to load a class definition at regular method calling, or at generation of a new instance using the new expression, NoClassDefFoundError is thrown if the class definition is not found.

For example, the class definition existed when the class being executed was compiled; however, it is not found after that.

The NoClassDefFoundError is output by the following factors:

1. An environment variable is incorrect which was set in the classpath for setting the WorkUnit environment.
2. The JDK environment used at application compilation differs from that used for application execution.
3. Uppercase and lowercase letters differ in specifying a class or method name.
4. When lookup is performed on an EJB application deployed in another IJServer, no classpath is set in the client distribution data.
5. A class in the classpath attempts to reference a class inside the Web application.
6. The package is the same, but it tried to call a class on a different class loader.
7. The version of Java that is used is different from the version of Java used to compile the client distribution data.

## User Action

1. Review the classpath definition for setting the WorkUnit environment.

The classpath set during IJServer operation is output to the container information log (info.log).

Using the container information log, check the classpath setting.

2. Set the following items in the same way:

- version of JDK that compiled an application and
- version of JDK on which the application operates.

Alternatively, recompile the application according to the environment of JDK on which the application runs.

3. Modify the application calling section to the correct class and method names.

4. Set the classpath in the client distribution data.

5. Perform one of the following corrective actions:

- Specify following items in the classpath: class within the Web application loaded from a class in the classpath.
- If a class that loads a class within the Web application is used only from the relevant Web application, include that class in the Web application and exclude it from the classpath specification.
- Using the context class loader, load a class from the Web application. For details of the class loader, refer to the JDK manual.

6. It may be possible to avoid this problem by using the [Application Library Path] of [WorkUnit Settings].

Additionally, check if there is an error in 'Separate Class Loader' of [WorkUnit Settings].

7. If the version of the Java that calls the EJB application is earlier than the deployed IJServer's, use the client distribution data that was deployed to the previous version/level (compatible) IJServer and make sure that the version of Java that calls the EJB application and the version of Java that generated the client distribution data match.

---

**java.lang.NoClassDefFoundError: "%s"**  
**or**  
**java.lang.NoClassDefFoundError: NullPointerException**

## Variable Information

%s = Class name used by the application

## Explanation

There is an error in the environment setup of an application.

## User Action

- Check that CLASSPATH for the classes used by the application is set correctly.

In the case of a J2EE application client, the following should also be checked:

- Check that CLASSPATH for the J2EE application client distribution is set correctly.
- Check that the J2EE application client is installed and set correctly.
- If the J2EE application client is running on a server machine on which Interstage is installed, check that the java command installed by Interstage Studio is used.

---

**java.lang.NoClassDefFoundError: "Class name used by Client"**  
**NullPointerException (\*1)**

## User Action

Confirm that:

- The CLASSPATH is correctly set for the class used by the client.

Additionally, confirm that the CLASSPATH is also correctly set for the client distribution data.

- The EJB service client is installed and correctly set.
- When a client application is being operated on the server machine where Interstage is installed, check whether the Interstage Application Server or a Java command installed in the Java execution environment (for Linux) is being used.

If a Java applet error occurs in the EJB application and the above exception is output to the Java console, check the following:

- Using Portable-ORB
  - Confirm that the necessary CLASSPATH is correctly set and that the Object Request Broker (ORB) is correctly specified.
  - Confirm that the necessary file has been downloaded.
- Not using Portable-ORB
  - Confirm that the necessary CLASSPATH is correctly set.

\*1 This problem may occur in the following case:

- JDK/JRE1.2.2 uses the JIT (Just In Time) compiler (default operation) and CLASSPATH is not correctly set.

In an environment not using the JIT compiler, NoClassDefFoundError: "Class name used with a client" occurs.

---

### [java.lang.NoClassDefFoundError: com/fujitsu/interstage/jms](#)

#### Explanation

The environment of the JMS is not set up correctly.

#### User Action

Confirm that necessary products are correctly installed and that the following environment variable CLASSPATH is set correctly (default installation path).

##### **Windows32/64**

- C:\Interstage\J2EE\lib\isj2ee.jar
- C:\Interstage\jms\lib\fjmsprovider.jar

##### **Solaris32/64 Linux32/64**

- /opt/FJSVj2ee/lib/isj2ee.jar
- /opt/FJSVjms/lib/fjmsprovider.jar

---

### [java.lang.NoClassDefFoundError: javax/ejb/EJBObject](#) or [java.lang.NoClassDefFoundError: javax/naming/NamingException](#)

#### User Action

When a client application is being operated on the server machine on which Interstage is installed, check whether the Interstage Application Server or a Java command installed in the Java execution environment (for Linux) is being used.

Moreover, check whether the client environment is correctly set up.

---

### [java.lang.NoClassDefFoundError: javax/naming/InitialContext](#)

#### User Action

Check that the EJB service client is installed and correctly set.

---

### [java.lang.NoClassDefFoundError: org/omg/CORBA/ORB](#)

#### Explanation

CORBA service or the CORBA service client is not installed or set up correctly.

#### User Action

Check that the CORBA Service or the CORBA Service client is installed and set correctly.

## 38.3.9 java.lang.NoSuchFieldException

---

### java.lang.NoSuchFieldException

#### Explanation

The field that existed at compilation was not present at execution. The possible causes are:

- When the field definition of the class was changed, the class that calls that class was not recompiled.
- The classpath is incorrect.

#### User Action

Perform the following corrective actions:

- If the field definition of the class was changed, recompile the class that calls that class, then re-execute the application.
- If the classpath is incorrect, correct it.

The classpath set during IJServer operation is output to the container information log (info.log). Using the container information log, check the classpath setting.

## 38.3.10 java.lang.NoSuchMethodException

---

### java.lang.NoSuchMethodException

#### Explanation

The method that existed at compilation was not present at execution. The possible causes are:

- When the method definition of a class was changed, class that calls for the changed class was not recompiled.
- The classpath is incorrect.
- The JDK/JRE Version Level used for compiling was different from that used for execution, and a method that did not exist in the JDK/JRE used for execution was called.
- If the following string is output, it means that the Symfoware correction has not been applied.

java.lang.NoSuchMethodException: Not exists setter method: PROPERTY=statementCache

#### User Action

Perform the following corrective actions:

- If the method definition of the class was changed, recompile the class that calls that class, then re-execute the application.
- If the classpath is incorrect, correct it.

The classpath set during IJServer operation is output to the container information log (info.log). Using the container information log, check the classpath setting.

- If the classes contained in JDK/JRE are displayed in the message details, verify that they were supported in the JDK/JRE Version Level used when the corresponding method was executed. Correct the application so that this method is not used, or change the JDK/JRE Version Level. For details of the JDK/JRE settings, refer to "Checking the Operating Environment" in the "Operating J2EE Applications" chapter of the J2EE User's Guide.

- If the Symfoware correction has not been applied, apply it.

For details, refer to "Software Products Required for Application Execution", "Database" in the "Supported Software" chapter of the Product Notes.

## 38.3.11 java.lang.NullPointerException

---

### java.lang.NullPointerException

## Explanation

The possible causes are:

1. An application is incorrect.
2. The necessary class is not specified in the classpath (WorkUnit environment definition).
3. For the EJB application, one of the following program errors may occur:
  - Processing continues although an abnormality occurred.
  - Access is unconditionally made to a return value of the method for which null might be returned, without judging whether the return value is null.

## User Action

Take the following action (note that the stack trace might not be output):

1. Review the application.

The cases listed below are thrown when an object is necessary and the application attempts to use null. Check whether the following cases occur:

- Calling the instance method of the null object
- Accessing or changing the field of the null object
- Acquiring a null length as if it is an array
- Throwing null as if it is a throwable value

2. Review the WorkUnit environment setting.

The classpath set during IJServer operation is output to the container information log (info.log).

Using the container information log, check the classpath setting.

3. Specify the cause, then correct the program error.

## 38.3.12 java.lang.NumberFormatException

---

### [java.lang.NumberFormatException](#)

#### Explanation

When an application attempts to convert a character string into a numeric type, this exception is thrown if the character string format is incorrect.

#### User Action

Check whether there is no problem with the character string to be converted. Review the application side.

## 38.3.13 java.lang.OutOfMemoryError

---

### [java.lang.OutOfMemoryError](#)

#### Explanation

The heap area is insufficient, or the real memory or swap of the system is not enough.

#### User Action

Refer to the "JDK/JRE Tuning" chapter of the Tuning Guide and take action.

## 38.3.14 java.lang.UnsatisfiedLinkError

---

### [java.lang.UnsatisfiedLinkError](#)

## Explanation

This exception is thrown when the JavaVM cannot find an appropriate native-language definition of the method declared as native.

## User Action

Perform the following corrective actions:

- The library of a native module may not be correctly set as the environment setup of the WorkUnit. Set the correct values as the following WorkUnit environment setup items, and restart the WorkUnit.

**Windows32/64**

PATH

**Solaris32/64 Linux32/64**

LIBRARYPATH

- Hotdeploy or class auto-reload may have been performed on the application containing the class using JNI.  
Hotdeploy or class auto-reload cannot be performed on the application containing the class which uses JNI. Restart the WorkUnit. For details of executing HotDeploy or class auto-reload for applications that use JNI, refer to "Notes about using class loaders" in "Class Loader" of the J2EE User's Guide.
- The method name may not conform to the native method rules.  
The method name may not conform to the rules of the native method. Correct the native method if necessary.
- The same Native module may have been loaded in different class loaders. Identical Native modules can only be used on the same class loader. Refer to "Notes about using class loaders" in "Class Loader" in the J2EE User's Guide.
- Make sure that there are execution permissions for the directory specified in the library path in the WorkUnit settings, and that a file has not been specified.

## 38.3.15 java.lang.UnsupportedOperationException

### java.lang.UnsupportedOperationException

#### Explanation

The called method is not supported.

#### User Action

Correct the application.

## 38.3.16 Other Exceptions

Exception	Explanation	User Action
java.lang.ArithmeticException	This exception is thrown if an exception condition occurs in an arithmetic operation. For example, if an integer is "divided by 0", the instance of this class is thrown.	Check that the variables and constants used in arithmetic operations are correct.
java.lang.ArrayIndexOutOfBoundsException	This exception is thrown to indicate that an array was accessed using an invalid index. This occurs when the index is negative or has a size equal to or greater than the array size.	Check that the size of the array index is included in the array size.
java.lang.ArrayStoreException	This exception is thrown to indicate that an attempt was made to store an object of invalid type in an array of the object.	Generate an array object of the same time with new, then insert it.

Exception	Explanation	User Action
java.lang.CloneNotSupportedException	When the clone method of the Object class was called to reproduce the object, this exception is thrown to indicate that the class of that object does not implement the Cloneable interface.	Check that the target class implements the Cloneable interface.
java.lang.IllegalAccessException	When the application attempts to load a class, this exception is thrown if the application cannot access the definition of the class in which the method being executed was specified, because that class is not "public" or is included in another package.	If "at java.lang.reflect.Field.get(Native Method)" is output after Exception, an error might be occurring in the native method.  Review the processing in the native method.  If the package is the same but it tried to call the class on a different class loader, it might be possible to avoid this problem by using the [Application Library Path] of [WorkUnit Settings].
java.lang.IllegalArgumentException	This exception is thrown to indicate that an invalid or improper argument was passed to the method.	Check that the value of the variable passed as an argument is a normal one in the normal range.
java.lang.IllegalMonitorState Exception	This exception is thrown to indicate that one of the following cases was posted: the thread having no prescribed monitor attempted to make a wait on the object monitor and another thread with no prescribed monitor makes a wait on the object monitor.	Check whether wait() or notify() are attempted to be used outside the block of synchronized() {...} (or outside the method to which synchronized was assigned). In such a case, this exception is thrown.  See the Java Tutorial for the method of using the wait method.
java.lang.IllegalThreadState Exception	This exception is thrown to indicate that the thread status is improper to the requested operation.	Check whether a thread calls another method in addition to start() or stop() while that thread is "a new one" and no system resource is allocated.  Moreover, check the processing to see if the thread calls the start method while it does not stop.
java.lang.IndexOutOfBoundsException	This exception is thrown to indicate that indexes of some type (array, character string, vector, etc.) are outside the range.	Check that the index size is included in each of the sizes of an array, character string, vector, etc.
java.lang.InstantiationException	When the application attempts to generate an instance of a class using the newInstance method of the Class method, this exception is thrown if that application cannot generate an instance of the specified object because the class is an interface or abstract class.	Use the implemented class, not the interface and abstract class.
java.lang.Interrupted Exception	When a thread is in a long-wait status, stop status, or temporary stop status, this exception is thrown if another thread generates an interrupt to this status using the interrupt method of the Thread class.	This exception indicates that an interrupt was generated from another thread.  The exception may also be used for timeout processing. So, it is not always used when a problem occurs.

Exception	Explanation	User Action
		Make processing occur according to the application logic when InterruptedException is caught.
java.lang.NegativeArraySize Exception	This exception is thrown when an application attempts to create an array having a negative size.	Check whether the variable and constant used for the size are correct.
java.lang.RuntimeException	RuntimeException is the super class of various exceptions that can be thrown in ordinary processing of the Java Virtual Machine.	This exception is thrown by JavaVM or middleware.  Its subclass is generally thrown. Investigate the cause using getMessage() and printStackTrace() methods.  When this exception occurs in a server application, it is recommended that the exception be output to the log.
java.lang.SecurityException	This exception is thrown by a security manager to indicate a violation of security.	This exception indicates that the processing to be attempted by the application is not allowed by settings.  Such settings can be changed from the policy file. Since this problem relates to application operations, a system administrator needs to set the appropriate policy.
java.lang.StringIndexOutOfBoundsException	This exception is thrown by the String method to indicate that the index is negative or has a size greater than the character string size.  For some methods such as charAt, this exception is thrown when the index size is equal to the character string size.	Check whether the index size is included in the character string size.
java.lang.AbstractMethodError	This exception is thrown when an application attempts to call the abstract method. The compiler generally catches this error.  -This error occurs during execution only when a definition of a class is changed and becomes incompatible after the method being executed is lastly compiled.	Recompile the entire application. If an error occurs due to compilation, perform a corrective action according to the related message.
java.lang.AssertionError	This exception is thrown to indicate that the declaration failed.	Check the Assert processing.
java.lang.ClassCircularityError	This exception is thrown when a loop is found at class initialization.	This exception occurs when an attempt is made again to initialize a class that was attempted to be initialized with the class loader (or its extension). If an original class loader is used, review the processing. Analyze the stack trace for validity.
java.lang.ClassFormatError	This exception is thrown when a Java virtual machine attempts to read a class file and judges that the file is destroyed, or when it cannot interpret the file as the class file.	Check whether the class file is destroyed.

Exception	Explanation	User Action
java.lang.Error	Error is a throwable subclass that indicates a major problem that an ordinary application will not catch. Most errors of this type are in an abnormal status. A ThreadDeath error is in a "normal" status. However, most applications will not catch it; so it is one of the Error subclasses.	This exception is used as described in the Meaning column. Refer to the stack trace and investigate the cause.
java.lang.IllegalAccessError	This exception is thrown when an application attempts to access or change an inaccessible field, or to call an inaccessible method.	<p>This error is generally detected by the compiler. It occurs when only some classes are separately compiled.</p> <p>Recompile the entire application. If an error is output due to compilation, perform a corrective action according to the related message.</p> <p>If the package is the same but it tried to call the class on a different class loader, it might be possible to avoid this problem using the [Application Library Path] of [WorkUnit Settings].</p>
java.lang.IncompatibleClass ChangeError	<p>This exception is thrown when there is an incompatible change in the class definition.</p> <p>The definition of the class on which the method being executed depends is changed after start of the execution.</p>	Check that a correct class is operating.
java.lang.InstantiationError	This exception is thrown when an application attempts to generate an instance of the abstract class or interface using the new syntax of Java.	Review the source of the relevant place.
java.lang.InternalError	This exception is thrown to indicate that an unexpected internal error occurred within the Java Virtual Machine.	This exception is used as described in the Meaning column. It is highly likely that a fault occurred in the Java Virtual Machine itself. If the latest correction is not applied, apply it. If this error recurs, contact a Fujitsu systems engineer.
java.lang.LinkageError	When a class is dependent on another class, the LinkageError subclass indicates that the compatibility between them was lost because the former class was compiled and then the latter class was changed.	<p>This exception occurs when some classes are separately compiled.</p> <p>Recompile the entire application. If an error is output due to compilation, perform a corrective action according to the related message.</p>
java.lang.NoSuchFieldError	When an application attempts to access or change the specified field of the object, this exception is thrown if the object does not contain that field.	<p>This exception occurs when some classes are separately compiled.</p> <p>Recompile the entire application. If an error is output due to compilation, perform a corrective action according to the related message.</p>
java.lang.StackOverflowError	This exception is thrown when a stack overflow occurs because the number of recursions in an application is excessive.	Review the recursive processing. If necessary, increase the stack size using the -Xss option. The default value of the stack is 512 kilobytes.

Exception	Explanation	User Action
java.lang.ThreadDeath	The instance of ThreadDeath is thrown within the target thread when the Thread class's stop method having no argument is called.	The stop method of the Thread class is not recommended.  Rewrite the processing using the interrupt method of the Thread class, and others.
java.lang.UnknownError	This exception is thrown when an unknown, important exception occurs in the Java Virtual Machine.	If this error recurs, contact a Fujitsu systems engineer.
java.lang.UnsupportedClass VersionError	This exception is thrown when the Java Virtual Machine judges that the major version number and minor version number of a class file are not supported while it is reading that file.	Java is basically upper-compatible; however, the execution of Java compiled with JDK of the subsequent versions is unpredictable. Check whether Java was compiled with the same version as that for Java used in execution.
java.lang.VerifyError	This exception is thrown when "verifier" detects that there is an internal conflict of some type or a security problem although a class file is properly formed.	Recompile the class in which the problem occurred. If a function that changes a Java class, such as the method trace function, is used, stop the use of the function to make comparison.
java.lang.VirtualMachineError	This exception is thrown to indicate that the Java Virtual Machine is destroyed or that resources required to continue operation have become insufficient.	Increase resources (real memory, virtual memory). If the error recurs, contact a Fujitsu systems engineer.

## 38.4 Exceptions Beginning with java.net

### 38.4.1 java.net.SocketException

#### java.net.SocketException

##### Explanation

For a Web application, the possible causes are as follows:

1. A client application such as a Web browser stopped processing (disconnected a socket), possibly for the following reasons:
  - Stopped due to user operations
  - Automatically stopped by the cache control of a client
2. A socket between the Web server and Servlet container was disconnected.
3. A socket between Servlet or JSP and the server application was disconnected.
4. The server application is down.
5. A file descriptor leak may have occurred in the application.

##### User Action

1. This exception indicates a stop made from the client application, not a server error.

The factors by which SocketException is output are as follows:

- Ending the client application
- Pressing the stop button without waiting for the completion of the request
- Pressing the reload button repeatedly

- Double-clicking the link and post destinations
- Making a transition to another link without waiting for the completion of the previous request

SocketException caused by the above factors does not always occur, it depends on the following:

- timing of detecting a socket disconnection of the client application by the Web server (this timing differs depending on the network status), and
  - timing of writing to the socket by the container.
2. Review the application processing. When the processing is adequate, extend the timeout setting of the Servlet container.
  3. Review the application processing. When the processing is adequate, extend the timeout setting of the socket used by the application.
  4. Check the server application status. If necessary, correct the server application.
  5. Check the application processing. If files or Socket resources are opened in the application, check whether some files or sockets have not been released.

## 38.5 Exceptions Beginning with java.rmi

---

### 38.5.1 java.rmi.MarshalException

---

#### java.rmi.MarshalException: CORBA COMM\_FAILURE

##### Explanation

An exception occurred in a client in an EJB application. The possible causes are:

- The communication time with the EJB application (server) exceeds the CORBA service idle time.
- The SSL environment setting is incorrect (only output when the encryption communication function of SSL is used.)

##### User Action

- If the communication time with the EJB application (server) exceeds the CORBA service idle time:
  - Check whether the EJB application is in an endless loop due to a program error
  - Check whether an overload is applied to the server
  - Check whether the amount of data to be exchanged with the EJB application is abnormally large
  - Check whether the EJB application is in an exclusive wait status for a database
  - Check whether communication is possible with the EJB application (that no network problem exists)
  - Check whether the number of connection clients is within the range of the system definition (isgendef) set at Interstage environment setting
  - When an interface is used which uses the class common to the client application and EJB application, check whether the same class file is used (check the file creation date and file size, etc.)
- If the encryption communication function of SSL is used, The SSL environment setting might be incorrect. To confirm this, perform the following procedures:
  - Check whether the SSL setting of the CORBA service of the client is correctly made. For details, refer to CORBA client environment setting in the Security System Guide.
  - Check whether "Use" is set for the SSL linkage function of the CORBA service of Interstage Management Console. If not set, specify "Use," then restart the relevant IJServer.

Solaris32/64 Linux32/64

- Check whether the user who starts the relevant IJServer, has appropriate access authorization for the Interstage certificate environment.

If the user has no access authorization, assign it to the user or have a user having appropriate access authorization restart the relevant IJServer. For details, refer to "Setting access authorization of the Interstage certificate environment" in the Security System Guide.

---

### **java.rmi.MarshalException: CORBA MARSHAL**

#### **User Action**

An exception occurred in a client in an EJB application.

Check the server environment for the following possible causes:

- A return value and argument of the method are defined in the interface and the class of the object sent from the client does not exist in the server.  
Alternatively CLASSPATH is not set for that class.
- The definition of the class, or definition of the business method, used as the interface between the client and server was changed, and subsequently the change was reflected in the client (or server) when Interstage Management Console was re-executed, but not reflected in the server (or client).
- Whether the return value, or argument class, used for method calling made by an EJB application, or the type used by an exception class, uses the type that is communicable at application execution.

The following may also be a cause. Check the application:

- When JDK/JRE1.2.2 is in use, the following interfaces are used for parameters and return values of the business method and the interface type that is communicable through RMI over IIOP at application execution is stored in those interfaces, or a method for the stored interface type is issued:
  - java.util.Collection
  - java.util.Enumeration

If the exception is output to the Java console due to a Java applet error, the possible cases are:

- Object Request Broker (ORB) might be specified incorrectly.
- Authorization may not be set correctly. For details, refer to "Using Java Applets" in the J2EE User's Guide.
- The necessary jar file may not correctly be stored in the Web server. For details, refer to "Using Java Applets" in the J2EE User's Guide.
- The necessary jar file may not be coded in the HTML file. For details, refer to "Using Java Applets" in the J2EE User's Guide.

---

## **38.5.2 java.rmi.NoSuchObjectException**

**java.rmi.NoSuchObjectException: CORBA OBJECT\_NOT\_EXIST 0 No; nested exception is: org.omg.CORBA.OBJECT\_NOT\_EXIST: CORBA\_Request\_get\_response minor code: 0 completed: No**

#### **Explanation**

The EJB object to be referenced has been deleted by the time monitoring function.

#### **User Action**

Check the log of the IJServer on which the EJB to be referenced is deployed, review the various settings of the time monitoring function.

---

## **38.5.3 java.rmi.RemoteException**

**java.rmi.RemoteException: CORBA BAD\_OPERATION**

#### **Explanation**

If an error occurs in a Java applet in the EJB application, it is displayed on the Java console.

#### User Action

Object Request Broker (ORB) might be specified incorrectly.

---

#### [java.rmi.RemoteException: CORBA FREE\\_MEM](#)

#### User Action

An exception occurred in a client in an EJB application.

Check the application for the following possible causes:

- When JDK/JRE1.2.2 is in use, the following interfaces are used for parameters and return values of the business method and the interface type that is communicable through RMI over IIOP at application execution is stored in those interfaces, or a method for the stored interface type is issued.
    - java.util.Collection
    - java.util.Enumeration
- 

#### [java.rmi.RemoteException: CORBA NO\\_IMPLEMENT 1179256960 No](#)

#### Explanation

The EJB application has not been started.

#### User Action

Check that the EJB application has been started.

---

#### [java.rmi.RemoteException: CORBA OBJ\\_ADAPTER 1179257480 No](#)

#### User Action

An exception occurred in a client in an EJB application.

In the EJB application deployed in IJServer, check whether "Yes" is specified for "Local Calling" of Interstage Management Console.

If "Yes" is specified, specify "No", then restart IJServer.

---

#### [java.rmi.RemoteException: CORBA UNKNOWN](#)

#### Explanation

If an error occurs in a Java applet in the EJB application, it is displayed on the Java console.

#### User Action

Object Request Broker (ORB) might be specified incorrectly.

---

## 38.6 Exceptions Beginning with java.security

---

### 38.6.1 java.security.AccessControlException

---

#### [java.security.AccessControlException: access denied \(<Permission> <TargetName> <Actions>\)](#)

#### Explanation

If an error occurs in a Java applet in the EJB application, it is displayed on the Java console.

#### User Action

Appropriate authorization may not be set in the jar file used by an applet. Refer to the stack information and error message and set appropriate authorization in the jar file.

---

#### [java.security.AccessControlException: access denied \(java.lang.RuntimePermission accessDeclaredMembers \)java.rmi.MarshalException: CORBA MARSHAL](#)

## Explanation

If an error occurs in a Java applet in the EJB application, it is displayed on the Java console.

## User Action

Object Request Broker (ORB) might be specified incorrectly.

# 38.7 Exceptions Beginning with java.sql

---

## 38.7.1 java.sql.SQLException

---

### java.sql.SQLException: %s

#### Variable Information

%s = JDBC driver's error message

#### Explanation

An error occurred in JDBC driver.

#### User Action

- Using Oracle

If the following character string is output to the message, a database error is occurring.

Perform a corrective action by referring to Oracle's Error Messages.

```
ORA-XXXXX
```

('X' indicates a numeric character.)

- Using SQL Server

Messages are not systematic. Analyze the stack trace. If SQLException is returned with a class called from the package class listed below, take corrective action by referring to the SQL Server manual.

```
com.microsoft.XXX
```

---

### java.sql.SQLException: [Microsoft][ODBC Driver Manager] Datasource name and specified driver can not be found

#### Explanation

An error occurred during use of SQL Server.

#### User Action

The ODBC data source may not be registered.

---

### java.sql.SQLException: [Microsoft][ODBC SQL Server Driver][DBNETLIB]ConnectionWrite (send()).

#### Explanation

An error occurred during use of SQL Server.

#### User Action

During EJB application operation, the SQL Server service might finish. Check the SQL Server status.

---

### java.sql.SQLException: [Microsoft][ODBC SQL Server Driver][SQL Server] Object name 'xxxx' is invalid.

#### Explanation

An error occurred during use of SQL Server.

The table that the EJB application (Entity Bean of CMP) uses on SQL Server may not exist.

#### User Action

Check whether the specified table exists on SQL Server.

---

#### **java.sql.SQLException: [SymfoWARE ODBC Driver] JYP1010E The request for connection to the server was denied.**

#### Explanation

If an error occurs while using Symfoware in a different server to the server that was used to install Interstage (Symfoware in the different server is used using the RDB2\_TCP connection), the corresponding exception information is output in FJEJBconsole.

#### User Action

MAX\_CONNECT\_TCP has not been set in the operating environment file for the Symfoware system, or the value for the parameter may be 0. Check whether MAX\_CONNECT\_TCP has been set correctly in the operating environment file for the Symfoware system.

---

#### **java.sql.SQLException: Io exception: Got minus one from a read call**

#### Explanation

The Oracle listener in the RAC environment may have crashed.

#### User Action

Confirm that the listener is running. If it is, refer to the Oracle manual and take appropriate action to resolve the error.

---

#### **java.sql.SQLException: Io exception: The Network Adapter could not establish the connection**

#### Explanation

The Oracle environment settings may be invalid.

#### User Action

Check that the Oracle environment settings are correct. For details, refer to the J2EE User's Guide, section "J2EE Common Edition" > "JNDI" > "Environment setup when JDBC (database) is referenced" > "Environment setup when Oracle is used".

---

#### **java.sql.SQLException: Invalid returned length value from server : connection infringement**

#### Explanation

If an error occurs while using Symfoware in a server different to the one where Interstage was installed (and Symfoware in the different server is used using the RDB2\_TCP connection), the corresponding exception information is output in FJEJBconsole.

#### User Action

The URL set in the Interstage Management Console may be incorrect. Check the Interstage Management Console URL.

---

#### **java.sql.SQLException: Invalid URL Format - invalid maxconnections value.**

#### Explanation

If an error occurs while using Symfoware in a different server to the server that was used to install Interstage (Symfoware in the different server is used using the RDB2\_TCP connection), the corresponding exception information is output in FJEJBconsole.

#### User Action

0 may have been set as the value for the maximum number of connections specified in the Interstage Management Console URL when the data source was defined. Check the value set for the maximum number of connections specified in the Interstage Management Console URL.

---

#### **java.sql.SQLException: LDWrapper class has not been loaded for local database access**

## Explanation

If an error occurs while using Symfoware in a different server to the server that was used to install Interstage (Symfoware in the different server is used using the RDB2\_TCP connection), the corresponding exception information is output in FJEJBconsole.

## User Action

Symfoware Client may not be installed. Check whether Symfoware Client has been installed correctly.

---

### **java.sql.SQLException: Maximum driver connections are active**

## Explanation

If an error occurs while using Symfoware in a different server to the server that was used to install Interstage (Symfoware in the different server is used using the RDB2\_TCP connection), the corresponding exception information is output in FJEJBconsole.

## User Action

The value for the MAX\_CONNECT\_TCP parameter in the operating environment file for the Symfoware system may be lower than the number of connections from the client. Check whether the value set for the MAX\_CONNECT\_TCP parameter in the operating environment file for the Symfoware system is higher than the number of connections from the client.

---

### **OALL8 is in an inconsistent state**

## Explanation

There was an inconsistency in the Oracle JDBC driver.

## User Action

The inconsistency may be the result of an Oracle server crash or network error.

If you are using OracleRAC, possible causes are:

- An ONS DOWN event may not have been notified to the client. Refer to the Oracle manual, set the ONS log level to [9], and check the log. If the DOWN event has not been logged, revise the client ONS settings.
- A node crash or network error may have occurred. If you are using the failover function, set up the OracleRAC environment again, and then redistribute the connections using the *ijstune* command.

---

## **38.8 Exceptions Beginning with java.util**

---

### **38.8.1 java.util.NoSuchElementException**

---

#### **java.util.NoSuchElementException**

## Explanation

This message means there is no following element when the next processing is performed after NamingEnumeration acquired by list or listBinding processing.

## User Action

User response not required.

---

## **38.9 Exceptions Beginning with javax.ejb**

---

### **38.9.1 javax.ejb.EJBException**

---

#### **javax.ejb.EJBException: [Microsoft][ODBC SQL Server Driver][DBNETLIB]SQL Server does not exist or access refused.**

## Explanation

An error occurred during use of SQL Server.

## User Action

SQL Server may not be active. Check whether SQL Server is active.

---

### **javax.ejb.EJBException: Invalid returned length value from server : connection infringement**

## Explanation

If an error occurs while using Symfoware in a server different to the one where Interstage was installed (and Symfoware in the other server is used using the RDB2\_TCP connection), the corresponding exception information is output in FJEJBconsole.

## User Action

The URL set in the Interstage Management Console may be incorrect. Check the Interstage Management Console URL.

---

## **38.9.2 javax.ejb.NoSuchObjectLocalException**

---

### **javax.ejb.NoSuchObjectLocalException: No such object**

## Explanation

The EJB object to be referenced has been deleted by the time monitoring function.

## User Action

Check the log of the IJServer on which the EJB to be referenced is deployed, review the various settings of the time monitoring function.

---

## **38.10 Exceptions Beginning with javax.naming**

---

### **38.10.1 javax.naming.ConfigurationException**

---

#### **javax.naming.ConfigurationException: Context does not have a corresponding NamingContext :**

## Explanation

The specified name is not registered in the naming service.

## User Action

- Check that a valid name is used to perform lookup processing.
- Check that the specified name is registered in the naming service.

---

#### **javax.naming.ConfigurationException: Failed to load the Web Service classes. The setting of the classpath might be not enough.**

## Explanation

Classes required for the Web service cannot be loaded. A class path may have been set incorrectly.

## User Action

The environment is set incorrectly. Refer to "Interstage Web Service Operation" in the J2EE User's Guide, and then set the environment correctly.

---

#### **javax.naming.ConfigurationException: ORB.init failed : JNDI :InitialContextForClient : ORB.init**

## Explanation

ORB.init failed.

## User Action

The environment settings have not been fully configured. Refer to "Environment Setup in Client Environment" in the J2EE User's Guide, and make the correct settings.

## 38.10.2 javax.naming.InvalidNameException

---

### javax.naming.InvalidNameException: %s

#### Variable Information

%s = detail information

#### Explanation

The specified name is incorrect. Alternatively, the name is null or empty.

#### User Action

Perform one of the following corrective actions according to the content output in the detailed information.

- **'/' cannot be used for the first character of a JNDI name.: %s**

Specify a name that does not start with a slash (/) for bind, unbind, rebind, rename, createSubcontext, and destroySubcontext processing.

- **'/' cannot be used for the last character of a JNDI name.: %s**

Specify a name that does not end with a slash (/) for bind, unbind, rebind, rename, createSubcontext, and destroySubcontext processing.

- **'/' more than 32 cannot be used for a JNDI name.: %s**

Specify a name that includes 32 or fewer slashes (/) for bind, unbind, rebind, rename, createSubcontext, and destroySubcontext processing.

- **Cannot bind empty name**

Check the name specified for bind processing.

- **Cannot rebind empty name**

Check the name specified for rebind processing.

- **Cannot rename empty name**

Check the name specified for rename processing.

- **Cannot unbind empty name**

Check the name specified for unbind processing.

- **Can't use GENERIC DataSource DSNAME=%s**

In a V8.0 compatible mode IJServer (or an IJServer in which the environment was upgraded from 8.0 or earlier), a data source for which the database type is a general-purpose definition cannot be used. Consider upgrading to a V9 IJServer.

- **Can't use Symfoware's ConnectionPoolDataSource ,IJServer Version V5 or V6 or V7 or V8 DSNAME=%s**

If the data source type in a V8.0 compatible mode IJServer (or an IJServer in which the environment was upgraded from 8.0 or earlier) is Symfoware, a data source that uses Interstage connection pooling cannot be used. Either use a data source that uses Symfoware connection pooling, or consider upgrading to a V9.0 IJServer.

- **JNDI name is null**

Check the name specified for lookup processing.

- **Name is empty**

Check the name specified for list, listBindings, destroySubcontext, createSubcontext, and lookupLink processing.

- **Name or Prefix is empty**

Check the name specified for composeName or the name of this context related to one of the high-order contexts.

- **Non Use .bindings File ,IIServer Version V5 or V6 or V7 or V8 DSNAME=%s**

In a V8.0 compatible mode IIServer (or an IIServer in which the environment was upgraded from 8.0 or earlier) a data source that does not use File System Service Provider cannot be used(\*1). Check whether [Use File System Service Provider] has been selected in the JDBC data source environment settings. If you do not use File System Service Provider, consider upgrading to a V9.0 IIServer.

- **physical-name is invalid NAME = %s**

Check the JNDI name (%s). For details, refer to "[38.16 Management When an Exception Occurs in Lookup Processing](#)".

- **propName is null**

Check the property name specified for removeFromEnvironment.

- **The length of a JNDI name is over maximum. Maximum: 255 characters.**

Check that a correct name has been specified for bind, unbind, rebind, rename, createSubcontext, and destroySubcontext processing. Moreover, check whether a name is less than 256 characters.

- **Two or more '/' cannot be continuously used for a JNDI name.: %s**

Check that a correct name has been specified for bind, unbind, rebind, rename, createSubcontext, and destroySubcontext processing. Moreover, check whether a name is not including multiple successive slashes (/).

\*1 The data sources below do not support settings that use File System Service Provider. Hence, an IIServer that is compatible with V8.0 mode, or an IIServer that was upgraded from an 8.0 or earlier environment cannot be used.

- Database type is "Oracle", and the data source is set to "Use Oracle connection pooling"

- Database type is "Oracle", and the data source is set to "Use RAC"

## 38.10.3 javax.naming.NameAlreadyBoundException

---

### [javax.naming.NameAlreadyBoundException: %s is already bound](#)

#### Variable Information

%s = Specified-name

#### Explanation

The specified name in createSubcontext processing is already bound.

#### User Action

Check that a correct name is used to perform createSubcontext processing.

---

### [javax.naming.NameAlreadyBoundException: %s: Use rebind to override](#)

#### Variable Information

%s = JNDI-name

#### Explanation

The specified name in bind processing is already bound.

#### User Action

Use rebind to overwrite the name.

---

### [javax.naming.NameAlreadyBoundException: Cannot rename; the newname is '%s'](#)

#### Variable Information

%s = New-name

## Explanation

The new name specified by rename processing is already bound.

## User Action

Check that a correct name is used to perform rename processing.

## 38.10.4 javax.naming.NameNotFoundException

---

### javax.naming.NameNotFoundException: %s

#### Variable Information

%s = JNDI-name

#### Explanation

An error occurred during lookup processing.

#### User Action

Refer to "[38.16 Management When an Exception Occurs in Lookup Processing](#)", and implement the suggested remedial actions.

---

### javax.naming.NameNotFoundException: %s is invalid

#### Variable Information

%s = JNDI-name

#### Explanation

An error occurred during lookup processing.

#### User Action

Check that a correct format (beginning with "java:comp/env") is used to perform lookup processing.

---

### javax.naming.NameNotFoundException: %s is not found

#### Variable Information

%s = Intermediate-context-name

#### Explanation

The name specified in bind, unbind, list, listBindings, destroySubcontext, or createSubcontext processing is incorrect.

#### User Action

- Check that a correct name is used to perform bind, unbind, list, listBindings, destroySubcontext or createSubcontext processing.
- Check that the intermediate context specified in the JNDI name exists.

---

### javax.naming.NameNotFoundException: %s is not found : %s

#### Variable Information

%s = JNDI-name

#### Explanation

An error occurred during in lookup processing.

#### User Action

Refer to "[38.16 Management When an Exception Occurs in Lookup Processing](#)", and implement the suggested remedial actions.

---

**javax.naming.NameNotFoundException: %s1 is not found : org.omg.CosNaming.namingContextPackage.NotFound %s2****Variable Information**

%s1 = JNDI-name

%s2 = Detailed information

**Explanation**

An error occurred during lookup processing.

**User Action**

Check that the specified name is registered in the naming service.

Also, refer to "[38.16 Management When an Exception Occurs in Lookup Processing](#)", and implement the suggested remedial actions.

---

**javax.naming.NameNotFoundException: java.lang.NullPointerException****Explanation**

When the EJB application is used, an exception occurred during lookup processing performed from the client.

**User Action**

Check whether the environment setting for Client is correctly specified.

Also, refer to "[38.16 Management When an Exception Occurs in Lookup Processing](#)", and implement the suggested remedial actions.

---

**javax.naming.NameNotFoundException: JMS:ERROR:jms6014: The name is not found. NAME '%s'****Variable Information**

%s = JNDI-name

**Explanation**

An error occurred during lookup processing.

**User Action**

Refer to "[38.16 Management When an Exception Occurs in Lookup Processing](#)", and implement the suggested remedial actions.

---

**javax.naming.NameNotFoundException: NamingContextPackage.NotFound  
javax.naming.NameNotFoundException: NamingContextPackage.CannotProceed  
javax.naming.NameNotFoundException: NamingContextPackage.InvalidName****Explanation**

When the EJB application is used, an exception occurred during lookup processing performed from the client.

**User Action**

Check the following:

- Is lookup processing performed with a correct name?
- Is processing performed with the multithread? When the client application operates with the multithread, issue the lookup process only once for the entire client application.
- Was Interstage changed?
- Is the name registered in the naming service using the *OD\_or\_adm* command correct? (For use of the load balance function, the name is a load balancing object group name).

Refer to "[38.16 Management When an Exception Occurs in Lookup Processing](#)", and implement the suggested remedial actions.

---

**javax.naming.NameNotFoundException: org.omg.CORBA.BAD\_PARAM**

## Explanation

If an error occurs in a Java applet in the EJB application, it is displayed on the Java console.

## User Action

Check each of the following:

- The coding of the operating environment setting file used with Portable-ORB might be incorrect. Check whether the coding is correct.
- The operating environment setting file used with Portable-ORB may not correctly be stored in the Web server. Check whether the operating environment setting file used with Portable-ORB is correctly stored.
- Authorization may not be set correctly. For details, refer to "Using Java Applets" in the J2EE User's Guide.

---

## **javax.naming.NameNotFoundException: org.omg.CORBA.COMM\_FAILURE**

## Explanation

When the EJB application is used, an exception occurred during lookup processing performed from the client.

## User Action

Check the following:

- Check whether the client can access the naming service.
- Check whether the environment setting for Client is correctly specified.

Refer to "[38.16 Management When an Exception Occurs in Lookup Processing](#)", and implement the suggested remedial actions.

---

## **javax.naming.NameNotFoundException: org.omg.CORBA.NO\_IMPLEMENT**

## Explanation

When the EJB application is used, an exception occurred during lookup processing performed from the client.

## User Action

Check the following:

- Check that the naming service is active.
- When the load balance function is used, check whether the implementation repository ID set with the *odadministerlb* command is correct.
- When the name of EJB to be referenced is converted using the name conversion file in the environment that uses the distributed transaction function, the content defined in the <ejb-ref-entry> tag might be incorrect. Review the environment.

Refer to "[38.16 Management When an Exception Occurs in Lookup Processing](#)", and implement the suggested remedial actions.

---

## **javax.naming.NameNotFoundException: org.omg.CORBA.OBJ\_ADAPTER:**

## Explanation

If an error occurs in a Java applet in the EJB application, it is displayed on the Java console.

## User Action

Object Request Broker (ORB) might be specified incorrectly.

---

## **javax.naming.NameNotFoundException: org.omg.CORBA.UNKNOWN: Pre. configuration search fail.**

## Explanation

If an error occurs in a Java applet in the EJB application, it is displayed on the Java console.

## User Action

Appropriate authorization may not be set for the communication authorization (java.net.SocketPermission).

---

### **javax.naming.NameNotFoundException: org.omg.CosNaming.NamingContextPackage.NotFound**

#### Explanation

When the EJB application is used, an exception occurred during lookup processing performed from the client.

#### User Action

Check whether the client is accessing the EJB application deployed in IJServer that runs on the same JavaVM.

For operation on the same JavaVM, the EJB application cannot be called from applications existing outside the process, such as another IJServer application and an EJB client application.

Refer to "[38.16 Management When an Exception Occurs in Lookup Processing](#)", and implement the suggested remedial actions.

---

### **javax.naming.NameNotFoundException: UserTransaction not found**

#### Explanation

There is an error in the UserTransaction specification.

#### User Action

Check the transaction type and transaction attribute to verify that the EJB application can be used by UserTransaction.

---

## **38.10.5 javax.naming.NamingException**

---

### **javax.naming.NamingException: '%s' is an invalid resource type for URL**

#### Variable Information

%s = Value

#### Explanation

An error exists in the value of the res-type tag in the deployment descriptor file.

#### User Action

Check that the value of the res-type tag is java.net.URL.

---

### **javax.naming.NamingException: %s is not found**

#### Variable Information

%s = JNDI-name

#### Explanation

An error occurred during lookup processing.

#### User Action

Refer to "[38.16 Management When an Exception Occurs in Lookup Processing](#)", and implement the suggested remedial actions.

---

### **javax.naming.NamingException: .GlobalTransactionMode != True javax.naming.NamingException: .GlobalTransactionMode nothing**

#### Explanation

An error exists in the settings for using the distributed transaction function.

#### User Action

- Check that JNDI environment property com.fujitsu.ObjectDirector.CORBA.GlobalTransactionMode is set to "True".
- Check that JNDI environment property com.fujitsu.ObjectDirector.CORBA.GlobalTransactionMode has been specified.

---

### **javax.naming.NamingException: Access to directory service failed :**

## Explanation

Interstage Directory Service was incorrectly specified.

## User Action

Check that Interstage Directory Service is usable.

---

## **javax.naming.NamingException: An error occurred. [Root exception is %s]**

## Variable Information

%s = Exception that caused the error

## Explanation

An error occurred in lookup processing. The cause is %s.

## User Action

The Root exception output %s will contain a reference to an error message, check the "Messages" manual for the "Explanation" and "User Action" for that message, and take the appropriate action.

---

## **javax.naming.NamingException: Cannot bind null object**

## Explanation

The object specified for bind is null.

## User Action

Check that a correct object is used to perform bind processing.

---

## **javax.naming.NamingException: Cannot rebind null object**

## Explanation

The object specified for rebind is null.

## User Action

Check that a correct object is used to perform rebind processing.

---

## **javax.naming.NamingException: com.fujitsu.interstage.j2ee.def.FJDefException: %s**

## Variable Information

%s = URL name (such as java.sun.com)

## Explanation

The DOCTYPE declaration of a deployment descriptor file was incorrectly specified.

Or the deployment descriptor file for Web applications is used by the J2EE application client.

## User Action

- Check that the DOCTYPE declaration is correctly specified.
- Use the deployment descriptor file for a J2EE application client.

---

## **javax.naming.NamingException: com.fujitsu.interstage.j2ee.def.FJDefException: %s**

## **javax.naming.NamingException: com.fujitsu.interstage.j2ee.def.FJDefException: unknown error: %s**

## Variable Information

%s = Detailed information

## Explanation

An error exists in the description of the deployment descriptor file or the name conversion file.

## User Action

Check the following.

- If the following is output in the detailed information, check whether the %m-th column on the %n-th line contains an invalid character string or blank:

```
file:///(%n) : Line %n, Colum %m The above error was detected.
```

- Correct the error described in the detailed information.
- In addition, check that the coding is correct.

Check the following, depending on the content of the detailed information (%s):

- Attribute names must not start with "<"characters.

An invalid character is used for closing the start tag or separating attribute.

Check that the character which cannot be used as a pause of a start tag, an end tag, or an attribute has been specified.

- Character conversion error: "%s" (line number may be too low).

The specified character encoding contains an invalid character.

%s = Encoding system

Check that the character code specified by "encoding" of XML declaration is correct.

- Document root element is missing.

The document type declaration appears more than once.

Check that the DOCTYPE declaration is described two or more times.

- Document root element is missing.

There is an error at the start of the comment.

Check that a start declaration is correctly made during comment setup.

- Document root element is missing.

There is an error at the start of the document type declaration.

Check that there is no error in the description of the DOCTYPE declaration.

- Document root element is missing.

There is text outside the markup.

Check that no invalid character string is inserted between the XML declaration and the DOCTYPE declaration.

- Document root element is missing.

Unknown markup exists.

Check that the DOCTYPE declaration is correctly described (<!DOCTYPE ... >).

- Element "%s" does not allow text.

PCDATA occurs in the wrong place.

%s = Root element

Check the position of PCDATA.

- Element "%s" required additional elements.

The necessary child elements do not exist.

%s = The tag of a minor items

- Confirm that the contents of the minor items tag (under env-entry, ejb-ref, ejb-local-ref, resource-re, and resource-env-ref tag) of the deployment descriptor file are defined correctly.
- Confirm that the contents of the minor items tag (under ejb-ref-entry res-entry, and res-env-entry tag) of the name conversion file are defined correctly.

- Element "%s1" does not allow "%s2" here.

There is an element that cannot be a child element.

%s1 = Root element

%s2 = Child element

- Check that mandatory tag are not omitted.
  - Check tags that can be specified only once, were not specified several times.
  - Check that non-existent tags were not specified.
  - Check that the tags are specified in the correct order.
- Element type "%s" is not declared.

The root name in the document type declaration does not match the XML document root element name.

%s = Root element

Check that the "application-client" or "fujitsu-ebe-definition" has been specified in the root tag.

- Element type "%s" is not declared.

There is no root element declaration.

%s = Root element

Check that the <?xml ... ?> and <!DOCTYPE ... > tags are correctly described.

- End of entity while processing comment.

Reached the end of the file.

Check that an end declaration is correctly made during comment setup. All specification following comment specification is considered as a comment.

- Expected "%s" to terminate an element starting on line %n.

The end tag name does not match the start tag name.

%s = The end tag

Check that the end tag name matches the start tag name.

- Expected "%s" to terminate an element starting on line %n.

There is an error in the end tag name.

%s = The end tag

Check that the end tag has been specified correctly.

- Expected "version=...".

Cannot omit version information from the XML declaration.

Check that "version" is described in the XML declaration.

- Expecting quoted value for attribute value encoding.

There is an error in the encoding declaration.

Check that there is no error in the specification of "encoding" of XML declaration.

- Expecting quoted value for PUBLIC identifier.

There is no quotation mark to start the public identifier.

- Check that the public identifier (character string after "PUBLIC" in the DOCTYPE declaration) is correctly described.
- Check that the quotation mark in the public identifier (character string after "PUBLIC" in the DOCTYPE declaration) is correctly described.
- Expecting quoted value for SYSTEM identifier.  
There is no quotation mark to start the system identifier.  
Check that there are quotation marks at the start of the system identifier.
- I/O error: xml file read error  
The encoding name is empty.  
Check that specification of "encoding" of the XML declaration is empty.
- I/O error: xml file read error  
Unsupported encoding information exists.  
Check that no invalid character code is described in "encoding" of the XML declaration.
- Illegal character "%s" in encoding name.  
The encoding name contains an invalid character.  
%s = Character  
Check the validity of all characters in "encoding" of the XML declaration.
- Illegal character "&#x3e;" (>) at end of XML Declaration.  
There is an error in the XML declaration.  
Confirm that there are no errors in the XML declaration.
- Illegal character "&#x3f;" (?) at end of XML Declaration.  
The XML declaration is not closed correctly.  
Check that the tags in the XML declaration are correctly described (<?xml ... ?>).
- Illegal character "&#x65;" (e) at end of XML Declaration.  
There is an error at the start of the encoding declaration.  
Check that there is no error in the description of encoding specification.
- Illegal character in PUBLIC identifier: %s.  
The public identifier contains an invalid character.  
%s = Character  
Check that the public identifier (character string after "PUBLIC" in the DOCTYPE declaration) is correctly described.
- Missing whitespace before name in <!DOCTYPE declaration.  
There is an error in the document type declaration description.  
Check that the DOCTYPE declaration is correctly described.
- Missing whitespace before SYSTEM literal URI.  
There is an error in the external entity identifier.  
Check that the public identifier (character string after "PUBLIC" in the DOCTYPE declaration) is correctly described.
- Next character must be "=" after attribute name "%s".  
An undeclared attribute exists.  
%s = Attribute name  
Check that the attribute which is not declared exists.

- Next character must be "=" in XML Declaration.  
The character '=' in the encoding declaration cannot be omitted.  
Check the description of '=' of specification of "encoding" of XML declaration for errors.
- Next character must be "=" in XML Declaration.  
The character '=' in the version information cannot be omitted.  
Check that the '=' character is included in the version information.
- Next character must be ">" terminating <!DOCTYPE ...> declaration.  
There is an error in the public identifier keyword 'PUBLIC'.  
Check that the public identifier keyword "PUBLIC" is correctly described.
- Next character must be ">" terminating <!DOCTYPE ...> declaration.  
There is an error in the system identifier keyword 'SYSTEM'.  
Check that the system identifier keyword 'SYSTEM' is correctly described..
- Next character must be ">" terminating comment.  
There is an error at the end of the comment.  
Check that an end declaration was included during comment setup.
- Next character must be ">" terminating element "%s".  
The end tag is not closed correctly.  
%s = The end tag  
Check that the end tag is closed correctly.
- Only whitespace allowed before name in <!DOCTYPE declaration.  
There is an error in the root element name.  
Check that the DOCTYPE declaration is correctly described (<!DOCTYPE ... >).
- Processing instruction target is missing.  
There is an error in the processing instruction.  
Check description of a processing instruction.
- Tags with prefixes are not supported in this version of Interstage. TAGNAME: %s  
%s = tag name  
Check the deployment descriptor file for the J2EE application client, and delete the prefix from the tag name.
- XML version "1.0" is recognized, but not "%s".  
The specified XML version number is not supported.  
%s = Specification version  
Check that an unsupported version number is not specified in "version" of the XML declaration. Version 1.0 is valid only.

---

**javax.naming.NamingException: com.fujitsu.interstage.j2ee.def.FJDefException: file not found: %s (The specified path is not found.)**  
**javax.naming.NamingException: com.fujitsu.interstage.j2ee.def.FJDefException: file not found: %s (The specified file is not found.)**

#### Variable Information

%s = File path

#### Explanation

The specified deployment descriptor file or the specified name conversion file does not exist.

## User Action

- Confirm that the deployment descriptor file and the name conversion file exist.
- Otherwise, confirm that the path specified as a JNDI environmental property is correct.

---

**javax.naming.NamingException: com.fujitsu.interstage.j2ee.def.FJDefException: unknown error: java.lang.OutOfMemoryError**

## Explanation

Heap area size of Java VM is low.

## User Action

Increase the maximum area size of Java VM.

To determine the necessary increase, calculate the size for the XML files (deployment descriptor file and name conversion file) respectively using the following equation.

$$(((a*460)+b)/1024+500)*c \text{ (Unit: K byte)}$$

- a: Number of lines in the XML file
- b: XML file size (Unit: K byte)
- c: Number of threads issuing lookup (J2EE application client)
- c: Number of simultaneous client accesses (Web application)

Example when 128 MB are specified as the maximum heap size of Java VM.

```
java -Xmx128m ClientAPP
```

Specify the heap area size of JavaVM with the WorkUnit setting of [System] > [WorkUnit] > [IIServer Name] > [Environment Settings Tab] on Interstage Management Console.

---

**javax.naming.NamingException: com.fujitsu.interstage.j2ee.def.FJDefException: unknown error:javax/xml/parsers/ParserCofigurationException**

## Explanation

The XML processor is not installed or the path to an XML processor is not set as the CLASSPATH variable.

## User Action

- Check that the path to the XML processor has been specified in the CLASSPATH variable.  
The class path set during IIServer operation is output to the container information log (info.log). Check the setting of the class path with the container information log.
- Check that the XML processor is installed.

---

**javax.naming.NamingException: com.fujitsu.interstage.j2ee.def.FJDefException: unknown error:org/xml/sax/ErrorHandler**

## Explanation

The XML processor is not installed, or the path to an XML processor is not set as the CLASSPATH variable.

## User Action

- Check that the path to the XML processor has been specified in the CLASSPATH variable.  
The class path set during IIServer operation is output to the container information log (info.log).  
Check the setting of the class path with the container information log.
- Check that the XML processor is installed.

---

## **javax.naming.NamingException: DataSource is not found NAME= %s**

### Variable Information

%s = JDBC-datasource-name

### Explanation

The data source specified does not exist.

### User Action

Check that the data source is registered.

If Symfoware is used for pooling in the JDBC driver, also check whether the JDBC driver Naming Service is running, or whether the data source has been registered in the Naming Service.

---

## **javax.naming.NamingException: Error occurred in creating a ManagedConnectionFactory instance or setting properties. Exception=%s**

### Variable Information

%s = Module name

### Explanation

Failed to generate the resource adapter ManagedConnectionFactory instance or set the properties.

### User Action

Check the resource adapter to see whether an error occurs:

- When the resource adapter ManagedConnectionFactory class is initialized
- In the constructor
- Due to an incorrect property name.

---

## **javax.naming.NamingException: Error occurred in creating a new instance of ManagedConnectionFactory. : EXCEPTION=%s**

### Variable Information

%s = Exception

### Explanation

Failed to generate the resource adapter ManagedConnectionFactory instance.

### User Action

Check the resource adapter to see whether an error occurs:

- When the resource adapter ManagedConnectionFactory class is initialized
- In the constructor
- Due to an incorrect property name.

---

## **javax.naming.NamingException: Error occurred in creating ConnectionFactory. : EXCEPTION=%s**

### Variable Information

%s = Exception

### Explanation

Failed to generate the resource adapter ConnectionFactory.

## User Action

Check the resource adapter to see whether the ManagedConnectionFactory createConnectionFactory method fails.

---

**javax.naming.NamingException: Error occurred in loading ManagedConnectionFactory. : CLASS NAME=%s**

## Variable Information

%s = Class name

## Explanation

Failed to load the resource adapter ManagedConnectionFactory class.

## User Action

Confirm that the resource adapter and all required class paths are set. Additionally, check the resource adapter to see whether an error occurs when the ManagedConnectionFactory class is initialized.

---

**javax.naming.NamingException: Error occurred in ManagedConnectionFactory.setResourceAdapter. Exception=%s**

## Variable Information

%s = Module name

## Explanation

Failed to execute the resource adapter ManagedConnectionFactory setResourceAdapter method.

## User Action

Check whether an error occurred in the resource adapter ManagedConnectionFactory setResourceAdapter method.

---

**javax.naming.NamingException: FJUserID or FJPassword is invalid : FJUserID = %s1 FJPassword = %s2**

## Variable Information

%s1 = User ID

%s2 = Password

## Explanation

Either FJUserID or FJPassword is NULL or empty.

Otherwise, no user ID or password is registered in Interstage Directory Service.

## User Action

- Check that FJUserID and FJPassword are correctly specified.
- Check that a user ID and password are registered in Interstage Directory Service.

---

**javax.naming.NamingException: invalid resource definition**

## Explanation

An invalid character string exists in the value specified in the tag of the deployment descriptor file or the name conversion file.

## User Action

- Check that no control character such as a blank, tab, or line feed is included.
- Check that the specified character string is correct. For some tags, specifiable character strings are limited.
- Check that the description contents are correct.

---

**javax.naming.NamingException: It failed to do activate resource adapter. %s**

## Variable Information

%s = Module name

## Explanation

ConnectionFactory lookup failed because activation of the resource adapter failed.

## User Action

Resolve the cause of the failure to activate the resource adapter and then re-execute.

---

## **javax.naming.NamingException: java.lang.IllegalArgumentException: No attributes are implemented**

## Explanation

crimson does not support the loading of deployment descriptor files in J2EE 1.4 or later.

## User Action

To run applications in J2EE 1.4 or later, use JDK/JRE 6.

If an XML parser is specified, then specify an XML parser that supports JAXP 1.2 or later.

---

## **javax.naming.NamingException: java.net.MalformedURLException**

## Explanation

Either:

- An error occurred during lookup processing.
- No valid protocol was found for the URL name specified as the JNDI name.
- The character string cannot be analyzed.

## User Action

- Check that the URL name to be specified as the JNDI name is correct.

Refer to "[38.16 Management When an Exception Occurs in Lookup Processing](#)", and implement the suggested remedial actions.

---

## **javax.naming.NamingException: JavaMail: %s**

## Variable Information

%s = JNDI-name

## Explanation

An error occurred during lookup processing.

## User Action

Refer to "[38.16 Management When an Exception Occurs in Lookup Processing](#)", and implement the suggested remedial actions.

---

## **javax.naming.NamingException: javax.naming.CommunicationException: %s1: %s2 [Root exception is java.net.ConnectException: Connection refused: no further information]**

or

## **javax.naming.NamingException: javax.naming.AuthenticationException: [LDAP: error code %s3 - Invalid Credentials]**

or

## **javax.naming.NamingException: com.fujitsu.interstage.j2ee.security.FJSVj2eeSecurityException**

## Variable Information

%s1 = Host name

%s2 = Port number

%s3 = Code number

## Explanation

When the EJB application is used, an exception occurred during lookup processing performed on the client.

## User Action

Check the following.

- An error may occur in the Interstage Directory Service operating environment. Confirm that the repository is created or started correctly.
- Confirm that the security management environment definition file is set correctly.

Additionally, refer to "[38.16 Management When an Exception Occurs in Lookup Processing](#)", and implement the suggested remedial actions.

---

## **javax.naming.NamingException: javax.naming.NamingException: Certification failed**

## Explanation

When the EJB application is used, an exception occurred during lookup processing performed on the client.

## User Action

Check the following;

- The security role assigned to the user ID and password is not found. Confirm that lookup processing is being performed with the correct user ID and password.
- Confirm the security management environment definition file is set correctly.

Also, refer to "[38.16 Management When an Exception Occurs in Lookup Processing](#)", and implement the suggested remedial actions.

---

## **javax.naming.NamingException: JdbcBuilder new WrapperDataSource : Exception java.lang.ClassCastException: javax.naming.Reference or javax.naming.NamingException: JdbcBuilder new WrapperDataSource: Exception java.lang.ClassCastException**

## Explanation

The JDBC driver module may not have been set in the class path.

Or, maybe the JDBC driver class on the IJServer process cannot be referenced.

## User Action

Check that the JDBC driver class path settings are correct by referring to Environment Setup when JDBC (Database) is Referenced in the JNDI chapter of the J2EE User's Guide. .

**Solaris32/64 Linux32/64**

If the JDBC driver has been set correctly in the class path, check that the user who starts the IJServer has access authorization for the JDBC driver module. If the user has no access authorization, assign it to the user.

---

## **javax.naming.NamingException: ManagedConnectionFactory.createConnectionFactory returns null**

## Variable Information

%s = Definition name, class name, or exception information

## Explanation

Lookup failed because the resource adapter ManagedConnectionFactory createConnectionFactory method returned a 'null' value.

## User Action

Check that the resource adapter ManagedConnectionFactory createConnectionFactory method has not returned a 'null' value.

---

**javax.naming.NamingException: May not use connector. (%s)****Variable Information**

%s = ConnectionFactory name

**Explanation**

Connector cannot be used in a J2EE application client and Web application.

**User Action**

Check whether a connector is used with J2EE application client and Web application.

---

**javax.naming.NamingException: May not use XADataSource. (%s)****Variable Information**

%s = JDBC Datasource name

**Explanation**

XA Datasource cannot be used in a J2EE application client and Web application.

**User Action**

Check whether an XA datasource has been specified.

---

**javax.naming.NamingException: no protocol: %s****Variable Information**

%s = URL name

**Explanation**

An error occurred during lookup processing.

**User Action**

Check that the URL name is correct.

Refer to "[38.16 Management When an Exception Occurs in Lookup Processing](#)", and implement the suggested remedial actions.

---

**javax.naming.NamingException: Not found ConnectionFactory interface definition in the deployment descriptor.****Explanation**

Lookup failed because the ConnectionFactory interface has not been defined in the resource adapter.

**User Action**

Confirm that the ConnectionFactory interface has been defined in the resource adapter deployment descriptor.

---

**javax.naming.NamingException: Not found definition : %s1 : %s2  
or  
javax.naming.NamingException: Not found definition : %s3****Variable Information**

%s1 = Type of Resource access definition

%s2 = Resource name

%s3 = Details of a file access error

**Explanation**

No resource has been registered, or the resource definition file cannot be accessed.

#### User Action

Check whether the resource definition has been registered correctly.  
Also check whether there is access authority for the bindings file.

---

#### **javax.naming.NamingException: Not found JndiName for Administered Object Interface.**

#### Explanation

Lookup of the resource adapter management target object failed.

#### User Action

Confirm that the resource adapter has been deployed, and that the configured definition name is correct. If the resource adapter was redeployed using the HotDeploy functionality, reset the management target object definition name and then reactivate the module.

---

#### **javax.naming.NamingException: Not found ManagedConnectionFactory name in the deployment descriptor.**

#### Explanation

Lookup failed because ManagedConnectionFactory has not been described in the deployment descriptor.

#### User Action

Confirm that ManagedConnectionFactory has been defined in the resource adapter deployment descriptor.

---

#### **javax.naming.NamingException: Not found ManagedConnectionFactory name in the deployment descriptor(1.5).**

#### Explanation

Lookup failed because the ConnectionFactory interface has not been defined in the resource adapter.

#### User Action

Confirm that the ConnectionFactory interface has been defined in the resource adapter deployment descriptor.

---

#### **javax.naming.NamingException: propName or propVal is null**

#### Explanation

Either the environmental property name, or the environmental property value specified in addToEnvironment, is null.

#### User Action

Check that correct name and value are used to perform addToEnvironment processing.

---

#### **javax.naming.NamingException: Resource adapter is not deployed. : RESOURCE NAME=%s javax.naming.NamingException: Resource name does not exist. : RESOURCE NAME=%s**

#### Variable Information

%s = Definition name

#### Explanation

Lookup of the resource adapter ConnectionFactory failed.

#### User Action

Confirm that the resource adapter has been deployed, and that the configured definition name is correct. If the resource adapter was redeployed using the HotDeploy functionality, reset the ConnectionFactory definition name and then reactivate the module.

---

#### **javax.naming.NamingException: Root exception is java.lang.ClassCastException: %s**

## Variable Information

%s = Data source type name

## Explanation

An invalid data source (XA data source) has been specified.

## User Action

Check that the data source(s) (XA data source) specified can be used by client applications.

---

## **javax.naming.NamingException: Root exception is java.lang.ClassCastException: %s**

## Variable Information

%s = Class name

## Explanation

The environment of a J2EE application client is not set up correctly.

## User Action

Check that the environment is set correctly for the J2EE application client.

---

## **javax.naming.NamingException: security.properties I/O Error :**

## Explanation

Reading of the security.properties file failed.

## User Action

Confirm that the file has the proper permissions.

---

## **javax.naming.NamingException: security.properties is invalid :**

## Explanation

An error exists in the definition of the security.properties file.

## User Action

Check that the definition of the security.properties file is set up correctly.

---

## **javax.naming.NamingException: security.properties is not found :**

## Explanation

An error exists in the security.properties file.

## User Action

Check that the security.properties file exists in the following directories.

**Windows32/64**

C:\Interstage\J2EE\etc.

**Solaris32/64** **Linux32/64**

/etc/opt/FJSVj2ee/etc.

Create a file, when a security.properties file does not exist.

---

## **38.10.6 javax.naming.NoInitialContextException**

---

## **javax.naming.NoInitialContextException:**

### Explanation

Creation of InitialContext implementation failed.

### User Action

Perform the following corrective actions:

- For the J2EE application client
  - Check whether the J2EE application client is installed correctly.
  - Check whether the JNDI environment property used at J2EE application client execution is specified correctly.:

Environment property:

`java.naming.factory.initial`

Value:

`com.fujitsu.interstage.j2ee.jndi.InitialContextFactoryForClient`

Example:

`-Djava.naming.factory.initial=com.fujitsu.interstage.j2ee.jndi.InitialContextFactoryForClient`

- For the Web application

Check whether the specified JNDI environment setting or lookup format is specified correctly.

---

## **javax.naming.NoInitialContextException: Cannot instantiate class: %s**

### Variable Information

%s = Class name of the database

### Explanation

The setup of a database was not performed correctly.

### User Action

Check that the setup of a database is performed correctly.

---

## **javax.naming.NoInitialContextException: Cannot instantiate class: com.fujitsu.interstage.ejb.jndi.FJCNCtxFactoryForClient. Root exception is java.lang.ClassNotFoundException:**

### Explanation

If an error occurs in a Java applet in the EJB application, it is displayed on the Java console.

### User Action

Check the following:

- The necessary jar file may not correctly be stored in the Web server.
- The necessary jar file may not be coded in the HTML file.

---

## **javax.naming.NoInitialContextException: Cannot instantiate class: com.fujitsu.interstage.jms.InitialContextFactory.**

### Explanation

There is an error in the environment of JMS.

### User Action

Check that the JMS environmental setup is correct.

## 38.10.7 javax.naming.NotContextException

---

### javax.naming.NotContextException: %s

#### Variable Information

%s = Intermediate-context-name

#### Explanation

There is an error in an Intermediate-context.

#### User Action

- Check that a correct name is used to perform list or listBindings processing.
- The intermediate-context specified by the JNDI name must be a context object.

---

### javax.naming.NotContextException: %s cannot be listed

#### Variable Information

%s = Intermediate-context-name

#### Explanation

There is an error in an Intermediate-context.

#### User Action

- Check that a correct name is used to perform list or listBindings processing.
- The intermediate-context specified by the JNDI name must be a context object.

---

### javax.naming.NotContextException: %s is not InitialContext

#### Variable Information

%s = Intermediate-context-name

#### Explanation

There is an error in an Intermediate-context.

#### User Action

- Check that a correct name is used to perform bind, unbind or rename processing.
- The intermediate-context specified by the JNDI name must be a context object.

---

### javax.naming.NotContextException: The name '%s' is not an InitialContext

#### Variable Information

%s = Intermediate-context-name

#### Explanation

There is an error in an Intermediate-context.

#### User Action

- Check that a correct name has been specified for destroySubcontext or createSubcontext processing.
- The intermediate-context specified by the JNDI name should check that it is a context object.

## 38.10.8 javax.naming.OperationNotSupportedException

---

### javax.naming.OperationNotSupportedException

## Explanation

1. The operation that was called may not be supported.
2. If the exception message contains "LDAP", an error may have occurred in LDAP.

## User Action

1. Check the application to see whether the operation that was called is supported.
2. Refer to "LDAP Error Codes" in the "Error Codes to be Reported from Interstage Directory Service" chapter of the Messages manual.

---

## 38.11 Exceptions Beginning with javax.servlet

---

### 38.11.1 javax.servlet.ServletException

---

#### [javax.servlet.ServletException](#)

## Explanation

An exception occurred within the servlet.

## User Action

Refer to the message and stack trace and check the application processing.

---

## 38.12 Exceptions Beginning with javax.transaction

---

### 38.12.1 javax.transaction.HeuristicMixedException

---

#### [javax.transaction.HeuristicMixedException](#)

## Explanation

The exception occurs in each of the following cases:

- Not using the distributed transaction function

At the time of transaction commit, an exception occurred in the database when a transaction commit was issued for the database connection.

- Using the distributed transaction function

Any one of the following errors occurred at the time of transaction commit:

- Error in the resource management program
- Error in the database
- Indeterminate state

## User Action

Perform the following corrective actions:

- Not using the distributed transaction function

The details of the error generated in the database are output to the IJServer log file. Remove the cause of the error.

If two or more databases are accessed within one transaction, database integrity may not be established. Check the database contents and restore the database to the state it was in before the transaction committing, for example, restore the backup data saved in advance.

- Using the distributed transaction function

## 38.12.2 javax.transaction.SystemException

---

[javax.transaction.SystemException: com.fujitsu.interstage.ots.jts.FjtsSystemException: org.omg.CORBA.NO\\_IMPLEMENT:CORBA\\_Request\\_get\\_response](#)

### Explanation

This exception occurred in a client when the distributed transaction function was used during execution of the EJB application.

### User Action

The OTS system may not be active. Check whether the OTS system is active.

---

[javax.transaction.SystemException: thread is not initialized](#)

### Explanation

Transaction Service processing cannot be continued.

### Cause

UserTransaction may have been subject to lookup processing in JNDI from a user thread generated in the Web application.

### User Action

UserTransaction cannot receive lookup processing from a user thread generated in Web applications.

Perform processing using a Servlet container thread (a thread for start/stop/request processing) extension, not a thread generated in the Web application..

## 38.12.3 javax.transaction.NotSupportedException

---

[javax.transaction.SystemException:com.fujitsu.interstage.ots.jts.FjtsSystemException:org.omg.CORBA.NO\\_IMPLEMENT:CORBA\\_Request\\_get\\_response](#)

### Explanation

The transaction operation that was requested cannot be executed.

### Cause

The possible causes are:

- The javax.transaction.UserTransaction begin() method may have been issued when the transaction had already started.
- After the occurrence of javax.transaction.HeuristicMixedException when commit of javax.transaction.UserTransaction is executed, the transaction may not have completed because rollback of javax.transaction.UserTransaction was not executed.

### User Action

Check the following:

- Check the application to see whether the javax.transaction.UserTransaction begin() method was executed without the javax.transaction.UserTransaction commit or rollback processing being performed. If the corresponding processing is found, correct the application so that the UserTransaction object begin() method is issued when the commit or rollback processing is performed.
- Correct the application so that, after the occurrence of javax.transaction.HeuristicMixedException when commit of javax.transaction.UserTransaction is executed, rollback of javax.transaction.UserTransaction is executed.

## 38.13 Exceptions Beginning with oracle.ons

---

### 38.13.1 oracle.ons.ONSEException

---

[oracle.ons.ONSEException: %s](#)

## Variable Information

%s = JDBC driver error message

## Explanation

An error occurred in the JDBC driver.

## User Action

The error messages are as follows:

- oracle.ons.oraclehome not set

The ORACLE\_HOME value has not been set in the -Doracle.ons.oraclehome JavaVM option.

Refer to "Interstage Settings" in the "Linkage with Oracle Real Application Clusters" appendix of the J2EE User's Guide, configure the ORACLE\_HOME settings and re-execute.

- Unable to open config file

The settings file cannot be read because the ORACLE\_HOME value set in the -Doracle.ons.oraclehome JavaVM option is incorrect.

Check/correct the ORACLE\_HOME value set in the -Doracle.ons.oraclehome JavaVM option and re-execute.

## 38.13.2 oracle.ons.SubscriptionException

---

**oracle.ons.SubscriptionException: Subscription request timed out after \*\*\*\*\* milliseconds. Possible causes: OPMN may not be running, you may have an OPMN running in an alternate ORACLE\_HOME using duplicate port values, or OPMN may be misconfigured.**

### Explanation

An error occurred in the JDBC driver because Oracle Notification Service is not running.

### User Action

Refer to the Oracle manual, configure the settings for and start Oracle Notification Service, and re-execute.

## 38.14 Exceptions Beginning with org.apache.jasper

---

### 38.14.1 org.apache.jasper.JasperException

---

#### [org.apache.jasper.JasperException](#)

### Explanation

Failed to compile or execute JSP.

### User Action

If the compile failed, refer to the contents output afterwards and correct the application.

If the execution failed, refer to the exception information output afterwards.

## 38.15 Exceptions Beginning with org.omg.CORBA

---

### CORBA messages generated in EJB applications

Since the EJB application uses RMI over IIOP as the communication mode, it uses IIOP of CORBA as the protocol. Therefore, a CORBA exception might be returned during EJB application operation.

- CORBA message configuration

A CORBA message is output as: "CORBA OBJ\_ADAPTER 1179257480 No." This message is configured as follows:

```
CORBA OBJ_ADAPTER 1179257480 No
---- 1 ----- 2 ----- 3 -----
```

- (1): Indicates the message of CORBA.
- (2): Indicates the exception information of the CORBA service.
- (3): Indicates the minor code of the CORBA service.

The CORBA message may also be output in the following format:

```
org.omg.CORBA.MARSHAL: write_Value()] java.io.NotSerializableException: nnn.Impl
----- 1 ----- 2 ----- 3 -----
minor code: 1179255425 completed: No
----- 4 -----
```

- (1): Indicates the exception information of the CORBA service.
- (2): Indicates the method information being internally executed.
- (3): Indicates the exception information internally generated.
- (4): Indicates the minor code of the CORBA service.

- Handling messages

For the exception information of the CORBA service, refer to "CORBA Service Exception Information" in the "Exception Information Minor Codes Reported from the CORBA Service" chapter, and then take the appropriate action.

For the CORBA service minor code, refer to "CORBA Service Minor Codes" in the "Exception Information Minor Codes Reported from the CORBA Service" chapter.

## 38.15.1 org.omg.CORBA.COMM\_FAILURE

---

### org.omg.CORBA.COMM\_FAILURE:

#### Explanation

An error occurred in communication with the EJB application.

The ORB (Object Request Broker) that was specified may be invalid.

#### User Action

Refer to "Environment Setup for Referencing EJB" in the "JNDI" chapter of the J2EE User's Guide, and then review the ORB settings.

If the problem cannot be resolved by performing the above action, refer to "CORBA Service Exception Information", "COMM\_FAILURE" in the "Exception Information Minor Codes Reported from the CORBA Service" chapter, and then take the appropriate action.

## 38.15.2 org.omg.CORBA.INITIALIZE

---

### org.omg.CORBA.INITIALIZE: can't instantiate default ORB implementation %s

#### Variable Information

%s = Class name

#### User Action

Check the following:

- The necessary jar file may not correctly be stored in the Web server.

- The necessary jar file may not be coded in the HTML file.
- Object Request Broker (ORB) might be specified incorrectly.

---

**org.omg.CORBA.INITIALIZE: can't instantiate default ORB implementation  
com.fujitsu.ObjectDirector.CORBA.ORB minor code: 0 completed: No**

#### Explanation

The path to an ODjava4.jar file is not set as the CLASSPATH variable.

#### User Action

Check that the path to the ODjava4.jar file has been specified in the CLASSPATH variable.

The class path set during IJServer operation is output to the container information log (info.log). Check the class path setting with the container information log.

---

**org.omg.CORBA.INITIALIZE: JNDI lookup error. minor code: 1179255429 completed: No**

#### Explanation

There was an error in the environment during distributed transaction functional use.

#### User Action

- If the distributed transaction function is used, OTS/JTS must be set up.  
Check that OTS/JTS is set up.
- If the distributed transaction function is not used, set com.fujitsu.ObjectDirector.CORBA.GlobalTransactionMode to "False".

## 38.15.3 org.omg.CORBA.INTERNAL

---

**org.omg.CORBA.INTERNAL**

#### Explanation

An error occurred in the EJB application.

#### User Action

The contents (field definition, etc.) defined in the class used with the Home or Remote interface of the relevant EJB application might be different between the server and client. Check whether the contents defined in the class are the same.

An example of this is as follows:

- When the ejb-jar file was corrected and deployed with Interstage Management Console, the correction was reflected in the server side (or client side), but not reflected in the client side (or server side).

## 38.15.4 org.omg.CORBA.MARSHAL

---

**org.omg.CORBA.MARSHAL: [write\_Value()] java.io.NotSerializableException: %s.Impl minor code:  
1179255425 completed: No**

#### Variable Information

%s = Class name

#### User Action

This exception occurs when Handle for EJB Object of Bean that performs local calling of Interstage Management Console is obtained and is returned to the client application.

Specify "No" for "Local Calling" of Interstage Management, then restart IJServer.

## 38.15.5 org.omg.CORBA.NO\_IMPLEMENT

---

### org.omg.CORBA.NO\_IMPLEMENT:

#### Explanation

Naming service is not started.

#### User Action

Check that naming service is started.

## 38.15.6 org.omg.CORBA.UNKNOWN

---

### org.omg.CORBA.UNKNOWN

#### Explanation

CORBA Service is not started.

- For EJB application

If an error occurs in a Java applet in the EJB application, it is displayed on the Java console.

#### User Action

Check that CORBA Service is started.

- For EJB application

Authorization may not be set correctly.

## 38.16 Management When an Exception Occurs in Lookup Processing

---

When an exception occurs in lookup processing, check the following:

Note: The exception information that is output is explained in the other sections in this chapter.

### Common points to check

- A valid name is used to perform lookup processing.
- The correct format (beginning with "java:comp/env") is used to perform lookup processing.
- The definitions of the env-entry, ejb-ref, ejb-local-ref, resource-ref, resource-env-ref, message-destination-ref, message-destination, and service-ref tag of a deployment descriptor file are correct.
- The environment property definition of the deployment descriptor must be correct in order to use lookup of the environment property. Also, the value of the environment property must be correctly specified.
- Other Bean reference information of the deployment descriptor must be correctly specified in order to use the inter-server linkage, and that the concerned EJB application must be installed
- The reference resource information of the deployment descriptor must be correctly specified in order to use lookup of the resource manager.
- The resource manager must be registered correctly by the Interstage Management Console or the *j2eeadmin* command.
- When the JDBC driver is being used, check whether the class path is set up.
- When Symfoware is being used for a database, check whether JDBC naming service has started.
- Before using Oracle in the database, check that the '.bindings' file exists. If the '.bindings' file does not exist, create it using the Interstage Management Console.
- If the JMS connection factory or the JMS Destination is looked up, the JMS resource must be correctly registered.

- When the name conversion file is being used, check the following:
  - The <app-name>, <jndi-name> or <module-name> must correctly correspond to the deployed application name and module name.
  - The definition of its ejb-ref-entry, res-entry, res-env-entry or message-destination-entry tag must be correct.
- It may not be possible to reference EJB applications of other modules because "Separate between EARs" or "Separate All" has been selected for the class loader separation. Check that there is no problem with the application configuration or the class loader separation. For details of class loaders, refer to "Class Loader" in the J2EE User's Guide.
- Perform the add new/update definition/delete operations for the JDBC data source before IJServer is started. If IJServer is already running, it must be restarted after the definition operation.
- When the Web service is used in the class that is executed when IJServer is started or stopped, get the Service object using the JAX-RPC ServiceFactory class.

### Points to check in J2EE application clients

In the case of a J2EE application client, check the following:

- The deployment descriptor file must be correctly specified (full path) in the JNDI environmental property "com.fujitsu.interstage.j2ee.DeploymentDescriptorClient".
- When the name conversion file is being used, its file name must be correctly specified in the JNDI environmental property EBEproperties.
- The resource access definition file must have read permission.
- Refer to "Environment Settings for Referencing EJB"- "Environment Settings in the Client Environment" in the J2EE User's Guide, and check that parameters such as CLASSPATH and ORB are specified correctly.

### Points to check for lookup of EJB applications

When you lookup EJB application, check the following:

- Whether the EJB application to be called has been deployed.
- Whether an attempt is made to call the EJB application, which was deployed to the IJServer (Web + EJB[1VM]), from somewhere other than the IJServer. The EJB application deployed to the IJServer (Web + EJB[1VM]) cannot be called from another JavaVM application.
- Whether a Local EJB application has been deployed besides the IJServer (Web + EJB[1VM]). Even if a Local EJB application has been deployed besides the IJServer (Web + EJB[1VM]), it cannot be called from a Web application.
- If a referenced EJB application is equipped with both a Home interface and a Local Home interface, refer to "Specifying information in deployment descriptor files" in the J2EE User's Guide, and check that both the information contained in the deployment descriptor file and the lookup process are correct.

### Points to check in Web service client applications

In Web service client applications, also check the following:

- Refer to "Interstage Web Service Operation" in the J2EE User's Guide, and check that the environment and class path were set correctly.

### Points to check in resource adapter ConnectionFactory or management target objects

In resource adapter ConnectionFactory or management target objects, check the following:

- Check that the resource adapter has been deployed, and that the configured definition name is correct.
- Check that resource adapter and required related library class paths have been set.
- Check the resource adapter to see whether the ConnectionFactory or management target object generation fails.
- Check the resource adapter to see whether the ManagedConnectionFactory createConnectionFactory method fails.

# Chapter 39 Messages Output by IJServer WorkUnits

This chapter explains the messages that are output by the IJServer WorkUnit.

The messages output for the IJServer WorkUnit can be referenced using the Interstage Administration Console: Select [WorkUnits] > "IJServer WorkUnit Name" > [View Log] tab > [Container log].

## 39.1 Messages Output when the IJServer WorkUnit Starts

### Digester - -End event threw exception

#### Explanation

An inconsistency or error was detected during XML parsing.

#### User Action

Remove the cause of the error according to the exception messages output before and after this message:

web.xml (Web application environment definition file) may contain an error

### Digester - -Parse Fatal Error at line <line> column <column> : <message>

#### Explanation

In xml analysis, it failed at the described location: <column> characters of <line> lines or the element of the neighborhood.

When it is the problem which cannot specify a line or a character, it is displayed on <line> or <column> as -1.

#### User Action

Remove the problem by referring to the content of <message>.

web.xml (Web application environment definition file) may contain an error

### Digester - -Parse Error at line <line> column <column> : <message>

#### Explanation

In xml analysis, it failed at the described location: <column> characters of <line> lines or the element of the neighborhood.

When it is the problem which cannot specify a line or a character, it is displayed on <line> or <column> as -1.

#### User Action

Remove the problem by referring to the content of <message>.

web.xml (Web application environment definition file) may contain an error

# Chapter 40 Messages Output by the Servlet Service of Interstage Management Console

## 40.1 About Servlet Container Messages

Servlet Container messages are output to a log file.

In either of the following cases, [Date] is displayed at the beginning of each message. This item is omitted in the following explanation.

- When timestamp output is enabled in the "Servlet Container Log" in the Servlet Container Environment Definition File
- When nothing is specified for timestamp output in the "Servlet Container Log" in the Servlet Container Environment Definition File

## 40.2 Exceptions or Errors that Occur in the Servlet Container

This section describes the causes of exceptions and Java errors that occur frequently in the Servlet Service and abnormal application termination.

If the Servlet or JSP terminates abnormally, the Java stack trace is output to the standard output/standard error log of the Servlet Container, Servlet log, Servlet Container log, or browser. Causes listed below indicate the fundamental causes that trigger the relevant exception. If multiple exceptions occur simultaneously, follow the measures for exception that are indicated in "Root cause:".

For these messages, refer directly to the content of the message.

### BindException

#### Cause

An attempt to set up a connection to the IP address and port number in the class definition of the servlet container, defined in the servlet container environment definition file, failed.

The port may be in use or IP address assignment may have failed.

#### User Action

Check if the Interstage Management Console port number is already in use. The *netstat* command can be used to check for ports being used. For more information about the *netstat* command, refer to the OS manual and Help.

If the following message is output to the standard output/standard error output log of the Container, refer to "[40.3 Startup Logs and Log Messages of Standard Output and Standard Error Output of Container](#)".

```
FATAL: java.net.BindException: Address in use: bind
java.net.BindException: Address in use: bind
```

or

```
FATAL: java.net.BindException: Cannot assign requested address: JVM_Bind
java.net.BindException: Cannot assign requested address: JVM_Bind
```

### ClassCastException

#### Cause

Inconsistency of session information with the Web browser occurred due to Servlet or JSP reload.

#### User Action

Exit the Web browser, and start session management from scratch.

### IncompatibleClassChangeError

#### Cause

The JDK environment during application compile and that of during application execution are different.

## User Action

Make the version of the JDK that compiles the application identical to that of the JDK where the Servlet Container operates.  
Alternatively, recompile the application according to the JDK environment of the Servlet Container.

---

## java.io.IOException

### Cause

If the following message is output to the standard output log or standard error output of the Container, refer to "[40.3 Startup Logs and Log Messages of Standard Output and Standard Error Output of Container](#)".

```
HANDLER THREAD PROBLEM: java.io.IOException: Stream broken
java.io.IOException: Stream broken
```

In other cases, this error may be caused when the socket between the servlet gateway and servlet container is disconnected while the servlet container sends a response.

The timing at which the gateway disconnects the socket without waiting for completion of container response processing is as follows:

- The system detected that a client application such as a Web browser interrupted processing (disconnected the socket).
  - Interruption by user operation
  - Automatic interruption by client cache control

### User Action

- This is an interruption by the client application and does not indicate an error on the server. The causes that output an IOException are as follows:
  - End of client application
  - Pressing the cancel button before completion of a request
  - Repetition of reloading
  - Double-clicking the link or post destination
  - Transition to another link before completion of current request

These IOExceptions do not always occur because they depend on the time when the gateway detects a socket disconnection by a client application (depends on the network status) and the time when the container writes to the socket.

---

## NoClassDefFoundError

### Cause

The class file to be executed cannot be not found.

### User Action

Check the CLASSPATH setting.

---

## OutOfMemoryError

### Cause

1. Insufficient heap area of Java VM
2. Insufficient Java VM permanent area
3. Insufficient system memory space

To investigate the isolation of the cause, the *jheap* command can be used. It enables confirmation of the heap use status of the servlet container. The process ID of Servlet container required for using *jheap* command can be confirmed by using *jscontdisp* command.

#### User Action

1. Increase the size of the maximum heap area of Java VM.
2. If this message is output even when the heap area has enough free space, the permanent area may be short of free space. Increase the size of the permanent area for the JavaVM.
3. Terminate other unnecessary applications.  
If the memory amount is insufficient, add memory.

---

#### ServletException

##### Cause

An exception occurred in the servlet.

##### User Action

Take action for the exception in "Root cause:" that is output after this exception.

---

## 40.3 Startup Logs and Log Messages of Standard Output and Standard Error Output of Container

---

For these messages, refer directly to the content of the message.

---

#### Starting INTERSTAGE Servlet container

##### Explanation

Startup of Servlet container is in progress.

---

#### Started normally INTERSTAGE Servlet container

##### Explanation

Servlet container is started.

---

#### cannot load servlet name: <name>

##### Explanation

Application loading failed because an error occurred in the initialization method (init method or jspInit method) of the servlet or JSP application loaded by the load-on-startup function.

##### User Action

According to the exception or error message that is output immediately after this message, remove the cause of the exception or error that occurred in the initialization method (init method or jspInit method).

---

#### ERROR reading <filename>

##### Explanation

There is an error in the Web Application Environment Definition File <filename>.

##### User Action

Collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

---

#### ERROR reading <filename>

#### At com.sun.xml.parser/P-<message>

##### Explanation

There is an error in the Web Application Environment Definition File <filename>.

#### User Action

Collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

---

**ERROR reading (<filename>) java.lang.NullPointerException:  
At Line <number> <web-app-id>**

#### Explanation

There is an error in the environment definitions between the end and start tags in line <number> of Web Application Environment Definition File <filename>.

#### User Action

Collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

---

**ERROR reading <filename>  
At com.sun.xml.parser/P-<number>  
FATAL: configuration error  
java.lang.NullPointerException:**

#### Explanation

There is a syntax error in the Servlet Container Environment Definition File <filename>.

#### User Action

Collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

---

**FATAL: com.fujitsu.interstage.jservlet.tomcat.core.TomcatException: Wrong home <filename>**

#### Explanation

No Servlet Service system file exists.

#### User Action

Reinstall the Servlet Service.

---

**FATAL: java.lang.Exception: Invalid ConnectionHandler  
java.lang.Exception: Invalid ConnectionHandler**

#### Explanation

There is an error in the Servlet Container Environment Definition File.

#### User Action

Collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

---

**HANDLER THREAD PROBLEM: java.lang.NullPointerException**

#### User Explanation

There is an error in the Servlet Container Environment Definition File.

#### User Action

Collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

---

**HANDLER THREAD PROBLEM: java.net.SocketException: Connection aborted by peer: socket write error**

#### Explanation

A client may have terminated during processing of a request.

---

**HANDLER THREAD PROBLEM: java.net.SocketException: Connection reset by peer: JVM\_recv in socket input stream read****Explanation**

The cause may be one of the following:

1. There was insufficient memory when the Servlet Gateway was sending data to the Servlet Container.
2. A timeout occurred when the Servlet Gateway was sending data to the Servlet Container.
3. A system function call failed when the Servlet Gateway was sending data to the Servlet Container.
4. A client may have terminated during processing of a request.

**User Action**

If a message is output to a Servlet Gateway log file, take the action indicated in the message.

---

**HANDLER THREAD PROBLEM: java.io.IOException: Wrong Protocol.****Explanation**

The Servlet Gateway and Servlet Container versions do not match.

**User Action**

Re-install the Servlet service.

---

**IllegalArgumentException:Cookie name <cookiename> is a reserved token****Cause**

This message is output because a cookie reserved word <cookiename> was sent from a client (such as a Web browser). A cookie reserved word is sent when:

1. A script or applet sets a reserved word <cookiename> in the cookie.
2. A client application (such as a Web browser) specifies a reserved word <cookiename> in the cookie.

An `IllegalArgumentException` is thrown to indicate that an invalid or improper argument has been passed to the method. If this exception is output without this detail message, analyze the stack-back trace that is output after this message and check the application.

**User Action**

Check the processing of the browser.

1. If the client application (script or applet) uses a reserved word, change the cookie name.
  2. Collect a network trace and determine the client application (such as a Web browser) that issued the relevant request, and call the client application developer.
- 

**IllegalStateException: OutputStream is already being used for this request****Cause**

When the Web application uses the forward method, this exception occurs if a response has already been returned to the client. Before the forward method is used, the servlet returns a response with `getOutputStream`.

An `IllegalStateException` is thrown to indicate that an invalid or improper argument has been passed to the method.

**User Action**

Collect diagnostic information using the `iscollectinfo` command, then contact a service engineer.

---

**java.lang.NoClassDefFoundError: com/fujitsu/interstage/jservlet/tomcat/startup/TomcatException in thread "main" or  
java.lang.NoClassDefFoundError: org/xml/sax/DocumentHandler or java.lang.NoClassDefFoundError: javax/servlet/ServletRequest**

## Explanation

There is an error in the Servlet Container Environment Definition File.

## User Action

Collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

---

### **FATAL: java.net.BindException: Address in use: bind java.net.BindException: Address in use: bind**

## Explanation

1. The Interstage Management Console port number is already in use.
2. If the Servlet Container terminates abnormally, the used port number cannot be released by the system.

## User Action

1. Close the application using the port number.
  2. Restart the system.
- 

### **FATAL: java.net.BindException: Cannot assign requested address: JVM\_Bind java.net.BindException: Cannot assign requested address: JVM\_Bind**

## Explanation

The class definition IP address of the Servlet Container specified in the Servlet Container Environment Definition File cannot be used on this server.

## User Action

Collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

---

### **FATAL: java.net.SocketException: create (code=xxxxx) java.net.SocketException: create (code=xxxxx)**

## Explanation

There is an error in the Servlet Container Environment Definition File.

## User Action

Collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

---

### **FATAL: com.fujitsu.interstage.jservlet.tomcat.service.AddressRestrictException: The value of ipaddress is not supported. Please define localhost.**

## Explanation

The Interstage Application Server being used only supports operations in localhost mode.

## User Action

Collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

---

### **Unable to open log file: <filename> Using stderr as the default.**

## Explanation

There is an error in the Servlet Container Environment Definition File.

## User Action

Collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

---

### **ERROR: Defined filter is not implemented javax.servlet.Filter :<Filter-class-name> ,web application id :<Web-app-id>**

#### Explanation

Filter interface is not implemented.

#### User Action

Collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

---

### **ERROR: Defined filter is not found :<Filter-class-name> ,web application id :<Web-app-id>**

#### Explanation

Defined filter is not found.

#### User Action

Collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

---

### **ERROR: Defined filter has not default constructor :<Filter-class-name> ,web application id :<Web-app-id>**

#### Explanation

Defined filter class's default constructor is not public.

#### User Action

Collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

---

### **ERROR: Defined filter is interface or abstract class :<Filter-class-name> ,web application id :<Web-app-id>**

#### Explanation

Defined filter is interface or abstract class.

#### User Action

Collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

---

### **ERROR: Defined filter threw ServletException from init :<Filter-class-name> ,web application id :<Web-app-id>**

#### Explanation

ServletException was thrown from the init method of the Filter class defined.

#### User Action

Collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

---

### **ERROR: Define filter is not started by unexpected error :<Filter-class-name> ,web application id :<Web-app-id>**

#### Explanation

Define filter is not started by unexpected error.

#### User Action

Collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

---

### **ERROR: occurred unexpected error, when the filter was stopped :<Filter-class-name> ,web application id :<Web-app-id>**

#### Explanation

An error occurred during the call of the destroy method of a Filter class.

## User Action

Collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

---

**ERROR: occurred unexpected error, when filter was executed :<Filter-class-name> ,web application id :<Web-app-id>**

## Explanation

An error occurred during the call of the doFilter method of a Filter class.

The following causes can be considered:

1. [ Filter class ] loaded incorrectly.
2. Other error

## User Action

Collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

---

**ERROR: Defined listener is not implemented listener interface :<Listener-class-name> ,web application id :<Web-app-id>**

## Explanation

Listener interface is not implemented.

## User Action

Collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

---

**ERROR: Defined listener is not found :<Listener-class-name> ,web application id :<Web-app-id>**

## Explanation

Defined listener is not found.

## User Action

Collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

---

**ERROR: Defined listener has not default constructor :<Listener-class-name> ,web application id :<Web-app-id>**

## Explanation

Defined listener class's default constructor is not public.

## User Action

Collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

---

**ERROR: Defined listener is interface or abstract class :<Listener-class-name> ,web application id :<Web-app-id>**

## Explanation

Defined listener is interface or abstract class.

## User Action

Collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

---

**ERROR: Defined listener is not loaded by unexpected error :<Listener-class-name> ,web application id :<Web-app-id>**

## Explanation

An error occurred which is not expected at the time of a Listener class load.

#### User Action

Collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

---

**ERROR: occurred unexpected error, when ServletContextListener.contextInitialized was executed :<Listener-class-name> ,web application id :<Web-app-id>**

#### Explanation

An error occurred during the call of the contextInitialized method of ServletContextListener.

#### User Action

Collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

---

**ERROR: occurred unexpected error, when ServletContextListener.contextDestroyed was executed :<Listener-class-name> ,web application id :<Web-app-id>**

#### Explanation

An error occurred during the call of the contextDestroyed method of ServletContextListener.

#### User Action

Collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

---

**ERROR: occurred unexpected error, when ServletContextAttributeListener.attributeAdded was executed :<Listener-class-name> ,web application id :<Web-app-id>**

#### Explanation

An error occurred during the call of the attributeAdded method of ServletContextAttributeListener.

#### User Action

Collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

---

**ERROR: occurred unexpected error, when ServletContextAttributeListener.attributeRemoved was executed :<Listener-class-name> ,web application id :<Web-app-id>**

#### Explanation

An error occurred during the call of the attributeRemoved method of ServletContextAttributeListener.

#### User Action

Collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

---

**ERROR: occurred unexpected error, when ServletContextAttributeListener.attributeReplaced was executed :<Listener-class-name> ,web application id :<Web-app-id>**

#### Explanation

An error occurred during the call of the attributeReplaced method of ServletContextAttributeListener.

#### User Action

Collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

---

**ERROR: occurred unexpected error, when HttpSessionListener.sessionCreated was executed :<Listener-class-name> ,web application id :<Web-app-id>**

#### Explanation

An error occurred during the call of the sessionCreated method of HttpSessionListener.

#### User Action

Collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

---

**ERROR: occurred unexpected error, when HttpSessionListener.sessionDestroyed was executed :<Listener-class-name> ,web application id :<Web-app-id>**

**Explanation**

An error occurred during the call of the sessionDestroyed method of HttpSessionListener.

**User Action**

Collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

---

**ERROR: occurred unexpected error, when HttpSessionAttributeListener.attributeAdded was executed :<Listener-class-name> ,web application id :<Web-app-id>**

**Explanation**

An error occurred during the call of the attributeAdded method of HttpSessionListener.

**User Action**

Collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

---

**ERROR: occurred unexpected error, when HttpSessionAttributeListener.attributeRemoved was executed :<Listener-class-name> ,web application id :<Web-app-id>**

**Explanation**

An error occurred during the call of the attributeRemoved method of HttpSessionListener.

**User Action**

Collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

---

**ERROR: occurred unexpected error, when HttpSessionAttributeListener.attributeReplaced was executed :<Listener-class-name> ,web application id :<Web-app-id>**

**Explanation**

An error occurred during the call of the attributeReplaced method of HttpSessionListener.

**User Action**

Collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

---

**WARNING: Illegal access! maybe attacked from: [hostname/IPaddress]**

**Explanation**

Servlet container was accessed by an unauthorized IP address ([hostname/IPaddress]).

**User Action**

Unauthorized access to the servlet container may have occurred.

Check with the network administrator.

---

**ERROR: Cannot generate the X509Certificate object.**

**Explanation**

An unexpected error occurred during creation of the X509Certificate object.

**User Action**

1. Check the network for errors.
2. Check the Web server settings for errors.

---

**ERROR: connection timeout: Connection was closed by the Servlet Container.**

#### Explanation

A timeout occurred while request data was being read. The connection is closed.

#### User Action

Check the network environment.

---

#### **ERROR: Failed to read the file: <filename> Default value will be used.**

#### Explanation

The file <filename> could not be read. The default value is used.

#### User Action

The file <filename> may be damaged. Check the file system.

---

#### **INFO: No exist the file: <filename> Default value will be used.**

#### Explanation

The environment definition file <filename> is not found. The default value is used.

---

#### **CRITICAL ERR: accept thread died. CRITICAL ERR: container is stopped now.**

#### Explanation

The Servlet Container terminated because the number of request acceptance threads were reduced to zero. This may have been caused by:

1. An OutOfMemoryError
2. An unexpected error

#### User Action

1. Take any action indicated in OutOfMemoryError in [40.2 Exceptions or Errors that Occur in the Servlet Container](#).
  2. Check the content of previous messages. If you still cannot determine the cause of the error, call your Fujitsu systems engineer (SE).
- 

#### **CRITICAL ERR: All the request processing threads did not return for <time> minutes or more.**

#### Explanation

None of the request processing threads that are currently executing the application have been returned for at least <time> minutes.

#### Cause

There is no response from the application.

#### User Action

Use Full thread dump to investigate the reason for the application not being returned.

---

#### **Unrecognized option: XXX Could not create the Java virtual machine.**

#### Explanation

There is an error in the Servlet Container Environment Definition File.

#### User Action

Collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

---

**HANDLER THREAD PROBLEM: java.io.IOException: Stream broken**  
**java.io.IOException: Stream broken****Explanation**

1. The Web browser was connected to the port number of the Servlet Container
2. The Servlet Gateway and Servlet Container versions are different.

**User Action**

1. Check the port number of the Web browser. Connect to the port number of the Web browser.
2. Examine the Servlet Service environment.

---

**\*\*\* panic: libthread loaded into green threads****Explanation**

The Servlet Container is started by green thread.

**User Action**

Collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

---

**<message1>:****<message2>****Explanation**

A <message1> error or exception has occurred in the servlet container. The stack trace is output to <message2>.

If java.lang.OutOfMemoryError was output in <message1>, one of the following may be the cause:

1. Insufficient system memory
2. Insufficient Java VM heap

**User Action**

Check <message1> and <message2>, and remove the cause of the error or exception.

If java.lang.OutOfMemoryError was output in <message1>, take the following action:

1. Close all unnecessary applications apart from the current Servlet Service. If the memory amount is insufficient, expand memory.
2. Increase the maximum Java VM heap size.

---

**[dd/mm/yyyy HH:mm:ss:SSS] WARNING checking {%s1} Tag:%s2:unreadable xml:%s3****Variable information**

%s1 = Setup file

%s2 = Position where error is detected

%s3 = Exception message

**Explanation**

Failed to read the definition file.

**User Action**

The specified XML file does not exist. Create an XML file.

Reading is not permitted. Operate the Permission.

---

**[dd/mm/yyyy HH:mm:ss:SSS] WARNING checking {%s1} Tag:%s2:illegal xml:%s3**

### Variable information

%s1 = Setup file

%s2 = Position where error is detected

%s3 = Exception message

### Explanation

The file does not conform to the XML file format.

### User Action

Correct the file so that it conforms to the xml data format.

---

**[dd/mm/yyyy HH: mm: ss: SSS] WARNING checking {%s1} Tag: %s2: illegal header: %s3**

### Variable information

%s1 = Setup file

%s2 = Position where error is detected

%s3 = "Header value" or none

### Explanation

Header of the definition file is not appropriate.

### User Action

Modify the header of the XML file by referring to the manual of the corresponding file.

---

**[dd/mm/yyyy HH: mm: ss: SSS] WARNING checking {%s1} Tag: %s2: no tag: %s3**

### Variable information

%s1 = Setup file

%s2 = Position where error is detected

%s3 = tag name [ @Name of attribute ="Value of attribute " - - ] or , either name of tag or name of tag

### Explanation

No tag exists.

### User Action

Add the necessary tags by referring to the appropriate Manual of the corresponding tag.

---

**[dd/mm/yyyy HH: mm: ss: SSS] WARNING checking {%s1} Tag: %s2: no attribute: %s3**

### Variable information

%s1 = Setup file

%s2 = Position where error is detected

%s3 = @Name of attribute

### Explanation

No attribute exists.

### User Action

Add the necessary attribute names by referring to the appropriate Manual of the corresponding tag.

---

**[dd/mm/yyyy HH: mm: ss: SSS] WARNING checking {%s1} Tag: %s2: many tag: %s3**

### Variable information

%s1 = Setup file

%s2 = Position where error is detected

%s3 = Name of tag

### Explanation

There are too many tags.

### User Action

Delete the unnecessary tags by referring to the manual of the corresponding tag.

---

**[dd/mm/yyyy HH:mm:ss:SSS] WARNING checking {%s1} Tag:%s2:illegal value:%s3**

### Variable information

%s1 = Setup file

%s2 = Position where error is detected

%s3 = @Name of attribute ="Value of attribute" or , "Value of tag"

### Explanation

The value is inappropriate.

### User Action

Refer to the manual on the concerned tag and correct the value.

---

**[dd/mm/yyyy HH: mm: ss: SSS] WARNING checking {%s1} Tag: %s2: no value: %s3**

### Variable information

%s1 = Setup file

%s2 = Position where error is detected

%s3 = Note or @Name of attribute

### Explanation

No value is set.

### User Action

Input a value by referring to the Manual of the corresponding tag.

---

**[dd/mm/yyyy HH:mm:ss:SSS] WARNING checking {%s1} Tag:%s2:not exist:%s3**

### Variable information

%s1 = Setup file

%s2 = Position where error is detected

%s3 = @Name of attribute ="Value of attribute "

### Explanation

The file does not exist.

### User Action

Prepare a file directory that is indicated by a value of attribute or a value of tag.

Operate the Permission that enables referring to the file.

---

**[dd/mm/yyyy HH: mm: ss: SSS] WARNING checking {%s1} Tag: %s2: permission deny: %s3**

**Variable information**

%s1 = Setup file

%s2 = Position where error is detected

%s3 = @Name of attribute ="Value of attribute "

**Explanation**

1. No read or write permission to the file is granted.
2. The file or directory name is invalid.

**User Action**

1. Refer to the manual of the concerned tag and grant an appropriate permission to the file or directory.
2. Refer to the manual of the concerned tag and correct the characters and length in the character string of the file or directory name.

---

**[dd/mm/yyyy HH: mm: ss: SSS] WARNING checking {%s1} Tag: %s2: illegal character: %s3**

**Variable information**

%s1 = Setup file

%s2 = Position where error is detected

%s3 = @ attribute -name=" attribute -value" or "tag-value"

**Explanation**

Characters that are not permitted for use, are used in the value of attribute or value of tag.

**User Action**

Modify the value by referring to the manual of the corresponding tag.

---

**[dd/mm/yyyy HH: mm: ss: SSS] WARNING checking {%s1} Tag: %s2: no link: %s3**

**Variable information**

%s1 = Setup file

%s2 = Position where error is detected

%s3 = "Value of tag" link "name of tag"

**Explanation**

The same value is not defined in the link and the tag name.

**User Action**

Correct the value to the defined value (indicated by the position of the tag name) by referring to the appropriate manual of the corresponding tag.

---

**[dd/mm/yyyy HH:mm:ss:SSS] WARNING checking {%s1} Tag:%s2:alternative:%s3**

**Variable information**

%s1 = Setup file

%s2 = Position where error is detected

%s3 = either name of tag or name of tag

## Explanation

Only one of the tag names is permitted.

## User Action

Refer to the manual of the concerned tag and delete one of the tags.

---

**[dd/mm/yyyy HH:mm:ss:SSS] WARNING checking {%s1} Tag:%s2:duplicate tag:%s3**

## Variable information

%s1 = Setup file

%s2 = Position where error is detected

%s3 = tag-name@ attribute -name=" attribute -value" [@attribute -name=" attribute -value"...] or tag-name [tag-name...]="tag-value"

## Explanation

The tag is duplicated.

## User Action

Correct the duplicated tags by referring to the appropriate manual of the corresponding tag.

---

**[dd/mm/yyyy HH:mm:ss:SSS] WARNING checking {%s1} Tag:%s2:too long:%s3**

## Variable information

%s1 = Setup file

%s2 = Position where error is detected

%s3 = @ attribute -name=" attribute -value" or "tag-value"

## Explanation

Character string of the value is too long.

## User Action

Modify the character string by referring to the appropriate manual of the corresponding tag.

---

**[dd/mm/yyyy HH:mm:ss:SSS] The data size written by one times is too large.**

## Explanation

The written data size is too large.

## 40.4 Log Messages of Servlet

---

---

**<!context path=" <web-app-id>" ><message></!context>**

## Explanation

The servlet or alias of Web application identifier <web-app-id> has output <message>.

---

**<!context path=" <web-app-id>" ><servletname/alias>: destroy</!context>**

## Explanation

A call has been made for the destroy method of the servlet or alias of Web application identifier <web-app-id>.

---

**<!context path=" <web-app-id>" ><servletname/alias>: init</!context>**

## Explanation

A call has been made for the init method of the servlet or alias of Web application identifier <web-app-id>.

---

**[dd/mm/yyyy HH:mm:ss:SSS] The data size written by one times is too large.**

**Explanation**

The written data size is too large.

For these messages, refer directly to the content of the message.

---

## 40.5 Log Messages of Servlet Container

---

**<l:addContext path="<web-app-id>" docBase="<path>" />**

**Explanation**

A Web application is started with Web application identifier <web-app-id> and in the Web application root directory <path>.

---

**<l:ctx path="<web-app-id>" >Internal Servlet Error:</l:ctx>**

**Explanation**

A mandatory tag has been omitted from the Web application identifier <web-app-id>.

**User Action**

Collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

---

**<l:ctx path="<web-app-id>" > Error in custom error handler java.lang.NullPointerException</l:ctx>**

**Explanation**

1. A mandatory tag has been omitted from the Web application identifier <web-app-id>.
2. The definition of the location tag in the error-page tag of the Web application identifier <web-app-id> is incorrect.

**User Action**

Collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

---

**<l:ctx path="<web-app-id>" >File not found (<filename>) </l:ctx>**

**Explanation**

The file <filename> is missing from the Web application identifier <web-app-id>.

**User Action**

Collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

---

**<l:ctx path="<web-app-id>" >File not found, using defaults (<filename>)</l:ctx>**

**Explanation**

web.xml is missing from the Web application identifier <web-app-id>.

**User Action**

Collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

---

**<l:ctx path="<web-app-id>" >Removing duplicate <url-pattern> -> Wrapper(<servlet-name> <servlet-class>)</l:ctx>**

**Explanation**

A duplicate definition has been entered for <url-pattern> in Web application identifier <web-app-id>.

---

**<l:ctx path="<web-app-id>" >Removing duplicate servlet <servlet-name1> Wrapper(<servlet-name2> <servlet-class>)</l:ctx>**

## Explanation

A duplicate definition has been entered for <servlet-name1> in Web application identifier <web-app-id>.

---

```
<!ctx path="<web-app-id>" ><message1>
<message2>
</!ctx>
```

## Explanation

A Web application ID <web-app-id> servlet or alias is output to <message1> and <message2>.

If java.lang.OutOfMemoryError was output to <message2>, one of the following may be the cause:

1. Insufficient system memory
2. Insufficient Java VM heap

## User Action

Take the following action:

1. Close all unnecessary applications apart from the current Servlet Service.If the memory amount is insufficient, expand memory.
  2. Increase the maximum Java VM heap size.
- 

```
<!ctx path="<web-app-id>" ><message></!ctx>
```

## Explanation

A Web application ID <web-app-id> servlet or alias is output to <message>.

If java.lang.OutOfMemoryError was output to <message>, one of the following may be the cause:

1. Insufficient system memory
2. Insufficient Java VM heap

## User Action

Take the following action:

1. Close all unnecessary applications apart from the current Servlet Service. If the memory amount is insufficient, expand memory.
  2. Increase the maximum Java VM heap size.
- 

```
<!jspvlet home="null" classPath="<classpath>" />
```

## Explanation

The Servlet Container was started as class path <classpath>.

---

```
<!removeContext path="<path>" />
```

## Explanation

Stop Web application identifier<web-app-id>.

---

```
<!startEndpoint port="<port>"
handler="com.fujitsu.interstage.jspvlet.tomcat.service.connector.Ajp12ConnectionHandler" />
```

## Explanation

Use port number <port> to communicate with the Servlet Gateway.

---

```
java.lang.NoClassDefFoundError: <servlet-name1> (wrong name: <servlet-name2>)
```

## Explanation

The servlet <servlet-name1> specified in the URL should correctly be <servlet-name2>.

#### User Action

Specify the correct URL.

---

**[dd/mm/yyyy HH:mm:ss:SSS] The data size written by one times is too large.**

#### Explanation

The written data size is too large.

# Chapter 41 Messages Output by the J2EE Application Security Function

This chapter describes error messages of the Security Function.

## 41.1 Security Function Error Messages

For these messages, refer directly to the content of the message.

---

### **security (Environment Error: File Not Found or Read) File="Security.properties"**

#### Explanation

The security control environment definition file is not found or cannot be read.

#### User Action

Create a new security control environment definition file, or check read permission.

---

### **security (Environment Error: File Access Fault) File="Security.properties"**

#### Explanation

An attempt to access the security control environment definition file failed.

#### User Action

Check that the security control environment definition file is not broken.

---

### **security (Environment Error: no such top DN) ldap.top=""**

#### Explanation

ldap.top of the security control environment definition file is not set.

#### User Action

Set ldap.top.

---

### **security (Environment Error: no such url ) ldap.url=""**

#### Explanation

ldap.url of the security control environment definition file is not set.

#### User Action

Set ldap.url.

---

### **security (Environment Error: no such role) ldap.role=""**

#### Explanation

ldap.role of the security control environment definition file is not set.

#### User Action

Set ldap.role. For the setting of the security control environment definition file.

---

### **security (Environment Error: bad URL was set) ldap.url="(the value of ldap.url set in the security control environment definition file)"**

#### Explanation

An illegal url is set in ldap.url of the security control environment definition file.

## User Action

Check ldap.url and set the correct value.

---

### **security (Environment error: no such object) ldap.top="(the value of ldap.top set in the security control environment definition file)"**

## Explanation

An illegal value is set in ldap.top of the security control environment definition file.

## User Action

Check ldap.top and set the correct value.

---

### **security (Environment error: Invalid DN syntax) ldap.top="(the value of ldap.role set in the security control environment definition file)"**

## Explanation

An illegal attribute name was specified in ldap.role of the security control environment definition file.

## User Action

Set the correct attribute name of the user object used as a security role.

---

### **security (Execute Error: LDAP Server is not running) ldap.url="(the value of ldap.url set in the security control environment definition file)"**

## Explanation

The following may have occurred.

1. Interstage Directory Service is not running.
2. An illegal url is set for ldap.url of the security control environment definition file.
3. An error occurred during communication between the security function and Interstage Directory Service.

## User Action

1. Start Interstage Directory Service.
2. Check ldap.url and set the correct value.
3. Examine the cause of the error referring to the following, and take corrective action.
  - Exception of standard output and standard error output of container of each service.
  - Log authentication of security function
  - Interstage Directory Service log

If the cause of the error cannot be determined, after extracting information using the *iscollectinfo* command, contact your Fujitsu SE.

---

### **security (Execute Error: timelimit exceeded)**

## Explanation

A timeout has occurred in the connection to Interstage Directory Service.

## User Action

On the Interstage Management Console, select [Repository] > [Repository name] > [Environment settings], and increase the value of the [Search timeout period].

---

### **security (Execute Error: sizelimit limit exceeded)**

## User Action

On the Interstage Management Console, select [Repository] > [Repository name] > [Environment settings], and increase the value of the [Maximum number of searchable entries].

---

### **security (Execute Error: DSA is busy)**

#### Explanation

Interstage Directory Service is busy.

#### User Action

Duplicate Interstage Directory Service to distribute load.

---

### **security (Execute Error: DSA is unwilling to perform)**

#### User Action

If exception information was output after this message, refer to the message documentation for the exemption and take action.

If exception information was not output, or the problem was not resolved, contact your service engineer.

---

### **security (Execute Error: error has occurred on JNDI) Message="Detailed information"**

#### User Action

If this message is output, contact your service engineer.

---

### **security (Execute Error: authentication failed)**

#### Explanation

The authentication was rejected.

#### User Action

Enforce the setting so that authentication "without credential" and authentication "with password" shall be granted for general read authorization and update authorization.

---

### **security (Runtime Exception has occurred) Message="Detailed information"**

#### User Action

If this message is output, contact your service engineer.

---

### **security (Runtime Error has occurred) Message="Detailed information"**

#### User Action

If this message is output, contact your service engineer.

---

### **security (Execute Error: cannot open file) com.fujitsu.interstage.j2ee.security.logfile=""**

#### Explanation

The log file name used in the trace function of the security function is not set.

#### User Action

Set the Log file name.

---

### **security (Execute Error: cannot open file) com.fujitsu.interstage.j2ee.security.logfile= "The log filename that is specified by parameter at the startup of JavaVM."**

#### Explanation

Unable to open in the log file that is used by the trace function of the security function.

#### User Action

Confirm the path that is specified as log filename, the write permission, and the available disk capacity.

---

**security (Execute Error: cannot write file) com.fujitsu.interstage.j2ee.security.logfile= "The log filename that is specified by parameter at the startup of JavaVM."**

#### Explanation

Unable to write in the log file that is used by the trace function of the security function.

---

**security (Execute Error: cannot close file) com.fujitsu.interstage.j2ee.security.logfile= "The log filename that is specified by parameter at the startup of JavaVM."**

#### Explanation

Unable to close the log file used by the trace function of the security function.

---

**security (Environment Error: invalid value in log size) com.fujitsu.interstage.j2ee.security.logsize=""**

#### Explanation

The log file name used in the trace function of the security function is not set.

#### User Action

Set the log size correctly.

---

**security (Environment Error: invalid value in log size) com.fujitsu.interstage.j2ee.security.logsize= "The log filename that is specified by parameter at the startup of JavaVM."**

#### Explanation

An illegal attribute name is set in the log file name, used in the trace function of the security function.

#### User Action

Set the log size correctly.

# Chapter 42 Messages Output by the Component Transaction Service

This chapter describes the following messages:

- [42.1 Common Error Log \(1000 to 1999\)](#)
- [42.2 Error Log Output by Cooperation with Transaction Application \(2000 to 2999\)](#)
- [42.3 Error Messages Output from AIM Linkage \(3000 to 3999\)](#)

## 42.1 Common Error Log (1000 to 1999)

This section details the common error log messages with message numbers between 1000 and 1999.

### 42.1.1 1001

#### 1001:Error log started

##### Explanation

Error log extraction has started.

### 42.1.2 1002

#### 1002:Error log ended

##### Explanation

Error log extraction has ended.

### 42.1.3 1005

#### 1005:The request failed due to insufficient memory(%s1). Object id = (%s2) Operation id = (%s3)

##### Variable Information

%s1 = Error information

%s2 = Object name

%s3 = Operation name

##### Explanation

The client's request failed due to insufficient TD memory.

##### System Action

Returns 10001 to the client.

##### User Action

Execute the process again later. If this message is generated frequently, refer to the Interstage Application Server Tuning Guide, re-estimate the memory required to run Interstage and confirm that enough memory is available.

If there is enough memory (relative to the amount of memory needed to run Interstage), it may be that there is inadequate memory to run other applications. Also re-estimate the amount of memory required for the other applications running on the same machine, to determine if there is an appropriate amount of memory.

Contact your system administrator if the re-estimation indicates that the memory is insufficient. Ask the system administrator to either increase the size of the main memory or to increase the size of the page file.

## 42.1.4 1006

---

**1006:The object is not activated in TD. Object id = (%s1) Operation id = (%s2)**

### Variable Information

%s1 = Object name

%s2 = Operation name

### Explanation

The object requested by the client could not be located in any WorkUnit started under Component Transaction Service or AIM linkage.

### System Action

Returns `ex_CORBA_StExcep_INV_OBJREF` system exception to the client.

### User Action

Start the WorkUnit that contains the specified object %s1.

## 42.1.5 1007

---

**1007:The request failed due to error in OD(%s1-%s2-%s3-%s4-%s5)**

### Variable Information

%s1 = Object name

%s2 = Operation name

%s3 = Abnormal service name

%s4 = Error information1

%s5 = Error information2

### Explanation

The OD reported an error.

### System Action

Returns 10001 to the client.

### User Action

Check that the OD is operating correctly. If the OD has started, record the variable information, and then contact your software supplier.

## 42.1.6 1008

---

**1008:The request ended abnormally because of forced termination of WU or TD. Object id = (%s1)  
Operation id = (%s2)**

### Variable Information

%s1 = Object name

%s2 = Operation name

### Explanation

The demand from the client terminated abnormally by stopping the WorkUnit or Interstage compulsion.

### System Action

Returns 10001 to the client.

## User Action

Start the WorkUnit or Interstage.

### 42.1.7 1009

---

**1009: The request failed due to invalid client programming or mismatched Interface Repository. (%s1 - %s2 - %s3)**

#### Variable Information

%s1 = Object Name

%s2 = Operation Name

%s3 = Parameter Name

#### Explanation

An invalid parameter was given by the client. The client application may be incorrect or the Interface Repository and client application stubs may not match.

#### System Action

Notifies the client of BAD\_PARAM system exception.

#### User Action

The in or inout character string parameters specified on the client side may be incorrect. For Java clients, in particular, it is possible that only the default constructor StringHolder() has been used and a server method invoked without setting a value for the value member.

(Incorrect)

```
inoutPara = new StringHolder();
```

(Correct)

```
inoutPara = new StringHolder("");
```

Review the client application processing.

Also, check whether the Interface Repository information registered with the *tdc* command matches the stub on the client side. If the HTML Page Editing Service is being used, ensure that Interstage and the HTML Page Editing Service have been re-started after the IDL definition (CORBA object) was changed.

### 42.1.8 1010

---

**1010: The request failed due to mismatch of Interface Repository and client stub. (%s1 - %s2 - %s3)**

#### Variable Information

%s1 = Object Name

%s2 = Operation Name

%s3 = IP address

#### Explanation

The interface function detected that the Interface Repository information does not match the stubs on the client side.

#### System Action

Notifies the client of BAD\_PARAM system exception.

## User Action

Check that the IDL information of Interface Repository registered by the *tdc* command matches that of the stubs on the client side. If it does not match, stop the WorkUnit, and then reexecute the command. Then develop the client application again using the latest stubs, change the applications, and re-start the WorkUnit.

## 42.2 Error Log Output by Cooperation with Transaction Application (2000 to 2999)

---

This section details the error log output messages with message numbers between 2000 and 2999.

### 42.2.1 2001

---

**2001: The request failed due to fail in getting context data for TM. Object id = (%s1) Operation id = (%s2)**

#### Variable Information

%s1 = Object name

%s2 = Operation name

#### Explanation

Unable to obtain the transaction context set by the client.

#### System Action

Returns 10001 to the client.

#### User Action

Check that the client has set the transaction context correctly.

### 42.2.2 2002

---

**2002: Total length of input data or output data exceeded the maximal length of queue data. Object id = (%s1) Operation id = (%s2)**

#### Variable Information

%s1 = Object name

%s2 = Operation name

#### Explanation

The sum of the data length of all the in or inout parameters setup by client, or the sum of the data length of all the inout or out parameters setup by the TD application, has exceeded the maximum value of 32000 bytes.

#### System Action

Returns 10002 to the client.

#### User Action

Check that the input data from the client, or the output data from the TD server application, is valid.

### 42.2.3 2003

---

**2003: The request failed due to abnormal end of TD application. Object id = (%s1) Operation id = (%s2)**

#### Variable Information

%s1 = Object name

%s2 = Operation name

#### Explanation

The TD application corresponding to object %s1 terminated abnormally.

#### System Action

Returns 10004 to the client.

#### User Action

Check the cause of the TD application error.

### 42.2.4 2004

---

**2004:The request failed due to inactivation of TD application. Object id = (%s1) Operation id = (%s2)**

#### Variable Information

%s1 = Object name

%s2 = Operation name

#### Explanation

The client request failed for one of the following reasons:

- The TD application corresponding to object %s1 is not operating.
- The WorkUnit has stopped.
- The component transaction service has stopped.
- Object %s1 is being closed.

#### System Action

Returns 10004 to the client.

#### User Action

- If the transaction application is not operating, determine the cause.
- If the WorkUnit has stopped, restart it.
- If the component transaction service has stopped, restart it.
- Check the object status using the *tdlistobj* command. If the object is closed, release it.

### 42.2.5 2005

---

**2005:The request failed due to insufficiency of queue resource. Object id = (%s1) Operation id = (%s2)**

#### Variable Information

%s1 = Object name

%s2 = Operation name

#### Explanation

The queue resources became insufficient while the client request was being processed.

#### System Action

Returns 10008 to the client.

## User Action

Wait for a while, and then rerun the job. If this error occurs frequently, determine whether the maximum queuing value specified in the WorkUnit definition is appropriate.

## 42.2.6 2006

---

**2006:Version of TD application does not coincide with TD. Object id = (%s1) Operation id = (%s2)**

### Variable Information

%s1 = Object name

%s2 = Operation name

### Explanation

The operation requested by the client includes a parameter that is not supported by the TD.

### System Action

Returns 10001 to the client.

### User Action

Check the parameter data types currently supported by TD, and modify the client application accordingly.

## 42.2.7 2007

---

**2007:The request failed due to forced termination of TD. Object id = (%s1) Operation id = (%s2)**

### Variable Information

%s1 = Object name

%s2 = Operation name

### Explanation

The client request was denied because the TD was terminated.

### System Action

Returns 10001 to the client.

### User Action

To process the client request, restart the TD.

## 42.2.8 2008

---

**2008:The Request failed due to insufficient buffer in the TD application. Object id = (%s1) Operation id = (%s2)**

### Variable Information

%s1 = Object name

%s2 = Operation name

### Explanation

Could not execute the process due to insufficient resources in the TD application.

### System Action

Returns 10004 to the client.

## User Action

If this message is displayed frequently, the number of communication buffers for the transaction application may be insufficient. Refer to the Interstage Application Server Tuning Guide to correct the environment definition of the component transaction and change the number of communication buffers.

### 42.2.9 2009

---

**2009: The number of output data is different from IDL definition. Object id=(%s1) Operation id=(%s2)**

#### Variable Information

%s1 = Object name

%s2 = Operation name

#### Explanation

The number of the data output from the transaction application is not corresponding to the IDL definition.

#### System Action

Returns 10004 to the client.

#### User Action

Please confirm whether the IDL definition is corresponding to the transaction application. Please make the transaction application again after compiling the IDL definition again by the *tdc* command.

### 42.2.10 2010

---

**2010: An incorrect data exists in the output data. Object id=(%s1) Operation id=(%s2)**

#### Variable Information

%s1 = Object name

%s2 = Operation name

#### Explanation

The data type output from the transaction application is not corresponding to the IDL definition.

#### System Action

Returns 10004 to the client.

#### User Action

Please confirm whether the IDL definition is corresponding to the transaction application. Please make the transaction application again after compiling the IDL definition again by the *tdc* command.

### 42.2.11 2011

---

**2011: The request failed due to error in access check. Object id=(%s1) Operation id=(%s2) Error Code=(0x%x)**

#### Variable Information

%s1 = Object name

%s2 = Operation name

%x = Error code

#### Explanation

The requesting client does not have the correct access rights.

## System Action

Return value 10006 is notified to the client when there is no access right and return value 10001 is notified for other abnormalities.

## User Action

Refer to the relevant error code detailed below:

### 0020

There is no access right to base DN. Please input correct user DN and the password and execute the client program again.

### 0022

The mistake is found in the form of user DN to whom was input from the client. Please input user DN of a correct form and execute the client program again.

### 0031

Failed in the attestation of user DN and the password, which had been input from the client. Enter the correct user DN and password, and then reexecute the client program.

### 0033

InfoDirectory is busy. Please send the demand again from the client program.

### 0051

InfoDirectory is not started. Confirm that the host name and port number of the InfoDirectory server specified in the system environment definition is correct. If not correct, edit the definition to insert the correct host name and port number. Restart InfoDirectory, then the Component Transaction Service, and then the WorkUnit.

This error code may also indicate that there are insufficient resources to run InfoDirectory. It may therefore be necessary to reassign system resources before attempting to resend a request from the client program.

### 0100

System resource shortage occurred. Please add a memory and a swap necessary for the operation.

### 0201

There are no permissions to access to the access control object. Enter the correct user DN and password, and then reexecute the client program.

### 0300

The mistake is found in the length of user DN entered from the client. Enter the correct user DN, and then reexecute the client program.

### 0301

The mistake is found in the length of the password input from the client. Please input a correct password, and then reexecute the client program.

## Others

Please keep a record of the error code and investigate InfoDirectory to determine the cause of the error. If an error code other than one of those listed above is displayed, consult your system administrator.

## 42.2.12 2012

---

### 2012: Invalid Session id. Object id = (%1) Operation id = (%s2)

#### Variable Information

%s1 = Object name

%s2 = Operation name

#### Explanation

The session is interrupted due to one of following reasons:

- When the session to the object did not exist, methods other than the begin session method were called. (Session beginning error)
- When the session to the object existed, the same session ID was used in more than one begin session method. (Session beginning request of double).
- When the session to the object existed and the server side method was processed, the same session ID was used more than once (Session continuance request of double).

#### System Action

Returns 10007 to the client.

#### User Action

Please review the processing of the client application.

### 42.2.13 2013

---

**2013:The length of code converted string exceeded the IDL definition length. Object id = (%s1) Operation id = (%s2)**

#### Variable Information

%s1 = Object Name

%s2 = Operation Name

#### Explanation

The length of the character string after code conversion exceeded the length specified in the IDL definitions.

#### System Action

Notifies the client of BAD\_PARAM system exception.

#### User Action

Specify a character string length in the IDL definitions based on the length after code conversion. Alternatively, specify a variable character string length in the definitions.

### 42.2.14 2015

---

**2015:The request failed because of too many sessions. Object id = (%s1) Operation id = (%s2)**

#### Variable Information

%s1 = Object Name

%s2 = Operation Name

#### Explanation

Too many sessions are held by the process bind service.

#### System Action

Return value 10002 is reported to clients.

#### User Action

Check whether the number of sessions held by the process bind service exceeds the number of clients connected at the same time. The number of clients is determined based on system size of the Interstage system definition file.

In addition, check whether unnecessary sessions are held in the server object under the work unit.

## 42.3 Error Messages Output from AIM Linkage (3000 to 3999)

---

This section details the logged error messages output from AIM linkage with message numbers between 3000 and 3999.

### 42.3.1 3001

---

**3001:IDCM reported an error. Object id = (%s1) Operation id = (%s2) Cause code = (0x%x1-0x%x2)**

#### Variable Information

%s1 = Object name

%s2 = Operation name

%x1 = Returned code reported by the IDCM

%x2 = Error code reported by the IDCM

#### Explanation

The IDCM service returned abnormally.

#### System Action

Returns 10001 to the client.

#### User Action

Record the return code and error code reported by the IDCM, and then contact your software supplier.

### 42.3.2 3002

---

**3002:The system received an erroneous data from the partner. Object id = (%s1) Operation id = (%s2)**

#### Variable Information

%s1 = Object name

%s2 = Operation name

#### Explanation

An unrecoverable error occurred during communication with NETSTAGE/Partner.

#### System Action

Returns 10003 to the client.

#### User Action

Contact your software supplier.

### 42.3.3 3003

---

**3003:The request ended abnormally because of a lack of resources in the partner or partner system. Object id = (%s1) Operation id = (%s2)**

#### Variable Information

%s1 = Object name

%s2 = Operation name

#### Explanation

Insufficient resources on the NETSTAGE/Partner side.

## System Action

Returns 10003 to the client.

## User Action

Determine why there are insufficient resources on the NETSTAGE/Partner side.

### 42.3.4 3004

---

**3004: The request ended abnormally because of a time-out. Object id = (%s1) Operation id = (%s2)**

#### Variable Information

%s1 = Object name

%s2 = Operation name

#### Explanation

While waiting for a response from the AIM application, a communication time observation error has occurred in either the TD or NETSTAGE/Partner.

#### System Action

Returns 10004 to the client.

#### User Action

Check if the linked AIM application is in no-response state.

### 42.3.5 3005

---

**3005: The partner is not defined, has not started, or ended abnormally. Object id = (%s1) Operation id = (%s2)**

#### Variable Information

%s1 = Object name

%s2 = Operation name

#### Explanation

NETSTAGE/Partner has either not been started, not been defined, or has terminated abnormally.

#### System Action

Returns 10003 to the client.

#### User Action

If NETSTAGE/Partner has not been started or defined, start NETSTAGE/Partner.

If NETSTAGE/Partner terminated abnormally, refer to the NETSTAGE/Partner Handbook for the appropriate actions.

### 42.3.6 3006

---

**3006: The system received a forcefully terminated data from the partner. Object id = (%s1) Operation id = (%s2) Reason code = (0x%x)**

#### Variable Information

%s1 = Object name

%s2 = Operation name

%x = Error information

## Explanation

An error was reported during communication with NETSTAGE/Partner.

## System Action

Returns 10003 to the client.

## User Action

Record the error information, and then contact your software supplier.

## 42.3.7 3007

---

**3007:The IDCM conversational connection cannot be established. Object id = (%s1) Operation id = (%s2)**

### Variable Information

%s1 = Object name

%s2 = Operation name

## Explanation

The initial conversational connections of the DPCF communication failed.

## System Action

Returns 10001 to the client.

## User Action

Reset the number for the initial conversational connections of the DPCF communication to a value greater than the number of clients performing AIM linkage. Restart the IDCM, and then restart the WorkUnit. Refer to the IDCM User's Guide for details about the number of initial conversational connections.

## 42.3.8 3008

---

**3008:The DPCF communication path is not established or is being forcibly terminated. Object id = (%s1) Operation id = (%s2)**

### Variable Information

%s1 = Object name

%s2 = Operation name

## Explanation

Either the DPCF communication is not established, is undefined, or was released during communication to NETSTAGE/Partner.

## System Action

Returns 10003 to the client.

## User Action

Check whether the DPCF communication path is established. If not, establish it. Refer to the IDCM User's Guide for details about how to establish the DPCF communication path.

If the DPCF communication path was released during linkage with NETSTAGE/Partner, check the cause of the release.

## 42.3.9 3101

---

**3101:The request ended abnormally because of an error in the partner. Object id = (%s1) Operation id = (%s2) Detail code = (0x%x)**

## Variable Information

%s1 = Object name

%s2 = Operation name

%x = Detail code

The meaning of the detail code is as follows:

00000020

The AIM application is either not started or not defined.

00000021

The AIM application has output abnormal data.

00000022

The AIM application has terminated abnormally.

00000023

The AIM application output item attributes are abnormal.

00000030

An error has occurred while converting the client input data attribute.

00000031

The AIM application function is not supported.

00000032

Partner attribute information is abnormal.

## Explanation

NETSTAGE/Partner reported an error (indicated in the detail code).

## System Action

Returns 10004 to the client.

## User Action

Take the following actions, depending on the specific detail code:

00000020

Check that the AIM application name defined in the wrapper definition `smqn` operand is valid. If the AIM application name is correct, check that the AIM application has started.

00000021

An error exists in AIM application output field data.

00000022

Determine why the AIM application terminated abnormally.

00000023

The AIM application output item attributes are different from the NETSTAGE/Partner attribute information.

Check whether the NETSTAGE/Partner attribute information and the record information is the latest. If not, transfer the attribute information to NETSTAGE/Partner using the `tdtrans` command.

00000030

Client input data contains inconvertible data.

00000031

The interface between the AIM application and NETSTAGE/Partner is invalid. Check the AIM application interface. Refer to the NETSTAGE/ Partner Handbook for details about the interface.

00000032

Partner attribute information does not exist. Transfer the attribute information to NETSTAGE/Partner using the *tdtrans* command.

## 42.3.10 3111

---

**3111:Unrecognizable data received from the partner. Object id = (%s1) Operation id = (%s2)**

### Variable Information

%s1 = Object name

%s2 = Operation name

### Explanation

An unrecoverable error was detected during communication with NETSTAGE/Partner.

### System Action

Returns 10003 to the client.

### User Action

Contact your software supplier.

## 42.3.11 3112

---

**3112:Version of the partner does not coincide with TD. Object id = (%s1) Operation id = (%s2)**

### Variable Information

%s1 = Object name

%s2 = Operation name

### Explanation

The NETSTAGE/Partner used in the AIM linkage function is not the correct version.

### System Action

Returns 10003 to the client.

### User Action

The NETSTAGE/Partner version used in the AIM linkage function may be incorrect. Use the appropriate version.

## 42.3.12 3201

---

**3201:The request ended abnormally because of an error in the protocol of the partner. Object id = (%s1) Operation id = (%s2) Detail code = (%d)**

### Variable Information

%s1 = Object name

%s2 = Operation name

%d = Error information

### Explanation

An unrecoverable error was notified by the NETSTAGE/Partner during communication.

## System Action

Returns 10003 to the client.

## User Action

Record the error information, and then contact your software supplier.

### 42.3.13 3202

---

**3202: The number of output data is different from wrapper definition. Object id = (%s1) Operation id = (%s2)**

#### Variable Information

%s1 = Object name

%s2 = Operation name

#### Explanation

The number of data items returned from the AIM application does not match the number of out or inout parameters specified in the IDL definition.

#### System Action

Returns 10003 to the client.

#### User Action

Check whether the NETSTAGE/Partner attribute information and the record information is the latest. If not, transfer the attribute information to NETSTAGE/Partner using the *tdtrans* command.

### 42.3.14 3203

---

**3203: Length error occurred in the output data. Object id = (%s1) Operation id = (%s2) Item id = (%s3)**

#### Variable Information

%s1 = Object name

%s2 = Operation name

%s3 = Parameter name

#### Explanation

The length of the output item received from the AIM application exceeded the length that can be returned to the client.

#### System Action

Returns 10003 to the client.

#### User Action

Check that the length of the output item set by the AIM application is within range.

### 42.3.15 3204

---

**3204: Value error occurred in the output data. Object id = (%s1) Operation id = (%s2) Item id = (%s3)**

#### Variable Information

%s1 = Object name

%s2 = Operation name

%s3 = Parameter name

### Explanation

The value of the output received from the AIM application for a numeric parameter is larger than the client can recognize.

### System Action

Returns 10003 to the client.

### User Action

Check that the value of output parameter set by the AIM application is within range.

## 42.3.16 3205

---

**3205:An incorrect data exists in the output data. Object id = (%s1) Operation id = (%s2) Item id = (%s3)**

### Variable Information

%s1 = Object name

%s2 = Operation name

%s3 = Parameter name

### Explanation

The data type of the output item received from the AIM application is different to that of the output parameter registered in the output attribute information.

### System Action

Returns 10003 to the client.

### User Action

Check whether the NETSTAGE/Partner attribute information and the record information is the latest. If not, transfer the attribute information to NETSTAGE/Partner using the *tdtrans* command.

## 42.3.17 3251

---

**3251:The requested information exceeds the limited value. Object id = (%s1) Operation id = (%s2)**

### Variable Information

%s1 = Object name

%s2 = Operation name

### Explanation

The total of the input data set by the client application has exceeded the maximum limit of 32Kb.

### System Action

Returns 10002 to the client.

### User Action

Check that the total of the input data set by the client is within the limit.

## 42.3.18 3252

---

**3252:The number of input data is different from wrapper definition. Object id = (%s1) Operation id = (%s2)**

### Variable Information

%s1 = Object name

%s2 = Operation name

### Explanation

The number of parameters registered in the input attribute information does not match the number of parameters of the operation requested by the client.

### System Action

Returns 10002 to the client.

### User Action

Check if the IDL definition has changed, or whether the same input attribute information has been duplicated in multiple wrapper definitions. If so, define the IDL or the wrapper correctly. Use the *tdc* command to compile the IDL, and then transfer the attribute information to NETSTAGE/Partner using the *tdtrans* command.

## 42.3.19 3253

---

**3253:Length error occurred in the input data. Object id = (%s1) Operation id = (%s2) Item id = (%s3)**

### Variable Information

%s1 = Object name

%s2 = Operation name

%s3 = Parameter name

### Explanation

The number of input characters in the char or string parameters set by the client has exceeded the number of characters that can be returned to the AIM application.

### System Action

Returns 10002 to the client.

### User Action

Refer to the wrapper definition specification to check that the number of input characters set by the client is within range.

## 42.3.20 3254

---

**3254:Value error occurred in the input data. Object id = (%s1) Operation id = (%s2) Item id = (%s3)**

### Variable Information

%s1 = Object name

%s2 = Operation name

%s3 = Parameter name

### Explanation

The input value of the numeric parameter set by the client has exceeded the maximum value that can be returned to the AIM application.

### System Action

Returns 10002 to the client.

### User Action

Refer to the wrapper definition specification to check that the input data value set by the client is within range.

## 42.3.21 3255

---

---

**3255:An incorrect data exist in the request data. Object id = (%s1) Operation id = (%s2) Item id = (%s3)****Variable Information**

%s1 = Object name

%s2 = Operation name

%s3 = Parameter name

**Explanation**

A parameter that is different from the input item registered in the input attribute information has been requested from the client.

**System Action**

Returns 10002 to the client.

**User Action**

Check if the IDL definition has changed, or whether the same input attribute information has been duplicated in multiple wrapper definitions. If so, define the IDL or the wrapper correctly. Use the *tdc* command to compile the IDL, and then transfer the attribute information to NETSTAGE/Partner using the *tdtrans* command.

---

**42.3.22 3301**

---

**3301: The request was rejected because the number of sessions exceeds the specification. Object id = (%s1) Operation id = (%s2)****Variable Information**

%s1 = Object Name

%s2 = Operation Name

**Explanation**

The number of requests from the client exceeds the maximum number of simultaneous communications sessions specified in the system environment definitions or the maximum number of sessions that can be held on the system.

**System Action**

Returns 10002 to the client.

**User Action**

Check for operational problems. If there are no operational problems, confirm that the settings for the maximum number of simultaneous sessions and the maximum number of sessions that can be held by the system are correct.

---

**42.3.23 3302**

---

**3302: The session cannot be established, or terminated abnormally. Object id = (%s1) Operation id = (%s2)****Variable Information**

%s1 = Object Name

%s2 = Operation Name

**Explanation**

The session was not established and an operation other than that specified in the Method Name to Begin Session statement in the WorkUnit definition was issued. Alternatively, the session was forcibly terminated for some reason.

**System Action**

Sends a return value 10005 to the client.

## User Action

When using the session continuation function, start the session with the operation specified in the Method Name to Begin Session statement in the WorkUnit definitions. If the session has been started, a communication time monitoring error may have occurred during session continuation or the session may have been forcibly terminated by a forced WorkUnit termination. Determine whether the client is in non-communication status or if the WorkUnit has been forcibly terminated.

# Chapter 43 Messages Output by the Interstage Management Console

This chapter describes messages in the Error Log Output by the Interstage Management Console.

## 43.1 Error Log Output by the Interstage Management Console

This section describes the error log messages collected by the Interstage Management Console.

### Output Directory

**Windows32/64**

```
C:\Interstage\gui\trc\isadmin_logon0.log  
C:\Interstage\gui\trc\isadmin_logon1.log (*1)
```

**Solaris32/64** **Linux32/64**

```
/var/opt/FJSVisgui/trc/isadmin_logon0.log  
/var/opt/FJSVisgui/trc/isadmin_logon1.log (*1)
```

\*1 This is the administration log file created when there is logging for a fixed amount.

### Output Contents

The following Interstage Management Console logs are output in the Interstage Management Console log file:

- Information on the login operation
- Information on the logout operation
- Information about timeout during logout operation

The log output format is:

```
ddd mmm DD HH:MM:SS YYYY log text
```

ddd mmm DD HH:MM:SS YYYY

Log generation time is output.

log text

Log text is output. Contents are as follows:

- If login succeeded:  
[%s1] 21064: Logon was succeed. USER=%s2
- If login failed:  
[%s1] 21065: Logon was failed. USER=%s2
- For logout:  
[%s1] 21066: Logout was successful. USER=%s2
- For timeouts:  
[%s1] 21066: Logout occurred because of a timeout. USER=%s2

The variable Information in the log text above is as follows:

Variable Information

- %s1 = Remote address
- %s2 = Login user name

The system administrator monitors the log file regularly. If there is frequent access to the same server, the system administrator can change the Web Server configuration for the Interstage Management Console so that access is only allowed from a specific Host (IP address).

## Customizing the log

The Interstage Management Console log file is customized using the following files:

**Windows32/64**

```
C:\Interstage\gui\etc\config
```

**Solaris32/64** **Linux32/64**

```
/etc/opt/FJSVisgui/config
```

Replace 'Number' in the 'Logon Trace Flag:Number' line (see Note:) with 0, 1, or 2 as described below, and then save the file:

0 The log is not output.

1 The log is output if the login fails.

2 The log is always output.

The default is 1.

### Note

Do not enter a space before or after the colon (:) in 'Logon Trace Flag:Number'.

When the config file is edited, the changes are effective for the next logon operation.

# Chapter 44 Messages Output by the Event Service

This chapter describes the messages output by the Event Service.

Log messages of the Event Service are output to the following files:

## Windows32/64

(default installation path)

C:\Interstage\ESWIN\var\ESLOG.log

## Solaris32/64

(default installation path)

/var/opt/FJSVes/ESLOG.log

## Linux32/64

/var/opt/FJSVes/ESLOG.log

The log output format is:

```
YYYY.MM.DD HH:MM:SS(nnn) log text
```

where:

- *YYYY.MM.DD HH:MM:SS* is the time the log was output.
- *nnn* is the process ID of the Event Channel that output the log.
- *Log text* is the text of the log output

### Note

When the Interstage JMS built on the notification service uses the message selector function, the messages are also output to the Event Service log files.

If you are running the IPv6 environment, the IP address of IPv4 output in the body text of the log is output as an IPv4 projection address.

Example: ": : ffff: 10.34.169.155"

For details about the setting that is operated in the IPv6 environment, refer to the Tuning Guide.

## 44.1 Log Messages of the Event Service

### Event data not queuing (queuing maxvalue over) group = %s1, channel = %s2, push supplier IP = %s3

#### Variable Information

%s1 = Group name

%s2 = Event Channel name

%s3 = IP address of the supplier who sent the event data

#### Explanation

Event data failed to be stored in the Event Channel because the number of event data items has reached the maximum number that can be stored.

#### User Action

Since some consumers have not received the event data, it is likely that the event data is stored in the Event Channel. Check whether all the consumers have received the event data and review the maximum number of event data items that can be stored in the Event Channel.

---

**Event data not queuing (consumer not connected)  
group = %s1, channel = %s2, push supplier IP = %s3**

**Variable Information**

- %s1 = Group name
- %s2 = Event Channel name
- %s3 = IP address of the supplier who sent the event data

**Explanation**

The event data failed to be stored because no consumers were connected to the Event Channel.

**User Action**

Execute event communications while the consumers are connected to the Event Channel.

---

**Event data removed (time over): group = %s1, channel = %s2, supplier IP = %s3**

**Variable Information**

- %s1 = Group name
- %s2 = Event Channel name
- %s3 = IP address of the supplier who sent the deleted event data

**Explanation**

The event data has been deleted from the Event Channel because the event data lifetime has been exceeded.

**User Action**

Since some consumers have not received the event data, it is likely that the event data is still stored in the Event Channel and that its lifetime has been exceeded. Check whether all the consumers have received the event data and review the lifetime of the event data.

---

**group = %s1, channel = %s2, unreceived consumer IP = %s3  
group = %s1, channel = %s2, unreceived consumer count = %s4**

**Variable Information**

- %s1 = Group name
- %s2 = Event Channel name
- %s3 = IP addresses of the consumers that did not receive the event data, (this is output for each consumer that did not receive the event data.)
- %s4 = Number of consumers that did not receive the event data

**Explanation**

Because the lifetime has been exceeded, the IP addresses of the consumers that did not receive the deleted event data and the number of consumers that did not receive this data are output. This is output if a value of "2" or more is specified in loglevel.

**User Action**

The cause of the error may be one of the following:

1. The receiver application terminated without recovering connection information on an EventChannel for which the automatic connection recovery function is disabled (the *esmchnl* command was executed without the -autodiscon option being specified).
2. The IJServer WorkUnit was stopped in Forced stop mode.

If none of the above applies, then there is no need to take action.

If any of the above applies, then collect connection information using the *esmonitorchnl* command.

If the first condition applies, then also follow the procedure below in the receiver application:

- If the Event Service/Notification Service is used, then check whether the disconnect method was issued and the connection information recovered before the receiver application terminated.
- If Interstage JMS is used, then check whether the Session.close or connection.close methods were issued and the connection information recovered before the receiver application terminated.

---

**data size = %s1, dump size = %s2  
string data = %s3**

#### Variable Information

%s1 = Event data size

%s2 = Size output to the log

%s3 = Send data contents

#### Explanation

Output the event data contents. This is output if a value of "3" is specified in loglevel.

The event data contents are output when the following events occur:

- event data that has exceeded its lifetime is deleted
- the event data failed to be stored in the Event Channel because the maximum number of stored items has been reached
- there are no connected consumers and the event data has not been stored in the Event Channel
- the distribution of event data in a Push model fails

---

**Environmental definition of the EventService, the limit was exceeded (%s1)  
group = %s2, channel = %s3**

#### Variable Information

%s1 = Option name

%s2 = Group name

%s3 = Event Channel name

#### Explanation

The upper limit for Event Service configuration information has been exceeded.

#### User Action

Specify a value that is within the permissible range for the Event Service configuration information using the option %s1 of *esetconf* command.

#### User Action

This error could have been caused by one of the following:

1. For an EventChannel for which the automatic connection recovery function is disabled (the *esmkchnl* command is executed without the *-autodiscon* option being specified), the receiver application terminates without the connection information being recovered.
2. The IJServer WorkUnit was stopped in Shutdown mode.

If the above does not apply, then there is no need to take action.

If the above does apply, recover unnecessary connection information using the *esmonitorchnl* command.

If 1. applies, then also follow the procedure below in the receiver application:

- When the Event Service/Notification Service is used, check whether the disconnect method was issued and the connection information recovered before the receiver application terminated.

- When Interstage JMS is used, check whether the Session.close method or connection.close method was issued and the connection information recovered before the receiver application terminated.

---

**Push error occurred(exception=%s1)  
group = %s2, channel = %s3, push supplier IP = %s4  
push consumer IP = %s5**

**Variable Information**

- %s1 = Exception information notified by CORBA Service
- %s2 = Group name
- %s3 = Event Channel name
- %s4 = IP address of the supplier who sent the event data
- %s5 = IP address of the consumer that failed to receive the event data

**Explanation**

The sending of data to a consumer by a Push model failed.

**User Action**

Refer to the exception information, eliminate the cause of the sending failure, and re-send the data.

---

**send\_multiple\_requests\_deferred error occurred(exception=%s1)**

**Variable Information**

- %s1 = Exception information notified by CORBA Service

**Explanation**

In a Push model, the sending of data to a consumer failed.

**User Action**

Refer to the exception information, eliminate the cause of the sending failure, and re-send the data.

---

**push response error(exception=%s1)**

**Variable Information**

- %s1 = Exception information notified by CORBA Service

**Explanation**

In a Push model, the sending of data to a consumer failed.

**User Action**

Refer to the exception information, eliminate the cause of the failure, and re-send the data.

---

**pull error occurred(exception=%s1)  
group = %s2, channel = %s3, pull supplier IP = %s4**

**Variable Information**

- %s1 = Exception information notified by CORBA Service
- %s2 = Group name
- %s3 = Event Channel name
- %s4 = IP address of the supplier that failed to obtain event data

**Explanation**

In a Pull model, the collection of data from a supplier failed.

## User Action

Refer to the exception information, eliminate the cause of the failure, and re-send the data.

---

**try\_pull error occurred(exception=%s1)  
group = %s2, channel = %s3, pull supplier IP = %s4**

## Variable Information

%s1 = Exception information notified by CORBA Service  
%s2 = Group name  
%s3 = Event Channel name  
%s4 = IP address of the supplier that failed to obtain the event data

## Explanation

In a Pull model, the collection of data from a supplier failed.

## User Action

Refer to the exception information, eliminate the cause of the failure, and re-send the data.

---

**Internal error occurred. %s1, %s2**

## Variable Information

%s1 = Error location  
%s2 = Detail code

## Explanation

An internal conflict occurred.

## User Action

Write down the error location and the detail code and contact the system administrator.

---

**Enough memory is not available. %s1**

## Variable Information

%s1 = Detail code

## Explanation

There is insufficient memory.

## User Action

Terminate any unnecessary programs.

---

**System function call error occurred. :Function = %s1 errno = %s2**

## Variable Information

%s1 = Function name

**Windows32/64**

%s2 = Windows® API error number

**Solaris32/64 Linux32/64**

%s2 = System call error number

## Explanation

A system error has occurred.

## User Action

Write down the function name and the detail code and contact the system administrator.

---

## **EventFactory process create error(%s1)**

### Variable Information

%s1 = Detail code

## Explanation

Activation of the channel process in the Event Factory failed.

## User Action

Re-activate the process.

---

## **Event data removed (queuing maxvalue over) group = %s1, channel = %s2, supplier IP = %s3**

### Variable Information

%s1 = Group name

%s2 = Event Channel name

%s3 = IP address of the supplier who sent the event data

## Explanation

Previously stored event data was deleted because the maximum number of storable event data items had been reached.

## User Action

Because some consumers have not received the event data, it is likely that the event data is stored in the Event Channel.

Check whether all the consumers have received the event data and review the maximum number of event data items that can be stored in the Event Channel.

---

## **Exception information : method = %s1 exception = %s2 minor = %s3 group = %s4, channel = %s5, ClientIP = %s6 pid = %s7 internalcode = %s8**

### Variable Information

%s1 = Method name

%s2 = Exception to be posted

%s3 = Minor code

%s4 = Group name

%s5 = Event Channel name

%s6 = IP address of the application that posts the exception

%s7 = Process ID

%s8 = Internal code

## Explanation

The Event Channel posted an exception to the application.

## User Action

Refer to the manuals shown below, and take whatever action is necessary to address the exception posted to the application by the Event Channel.

- When Minor code (%s3) is "0"

The explanation about the Method (%s1) is in the Reference Manual (API Edition).

- When Minor code (%s3) is a value other than "0"

Refer to the "Exception Information Reported from the Database Linkage Service" chapter of this manual.

Exceptions associated with minor codes messages are not posted to the application. They are for internal reference only and can be ignored.

---

### **pull timeout occurred : method = %s1 group = %s2, channel = %s3, ClientIP = %s4 pid = %s5**

#### Variable Information

%s1 = Method name

%s2 = Group name

%s3 = Event Channel name

%s4 = IP address of the application that posts the exception

%s5 = Process ID

#### Explanation

The channel posted an exception to the application because event data was not received within a specific time.

---

### **proxy object was automatically disconnected : group = %s1, channel = %s2, ClientIP = %s3 pid = %s4**

#### Variable Information

%s1 = Group name

%s2 = Event Channel name

%s3 = IP address of the application that posts the exception

%s4 = Process ID

#### Explanation

The connection information was disconnected because either:

- an application terminated abnormally, or
- a network error occurred.

## User Action

Rectify the source of abnormal termination of the application or the network error.

---

### **Event data was automatically rolled back : group = %s1, channel = %s2, ClientIP = %s3 pid = %s4**

#### Variable Information

%s1 = Group name

%s2 = Event Channel name

%s3 = IP address of the application that posts the exception

%s4 = Process ID

#### Explanation

The event data pulled by an application was rolled back and recovered because either:

- an application terminated abnormally, or
- a network error occurred.

#### User Action

Rectify the source of abnormal termination of the application or the network error.

---

**The size of the repository data for the EventChannel has exceeded the monitor repository data size (threshold value) : QueueCount = %s1, maxvalue = %s2, Threshold = %s3, Unblockade = %s4, Safevalue = %s5, group = %s6, channel = %s7, pid = %s8**

#### Variable Information

- %s1 = Number of the Event Channel repository data
- %s2 = Maximum number of repository data
- %s3 = Number of monitor repository data
- %s4 = Number of automatic unblock data
- %s5 = Number of monitor restart repository data
- %s6 = Group name
- %s7 = Event Channel name
- %s8 = Process ID of the Event Channel group

#### Explanation

The number of the Event Channel repository data (%s1) has changed to the Number of monitor repository data (%s3).

#### User Action

If this message is output frequently, check the Event Channel definition. After changing the Event Channel definition, restart the Event Channel.

---

**The size of the repository data for EventChannel has recovered to the size of monitor re-open repository data : QueueCount = %s1, maxvalue = %s2, Threshold = %s3, Unblockade = %s4, Safevalue = %s5, group = %s6, channel = %s7, pid = %s8**

#### Variable Information

- %s1 = Number of the Event Channel repository data
- %s2 = Maximum number of repository data
- %s3 = Number of monitor repository data
- %s4 = Number of automatic unblock data
- %s5 = Number of monitor restart repository data
- %s6 = Group name
- %s7 = Event Channel name
- %s8 = Process ID of the Event Channel group

#### Explanation

The number of the Event Channel repository data (%s1) has changed to the number of monitor restart repository data (%s5).

#### User Action

If this message is output frequently, check the Event Channel definition. After changing the Event Channel definition, restart the Event Channel.

---

**The repository data of EventChannel was destroyed after the persistent time had lapsed, and its size has recovered to that of the monitor re-open repository data : QueueCount = %s1, maxvalue = %s2, Threshold = %s3, Unblockade = %s4, Safevalue = %s5, group = %s6, channel = %s7, pid = %s8**

#### Variable Information

%s1 = Number of the Event Channel repository data  
%s2 = Maximum number of repository data  
%s3 = Number of monitor repository data  
%s4 = Number of automatic unblock data  
%s5 = Number of monitor restart repository data  
%s6 = Group name  
%s7 = Event Channel name  
%s8 = Process ID of the Event Channel group

#### Explanation

The number of the Event Channel repository data (%s1) has changed to the number of monitor restart repository data (%s5) because the persistent time of the event data has lapsed.

#### User Action

If this message is output frequently, check the Event Channel definition. After changing the Event Channel definition, restart the Event Channel.

---

**The EventChannel was blocked automatically : QueueCount = %s1, TranAddCount = %s2, maxvalue = %s3, Threshold = %s4, Unblockade = %s5, Safevalue = %s6, group = %s7, channel = %s8, pid = %s9**

#### Variable Information

%s1 = Number of the Event Channel repository data  
%s2 = Number of monitor repository data in the transaction (The number of times "push" occurs from "begin" until "commit")  
%s3 = Maximum number of repository data  
%s4 = Number of monitor repository data  
%s5 = Number of automatic unblock data  
%s6 = Number of monitor restart repository data  
%s7 = Group name  
%s8 = Event Channel name  
%s9 = Process ID of the Event Channel group

#### Explanation

Automatic block for the event channel was successful.

#### User Action

If this message is output frequently, check the Event Channel definition. After changing the Event Channel definition, restart the Event Channel.

---

**The EventChannel was blocked successfully : QueueCount = %s1, maxvalue = %s2, Threshold = %s3, Unblockade = %s4, Safevalue = %s5, group = %s6, channel = %s7, pid = %s8**

#### Variable Information

%s1 = Number of the Event Channel repository data  
%s2 = Maximum number of repository data

%s3 = Number of monitor repository data  
%s4 = Number of automatic unblock data  
%s5 = Number of monitor restart repository data  
%s6 = Group name  
%s7 = Event Channel name  
%s8 = Process ID of the Event Channel group

### Explanation

Block for the Event Channel was successful. Block was specified using the command.

---

**Automatic block of EventChannel was cancelled : QueueCount = %s1, maxvalue = %s2, Threshold = %s3, Unblockade = %s4, Safevalue = %s5, group = %s6, channel = %s7, pid = %s8**

### Variable Information

%s1 = Number of the Event Channel repository data  
%s2 = Maximum number of repository data  
%s3 = Number of monitor repository data  
%s4 = Number of automatic unblock data  
%s5 = Number of monitor restart repository data  
%s6 = Group name  
%s7 = Event Channel name  
%s8 = Process ID of the Event Channel group

### Explanation

The Event Channel was unblocked automatically.

### User Action

If this message is output frequently, check the following Event Channel definitions and take appropriate action. After changing the Event Channel definition, restart the Event Channel.

- Increase the difference between the maximum number of the repository data and the number of the automatic unblock data
- Increase the maximum number of the repository data.

---

**The repository data of EventChannel was destroyed after the persistent time had lapsed, and the block was cancelled : QueueCount = %s1, maxvalue = %s2, Threshold = %s3, Unblockade = %s4, Safevalue = %s5, group = %s6, channel = %s7, pid = %s8**

### Variable Information

%s1 = Number of the Event Channel repository data  
%s2 = Maximum number of repository data  
%s3 = Number of monitor repository data  
%s4 = Number of automatic unblock data  
%s5 = Number of monitor restart repository data  
%s6 = Group name  
%s7 = Event Channel name  
%s8 = Process ID of the Event Channel group

## Explanation

Unblock for the Event Channel was successful because the persistent time of the event data had lapsed.

## User Action

If this message is output frequently, check the following Event Channel definitions and take appropriate action. After changing the Event Channel definition, restart the Event Channel.

- Increase the difference between the maximum number of the repository data and the number of the automatic unblock data
- Increase the maximum number of the repository data.

---

**Blocking of EventChannel was successfully cancelled : QueueCount = %s1, maxvalue = %s2, Threshold = %s3, Unblockade = %s4, Safevalue = %s5, group = %s6, channel = %s7, pid = %s8**

## Variable Information

%s1 = Number of the Event Channel repository data

%s2 = Maximum number of repository data

%s3 = Number of monitor repository data

%s4 = Number of automatic unblock data

%s5 = Number of monitor restart repository data

%s6 = Group name

%s7 = Event Channel name

%s8 = Process ID of the Event Channel group

## Explanation

Unblock for the Event Channel was successful. Unblock was specified using the command.

---

**Event data removed Skip (local transaction not committed) : group = %s1, channel = %s2**

## Variable Information

%s1 = Group name

%s2 = Event Channel name

## Explanation

The lifetime of the event data has been exceeded, but the event data cannot be deleted because a transaction is in progress.

## 44.2 Log Messages of Interstage JMS

---

---

**selector error = [%s1], group = %s2, channel = %s3, IP = %s4**

## Variable Information

%s1 = Selector statement

%s2 = Group name

%s3 = Channel name

%s4 = IP address of the JMS application that sent the selector statement

## Explanation

A syntax error occurred in the specified selector statement, and registering the selector statement failed.

## User Action

Specify the correct selector statement.

According to the log message output under this log message, take the corrective action to remove the cause of the error.

---

**selector error : reason = String literals can not be specified to be comparison operator '<'.**

**Explanation**

A character string literal cannot be specified to the right of the comparison operator "<".

**User Action**

Specify a complete or approximate numeric value literal to the right of the comparison operator "<".

---

**selector error : reason = String literals can not be specified to be comparison operator '>'.**

**Explanation**

A character string literal cannot be specified to the right of the comparison operator ">".

**User Action**

Specify a complete or approximate numeric value literal to the right of the comparison operator ">".

---

**selector error : reason = String literals can not be specified to be comparison operator '<='.**

**Explanation**

A character string literal cannot be specified to the right of the comparison operator "<=".

**User Action**

Specify a complete or approximate numeric value literal to the right of the comparison operator "<=".

---

**selector error : reason = String literals can not be specified to be comparison operator '>='.**

**Explanation**

A character string literal cannot be specified to the right of the comparison operator ">=".

**User Action**

Specify a complete or approximate numeric value literal to the right of the comparison operator ">=".

---

**selector error : reason = String literals needs to be one or more characters enclosed in single quotes.**

**Explanation**

Character string literals must be enclosed with the single quotes (').

**User Action**

Enclose character string literals with single quotes (').

---

**selector error : reason = String literals can not be specified to be BETWEEN logical operator.**

**Explanation**

A character string literal cannot be specified to the right of the BETWEEN logical operator.

**User Action**

Specify a complete or approximate numeric value literal to the right of the BETWEEN logical operator.

---

**selector error : reason = Numeric values can not be specified to be LIKE comparison operator.**

**Explanation**

Neither a complete nor approximate numeric value literal can be specified to the right of the LIKE comparison operator.

#### User Action

Specify a character string literal to the right of the LIKE comparison operator.

---

**selector error : reason = Numeric values can not be specified to be IN comparison operator.**

#### Explanation

Neither a complete nor approximate numeric value literal can be specified to the right of the IN comparison operator.

#### User Action

Specify a character string literal to the right of the IN comparison operator.

---

**selector error : reason = The number of string literal exceeded maximum(256).**

#### Explanation

The number of listed character string literals of the IN comparison operator exceeded the maximum value.

#### User Action

Specify a number below the maximum value for the number of character string literals to be listed to the IN comparison operator.

---

**selector error : reason = The sum of identifiers and string literals exceeded maximum(512).**

#### Explanation

The total number of the identifiers and character string literals specified in a comparison operator exceeds the maximum value.

#### User Action

Specify the total number of the identifiers and character string literals to be specified in a comparison operator below the maximum value.

---

**selector error : reason = JMSDestination/JMSExpiration/JMSRedelivered/JMSReplyTo/JMSCorrelationIDAsBytes can not be specified to be identifier.**

#### Explanation

The JMSDestination, JMSExpiration, JMSRedelivered, JMSReplyTo, JMSCorrelationIDAsBytes cannot be specified in the selector statement.

#### User Action

Do not specify JMSDestination, JMSExpiration, JMSRedelivered, JMSReplyTo, JMSCorrelationIDAsBytes.

---

**selector error : reason = A numerical value cannot be divided by zero.**

#### Explanation

A numeric value cannot be divided by zero.

#### User Action

Do not divide the numeric value with the zero.

---

**Windows32/64**

**selector error : reason = Syntax error**

**Solaris32/64 Linux32/64**

**selector error : reason = syntax error**

#### Explanation

There is a syntax error in the selector statement.

#### User Action

Correct the syntax error in the selector statement.

---

**selector error : reason = Message selector sentence exceeded maximum(4096).**

**Explanation**

The length of the selector character strings exceeds the maximum value.

**User Action**

Specify the length of the selector character strings below the maximum value.

---

**selector error : reason = Unterminated string**

**Explanation**

A string literal has not been terminated by the single quotation mark.

**User Action**

Complete the string literal with the single quotation mark.

# Chapter 45 Messages Logged and Output in Single Sign-on

This chapter describes the messages logged and output in Single Sign-on.

## 45.1 Access Log In Single Sign-on Mode

Access log messages output during Interstage Single Sign-on operation are stored in the file specified in each environment setup of the repository server, authentication server, and business server. (\*1)

The following explains information to be recorded in the access log. Supplementary information to be recorded varies according to each server.

If the client side causes a problem, the single sign-on access log is output. If the server side causes a problem, however, only the system log is output. If a problem occurs, therefore, it is important to reference not only the single sign-on access log but also the system log.

\*1 For details of the access logs in the servers, see the following:

- Repository server:

[System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Repository server] > [Settings] tab > [Access Log Settings] on the Interstage Management Console.

- Authentication server:

[System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Authentication server] > [Settings] tab > [Access Log Settings] on the Interstage Management Console.

- Business server:

[System] > [Security] > [Single Sign-on] > [Business system] > [Business system Name] > [Settings] tab > [Access Log Settings] on the Interstage Management Console.

### 45.1.1 Access Log of the Repository Server

For the access log of a repository server, user information stored in the SSO repository is obtained and collected for user authentication requested by an authentication server.

If session management is used, the request from the client and the canceled user Forced Sign-on are recorded. The session ID for each process is also recorded.

The format and contents of the information collected are as follows:

```
authentication-server - client [date-and-time] - "user-identification"  
result-of-authentication (supplementary-information) SessionID="sessionID"
```

#### Authentication server:

The IP address of the authentication server is recorded in IPv4 or IPv6 format.

'unknown' is recorded if the authentication request is not provided from the authentication server.

#### Client:

The IP address of the client that requested authentication is recorded in IPv4 or IPv6 format.

#### Date and time:

Date and time at which the access occurred in the form of 'YYYY/MM/DD HH:MM:SS+XXXX'

'+XXXX' indicates the time difference to UTC (Universal Time Coordinate). If used, '-XXXX', also has the same meaning.

#### User identification:

Identification (dn or uid) of the user who requested authentication or was authenticated.

If the user cannot be identified, the user identification is set to 'unknown.' If the certificate indicated by certificate authentication has not been registered in the SSO repository (or if the user is not uniquely identifiable with the indicated certificate), the serial number of the certificate, issuer distinguished name, and owner distinguished name are collected.

**Result of authentication:**

The result of authentication is obtained in any of the following forms:

- When a request for authentication is made:
  - When operating a single repository server or when operating multiple repository servers in a reference system  
Authentication (authentication method) {succeeded|failed}.

One of the following is recorded for authentication method:

{basicAuth|certAuth|basicAuthAndCertAuth|unknown}

The meanings of the above authentication methods are as follows:

basicAuth	'Password Authentication'
certAuth	'Certificate Authentication'
basicAuthAndCertAuth	'Password Authentication and Certificate Authentication'
Unknown	'The authentication method cannot be determined.'

If 'Password Authentication or Certificate Authentication' was performed, the 'basicAuth' or 'certAuth' access log is recorded.

- When operating multiple repository servers in an updated system  
Modification {succeeded|failed}.
- When updating role information from Interstage Management Console:  
RoleInfoUpd {succeeded|failed}.
- When updating access control information in the following ways:
  - updating information from Interstage Management Console
  - updating information automatically on business server startup  
ResourceInfo {succeeded|failed}. (\*1)
- There was a request for a session validation check  
Session validation {succeeded|failed}.
- There was a request for user Sign-off, or the user Forced Sign-on was canceled  
Revocation {succeeded|failed}.
- There was a request for user Forced Sign-on  
Session modification {succeeded|failed}.
- There was a request to acquire information  
Information acquisition {succeeded|failed}.
- The encryption information (service ID) is updated according to the following methods:
  - Using the Interstage Management Console to update the protection resource
  - Using the Interstage Management Console to download the Business system setup file
  - Using the *ssoupsid* command to update  
Service ID update {succeeded|failed}.
- User authentication processing or the receipt of updated access control information failed  
Bad request Received {succeeded|failed}.

## Supplementary information:

Cause of an authentication failure or other supplementary information. This item is not always collected.

## SessionID:

Records the session ID.

This is only recorded if session management is used. If the session ID cannot be identified, it is recorded as 'unknown'.

\*1 This may be output more than once in some cases.

## Example

Session management is used

```
10.131.201.10 - 10.131.201.199 [2002/09/11 20:28:22 +0900] - "cn=Fujitsu
Tarou,ou=User,ou=interstage,o=fujitsu,dc=com" Authentication(basicAuth)
succeeded. SessionID="ddzWs+4zVLhd3PbPzaanr7CgITETe9qZwYoAXzRvu9NO9KBWXpasM4"
```

Session management is not used

```
10.131.201.10 - 10.131.201.199 [2002/09/11 20:28:22 +0900] - "cn=Fujitsu
Tarou,ou=User,ou=interstage,o=fujitsu,dc=com" Authentication(basicAuth)
succeeded.
```

## 45.1.1.1 Supplementary Information in the Access Log of the Repository Server

### Supplementary Information Output when the Result of Authentication is 'failed'

---

#### Abnormalities in access of SSO Repository.

##### Explanation

An error occurred in an access to the SSO repository (or "Active Directory" when Active Directory is used in the user information registration destination).

##### User Action

A message concerning the error is output in the system log. Take the action indicated by the User Action section of the message.

---

#### Access was denied by SSO Repository.

##### Explanation

The SSO repository (or "Active Directory" when Active Directory is used in the user information registration destination) rejected a connection.

##### User Action

A message concerning the error is output in the system log. Take the action indicated by the User Action section of the message.

---

#### Already locked.

##### Explanation

The user has been already locked out.

##### User Action

A user who has already been locked out made a request for authentication. Ask the user for the lockout state, and unlock the user if required. For details on unlocking users, see "Operation and Maintenance" - "User Related Operation" - "Canceling Lockout" in the Single Sign-on Operator's Guide.

---

#### Authentication of SSO Repository failed.

## Explanation

The SSO repository (or "Active Directory" when Active Directory is used in the user information registration destination) rejected authentication.

## User Action

A message concerning the error is output in the system log. Take the action indicated by the User Action section of the message.

---

### Authentication type mismatch.(no certificate)

## Explanation

Read "Active Directory" for "SSO repository" when Active Directory is used in the user information registration destination.

An error occurred for the authentication method. A possible cause of the error is as follows:

- The authentication method specified in the user information in the SSO repository requires authentication by means of a certificate, but the user did not show a certificate.

## User Action

Check the authentication method specified in the user information in the SSO repository and that specified by the user, then perform authentication using a certificate.

For the authentication method specified by the user, check "ssoAuthType" (authentication method) specified in the user information in the SSO repository.

For details on how to check Active Directory, refer to the Active Directory manual.

---

### Authentication type mismatch.(no user's ID/password)

## Explanation

Read "Active Directory" for "SSO repository" when Active Directory is used in the user information registration destination.

The authentication method specified in the user information in the SSO repository requires authentication by means of a user name and password, but the user did not provide a user name or password.

## User Action

Check the authentication method specified in the user information in the SSO repository and that specified by the user, then perform authentication by means of a user name and password.

For the authentication method specified by the user, check "ssoAuthType" (authentication method) specified in the user information in the SSO repository.

For details on how to check Active Directory, refer to the Active Directory manual.

---

### Bad request.

## Explanation

A request could not be successfully received.

## User Action

If a message concerning the error has been output in the system log, take the action indicated by the User Action section of the message.

Otherwise, check the network environment. Alternatively, a timeout may have occurred for an operation. Check that a sufficient value is specified for the client transmission timeout in the environment definition file (httpd.conf) of the Interstage HTTP Server.

For the client transmission timeout, see "Web Server (Interstage HTTP Server) Environment Definition" in the Tuning Guide.

---

### Blockaded now.

## Explanation

The Interstage Single Sign-on Repository server is currently blocked.

#### User Action

System log sso01009 is output. Take action according to [User action] in the message.

---

#### **Communication data decryption failed.**

#### Explanation

Communication data decryption failed.

#### User Action

A message concerning the error is output in the system log. Take the action indicated by the User Action section of the message.

---

#### **Connection of SSO Repository failed.**

#### Explanation

A connection to the SSO repository (or "Active Directory" when Active Directory is used in the user information registration destination) failed.

#### User Action

A message concerning the error is output in the system log. Take the action indicated by the User Action section of the message.

---

#### **Count up failure count.**

#### Explanation

Basic authentication failed and the failure count was increased.

---

#### **Count up failure count and lock out.**

#### Explanation

The user has been locked out.

#### User Action

A message concerning the error is output in the system log. Take the action indicated by the User Action section of the message.

---

#### **Creation of credential failed.**

#### Explanation

Information for authentication could not be created.

#### User Action

A message concerning the error is output in the system log. Take the action indicated by the User Action section of the message.

---

#### **Credential is incomplete.**

#### Explanation

Incomplete information was created for authentication.

#### User Action

A message concerning the error is output in the system log. Take the action indicated by the User Action section of the message.

---

#### **Credential is too large.**

#### Explanation

Information for authentication could not be created because the information for authentication exceeds the maximum permitted length.

#### User Action

A message concerning the error is output in the system log. Take the action indicated by the User Action section of the message.

---

### Encryption of a response data failed.

#### Explanation

Data to be sent could not be encrypted.

#### User Action

A message concerning the error is output in the system log. Take the action indicated by the User Action section of the message.

---

### Error in definition of SSO Repository.

#### Explanation

The SSO repository (or "Active Directory" when Active Directory is used in the user information registration destination) contains an incorrect definition.

#### User Action

A message concerning the error is output in the system log. Take the action indicated by the User Action section of the message.

---

### Error in user's information.

#### Explanation

The SSO repository (or "Active Directory" when Active Directory is used in the user information registration destination) contains an incorrect registration.

#### User Action

A message concerning the error is output in the system log. Take the action indicated by the User Action section of the message.

---

### Failed to resolve the Hostname.

#### Explanation

Failed to resolve the hostname of the Interstage Single Sign-on session management server.

#### User Action

A message concerning the error is output in the system log. Take the action indicated by the User Action section of the message.

---

### Internal error.

#### Explanation

An internal error occurred.

#### User Action

A message concerning the error is output in the system log. Take the action indicated by the User Action section of the message.

---

### Invalid request was received.

#### Explanation

An invalid request was received by the Interstage Single Sign-on Repository server. An Interstage Single Sign-on Authentication server with different settings or of a different version is running.

#### User Action

A message concerning the error is output in the system log. Take the action indicated by the User Action section of the message.

---

### Invalid response was received.

#### Explanation

An invalid response was received by the Interstage Single Sign-on repository server. Possible causes are as follows:

- A session management server with different settings or of a different version is running.
- A connection was made with a session management server with a different Authentication infrastructure.
- The repository server environment is corrupted.

#### User Action

A message concerning the error is output in the system log. Take the action indicated by the User Action section of the message.

---

#### **Locked out.**

##### Explanation

The user has been locked out.

##### User Action

A message concerning the error is output in the system log. Take the action indicated by the User Action section of the message.

---

#### **Network resources are insufficient.**

##### Explanation

Network resources are insufficient.

##### User Action

A message concerning the error is output in the system log. Take the action indicated by the User Action section of the message.

---

#### **No entry for reference into certificate.**

##### Explanation

A certificate includes no user identification information.

##### User Action

Check that the certificate includes the [Attributes used for Authentication] setting specified in the authentication server. If the certificate does not include [Attributes used for Authentication], ask the user to obtain the certificate again, if necessary.

For [Attributes used for Authentication], select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Authentication server] on the Interstage Management Console, click [Detailed Settings [Show]] on the [Settings] tab, then check [Certificate Authentication Settings].

---

#### **Path configuration is incorrect.**

##### Explanation

The contents registered for the SSO repository path configuration are incorrect.

##### User Action

A message concerning the error is output in the system log. Take the action indicated by the User Action section of the message.

---

#### **Processing was skipped because of the session status.**

##### Explanation

The session cannot receive requests.

---

#### **Required request item does not exist.**

##### Explanation

Information required for authentication is missing. There is also a possibility that the user ID contains illegal characters.

##### User Action

Take any of the following measures:

- Specify a certificate, correct user ID, or correct password.
- Use characters that are valid for the SSO repository (or "Active Directory" when Active Directory is used in the user information registration destination) user information 'uid' user ID attribute for the user ID entered in the Web browser.

For details about character types that are valid for the SSO repository user information, refer to 'Environment Setup (SSO Administrator)' - 'Repository server Setup' - 'Registering User Information and Role Configuration in the SSO Repository' - 'User Information Entry' in the 'Single Sign-on Operator's Guide'.

For details on how to check Active Directory, refer to the Active Directory manual.

---

### **Session expired.**

#### **Explanation**

The session has expired.

---

### **Session timed out.**

#### **Explanation**

A timeout occurred in Idle Monitoring.

---

### **Setting of role is incorrect.**

#### **Explanation**

There is an error in the role information for the SSO repository.

#### **User Action**

A message concerning the error is output in the system log. Take the action indicated by the User Action section of the message.

---

### **SSO Session management server connection failed.**

#### **Explanation**

The connection with the Interstage Single Sign-on session management server failed.

#### **User Action**

A message concerning the error is output in the system log. Take the action indicated by the User Action section of the message.

---

### **The system error occurred in the SSO Session management server.**

#### **Explanation**

A system error occurred in the Interstage Single Sign-on session management server.

#### **User Action**

A message concerning the error is output in the system log. Take the action indicated by the User Action section of the message.

---

### **The user ID is already signed on.**

#### **Explanation**

The user can only run one session at a time.

---

### **Timeout occurred in SSO Repository.**

#### **Explanation**

A timeout occurred in an access to the SSO repository (or "Active Directory" when Active Directory is used in the user information registration destination).

#### **User Action**

A message concerning the error is output in the system log. Take the action indicated by the User Action section of the message.

---

## User entry can not be specified.

### Explanation

Read "Active Directory" for "SSO repository" when Active Directory is used in the user information registration destination.

Information about an SSO repository user could not be identified. Possible causes of the error are as follows:

- Registration of the entered user identification (user ID) has been duplicated in the SSO repository.
- The certificate the user indicated includes the [Attributes used for Authentication] setting for which registration has been duplicated in the SSO repository.
- The entry identified by the user ID that the user entered does not match the entry identified by the [Attributes used for Authentication] setting included in the certificate the user indicated in the SSO repository.

### User Action

Take any of the following measures:

- Check that the identification (user ID) the user entered is unique in the SSO repository. If the identification (user ID) is not unique, modify it to make it unique in the SSO repository. (\*1) (\*3)
- Check that the [Attributes used for Authentication] setting included in the certificate indicated by the user is unique in the SSO repository. (\*1) (\*2) (\*3)

If the [Attributes used for Authentication] setting is not unique, modify it to make it unique in the SSO repository.

- Check that the user ID entered by the user and the [Attributes used for Authentication] setting included in the certificate indicated by the user are for an identical user. (\*1) (\*2) (\*3)

\*1 For details on registering user information in the SSO repository, see 'Environment Setup(SSO Administrators)' - 'Repository Server Setup' - 'Registering User Information and Role Definition in the SSO Repository' in the Single Sign-on Operator's Guide.

\*2 For [Attributes Used for Authentication], select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Authentication server] on the Interstage Management Console. Click [Detailed Settings [Show]] on the [Settings] tab, then check [Certificate Authentication Settings].

\*3 For details on how to check Active Directory, refer to the Active Directory manual.

---

## User entry not found.

### Explanation

No entry could be found for the user in the SSO repository (or "Active Directory" when Active Directory is used in the user information registration destination).

### User Action

Check the registration details in the SSO repository (or "Active Directory" when Active Directory is used in the user information registration destination). Also, check that the data in the SSO repository of the repository server (update system) matches that of the repository server (reference system).

---

## User is invalid.

### Explanation

Read "Active Directory" for "SSO repository" when Active Directory is used in the user information registration destination.

The date and time at which a user attempted to perform authentication is earlier than the beginning of the valid term of the user information registered in the SSO repository. Alternatively, the valid term of authentication by the user has already expired.

### User Action

Check the valid term of authentication specified in the user information in the SSO repository. Identify the user and change the valid term of authentication, if necessary.

For details on checking or changing the user validity period, see 'Operation and Maintenance' - 'User Related Operation' - 'Checking and Changing User Validity Period' in the Single Sign-on Operator's Guide.

For details on how to check Active Directory, refer to the Active Directory manual.

---

### User's certificate not supported.

#### Explanation

The form of a certificate is incorrect.

#### User Action

Identify the user according to the client IP address in the access log, and then check for the certificate.

---

### Violation request of specification.

#### Explanation

An invalid request was received.

#### User Action

A message concerning the error is output in the system log. Take the action indicated by the User Action section of the message.

---

### No supplementary information

#### Explanation

Read "Active Directory" for "SSO repository" when Active Directory is used in the user information registration destination.

Possible causes are as follows:

- The identification (user ID) or password entered by the user was incorrect.
- Registration of the identification (user ID) entered by the user was duplicated in the SSO repository.
- Although the user entered a user ID and password, the user information corresponding to the user ID has no value specified in the password attribute 'userPassword' in the SSO repository.
- The [Attributes Used for Authentication] setting included in the certificate indicated by the user has not been registered in the user information in the SSO repository.
- The [User Information Registration Entry] setting has not been specified correctly.
- The object class 'ssoUser' might not have been specified when user information was set in the SSO repository.
- The certificate indicated by the user is different from that registered in the SSO Repository.

#### User Action

Take any of the following measures:

- Specify the correct user ID and password.
- Check that the user ID output to the access log has been registered in the SSO repository user information and is unique. (\*4)
- Check that a value of the password attribute 'userPassword' has been specified in the user information corresponding to the user ID entered by the user in the SSO repository. (\*3) (\*4)
- Check that the [Attributes Used for Authentication] setting included in the certificate indicated by the user has been registered in the user information in the SSO repository. (\*1) (\*4)
- When the user information has been registered in the SSO repository, check that the [User Information Registration Entry] setting has been specified correctly in the SSO repository. (\*2)
- Check that the object class 'ssoUser' was specified when user information was set in the SSO repository. (\*3) (\*4)
- Check that any valid certificate has been registered in the SSO repository or the certificate indicated by the user matches the certificate registered in the SSO repository.

\*1 For [Attributes used for Authentication], select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Authentication server] on the Interstage Management Console. Click [Detailed Settings [Show]] on the [Settings] tab, then check [Certificate Authentication Settings].

\*2 For [User Information Registration Entry], select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Repository server] or [Repository server (reference system)] on the Interstage Management Console. Click [Repository server detailed settings [Show]] or [Detailed Settings [Show]] on the [Settings] tab, then check [Repository].

\*3 For details on registering user information in the SSO repository, see 'Environment Setup (SSO Administrators)' - 'Repository Server Setup' - 'Registering User Information and Role Definition in the SSO Repository' in the Single Sign-on Operator's Guide.

\*4 For details on how to check Active Directory, refer to the Active Directory manual.

---

## Supplementary Information Output when the Result of Authentication is 'succeeded'

---

### Already locked.

#### Explanation

The user has been already locked out.

#### User Action

A user who has been already locked out made a request for authentication. Ask the user for their lockout state, then unlock the user if required. For details on unlocking users, see 'Operation and Maintenance' - 'User Related Operation' - 'Canceling Lockout' in the Single Sign-on Operator's Guide.

Note that this message is output to the repository (update system).

---

### Count up failure count.

#### Explanation

The number of authentication failures for user status or user name/password in the user information in the SSO repository (or "Active Directory" when Active Directory is used in the user information registration destination) was increased by 1.

This message is output to the repository server (update system).

---

### Count up failure count and lock out.

#### Explanation

The user has been locked out.

#### User Action

A message concerning the error is output in the system log. Take the action indicated by the User Action section of the message.

---

### No necessity to reset.

#### Explanation

The number of authentication failures for user status or user name/password in the user information in the SSO repository (or "Active Directory" when Active Directory is used in the user information registration destination) was not reset. Possible causes of the error are as follows:

- The user has not been locked out, so the number of authentication failures for user name/password was not recorded.
- Authentication was performed using a certificate.

---

### Redirect to xxx. (\*1)

#### Explanation

Redirection occurred because Sign-on was performed on the other machine.

\*1 xxx records the host name or IP address of the machine that you are redirected to.

---

### Reset user status.

## Explanation

The number of authentication failures for user status or user name/password in the user information in the SSO repository (or "Active Directory" when Active Directory is used in the user information registration destination) was reset.

---

## Session expired.

### Explanation

The session has expired.

---

## 45.1.2 Access Log of the Authentication Server

The results of authentication requested of a repository server are collected for user authentication requested by a business server and sent to the access log of an authentication server.

If session management is used, the request from the client and the canceled user Forced Sign-on are recorded. The session ID for each process is also recorded.

When multiple authentication servers are in use for load balancing, a load balancer setting may distribute access logs to other servers.

The format and contents of the information collected are as follows:

```
client - business-server - repository-server [date-and-time] - "user-identification" result-of-authentication (supplementary-information) SessionID="sessionID"
```

### Client:

The IP address of the client that requested authentication is recorded in IPv4 or IPv6 format.

### Business server:

The FQDN or IP address of the business server from which the authentication request was issued is recorded in IPv4 or IPv6 format.

If the authentication request was issued from Interstage Portalworks, a character string 'SSO-JavaAPI' is recorded. For such an authentication request, the FQDN or IP address of the computer running the application is recorded in IPv4 or IPv6 format.

'unknown' is recorded if the authentication request generation source cannot be determined.

### Repository server:

The IP address of the repository server that requested authentication is recorded in IPv4 or IPv6 format. When a repository server (update system) and a repository server (reference system) are in use for load balancing, the IP address of the repository server (reference system) is obtained.

'unknown' is recorded if the repository server is not requested to perform authentication processing.

### Date and time:

Date and time at which the access was made in the form of 'YYYY/MM/DD HH:MM:SS+XXXX'

'+XXXX' indicates the time difference to UTC (Universal Time Coordinate). If used, '-XXXX', also has the same meaning

### User identification:

Identification (dn or uid) of the user who requested authentication or was authenticated.

If the user cannot be identified, the user identification is set to 'unknown.' If the certificate indicated by certificate authentication has not been registered in the SSO repository (or if the user is not uniquely identifiable with the indicated certificate), the serial number of the certificate, issuer distinguished name, and owner distinguished name are collected.

### Result of authentication:

The result of authentication is obtained in any of the following forms:

- When a request for authentication is made by a business server:  
Authentication (authentication method) {succeeded|failed}.

One of the following is recorded for authentication method:

{basicAuth|certAuth|basicAuthAndCertAuth|unknown}

The meanings of the above authentication methods are as follows:

basicAuth	"Password Authentication"
certAuth	"Certificate Authentication"
basicAuthAndCertAuth	"Password Authentication and Certificate Authentication"
Unknown	"The authentication method cannot be determined."

If "password authentication or certificate authentication" was performed, the "basicAuth" or "certAuth" access log is recorded.

- Session management is used, and access control information is automatically updated when the Business server is started:  
ResourceInfo {succeeded|failed}.
- There was a request for a session validation check:  
Session validation {succeeded|failed}.
- There was a request from the user for notification of the time of the previous Sign-on:  
Last sign-on time {succeeded|failed}.
- There was a request from the user for Sign-off:  
Revocation {succeeded |processing|failed}.

### Supplementary information:

Cause of an authentication failure or other supplementary information. This item is not always collected.

### SessionID:

Records the session ID.

This is only recorded if session management is used. If the session ID cannot be identified, it is recorded as 'unknown'.

### Example

Session management is used

```
10.131.201.199 - 10.131.201.34 - 10.131.201.88 [2002/09/11 20:28:22 +0900]
- "cn=Fujitsu Tarou,ou=User,ou=interstage,o=fujitsu,dc=com" Session
validation succeeded. SessionID="JvuX1EwSEoRfk2bs7dGdRSj8kRI"
```

Session management is not used

```
10.131.201.199 - 10.131.201.34 - 10.131.201.88 [2002/09/11 20:28:22 +0900]
- "cn=Fujitsu Tarou, ou=User,ou=interstage,o=fujitsu,dc=com"
Authentication(basicAuth) failed. (Authentication by ID and password is required)
```

## 45.1.2.1 Supplementary Information in the Access Log of the Authentication Server

### Supplementary Information Output when the Result of Authentication is 'failed'

#### Access-token disagreement.

##### Explanation

The authentication information presented from the Business server is out of date. For this reason, the latest authentication information was returned.

#### Already authenticated.

## Explanation

Possible causes of this error are as follows:

- A browser that is already authenticated was used to access the form authentication page directly.
- The system times of the business server, authentication server, and repository server may not have been synchronized.

## User Action

Take any of the following measures:

- Access the protection resource directly.
- To perform user authentication with another user ID/password, close your browser, reenter a user ID/password, and then perform user authentication again.
- Synchronize the system times of the business server, authentication server, and repository server.

---

## Authentication by certificate is required.

### Explanation

Read "Active Directory" for "SSO repository" when Active Directory is used in the user information registration destination.

Authentication needs to be performed by means of a certificate. Possible causes of the error are as follows:

- Authentication by means of a certificate was required, but the user did not indicate any certificate.
- If the user indicated a proper certificate, possible causes of the error are as follows:
  - User information could not be identified in the SSO repository from the certificate indicated by the user.
  - The object class 'ssoUser' may not have been specified when user information was set in the SSO repository.
  - The certificate indicated by the user differs from that registered in the SSO Repository.

### User Action

Take any of the following measures:

- If the user did not indicate a certificate:
  - Close the browser, restart it, and then select a certificate. If a proper certificate has not been registered in the browser, obtain and register it.
- If the user indicated a proper certificate:
  - Check that the [Attributes used for Authentication] setting included in the certificate indicated by the user is unique in the SSO repository. (\*1) If the [Attributes used for Authentication] setting is not unique, modify the user information to make it unique in the SSO repository. (\*3)
  - Check that the object class 'ssoUser' was specified when user information was set in the SSO repository. (\*2) (\*3)
  - Check that any valid certificate has been registered in the SSO repository or the certificate indicated by the user matches a certificate registered in the SSO repository.

\*1 For [Attributes Used for Authentication], select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Authentication server] on the Interstage Management Console. Click [Detailed Settings [Show]] on the [Settings] tab, then check [Certificate Authentication Settings].

\*2 For details on how to register user information in the SSO repository, see 'Environment Setup (SSO Administrators)' - 'Repository Server Setup' - 'Registering User Information and Role Definition in the SSO Repository' in the Single Sign-on Operator's Guide.

\*3 For details on how to check Active Directory, refer to the Active Directory manual.

---

## Authentication by ID and password is required.

### Explanation

Read "Active Directory" for "SSO repository" when Active Directory is used in the user information registration destination.

Authentication by means of a user ID/password is required. Possible causes of this error are as follows:

- Authentication failed with the certificate indicated by the user. Alternatively, the certificate indicated by the user includes a [Attributes used for Authentication] setting for which registration has been duplicated in the SSO repository. (\*1)
- Although certificate authentication has been performed successfully, basic authentication is also required.
- The specified user ID or password is incorrect. Alternatively, registration of the user ID that the user entered has been duplicated in the SSO repository.
- The user ID contains illegal characters.
- No password corresponding to the user ID that the user entered has been specified in the user information in the SSO repository.
- The entry identified by the user ID that the user entered does not match the entry identified by the [Attributes used for Authentication] setting included in the certificate indicated by the user in the SSO repository. (\*1)
- The [User Information Registration Entry] setting has been incorrectly specified. (\*2)
- The object class 'ssoUser' might not have been specified when user information was set in the SSO repository.
- The certificate indicated by the user is different from that registered in the SSO Repository.

## User Action

If this message is displayed although the user specified the correct certificate or user ID/password, take the following action:

- Check that the [Attributes used for Authentication] setting included in the certificate indicated by the user is unique in the SSO repository. (\*1)  
If the [Attributes used for Authentication] setting is not unique, modify it to make it unique in the SSO repository. (\*5)
- Make a basic authentication, if necessary.
- Check that the identification that the user entered (user ID) is unique in the SSO repository. If the user ID is not unique, modify it in the user information in the SSO repository. (\*5)
- Use characters that can be set in the SSO repository user information 'uid' user ID attribute for the user ID entered in the Web browser. (\*4)
- Check that a value of the password attribute 'userPassword' has been specified in the user information corresponding to the user ID that the user entered in the SSO repository. (\*3) (\*5)
- Check that the user ID that the user entered and the [Attributes used for Authentication] setting included in the certificate indicated by the user are of an identical user. (\*1)
- When user information has been registered in the SSO repository, check that the [User Information Registration Entry] setting has been specified correctly in the SSO repository. (\*2)
- Check that the object class 'ssoUser' was specified when user information was set in the SSO repository. (\*3) (\*5)
- Check that a valid certificate has been registered in the SSO repository or the certificate indicated by the user matches a certificate registered in the SSO repository.

\*1 For [Attributes used for Authentication], select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Authentication server] on the Interstage Management Console. Click [Detailed Settings [Show]] on the [Settings] tab, then check [Certificate Authentication Settings].

\*2 For [User Information Registration Entry], select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Repository server] or [Repository server (reference system)] on the Interstage Management Console. Click [Repository server detailed settings [Show]] or [Detailed Settings [Show]] on the [Settings] tab, then check [Repository].

\*3 For details on how to register user information in the SSO repository, see 'Environment Setup (SSO Administrators)' - 'Repository Server Setup' - 'Registering User Information and Role Definition in the SSO Repository' in the Single Sign-on Operator's Guide.

\*4 For details about character types that can be set in the SSO repository user information, refer to 'Environment Setup (SSO Administrator)' - 'Repository Sserver Setup' - 'Registering User Information and Role Configuration in the SSO Repository' - 'User Information Entry' in the 'Single Sign-on Operator's Guide'.

\*5 For details on how to check Active Directory, refer to the Active Directory manual.

---

## Authentication is processing.

### Explanation

A protection resource was accessed during the period from when a form authentication page was displayed on the Web browser to when authentication terminated.

### User Action

- If user authentication is being performed with another Web browser frame, perform user authentication with that frame and then access the protection resource again.
- If user authentication is not being performed with another Web browser frame, access the form authentication page directly and perform user authentication.

---

## Authentication required.

### Explanation

A request for re-authentication from the Interstage Single Sign-on business server was received.

### User Action

Enter the user ID and password, then perform re-authentication.

---

## Authentication type mismatch.(no certificate)

### Explanation

Read "Active Directory" for "SSO repository" when Active Directory is used in the user information registration destination.

An error occurred for the authentication method. A possible cause of the error is as follows:

- The authentication method specified in the user information in the SSO repository requires authentication by means of a certificate, but the user did not show any certificate.

### User Action

Check for the authentication method specified in the user information in the SSO repository and that specified by the user, then perform authentication by means of a certificate.

For the authentication method specified by the user, check 'ssoAuthType' (authentication method) specified in the user information of the SSO repository.

For details on how to check Active Directory, refer to the Active Directory manual.

---

## Authentication type mismatch.(no user's ID/password)

### Explanation

Read "Active Directory" for "SSO repository" when Active Directory is used in the user information registration destination.

Although the authentication method specified in the user information in the SSO repository requires authentication by means of a user name and password, the user did not show a user name or password.

### User Action

Check for the authentication method specified in the user information in the SSO repository and that specified by the user, then perform authentication by means of a user name and password. (\*1) (\*2) (\*3)

\*1 For the authentication method specified by the user, check 'ssoAuthType' (authentication method) specified in the user information of the SSO repository.

\*2 When 'basicAuthAndCertAuth' has been set to 'ssoAuthType' in the user information in the SSO repository, this message is always recorded in the access log for the operation. No user action is required for this message.

\*3 For details on how to check Active Directory, refer to the Active Directory manual.

---

## Credential can not be decrypted.

## Explanation

Information for authentication could not be decrypted. Possible causes of the error are as follows:

- An error occurred in communication between the client and the Interstage Single Sign-on authentication server.
- There is an Interstage Single Sign-on business server communicating with a different Authentication infrastructure.
- An external breach may have occurred.

## User Action

Take any of the following measures:

- There may be a communication path problem. Ask the network administrator to check that the environment has been secured for communication between the client and the authentication server.
- Check that there is no Interstage Single Sign-on business server communicating with a different Authentication infrastructure. If there is, ask the administrator of the business server to check the information about the Authentication infrastructure on the business server. (\*1)

If a setting problem is detected, ask the administrator to rebuild the business server. (\*2)

- Check for the possibility of an external attack.

\*1 For [Information about Authentication Infrastructure], select [System] > [Security] > [Single Sign-on] > [Business system] > [Business system Name] on the Interstage Management Console. Click [Detailed Settings [Show]] on the [Settings] tab, then check [Authentication infrastructure URL] for [Authentication Infrastructure Information Settings].

\*2 To rebuild an business server, select [System] > [Security] > [Single Sign-on] > [Business system] on the Interstage Management Console, delete the business server on the [List] tab, then add the business server again on the [Addition of Business server] tab.

---

## Credential is invalid.

### Explanation

Information for authentication is invalid.

### User Action

Enter the user ID and password, then perform re-authentication.

---

## Credential is not found.

### Explanation

Sign-off may not be complete because the authentication information does not exist. Possible causes of the error are as follows:

- The upper limit for cookies that can be kept in the Web browser was exceeded, so a cookie or cookies required for Interstage Single Sign-on processing may have been deleted.

### User Action

Take any of the following measures:

- Close the Web browser. If more than one Web browser is running, close all of them.
- Check whether there is a large number of cookies being issued by applications operating with the same host name or domain as the authentication server, and if there are, either reduce the number of cookies being issued, or use a different host name or domain to that of the authentication server.

---

## Credential is too large.

### Explanation

Generation of the authentication information failed because the size of the authentication information reached the upper limit.

### User Action

A message concerning the error is output in the system log. Take the action indicated by the User Action of the message.

---

### **Error is in user information.**

#### **Explanation**

The user information in the SSO repository (or "Active Directory" when Active Directory is used in the user information registration destination) contains a value that is not permitted.

#### **User Action**

Check the user information values in the SSO repository (or "Active Directory" when Active Directory is used in the user information registration destination).

---

### **Failed to decrypt the request data.**

#### **Explanation**

Failed to decrypt the request data.

#### **User Action**

A message concerning the error is output in the system log. Take the action indicated by the User Action of the message.

---

### **Forced Sign-on request was canceled.**

#### **Explanation**

The user canceled the Forced Sign-on request.

---

### **Information for the client connection is not the same.**

#### **Explanation**

The client IP address and the IP address recorded in the request data are not the same.

#### **User Action**

Re-execute the Sign-on operation.

---

### **Internal error.**

#### **Explanation**

An internal error occurred.

#### **User Action**

A message concerning the error is output in the system log. Take the action indicated by the User Action of the message.

---

### **Internal error occurred in repository server.**

#### **Explanation**

An internal error occurred in the Interstage Single Sign-on repository server.

#### **User Action**

Check the access log and system log of the Interstage Single Sign-on repository server with the "IP address of the repository server" indicated in the access log, then take the action indicated by the description in the logs.

---

### **No entry for reference into certificate.**

#### **Explanation**

A certificate includes no information for identifying a user.

#### **User Action**

Check that the certificate includes the [Attributes used for Authentication] setting specified in the authentication server.

If the certificate does not include [Attributes used for Authentication], ask the user to obtain the certificate again, if necessary.

For [Attributes used for Authentication], select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Authentication server] on the Interstage Management Console. Click [Detailed Settings [Show]] on the [Settings] tab, then check [Certificate Authentication Settings].

---

### Pre Sign-on application failed.

#### Explanation

Authentication processing in Integrated Windows Authentication failed.

#### User Action

Check the SSO repository and Active Directory association again. For details, refer to the appendix "Configuring Single Sign-on to link with Active Directory" in the Single Sign-on Operator's Guide.

If there are no problems with the above settings, refer to the repository server access log.

---

### Pre Sign-on application was called.

#### Explanation

A protection resource or Authentication infrastructure URL was accessed during the Integrated Windows Authentication operation, so the Integrated Windows Authentication servlet was called again.

---

### Query about forced Sign-on.

#### Explanation

While the user was making a Forced Sign-on query, an attempt was made to access the protection resource. For this reason, the user received another Forced Sign-on query.

---

### Reload detected.

#### Explanation

Possible causes of the error are as follows:

- The reload command was detected on the browser and a request for re-authentication was made.
- If the Basic Authentication dialog for password authentication is canceled in Internet Explorer, authentication fails because the Basic Authentication dialog is displayed continuously.

#### User Action

Take any of the following actions:

- Enter the user ID and password, then perform re-authentication.
- Re-enter the correct user ID/password in the Basic Authentication dialog, and re-execute authentication.

---

### Request data is broken.

#### Explanation

Corrupted request data was received.

#### User Action

A message concerning the error is output in the system log. Take the action indicated by the User Action of the message.

---

### Request data was invalid.

#### Explanation

Failed to interpret the request data.

#### User Action

A message concerning the error is output in the system log. Take the action indicated by the User Action of the message.

---

**Session expired.****Explanation**

The session has expired.

**User Action**

Re-execute the Sign-on operation.

---

**Session information is in another location.****Explanation**

Redirection occurred because Sign-on was performed on another machine.

---

**Session information was not found.****Explanation**

The session information does not exist, so Sign-off could not continue.

**User Action**

If a message is output to the Web browser, take action according to the message.

---

**Session timed out.****Explanation**

A timeout occurred in Idle Monitoring.

**User Action**

Re-execute the Sign-on operation.

---

**Sign-off was canceled.****Explanation**

The user selected to cancel the Sign-off request in the Sign-off query window.

---

**Sign-on was not performed.****Explanation**

Sign-on was not performed, so the requested operation was not performed.

**User Action**

Sign on if necessary.

---

**The user ID is already signed on.****Explanation**

The user can only sign on to one session at a time.

**User Action**

Take the following action:

- If the user ID was already authenticated in another browser, sign off in the browser.
  - If the user ID was not authenticated in another browser, contact the Business server administrator.
- 

**Time limit of credential is over.**

## Explanation

Read "Active Directory" for "SSO repository" when Active Directory is used in the user information registration destination.

Possible causes of the error are as follows:

- The time duration specified in the re-authentication interval has expired.
- The user information in the SSO repository has already expired.

## User Action

Take any of the following measures:

- Enter the user ID and password, then perform re-authentication.
- Check for the valid term of authentication specified in the user information in the SSO repository. Identify the user and change the valid term of authentication, if necessary.

For details on checking or changing the valid term of a user, see "Operation and Maintenance" - "User Related Operation" - "Checking and Changing User Validity Period" in the Single Sign-on Operator's Guide.

For details on how to check Active Directory, refer to the Active Directory manual.

---

## User certificate has expired.

### Explanation

The certificate has expired.

### User Action

The SSO administrator identifies the owner of the expired certificate based on the user ID information, and takes the following action if necessary.

1. Re-obtains the user certificate.
2. Registers the user certificate in the SSO repository (or "Active Directory" when Active Directory is used in the user information registration destination).
3. Issues a new certificate to the user, and instructs the user to register the certificate in the user Web browser.

---

## User entry can not be specified.

### Explanation

Read "Active Directory" for "SSO repository" when Active Directory is used in the user information registration destination.

Information about a user of the SSO repository could not be identified. Possible causes of the error are as follows:

- Registration of the user ID entered by the user has been duplicated in the SSO repository.
- The certificate indicated by the user includes the [Attributes used for Authentication] setting registered twice in the SSO repository.
- The entry identified by the user ID that the user entered does not match the entry identified by the [Attributes used for Authentication] setting included in the certificate indicated by the user in the SSO repository.

### User Action

Take any of the following measures:

- Check that the identification (user ID) that the user entered is unique in the SSO repository. If the identification (user ID) is not unique, modify it to make it unique in the SSO repository. (\*1) (\*3)
- Check that the [Attributes used for Authentication] setting included in the certificate indicated by the user is unique in the SSO repository. (\*1) (\*2) (\*3)

If the [Attributes used for Authentication] setting is not unique, modify it to make it unique in the SSO repository.

- Check that the user ID that the user entered and the [Attributes used for Authentication] setting included in the certificate indicated by the user are of an identical user. (\*1) (\*2) (\*3)

\*1 For details on registering user information in the SSO repository, see 'Environment Setup (SSO Administrators)' - 'Repository Server Setup' - 'Registering User Information and Role Definition in the SSO Repository' in the Single Sign-on Operator's Guide.

\*2 For [Attributes used for Authentication], select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Authentication server] on the Interstage Management Console. Click [Detailed Settings [Show]] on the [Settings] tab, then check [Certificate Authentication Settings].

\*3 For details on how to check Active Directory, refer to the Active Directory manual.

---

### User ID and password do not exist.

#### Explanation

The user ID/password has not been entered.

This message is output if the authentication operation is aborted, or the user ID/password or certificate is not presented.

For password authentication, the browser prompts the Authentication server to enter the user ID/password at the time of the first access. The message is also output at this time.

It is also output when applications using JAAS (Single Sign-on JavaAPI) receive confirmation of access to the Authentication server before sending the user ID/password.

#### User Action

Sign on again with the correct User ID/password pair.

If the 'SSO-JavaAPI' string is recorded as the Business server IP address, it means there is access for consecutive authentication. If authentication access is not recorded, it might cause problems to occur in applications using JAAS. Ask the administrator of the Business server recorded as the client IP address to investigate.

---

### User is invalid.

#### Explanation

Read "Active Directory" for "SSO repository" when Active Directory is used in the user information registration destination.

The date and time at which a user attempted to perform authentication is earlier than the beginning of the valid term of the user information registered in the SSO repository or the valid term of user authentication has already expired.

#### User Action

Check for the valid term of authentication specified in the user information in the SSO repository. Identify the user and change the valid term of authentication, if necessary.

For details on checking or changing the valid term of a user, see "Operation and Maintenance" - "User Related Operation" - "Checking and Changing User Validity Period" in the Single Sign-on Operator's Guide.

For details on how to check Active Directory, refer to the Active Directory manual.

---

### User's certificate is revoked.

#### Explanation

The certificate is no longer in effect.

#### User Action

The SSO administrator needs to identify the owner of the certificate according to the user identification information, then take the following steps if necessary:

1. Obtain a certificate for the user.
2. Register the certificate for the user in the SSO repository (or "Active Directory" when Active Directory is used in the user information registration destination).
3. Deliver the certificate to the user, then instruct the user to register it in the Web browser being used.

---

### User's certificate not supported.

## Explanation

The form of a certificate is incorrect.

## User Action

Identify the user according to the "client IP address" in the access log, then check for the certificate.

---

## User's ID/password and certificate do not exist.

### Explanation

Neither the certificate nor the user ID/password was available.

This is output if an authentication operation was canceled or a user ID/password or certificate was not indicated.

For basic authentication using a browser, the browser accesses an authentication server once, then prompts for input of a user ID and password. This message is output in such a situation.

In addition, this message is output when an application with JAAS (Single Sign-on JavaAPI) used accepts an access for checking an authentication server before it sends a user ID and password.

### User Action

Specify a correct user ID and password. Alternatively, indicate a correct certificate because certificate authentication is required.

When the character string 'SSO-JavaAPI' is recorded as the IP address of the business server, an authentication access is recorded subsequent to it. If no authentication access has been recorded, the application with JAAS may have a problem. Ask the administrator of the business server indicated as the IP address of the client to further investigate the error.

---

## User was already locked.

### Explanation

The user has already been locked out.

### User Action

A user who has already been locked out made a request for authentication. Ask the user for the lockout state, and then unlock the user if necessary. For details on unlocking users, see "Operation and Maintenance" - "User Related Operation" - "Canceling Lockout" in the Single Sign-on Operator's Guide.

---

## User was locked.

### Explanation

The user has been locked out.

### User Action

Check the system log of the Interstage Single Sign-on repository server, and then take the action indicated by the User Action of the message.

---

## Violation request of specification.

### Explanation

An invalid request was received.

### User Action

A message concerning the error is output in the system log. Take the action indicated by the User Action of the message.

---

## Supplementary Information Output when the Result of Authentication is "succeeded"

### Access-token does not exist.

#### Explanation

The user has signed on, but the authentication details were not present when trying to perform a process

---

**Authentication required.****Explanation**

A request for re-authentication from the Interstage Single Sign-on business server was received and re-authentication was performed.

---

**Credential can not be decrypted.****Explanation**

Information for authentication could not be decrypted and the information for authentication was re-created.

**User Action**

Check that there is no Interstage Single Sign-on authentication server using a different service ID.

---

**Credential is invalid.****Explanation**

Information for authentication was invalid and re-authentication was performed.

---

**Credential is valid.****Explanation**

Information for authentication was valid.

---

**Forced Sign-on.****Explanation**

The user performed Forced Sign-on.

---

**Information for the client connection is not the same.****Explanation**

The client IP address and the IP address recorded in the request data are not the same.

**User Action**

There is no particular need to take action because the processing result was 'succeeded'.

If this message is output in an environment in which the client IP address has not changed, however, investigate the possibility of an attack.

---

**Pre Sign-on application called.****Explanation**

An Integrated Windows Authentication servlet was called.

---

**Pre Sign-on application succeeded.****Explanation**

Notification that authentication was successful was received from the Integrated Windows Authentication servlet.

---

**Query about forced Sign-on.****Explanation**

There was a query by a user about Forced Sign-on.

---

**Session expired.****Explanation**

Sign-off was performed, but the validity period of the session had already expired.

---

### Time limit of credential is over.

#### Explanation

Possible causes of the error are as follows:

- Re-authentication was performed because the time duration specified in the re-authentication interval has expired.
- The valid term of the user information registered in the SSO repository (or "Active Directory" when Active Directory is used in the user information registration destination) was shorter than the time duration specified in the re-authentication interval and the valid term was extended. Since then, the time duration specified in the re-authentication interval has expired and re-authentication was performed.

---

### Supplementary Information Output when the Result of Authentication is "processing"

#### Query about Sign-off.

#### Explanation

The Sign-off query window was returned.

---

## 45.1.3 Access Log of the Business Server

In the access log of a business server, the results of user accesses are collected.

If session management is used, the session ID for each process is recorded.

The format and contents of the information collected are as follows:

```
client [date-and-time] - "user-identification" "target-of-access" result-of-  
authentication (supplementary-information) SessionID="sessionID" Server="IP  
address" RequestID="Web server request ID"
```

#### Client:

The IP address of the client that requested access to it is recorded in IPv4 or IPv6 format.

#### Date and time:

Date and time at which the access occurred in the form of "YYYY/MM/DD HH:MM:SS+XXXX"

"+XXXX" indicates the time difference to UTC (Universal Time Coordinate). If used, "-XXXX", also has the same meaning

#### User identification:

Identification (dn or uid) of the user who requested access to it

If the user cannot be identified, the user identification is set to "unknown."

#### Target of access:

Information about the resource to which an access is to be made

#### Result of authentication:

The result of authentication is obtained in any of the following forms:

When a user requests access to it:

- Authorization {succeeded|failed}.

#### Supplementary information:

Indicates causes of unsuccessful access or other errors. This item is not always collected.

## SessionID:

Records the session ID.

This is only recorded if session management is used. If the session ID cannot be identified, it is recorded as 'unknown'.

## Server:

Records the host name or IP address of the Repository Server (update system) used to manage the session. This item is not always collected.

## RequestID:

Records the Web server request ID. (\*1)

If the Web server request ID cannot be identified, this is recorded as "unknown".

\*1 The Interstage HTTP Server environment definition file (httpd.conf) settings must be configured to output the request ID in the access log. For details about the Interstage HTTP Server environment definition file settings, refer to "Access Log" in the "Security Audit Trail Functions" chapter of the "Security System Guide".

## Example

Session management is used

```
10.131.201.23 [2007/01/16 16:37:15 +0900] - "cn=Fujitsu
Jirou,ou=User,ou=interstage,o=fujitsu,dc=com" "/admin/index.html"
Authorization failed. (Access denied.)
SessionID="FYexnW4FfUDP/Fp47lfztK6FrCsYVkXl3Kj2nIjNp9OjDHGONdVtVs"
Server="10.131.201.41" RequestID="blQdLAqDyRcAAAbsAAQAAAax"
```

Session management is not used

```
10.131.201.23 [2007/01/16 16:40:51 +0900] - "cn=Fujitsu
Jirou,ou=User,ou=interstage,o=fujitsu,dc=com" "/admin/index.html"
Authorization failed. (Role check error.)
RequestID="ezyYcAqDyRcAAAY0AAUAAAax"
```

## 45.1.3.1 Supplementary Information in the Access Log of the Business Server

### Supplementary Information Output when the Result of Authentication is 'failed'

#### Access denied.

#### Explanation

The user does not have a role required for access, so the resource is not available to the user.

#### User Action

Check that the role required for access was allocated to the user. If the role is not allocated, the resources cannot be accessed.

If the role was allocated, take the following action:

- Check that the user or the protected path accessed by the user is assigned an appropriate role. If necessary, assign an appropriate role. (\*1)
- Access control information may not have been updated. Update access control information for the Interstage Management Console. (\*2)
- In all other cases, a message may have been output to the system log of the repository server. Take the action indicated by the User Action of the message.

\*1 For details on assigning a role, refer to Amending Role Configurations in "Operation and Maintenance" of the Single Sign-on Operator's Guide.

\*2 To update access control information in Interstage Management Console, select [System] > [Security] > [Single Sign-on] > [Business system] > [Business system Name] > [Update access control information] tab, and click [Update].

---

## Cookie check error.

### Explanation

Cookies could not be set in a browser. Possible causes of the error are as follows:

- The browser has been set up so that it does not accept any cookies.
- When Interstage Portalworks has been linked, the business system may have been built after domains that could not accept cookies were specified in the browser.

### User Action

Take any of the following measures:

- Set the browser so that it can accept cookies.
- A two-layered domain name (such as .co.jp) specified when the business system was built may prevent the browser accepting cookies. Re-build the business server, specifying domain names in the form of three or more layers (for example, fujitsu.co.jp).

To rebuild a business server, select [System] > [Security] > [Single Sign-on] > [Business system] on the Interstage Management Console, delete the business server on the [List] tab, then add the business server again on the [Addition of Business server] tab.

---

## Cookie is not set.

### Explanation

Cookies could not be created in the browser's computer. Possible causes are as follows:

- The browser is set to not receive cookies.

### User Action

Take any of the following measures:

- Change the settings so that the browser receives cookies.

---

## Credential can not be decrypted.

### Explanation

The service ID of the Interstage Single Sign-on business server was incorrect.

### Explanation when session management is used

Failed to decrypt the authentication information. Possible causes are as follows:

- An abnormality occurred in the connection between the client and Interstage Single Sign-on Business server.
- There was an external attack.

### User Action

A message concerning the error is output in the system log. Take the action indicated by the User Action of the message.

### User Action when session management is used

Take any of the following measures:

- There might be a problem in the communication pathway. Ask the network administrator to check that communication between the client and Authentication server is normal.
- Investigate the possibility that there was an external attack.

---

## Credential expired.

### Explanation

The time duration specified in the re-authentication interval has expired.

## User Action

If re-authentication is not performed automatically, perform authentication again.

---

## HTTP post method denied.

### Explanation

A POST method request for which the HTTP request header content-type was not "application/x-www-form-urlencoded" was received when the authentication validity period had expired or authentication had not been performed.

### User Action

Take the following action.

- When creating contents that use the POST method, use the "application/x-www-form-urlencoded" HTTP request header content-type.
  - Restart the browser and re-execute the Sign-on operation.
- 

## Internal error.[%s]

### Variable Information

%s = Maintenance information

### Explanation

An abnormality occurred internally in the Interstage Single Sign-on business server.

### User Action

A message concerning the error is output in the system log. Take the action indicated by the User Action of the message.

---

## Invalid path.

### Explanation

The format of the URL path that was requested is incorrect. Possible causes include:

- An 8.3 format file name that is generated automatically from a long file name cannot be specified in a URL path. In Windows, an 8.3 format file name is sometimes generated automatically from a long file name, as shown in the example below.

- (Example) ABCDEFGHIJ.TXT \* ABCDEF~1.TXT

The file name that is generated automatically, as shown in the ABCDEF~1.TXT part above, cannot be specified in the URL path.

- The '.' (period) at the end of the folder/file name cannot be specified in the URL path.

### User Action

Take the following action.

- Specify a long file name in the path instead of a file name that is generated automatically.
  - If the folder/file name that is included in the path contains a '.' at the end of it, remove it.
- 

## IPAddress check error. IPAddr=[%s]

### Variable Information

%s = IP address

### Explanation

Possible causes of the error are as follows:

- The IP address(%s) used to access the Authentication server when the user signs on is different from that used for access to the business server.

- When Interstage Portalworks has been linked, or in the client environment, or when a proxy server or IPCOM is in use, [Enable Client IP Address Check?] may have been set to 'Yes.'
- When IPv4 and IPv6 communication are both enabled for the authentication server or the business server, [Enable Client IP Address Check?] may have been set to 'Yes'.
- There was an external attack

## User Action

Take any of the following measures:

- A proxy setting on the browser may enable access to either the authentication server or business server through proxy. Check the proxy settings so that access to the authentication server and the business server is made through the same path. Alternatively, when a load balancer is used in the business server or authentication server, the load balancer may convert certain kinds of IP addresses. Resetting the proxy does not solve the error; check the load balancer settings.
- When Interstage Portalworks has been linked, or in the client environment, or when a proxy server or IPCOM is in use, set 'No' for [Enable Client IP Address Check?].(\*1)
- When IPv4 and IPv6 communication are both enabled for the authentication server or the business server, set 'No' for [Enable Client IP Address Check?].(\*1)
- Investigate the possibility of an external attack.

\*1 To check the [Check Client IP Address] setting, select [System] > [Security] > [Single Sign-on] > [Business system] > [Business system Name] on the Interstage Management Console. Click [Detailed Settings [Show]] on the [Settings] tab, then check [Enable Client IP Address Check?].

---

## IP address is not the same. IPAddr=[%s]

### Variable Information

%s = IP address

### Explanation

Possible causes of the error are as follows:

- The IP address(%s) used to access the Authentication server when the user signs on is different from that used for access to the business server.
- When Interstage Portalworks has been linked, or in the client environment, or when a proxy server or IPCOM is in use, [Enable Client IP Address Check?] may have been set to 'Yes.'
- When IPv4 and IPv6 communication are both enabled for the authentication server or the business server, [Enable Client IP Address Check?] may have been set to 'Yes.'
- There was an external attack.

## User Action

Take any of the following measures:

- A proxy setting on the browser may enable access to either the authentication server or business server through proxy. Check the proxy settings so that access to the authentication server and the business server is made through the same path. Alternatively, when a load balancer is used in the business server or authentication server, the load balancer may convert certain kinds of IP addresses. Resetting the proxy does not solve the error; check the load balancer settings.
- When Interstage Portalworks has been linked, or in the client environment, or when a proxy server or IPCOM is in use, set 'No' for [Enable Client IP Address Check?].(\*1)
- When IPv4 and IPv6 communication are both enabled for the authentication server or the business server, set 'No' for [Enable Client IP Address Check?].(\*1)
- Investigate the possibility that there was an external attack.

\*1 To check the [Check Client IP Address] setting, select [System] > [Security] > [Single Sign-on] > [Business system] > [Business system Name] on the Interstage Management Console. Click [Detailed Settings [Show]] on the [Settings] tab, then check [Enable Client IP Address Check?].

---

### Role check error.

#### Explanation

The user does not have a role required for access, so the resource is not available to the user.

#### User Action

Check that the role required for access was allocated to the user. If the role is not allocated, the resources cannot be accessed. If the role was allocated, take the following action:

- Check that the user or the protected path accessed by the user is assigned an appropriate role. If necessary, assign an appropriate role. (\*1)
- Access control information may not have been updated. Update access control information for the Interstage Management Console. (\*2)
- In all other cases, a message may have been output to the system log of the repository server. Take the action indicated by the User Action of the message.

\*1 For details on assigning a role, refer to Amending Role Configurations in "Operation and Maintenance" of the Single Sign-on Operator's Guide.

\*2 To update access control information in Interstage Management Console, select [System] > [Security] > [Single Sign-on] > [Business system] > [Business system Name] > [Update access control information] tab, and click [Update].

---

### Server error[%s].

#### Variable Information

%s = Maintenance information

#### Explanation

An abnormality occurred internally in the Interstage Single Sign-on business server.

#### User Action

If the system log is not output, use the Web server definition file that operates the business server, or the definition information, and the *iscollectinfo* command to collect diagnostic information. Send this information to a Systems Engineer.

---

### Session expired.

#### Explanation

The session has reached the expiry time .

#### User Action

Re-execute the Sign-on operation.

---

### Session timed out.

#### Explanation

A timeout occurred in Idle Monitoring.

#### User Action

Re-execute the Sign-on operation.

---

### There is no credential. Access after doing authentication.

#### Explanation

No information for authentication could be found to allow access to resources.

#### User Action

Restart the browser, access the business server, then perform authentication.

---

#### **Violation request.**

#### Explanation

The received request is invalid.

#### User Action

A message concerning the error is output in the system log. Take the action indicated by the User Action of the message.

---

### **Supplementary Information Output When the Result of Authentication is "succeeded"**

---

#### **Authorization end.**

#### Explanation

Authorization ended successfully. Access is granted.

---

#### **It does redirect to the approval because credential isn't attached to cookie, URL.**

#### Explanation

Authentication was not performed, or the authentication information from the browser was not notified. Make the request to the Authentication server.

#### User Action

Perform the Sign-on operation.

---

#### **Not authenticated. Make the request to the authentication server.**

#### Explanation

Authentication was not performed, or the authentication information from the browser was not notified. Make the request to the Authentication server.

#### User Action

Perform the Sign-on operation.

---

#### **Post request was received. It is not authenticated yet.**

#### Explanation

The authentication period has expired, or the POST request was received without authentication being performed. Make the request to the Authentication server.

#### User Action

Perform the Sign-on operation.

---

## **45.2 Session Management Log In Single Sign-on Mode**

---

If session management is used in Interstage Single Sign-on, the session update status is recorded as a session management log. The session management log is recorded in the session management server, and the session information update status is output as a text file. Each record is output on a separate line.

Use the Repository server (reference system) Interstage Management Console to specify the session management log output file name and maximum file size, and the method for saving the files. Click the following tabs:

- [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Repository Server] > [Settings] > [Session management Log Settings]

For details about the Interstage Management Console definitions, refer to the Operator's Guide.

The format and contents of the information collected are as follows:

[date-and-time] "sessionID" result (supplementary-information) variable information
-------------------------------------------------------------------------------------

### **Date and time:**

Date and time at which the session information was updated in the form of 'YYYY/MM/DD HH:MM:SS+XXXX'

'+XXXX' indicates the time difference to UTC (Universal Time Coordinate).If used, '-XXXX', also has the same meaning

### **Session ID:**

Records the updated session ID.

### **Result:**

The result of authentication is obtained in any of the following forms:

- Session registration

Registration {succeeded|failed}.

This is recorded in the following cases:

- The user performs the Sign-on operation

- Session status update

Modification {succeeded|failed}.

This is recorded in the following cases:

- The user performs the Forced Sign-on operation

- Session deletion

Deletion (delete method) {succeeded|failed}.

This is recorded in the following cases:

- The delete method is 'sign-off'

The user performs the Sign-off operation

- The delete method is 'forced-sign-on'

The user canceled Forced Sign-on

- The delete method is 'forced-sign-off'

The SSO administrator performs the Forced Sign-off operation

- The delete method is 'auto-garbage-collection'

The following invalid sessions in the session management server are deleted

- Sessions that have expired

- Sessions in which an Idle Monitoring timeout occurs during session evaluation/status update

- The delete method is 'internal-rollback'

The session had to be deleted in session management server internal processing

- Session evaluation

Validation {succeeded|failed}.

This is recorded in the following cases:

- The user accesses the protection resource
  - Acquisition of session information  
Information acquisition {succeeded|failed}.
- This is recorded in the following cases:
- The user accessed a protection resource
  - The user performed the Sign-off operation

- Internal session evaluation  
Internal validation failed.

This is recorded in the following cases:

- Evaluation of the session failed in session management server internal processing

### Supplementary information:

Records the detail information when the session is updated. This item is not always collected.

### Variable information:

Records the information used to identify the updated session user and session status. This item is not always collected.

### Example

```
[2002/09/11 20:28:22 +0900] "ih8ijgVTHFYOoE5vrjeGgW3H/yo" Registration
succeeded. status="Sign-on" dn="cn=Fujitsu Tarou, o=Fujitsu,c=jp"
uid="tarou"
```

## 45.2.1 Supplementary Information in the Session Management Log

### Supplementary Information Output when the Result is failed'

---

#### Processing was skipped because of the session status.

Explanation

The session cannot receive requests.

---

#### Session expired.

Explanation

The session has expired.

---

#### Session is already invalid.

Explanation

The session is already invalid.

---

#### Session not found.

Explanation

The session could not be found.

---

#### Session timed out.

Explanation

A timeout occurred in Idle Monitoring.

---

**The user ID is already signed on.****Explanation**

The user ID is already signed on.

---

**Supplementary Information Output when the Result is "succeeded"**

---

**Forced Sign-on was canceled.****Explanation**

Forced Sign-on was canceled.

---

**Forced Sign-on was performed using the same user ID.****Explanation**

Forced Sign-on was performed using the same user ID.

---

**From forced Sign-on processing to Sign-on.****Explanation**

The session status changed from Forced Sign-on processing to completion of Sign-on

---

**Session management log variable information**

---

**dn="%s"****Variable Information**

%s = User ID information (dn)

**Explanation**

Indicates the information used to identify the registered session user (dn).

---

**status="%s"****Variable Information**

%s = session status

**Explanation**

The current session status is shown as follows:

- Sign-on: Sign-on was completed.
- Forced Sign-on processing: Forced Sign-on is being processed but was not yet completed.
- Session timed out: A timeout occurred in Idle Monitoring.
- Session expired: The validity has expired.

---

**uid="%s"****Variable Information**

%s = User ID

**Explanation**

Indicates the registered session user ID.
