If this error message is produced frequently, refer to the "Tuning Guide" and check whether sufficient free memory space is available for Interstage operation.

If the size of free memory space is too small, expand the main memory capacity or swap area.

## 8.6.19 IJServer12019

---

**(error) IJServer12019: Registry not found. registry=<registry> func=<func> pid=<pid> tid=<tid>**

### Variable Information

<registry> = registry

<func> = Name of the function in which an error occurred

<pid> = Web server process ID

<tid> = Web server thread ID

### Explanation

The registry value cannot be obtained.

### Cause

Possible causes are as follows:

- The registry does not exist.
- The registry is faulty.

## User Action

Reinstall Interstage.

### 8.6.20 IJServer12020

---

**(warn) IJServer12020: Rollover log file has already existed. Rollover process is performed next time with the new name. file=<filename> pid=<pid> tid=<tid>**

#### Variable Information

<filename> = Name of rollover log file

<pid> = Web server process ID

<tid> = Web server thread ID

#### Explanation

A file having the same name as the rollover log file already exists. Because log output occurred frequently, rollover was executed with the same name.

#### User Action

Log rollover will be executed with a new name when a message is next produced.

To increase the maximum amount of log collection, increase the [Log Size] or [Number of log files to maintain] at [Services] > [Web Server] > "Web server name" > [Web Server Connector] > [Log Settings] tab on the Interstage Management Console.

### 8.6.21 IJServer12021

---

**(error) IJServer12021: Server certificate has expired. Please get a new certificate. definitionName=<name> error=<error> details=<details> pid=<pid> tid=<tid>**

#### Variable Information

<name> = SSL definition name

<error> = Error number

<details> = Error detail number

<pid> = Web server process ID

<tid> = Web server thread ID

#### Explanation

The site certificate on the WorkUnit (IJServer) has expired.

#### User Action

Obtain a new site certificate on the WorkUnit (IJServer) and register it in the certificate/key management environment on the WorkUnit (IJServer). Select the new site Certificate Nickname on the [SSL Detailed Settings], which can be displayed by selecting [System] > [Security] > [SSL] > [SSL Configuration Name] on the Interstage Management Console.

Use the certificate/CRL registration command (scscenter) to register the certificate.

### 8.6.22 IJServer12022

---

**(warn) IJServer12022: Service temporarily unavailable. The number of requests exceeded the number of maximum connections. Increase the number of maximum connections. serverName=<serverName> serverPort=<serverPort> uri=<uri> pid=<pid> tid=<tid>**

#### Variable Information

<serverName> = Server name of Web server

<serverPort> = Port number of Web server

<uri> = Web browser request URI

<pid> = Web server process ID

<tid> = Web server thread ID

## Explanation

Service is temporarily unavailable.

## Cause

The possible causes are:

1. The number of requests made from the Web browser exceeds the maximum number of connections of the servlet container.
2. The "OFF" option of the *ijdispatchcont* command excludes all WorkUnits (IJSERVER) from the distribution of requests made from the Web browser. Alternatively, since some WorkUnits (IJSERVER) are excluded from the distribution of requests made from the Web browser, the number of requests from the Web browser exceeds the number of concurrent processes of the servlet container.
3. If a Web application that uses session management is deployed in a WorkUnit (IJSERVER), the Web server connector distributes Web browser's requests to the WorkUnit (IJSERVER) that established the session. As a result, even if the process concurrency of the WorkUnit (IJSERVER) is 2 or more, requests temporarily concentrate on one WorkUnit (IJSERVER) and this message might be output chronically.

## System Action

Web browser services of a WorkUnit (IJSERVER) are temporarily unavailable. The Web server connector interrupted the connection to the WorkUnit (IJSERVER), and sent status code 503 (Service Temporarily Unavailable) to the web browser.

## User Action

1. Tune the Web server connector and Servlet container.
  - For IJSERVER(J2EE), refer to the "Tuning Guide", section "Tuning J2EE Applications" > "Tuning Servlet Containers".
  - For IJSERVER cluster, refer to the "Java EE Operation Guide", section "Java EE Function Tuning" > "Web Container Tuning".
2. Use the "ON" option of the *ijdispatchcont* command to exclude the WorkUnit (IJSERVER) from the distribution of requests from the Web browser.
3. If this message is regularly output, use method 1. (above) to:
  - increase the process concurrency of the WorkUnit (IJSERVER), or
  - to change either the number of concurrent client connections of the Web server, or the number of concurrent processes of the servlet container.

For the IJSERVER's process concurrency, see "IJSERVER tuning" in the "Tuning Guide."

## 8.6.23 IJSERVER12023

---

**(error) IJSERVER12023: SSL definition is invalid. definitionName=<name> error=<error> details=<details> pid=<pid> tid=<tid>**

### Variable Information

<name> = SSL definition name

<error> = Error number

<details> = Error detail number

<pid> = Web server process ID

<tid> = Web server thread ID

## Explanation

The SSL definition indicated by <name> contains an error.

## Cause

Possible causes are as follows:

- When <error> is 0x100002, the character string indicating the encryption method is invalid.
- When <error> is 0x10003E, the nickname of the site certificate was specified incorrectly.
- When <error> is 0x10004B, the group containing the certificate and key management environment does not match the Web server execution group. Alternatively, an SSL definition error occurs.
- In other cases, the content of the SSL definition is abnormal.

## User Action

When <error> is 0x10004B, make the possession group of a certificate and key management environment the same as the execution group of a Web server. When they match, delete the SSL definition name containing the error using the [System] > [Security] > [SSL] > [List] tab on the Interstage Management Console, then create a new SSL definition.

In the case of others, on the Interstage Management Console, select [System] > [Security] > [SSL] > [View SSL Congigurations], and delete the abnormal SSL configuration name, then create another SSL configuration.

## 8.6.24 IJServer12024

---

**(error) IJServer12024: SSL definition not found. definitionName=<name> details=<details> pid=<pid> tid=<tid>**

### Variable Information

<name> = SSL definition name

<details> = Error detail number

<pid> = Web server process ID

<tid> = Web server thread ID

## Explanation

The SSL definition indicated by <name> cannot be obtained.

## Cause

Possible causes are as follows:

1. When <details> is 2, the SSL definition does not exist.
2. When <details> is 4, The SSL definition format is invalid.
3. When <details> is 5, a memory shortage occurred.
4. When <details> is 6, permission to obtain the SSL definition is not granted.
5. When <details> is 7, a certificate/key management environment has not been created.
6. When <details> is 8, the certificate/key management environment is abnormal.
7. In other cases, a system error may have occurred.

## User Action

Do as follows:

1. On the Interstage Management Console, select [System] > [Security] > [SSL] > [View SSL Congigurations], and check the SSL configuration name. If the SSL configuration name is not defined there, create it.

2. On the Interstage Management Console, select [System] > [Security] > [SSL] > [View SSL Congigurations], and delete the abnormal SSL configuration, then create another SSL configuration.
3. Terminate unnecessary applications, or expand the memory capacity.
4. Execute the command as a user having permission to obtain the SSL definition.
5. Use the CSR (certificate signing request) creation command (scsmakeenv) to create a certificate/key management environment.
6. Use the CSR (certificate signing request) creation command (scsmakeenv) to recreate a certificate/key management environment.
7. Collect the check information using the *iscollectinfo* command, then contact a service engineer.

## 8.6.25 IJServer12025

---

**(error) IJServer12025: The connection of IJServer was aborted. IJServer did a timeout. SSL definition may differ from IJServer. definitionName=<name> error=<error> details=<details> pid=<pid> tid=<tid>**

### Variable Information

- <name> = SSL definition name
- <error> = Error number
- <details> = Error detail number
- <pid> = Web server process ID
- <tid> = Web server thread ID

### Explanation

A timeout occurred on the WorkUnit (IJServer) and the connection was interrupted.

### Cause

SSL may not be defined on the WorkUnit (IJServer).

### System Action

The Web server connector interrupted connection to the workunit (IJServer), and sent the error message status code 500 (Internal Server Error) to the web browser.

### User Action

Check whether the WorkUnit (IJServer) started in SSL mode. If not, restart the WorkUnit (IJServer) in SSL mode or disable the SSL definition in the Web server connector.

## 8.6.26 IJServer12026

---

**(error) IJServer12026: The connection of IJServer was aborted. IJServer stops or Web Application timed out. SSL definition may differ from IJServer. definitionName=<name> serverName=<serverName> serverPort=<serverPort> host=<host> port=<port> uri=<uri> errno=<errno> pid=<pid> tid=<tid>**

### Variable Information

- <name> = SSL definition name
- <serverName> = Server name of Web server
- <serverPort> = Port number of Web server
- <host> = Host name of IJServer workunit
- <port> = Port number of IJServer workunit
- <uri> = Web browser request URI
- <errno> = Error number

<pid> = Web server process ID

<tid> = Web server thread ID

## Explanation

The connection with the WorkUnit (IJSERVER) has been interrupted.

## Cause

Possible causes are as follows:

1. The WorkUnit (IJSERVER) is overloaded. A memory shortage may have occurred in the Java VM.
2. The SSL definition differed from that on the WorkUnit (IJSERVER), or the certificate/key management environment contained an error and client authentication on the WorkUnit (IJSERVER) failed.
3. The WorkUnit (IJSERVER) process is forcibly stopped because of an application timeout.
4. The WorkUnit (IJSERVER) is stopped.
5. The WorkUnit (IJSERVER) is temporarily stopped because an error occurred in the Web application.
6. The Web server connector Servlet container IP address/Port Number settings are incorrect.

## System Action

The Web server connector interrupted connection to the workunit (IJSERVER), and sent the error message status code 500 (Internal Server Error) to the web browser.

## User Action

Do as follows:

When the message is output to the container log of a workunit (IJSERVER), follow management of the current message.

1. If this error message is output frequently, increase the process multiplicity of the WorkUnit (IJSERVER) or check the system configuration (hardware and software) and reconfigure an overload-resistant system. Consider upgrading the CPU as needed.  
Check the event log (system log) or container log of IJSERVER. If there is insufficient Java VM memory ('OutOfMemoryError' is output), refer to "JDK/JRE Tuning" in the "Tuning Guide".
2. Use the Interstage Management Console to determine whether the SSL definitions of a Web server connector and a workunit (IJSERVER) differ, or the required certificate is effective.
3. Tune the Web server connector and Servlet container.
  - For IJSERVER(J2EE), refer to the "Tuning Guide", section "Tuning J2EE Applications" > "Tuning Servlet Containers".
  - For IJSERVER cluster, refer to the "Java EE Operation Guide", section "Java EE Function Tuning" > "Web Container Tuning".
4. If the WorkUnit (IJSERVER) is stopped, start it.
5. If the WorkUnit (IJSERVER) is stopped because of an error in a Web application, check Web applications for abnormalities. In particular, a Web application using the Java Native Interface (JNI) may have an abnormality.
6. Check the Web server connector Servlet container IP address:Port Number settings.

## 8.6.27 IJSERVER12027

---

**(error) IJSERVER12027: The connection of IJSERVER was aborted. The following are the most common causes of this error: IJSERVER stops, Web Application timed out, Setting up SSL on IJSERVER.**  
**serverName=<serverName> serverPort=<serverPort> host=<host> port=<port> uri=<uri> errno=<errno> pid=<pid> tid=<tid>**

### Variable Information

<serverName> = Server name of Web server

<serverPort> = Port number of Web server

<host> = Host name of IJServer workunit

<port> = Port number of IJServer workunit

<uri> = Web browser request URL

<errno> = Error number

<pid> = Web server process ID

<tid> = Web server thread ID

## Explanation

The connection with the WorkUnit (IJServer) has been interrupted.

## Cause

Possible causes are as follows:

1. The WorkUnit (IJServer) process is forcibly stopped because of an application timeout.
2. The WorkUnit (IJServer) is stopped.
3. The WorkUnit (IJServer) is temporarily stopped because an error occurred in the Web application.
4. The SSL usage settings are inconsistent between the Web server connector and Servlet container.
5. The WorkUnit (IJServer) is overloaded. A memory shortage may have occurred in the Java VM.
6. The number of requests that was received exceeded the maximum number of connections to the Servlet container.
7. The Web server connector Servlet container IP address:Port Number settings are incorrect.
8. In other cases, an error may have occurred in the WorkUnit (IJServer).

## System Action

The Web server connector interrupted connection to the workunit(IJServer), and sent the error message status code 500 (Internal Server Error) to the web browser.

## User Action

Do as follows:

When the message outputs to the container log of a WorkUnit (IJServer), follow management of the current message.

1. Tune the Web server connector and Servlet container.
  - For IJServer(J2EE), refer to the "Tuning Guide", section "Tuning J2EE Applications" > "Tuning Servlet Containers".
  - For IJServer cluster, refer to the "Java EE Operation Guide", section "Java EE Function Tuning" > "Web Container Tuning".
2. If the WorkUnit (IJServer) is stopped, start it.
3. If the WorkUnit (IJServer) is stopped because of an error in a Web application, check Web applications for abnormalities. In particular, a Web application using the Java Native Interface (JNI) may have an abnormality.
4. If you are not using the multiserver management function, and the Web server and WorkUnit (IJServer) run on different server machines, configure the setup the same as for use of SSL.
5. If this error message is output frequently, increase the process multiplicity of the WorkUnit (IJServer) or check the system configuration (hardware and software) and reconfigure an overload-resistant system. Consider upgrading the CPU as needed.

Check the event log (system log) or container log of IJServer. If there is insufficient Java VM memory ('OutOfMemoryError' is output), refer to "JDK/JRE Tuning" in the "Tuning Guide".
6. Tune the Web server connector and Servlet container.
  - For IJServer(J2EE), refer to the "Tuning Guide", section "Tuning J2EE Applications" > "Tuning Servlet Containers".
  - For IJServer cluster, refer to the "Java EE Operation Guide", section "Java EE Function Tuning" > "Web Container Tuning".
7. Check the Web server connector Servlet container IP address:Port Number settings.

8. Check the WorkUnit (IJSERVER) log. If an error has occurred, take action according to the message.

## 8.6.28 IJSERVER12028

---

**(error) IJSERVER12028: The definition of a Web Server Connector and IJSERVER are not in agreement. definitionName=<name> error=<error> details=<details> pid=<pid> tid=<tid>**

### Variable Information

<name> = SSL definition name

<error> = Error number

<details> = Error detail number

<pid> = Web server process ID

<tid> = Web server thread ID

### Explanation

The SSL environments are inconsistent between the Web server connector and WorkUnit (IJSERVER).

### Cause

Possible causes are as follows:

1. SSL is probably not defined on the WorkUnit (IJSERVER).
2. The SSL protocol version or the encryption method may not be consistent with that on the WorkUnit (IJSERVER).
3. Client authentication probably failed.
4. Another environmental inconsistency may exist.

### System Action

The Web server connector interrupted connection to the workunit (IJSERVER), and sent the error message status code 500 (Internal Server Error) to the web browser.

### User Action

1. Check whether the WorkUnit (IJSERVER) started in SSL mode. If not, restart the WorkUnit (IJSERVER) in SSL mode or disable the SSL definition in the Web server connector.
2. Check the protocol versions and encryption methods on the Web server connector and WorkUnit (IJSERVER).
3. Use the Interstage Management Console to check whether the CA certificate on the Web server connector is registered in the certificate/key management environment on the WorkUnit (IJSERVER) and whether the CA certificate is validated in the SSL definition. Use the certificate/CRL registration command (scscenter) to register the certificate.
4. Check for other specification inconsistencies.

## 8.6.29 IJSERVER12029

---

**(error) IJSERVER12029: The error occurred in encryption library. Please inform an engineer. definitionName=<name> error=<error> details=<details> pid=<pid> tid=<tid>**

### Variable Information

<name> = SSL definition name

<error> = Error number

<details> = Error detail number

<pid> = Web server process ID

<tid> = Web server thread ID

## Explanation

An error occurred in the encryption library.

## User Action

Collect the check information using the *iscollectinfo* command, then contact a service engineer.

## 8.6.30 IJServer12030

---

**(error) IJServer12030: The error occurred in SCS library. definitionName=<name> details=<details> pid=<pid> tid=<tid>**

### Variable Information

<name> = SSL definition name

<details> = Error detail number

<pid> = Web server process ID

<tid> = Web server thread ID

## Explanation

An error occurred in the SCS library.

## Cause

Possible causes are as follows:

1. When <details> is 5, a memory shortage occurred.
2. When <details> is 6, permission to decrypt the encrypted password was not granted.
3. When <details> is 7, a certificate/key management environment was not created.
4. When <details> is 8, the certificate/key management environment is abnormal.
5. In other cases, a system error may have occurred.

## User Action

Do as follows:

1. Terminate unnecessary applications, or expand the memory capacity.
2. Make the possession group of a certificate and key management environment, the same as the execution group on the Web server.

Change the possession group of the certificate and key management environment and execute the CSR (certificate signing request) creation command (*scsmakeenv*) of the certificate and key management environment.

For details on specifying the possession group of a certificate and key management environment, refer to Configuring Environments under Setting and Use of the Interstage Certificate Environment in the Security System Guide.

To change the execution group of the Web server, define the execution group in the Web server environment definition file.

3. Use the CSR (certificate signing request) creation command (*scsmakeenv*) to create a certificate/key management environment.
4. Use the CSR (certificate signing request) creation command (*scsmakeenv*) to recreate a certificate/key management environment.
5. Collect the check information using the *iscollectinfo* command, then contact a service engineer.

## 8.6.31 IJServer12031

---

**(error) IJServer12031: The error occurred in SSL protocol. Please inform an engineer. definitionName=<name> error=<error> details=<details> pid=<pid> tid=<tid>**

### Variable Information

<name> = SSL definition name

<error> = Error number

<details> = Error detail number

<pid> = Web server process ID

<tid> = Web server thread ID

### Explanation

An error occurred in the SSL protocol.

### System Action

The Web server connector interrupted connection to the workunit (IJServer), and sent the error message status code 500 (Internal Server Error) to the web browser.

### User Action

Collect the check information using the *iscollectinfo* command, then contact a service engineer.

## 8.6.32 IJServer12032

---

**(info) IJServer12032: The existing log file is rolled over to a new file. file="<filename>" pid=<pid> tid=<tid>**

### Variable Information

<filename> = Name of rollover log file

<pid> = Web server process ID

<tid> = Web server thread ID

### Explanation

The log file of the Web server connector has been rolled over to a new file.

## 8.6.33 IJServer12033

---

**(info) IJServer12033: The most recent Web Server Connector properties have been loaded. conf="<filename>" pid=<pid> tid=<tid>**

### Variable Information

<filename> = Property file of Web server connector

<pid> = Web server process ID

<tid> = Web server thread ID

### Explanation

The latest Web server connector properties have been loaded.

## 8.6.34 IJServer12034

---

**(error) IJServer12034: The requests cannot be sent to Web Application. serverName=<serverName> serverPort=<serverPort> host=<host> port=<port> uri=<uri> func=<func> errno=<errno> pid=<pid> tid=<tid>**

### Variable Information

<serverName> = Server name of Web server

<serverPort> = Port number of Web server

<host> = Host name of IIServer WorkUnit  
<port> = Port number of IIServer WorkUnit  
<uri> = Web browser request URL  
<func> = Name of the function in which an error occurred  
<errno> = Error number  
<pid> = Web server process ID  
<tid> = Web server thread ID

### Explanation

Data cannot be transferred to the Web application.

### Cause

Possible causes are as follows:

- A system resource shortage occurred.
- A network or system error occurred.
- The connection with the WorkUnit (IIServer) was aborted.

### User Action

- If a resource shortage occurred, refer to the "Tuning Guide" and check whether sufficient system resources required for Interstage operation have been prepared. If sufficient system resources have been prepared, terminate other applications.
- When the Web server and WorkUnit (IIServer) operate on different servers, check for errors in the network connection between the Web server and WorkUnit (IIServer).
- Check the event log (system log) for system errors.
- Refer to the User Action in message IIServer12027 and take action.

## 8.6.35 IIServer12035

---

**(error) IIServer12035: The requests sent to the Web Application did a timeout. Delay in Web Applications or IIServer overloaded. serverName=<serverName> serverPort=<serverPort> host=<host> port=<port> uri=<uri> time=<time> seconds pid=<pid> tid=<tid>**

### Variable Information

<serverName> = Server name of Web server  
<serverPort> = Port number of Web server  
<host> = Host name of IIServer WorkUnit  
<port> = Port number of IIServer WorkUnit  
<uri> = Web browser request URL  
<time> = Timeout time  
<pid> = Web server process ID  
<tid> = Web server thread ID

### Explanation

A timeout occurred during data transfer to the Web application. The form data sent from the Web browser cannot be transferred to the Web application.

### Cause

Possible causes are as follows:

1. Data transfer failed to complete within the timeout time.
2. Web application processing was delayed.
3. The WorkUnit (IJSERVER) is overloaded. A memory shortage may have occurred in the Java VM.
4. A network error occurred between the Web server and WorkUnit (IJSERVER).

### System Action

The Web server connector interrupted connection to the workunit (IJSERVER), and sent the error message status code 500 (Internal Server Error) to the web browser.

### User Action

If this error message is output frequently, increase the process multiplicity of the WorkUnit (IJSERVER) or check the system configuration (hardware and software) and reconfigure an overload-resistant system. Consider upgrading the CPU as needed.

1. Tune the Web server connector and Servlet container.
  - For IJSERVER(J2EE), refer to the "Tuning Guide", section "Tuning J2EE Applications" > "Tuning Servlet Containers".
  - For IJSERVER cluster, refer to the "Java EE Operation Guide", section "Java EE Function Tuning" > "Web Container Tuning".
2. Check whether a processing delay occurred in the Web application.
3. Check the event log (system log) or container log of IJSERVER. If there is insufficient Java VM memory ('OutOfMemoryError' is output), refer to "JDK/JRE Tuning" in the "Tuning Guide".
4. When the Web server and WorkUnit (IJSERVER) operate on different server machines, check for network connection errors between the Web server and WorkUnit (IJSERVER).

## 8.6.36 IJSERVER12036

---

**(error) IJSERVER12036: The response of the Web Application cannot be received.**  
**serverName=<serverName> serverPort=<serverPort> host=<host> port=<port> uri=<uri> func=<func>**  
**errno=<errno> pid=<pid> tid=<tid>**

### Variable Information

<serverName> = Server name of Web server  
<serverPort> = Port number of Web server  
<host> = Host name of IJSERVER WorkUnit  
<port> = Port number of IJSERVER WorkUnit  
<uri> = Web browser request URL  
<func> = Name of the function in which an error occurred  
<errno> = Error number  
<pid> = Web server process ID  
<tid> = Web server thread ID

### Explanation

A response from the Web application cannot be received.

### Cause

Possible causes are as follows:

- A system resource shortage occurred.
- A network or system error occurred.
- The connection with the WorkUnit (IJSERVER) was aborted.

## System Action

The Web server connector interrupted connection to the workunit (IJSERVER), and sent the error message status code 500 (Internal Server Error) to the web browser.

## User Action

- If a resource shortage occurred, refer to the "Tuning Guide" and check whether sufficient system resources required for Interstage operation have been prepared. If sufficient system resources have been prepared, terminate other applications.
- When the Web server and WorkUnit (IJSERVER) operate on different servers, check for errors in the network connection between the Web server and WorkUnit (IJSERVER).
- Check the event log (system log) for system errors.
- Refer to the User Action in message IJSERVER12027 and take action.

## 8.6.37 IJSERVER12037

---

**(error) IJSERVER12037: Unable to create log file. Missing write permission for log file or file is already open with write access. Add write permission on the file or directory. file="<filename>" errno=<errno> pid=<pid> tid=<tid>**

### Variable Information

<filename> = File name

<error> = Error number

<pid> = Web server process ID

<tid> = Web server thread ID

### Explanation

Web server connector message cannot be logged.

### Cause

Possible causes are as follows:

1. Write permission is not granted to the log file or the directory to which a log is to be output.
2. The log file has been opened by another application.
3. A directory having the same name as the log file exists.
4. **Windows32/64**

When on a Windows(R) system, the network drive is specified to the log output directory of a Web server connector.

### User Action

1. Grant the log file or the directory to which a log is to be output write permission for Web server users.  
If you are using Microsoft(R) Internet Information Services 6.0 or 7.0, assign "Full Control" permission for access as a general user to the Web Server connector log output directory and log file.
2. Close the log file.
3. If <filename> is a directory, change or delete the directory.
4. Specify the path name for a log output directory to be on a local disk.

## 8.6.38 IJSERVER12038

---

**(error) IJSERVER12038: Unable to create log file. Too many open files. Close some of the opened files or close any unnecessary applications. file="<filename>" errno=<errno> pid=<pid> tid=<tid>**

### Variable Information

<filename> = File name

<error> = Error number

<pid> = Web server process ID

<tid> = Web server thread ID

### Explanation

A Web server connector log file could not be created

### Cause

Because too many files were open.

### User Action

Terminate other applications, or increase the number of files that can be opened in the system.

## 8.6.39 IJServer12039

---

**(error) IJServer12039: Unable to open file. No such file or permission denied. Add read permission on the file. file="<filename>" errno=<errno> pid=<pid> tid=<tid>**

### Variable Information

<filename> = File name

<error> = Error number

<pid> = Web server process ID

<tid> = Web server thread ID

### Explanation

The indicated file cannot be opened.

### Cause

Possible causes are as follows:

1. The file does not exist.
2. Read permission is not granted to the file.
3. Too many files are open.

### User Action

1. Check whether the file exists.
2. Grant the file read permission for Web server users.
3. Terminate other applications, or increase the number of files that can be opened in the system.

## 8.6.40 IJServer12040

---

**(warn) IJServer12040: Unable to remove old log file. Missing write permission for old log file or file is already open with write access. You must remove the old log file manually. file="<filename>" errno=<errno> pid=<pid> tid=<tid>**

### Variable Information

<filename> = Name of old log file

<error> = Error number

<pid> = Web server process ID

<tid> = Web server thread ID

#### Explanation

The indicated old log file cannot be deleted.

#### Cause

Possible causes are as follows:

- Permission to write to the old log file is not granted.
- The old log file is opened by another application.

#### User Action

Because the old log file may exhaust the free disk space, manually delete the old log file.

## 8.6.41 IJServer12041

---

**( warn) IJServer12041: Unable to rollover log file. pid=<pid> tid=<tid>**

#### Variable Information

<pid> = Web server process ID

<tid> = Web server thread ID

#### Explanation

Log file rollover failed.

#### Cause

A log file could not be rolled over.

#### User Action

Take action according to the message that was output to the Web server connector log or event log (system log).

## 8.6.42 IJServer12042

---

**( warn) IJServer12042: Unable to run Web Server Connector. conf="<filename>" webtype=<webtype> pid=<pid> tid=<tid>**

#### Variable Information

<filename> = Property file of Web server connector

"none" is output if an error occurs immediately after the Web server connector is activated.

<webtype> = Web server I/F which the Web server connector is using.

"nsapi" is output when Microsoft (R) Internet Information Services is used, and "isapi" is output when Sun Java System Web Server is used.

This variable information is not outputted at the time of use of Interstage HTTP Server.

Property file of Web server connector

"none" is output if an error occurs immediately after the Web server connector is activated.

<pid> = Web server process ID

<tid> = Web server thread ID

#### Explanation

The Web server connector cannot be activated.

## System Action

The Web server connector sent the error message status code 404 (Not Found) to the web browser.

The status code 404 (Not Found) may be notified. Moreover, after this message is output, the status code 404 (Not Found) may be notified also to other requests.

## User Action

Take action according to the message that was output to the Web server connector log or event log (system log). If the Web server is active, stop it and restart it.

## Note

In Microsoft(R) Internet Information Services 6.0, this message is output after the Web Server is started and the first access is made from the client. In Web Servers other than Microsoft(R) Internet Information Services 6.0, this message is output when the Web Server is started.

## 8.6.43 IJServer12043

---

**(error) IJServer12043: Unable to write log file. Device was removed or an I/O error occurred. file="<filename>" errno=<errno> pid=<pid> tid=<tid>**

### Variable Information

<filename> = File name

<errno> = Error number

<pid> = Web server process ID

<tid> = Web server thread ID

### Explanation

Web server connector messages cannot be logged.

### Cause

An I/O error occurred. The disk was removed or the availabilities of a disk are insufficient.

### User Action

Check the event viewer (system log) to check for system errors.

## 8.6.44 IJServer12044

---

**(error) IJServer12044: Web Application does not respond. Web Application has timed out. Delay in Web Applications or IJServer overloaded. serverName=<serverName> serverPort=<serverPort> host=<host> port=<port> uri=<uri> time=<time> seconds pid=<pid> tid=<tid>**

### Variable Information

<serverName> = Server name of Web server

<serverPort> = Port number of Web server

<host> = Host name of IJServer WorkUnit

<port> = Port number of IJServer WorkUnit

<uri> = Web browser request URI

<time> = Timeout time

<pid> = Web server process ID

<tid> = Web server thread ID

## Explanation

The Web application does not respond. A timeout occurred during waiting for a response from the Web application.

## Cause

Possible causes are as follows:

1. The Web application failed to respond within the specified timeout time.
2. Web application processing was delayed.
3. The WorkUnit (IJSERVER) is overloaded. A memory shortage may have occurred in the Java VM.
4. A network error occurred between the Web server and WorkUnit (IJSERVER).

## System Action

The Web server connector interrupted connection to the WorkUnit (IJSERVER), and sent the error message status code 500 (Internal Server Error) to the web browser.

## User Action

1. Tune the Web server connector and Servlet container.
  - For IJSERVER(J2EE), refer to the "Tuning Guide", section "Tuning J2EE Applications" > "Tuning Servlet Containers".
  - For IJSERVER cluster, refer to the "Java EE Operation Guide", section "Java EE Function Tuning" > "Web Container Tuning".
2. Check whether a processing delay or a hang-up occurred in the Web application.
3. If this error message is produced frequently, increase the process multiplicity of the WorkUnit (IJSERVER) or check the system configuration (hardware and software) and reconfigure an overload-resistant system. Consider upgrading the CPU as needed.  
Check the event log (system log) or container log of IJSERVER. If there is insufficient Java VM memory ('OutOfMemoryError' is output), refer to "JDK/JRE Tuning" in the "Tuning Guide".
4. When the Web server and WorkUnit (IJSERVER) operate on different server machines, check for network connection errors between the Web server and WorkUnit (IJSERVER).

## 8.6.45 IJSERVER12045

---

**( warn) IJSERVER12045: Web Server Connector properties could not be loaded. conf="<filename>" pid=<pid> tid=<tid>**

### Variable Information

<filename> = Property file of Web server connector

<pid> = Web server process ID

<tid> = Web server thread ID

## Explanation

The property file of the Web server connector cannot be loaded. The Web server connector operates with the properties most recently loaded, or those properties used at start of the Web server.

**Windows32/64**

The Web server connector operates with the properties most recently loaded, or those properties used at start of the Web server.

**Solaris32/64 Linux32/64**

The Web connector posts status code 500 (Internal Server Error) to the Web browser.

The Web connector posts status code 500 (Internal Server Error) to the Web browser also to the request after this message was output.

## User Action

Take action according to the message that was output to the Web server connector log or event log (system log).

### 8.6.46 IJServer12046

---

**( warn) IJServer12046: Web Server Connector property file does not exist. conf="<filename>" pid=<pid> tid=<tid>**

#### Variable Information

<filename> = Property file of Web server connector

<pid> = Web server process ID

<tid> = Web server thread ID

#### Explanation

The property file of the Web server connector does not exist. It was deleted.

#### User Action

- If the property file of the Web server connector was deleted, restore the deleted file. If it cannot be restored, use the IJServer restore command (*ijsrestore*) to restore the property file of the Web server connector.
- Check whether there is an Interstage HTTP Server operating environment for the "Fjapache" Web server. If there is not, create the Interstage HTTP Server operating environment again using the name "Fjapache".

### 8.6.47 IJServer12047

---

**( info) IJServer12047: Web Server Connector running. conf="<filename>" webtype=<webtype> pid=<pid> tid=<tid>**

#### Variable Information

<filename> = Property file of Web server connector

<webtype> = Web server I/F which the Web server connector is using.

"nsapi" is output when Microsoft (R) Internet Information Services is used, and "isapi" is output when Sun Java System Web Server is used.

This variable information is not outputted at the time of use of Interstage HTTP Server.

<pid> = Web server process ID

<tid> = Web server thread ID

#### Explanation

The Web server connector has been activated.

#### Note

In Microsoft(R) Internet Information Services 6.0 or 7.0, this message is output after the Web Server is started and the first access is made from the client. In Web Servers other than Microsoft(R) Internet Information Services 6.0 or 7.0, this message is output when the Web Server is started.

### 8.6.48 IJServer12048

---

**( info) IJServer12048: Web Server Connector stops running. conf="<filename>" webtype=<webtype> pid=<pid> tid=<tid>**

#### Variable Information

<filename> = Property file of Web server connector

<webtype> = Web server I/F which the Web server connector is using.

"nsapi" is output when Microsoft (R) Internet Information Services is used, and "isapi" is output when Sun Java System Web Server is used.

This variable information is not outputted at the time of use of Interstage HTTP Server.

<pid> = Web server process ID

<tid> = Web server thread ID

#### Explanation

The Web server connector has been stopped.

### 8.6.49 IJServer12049

---

**(error) IJServer12049: Unable to open file. Too many open files. Close some of the opened files or close any unnecessary applications. file="<filename>" errno=<errno> pid=<pid> tid=<tid>**

#### Variable Information

<filename> = File name

<errno> = Error number

<pid> = Web server process ID

<tid> = Web server thread ID

#### Explanation

A file cannot be opened.

#### Cause

There are too many opened files.

#### User Action

End other applications or increase the number of files that can be opened by the system.

### 8.6.50 IJServer12050

---

**(error) IJServer12050: Unable to open file. Missing write permission for file or file is already open with write access. Add write permission on the file or directory. file="<filename>" errno=<errno> pid=<pid> tid=<tid>**

#### Variable Information

<filename> = File name

<errno> = Error number

<pid> = Web server process ID

<tid> = Web server thread ID

#### Explanation

Unable to open file.

#### Cause

Possible causes are as follows:

- There is no authority written in the directory to which the file exists.
- The file is already opened by another application.
- A directory exists with the same name as the file.

### User Action

Give the authority which the execution user of a Web server writes to the directory where the file exists.

Close the file.

When <filename> is a directory, move the directory or delete the directory.

## 8.6.51 IJServer12051

---

**(error) IJServer12051: Unable to read file. Device was removed or an I/O error occurred. file="<filename>" errno=<errno> pid=<pid> tid=<tid>**

### Variable Information

<filename> = File name

<errno> = Error number

<pid> = Web server process ID

<tid> = Web server thread ID

### Explanation

Unable to read file.

### Cause

The I/O error occurred. The disk may have been removed.

### User Action

Check whether with reference to an event log (system log), there are any abnormalities in a system.

## 8.6.52 IJServer12052

---

**(error) IJServer12052: Unable to write file. Device was removed or an I/O error occurred. file="<filename>" errno=<errno> pid=<pid> tid=<tid>**

### Variable Information

<filename> = File name

<errno> = Error number

<pid> = Web server process ID

<tid> = Web server thread ID

### Explanation

Unable to write file.

### Cause

The I/O error occurred. The disk may have been removed, or be insufficiently available.

### User Action

Check whether with reference to an event log (system log), there are any abnormalities in a system.

## 8.6.53 IJServer12053

---

**(error) IJServer12053: Failed to get a semaphore. errno=<errno> pid=<pid> tid=<tid>**

### Variable Information

<errno> = Error number

<pid> = Web server process ID

<tid> = Web server thread ID

#### Explanation

The attempt to get a semaphore failed.

#### Cause

The system resources (semaphores) were insufficient.

#### User Action

Refer to the Tuning Guide, and check that there are sufficient system resources (semaphores) to run Interstage. If system resources are sufficient, close other applications.

### 8.6.54 IJServer12054

---

**(error) IJServer12054: HTTP request which contains wrong header was received. header=<http\_header> pid=<pid> tid=<tid>**

#### Variable Information

<http\_header> = HTTP header

<pid> = Web server process ID

<tid> = Web server thread ID

#### Explanation

An HTTP request containing an illegal HTTP header was received.

#### Cause

The server may have been attacked externally.

#### System Action

The Web server connector aborts the connection to the WorkUnit (IJServer) and notifies a status code 400 (Bad Request) message to the Web browser.

#### User Action

Investigate the possibility of an attack based on the request source IP address or host name that was output to the Web server access log.

### 8.6.55 IJServer12055

---

**(error) IJServer12055: Web Server does not exist. pid=<pid> tid=<tid>**

#### Variable Information

<pid> = Web server process ID

<tid> = Web server thread ID

#### Explanation

The Web server does not exist.

#### Cause

A system error occurred.

#### User Action

Collect the check information using the *iscollectinfo* command, then contact a service engineer.

## 8.7 IJServer12100 to IJServer12199

---

### 8.7.1 IJServer12101

---

**(error) IJServer12101: Cannot load Fault monitoring function library. lib="<filename>" func=<func> pid=<pid> tid=<tid>**

#### Variable Information

<filename>= The library path of the Web server connector fault monitoring function

<func>=Error occurrence function name

<pid>=Web server process ID

<tid>=Web server thread ID

#### Explanation

Failed to load the library of the Web server connector fault monitoring function.

#### System Action

Continues processing without the fault monitoring function.

#### Cause

The following can be considered as possible causes:

- The library of the Web server connector fault monitoring function does not exist.
- The library files of the Web server connector fault monitoring function contain an error.
- There is no access authority to the library of the Web server connector fault monitoring function.

#### User Action

Reinstall Interstage.

### 8.7.2 IJServer12102

---

**(error) IJServer12102: Cannot initialization Fault monitoring function. status=<status>. pid=<pid> tid=<tid>**

#### Variable Information

<status>=The value returned from the fault monitoring function

<pid>=Web server process ID

<tid>=Web server thread ID

#### Explanation

Failed to initialize the fault monitoring function.

#### System Action

Continues processing without the fault monitoring function.

#### User Action

Take action according to the suggestion in the message displayed immediately before.

If there is no message displayed immediately before, use the *iscollectinfo* command to collect diagnostic information. Send this information to a Systems Engineer.

## 8.7.3 IJServer12103

---

**(info) IJServer12103: initialization success Fault monitoring function. pid=<pid> tid=<tid>**

### Variable Information

<pid>=Web server process ID

<tid>=Web server thread ID

### Explanation

The fault monitoring function was initialized successfully.

## 8.7.4 IJServer12104

---

**(error) IJServer12104: Cannot initialization Fault monitoring function, because of retry time over. status=<status> time(second)=<time> pid=<pid> tid=<tid>**

### Variable Information

<status>=The value returned from the fault monitoring function

<time>=The wait time for starting the fault monitoring function

<pid>=Web server process ID

<tid>=Web server thread ID

### Explanation

Initialization of the fault monitoring function was not completed during the wait time.

### System Action

Continues processing without the fault monitoring function.

### User Action

The system might take a long time to start up if there is a load status when the system starts up. In this case, increase the value for the Fault Monitoring Settings wait time.

If the above action is taken and there is still no improvement, follow the suggestion in the message starting with SvMon displayed immediately before.

If there is no message starting with SvMon displayed immediately before, use the *iscollectinfo* command to collect diagnostic information. Send this information to a Systems Engineer.

## 8.7.5 IJServer12105

---

**(error) IJServer12105: Unable to stop Fault monitoring function. status=<status> pid=<pid> tid=<tid>**

### Variable Information

<status>=The value returned from the fault monitoring function

<pid>=Web server process ID

<tid>=Web server thread ID

### Explanation

Failed to stop monitoring using the fault monitoring function.

### System Action

Continues processing without the fault monitoring function.

## User Action

If the server was installed using secure mode, or the mode was changed to secure mode using the *issetsecuritymode* command, the settings for the group (the "Group" directive in the httpd.conf file) with Interstage HTTP Server communication process execution authority may contradict the settings for the fault monitoring function file and directory group. Set the group with Interstage HTTP Server communication process execution authority for the following file groups and then restart Interstage HTTP Server.

- /var/opt/FJSVsvmon/.svmonsock
- /var/opt/FJSVsvmon/log/svmon\_api.log\*
- /var/opt/FJSVsvmon
- /var/opt/FJSVsvmon/log

In all other cases, take action according to the suggestion in the message displayed immediately before.

If there is no message displayed immediately before, use the *iscollectinfo* command to collect diagnostic information. Send this information to a Systems Engineer.

## 8.7.6 IJServer12106

---

**(info) IJServer12106: Fault monitoring function stops running. pid=<pid> tid=<tid>**

### Variable Information

<pid>=Web server process ID

<tid>=Web server thread ID

### Explanation

Monitoring using the fault monitoring function stopped normally.

## 8.7.7 IJServer12107

---

**(error) IJServer12107: Unable to shutdown Fault monitoring function. status=<status> pid=<pid> tid=<tid>**

### Variable Information

<status>=The value returned from the fault monitoring function

<pid>=Web server process ID

<tid>=Web server thread ID

### Explanation

Failed to stop the fault monitoring function.

### System Action

Continues processing without the fault monitoring function.

### User Action

Follow the suggestion in the message displayed immediately before.

If there is no message displayed immediately before, use the *iscollectinfo* command to collect diagnostic information. Send this information to a Systems Engineer.

## 8.7.8 IJServer12108

---

**(info) IJServer12108: Fault monitoring function shutdown. pid=<pid> tid=<tid>**

## Variable Information

<pid>=Web server process ID

<tid>=Web server thread ID

## Explanation

The fault monitoring function stopped normally.

## 8.7.9 IJServer12109

---

**(error) IJServer12109: Unable to run Fault monitoring function. status=<status> pid=<pid> tid=<tid>**

## Variable Information

<status>=The value returned from the fault monitoring function

<pid>=Web server process ID

<tid>=Web server thread ID

## Explanation

Failed to start monitoring using the fault monitoring function.

## System Action

Continues processing without the fault monitoring function.

## User Action

If the server was installed using secure mode, or the mode was changed to secure mode using the *issetsecuritymode* command, the settings for the group (the "Group" directive in the httpd.conf file) with Interstage HTTP Server communication process execution authority may contradict the settings for the fault monitoring function file and directory group. Set the group with Interstage HTTP Server communication process execution authority for the following file groups and then restart Interstage HTTP Server.

- /var/opt/FJSVsvmon/.svmonsock
- /var/opt/FJSVsvmon/log/svmon\_api.log\*
- /var/opt/FJSVsvmon
- /var/opt/FJSVsvmon/log

In all other cases, this message may be generated when the startup wait time of the fault monitoring setup is set to 0. Correct it to the default value or a higher value.

If the above action is taken and there is still no improvement, follow the suggestion in the message starting with SvMon displayed immediately before.

If there is no message starting with SvMon displayed immediately before, use the *iscollectinfo* command to collect diagnostic information. Send this information to a Systems Engineer.

## 8.7.10 IJServer12110

---

**(info) IJServer12110: Fault monitoring function running. pid=<pid> tid=<tid>**

## Variable Information

<pid>=Web server process ID

<tid>=Web server thread ID

## Explanation

Monitoring using the fault monitoring function has started.

## 8.7.11 IJServer12111

---

**(error) IJServer12111: Unable to get monitoring status Fault monitoring function. status=<status> host=<host> port=<port> pid=<pid> tid=<tid>**

### Variable Information

<status>=The value returned from the fault monitoring function

<host>=Host name to be monitored

<port>=Port number to be monitored

<pid>=Web server process ID

<tid>=Web server thread ID

### Explanation

Failed to start monitoring using the fault monitoring function.

### System Action

Continues processing without the fault monitoring function.

### User Action

Follow the suggestion in the message displayed immediately before.

If there is no message displayed immediately before, use the *iscollectinfo* command to collect diagnostic information. Send this information to a Systems Engineer.

## 8.8 IJServer14000 to IJServer14099

---

### 8.8.1 IJServer14000

---

**IJServer14000: <Management information name> is under registration to MBeanServer: NAME=<IJServer name>**

### Explanation

Management information is being registered to the Interstage JMX service.

### 8.8.2 IJServer14001

---

**IJServer14001: <Management information name> is under unregistration from MBeanServer: NAME=<IJServer name>**

### Explanation

Management information is being deleted from the Interstage JMX service.

### 8.8.3 IJServer14002

---

**IJServer14002: Acquisition of MBeanServer was failed: NAME=<IJServer name>**

### Explanation

The Interstage JMX service connection failed.

### Cause

The Interstage JMX service may be stopped.

## User Action

Check whether the Interstage JMX service is active.

If the Interstage JMX Service has started, the configuration file that is essential for running Interstage JMX Service is damaged, or does not exist. Reinstall Interstage, and then restore the essential configuration file.

---

## 8.8.4 IJServer14003

---

### IJServer14003: Additional JARs have been added

#### Explanation

A JAR file has been added.

---

## 8.8.5 IJServer14004

---

### IJServer14004: Additional JARs have been added : '<JAR file name>'

#### Explanation

The JAR file indicated by <JAR file name> has been added.

---

## 8.8.6 IJServer14005

---

### IJServer14005: Allocate exception for servlet <servlet>

#### Explanation

Initialization of the servlet indicated by <servlet> failed due to one of the following causes.

#### Cause

This servlet is invalid.

- The servlet class is not found.
- Class generation failed.
- The init method caused an exception.

#### User Action

Remove the failure cause by referring to the content of the exception.

---

## 8.8.7 IJServer14006

---

### IJServer14006: Cannot allocate servlet instance for path <path>

#### Explanation

Initialization of the servlet indicated by <path> failed due to one of the following causes.

#### Cause

This servlet is invalid.

- The servlet class is not found.
- Class generation failed.
- The init method caused an exception.

#### User Action

Remove the failure cause by referring to the content of the exception.

## 8.8.8 IJServer14007

---

### IJServer14007: Cannot deallocate servlet instance for path <path>

#### Explanation

The *destroy* method of the servlet indicated by <path> failed.

#### User Action

Remove the failure cause by referring to the content of the exception.

## 8.8.9 IJServer14008

---

### IJServer14008: Catalina.start : exception

#### Explanation

The Web container could not be started.

#### User Action

An error occurred during initialization of the Web container. Remove the error cause by referring to the content of the exception.

## 8.8.10 IJServer14009

---

### IJServer14009: Communication of MBeanServer cannot be starting: NAME=<IJServer name>

#### Explanation

The Interstage JMX service connection failed.

#### Cause

Interstage JMX service may be stopped.

#### User Action

Check whether the Interstage JMX service is active.

If the Interstage JMX Service has started, the configuration file that is essential for running Interstage JMX Service is damaged, or does not exist. Reinstall Interstage, and then restore the essential configuration file.

## 8.8.11 IJServer14010

---

### IJServer14010: Communication of MBeanServer cannot be stopping: NAME=<IJServer name>

#### Explanation

Disconnection from Interstage JMX service failed.

#### Cause

Termination processing with the Interstage JMX service may have failed.

#### User Action

Correct the error by referring to the exception in the log file of the Interstage JMX service.

## 8.8.12 IJServer14011

---

### IJServer14011: Communication of MBeanServer is starting: NAME=<IJServer name>

#### Explanation

A connection has been made with the Interstage JMX service.

## 8.8.13 IJServer14012

---

### IJServer14012: Communication of MBeanServer is stopping: NAME=<IJServer name>

#### Explanation

Disconnection from the Interstage JMX service has taken place.

## 8.8.14 IJServer14013

---

### IJServer14013: Communication of MBeanServer was starting: NAME=<IJServer name>

#### Explanation

A connection has been made with the Interstage JMX service.

## 8.8.15 IJServer14014

---

### IJServer14014: Communication of MBeanServer was stopping: NAME=<IJServer name>

#### Explanation

Disconnection from the Interstage JMX service has taken place.

## 8.8.16 IJServer14015

---

### IJServer14015: Context startup failed due to previous errors

#### Explanation

The context (Web application) could not be started.

#### User Action

Remove the error cause by referring to the exception that occurred immediately before this error.

## 8.8.17 IJServer14016

---

### IJServer14016: Deallocate exception for servlet <servlet>

#### Explanation

The *destroy* method of the servlet indicated by <servlet> failed.

#### User Action

Remove the failure cause by referring to the content of the exception.

## 8.8.18 IJServer14017

---

### IJServer14017: Deploy class files <path> to <directory>

#### Explanation

The class file indicated by <path> is deployed to the directory indicated by <directory>.

## 8.8.19 IJServer14018

---

### IJServer14018: Deploy JAR <path> to <directory>

#### Explanation

The JAR file indicated by <path> is deployed to the directory indicated by <directory>.

## 8.8.20 IJServer14019

---

### IJServer14019: Deploying class repositories to work directory <directory>

#### Explanation

The directory indicated by <directory> is used as a repository work directory.

## 8.8.21 IJServer14023

---

### IJServer14023: Error configuring application listener of class <class>

#### Explanation

The listener class indicated by <class> could not be generated.

#### Cause

The listener class is not found. Alternatively, class generation may have failed.

#### User Action

Remove the failure cause by referring to the content of the exception.

## 8.8.22 IJServer14024

---

### IJServer14024: Error tracking modifications

#### Explanation

Resource modification checking failed. The system continues resource modification checking.

#### User Action

If this warning is output continuously, check whether the Web application deployment directory is damaged or access authority is granted. If no problem is found, restart the IJServer.

## 8.8.23 IJServer14025

---

### IJServer14025: Exception sending context destroyed event to listener instance of class <class>

#### Explanation

The contextDestroyed method of the listener class indicated by <class> threw an exception.

#### User Action

Remove the failure cause by referring to the content of the exception.

## 8.8.24 IJServer14026

---

### IJServer14026: Exception sending context initialized event to listener instance of class <class>

#### Explanation

The contextInitialized method of the listener class indicated by <class> threw an exception.

#### User Action

Remove the failure cause by referring to the content of the exception.

## 8.8.25 IJServer14027

---

### IJServer14027: Exception starting filter <class>

## Explanation

Initialization of the filter class indicated by <class> of context [0] failed.

## Cause

Possible causes are as follows:

- The filter class is not found.
- Class generation failed.
- The init method caused an exception.

## User Action

Remove the failure cause by referring to the content of the exception.

## 8.8.26 IJServer14028

---

### IJServer14028: Exception starting Wrapper for servlet <servlet>

## Explanation

Initialization of the servlet indicated by <servlet> failed. This servlet is invalid:

## Cause

Possible causes are as follows:

- The servlet class is not found.
- Class generation failed.
- The init method caused an exception.

## User Action

Remove the failure cause by referring to the content of the exception.

## 8.8.27 IJServer14029

---

### IJServer14029: Exception stopping Wrapper for servlet <servlet>

## Explanation

The *destroy* method of the servlet indicated by <servlet> failed.

## User Action

Remove the failure cause by referring to the content of the exception.

## 8.8.28 IJServer14030

---

### IJServer14030: Exception thrown by attributes event listener

## Explanation

The *attributeRemoved* method of the listener class threw an exception.

## User Action

Remove the failure cause by referring to the content of the exception.

## 8.8.29 IJServer14031

---

### IJServer14031: Exception thrown by attributes event listener

## Explanation

The attributeAdded method of the listener class threw an exception.

## User Action

Remove the failure cause by referring to the content of the exception.

### 8.8.30 IJServer14032

---

#### **IJServer14032: Failed to notify workunit of its aliveness continuously. Stopping the this output until success**

## Explanation

"Alive" notification to the WorkUnit failed successively. Error output will be suppressed until "alive" notification is successful.

## User Action

None.

### 8.8.31 IJServer14033

---

#### **IJServer14033: Failed to start application Filters successfully**

## Explanation

Initialization of the filter class failed.

## Cause

Possible causes are as follows:

- The filter class is not found.
- Class generation failed.
- The init method caused an exception.

## User Action

Remove the failure cause by referring to the content of the exception.

### 8.8.32 IJServer14034

---

#### **IJServer14034: Failed to start application Listeners successfully**

## Explanation

Initialization of the listener class failed.

## Cause

Possible causes are as follows:

- The listener class is not found.
- Class generation failed.

## User Action

Remove the failure cause by referring to the content of the exception.

### 8.8.33 IJServer14035

---

#### **IJServer14035: IJServer Web container continues starting up.**

Explanation

IJServer has made a normal return from advance startup completion notification processing for the WorkUnit.

---

### 8.8.34 IJServer14036

---

**IJServer14036: IJServer Web container is activated. : instanceNo=%1, port=%2**

Explanation

IJServer is calling startup completion notification processing for the WorkUnit.

---

### 8.8.35 IJServer14037

---

**IJServer14037: IJServer Web container is now up to standby level.**

Explanation

IJServer is calling advance startup completion notification processing for the WorkUnit.

---

### 8.8.36 IJServer14038

---

**IJServer14038: IJServer Web container is releasing workunit resources.**

Explanation

IJServer is calling resource collection processing.

---

### 8.8.37 IJServer14039

---

**IJServer14039: IJServer Web container is running...**

Explanation

IJServer is calling container stop wait processing for the WorkUnit.

---

### 8.8.38 IJServer14040

---

**IJServer14040: IJServer Web container now starts shutting down.**

Explanation

IJServer has made a normal return from container stop wait processing for the WorkUnit. "Synchronous stop mode"

---

### 8.8.39 IJServer14041

---

**IJServer14041: IJServer Web container receipt shutdown notification. But shutting down is already started.**

Explanation

Because IJServer has already started stop processing, the second and subsequent stop instructions were ignored.

---

### 8.8.40 IJServer14042

---

**IJServer14042: IJServer Web container released workunit resources.**

Explanation

IJServer has made a normal return from resource collection processing.

## 8.8.41 IJServer14043

---

### IJServer14043: IJServer Web container started.

#### Explanation

IJServer has made a normal return from startup completion notification processing for the WorkUnit.

## 8.8.42 IJServer14044

---

### IJServer14044: IJServer Web container transmits the notice of a TIMEOUT.

#### Explanation

IJServer is calling timeout notification processing.

## 8.8.43 IJServer14045

---

### IJServer14045: IJServer Web container transmitted the notice of a TIMEOUT.

#### Explanation

IJServer has made a normal return from timeout notification processing.

## 8.8.44 IJServer14046

---

### IJServer14046: IJServer Web container was forced to terminate.

#### Explanation

IJServer has made a normal return from container stop wait processing for the WorkUnit. "Forced stop mode"

## 8.8.45 IJServer14047

---

### IJServer14047: IJServer Web+EJB container is activated. : instanceNo=%1, port=%2

#### Explanation

IJServer is calling startup completion notification processing for the WorkUnit.

## 8.8.46 IJServer14048

---

### IJServer14048: IJServer Web+EJB container is releasing workunit resources.

#### Explanation

IJServer is calling resource collection processing.

## 8.8.47 IJServer14049

---

### IJServer14049: IJServer Web+EJB container is running...

#### Explanation

IJServer is calling container stop wait processing for the WorkUnit.

## 8.8.48 IJServer14050

---

### IJServer14050: IJServer Web+EJB container now starts shutting down.

#### Explanation

IJServer has made a normal return from container stop wait processing for the WorkUnit. "Synchronous stop mode"

## 8.8.49 IJServer14051

---

**IJServer14051: IJServer Web+EJB container receipt shutdown notification. But shutting down is already started.**

### Explanation

Because IJServer had already started stop processing, the second and subsequent stop instructions were ignored.

## 8.8.50 IJServer14052

---

**IJServer14052: IJServer Web+EJB container released workunit resources.**

### Explanation

IJServer has normally returned from resource collection processing.

## 8.8.51 IJServer14053

---

**IJServer14053: IJServer Web+EJB container started.**

### Explanation

IJServer has made a normal return from startup completion notification processing for the WorkUnit.

## 8.8.52 IJServer14054

---

**IJServer14054: IJServer Web+EJB container transmits the notice of a TIMEOUT.**

### Explanation

IJServer is calling timeout notification processing.

## 8.8.53 IJServer14055

---

**IJServer14055: IJServer Web+EJB container transmitted the notice of a TIMEOUT.**

### Explanation

IJServer has made a normal return from timeout notification processing.

## 8.8.54 IJServer14056

---

**IJServer14056: IJServer Web+EJB container was forced to terminate.**

### Explanation

IJServer has made a normal return from container stop wait processing for the WorkUnit. "Forced stop mode"

## 8.8.55 IJServer14057

---

**IJServer14057: Initialization of MBeanServer was unsuccessful: NAME=<IJServer name>**

### Explanation

The Interstage JMX service connection failed.

### Cause

The Interstage JMX service may be stopped.

### User Action

Check whether the Interstage JMX service is active.

If the Interstage JMX service is active, the definition file required for Interstage JMX service operation may be damaged or may not exist. Reinstall Interstage to restore the required definition file.

## 8.8.56 IJServer14058

---

**IJServer14058: It succeeded in the notice of aliveness to workunit. It will output if the notification fails from now**

### Explanation

"Alive" notification to the WorkUnit ended successfully. If "alive" notification fails next time, an error will be produced.

### User Action

None.

## 8.8.57 IJServer14059

---

**IJServer14059: java.lang.OutOfMemoryError**

### Explanation

The memory (heap area), system real memory, or swap area is short of free space.

### User Action

Refer to "JDK/JRE Tuning" in the "Tuning Guide", and take action.

## 8.8.58 IJServer14060

---

**IJServer14060: Marking servlet <servlet> as unavailable**

### Explanation

Initialization of the servlet indicated by <servlet> failed. This servlet is currently invalid.

### Cause

Possible causes are as follows:

- The servlet class is not found.
- Class generation failed.
- The init method caused an exception.

### User Action

Remove the failure cause by referring to the content of the exception.

## 8.8.59 IJServer14061

---

**IJServer14061: Marking this application unavailable due to previous error(s)**

### Explanation

The context (Web application) could not be started. This Web application is currently invalid.

### User Action

Remove the error cause by referring to the exception that occurred immediately before this error.

## 8.8.60 IJServer14062

---

**IJServer14062: MBeanServer is under acquisition: NAME=<IJServer name>**

## Explanation

A connection has been made with the Interstage JMX service.

### 8.8.61 IJServer14063

---

#### IJServer14063: MBeanServer is under initialization: NAME=<IJServer name>

## Explanation

A connection has been made with the Interstage JMX service.

### 8.8.62 IJServer14064

---

#### IJServer14064: MBeanServer is under releasing: NAME=<IJServer name>

## Explanation

Disconnection from the Interstage JMX service has taken place.

### 8.8.63 IJServer14065

---

#### IJServer14065: MBeanServer was acquired: NAME=<IJServer name>

## Explanation

Disconnection from the Interstage JMX service has taken place.

### 8.8.64 IJServer14066

---

#### IJServer14066: MBeanServer was initialized: NAME=<IJServer name>

## Explanation

A connection has been made with the Interstage JMX service.

### 8.8.65 IJServer14067

---

#### IJServer14067: Missing application web.xml, using defaults only

## Explanation

The web.xml file of the context (Web application) is not found. The web.xml file in the IJServer root directory is used.

## User Action

Check that the Web.xml file of the context (Web application) exists. This message can be ignored if web.xml is not to be used.

### 8.8.66 IJServer14068

---

#### IJServer14068: no response detected. url:<url> time:<time> thread:<thread>

## Explanation

A timeout was detected during calling the application indicated by <url>. The call time is <time>.

## Cause

Application is not operating normally or the value set for the timeout time may be too small.

## User Action

Check whether the application runs normally. If it runs normally, the value set for the timeout time may be too small. Set the proper value for the "maximum processing time of application" in the WorkUnit environment definition.

## 8.8.67 IJServer14069

---

### IJServer14069: Occurred at line <line> column <column>

#### Explanation

Analysis of web.xml of the context (Web application) failed (approximately <column> characters of <line> lines).

When the problem is that a line or a character cannot be specified, it is displayed on <line> or <column> as -1. Check the content of the exception.

#### User Action

Remove the failure cause by referring to the content of the SAX exception displayed before this message and one immediately after.

## 8.8.68 IJServer14070

---

### IJServer14070: Parse error in application web.xml

#### Explanation

Parsing of web.xml of the context (Web application) failed.

#### User Action

Remove the failure cause by referring to the content of the SAX exception that occurred immediately before this failure.

## 8.8.69 IJServer14071

---

### IJServer14071: Registration of MBean was successful: NAME=<IJServer name> RESOURCE=<Management information name>

#### Explanation

The management information has been registered in the Interstage JMX service.

## 8.8.70 IJServer14072

---

### IJServer14072: Registration of MBean was unsuccessful: NAME=<IJServer name> RESOURCE=<Management information name>

#### Explanation

MBean registration failed.

#### User Action

The management information has not been registered to the Interstage JMX service.

## 8.8.71 IJServer14073

---

### IJServer14073: Release of MBeanServer was successful: NAME=<IJServer name>

#### Explanation

Disconnection from the Interstage JMX service has taken place.

## 8.8.72 IJServer14074

---

### IJServer14074: Release of MBeanServer was unsuccessful: NAME=<IJServer name>

#### Explanation

Disconnection from the Interstage JMX service failed.

#### Cause

Termination processing with the Interstage JMX service may have failed.

#### User Action

Correct the error by referring to the exception in the log file of the Interstage JMX service.

---

### 8.8.73 IJServer14075

---

#### IJServer14075: Reloading checks are enabled for this Context

#### Explanation

The reloader thread has started.

---

### 8.8.74 IJServer14076

---

#### IJServer14076: Reloading this Context failed due to previous errors

#### Explanation

Context reloading failed.

---

### 8.8.75 IJServer14077

---

#### IJServer14077: Reloading this Context has started

#### Explanation

Context reloading has started.

---

### 8.8.76 IJServer14078

---

#### IJServer14078: Reloading this Context is completed

#### Explanation

Context reloading has completed successfully.

---

### 8.8.77 IJServer14079

---

#### IJServer14079: Resource '<path>' is missing

#### Explanation

Resource '<path>' is missing.

#### Cause

The resource indicated by <path> may have been damaged or deleted during operation.

#### User Action

By referring to the Web application deployment directory, check that required resources such as applications and setting files exist.

---

### 8.8.78 IJServer14080

---

#### IJServer14080: Resource '<path>' was modified; Date is now: <date> Was: <date>

#### Explanation

The resource indicated by <path> has been modified.

## 8.8.79 IJServer14081

---

### IJServer14081: Resources start failed:

#### Explanation

IJServer failed to start a resource

#### Cause

The document base did not exist or could not be read.

#### User Action

Check that the document base exists and can be read.

## 8.8.80 IJServer14082

---

### IJServer14082: servlet <servlet> is currently unavailable

#### Explanation

Initialization of the servlet indicated by <servlet> failed due to one of the following reasons. This servlet is currently invalid.

#### Cause

Possible causes are as follows:

- The servlet class is not found.
- Class generation failed.
- The init method caused an exception.

#### User Action

Remove the failure cause by referring to the content of the exception.

## 8.8.81 IJServer14083

---

### IJServer14083: servlet <servlet> threw load() exception

#### Explanation

The servlet indicated by <servlet> could not be loaded due to one of the following reasons. This servlet is currently invalid.

#### Cause

Possible causes are as follows:

- The servlet class is not found.
- Class generation failed.
- The init method caused an exception.

#### User Action

Remove the failure cause by referring to the content of the exception.

## 8.8.82 IJServer14084

---

### IJServer14084: servlet <servlet> threw unload() exception

#### Explanation

The *destroy* method of the servlet indicated by <servlet> failed.

#### User Action

Remove the failure cause by referring to the content of the exception.

### 8.8.83 IJServer14085

---

#### IJServer14085: Servlet.service() for servlet <servlet> threw exception

#### Explanation

The service method of the servlet indicated by <servlet> threw an exception.

#### User Action

Remove the failure cause by referring to the content of the exception.

### 8.8.84 IJServer14086

---

#### IJServer14086: Session attribute event listener threw exception

#### Explanation

The *attributeRemoved* method, *attributeAdded* method, or *attributeReplaced* method of the listener class threw an exception.

The *attributeRemoved* method, *attributeAdded* method, *attributeReplaced* method, *activate* method, or *passivate* method of the listener class threw an exception (when session recovery was enabled)

#### User Action

Remove the failure cause by referring to the content of the exception.

### 8.8.85 IJServer14087

---

#### IJServer14087: Session event listener threw exception

#### Explanation

The *sessionCreated* method or *sessionDestroyed* method of the listener class threw an exception.

#### User Action

Remove the failure cause by referring to the content of the exception.

### 8.8.86 IJServer14088

---

#### IJServer14088: Since information is insufficient, JMX processing is not performed.

#### Explanation

The name of the called context (Web application) or servlet name could not be obtained. Performance information is not totaled.

#### User Action

Check that servlet/JSP definition and mapping definition have been performed normally in the web.xml file of the context (Web application).

### 8.8.87 IJServer14089

---

#### IJServer14089: Skipped installing application listeners due to previous error(s)

#### Explanation

Initialization of the listener class failed due to one of the following reasons. Listener class registration was not performed.

## Cause

Possible causes are as follows:

- The listener class is not found.
- Class generation failed.

## User Action

Remove the failure cause by referring to the content of the exception.

## 8.8.88 IJServer14090

---

**IJServer14090: Unregistration of MBean was successful: NAME=<IJServer name>  
RESOURCE=<Management information name>**

### Explanation

The management information has been unregistered from the Interstage JMX service.

## 8.8.89 IJServer14091

---

**IJServer14091: Unregistration of MBean was unsuccessful: NAME=<IJServer name>  
RESOURCE=<Management information name>**

### Explanation

The management information could not be unregistered from the Interstage JMX service.

### User Action

Remove the warning by referring to the exception logged into the log file of the Interstage JMX service.

## 8.8.90 IJServer14092

---

**IJServer14092: validateJarFile(<jarfile>) - jar not loaded. See Servlet Spec 2.3,section 9.7.2. Offending class: <name>**

### Explanation

Jar was not read using the JAR file check. Refer to section 9.7.2. of Servlet Specification 2.3.

### Cause

A J2SE or ServletAPI class (or a class with the same name) was contained in the application JAR file.

### User Action

Do not include J2SE or ServletAPI classes (or classes with the same name) in the application.

## 8.8.91 IJServer14093

---

**IJServer14093: WARNING: Error page location <location> must start with a '/' in Servlet 2.3**

### Explanation

Because the definition of the ErrorPage (Location) indicated by <location> did not begin with '/', the container appended '/' to the beginning. Under the Servlet2.3 specifications, the ErrorPage (Location) definition must begin with '/'.

### User Action

This problem is handled as a warning because IJServer runs on Servlet2.2. When running IJServer on Servlet2.3, correct the ErrorPage (Location) definition properly.

## 8.8.92 IJServer14094

---

### IJServer14094: WARNING: Form error page <page> must start with a '/' in Servlet 2.3

#### Explanation

Because the definition of the ErrorPage indicated by <page> did not begin with '/', the container appended '/' to the beginning. Under the Servlet2.3 specifications, the ErrorPage definition must begin with '/'.

#### User Action

This problem is handled as a warning because IJServer runs on Servlet2.2. When running IJServer on Servlet2.3, correct the ErrorPage definition properly.

## 8.8.93 IJServer14095

---

### IJServer14095: WARNING: Form login page <page> must start with a '/' in Servlet 2.3

#### Explanation

Because the definition of the LoginPage indicated by <page> did not begin with '/', the container appended '/' to the beginning. Under the Servlet2.3 specifications, the LoginPage definition must begin with '/'.

#### User Action

This problem is handled as a warning because IJServer runs on Servlet2.2. When running IJServer on Servlet2.3, correct the LoginPage definition properly.

## 8.8.94 IJServer14096

---

### IJServer14096: WARNING: JSP file {0} must start with a '/' in Servlet 2.3

#### Explanation

Because the JSP {0} definition did not begin with '/', the container appended '/' to the beginning. Under the Servlet2.3 specifications, the JSP definition must begin with '/'.

#### User Action

This problem is handled as a warning because IJServer runs on Servlet2.2. When running IJServer on Servlet2.3, correct the JSP definition properly.

## 8.8.95 IJServer14097

---

### IJServer14097: WARNING: URL pattern {0} must start with a '/' in Servlet 2.3

#### Explanation

Because the URL pattern definition {0} did not begin with '/', the container appended '/' to the beginning. Under the Servlet2.3 specifications, the URL pattern definition must begin with '/'.

#### User Action

This problem is handled as a warning because IJServer runs on Servlet2.2. When running IJServer on Servlet2.3, correct the URL pattern definition properly.

## 8.8.96 IJServer14098

---

### IJServer14098: Workunit failed in keeping of running or starting of shutting-down. IJServer Web container is aborted.(code=%1)

#### Explanation

IJServer has returned an error from container stop wait processing for the WorkUnit.

#### Cause

The WorkUnit (TD) may not be active.

#### User Action

Remove the error cause by referring to the WorkUnit log file.

### 8.8.97 IJServer14099

---

**IJServer14099: Workunit failed in keeping of running or starting of shutting-down. IJServer Web+EJB container is aborted.(code=%1)**

#### Explanation

IJServer has returned an error from container stop wait processing for the WorkUnit.

#### Cause

The WorkUnit (TD) may not be active.

#### User Action

Remove the error cause by referring to the WorkUnit log file.

### 8.9 IJServer14100 to IJServer14199

---

#### 8.9.1 IJServer14100

---

**IJServer14100: Workunit failed in releasing resources. IJServer Web container is aborted.(code=%1)**

#### Explanation

IJServer has returned an error from resource collection processing.

#### Cause

The WorkUnit (TD) may not be active.

#### User Action

Remove the error cause by referring to the WorkUnit log file.

#### 8.9.2 IJServer14101

---

**IJServer14101: Workunit failed in releasing resources. IJServer Web+EJB container is aborted.(code=%1)**

#### Explanation

IJServer has returned an error from resource collection processing.

#### Cause

The WorkUnit (TD) may not be active.

#### User Action

Remove the error cause by referring to the WorkUnit log file.

#### 8.9.3 IJServer14102

---

**IJServer14102: Workunit failed in standby level operation. IJServer Web container starting up is aborted.(code=%1)**

#### Explanation

IJServer has returned an error from advance startup completion notification processing for the WorkUnit.

#### User Action

The WorkUnit (TD) may not be active. Remove the error cause by referring to the WorkUnit log file.

### 8.9.4 IJServer14103

---

**IJServer14103: Workunit failed in transmission of the notice of TIMEOUT. IJServer Web container is aborted.(code=%1)**

#### Explanation

IJServer has returned an error from timeout notification processing.

#### Cause

The WorkUnit (TD) may not be active.

#### User Action

Remove the error cause by referring to the WorkUnit log file.

### 8.9.5 IJServer14104

---

**IJServer14104: Workunit failed in transmission of the notice of TIMEOUT. IJServer Web+EJB container is aborted.(code=%1)**

#### Explanation

IJServer has returned an error from timeout notification processing.

#### Cause

The WorkUnit (TD) may not be active.

#### User Action

Remove the error cause by referring to the WorkUnit log file.

### 8.9.6 IJServer14105

---

**IJServer14105: Workunit failed to notify workunit of its aliveness. IJServer Web container has failed. (code=%1)**

#### Explanation

IJServer has returned an error from "alive" notification processing.

#### Cause

The WorkUnit (TD) may not be active.

#### User Action

Remove the error cause by referring to the WorkUnit log file.

### 8.9.7 IJServer14106

---

**IJServer14106: Workunit failed to notify workunit of its aliveness. IJServer Web+EJB container has failed. (code=%1)**

#### Explanation

IJServer has returned an error from "alive" notification processing.

#### Cause

The WorkUnit (TD) may not be active.

#### User Action

Remove the error cause by referring to the WorkUnit log file.

### 8.9.8 IJServer14107

---

#### **IJServer14107: Workunit starting-up failed. IJServer Web container starting up is aborted.(code=%1)**

#### Explanation

IJServer has returned an error from startup completion notification processing for the WorkUnit.

#### User Action

The WorkUnit (TD) may not be active. Remove the error cause by referring to the WorkUnit log file.

### 8.9.9 IJServer14108

---

#### **IJServer14108: Workunit starting-up failed. IJServer Web+EJB container starting up is aborted.(code=%1)**

#### Explanation

IJServer has returned with an error from startup completion notification processing for the WorkUnit.

#### Cause

The WorkUnit (TD) may not be active.

#### User Action

Remove the error cause by referring to the WorkUnit log file.

### 8.9.10 IJServer14109

---

#### **IJServer14109: Response Monitor is started.**

#### Explanation

Application monitoring has started.

### 8.9.11 IJServer14110

---

#### **IJServer14110: INFO: Initialization of a container log is started.**

#### Explanation

Initialization of the container log has started.

### 8.9.12 IJServer14111

---

#### **IJServer14111: INFO: Initialization of a container log was completed.**

#### Explanation

Initialization of the container log has ended.

## 8.9.13 IJServer14112

---

**IJServer14112: INFO: Since rotation conditions were fulfilled, "container.log" was renamed to "file name".**

### Explanation

The container.log file has been renamed because the rollover conditions were satisfied.

## 8.9.14 IJServer14113

---

**IJServer14113: INFO: The number of backup files exceeded the limit, the following old log file(s) were deleted. (file name)**

### Explanation

The file indicated by (file name) has been deleted because the number of backup files exceeded the maximum allowable number.

## 8.9.15 IJServer14114

---

**IJServer14114: WARNING: Since the backup file of the same name already exists, an output is continued.**

### Explanation

Output is continued because the backup file name subjected to rollover already exists.

## 8.9.16 IJServer14115

---

**IJServer14115: ERROR: The output of a message was not processed normally. Please check whether the file is opened or there is any authority of writing.**

### Explanation

A message could not be output.

### Cause

Cannot write to the file.

There may be insufficient permissions, another process may be referencing the file, or a file descriptor leak may have occurred.

### User Action

Confirm that:

- The file is not open
- The write permissions are set
- A file descriptor leak has not occurred in the application.

If an exception was output, also refer to the exception information.

## 8.10 IJServer14600 to IJServer14699

---

### 8.10.1 IJServer14623

---

**IJServer14623: Cannot create a session after the response has been committed**

### Explanation

A session has already been created for the committed HTTP response. A new session cannot be created afterward.

## User Action

Create the session before performing the commit operation for the HTTP response. The commit operation for the HTTP response indicates the following processing:

- Setting the status code
- Writing to the HTTP header

## 8.10.2 IJServer14624

---

### IJServer14624: Read of HTTP Request POST parameters failed: read <content length>

#### Explanation

Since the HTTP request length was smaller than the Content-Length header value, the HTTP request failed to be read. The HTTP request was not processed.

#### Cause

The HTTP request is incorrect, or its delivery or processing may have been interrupted.

#### User Action

Refer to the access log of the Web server.

If you can identify the HTTP request sending source, check whether the source is in error.

## 8.10.3 IJServer14625

---

### IJServer14625: Read of HTTP Request POST parameters failed: (%s)

#### Variable Information

%s = Detailed message

#### Explanation

The POST parameter of the HTTP request failed to be read, details of the cause of the failure are contained in the detailed message. The HTTP request was not processed.

#### Cause

The received HTTP request may contain an error.

#### User Action

Refer to the access log of the Web server.

If you can specify the HTTP request-sending source, check whether the source is in error.

## 8.10.4 IJServer14626

---

### IJServer14626: Cannot call `sendError()` after the response has been committed

#### Explanation

Since the `sendError` method was called after the committed HTTP response, the `IllegalStateException` exception occurred.

#### User Action

To use the `sendError` method of the `HttpServletResponse` interface, call the method before performing the commit operation for the HTTP response. The commit operation for the HTTP response indicates the following processing:

- Setting the status code
- Writing to the HTTP header

## 8.10.5 IJServer14627

---

### IJServer14627: Cannot call sendRedirect() after the response has been committed

#### Explanation

Since the *sendRedirect* method was called after the committed HTTP response, the *IllegalStateException* exception occurred.

#### User Action

To use the *sendRedirect* method of the *HttpServletResponse* interface, call the method before performing the commit operation for the HTTP response. The commit operation for the HTTP response indicates the following processing:

- Setting the status code
- Writing to the HTTP header

## 8.10.6 IJServer14628

---

### IJServer14628: getReader() has already been called for this request

#### Explanation

The *getReader* method of the *ServletRequest* interface can be called only once for the same HTTP request instance.

Since the *getReader* method was called again for the HTTP request, which was previously called, the *IllegalStateException* exception occurred.

#### User Action

Check whether the *getReader* method is not called two or more times for the same HTTP request instance in the Web application.

## 8.10.7 IJServer14629

---

### IJServer14629: getInputStream() has already been called for this request

#### Explanation

The *getInputStream* method of the *ServletRequest* interface can be called only once for the same HTTP request instance.

Since the *getInputStream* method was called again for the HTTP request, which was previously called, the *IllegalStateException* exception occurred.

#### User Action

Check that the *getInputStream* method is not called two or more times for the same HTTP request instance in the Web application.

## 8.10.8 IJServer14630

---

### IJServer14630: Cannot close the same input stream twice

#### Explanation

The *close* method of the *ServletInputStream* class can be called only once for the same HTTP request instance.

Since the *close* method was called again for the closed *ServletInputStream*, the *IOException* exception occurred.

#### User Action

Check whether the *close* method is not called two or more times for the same HTTP request instance in the Web application.

## 8.10.9 IJServer14632

---

### IJServer14632: This input stream has been closed

## Explanation

Since an attempt was made to read the closed `ServletInputStream`, the `IOException` exception occurred.

## User Action

After the `close` method of the `ServletInputStream` class is called, the reading to the same instance is impossible.

Check that the reading (read method calling, etc) is not done for the `ServletInputStream` instance closed in the Web application.

## 8.10.10 IJServer14633

---

### IJServer14633: `getWriter()` has already been called for this response

#### Explanation

The `getOutputStream` method of the `ServletResponse` interface cannot be called on the same HTTP response instance after the `getWriter` method is called.

Since the `getOutputStream` method called for the HTTP response for which the `getWriter` method was already called, the `IllegalStateException` exception occurred.

Similarly, if the `getWriter` method is called on the same HTTP response instance after the `getOutputStream` method is called, the `IllegalStateException` exception occurs.

#### User Action

Check that the `getOutputStream` method is not called after the `getWriter` method was called for the same HTTP response in the Web application.

## 8.10.11 IJServer14634

---

### IJServer14634: `getOutputStream()` has already been called for this response

#### Explanation

The `getWriter` method of the `ServletResponse` interface cannot be called on the same HTTP response instance after the `getOutputStream` method was already called.

Since the `getWriter` method was called for the HTTP response for which the `getOutputStream` method was already called, the `IllegalStateException` exception occurred.

Similarly, if the `getOutputStream` method is called on the same HTTP response instance after the `getWriter` method is called, the `IllegalStateException` exception occurs.

#### User Action

Check that the `getWriter` method is not called after the `getOutputStream` method is called for the same HTTP response in the Web application.

## 8.10.12 IJServer14635

---

### IJServer14635: Cannot reset after response has been committed

#### Explanation

Since the `reset` method was called for the committed HTTP response, the `IllegalStateException` exception occurred.

#### User Action

Reset the HTTP response information before performing the commit operation for the HTTP response. The commit operation for the HTTP response indicates the following processing:

- Setting the status code
- Writing to the HTTP header

## 8.10.13 IJServer14637

---

### IJServer14637: Name cannot be null

#### Explanation

Since null was passed as the attribute name for the argument of the *ServletRequest.setAttribute* or *HttpServletRequest.setAttribute* method, the *IllegalArgumentException* exception occurred.

#### User Action

Check the Web application to see if the attribute name of the *setAttribute* method is null.

## 8.10.14 IJServer14638

---

### IJServer14638: Buffer size cannot be changed after data has been written

#### Explanation

Since the *setBufferSize* method was called for the HTTP response for which writing was made once or the commit operation was performed, the *IllegalStateException* exception occurred.

#### User Action

Change the buffer size of the HTTP response before output is made to the HTTP response and the commit operation is performed. The commit operation for the HTTP response indicates the following processing:

- Setting the status code
- Writing to the HTTP header

## 8.10.15 IJServer14639

---

### IJServer14639: This output stream has already been closed

#### Explanation

The *close* method of the *ServletOutputStream* class can only be called once for the same instance.

When the *close* method is called for the closed *ServletOutputStream*, the *IOException* exception occurs.

#### User Action

Check that the *close* method is not called two or more times for the same *ServletOutputStream* instance in the Web application.

## 8.10.16 IJServer14640

---

### IJServer14640: Cannot flush a closed output stream

#### Explanation

After the *close* method of the *ServletOutputStream* class is called, the *flush* method cannot be called for the same instance.

When the *flush* method is called for a closed *ServletOutputStream*, the *IOException* exception occurs.

#### User Action

Check that the *flush* method was not called for the *ServletOutputStream* instance already closed in the Web application.

## 8.10.17 IJServer14641

---

### IJServer14641: The stream has been closed

#### Explanation

When the *close* method or the *flush* method was called for in the closed *ServletOutputStream*, the *IOException* exception occurred.

#### User Action

Check that the *close* method or the *flush* method is not called for the `ServletOutputStream` instance already closed in the Web application. Note that even if the *close* method is not explicitly called for the `ServletOutputStream` instance, `ServletOutputStream` is closed if the *sendError* or *sendRedirect* method is called for in the `HttpServletResponse` instance.

---

### 8.10.18 IJServer14642

---

#### IJServer14642: Cannot write to a closed output stream

##### Explanation

After the *close* method of the `ServletOutputStream` class is called, no write operation can be performed for the same instance.

When an attempt is made to perform the write operation for the closed `ServletOutputStream`, the `IOException` exception occurs.

##### User Action

Check that the write operation (write method calling, etc.) is not performed for the `ServletOutputStream` instance closed in the Web application.

---

### 8.10.19 IJServer14657

---

#### IJServer14657: Invalid 'Content-Length' header

##### Explanation

No processing can be performed because an HTTP request was received with an invalid value specified as the Content-Length attribute of the HTTP request header information.

##### User Action

Refer to the access log of the Web server. If sending source can be indentified, check whether no error occurs in it.

---

### 8.10.20 IJServer14658

---

#### IJServer14658: Invalid HTTP header format

##### Explanation

No processing can be performed because an HTTP request was received in which the name and value of the HTTP request header are not delimited by a colon.

##### User Action

Refer to the access log of the Web server. If sending source can be identified, check whether no error occurs in it.

---

### 8.10.21 IJServer14659

---

#### IJServer14659: Invalid TCP/IP port number in 'Host' header

##### Explanation

No processing can be performed because an HTTP request was received in which an invalid value was specified in the Host attribute of the HTTP request header information.

##### User Action

Refer to the access log of the Web server. If sending source can be indentified, check whether no error occurs in it.

---

### 8.10.22 IJServer14661

---

#### IJServer14661: Missing HTTP request method

#### Explanation

No processing can be performed because an HTTP request having no method such as GET and POST was received.

#### User Action

Refer to the access log of the Web server. If sending source can be identified, check whether no error occurs in it.

### 8.10.23 IJServer14662

---

#### IJServer14662: Missing HTTP request line

#### Explanation

No processing can be performed because an HTTP request without a first line, or having an invalid first line, was received.

#### User Action

Refer to the access log of the Web server. If sending source can be specified, check whether no error occurs in it.

### 8.10.24 IJServer14663

---

#### IJServer14663: Missing HTTP request URI

#### Explanation

No processing can be performed because an HTTP request having no HTTP request URI, or having an invalid HTTP request URI, was received.

#### User Action

Refer to the access log of the Web server. If sending source can be identified, check it for errors.

### 8.10.25 IJServer14664

---

#### IJServer14664: Unknown Expect header field

#### Explanation

Unknown Expect header field.

#### Cause

A character string other than "100-continue" was set in the expect attribute of the HTTP request header.

#### User Action

Refer to the access log of the Web server. If sending source can be identified, check it for errors.

### 8.10.26 IJServer14671

---

#### IJServer14671: Couldn't read line

#### Explanation

A HTTP request cannot be read correctly.

#### Cause

An item exists in which no value is defined for the following settings of the HTTP request.

- Method specification
- Request URI specification
- Protocol specification

Alternatively, an item exists in which no value is defined in the attribute value in the HTTP request header.

#### User Action

Refer to the access log of the Web server. If sending source can be identified, check that no errors occur in it.

### 8.10.27 IJServer14672

---

#### IJServer14672: Line too long

##### Explanation

This message indicates that the Web application failed to start.

##### System Action

Processing stops because the Web application failed to start.

##### User Action

Refer to the container log of IJServer and remove the cause of the error.

### 8.10.28 IJServer14684

---

#### IJServer14684: Invalid 'Content-Length' header

##### Explanation

Refer to the entry for message number IJServer14657.

##### User Action

Refer to the entry for message number IJServer14657.

### 8.10.29 IJServer14685

---

#### IJServer14685: Invalid HTTP header format

##### Explanation

Refer to the entry for message number IJServer14658.

##### User Action

Refer to the entry for message number IJServer14658.

### 8.10.30 IJServer14686

---

#### IJServer14686: Invalid TCP/IP port number in 'Host' header

##### Explanation

Refer to the entry for message number IJServer14659.

##### User Action

Refer to the entry for message number IJServer14659.

### 8.10.31 IJServer14687

---

#### IJServer14687: Missing HTTP request method

##### Explanation

Refer to the entry for message number IJServer14661.

#### User Action

Refer to the entry for message number IJServer14661.

### 8.10.32 IJServer14688

---

#### IJServer14688: Missing HTTP request line

#### Explanation

Refer to the entry for message number IJServer14662.

#### User Action

Refer to the entry for message number IJServer14662.

### 8.10.33 IJServer14689

---

#### IJServer14689: Missing HTTP request URI

#### Explanation

Refer to the entry for message number IJServer14663.

#### User Action

Refer to the entry for message number IJServer14663.

### 8.10.34 IJServer14694

---

#### IJServer14694: Path (%s) does not start with a "/" character

#### Variable Information

%s = Request URI

#### Cause

The path to the servlet application that dispatches requests does not begin with '/'.

#### User Action

The path to the servlet application that dispatches requests must begin with '/'. Prefix '/' to the path displayed in the variable information.

### 8.10.35 IJServer14695

---

#### IJServer14637: Name cannot be null

#### Explanation

Refer to the entry for message number IJServer14637.

#### User Action

Refer to the entry for message number IJServer14637.

### 8.10.36 IJServer14698

---

#### IJServer14698: Cannot forward after response has been committed

#### Explanation

Cannot forward after response has been committed.

## User Action

Forward the response before committing it manually or before it is automatically committed. When a response is output that exceeds response buffer size, it may be committed automatically.

## 8.11 IJServer14700 to IJServer14799

---

### 8.11.1 IJServer14710

---

#### IJServer14710: Container StandardContext[(%s)] has not been started

##### Variable Information

%s = Web application name

##### Explanation

An exception occurred while the Web application (%s) stopped because the Web application failed to start previously.

##### User Action

Refer to the container log of IJServer and remove the cause of the error.

### 8.11.2 IJServer14713

---

#### IJServer14713: Filter execution threw an exception

##### Explanation

The filter application failed to be executed.

##### User Action

An error occurs when the filter application is called.

Refer to the container log of IJServer and remove the cause of the error.

### 8.11.3 IJServer14714

---

#### IJServer14714: Servlet execution threw an exception

##### Explanation

The Servlet application failed to be executed.

##### User Action

An error occurs when the Servlet application is called.

Refer to the container log of IJServer and remove the cause of the error.

### 8.11.4 IJServer14729

---

#### IJServer14729: Error page location {0} must start with '/'

##### Explanation

The value of the <location> tag in which an error page was defined in web.xml of the Web application, does not begin with '/'.

##### User Action

Edit the value of the <location> tag in which the error page was defined in web.xml of the Web application so that it begins with '/', then redeploy the Web application.

## 8.11.5 IJServer14732

---

### IJServer14732: Filter mapping must specify either a <url-pattern> or a <servlet-name>

#### Explanation

The <url-pattern> or <servlet-name> tag is not specified in the filter mapping defined in web.xml of the Web application.

#### User Action

Specify the <url-pattern> or <servlet-name> tag in the filter mapping defined in web.xml of the Web application, then redeploy the Web application.

## 8.11.6 IJServer14733

---

### IJServer14733: Filter mapping specifies an unknown filter name (%s)

#### Variable Information

%s = Filter name

#### Explanation

The filter application is not properly specified in the filter mapping defined in web.xml of the Web application. The name may be wrong, or it may not exist.

#### User Action

Correctly specify the filter application defined in the filter mapping defined in web.xml of the Web application.

Alternatively, define a new filter, associate it with the Web application using the filter mapping, then redeploy the Web application.

## 8.11.7 IJServer14734

---

### IJServer14734: Invalid <url-pattern> (%s) in filter mapping

#### Variable Information

%s = Invalid URL pattern

#### Explanation

Filter mapping is invalid because incorrect characters are specified as a URL in the filter mapping defined in web.xml of the Web application.

#### User Action

Replace the incorrect characters specified as the URL in the filter mapping defined in web.xml of the Web application, then redeploy the Web application.

## 8.11.8 IJServer14737

---

### IJServer14737: This application is not currently available

#### Explanation

The servlet application cannot be used because the servlet class defined as servlet in web.xml of the Web application is not found.

#### User Action

Check web.xml of the Web application, then redeploy the Web application.

## 8.11.9 IJServer14741

---

### IJServer14741: Form error page (%s) must start with a '/'

## Variable Information

%s = Value specified with the <form-error-page> tag

## Explanation

A value of the <form-error-page> tag, or a child element of the <form-login-config> tag defined for login in web.xml of the Web application, does not begin with '/'.

## User Action

Correct the value of the <form-error-page> tag defined for login in web.xml of the Web application so that it begins with '/', then redeploy the Web application.

## 8.11.10 IJServer14743

---

### IJServer14743: Form login page (%s) must start with a '/'

## Variable Information

%s = Value specified with the <form-error-page> tag

## Explanation

A value of the <form-login-page> tag, or a child element of the <form-login-config> tag defined for login in web.xml of the Web application, does not begin with '/'.

## User Action

Correct the value of the <form-login-page> tag defined for login in web.xml of the Web application so that it begins with '/', then redeploy the Web application.

## 8.11.11 IJServer14751

---

### IJServer14751: Duplicate context initialization parameter (%s)

## Variable Information

%s = Parameter name

## Explanation

The parameter name (the value set for <param-name>) in the servlet context initialization parameter (<context-param>) defined in web.xml of the Web application was duplicated.

## User Action

Correct the Web application (web.xml) so that the parameter name is not duplicated.

## 8.11.12 IJServer14759

---

### IJServer14759: Invalid <url-pattern> (%s) in security constraint

## Variable Information

%s =URL

## Explanation

A value of the <url-pattern> tag does not begin with '/' or ".\*" in the security-constraint definition defined in the Web application environment definition file (web.xml).

## User Action

Correct the value of the <url-pattern> tag so that it begins with '/' or ".\*" in the security-constraint definition defined in the Web application environment definition file (web.xml).

## 8.11.13 IJServer14760

---

### IJServer14760: Servlet mapping specifies an unknown servlet name (servlet name)

#### Explanation

Servlet mapping specifies an unknown servlet name (servlet name)

#### User Action

Specify the right serve let name.

## 8.11.14 IJServer14761

---

### IJServer14761: Invalid <url-pattern> (URL value) in servlet mapping

#### Explanation

Invalid <url-pattern> (URL value) in servlet mapping

#### User Action

Specify a URL value effective in <url-pattern> in servlet mapping.

## 8.11.15 IJServer14762

---

### IJServer14762: Exception during cleanup after start failed

#### Explanation

An exception occurred when the Web application stopped.

#### User Action

The cause of this problem can be found in the error message which immediately precedes this error message. Correct the problem causing the previous error message and this current error message will not reappear.

## 8.11.16 IJServer14773

---

### IJServer14773: JSP file (%s) must start with a '/'

#### Variable Information

%s = JSP file name

#### Explanation

A value of the <jsp-file> tag does not begin with '/' in the JSP definition in web.xml of the Web application.

#### User Action

Correct the value of the <jsp-file> tag of the JSP application defined as servlet in web.xml of the Web application so that it begins with '/', then redeploy the Web application.

## 8.11.17 IJServer14795

---

### IJServer14795: MAPPING configuration error for request URI %s1

#### Variable Information

%s = requestedURI

#### Explanation

The specified Web application does not exist.

## Cause

Possible causes are as follows:

1. If the Web server and the WorkUnit are running on separate machines, the information about the Web application registered in the Web server connector on the Web server machine and the name of the Web application deployed to the WorkUnit machine are different.
2. An attempt was made to obtain Web application context that does not exist.

## User Action

- If 1. above is the cause, take the following action.

If the request URI output to the IJServer's log file is incorrect, reregister the Web application information of the Web server-side machine as the name of the Web application deployed in the WorkUnit.

When the request URI output to the IJServer's log file is correct, deploy the same Web application indicated in the Web application information of the Web server connector, on the WorkUnit-side machine.

- Non-existent Web application context cannot be obtained using the `ServletContext#getContext()` method. Check whether the Web application context that you tried to obtain exists.

---

## 8.12 IJServer14800 to IJServer14899

---

### 8.12.1 IJServer14806

---

#### IJServer14806: Removing web application at context path (Web application name)

##### Explanation

The Web application on the context path (Web application name) has been deleted.

---

### 8.12.2 IJServer14807

---

#### IJServer14807: Error removing application at context path (%s)

##### Variable Information

%s = Web application name

##### Explanation

An exception occurred during stop processing of the Web application (%s).

##### User Action

Refer to the container log of IJServer and remove the cause of the error.

---

### 8.12.3 IJServer14822

---

#### IJServer14822: Starting service (IJServer name)

##### Explanation

The IJServer indicated by (IJServer name) has been started.

---

### 8.12.4 IJServer14824

---

#### IJServer14824: Stopping service (IJServer name)

##### Explanation

The IJServer indicated by (IJServer name) has been stopped.

## 8.12.5 IJServer14826

---

### IJServer14826: Error allocating a servlet instance

#### Explanation

An unexpected exception occurred when the servlet instance was initialized.

#### Cause

Two possible causes are:

- No class was found or,
- The constructor has thrown an exception.

#### User Action

Refer to the container log of IJServer and remove the cause of the error.

## 8.12.6 IJServer14828

---

### IJServer14828: Loading container servlet (servlet name)

#### Explanation

The container servlet indicated by (servlet name) has been loaded.

## 8.12.7 IJServer14831

---

### IJServer14831: Servlet.destroy() for servlet (%s) threw exception

#### Variable Information

%s = Servlet name

#### Explanation

An exception occurred while the *destroy* method of the servlet application (%s) was processed.

#### User Action

Refer to the container log of IJServer and remove the cause of the error.

## 8.12.8 IJServer14836

---

### IJServer14836: Servlet.init() for servlet (%s) threw exception

#### Variable Information

%s = Servlet name

#### Explanation

An exception occurred during initialization of the servlet application (%s).

#### User Action

Refer to the container log of IJServer and remove the cause of the error.

## 8.12.9 IJServer14837

---

### IJServer14837: Error instantiating servlet class (%s)

## Variable Information

%s = Servlet class name

## Explanation

An exception occurred during initialization of the instance of the servlet class (%s).

Alternatively, the constructor might have thrown the exception.

## User Action

Refer to the container log of IJServer and remove the cause of the error.

## 8.12.10 IJServer14842

---

### IJServer14842: Wrapper cannot find servlet class (%s) or a class it depends on

## Variable Information

%s = Servlet class name

## Explanation

The servlet class (%s) has no access authorization.

## Cause

The servlet class (%s) to be called does not exist.

## User Action

Check that the servlet class (%s) exists in the Web application, then redeploy the Web application.

## 8.12.11 IJServer14845

---

### IJServer14845: No servlet class has been specified for servlet (%s)

## Variable Information

%s = Servlet name

## Explanation

There is no specified servlet class.

## Cause

An attempt was made to call the servlet class not properly defined in web.xml.

## User Action

The <servlet> tag in web.xml of the Web application may not contain the <servlet-class> tag element. Check web.xml of the Web application, then redeploy the Web application.

## 8.12.12 IJServer14847

---

### IJServer14847: Class (%s) is not a Servlet

## Variable Information

%s = Servlet class name

## Explanation

Class (%s) is not a Servlet.

## Cause

Since the servlet class (%s) does not inherit the javax.servlet.http.HttpServlet or javax.servlet.GenericServlet class, it cannot be called as a servlet.

## User Action

Correct the Web application so that the servlet class (%s) inherits the javax.servlet.http.HttpServlet or javax.servlet.GenericServlet class.

## 8.12.13 IJServer14849

---

### IJServer14849: Release filters exception for servlet (%s)

#### Variable Information

%s = Servlet name

#### Explanation

An exception occurred during processing of the filter application for the servlet application (%s).

#### User Action

Refer to the container log of IJServer and remove the cause of the error.

## 8.12.14 IJServer14855

---

### IJServer14855: Cannot allocate servlet (%s) because it is being unloaded

#### Variable Information

%s = Servlet name

#### Explanation

Cannot allocate servlet (%s) because it is being unloaded.

## Cause

An unexpected exception occurred when the servlet application (%s) was initialized.

Two possible causes are:

- No class was found.
- The constructor has thrown an exception

#### User Action

Refer to the container log of IJServer and remove the cause of the error.

## 8.13 IJServer15000 to IJServer15099

---

### 8.13.1 IJServer15040

---

#### IJServer15040: Seeding of random number generator has been completed

#### Explanation

Seeding the random number generator has been completed.

### 8.13.2 IJServer15043

---

#### IJServer15043: Exception initializing random number generator of class java.security.SecureRandom

#### Explanation

A session ID failed to be created with the `java.security.SecureRandom` class.

#### System Action

The session ID is recreated with the `java.util.Random` class, and processing continues.

### 8.13.3 IJServer15044

---

#### IJServer15044: Seeding random number generator class (class name)

#### Explanation

The system is seeding the random number generator class indicated by (class name).

### 8.13.4 IJServer15048

---

#### IJServer15048: processsExpire: Exception during session expiration

#### Explanation

An unknown exception occurred during session stop processing.

If the session listener is in use, an exception might be occurring in the `sessionDestroyed` method.

#### User Action

If the session listener is in use, the exception might be occurring in the `sessionDestroyed` method of the `HttpSessionListener` interface. Refer to the latest exception information that was being output, and remove the problem.

### 8.13.5 IJServer15059

---

#### IJServer15059: invalidate: Session already invalidated

#### Explanation

The `IllegalStateException` exception occurred because the `invalidate` method has called for an invalidated session.

#### User Action

The `invalidate` method cannot be called for the invalidated session instance (`HttpSession` instance).

Check that the `invalidate` method has not called for a session instance that is already invalidated in the Web application.

### 8.13.6 IJServer15060

---

#### IJServer15060: isNew: Session already invalidated

#### Explanation

The `IllegalStateException` exception occurred because the `isNew` method has called for an invalidated session.

#### User Action

The `isNew` method cannot be called for the invalidated session instance (`HttpSession` instance).

Check that the `isNew` method has not called for a session instance that is already invalidated in the Web application.

### 8.13.7 IJServer15061

---

#### IJServer15061: getAttribute: Session already invalidated

#### Explanation

The `IllegalStateException` exception occurred because the `getAttribute` method called for an invalidated session.

#### User Action

The *getAttribute* method cannot be called for the invalidated session instance (HttpSession instance).

Check that the *getAttribute* method has not called for a session instance that is already invalidated in the Web application.

### 8.13.8 IJServer15062

---

#### IJServer15062: getAttributeNames: Session already invalidated

##### Explanation

The *IllegalStateException* exception occurred because the *getAttributeNames* method has called for an invalidated session.

##### User Action

The *getAttributeNames* method cannot be called for the invalidated session instance (HttpSession instance).

Check that the *getAttributeNames* method has not called for a session instance that is already invalidated in the Web application.

### 8.13.9 IJServer15063

---

#### IJServer15063: getCreationTime: Session already invalidated

##### Explanation

The *IllegalStateException* exception occurred because the *getCreationTime* method has called for an invalidated session.

##### User Action

The *getCreationTime* method cannot be called for the invalidated session instance (HttpSession instance).

Check that the *getCreationTime* method has not called for a session instance that is already invalidated in the Web application.

### 8.13.10 IJServer15065

---

#### IJServer15065: getAttributeNames: Session already invalidated

##### Explanation

The *IllegalStateException* exception occurred because the *getValueNames* method has called for an invalidated session.

##### User Action

The *getValueNames* method cannot be called for the invalidated session instance (HttpSession instance).

Check that the *getValueNames* method has not called for a session instance that is already invalidated in the Web application.

### 8.13.11 IJServer15067

---

#### IJServer15067: removeAttribute: Session already invalidated

##### Explanation

The *IllegalStateException* exception occurred because the *removeAttribute* method has called for an invalidated session.

##### User Action

The *removeAttribute* method cannot be called for the invalidated session instance (HttpSession instance).

Check that the *removeAttribute* has not called for a session instance that is already invalidated in the Web application.

### 8.13.12 IJServer15069

---

#### IJServer15069: setAttribute: Non-serializable attribute

## Explanation

The attribute specified for `setAttribute` could not be serialized.

## User Action

When session recovery is used, the `java.io.Serializable` interface must be implemented for the attribute specified for `setAttribute` in the session so that the attribute can be serialized. Correct the application.

## 8.13.13 IJServer15070

---

### IJServer15070: setAttribute: Session already invalidated

## Explanation

The *IllegalStateException* exception occurred because the *setAttribute* method has called for an invalidated session.

## User Action

The *setAttribute* method cannot be called for the invalidated session instance (HttpSession instance).

Check that the *setAttribute* method has not called for a session instance that is already invalidated in the Web application.

## 8.13.14 IJServer15071

---

### IJServer15071: setAttribute: name parameter cannot be null

## Explanation

The *IllegalArgumentException* exception occurred since null was passed as an attribute name in a method argument.

## User Action

Check the Web application to see if processing causes the attribute name of the *setAttribute* method to be null.

## 8.13.15 IJServer15092

---

### IJServer15092: Configured an authenticator for method (%s)

## Variable Information

%s = authentication method

## Explanation

An authenticator for the authentication method (%s) is specified in the Servlet container.

## 8.13.16 IJServer15094

---

### IJServer15094: Cannot configure an authenticator for method %s1

## Variable Information

%s = authentication method

## Explanation

The authentication method (%s1) authenticator settings failed.

## Cause

The contents of the Web application environment definition file `auth-method` tag are incorrect.

## User Action

Check the contents of the Web application environment definition file `auth-method` tag.

## 8.14 IJServer15100 to IJServer15199

---

### 8.14.1 IJServer15101

---

#### IJServer15101: Missing default web.xml, using application web.xml only

##### Explanation

Missing default web.xml.

##### Cause

The internally set file (web.xml) of IJServer does not exist, or it has no access authorization.

##### User Action

When the following files exist, confirm that they have access authorization

**Windows32/64**

J2EE common directory\ijserver\IJServer WorkUnit name\web.xml

(The default of a J2EE common directory is C:\Interstage\J2 EE\var\deployment.)

**Solaris32/64** **Linux32/64**

J2EE common directory/ijserver/IJServer WorkUnit name/web.xml

(The default of a J2EE common directory is /opt/FJSVj2ee/var/deployment.)

If they do not exist, recreate IJServer.

### 8.14.2 IJServer15102

---

#### IJServer15102: Parse error in default web.xml

##### Explanation

Parse error in default web.xml.

##### User Action

Correct web.xml.

### 8.14.3 IJServer15105

---

#### IJServer15105: ContextConfig[%s1]: WARNING: Security role name {%s2} used in an <auth-constraint> without being defined in a <security-role>

##### Variable Information

%s1 = Web application name

%s2 = Security role name

##### Explanation

Within the <auth-constraint> defined in web.xml of the Web application (%s1), a security role (%s2) that is not defined in the <security-role> definition was used. Processing continues in the same way as if the security role (%s2) was defined in the <security-role> definition.

##### User Action

Add the security role (%s2) to the <security-role> definition in the web.xml of the Web application (%s1), and redeploy the Web application.

## 8.14.4 IJServer15106

---

**IJServer15106: ContextConfig[/%s1]: WARNING: Security role name {%s2} used in a <role-link> without being defined in a <security-role>**

### Variable Information

%s1 = Web application name

%s2 = Security role name

### Explanation

Within the <role-link> defined in web.xml of the Web application (%s1), a security role (%s2) that is not defined in the <security-role> definition was used. Processing continues in the same way as if the security role (%s2) was defined in the <security-role> definition.

### User Action

Add the security role (%s2) to the <security-role> definition in the web.xml of the Web application (%s1), and redeploy the Web application.

## 8.14.5 IJServer15107

---

**IJServer15107: ContextConfig[/%s1]: WARNING: Security role name {%s2} used in a <run-as> without being defined in a <security-role>**

### Variable Information

%s1 = Web application name

%s2 = Security role name

### Explanation

Within the <run-as> defined in web.xml of the Web application (%s1), a security role (%s2) that is not defined in the <security-role> definition was used. Processing continues in the same way as if the security role (%s2) was defined in the <security-role> definition.

### User Action

Add the security role (%s2) to the <security-role> definition in the web.xml of the Web application (%s1), and redeploy the Web application.

## 8.14.6 IJServer15110

---

**IJServer15110: Exception processing TLD (%s2) in JAR at resource path (%s1)**

### Variable Information

%s1 = JAR file path

%s2 = TagLibraryDescriptor file

### Explanation

Exception processing TLD (%s2) in JAR at resource path (%s1).

### Cause

The possible causes are:

1. The JAR file indicated with the JAR file path does not exist.
2. The JAR file indicated with the JAR file path has no access authorization.
3. The JAR file does not contain the TagLibraryDescriptor file.

## User Action

Perform the following corrective actions, then deploy the Web application again.

1. Add the JAR file to the path indicated in the JAR file path, then create the WAR file.
2. Add access authorization to the JAR file indicated in the JAR file path, then create the WAR file.
3. Add the TagLibraryDescriptor file in the JAR file indicated in the JAR file path, then create the WAR file.

## 8.14.7 IJServer15111

---

### IJServer15111: Exception processing TLD at resource path (%s)

#### Variable Information

%s = TagLibraryDescriptor file path

#### Explanation

Exception processing TLD at resource path (%s).

#### Cause

1. The TagLibraryDescriptor file coded in the <taglib-location> tag does not exist in tag library mapping defined in web.xml of the Web application.
2. The XML syntax of a TagLibraryDescriptor file under WEB-INF of the Web application is incorrect.

#### User Action

1. Store the TagLibraryDescriptor file in the path coded in the <taglib-location> tag in tag library mapping defined in web.xml of the Web application, then create the WAR file.
2. Check the TagLibraryDescriptor file and correct the XML syntax., then, deploy the Web application again.

## 8.14.8 IJServer15112

---

### IJServer15112: Exception processing JAR at resource path (%s)

#### Variable Information

%s = JAR file path

#### Explanation

Exception processing JAR at resource path (%s).

#### Cause

The possible causes are:

1. The JAR file indicated with the JAR file path does not exist.
2. The JAR file indicated with the JAR file path has no access authorization.

#### User Action

Perform the following corrective actions, then deploy the Web application again.

1. Add the JAR file to the path indicated in the JAR file path, then create the WAR file.
2. Add access authorization to the JAR file indicated in the JAR file path, then create the WAR file.

## 8.14.9 IJServer15113

---

### IJServer15113: Invalid TLD resource path (%s)

## Explanation

See the information for message number IJServer15111.

## User Action

See the information for message number IJServer15111.

---

## 8.15 IJServer15200 to IJServer15299

---

### 8.15.1 IJServer15224

---

#### IJServer15224: Document base (%s) does not exist or is not a readable directory

##### Variable Information

%s = path name

##### Explanation

Document base (%s) does not exist or is not a readable directory.

##### Cause

The possible causes are:

- The webapps directory does not exist in which Web application properties of IJServer are stored. Alternatively, there is no directory (%s) in which a deployed Web application was stored.
- No read permission is assigned to the webapps directory.

##### User Action

Perform the following corrective actions:

- Check whether the webapps directory exists in which Web application properties of IJServer are stored. Alternatively, check whether the directory (%s) exists in which the deployed Web application was stored.
- Assign read authorization to the webapps directory.

---

## 8.16 IJServer15300 to IJServer15399

---

### 8.16.1 IJServer15300

---

#### IJServer15300: Compile: javaFileName=%s

##### Variable Information

%s = File name

##### Explanation

File (%s) is compiled.

This message is for information only.

---

### 8.16.2 IJServer15301

---

#### IJServer15301: Exception compiling %s

##### Variable Information

%s = exception information

## Explanation

An exception occurred in javac compile.

## Cause

The possible causes are:

- There is a syntax error in the java source.
- A resource required for compilation was not found.

## User Action

- Check if there is a problem in the JSP file code.
- Check the exception information output immediately after this message and fix the problem.

## 8.16.3 IJServer15302

---

### IJServer15302: Error compiling file: %s1 %s2

#### Variable Information

%s1 = file name

%s2 = Error information

#### Explanation

An error occurred while compiling the file (%s1).

#### Cause

The possible causes are:

- There is a syntax error in the java source.
- A resource required for compilation was not found.

#### User Action

- Check if there is a problem in the JSP file code.
- Check the exception information output immediately after this message and fix the problem.

## 8.16.4 IJServer15303

---

### IJServer15303: Info: %s

#### Variable Information

%s = information

#### Explanation

This error results from a compile error passed from the javac compiler and output as detailed information. The target file name, class path information, etc. are given in the variable information (%s).

This message is an information message.

## 8.16.5 IJServer15304

---

### IJServer15304: Exception: %s

#### Variable Information

%s = error information

## Explanation

When an error occurs during javac compile, this error it is output. The error information and stack trace for the exception are given in the variable information (%s).

## Cause

The possible causes are:

- There is a syntax error in the java source.
- A resource required for compilation was not found.

## User Action

- Check if there is a problem in the JSP file code.
- Check the exception information and fix the problem.

## 8.16.6 IJServer15315

---

### IJServer15315: Exception initializing page context %s

#### Variable Information

%s = exception information

#### Explanation

Initialization of the JSP processing failed.

#### User Action

Check the exception information (%s), fix the problem and restart the IJServer.

## 8.16.7 IJServer15316

---

### IJServer15316: Internal error flushing the buffer in release()

#### Explanation

Clearing the buffer used for JSP processing failed.

#### User Action

In most cases, this message can be ignored. If the message is output repeatedly, restart the IJServer.

## 8.16.8 IJServer15317

---

### IJServer15317: Security Violation, attempt to use Restricted Class: %s

#### Variable Information

%s = class name

#### Explanation

Unauthorised user attempted to use class (%s).

#### Cause

JSP tried to refer to class (%s). It does not have access rights for this class from the JSP.

#### User Action

Check that the JSP source codes does not refer to to the wrong class.

## 8.17 IJServer15600 to IJServer15699

---

### 8.17.1 IJServer15614

---

#### IJServer15614: Exception Processing %1

##### Variable Information

%s = Detailed information of error page

##### Explanation

An error occurred during error page processing.

##### Cause

Possible causes are as follows:

- A response was committed in the application or framework before error page processing.
- An error may have occurred in the network environment while the error page was being returned.
- An exception occurred in the error page.

##### User Action

Take one of the following actions:

- Check whether response data commit or processing (involving commit as a side-effect) was performed before transition to the error page in application or framework processing.
- Check the inter-client network environment.
- Check the exception information that is output, and resolve the problem.

### 8.17.2 IJServer15615

---

#### IJServer15615: ERROR: Closing of a file went wrong.

##### Explanation

Could not complete the writing of the container log properly.

##### Cause

Possible causes are as follows:

- There are no permissions for access to the file or directory
- A disk input/output fault occurred
- There is not enough memory
- There is not enough disk space

##### User Action

- If exception information was output in info.log, refer to the exception to resolve the problem.
- In all other cases, check the system environment.

### 8.17.3 IJServer15616

---

#### IJServer15616: ERROR: Closing of a file went wrong.

##### Explanation

Could not complete the writing of the container log properly.

## Cause

Possible causes are as follows:

- There are no permissions for access to the file or directory
- A disk input/output fault occurred
- There is not enough memory
- There is not enough disk space

## User Action

- If exception information was output in info.log, refer to the exception and resolve the problem.
- In all other cases, check the system environment.

## 8.17.4 IJServer15617

---

**IJServer15617: ERROR: Since the lock of a file went wrong, roll-over processing was not performed.**

### Explanation

Rollover processing was not performed because file lock processing failed.

### Cause

Another process is using the file.

### System Action

Continues processing without performing rollover.

### User Action

If the same message is output continuously, restart the IJServer.

If this problem still occurs, use the iscollectinfo command to collect investigation information. Send the error information to a Systems Engineer.

## 8.17.5 IJServer15618

---

**IJServer15618: ERROR: Roll-over was not processed normally.**

### Explanation

Rollover was not processed.

### Cause

An unexpected exception occurred.

### System Action

Continues processing without performing rollover.

### User Action

Check the exception information that was output in info.log, and resolve the problem.

## 8.18 IJServer15900 to IJServer15999

---

### 8.18.1 IJServer15936

---

**IJServer15936: ContainerBase.removeChild: stop:**

#### Explanation

A stop of a container was not completed.

#### User Action

Cope with it according to the message produced immediately after this message.

### 8.18.2 IJServer15944

---

#### IJServer15944: Interstage Servlet container/%s

#### Variable Information

%s = version information

#### Explanation

This message shows the version of the servlet container.

### 8.18.3 IJServer15958

---

#### IJServer15958: HookManager have not been initialized. Startup classes were not called.:<Exception details>

#### Explanation

An internal error occurred.

#### User Action

Collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

### 8.18.4 IJServer15959

---

#### IJServer15959: ERROR in calling Startup classes, IJServer <IJServer type> container starting-up is aborted.

#### Explanation

Since the problem occurred during execution of a startup time execution class, starting of IJServer is stopped.

#### User Action

Refer to the contents of the messages output immediately before and after this message, and correct the contents or the settings of the startup time execution class, or the settings of the IJServer WorkUnit.

### 8.18.5 IJServer15960

---

#### IJServer15960: Failed in EJB activation

#### Explanation

The error occurred in start processing of an EJB container.

#### User Action

Remove the error output before and restart IJServer.

### 8.18.6 IJServer15977

---

#### IJServer15977: Lifecycle error : CL stopped

## Explanation

Resource load was performed for a class loader that has been stopped.

## Cause

Another thread attempted to load resources while the WorkUnit was not running.

## System Action

Resource load is aborted.

## User Action

If the thread was generated in the application, make sure that the thread has closed when application close processing is complete. Application close processing examples are shown below.

- The servlet destroy method (If the thread was generated using the init method)
- The ServletContextListener contextDestroyed method (If the thread was generated using the contextInitialized method)
- The executable class when the WorkUnit was not running (If the thread was generated using the executable class when the WorkUnit was running)

If the thread still runs even after close processing, this message may be output if a class loader that has already been stopped is used.

## 8.19 IJServer16200 to IJServer16299

---

### 8.19.1 IJServer16261

---

**IJServer16261: IJServer <IJServer type> container failed in EJB container startup.:<Exception>**

#### Explanation

An error occurred in the initialization processing of an EJB container.

#### User Action

Remove the error output before and restart IJServer.

### 8.19.2 IJServer16267

---

**IJServer16267: Catalina.start error in configuring with (file path)**

#### Explanation

Starting of run time went wrong.

#### Cause

An error is in the file which (file path shows).

#### User Action

Take action according to the message output immediately before this message.

### 8.19.3 IJServer16269

---

**IJServer16269: Problem in Catalina.start: %s**

#### Variable Information

%s = Detailed information

## Explanation

Servlet container setup failed.

## User Action

Remove the problem with reference to the contents of detailed information.

If the above action cannot remove the error, collect investigation information using the *iscollectinfo* command, then contact a service engineer.

## 8.19.4 IJServer16276

---

**IJServer16276: WARN: could not get valid max processors. EJB container using value 32.**

## Explanation

Servlet container setup failed.

## User Action

An invalid value has been set for the number of Servlet containers that can be processed simultaneously.

Confirm the number of Servlet containers that can be processed simultaneously by the Interstage Management Console, and change the specified value to the correct one.

## 8.20 IJServer16500 to IJServer16599

---

### 8.20.1 IJServer16500

---

**IJServer16500: IJServer main illegal argument. "-n" does not trail <IJServer name>.**

## Explanation

An internal error occurred.

## User Action

Collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

### 8.20.2 IJServer16501

---

**IJServer16501: IJServer main argument lack. "-n <IJServer name>" needed.**

## Explanation

An internal error occurred.

## User Action

Collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

### 8.20.3 IJServer16502

---

**IJServer16502: Failed to initialize commonutil.**

## Explanation

An internal error occurred.

## User Action

Collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

## 8.20.4 IJServer16503

---

### IJServer16503: self changing %s1 failed.

#### Variable Information

Windows32/64

%s1 = " folder(windows only) "

Solaris32/64 Linux32/64

%s1 = " to common current directory"

#### Explanation

Current directory movement of a workunit process went wrong.

#### User Action

Check whether there are any abnormalities in the current directory of the file composition directory of IJServer, or the current directory specified by the workunit definition, or satisfactory authority of a directory.

## 8.20.5 IJServer16504

---

### IJServer16504: Class loader creation threw exception

#### Explanation

Generation of a class loader failed.

#### User Action

Refer to the exception, and correct the cause of the problem.

## 8.20.6 IJServer16505

---

### IJServer16505: Exception during startup processing.

#### Explanation

An error occurred during startup of a workunit.

#### User Action

Remove a problem with this message with reference to the message and stack trace output.

## 8.20.7 IJServer16506

---

### IJServer16506: Exception thrown in catalina.

#### Explanation

The error occurred during starting of a WorkUnit, or employment.

#### User Action

Remove a problem with this message with reference to the message and stack trace output.

## 8.20.8 IJServer16508

---

### IJServer16508: IJServer definition ERROR. Cannot get the definition of <common>.

#### Explanation

Abnormalities occurred in reading and analysis of a definition of a WorkUnit.

User Action

Re-create a WorkUnit.

---

## 8.20.9 IJServer16509

---

**IJServer16509: IJServer definition ERROR. Cannot get the definition of <log>.**

Explanation

Abnormalities occurred in reading and analysis of a definition of a WorkUnit.

User Action

Re-create a WorkUnit.

---

## 8.20.10 IJServer16510

---

**IJServer16510: IJServer definition ERROR:%s1**

Variable Information

%s1 = Detail information

Explanation

Abnormalities occurred in reading and analysis of a definition of a WorkUnit.

User Action

Re-create a workunit.

---

## 8.20.11 IJServer16511

---

**IJServer16511: IJServer definition ERROR:%s1**

Explanation

Abnormalities occurred in reading and analysis of a definition of a workunit.

User Action

Re-create a workunit.

---

## 8.20.12 IJServer16512

---

**IJServer16512: IJServer definition ERROR. Cannot get the definition of <web>.**

Explanation

Abnormalities occurred in reading and analysis of a definition of a WorkUnit.

User Action

Re-create a WorkUnit.

---

## 8.21 IJServer17000 to IJServer17099

---

---

### 8.21.1 IJServer17005

---

**IJServer17005: Error processing request <%s1>**

## Variable Information

%s1 = Exception information

## Explanation

An exception occurred during request processing.

## User Action

Take action according to the exception information. For details on exceptions, refer to the "[Chapter 38 Exceptions Output during J2EE Usage](#)" chapter.

If the above action cannot remove the error, collect investigation information using the *iscollectinfo* command, then contact a service engineer.

## 8.21.2 IJServer17013

---

### IJServer17013: Error starting endpoint <%s1>

## Variable Information

%s1 = Detailed information

## Explanation

Initialization of request registration of a Servlet container went wrong.

## User Action

Remove the problem with reference to the contents of detailed information.

Change the port number of a Servlet container.

## 8.21.3 IJServer17014

---

### IJServer17014: Initializing Coyote HTTP/1.1 on port (%s)

## Variable Information

%s = Port number

## Explanation

The function to setup a connection to the Web server connector is initialized using the port indicated by (port number).

## 8.21.4 IJServer17015

---

### IJServer17015: Error reading request, ignored

## Explanation

An exception occurred during request processing.

## User Action

Refer to the contents of the messages, and their exception output, displayed immediately before and after this message. Take action as recommended in those messages.

## 8.21.5 IJServer17021

---

### IJServer17021: Error initializing socket factory

## Explanation

An exception occurred during initialization of the socket factory.

## User Action

Perform the following corrective actions:

- Refer to the contents of the messages, and their exception output, before and after this message.
- When SSL is used between the Web server connector and Servlet container, check whether a JAR file of the Java Secure Socket Extension (JSSE), other than the JAR file for this product, is set in the class path, etc.
- Check the network settings of the operating system for errors.
- If the above actions failed to remove the error, recreate the IJServer WorkUnit.

## 8.21.6 IJServer17022

---

### IJServer17022: Starting Coyote HTTP/1.1 on port (%s)

#### Variable Information

%s = Port number

#### Explanation

The function to set up a connection to the Web server connector is started using the port indicated by (port number).

## 8.22 IJServer17200 to IJServer17299

---

### 8.22.1 IJServer17203

---

#### IJServer17203: Protocol handler destroy failed: %s

#### Variable Information

%s = Detailed information

#### Explanation

A problem occurred during end processing in the request receiving section of the Servlet container.

#### User Action

Remove the problem by referring to the detailed information (%s), and other output messages.

If the above action cannot remove the error, collect investigation information using the *iscollectinfo* command, then contact a service engineer.

### 8.22.2 IJServer17205

---

#### IJServer17205: The protocol handler failed to start

#### Explanation

Initialization of request registration of a Servlet container went wrong.

#### User Action

It is possible that there is a problem in the server.xml configuration contents. Check that:

- there is a connector configuration for receiving the user application.
- the connector port number for receiving the control request is configured correctly.

### 8.22.3 IJServer17206

---

#### IJServer17206: Protocol handler start failed: %s1

## Variable Information

%s1 = Detailed information

## Explanation

Initialization of request registration of a Servlet container went wrong.

## User Action

Refer to the contents of detailed information (%s) in order to rectify the problem. Possible causes are as follows:

- The port number is being used.

Change the port number of the Servlet container using the Interstage Management Console.

- The IP address of a Servlet container is incorrect.

Change the IP address of the Servlet container using the Interstage Management Console.

If you are using the multiserver management function, delete the Managed Server from the Site, change the IP address, and then re-add the Managed Server to the Site.

- In the case of resource importing, the IP address may not have been changed correctly.

If this message occurs after importing resources, the IP address may not have been changed correctly. Correct the IP address. Refer to "Moving Resources to Another Server" in "Maintenance (Resource Backup)" in the Operator's Guide.

- Check if a file descriptor leak has occurred. If files or Socket resources are opened in the application, some files or sockets may not have been released, or too many files or sockets may be in use.

## 8.22.4 IJServer17207

---

### IJServer17207: An exception or error occurred in the container during the request processing

#### Explanation

An exception occurred in the Servlet container during request processing.

#### User Action

Refer to the contents of the messages, and their exception output, before and after this message. Take action as recommended in those messages.

If the above action cannot remove the error, collect investigation information using the *iscollectinfo* command, then contact a service engineer.

## 8.22.5 IJServer17208

---

### IJServer17208: getWriter() has already been called for this response

#### Explanation

The *getWriter* and *getOutputStream* methods were called for the same response.

#### User Action

To the same response, either a *getWriter* method or a *getOutputStream* method (but not both) can be used.

The application may be calling both methods instead of only one. Check the application and correct it.

## 8.22.6 IJServer17209

---

### IJServer17209: getOutputStream() has already been called for this response

#### Explanation

The *getOutputStream* and *getWriter* methods were called for the same response.

## User Action

To the same response, either a *getWriter* method or a *getOutputStream* method (but not both) can be used.

The application may be calling both methods instead of only one. Check the application and correct it.

---

### 8.22.7 IJServer17210

---

#### IJServer17210: Cannot reset buffer after response has been committed

##### Explanation

After the processing the return of part or all of the response, an attempt was made to reset a response buffer. The buffer could not be reset.

##### User Action

Check the application to ensure that the *resetBuffer* method is only called prior to data being written to the buffer.

---

### 8.22.8 IJServer17211

---

#### IJServer17211: Cannot call *sendError()* after the response has been committed

##### Explanation

The *sendError* method of the response was called after some or all of the response data was written to the buffer.

##### User Action

Check the application to ensure that the *sendError* method is only called prior to data being written to the buffer.

---

### 8.22.9 IJServer17212

---

#### IJServer17212: Cannot call *sendRedirect()* after the response has been committed

##### Explanation

The *sendRedirect* method of the response was called after some or all of the response data was written to the buffer.

##### User Action

Check the application to ensure that the *sendRedirect* method is only called prior to data being written to the buffer.

---

### 8.22.10 IJServer17213

---

#### IJServer17213: Cannot change buffer size after data has been written

##### Explanation

The *setBufferSize* method of the response was called after some or all of the response data was written to the buffer.

##### User Action

Check the application to ensure that the *setBufferSize* method is only called prior to data being written to the buffer.

---

### 8.22.11 IJServer17214

---

#### IJServer17214: *getReader()* has already been called for this request

##### Explanation

The *getInputStream* and *getReader* methods were called for the same request.

##### User Action

To the same response, either a *getReader* method or a *getInputStream* method (but not both) can be used.

The application may be calling both methods instead of only one. Check the application and correct it.

## 8.22.12 IJServer17215

---

### IJServer17215: *getInputStream()* has already been called for this request

#### Explanation

The *getReader* and *getInputStream* methods were called for the same request.

#### User Action

To the same response, either a *getReader* method or a *getInputStream* method (but not both) can be used.

The application may be calling both methods instead of only one. Check the application and correct it.

## 8.22.13 IJServer17216

---

### IJServer17216: Cannot create a session after the response has been committed

#### Explanation

An attempt was made to generate a session after some or all of the response data was written to the buffer.

#### User Action

Check the application to ensure that the *setSession* method is only called prior to data being written to the buffer.

## 8.22.14 IJServer17217

---

### IJServer17217: Cannot call *setAttribute* with a null name

#### Explanation

The *setAttribute* (String name, Object value) method called for a request with the argument name set to null.

#### User Action

Check the application to see if it calls the *setAttribute* (String name, Object value) method for a request with the argument name set to null. If it does, correct the application to specify a valid Argument name.

## 8.22.15 IJServer17219

---

### IJServer17219: Bad Cookie Name: (%s) /Value: (%s)

#### Variable Information

%s1 = Cookie name

%s2 = Cookie value

#### Explanation

The name of Cookie sent from the client is illegal.

#### User Action

If this message is output repeatedly, review the IJServer WorkUnit, and the entire Web site system, use a find or search tool to determine whether a Cookie having the name displayed for %s1 is set somewhere in the site system.

## 8.22.16 IJServer17220

---

### IJServer17220: CoyoteAdapter %s

## Variable Information

%s = Message

## Explanation

A problem was detected during HTTP processing of the Servlet container.

## User Action

Perform corrective action suggested by the (%s) message, and other output messages.

## 8.22.17 IJServer17221

---

### IJServer17221: CoyoteAdapter %s

## Variable Information

%s = Message

## Explanation

A problem was detected during HTTP processing of the Servlet container.

## User Action

Exception information (%s) is output following this message.

Perform a corrective action according to the contents of the message, exception information, and other output messages.

## 8.22.18 IJServer17222

---

### IJServer17222: WARN: webconnectorAddr not availavle at CoyoteReqest.getWebconnectorAddr. use 127.0.0.1

## Explanation

The IP address of the Web server connector failed to be acquired.

## System Action

Processing continues with the IP address of the Web server connector set to 127.0.0.1.

## User Action

Check the network settings of the operating system for errors.

When SSL is used between the Web server connector and Servlet container, check whether a JAR file of Java Secure Socket Extension (JSSE) other than for the IJServer is set in the class path, etc.

Check whether the Servlet container for this product is specified in the class path, etc.

If the above actions fail to remove the error, recreate the IJServer WorkUnit.

## 8.22.19 IJServer17223

---

### IJServer17223: No ssl configuration is specified.

## Explanation

There is an inconsistency in the SSL communication settings between the Web server connector and Servlet container.

## User Action

Check that the Servlet container of this product is specified in the environment variable CLASSPATH.

If it is not, set the environment variable CLASSPATH to this product's Servlet container.

If the above action fails to rectify the error, recreate the IJServer WorkUnit.

## 8.22.20 IJServer17224

---

### IJServer: INFO: IJServer17224: Using ssl configuration '%s'.

#### Variable Information

%s = SSL definition name

#### Explanation

SSL definition name (%s) is used in SSL communication between the Web server connector and Servlet container.

#### System Action

Processing continues.

## 8.22.21 IJServer17225

---

### IJServer17225: Can not get ssl configuration.: %s

#### Variable Information

%s = Detailed information

#### Explanation

The SSL definition, used in SSL communication between the Web server connector and Servlet container, failed to be acquired.

#### User Action

Perform the following corrective actions:

- Remove the problem by referring the detailed information (%s).
- Check whether access authorization of the Interstage certificate environment was illegally changed.  
The environment must be available as a reference with the start authorization of the IJServer WorkUnit.
- The Interstage certificate environment might be destroyed.  
If it is, recreate the Interstage certificate environment.
- If the above actions fail to rectify the error, recreate the IJServer WorkUnit.

## 8.22.22 IJServer17226

---

### IJServer17226: Can not get keystore accessing infomation from ssl configuration "%s1" . : %s2

#### Variable Information

%s1 = SSL definition name

%s2 = Detailed information

#### Explanation

The SSL definition, used in SSL communication between the Web server connector and Servlet container, failed to be accessed.

#### User Action

Perform the following corrective actions:

- Remove the problem by referring the detailed information (%s2).
- Check whether access authorization of the Interstage certificate environment was illegally changed.  
The environment must be available as a reference with the start authorization of the IJServer WorkUnit.

- The Interstage certificate environment might be destroyed.  
If it is, recreate the Interstage certificate environment.
- If the above actions fail to rectify the error, recreate the IJServer WorkUnit.

## 8.23 IJServer17600 to IJServer17699

---

### 8.23.1 IJServer17613

---

**IJServer: WARNING: IJServer17613: CA Certificate '(%s1)' is not valid at now. Removing it from trusted CAs. It may cause failure in connecting to the web connector. error:%s2**

#### Variable Information

%s1 = CA certificate name

%s2 = Detailed information

#### Explanation

The CA certificate is invalid and it cannot be trusted.

#### User Action

Check whether the CA certificates in the SSL definition used for SSL communication between the Web server connector and Servlet container contain invalid or expired certificates.

Correct the SSL definition setting so that it includes only valid CA certificates that can be trusted.

If necessary, acquire new CA certificates.

### 8.23.2 IJServer17614

---

**IJServer: WARNING: IJServer17614: Optional Client authentication is not supported. It will be configured as 'must'.**

#### Explanation

The SSL definition used in SSL communication between the Web sever connector and Servlet container requires authentication of the client certificate when it is presented. However, regardless of the setup, the Servlet container operates only when the client certificate is presented.

### 8.23.3 IJServer17616

---

**IJServer: INFO: IJServer17616: Using client CA certificates aliases for client authentication. : (%s)**

#### Variable Information

%s = CA certificate name

#### Explanation

The CA of the CA certificate indicated by (%s) is trusted to confirm the client certificate in SSL communication between the Web server connector and Servlet container.

### 8.23.4 IJServer17617

---

**IJServer: INFO: IJServer17617: All CA certificates in the keystore will be used for client authentication.**

#### Explanation

This message advises that the CAs of all CA certificates in the Interstage certificate environment are trusted to confirm the validity of the client certificates used in the SSL communications between the Web server connector and Servlet container.

## 8.23.5 IJServer17618

---

**IJServer: INFO: IJServer17618: Using site certificate : %s1 (issued by <%s2>).**

### Variable Information

%s1 = Nickname of the certificate used for the site certificate of a Servlet container

%s2 = The signer of the site certificate of %s1

### Explanation

The nickname (%s1) is used for the SSL communication between a Web server connector and a Servlet container as a site certificate of a Servlet container.

## 8.23.6 IJServer17619

---

**IJServer: WARNING: IJServer17619: Certificate indicated to use is not valid at now. It will cause failure in connecting to the web connector. cert: %s1 error: %s2**

### Variable Information

%s1 = Site certificate name

%s2 = Detailed information

### Explanation

The certificate (%s1) used as the Servlet container certificate in SSL communication between the Web server connector and Servlet container is invalid.

The Web server connector may encounter a problem when attempting a connection.

### User Action

Check the validity and expiration status of the site certificate of the Servlet container specified in the SSL definition used in SSL communication between the Web server connector and Servlet container.

Correct the SSL definition so that it defines a valid CA certificate that can be trusted.

If necessary, acquire a new Servlet container certificate.

## 8.23.7 IJServer17620

---

**IJServer: INFO: IJServer17620: Using cipher suite :%s1**

### Variable Information

%s1 = The list of symbols of the encryption method used for the SSL communication between a Web server connector and a Servlet container.

### Explanation

Identifies the encryption methods (%s1) used for the SSL communication between a Web server connector and a Servlet container.

## 8.23.8 IJServer17621

---

**IJServer17621: WARN: SSL client authorization is set to "%s1" without client authentication. Authorization will not be done.**

### Variable Information

%s1 = Inside information

## Explanation

Only server attestation is performed by the SSL communication between a Web server connector and a Servlet container, and restriction of the Web server connector which a client connects is not performed. (The output of this message is not unusual).

### 8.23.9 IJServer17624

---

**IJServer: WARNING: IJServer17624: Certificate indicated to use is not valid at now. It will cause failure in connecting to the web connector. cert: %s1 error: %s2**

#### Variable Information

%s1 = Site certificate name

%s2 = Detailed information

#### Explanation

The certificate (%s1) used as the Servlet container certificate in SSL communication between the Web server connector and Servlet container is currently invalid.

The Web server connector may encounter a problem when attempting a connection.

#### User Action

Check the validity and expiration status of the site certificate of the Servlet container specified in the SSL definition used in SSL communication between the Web server connector and Servlet container.

Correct the SSL definition so that it defines a valid CA certificates that can be trusted. If necessary, acquire a new Servlet container certificate.

### 8.23.10 IJServer17625

---

**IJServer17625: ERROR: Client authorization is failed. scheme:(%s1) client : (%s2)**

#### Variable Information

%s1 = Control method

"requireMyOwnCert": Requests the same certificate as that of the Servlet container . (This setting is appropriate when the Web server and WorkUnit are operated on the same machine)

"requireCertInList": Requests the certificate contained in the user-specified certificate list. (This setting is appropriate when the Web server and WorkUnit are not operated on the same machine)

%s2 = IP address of the request sending source

#### Explanation

The Servlet container authenticated the request sending source (it specified it with the trusted CA certificate) in SSL communication between the Web server connector and Servlet container. However, the Servlet container did not allow access because of the connection destination restriction.

#### User Action

Check the IP address of the request sending source to see if the source is the Web server connector to be connected to the Servlet container of the IJServer WorkUnit. To connect the machine differently from the IJServer WorkUnit to the Servlet container of the IJServer WorkUnit, change the Interstage system setting so that the Web server and WorkUnit are not operated on the same machine.

If you are not using the multiserver management function, and the Interstage system setting specifies that "Web server and WorkUnit are not operated on the same machine," check the site certificate specified in the SSL definition of the Web server connector to be connected to the Servlet container of the IJServer WorkUnit. Ensure that it is correctly included in "Restrict Connection Destination Connector" of "Web Server Connector" in the [System] > [WorkUnit] > [IJServer WorkUnit Name] > [Environment Settings] tab on the Interstage Management Console.

## 8.23.11 IJServer17626

---

**IJServer: ERROR: IJServer17626: Certificate from webconnector is not valid at now. error: (%s1) cert: (%s2)**

### Variable Information

%s1 = Detailed information

%s2 = Site certificate information sent from the request sending source (format: serial number@issuer)

### Explanation

The site certificate sent from the request sending source is invalid for SSL communication between the Web server connector and Servlet container.

### User Action

Check the validity and expiration status of the site certificate which is specified in the SSL definition used in SSL communication between the Web server connector and Servlet container.

If necessary, acquire a new site certificate and change the SSL definition.

## 8.23.12 IJServer17627

---

**IJServer17627: Error in getting site certificate from the KeyStore (%s1). : (%s2)**

### Variable Information

%s1 = Key store information

%s2 = Site certificate name

### Explanation

The site certificate used in SSL communication between the Web server connector and Servlet container failed to be acquired from the KeyStore.

### User Action

Perform the following corrective actions:

- Check the SSL definition and Interstage certificate environment to confirm that the specified site certificate (%s2) exists.
- Check whether the Interstage certificate environment can be accessed with the start authorization of the IJServer WorkUnit.

## 8.23.13 IJServer17628

---

**IJServer17628: Not found site certificate in the KeyStore(%s1). : (%s2)**

### Variable Information

%s1 = Key store information

%s2 = Site certificate name

### Explanation

The site certificate used in SSL communication between the Web server connector and Servlet container failed to be acquired.

### User Action

Check the SSL definition and Interstage certificate environment to see if the specified site certificate exists.

## 8.23.14 IJServer17629

---

**IJServer17629: Supported cipher suites in the environment: %s1**

## Variable Information

%s1 = The list of symbols of the encryption method which can be used in the environment of a WorkUnit of operation

## Explanation

Identifies the encryption methods (%s1) which can be used in the WorkUnit environment.

## 8.23.15 IJServer17630

---

**IJServer17630: Following cipher suites are not supported in the environment, and will not be used. : %s1**

## Variable Information

%s1 = The list of symbols of the encryption method which can't be used in the environment of a WorkUnit of operation

## Explanation

Identifies the encryption methods (%s1) which can't be used in the environment of a WorkUnit of operation.

## 8.23.16 IJServer17632

---

**IJServer17632: Endpoint %s1 shutdown due to exception: %s2 <%s3>**

## Variable Information

%s1 = Servlet container request acceptance socket information

%s2 = Exception

%s3 = Detailed information

## Explanation

The end point (%s1) is shut down because an exception occurred.

## Cause

An exception occurred in Servlet container request 'accept' processing.

## User Action

Resolve the cause of the error based on the exception information and detailed information.

## 8.23.17 IJServer17633

---

**IJServer17633: Endpoint %s1 ignored exception: %s2 <%s3>**

## Variable Information

%s1 = Information on the request receptionist socket of a Servlet container

%s2 = Exception information

%s3 = Detailed information

## Explanation

The exception occurred in request receptionist (accept) processing of a Servlet container. Re-initialization of a request receptionist socket is performed and processing is continued.

## Cause

Refer to the exception information and detailed information.

## User Action

Fix the cause of the error based on the exception information and detailed information.

## 8.23.18 IJServer17634

---

### IJServer17634: Reinitializing ServerSocket

#### Explanation

A request reception socket is re-initialized.

## 8.23.19 IJServer17635

---

### IJServer17635: Restarting endpoint

#### Explanation

A request reception part is rebooted.

## 8.23.20 IJServer17652

---

### IJServer17652: All threads are busy, waiting. Please increase maxThreads or check the servlet status%s1 %s2

#### Variable Information

%s1 = The present number of request connection

%s2 = maximum processing number + 1

#### Explanation

The number of simultaneous connection requests to a Servlet container exceeded the specified number of concurrent processing tasks.

#### User Action

Check if there is a problem in the system configuration relating to the estimate of simultaneous connection requests to the Servlet container (Web server connection limit, and the behavior of load balancing).

If the system is not fully loaded and there is available free memory, increase the process concurrency for the WorkUnit (in this case, the application must not depend on the number of processes if there is competition for file access, for example).

If the Servlet container and JavaVM heap have not reached maximum load, or the upper limit of the JavaVM heap can be increased, increase the value for simultaneous Servlet container processes in the WorkUnit settings (if necessary, also increase the JavaVM heap upper limit).

If there is no problem in the configuration, but resources are still insufficient, consider system scaleup.

## 8.23.21 IJServer17654

---

### IJServer17654: Caught exception executing %s1, terminating thread <%s2>

#### Variable Information

%s1 = Normally, org.apache.tomcat.util.net.TcpWorkerThread@<hexadecimal number>

%s2 = Exception information

#### Explanation

An exception occurred in the request receiving processing.

#### User Action

Take action according to the exception information and messages that are output at the same time.

For exceptions, refer to the following information and "Exceptions Output during J2EE Usage".

- java.lang.IllegalStateException

This message may be output if a request is received during Servlet container end processing. Ignore this message in such cases.

## 8.23.22 IJServer17655

---

### IJServer17655: Unexpected exception <%s1>

#### Variable Information

%s1 = java.lang.InterruptedException, or inherited Exception

#### Explanation

An exception occurred in accept processing for the request.

#### User Action

Unless this message is repeatedly output in a short space of time, there will be no impact on operations, so the message can be ignored.

If this message is output repeatedly, collect investigation information using the *iscollectinfo* command, then contact a service engineer.

## 8.24 IJServer18000 to IJServer18099

---

### 8.24.1 IJServer18000

---

#### IJServer: INFO: IJServer18000: startup class "%s1" finish.

#### Variable Information

%s1 = Name of startup class

#### Explanation

Execution of the startup class is finished.

### 8.24.2 IJServer18001

---

#### IJServer: INFO: IJServer18001: shutdown class "%s1" finish.

#### Variable Information

%s1 = Name of shutdown class

#### Explanation

Execution of the shutdown class is finished.

### 8.24.3 IJServer18002

---

#### IJServer: INFO: IJServer18002: startup class "%s1" start.

#### Variable Information

%s1 = Name of startup class

#### Explanation

Execution of the startup class has been started.

The following message is displayed when execution of the startup class is finished:

startup class "%s1" finish.

#### User Action

If WorkUnit startup processing terminates abnormally, check whether other messages are produced.

If the message (startup class "%s1" finish.) is not produced at the end of execution and no other message is produced, the WorkUnit was stopped during execution of the startup class. Check the WorkUnit monitoring time. If a sufficiently large value is set for the monitoring time, there is a problem in the processing time of the startup class. Check the processing of the startup class.

## 8.24.4 IJServer18003

---

**IJServer: INFO: IJServer18003: shutdown class "%s1" start.**

### Variable Information

%s1 = Name of shutdown class

### Explanation

Execution of the shutdown class has been started.

The following message is displayed when the execution of the shutdown class is finished:

shutdown class "%s1" finish.

### User Action

If WorkUnit shutdown processing terminates abnormally, check whether other messages are produced.

If the message (shutdown class "%s1" finish.) is not produced at the end of execution and no other message is produced, the WorkUnit was stopped during execution of the shutdown class. Check the WorkUnit monitoring time. If a sufficiently large value is set for the monitoring time, there is a problem in the processing time of the shutdown class. Check the processing of the shutdown class.

## 8.24.5 IJServer18004

---

**IJServer18004: The call of the startup class "%s1" is failed. "%s2" does not define 'public static void main(String[])'.**

### Variable Information

%s1 = Name of startup class

%s2 = Class name of startup class

### Explanation

The following method is not found in the startup class registered:

```
'public static void main(String[])'
```

### System Action

When the start-time execution class is newly created or its environment is set, WorkUnit continues starting if "Continuation" is specified in "Start WorkUnit at Exception".

If "Stop" is specified, the WorkUnit stops starting.

### User Action

Add the following method to the startup class:

```
'public static void main(String[])'
```

## 8.24.6 IJServer18005

---

**IJServer18005: The call of the shutdown class "%s1" is failed. "%s2" does not define 'public static void main(String[])'.**

### Variable Information

%s1 = Name of shutdown class

%s2 = Class name of shutdown class

## Explanation

The following method is not found in the shutdown class registered:

```
'public static void main(String[])'
```

## System Action

WorkUnit continues shutdown.

## User Action

Add the following method to the shutdown class:

```
'public static void main(String[])'
```

## 8.24.7 IJServer18006

---

**IJServer18006: The call of the startup class "%s1" is failed. "%s2" is not found in classpath. Please set "%s2" in your classpath.**

### Variable Information

%s1 = Name of startup class

%s2 = Class name of startup class

## Explanation

The registered startup class is not found in the classpath of the WorkUnit.

## System Action

When the start-time execution class is newly created, or its environment is set, the WorkUnit continues starting if "Continuation" is specified in "Start WorkUnit at Exception".

If "Stop" is specified, the WorkUnit stops starting.

## User Action

Take the following measures:

1. Set the startup class in the classpath of the WorkUnit. Set the classpath of the WorkUnit at [WorkUnit] > [WorkUnit Name] > [Settings] > [WorkUnit settings] on the Interstage Management Console. When the "IJServer Type" is "Web application and EJB application run in separate Java VM", two classpaths exist for the Servlet container and EJB container. Set the classpath of the container that calls the startup class.
2. Check whether the class name of the startup class is correct.  
Is the name spelled correctly?  
Is the package name qualified correctly?
3. Check whether the startup class is declared as a public class. If not, declare it as a public class.

## 8.24.8 IJServer18007

---

**IJServer18007: The call of the shutdown class "%s1" is failed. "%s2" is not found in classpath. Please set "%s" in your classpath.**

### Variable Information

%s1 = Name of shutdown class

%s2 = Class name of shutdown class

## Explanation

The registered shutdown class is not found in the classpath of the WorkUnit.

## System Action

WorkUnit continues shutdown.

## User Action

Take the following measures:

1. Set the shutdown class in the classpath of the WorkUnit. Set the classpath of the WorkUnit at [WorkUnit] > [WorkUnit Name] > [Settings] > [WorkUnit settings] on the Interstage Management Console. When the "IJServer Type" is "Web application and EJB application run in separate Java VM", two classpaths exist for the Servlet container and EJB container. Set the classpath of the container that calls the shutdown class.
2. Check whether the class name of the shutdown class is correct.  
Is the name spelled correctly?  
Is the package name qualified correctly?
3. Check whether the shutdown class is declared as a public class. If not, declare it as a public class.

## 8.24.9 IJServer18008

---

### IJServer18008: The call of the startup class "%s1" is failed.

#### Variable Information

%s1 = Name of startup class

#### Explanation

The registered startup class could not be terminated normally.

#### Cause

The registered startup class may have been installed incorrectly.

#### System Action

When the start-time execution class is newly created, or its environment is set, WorkUnit continues starting if "Continuation" is specified in "Start WorkUnit at Exception".

If "Stop" is specified, the WorkUnit stops starting.

#### User Action

Remove the cause of the exception by referring to the stack trace of the exception.

## 8.24.10 IJServer18009

---

### IJServer18009: The call of the shutdown class "%s1" is failed. %s3

#### Variable Information

%s1 = Name of shutdown class

%s3 = Stack trace of the exception that occurred during processing of the shutdown class

#### Explanation

The registered shutdown class could not be terminated normally.

#### Cause

The registered shutdown class may have been installed incorrectly.

## System Action

WorkUnit continues shutdown.

## User Action

Remove the cause of the exception by referring to the stack trace of the exception.

## 8.24.11 IJServer18020

---

**IJServer18020: The initialization of the startup class is failed. The item name is not specified. Please set classname as a character string of one character or more.**

### Explanation

Initialization of the startup class failed. The name of the startup class was not defined.

### Cause

The startup class may not have been registered from the Interstage Management Console.

### System Action

When the start-time execution class is newly created, or its environment is set, WorkUnit continues starting if "Continuation" is specified in "Start WorkUnit at Exception".

If "Stop" is specified, the WorkUnit stops starting.

### User Action

Follow the procedure below:

1. Stop Interstage.
2. Make a backup copy of the following file. Search the file for a <startupClass> element having a <name> tag as a subelement in which no value is defined, and delete the element together with the subelement.

**Windows32/64**

```
%IS_HOME%\J2EE\var\deployment\ijserver\IJServer\FJIJServer.xml
```

**Solaris32/64 Linux32/64**

```
/var/opt/FJSVj2ee/deployment/ijserver/IJServer/FJIJServer.xml
```

3. Start Interstage.
4. Reregister the startup class using the Interstage Management Console.

If the above action does not solve the problem, collect the check information using the *iscollectinfo* command, then contact a service engineer.

## 8.24.12 IJServer18021

---

**IJServer18021: The initialization of the shutdown class is failed. The item name is not specified. Please set classname as a character string of one character or more.**

### Explanation

Initialization of the shutdown class failed. The name of the shutdown class was not defined.

### Cause

The shutdown class may not have been registered from the Interstage Management Console.

### System Action

WorkUnit continues shutdown.

## User Action

Follow the procedure below:

1. Stop Interstage.
2. Make a backup copy of the following file. Search the file for a <shutdownClass> element having a <name> tag as a subelement in which no value is defined, and delete the element together with the subelement.

Windows32/64

```
%IS_HOME%\J2EE\var\deployment\ijserver\IJServer\FJIJServer.xml
```

Solaris32/64 Linux32/64

```
/var/opt/FJsvj2ee/deployment/ijserver/IJServer/FJIJServer.xml
```

3. Start Interstage.
4. Reregister the shutdown class using the Interstage Management Console.

If the above action does not solve the problem, collect the check information using the *iscollectinfo* command, then contact a service engineer.

## 8.24.13 IJServer18022

**IJServer18022: The initialization of the startup class is failed. %s1 for the item deploymentOrder does not fall in the range [0, 2147483647].**

### Variable Information

%s1 = Name of startup class

### Explanation

Initialization of the startup class failed. The setting of the execution order of the startup class is invalid.

### Cause

The startup class may not have been registered from the Interstage Management Console.

### System Action

When the start-time execution class is newly created, or its environment is set, WorkUnit continues starting if "Continuation" is specified in "Start WorkUnit at Exception".

If "Stop" is specified, the WorkUnit stops starting.

## User Action

Follow the procedure below:

1. Stop Interstage.
2. Make a backup copy of the following file. Search the file for a <startupClass> element having <deploymentOrder> as a subelement in which a value from 0 to 2147483647 is defined, and delete the element together with the subelement.

Windows32/64

```
%IS_HOME%\J2EE\var\deployment\ijserver\IJServer\FJIJServer.xml
```

Solaris32/64 Linux32/64

```
/var/opt/FJsvj2ee/deployment/ijserver/IJServer/FJIJServer.xml
```

3. Start Interstage.

4. Reregister the startup class using the Interstage Management Console.

If the above action does not solve the problem, collect the check information using the *iscollectinfo* command, then contact a service engineer.

## 8.24.14 IJServer18023

---

**IJServer18023: The initialization of the shutdown class is failed. %s1 for the item deploymentOrder does not fall in the range [0, 2147483647].**

### Variable Information

%s1 = Name of shutdown class

### Explanation

Initialization of the shutdown class failed. The setting of the execution order of the shutdown class is invalid.

### Cause

The shutdown class may not have been registered from the Interstage Management Console.

### System Action

WorkUnit continues shutdown.

### User Action

Follow the procedure below:

1. Stop Interstage.
2. Make a backup copy of the following file. Search the file for a <shutdownClass> element having <deploymentOrder> as a subelement in which a value from 0 to 2147483647 is defined, and delete the element together with the subelement.

**Windows32/64**

```
%IS_HOME%\J2EE\var\deployment\ijserver\IJServer\FJIJServer.xml
```

**Solaris32/64 Linux32/64**

```
/var/opt/FJSVj2ee/deployment/ijserver/IJServer/FJIJServer.xml
```

3. Start Interstage.
4. Reregister the shutdown class using the Interstage Management Console.

If the above action does not solve the problem, collect the check information using the *iscollectinfo* command, then contact a service engineer.

## 8.24.15 IJServer18024

---

**IJServer18024: The initialization of the startup class is failed. The item "name" is not specified. Please set name as a character string of one character or more.**

### Explanation

Initialization of the startup class failed. The name of the startup class was not defined.

### Cause

The startup class may not have been registered from the Interstage Management Console.

### System Action

When the start-time execution class is newly created, or its environment is set, WorkUnit continues starting if "Continuation" is specified in "Start WorkUnit at Exception".

If "Stop" is specified, the WorkUnit stops starting.

## User Action

Follow the procedure below:

1. Stop Interstage.
2. Make a backup copy of the following file. Search the file for a <startupClass> element having a <name> as a subelement in which no value is defined, and delete the element together with the subelement.

**Windows32/64**

```
%IS_HOME%\J2EE\var\deployment\ijserver\IJServer\FJIJServer.xml
```

**Solaris32/64** **Linux32/64**

```
/var/opt/FJSVj2ee/deployment/ijserver/IJServer/FJIJServer.xml
```

3. Start Interstage.
4. Reregister the startup class using the Interstage Management Console.

If the above action does not solve the problem, collect the check information using the *iscollectinfo* command, then contact a service engineer.

## 8.24.16 IJServer18025

**IJServer18025: The initialization of the shutdown class is failed. The item "name" is not specified. Please set name as a character string of one character or more.**

### Explanation

Initialization of the shutdown class failed. The name of the shutdown class was not defined.

### Cause

The shutdown class may not have been registered from the Interstage Management Console.

### System Action

WorkUnit continues shutdown.

### User Action

Follow the procedure below:

1. Stop Interstage.
2. Make a backup copy of the following file. Search the file for a <shutdownClass> element having a <name> as a subelement in which no value is defined, and delete the element together with the subelement.

**Windows32/64**

```
%IS_HOME%\J2EE\var\deployment\ijserver\IJServer\FJIJServer.xml
```

**Solaris32/64** **Linux32/64**

```
/var/opt/FJSVj2ee/deployment/ijserver/IJServer/FJIJServer.xml
```

3. Start Interstage.
4. Reregister the shutdown class using the Interstage Management Console.

If the above action does not solve the problem, collect the check information using the *iscollectinfo* command, then contact a service engineer.

## 8.24.17 IJServer18026

---

**IJServer18026: The initialization of the startup class "%s1" is failed. The item "deploymentOrder" is not specified.**

### Explanation

Initialization of the startup class failed. The name of the startup class was not defined.

### Cause

The startup class may not have been registered from the Interstage Management Console.

### System Action

When the start-time execution class is newly created, or its environment is set, WorkUnit continues starting if "Continuation" is specified in "Start WorkUnit at Exception".

If "Stop" is specified, the WorkUnit stops starting.

### User Action

Follow the procedure below:

1. Stop Interstage.
2. Make a backup copy of the following file. Search the file for a <startupClass> element having a <deploymentOrder> as a subelement in which no value is defined, and delete the element together with the subelement.

**Windows32/64**

```
%IS_HOME%\J2EE\var\deployment\ijserver\IJServer\FJIJServer.xml
```

**Solaris32/64** **Linux32/64**

```
/var/opt/FJSVj2ee/deployment/ijserver/IJServer/FJIJServer.xml
```

3. Start Interstage.
4. Reregister the startup class using the Interstage Management Console.

If the above action does not solve the problem, collect the check information using the *iscollectinfo* command, then contact a service engineer.

## 8.24.18 IJServer18027

---

**IJServer18027: The initialization of the shutdown class "%s1" is failed. The item "deploymentOrder" is not specified.**

### Explanation

Initialization of the shutdown class failed. The name of the shutdown class was not defined.

### Cause

The shutdown class may not have been registered from the Interstage Management Console.

### System Action

WorkUnit continues shutdown.

### User Action

Follow the procedure below:

1. Stop Interstage.

2. Make a backup copy of the following file. Search the file for a <shutdownClass> element having a <deploymentOrder> as a subelement in which no value is defined, and delete the element together with the subelement.

Windows32/64

```
%IS_HOME%\J2EE\var\deployment\ijserver\IJServer\FJIIJServer.xml
```

Solaris32/64 Linux32/64

```
/var/opt/FJJSVj2ee/deployment/ijserver/IJServer/FJIIJServer.xml
```

3. Start Interstage.
4. Reregister the shutdown class using the Interstage Management Console.

If the above action does not solve the problem, collect the check information using the *iscollectinfo* command, then contact a service engineer.

## 8.24.19 IJServer18028

**IJServer18028: The initialization of the startup class "%s1" is failed. %s2 for the item "deploymentOrder" does not fall in the range [0, 2147483647].**

### Variable Information

%s1 = Name of startup class

%s2 = Value defined as an execution order

### Explanation

Initialization of the startup class failed. The setting of the execution order of the startup class is invalid.

### Cause

The startup class may not have been registered from the Interstage Management Console.

### System Action

When the start-time execution class is newly created, or its environment is set, WorkUnit continues starting if "Continuation" is specified in "Start WorkUnit at Exception".

If "Stop" is specified, the WorkUnit stops starting.

### User Action

Follow the procedure below:

1. Stop Interstage.
2. Make a backup copy of the following file. Search the file for a <startupClass> element having <deploymentOrder> as a subelement in which a value from 0 to 2147483647 is defined, and delete the element together with the subelement.

Windows32/64

```
%IS_HOME%\J2EE\var\deployment\ijserver\IJServer\FJIIJServer.xml
```

Solaris32/64 Linux32/64

```
/var/opt/FJJSVj2ee/deployment/ijserver/IJServer/FJIIJServer.xml
```

3. Start Interstage.
4. Reregister the startup class using the Interstage Management Console.

If the above action does not solve the problem, collect the check information using the *iscollectinfo* command, then contact a service engineer.

## 8.24.20 IJServer18029

---

**IJServer18029: The initialization of the shutdown class "%s1" is failed. %s2 for the item "deploymentOrder" does not fall in the range [0, 2147483647].**

### Variable Information

%s1 = Name of shutdown class

%s2 = Value defined as an execution order

### Explanation

Initialization of the shutdown class failed. The setting of the execution order of the shutdown class is invalid.

### Cause

The shutdown class may not have been registered from the Interstage Management Console.

### System Action

WorkUnit continues shutdown.

### User Action

Follow the procedure below:

1. Stop Interstage.
2. Make a backup copy of the following file. Search the file for a <shutdownClass> element having <deploymentOrder> as a subelement in which a value from 0 to 2147483647 is defined, and delete the element together with the subelement.

**Windows32/64**

```
%IS_HOME%\J2EE\var\deployment\ijserver\IJServer\FJIIJServer.xml
```

**Solaris32/64 Linux32/64**

```
/var/opt/FJsvj2ee/deployment/ijserver/IJServer/FJIIJServer.xml
```

3. Start Interstage.
4. Reregister the shutdown class using the Interstage Management Console.

If the above action does not solve the problem, collect the check information using the *iscollectinfo* command, then contact a service engineer.

## 8.24.21 IJServer18030

---

**IJServer18030: The initialization of the startup class "%s1" is failed. The item %s2 is set to characters other than the figure. Please set the figure.**

### Variable Information

%s1 = Name of startup class

%s2 = Character string defined as an execution order

### Explanation

Initialization of the startup class failed. The setting of the execution order of the startup class is invalid.

### Cause

The startup class may not have been registered from the Interstage Management Console.

## System Action

When the start-time execution class is newly created, or its environment is set, WorkUnit continues starting if "Continuation" is specified in "Start WorkUnit at Exception".

If "Stop" is specified, the WorkUnit stops starting.

## User Action

Follow the procedure below:

1. Stop Interstage.
2. Make a backup copy of the following file. Search the file for a <startupClass> element having <deploymentOrder> as a subelement in which a non-numeric string is defined, and delete the element together with the subelement.

Windows32/64

```
%IS_HOME%\J2EE\var\deployment\ijserver\IJServer\FJIIJServer.xml
```

Solaris32/64 Linux32/64

```
/var/opt/FJSVj2ee/deployment/ijserver/IJServer/FJIIJServer.xml
```

3. Start Interstage.
4. Reregister the startup class using the Interstage Management Console.

If the above action does not solve the problem, collect the check information using the *iscollectinfo* command, then contact a service engineer.

## 8.24.22 IJServer18031

**IJServer18031: The initialization of the shutdown class "%s1" is failed. The item %s2 is set to characters other than the figure. Please set the figure.**

### Variable Information

%s1 = Name of shutdown class

%s2 = Character string defined as an execution order

### Explanation

Initialization of the shutdown class failed. The setting of the execution order of the shutdown class is invalid.

### Cause

The shutdown class may not have been registered from the Interstage Management Console.

## System Action

WorkUnit continues shutdown.

## User Action

Follow the procedure below:

1. Stop Interstage.
2. Make a backup copy of the following file. Search the file for a <shutdownClass> element having <deploymentOrder> as a subelement in which a non-numeric string is defined, and delete the element together with the subelement.

Windows32/64

```
%IS_HOME%\J2EE\var\deployment\ijserver\IJServer\FJIIJServer.xml
```

Solaris32/64 Linux32/64

```
/var/opt/FJSVj2ee/deployment/ijserver/IJServer/FJIJServer.xml
```

3. Start Interstage.
4. Reregister the shutdown class using the Interstage Management Console.

If the above action does not solve the problem, collect the check information using the *iscollectinfo* command, then contact a service engineer.

## 8.24.23 IJServer18032

---

**IJServer18032: The initialization of the startup class is failed. There is the repeated name %s1. Please specify a unique name.**

### Variable Information

%s1 = Character string defined as the name of a startup class

### Explanation

Initialization of the startup class failed. A startup class with the specified name is already registered.

### Cause

The startup class may not have been registered from the Interstage Management Console.

### System Action

When the start-time execution class is newly created, or its environment is set, WorkUnit continues starting if "Continuation" is specified in "Start WorkUnit at Exception".

If "Stop" is specified, the WorkUnit stops starting.

### User Action

Follow the procedure below:

1. Stop Interstage.
2. Make a backup copy of the following file. Remove all <startupClass> tags from the file.

**Windows32/64**

```
%IS_HOME%\J2EE\var\deployment\ijserver\IJServer\FJIJServer.xml
```

**Solaris32/64 Linux32/64**

```
/var/opt/FJSVj2ee/deployment/ijserver/IJServer/FJIJServer.xml
```

3. Start Interstage.
4. Reregister the startup class using the Interstage Management Console.

If the above action does not solve the problem, collect the check information using the *iscollectinfo* command, then contact a service engineer.

## 8.24.24 IJServer18033

---

**IJServer18033: The initialization of the shutdown class is failed. There is the repeated name %s1. Please specify a unique name.**

### Variable Information

%s1 = Character string defined as the name of a shutdown class

### Explanation

Initialization of the shutdown class failed. A shutdown class with the specified name is already registered.

## Cause

The shutdown class may not have been registered from the Interstage Management Console.

## System Action

WorkUnit continues shutdown.

## User Action

Follow the procedure below:

1. Stop Interstage.
2. Make a backup copy of the following file. Remove all <shutdownClass> tags from the file.

**Windows32/64**

```
%IS_HOME%\J2EE\var\deployment\ijserver\IJServer\FJIJServer.xml
```

**Solaris32/64 Linux32/64**

```
/var/opt/FJSVj2ee/deployment/ijserver/IJServer/FJIJServer.xml
```

3. Start Interstage.
4. Reregister the shutdown class using the Interstage Management Console.

If the above action does not solve the problem, collect the check information using the *iscollectinfo* command, then contact a service engineer.

## 8.24.25 IJServer18040

---

### IJServer18040: Can not read configuration file. detail=%s1

#### Variable Information

%s1 = Detail message

#### Explanation

The environment file could not be read.

#### System Action

- At execution of the startup class:

When the start-time execution class is newly created or its environment is set, WorkUnit continues starting if "Continuation" is specified in "Start WorkUnit at Exception".

If "Stop" is specified, the WorkUnit stops starting.

- At execution of the shutdown class:

WorkUnit continues shutdown.

#### User Action

Take action according to the message indicated by %s1. If doing so cannot solve the problem, do as follows:

- Check whether the access authority granted to the following file includes read permission. If not, grant read permission to the file.

**Windows32/64**

```
%IS_HOME%\J2EE\var\deployment\ijserver\IJServer\FJIJServer.xml
```

**Solaris32/64 Linux32/64**

```
/var/opt/FJSVj2ee/deployment/ijserver/IJServer/FJIJServer.xml
```

If the above action does not solve the problem, collect the check information using the *iscollectinfo* command, then contact a service engineer.

## 8.24.26 IJServer18050 to IJServer18060

---

### IJServer18050 to IJServer18060

#### Explanation

A system internal error occurred.

#### System Action

- At execution of the startup class:

When the start-time execution class is newly created or its environment is set, WorkUnit continues starting if "Continuation" is specified in "Start WorkUnit at Exception".

If "Stop" is specified, the WorkUnit stops starting.

- At execution of the shutdown class

WorkUnit continues shutdown.

#### User Action

Collect the check information using the *iscollectinfo* command, then contact a service engineer.

## 8.25 IJServer18100 to IJServer18199

---

### 8.25.1 IJServer18100

---

#### IJServer18100: Can not open ijserver.properties. detail=%s1

#### Variable Information

%s1 = Message about the exception that occurred

#### Explanation

The ijserver.properties file could not be opened.

#### System Action

Processing for the WorkUnit stops.

#### User Action

Take action according to the exception message. If doing so cannot solve the problem, do as follows:

- Check whether the access authority granted to the following file includes read permission. If not, grant read permission to the file.

**Windows32/64**

```
%IS_HOME%\J2EE\etc\ijserver.properties
```

**Solaris32/64** **Linux32/64**

```
/etc/opt/FJSVj2ee/etc/ijserver.properties
```

If the above action does not solve the problem, collect the check information using the *iscollectinfo* command, then contact a service engineer.

### 8.25.2 IJServer18101

---

---

## IJServer18101: The value is not found to "%s1" in ijservers.properties line:%s2.

### Variable Information

%s1 = Item for which no value is set

%s2 = Line number of the item

### Explanation

The ijservers.properties file contains an item for which no value is set.

### Cause

The following files might be directly edited:

**Windows32/64**

```
%IS_HOME%\J2EE\etc\ijservers.properties
```

**Solaris32/64** **Linux32/64**

```
/etc/opt/FJsvj2ee/etc/ijservers.properties
```

### System Action

Processing for the WorkUnit stops.

### User Action

If the following files have been directly edited, restore the settings in the files to what they had been before they were edited:

**Windows32/64**

```
%IS_HOME%\J2EE\etc\ijservers.properties
```

**Solaris32/64** **Linux32/64**

```
/etc/opt/FJsvj2ee/etc/ijservers.properties
```

If it has not been edited directly, collect the check information using the *iscollectinfo* command, then contact a service engineer.

## 8.25.3 IJServer18102

---

### IJServer18102: The key value is not found to "%s1" in ijserver.properties line:%s2.

#### Variable Information

%s1 = Item for which no key value is set

%s2 = Line number of the item

#### Explanation

The ijserver.properties file contains an item for which no key value is set.

#### Cause

The following files might be directly edited:

**Windows32/64**

```
%IS_HOME%\J2EE\etc\ijserver.properties
```

**Solaris32/64** **Linux32/64**

```
/etc/opt/FJsvj2ee/etc/ijserver.properties
```

## System Action

Processing for the WorkUnit stops.

## User Action

If the following files have been directly edited, restore the settings in the files to what they had been before they were edited:

**Windows32/64**

```
%IS_HOME%\J2EE\etc\ijservers.properties
```

**Solaris32/64** **Linux32/64**

```
/etc/opt/FJsvj2ee/etc/ijservers.properties
```

If it has not been edited directly, collect the check information using the *iscollectinfo* command, then contact a service engineer.

## 8.25.4 IJServer18103

---

**IJServer18103: The white space is included in "%s1" in ijserver.properties line:%s2.**

### Variable Information

%s1 = Item including a blank

%s2 = Line number of the item

### Explanation

The *ijservers.properties* file contains an item that includes a blank at an inappropriate position.

### Cause

The following files might be directly edited:

**Windows32/64**

```
%IS_HOME%\J2EE\etc\ijservers.properties
```

**Solaris32/64** **Linux32/64**

```
/etc/opt/FJsvj2ee/etc/ijservers.properties
```

## System Action

Processing for the WorkUnit stops.

## User Action

If the following files have been directly edited, restore the settings in the files to what they had been before they were edited:

**Windows32/64**

```
%IS_HOME%\J2EE\etc\ijservers.properties
```

**Solaris32/64** **Linux32/64**

```
/etc/opt/FJsvj2ee/etc/ijservers.properties
```

If it has not been edited directly, collect the check information using the *iscollectinfo* command, then contact a service engineer.

## 8.25.5 IJServer18104

---

**IJServer18104: %s1 in ijserver.properties line:%s2.**

## Variable Information

%s1 = Message about the exception that occurred

%s2 = Line number of the item

## Explanation

The `ijservers.properties` file contains an inappropriate value.

## Cause

The following files might be directly edited:

Windows32/64

```
%IS_HOME%\J2EE\etc\ijservers.properties
```

Solaris32/64 Linux32/64

```
/etc/opt/FJsvj2ee/etc/ijservers.properties
```

## System Action

Processing for the WorkUnit stops.

## User Action

If the following files have been directly edited, restore the settings in the files to what they had been before they were edited:

Windows32/64

```
%IS_HOME%\J2EE\etc\ijservers.properties
```

Solaris32/64 Linux32/64

```
/etc/opt/FJsvj2ee/etc/ijservers.properties
```

If it has not been edited directly, Collect the check information using the `iscollectinfo` command, then contact a service engineer.

## 8.25.6 IJServer18105

### IJServer18105: thr\_conc\_init "%s1" is not number. return default number :%s2

## Variable Information

%s1 = Character string defined in the `ijservers.properties` file

%s2 = Default value

## Explanation

Because the `ijservers.properties` file contains an inappropriate value, the default value is returned.

## Cause

The following files might be directly edited:

Windows32/64

```
%IS_HOME%\J2EE\etc\ijservers.properties
```

Solaris32/64 Linux32/64

```
/etc/opt/FJsvj2ee/etc/ijservers.properties
```

## System Action

Processing for the WorkUnit stops.

## User Action

If the following files have been directly edited, restore the settings in the files to what they had been before they were edited:

**Windows32/64**

```
%IS_HOME%\J2EE\etc\ijservers.properties
```

**Solaris32/64** **Linux32/64**

```
ijservers.properties
```

If it has not been edited directly, collect the check information using the *iscollectinfo* command, then contact a service engineer.

## 8.25.7 IJServer18106

---

### IJServer18106: thr\_conc\_maimum "%s1" is not number. return default number :%s2

#### Variable Information

%s1 = Character string defined in the ijservers.properties file

%s2 = Default value

#### Explanation

Because the ijservers.properties file contains an inappropriate value, the default value is returned.

#### Cause

The following files might be directly edited:

**Windows32/64**

```
%IS_HOME%\J2EE\etc\ijservers.properties
```

**Solaris32/64** **Linux32/64**

```
/etc/opt/FJsvj2ee/etc/ijservers.properties
```

## System Action

Processing for the WorkUnit stops.

## User Action

If the following files have been directly edited, restore the settings in the files to what they had been before they were edited:

**Windows32/64**

```
%IS_HOME%\J2EE\etc\ijservers.properties
```

**Solaris32/64** **Linux32/64**

```
/etc/opt/FJsvj2ee/etc/ijservers.properties
```

If it has not been edited directly, collect the check information using the *iscollectinfo* command, then contact a service engineer.

## 8.25.8 IJServer18110 to IJServer18140

---

### IJServer18110 to IJServer18140

### Explanation

A system internal error occurred.

### System Action

Processing for the WorkUnit stops.

### User Action

Collect the check information using the *iscollectinfo* command, then contact a service engineer.

# Chapter 9 Messages Beginning with 'IJSer2'

This chapter describes the messages displayed by the IJSer.

## 9.1 IJSer20100 to IJSer20999

This section details the messages with message numbers between IJSer20100 and IJSer20999.

### 9.1.1 IJSer20100

#### IJSer: ERROR: IJSer20100: Insufficient memory

##### Explanation

There is not enough memory available.

##### System Action

Stops processing.

##### User Action

Wait for a while, and then retry processing. If this message appears frequently, refer to the Interstage Application Tuning Guide, re-estimate the memory required for EJB Service operation, and confirm that there is enough memory.

If there is enough memory for the EJB Service, there may be insufficient memory to run other applications. Re-estimate the amount of memory needed for other applications running on the same machine.

If there is not enough memory, contact the system administrator. The system administrator must either increase the size of the main memory or increase the size of the page file.

### 9.1.2 IJSer20101

#### IJSer: ERROR: IJSer20101: I-O error: PATH="%s"

##### Variable Information

%s = File name

##### Explanation

An I/O error occurred.

##### System Action

Stops processing.

##### User Action

Restore the file with the I/O error from the backup.

### 9.1.3 IJSer20200

Windows32/64

#### IJSer: ERROR: IJSer20200: Incorrect file name or folder name : PATH="%s"

##### Variable Information

%s = File or folder name

##### Explanation

The file or folder name is incorrect.

## System Action

Stops processing.

## User Action

Specify the correct file name or folder name and perform the operation again.

---

**Solaris32/64** **Linux32/64**

**IJServer: ERROR: IJServer20200: Incorrect file name or directory name : PATH="%s"**

## Variable Information

%s = File or directory name

## Explanation

The file or directory name is incorrect.

## System Action

Stops processing.

## User Action

Specify the correct file name or directory name and perform the operation again.

## 9.1.4 IJServer20202

---

**Windows32/64**

**IJServer: ERROR: IJServer20202: File or folder not exist: PATH="%s"**

## Variable Information

%s = File or folder name

## Explanation

The possible causes are:

- The file or folder does not exist

## System Action

Stops processing.

## User Action

- When a file or folder does not exist.  
Check the path and perform the operation again.

---

**Solaris32/64** **Linux32/64**

**IJServer: ERROR: IJServer20202: File or directory not exist: PATH="%s"**

## Variable Information

%s = File or directory name

## Explanation

The possible causes are:

- The file or directory does not exist
- The XML Library has not been installed.
- The FJSVj2ee package is not installed.

## System Action

Stops processing.

## User Action

- When a file or directory does not exist.  
Check the path and perform the operation again.
- When the XML Library has not been installed.  
Install the XML Library.
- When the FJSVj2ee package is not installed  
Install the FJSVj2ee package.

## 9.1.5 IJServer20203

---

### IJServer: ERROR: IJServer20203: File opening failed: FILE="%s"

#### Variable Information

%s = File name

Windows32/64

#### Explanation

The file could not be opened because:

- The file is being used by other applications.
- The entire file or part of the file is locked by other applications.

## System Action

Stops processing.

## User Action

Terminate other applications that are using the file, and then perform the operation again.

Solaris32/64 Linux32/64

#### Explanation

The file could not be opened because:

- The file is being used by other applications.
- The entire file or part of the file is locked by other applications.
- The maximum number of files that can be opened has been exceeded.

## System Action

Stops processing.

## User Action

Terminate other applications that are using the file, and then perform the operation again.

If the maximum number of files that can be opened has been exceeded, use the *ulimit* command to increase the number of file descriptors, then perform the operation again.

## 9.1.6 IJServer20210

---

---

Windows32/64

**IJServer: ERROR: IJServer20210: No access permission to file or folder: PATH="%s"**

Variable Information

%s = File or folder name

Explanation

The access permission set for the specified file (or folder) does not allow it to be accessed.

System Action

Stops processing.

User Action

Change your access permission so that you can access the file or folder, or have it accessed by a user with the required permission.

---

Solaris32/64 Linux32/64

**IJServer: ERROR: IJServer20210: No access permission to file or directory: PATH="%s"**

Variable Information

%s = File or directory name

Explanation

The access permission set for the specified file (or directory) does not allow it to be accessed.

System Action

Stops processing.

User Action

Change your access permission so that you can access the file or directory, or have it accessed by a user with the required permission.

---

## 9.1.7 IJServer20222

---

**IJServer: Error: IJServer20222: Failed to open the library file: LIBRARY="%s1" INFO=%s2**

Variable Information

%s1 = Library name

%s2 = Information

Explanation

Failed to open the library file, %1.

System Action

Stop processing.

User Action

Record the information below, the message information, and use the *iscollectinfo* command to collect investigation information:

Windows32/64

- List of files under:

C:\Interstage installation folder\bin

- List of files under:

%SystemRoot%\system32

Solaris32/64 Linux32/64

- List of files under:  
/opt/FJSVejb/lib
- List of files under:  
/opt/FJSVj2ee/lib

Send this information to a Systems Engineer.

## 9.1.8 IJServer20223

---

**IJServer: Error: IJServer20223: Failed to read the function: LIBRARY="%s1" FUNCNAME=%s2 INFO=%s3**

### Variable Information

- %s1 = Library name
- %s2 = Function name
- %s3 = Detailed information

### Explanation

Failed to read the function.

### System Action

Stop processing.

### User Action

Record the information below, the message information, and use the *iscollectinfo* command to collect investigation information:

Windows32/64

- The DLL file displayed in the variable information

Solaris32/64 Linux32/64

- The so file displayed in the variable information

Send this information to a Systems Engineer.

## 9.1.9 IJServer20303

---

**IJServer: ERROR: IJServer20303: Connection with CORBA Service failed**

### Explanation

The system failed to access the CORBA Service because:

- Interstage is not initialized.
- The CORBA Service is not started.
- Insufficient resources are available to run the CORBA Service.
- The Naming Service is not initiated.

### System Action

Stops processing.

### User Action

Check that Interstage is initialized, the CORBA Service is started, and sufficient resources are available to run the CORBA Service, and then perform the operation again.

If Interstage is not initialized, initialize it as described in the Operator's Guide.

If the CORBA Service is not started, start it as described in the *S99startod* command or the *isstart* command in the Interstage Application Server Reference Manual (Command Edition).

If insufficient resources are available to run the CORBA Service, secure sufficient resources as described in the Tuning Guide.

If the Naming Service is not started, start it as described in the *CosNaming\_s* command or *isstart* command in the Reference Manual (Command Edition).

## 9.1.10 IJServer20450

---

**IJServer: ERROR: IJServer20450: The environment variable setting is invalid: ENV=%s1 CODE=%s2**

### Variable Information

%s1 = Environment variable name

%s2 = Error code

1: The environment variable is not set.

2: The value of the environment variable is not set.

### Explanation

The environment variable "CommonProgramFiles" causes a Windows(R) environment error. If this occurs, it may not be possible to run the Windows(R) environment.

### System Action

Stops processing.

### User Action

If the environment variable is "CommonProgramFiles", check the Windows(R) environment.

## 9.1.11 IJServer20480

---

**IJServer: ERROR: IJServer20480:J2EE properties are being updated**

### Explanation

Processing cannot continue because the J2ee property is being updated by the Interstage management console or the *isj2eeadmin* command.

### System Action

Stops processing.

### User Action

Perform the operation again after updating of the J2EE property by the Interstage management console or *isj2eeadmin* command is completed.

## 9.1.12 IJServer20610

---

**IJServer: ERROR: IJServer20610: Specified IJServer not exist: NAME=%s**

### Variable Information

%s = IJServer name

### Explanation

Operation failed because the specified IJServer does not exist.

#### System Action

Stops processing.

#### User Action

Perform the operation again with an existing IJServer.

### 9.1.13 IJServer20611

---

**IJServer: ERROR: IJServer20611: Web application not exist in IJServer: NAME=%s**

#### Variable Information

%s = IJServer name

#### Explanation

Operation failed because no Web application was deployed to the specified IJServer.

#### System Action

Stops processing.

#### User Action

Deploy a Web application and then perform the operation again.

### 9.1.14 IJServer20612

---

**IJServer: ERROR: IJServer20612: EJB application not exist in IJServer: NAME=%s**

#### Variable Information

%s = IJServer name

#### Explanation

Operation failed because no EJB application was deployed to the specified IJServer.

#### System Action

Stops processing.

#### User Action

Deploy an EJB application and then perform the operation again.

### 9.1.15 IJServer20613

---

**IJServer: ERROR: IJServer20613: EJB application communicable with RMI over IIOP not exist in IJServer: NAME=%s**

#### Variable Information

%s = IJServer name

#### Explanation

Operation failed because there was no EJB application that uses RMI over IIOP communication deployed in the specified IJServer.

#### System Action

Stops processing.

## User Action

Specify an IJServer to which an EJB application that uses RMI over IIOP has already been deployed, and then perform the operation again.

## 9.1.16 IJServer20614

---

**IJServer: ERROR: IJServer20614: Failure in reading a file of IJServer list definition: PATH="%s"**

### Variable Information

%s = Path of IJServer list definition file

### Explanation

Operation failed because the specified IJServer had not been created.

### System Action

Stops processing.

### User Action

Possible causes are as follows:

#### Windows32/64

- C:\Interstage\J2EE\etc\ijservers.properties does not exist.
- Access permission has not been granted to C:\Interstage\J2EE\etc\ijservers.properties.
- C:\Interstage\J2EE\etc\ijservers.properties contains an error.

#### Solaris32/64 Linux32/64

- /opt/FJSVj2ee/etc/ijservers.properties does not exist.
- Access permission has not been granted to /opt/FJSVj2ee/etc/ijservers.properties.
- /opt/FJSVj2ee/etc/ijservers.properties contains an error.

Remove the above error cause, and re-execute processing.

## 9.1.17 IJServer20615

---

**IJServer: WARNING: IJServer20615: Web application not exist in IJServer: NAME=%s**

### Variable Information

%s = Path of IJServer list definition file

### Explanation

On an IJServer used to run Web applications and EJB applications on different JavaVMs, IJServer was started without the Web application being deployed.

### System Action

Only the JavaVM for running EJB applications starts on the IJServer.

### User Action

If you do not want to run Web applications, select "Run EJB application only" as the IJServer type.

## 9.1.18 IJServer20616

---

**IJServer: WARNING: IJServer20616: EJB application not exist in IJServer: NAME=%s**

## Variable Information

%s = IJServer name

## Explanation

In an IJServer used to run Web applications and EJB applications on different JavaVMs, IJServer was started without the Web application being deployed.

## System Action

Only the JavaVM for running EJB applications starts on the IJServer.

## User Action

If you do not want to run Web applications, select "Run EJB application only" as the IJServer type.

## 9.1.19 IJServer20617

---

**IJServer: ERROR: IJServer20617: Web application, EJB application not exist in IJServer: NAME=%s**

## Variable Information

%s = IJServer name

## Explanation

Operation failed because no Web application and EJB application had been deployed to the specified IJServer. Or, the operation failed because only an EJB application (and no Web application) was deployed on an IJServer that runs both Web applications and EJB applications in the same JavaVM.

## System Action

Stops processing.

## User Action

Deploy a Web application and an EJB application and then perform the operation again. IJServers that operate both Web applications and EJB applications in the same JavaVM require the deployment of a Web application. Operation cannot take place with only an EJB application deployed.

## 9.1.20 IJServer20618

---

**IJServer:ERROR: IJServer20618: No notification of the end of request from IJServer: NAME=%s**

## Variable Information

%s = IJServer name

## Explanation

The isinfobj command or Interstage Management Console monitor could not be used to get information from part or all of the IJServer process.

## System Action

Stops processing.

## User Action

Possible causes are as follows:

- The entire system is overloaded.
- The CPU utilization is 100%.

- A memory shortage occurred.
  - Use the *isiinfobj* command,  
If the system load status is temporary, perform the operation again.
  - Use the Interstage Management Console monitor,  
In the Interstage Management Console, click System > [Environment Settings]. Increase the value for the automatic update interval time.

If the above case does not apply, refer to "Required Resources" in the "Tuning Guide" and check the system environment.

If the system is temporarily overloaded, perform the operation again.

If none of the above causes are applicable, check the system environment.

If message EXTP4371 is output before this message, it means that the IJServer process ended abnormally.

Check that the IJServer is running normally and then perform the operation again. If the IJServer is not running, fix the problem, and then start it.

## 9.1.21 IJServer20619

---

### IJServer:ERROR: IJServer20619: Send request of IJServer failed: NAME=%s

#### Variable Information

%s = IJServer name

#### Explanation

The *isiinfobj* command failed to send an information acquisition request to the IJServer process.

#### System Action

Stops processing.

#### User Action

Possible causes are as follows:

- The entire system is overloaded.
- The CPU utilization is 100%.
- A memory shortage occurred.

If the system is temporarily overloaded, perform the operation again.

If none of the above causes are applicable, check the system environment.

## 9.1.22 IJServer20620

---

### IJServer: ERROR: IJServer20620: Invalid operation of specified IJServer: NAME=%s

#### Variable Information

%s = IJServer name

#### Explanation

An invalid operation was performed for the specified IJServer.

An attempt was made to enable or disable the queue for an IJServer on the same Java VM or for a Web-only IJServer.

#### System Action

Stops processing.

## User Action

Specify an IJServer on another Java VM or an EJB-only IJServer, and perform the operation again.

### 9.1.23 IJServer20621

---

#### IJServer: ERROR: IJServer20621: Specified port already used: NAME=%s1 PORT=%s2

##### Variable Information

%s1 = IJServer name

%s2 = Port number

##### Explanation

The specified port is already used by another process.

##### System Action

Stops processing.

##### User Action

Specify an unused port number for the Servlet container and re-execute processing.

### 9.1.24 IJServer20650

---

#### IJServer: ERROR:IJServer20650: Improper Java Execution environment

##### Explanation

Processing failed because of an error in the Java execution environment.

##### System Action

Stops processing.

##### Windows32/64

##### User Action

Check the following:

- The environment (environment variables, etc.) does not contain an error.
- A correct JDK/JRE version is used.
- JDK/JRE is correctly installed.
- jre.exe does not exist in a Windows® folder or Windows® folder\system32.

If EJB applications are to be executed in a WorkUnit, also check the following items.

- No memory shortage has occurred.

If the cause cannot be determined by these checks, check the Java environment setup file for erroneous data.

Re-execute the processing after removing the cause of the error.

##### Solaris32/64 Linux32/64

##### User Action

Check the following:

- Does the environment (environment variables LD\_LIBRARY\_PATH, etc.) contain an error?
- Are you using the correct JDK/JRE version?
- Is JDK/JRE correctly installed?
- Is there a memory shortage?

If EJB applications are to be executed in a WorkUnit, also check the following items.

- Whether information was set in the Java environment setup file when the *isstart* command was executed.
- Whether information was set in the Java environment setup file when the Interstage Operation Tool was activated.

If the cause cannot be determined by these checks, check the Java environment setup file for erroneous data.

Re-execute the command after removing the cause of the error.

## 9.1.25 IJServer20655

---

**IJServer: ERROR: IJServer20655: Java environment file not exist: PATH="%s"**

### Variable Information

%s = File name

### Explanation

The probable causes are as follows:

- The Java environment file does not exist.
- The Java environment setup file contains an error.

### System Action

Stops processing.

### User Action

If the Java environment setup file does not exist, create it and try again.

If Java environment setup file exists, it contains an incorrect setting. For more details on settings, refer to 'Customizing and Checking the Operating Environment' in the "Operating J2EE Applications" chapter of the J2EE User's Guide.

## 9.1.26 IJServer20656

---

**IJServer: ERROR: IJServer20656: No access permission to Java environment file: PATH="%s"**

### Variable Information

%s = File name

### Explanation

Access permission to the Java environment file has not been set.

### System Action

Stops processing.

### User Action

Check and modify the access permissions for the Java environment file, or get a user with access permission to perform the processing.

## 9.1.27 IJServer20657

---

**IJServer: ERROR: IJServer20657: Incorrect Java environment file: PATH="%s"**

### Variable Information

%s = File name

### Explanation

The Java environment file contains incorrect settings.

## System Action

Stops processing.

## User Action

If IJServer assets created in an old version are used, check whether the following apply:

- IJServer created in Interstage Application Server 8.0 or earlier is used
- IJServer created by selecting [Create V8.0 compatible version IJServer] is used

IJServer cannot be used in the above versions, therefore create the IJServer again. It is easy to create the IJServer again by using the *isj2eeadmin* command to extract the definition, correcting the parts shown below, and then registering the definition. If the same IJServer name is used, after extracting the definition it will be necessary to delete the IJServer, and then create the IJServer again.

- Change the IJServer name of the <Name> tag to any name
- Change the value of the <Version> tag to 9.0, or delete the <Version> tag
- Change the value of the <JavaVersion> tag to 6, or delete the <JavaVersion> tag

If the above content does not apply, check the following:

- Is the JDK/JRE version used valid?
- Was JDK/JRE installed correctly?

Next, define valid content in the Java configuration file, and then re-execute the operation.

For details on how to check which content is defined in the Java configuration file, refer to "Operating J2EE Applications" - "Customizing and Checking the Operating Environment" - "Checking the Operating Environment" in the "J2EE User's Guide".

## 9.1.28 IJServer20658

---

### IJServer: ERROR: IJServer20658: Fujitsu XML Processor not exist

#### Explanation

Operation failed because the Fujitsu XML processor was not installed.

#### System Action

Stops processing.

#### User Action

Install the Fujitsu XML processor and then re-execute the command.

## 9.1.29 IJServer20659

---

### IJServer: ERROR: IJServer20659: No access permission to Fujitsu XML Processor

#### Explanation

Access permission is not granted to the Fujitsu XML processor.

#### System Action

Stops processing.

#### User Action

Ensure that access permission is granted to the Fujitsu XML processor, or re-execute processing as a user having access permission.

## 9.1.30 IJServer20665

---

### IJServer: ERROR: IJServer20665: Debug facility cannot be used by JRE environment

## Explanation

The debug function cannot be used in the JRE environment.

## System Action

Stops processing.

## User Action

Use the debug function in the JDK environment.

## 9.1.31 IJServer20666

---

### IJServer: ERROR:IJServer20666: Acquiring a port used by debug failed

#### Variable Information

%s1 = IJServer name

#### Explanation

A port to be used for remote debugging could not be obtained because no idle port was available.

#### System Action

Stops processing.

#### User Action

Ensure that an idle port is available and then re-execute processing.

## 9.2 IJServer21000 to IJServer21099

---

This section details the messages with message numbers between IJServer21000 and IJServer21099.

### 9.2.1 IJServer21001

---

#### IJServer: INFO:IJServer21001: EJB application activated : NAME=%s1

#### Variable Information

%s1 = EJB application name

#### Explanation

The IJServer has been activated successfully.

#### System Action

Activates the IJServer.

### 9.2.2 IJServer21002

---

#### IJServer: INFO:IJServer21002: EJB application deactivated : NAME=%s1

#### Variable Information

%s1 = EJB application name

#### Explanation

The IJServer has been deactivated successfully.

#### System Action

Deactivates the IJServer.

## 9.2.3 IJServer21004

---

**IJServer: ERROR:IJServer21004: Failure in reading a definition file: NAME=%s1 FILE="%s2"**

### Variable Information

%s1 = EJB application name

%s2 = File name

### Explanation

Failed to read a definition file.

### System Action

Stops starting up the IJServer.

### User Action

The possible causes are:

- No file with the specified file name exists in the folder.
- No access permission exists for the file or folder.
- A system environment abnormality such as a memory shortage occurred.

Check whether a definition with the specified file name exists. Check the access permission for the file, the system environment, and so on.

## 9.2.4 IJServer21005

---

**IJServer: ERROR:IJServer21005: Activation of EJB application failed : NAME=%s1**

### Variable Information

%s1 = EJB application name

### Explanation

The IJServer could not be activated.

### System Action

Stops activating the IJServer.

### User Action

Remove the cause of the failure according to the system log, and then reactivate the IJServer.

This error also occurs when you try to activate multiple EJB application processes, which use distributed transactions, under the following conditions. In these cases, activate only one process.

- When an Entity Bean is specified as a Rapid invoking Bean.
- When a STATELESS Session Bean is specified as a Rapid invoking Bean, and sharing the EJB object of Performance Option is selected in Customize Tool.
- When EJB application that Deployment is done before Interstage V4.1 is specified.

## 9.2.5 IJServer21008

---

**IJServer: WARNING:IJServer21008: Failed to write snap file : NAME=%s1 FILE=%s2**

### Variable Information

%s1 = EJB application name

%s2 = File name

### Explanation

An error occurred writing the information file, but processing is continued.

### System Action

Continues processing.

### User Action

Check the system environment. Possible causes are as follows:

- There is no access permission for the file or folder.
- A disk I/O error occurred.
- A memory shortage occurred.
- A disk capacity shortage occurred.

## 9.2.6 IJServer21010

---

**IJServer: ERROR:IJServer21010: No access right to EJB application : NAME=%s1 CLASS=%s2**

### Variable Information

%s1 = EJB application name

%s2 = Class name

### Explanation

An instance of the EJB application class could not be activated.

### System Action

Stops the IJServer startup process if this message is output during startup, or stops the method if the message is output while an EJB application method is executing.

### User Action

The access qualifier of the class whose instance could not be activated is not public. Change the qualifier to public.

## 9.2.7 IJServer21011

---

**IJServer: ERROR:IJServer21011: EJB application being deactivated : NAME=%s1**

### Variable Information

%s1 = EJB application name

### Explanation

A client application tried to execute a method, but the corresponding EJB application was performing the IJServer stop operation, or was using the HotDeploy function of J2EE to perform the activation processing. Therefore, the method could not be executed.

### System Action

Stops executing the method via the client application.

### User Action

Reactivate the IJServer, and then retry the method.

If the deployed module containing the corresponding EJB application is performing the activation processing, perform invoke the method again after the module status is updated and indicates the active state.

## 9.2.8 IJServer21012

---

**IJServer: ERROR:IJServer21012: STATELESS Session Bean not available for Rapid Invocation: NAME=%s1**

### Variable Information

%s1 = EJB application name

### Explanation

The EJB application could not be activated because a STATELESS Session Bean was included in the Rapid Invocation.

### System Action

Stops activation of the EJB application.

### User Action

Either delete the STATELESS Session Bean from the Rapid Invocation definition; or convert the interaction status management model to STATEFUL, then redeploy and reactivate the EJB application.

## 9.2.9 IJServer21013

---

**IJServer: ERROR:IJServer21013: Generation of EJB application class instance failed: NAME=%s1 CLASS=%s2**

### Variable Information

%s1 = EJB application name

%s2 = Class name

### Explanation

An EJB application class instance could not be generated because the EJB application class was defined as an interface.

### System Action

- If this message is output during the start processing of IJServer, the system cancels the start processing.
- Stops the method if this message is output while an EJB application method is executing.
- If this message is output while the HotDeploy function of J2EE is being used to perform the activation processing, the system stops the activation processing and puts the corresponding deployed module into the deactivated state.
- If this message is output during the automatic reload processing of a class, the system stops the reload processing and puts the relevant deployed module into the inactivated state.

### User Action

Take the following action:

- Make sure the EJB application class for which you attempt to generate an instance is not defined as an interface. When a constructor is defined in the EJB application class, check whether an exception has occurred in the constructor.
- Confirm whether or not lookup processing is executed in the Entity Bean constructor. If it is executed, correct the EJB application so that lookup processing is executed in the setEntityContext method.

## 9.2.10 IJServer21014

---

**IJServer: ERROR:IJServer21014: SessionContext setting failed: NAME=%s1**

### Variable Information

%s1 = EJB application name

## Explanation

An Exception occurred during execution of the `setSessionContext` method implemented in the Session Bean.

## System Action

When the interaction status management model is STATEFUL, an exception is returned to the client application and execution of the `create` method is stopped via the client application.

Stops the IJServer startup process if the interactive management model is STATELESS and the message appears during startup.

If this message is output when the interactive management model is STATELESS and the HotDeploy function of J2EE is being used to perform activation processing, the system stops activation processing and puts the corresponding deployed module in the inactivated state.

Stops the method if the interactive management model is STATELESS and the message is output while an EJB application method is executing.

## User Action

Examine the `setSessionContext` method implemented in the Session Bean of the EJB application to determine the required action. Otherwise, contact the EJB application Session Bean developer.

## 9.2.11 IJServer21015

---

**IJServer: ERROR:IJServer21015: EJB application class not found: NAME=%s1 CLASS=%s2**

### Variable Information

%s1 = EJB application name

%s2 = Class name

### Explanation

Loading of the EJB application file failed because there is no EJB application class

### System Action

- If this message is output during the start processing of IJServer, the system cancels the start processing of IJServer.
- If this message is output while the HotDeploy function of J2EE is being used to perform the activation processing, the system stops the activation processing and puts the corresponding deployed module in the inactivated state.
- If this message is output during the automatic reload processing of a class, the system stops the reload processing of the class and puts the relevant deployed module in the inactivated state.

### User Action

Check whether a required EJB application class file exists in the J2EE common directory.

Also check that:

If a correct class file exists, deploy the EJB application again and start the IJServer.

- The Primary Key class name defined in the deployment descriptor file matches the PrimaryKey class name (including the package name)
- The Enterprise Bean class name defined in the deployment descriptor file matches the Enterprise Bean class name (including the package name)
- The Home interface name defined in the deployment descriptor file matches the Home interface class name (including the package name)
- The Remote interface name defined in the deployment descriptor file matches the Remote interface class name (including the package name)

If re-deployment fails, there may be an error in the EJB application. Change the EJB application.

Additionally, check whether there is an error in "Separate Class Loader" of the IJServer environment definition settings.

## 9.2.12 IJServer21016

---

**IJServer: ERROR:IJServer21016: Method not found: NAME=%s1 METHOD=%s2**

### Variable Information

%s1 = EJB application name

%s2 = Method name or constructor

### Explanation

The EJB application class cannot be found.

### System Action

Stops executing the EJB application method.

### User Action

The probable causes are:

- The method does not exist in the EJB application class or there is an error in the method interface.
- The method of the EJB application class is not public.

Confirm that the method exists in the EJB application class and that there is no error in the method interface. Correct the error if the method of the EJB application class is not public.

## 9.2.13 IJServer21017

---

**IJServer: ERROR:IJServer21017: Unable to access method: NAME=%s1 METHOD=%s2**

### Variable Information

%s1 = EJB application name

%s2 = Method name or constructor

### Explanation

A security violation occurred during execution of the EJB application method.

### System Action

Stops executing the EJB application method.

### User Action

Examine the cause of the security violation.

## 9.2.14 IJServer21018

---

**IJServer: ERROR:IJServer21018: Argument error: NAME=%s1 METHOD=%s2**

### Variable Information

%s1 = EJB application name

%s2 = Method name or constructor

### Explanation

The argument passed to the EJB application method is incorrect.

### System Action

Stops executing the EJB application method.

## User Action

Check and correct the relevant argument.

## 9.2.15 IJServer21019

---

**IJServer: WARNING:IJServer21019: Failed to create snap file : NAME=%s1 FILE=%s2**

### Variable Information

%s1 = EJB application name

%s2 = File name

### Explanation

A snap file could not be generated. EJB application start processing continues, but data output to the snap file is not performed.

### System Action

Continues the IJServer start processing.

### User Action

**Windows32/64**

The possible causes are as follows:

- Access permission is not granted to "[J2EE common directory]\ijserver\[IJServer name]\log\[process serial number]".
- A disk I/O error occurred.

When the output to a snap file function is used, check the system environment, then reset snap acquisition and start the IJServer.

**Solaris32/64 Linux32/64**

The possible causes are as follows:

- Access permission is not granted to "[J2EE common directory]\ijserver\[IJServer name]\log\[process serial number]".
- A disk I/O error occurred.

When the output to a snap file function is used, check the system environment, then reset snap acquisition and start the IJServer.

## 9.2.16 IJServer21020

---

**IJServer: ERROR:IJServer21020: Method execution failed: NAME=%s1 METHOD=%s2**

### Variable Information

%s1 = EJB application name

%s2 = Method name

### Explanation

A user exception occurred in the method specified with %s2, in the EJB application specified with %s1.

### System Action

Stops executing the EJB application method.

### User Action

Examine why the exception occurred, following the procedure below.

1. Check the details of the exception in the log file:

**Windows32/64**

[J2EE common directory]\ijserver\[IJServer name]\log\[process serial number]\container.log

[J2EE common directory]/ijserver/[IJSERVER name]/log/[process serial number]/container.log

2. Check the stack trace to examine why the exception occurred. For details of the causes of exceptions which frequently occur, see "Exception Information Output When You Use J2EE."

After removing the cause, re-execute the application.

If necessary, use the *iscollectinfo* command to collect investigation information, and then contact the EJB application Session Bean developer.

## 9.2.17 IJSERVER21021

---

**IJSERVER: WARNING:IJSERVER21021: Generation of standard output or standard error output file failed: NAME=%s1 FILE="%s2"**

### Variable Information

%s1 = EJB application name

%s2 = File name

### Explanation

A standard output or standard error output file could not be generated. The IJSERVER activation procedure continues but there is no output to these files.

### System Action

Activates the IJSERVER.

### User Action

The probable causes are:

- The destination for standard output or standard errors has not been specified.
- The destination for standard output or standard errors is wrong.
- You do not have the correct access permissions to access standard output or the folder specified as the output destination for standard errors.
- A disk input/output error occurred.

When using standard output or using the function to output data to standard error output files, confirm related definitions and file environments, then reactivate the IJSERVER.

## 9.2.18 IJSERVER21022

---

**IJSERVER: ERROR:IJSERVER21022: Attempted function not supported: NAME=%s1**

### Variable Information

%s1 = EJB application name

### Explanation

An attempt was made to use an unsupported function.

### System Action

Stops activating the IJSERVER or stops executing the method via the client application.

### User Action

Refer to the EJB application interface in the Interstage Application Server Reference Manual (API Edition) for details of unsupported functions.

## 9.2.19 IJServer21023

---

**IJServer: ERROR:IJServer21023: Reached upper connection limit: NAME=%s1**

### Variable Information

%s1 = EJB application name

### Explanation

The create method was aborted because the number of times the create method was executed via the client application reached the upper limit.

### System Action

Outputs the following exception information to the console file, and then stops execution of the EJB application method.

FJTooManyObjectsException

### User Action

The maximum number of concurrent processes can be changed using the Interstage. To do so, select [WorkUnit], [IJServer Name], [Environment Setup], and then [EJB Container Setting] and change the setting at "Number of Concurrent Processes." For details, refer to the Help for Interstage.

Using the no-communication monitoring function for STATEFUL Session Bean can suppress the frequency of this symptom to some extent.

## 9.2.20 IJServer21024

---

**IJServer: ERROR:IJServer21024: EJB object not exist: NAME=%s1**

### Variable Information

%s1 = EJB application name

### Explanation

Processing was aborted because there is no EJB object.

### System Action

Stops executing the EJB application method.

### User Action

The probable causes are:

- During execution of the client application, the IJServer was stopped and then immediately restarted.
- There was insufficient memory in the Java VM during execution of the client application so the IJServer terminated and was immediately restarted.

Also check the following to determine other possible causes:

- Check whether the `EJBHome.remove` method has been issued twice in the client application.
- Check whether the `EJBObject.remove` method has been issued twice in the client application.
- Check whether the create method has been issued normally. (For example, check whether the create method has been issued even though an EJB object no longer exists.)

## 9.2.21 IJServer21025

---

**IJServer: ERROR:IJServer21025: Exception accepted from EJB application : NAME=%s1**

### Variable Information

%s1 = EJB application name

### Explanation

An Exception not defined in the interface was accepted from the EJB application method.

### System Action

Stops executing the EJB application method.

### User Action

See if the EJB application has thrown an exception that is not defined in the interface. Otherwise, contact the EJB application Session Bean developer.

## 9.2.22 IJServer21026

---

### IJServer: ERROR:IJServer21026: Transaction timeout: NAME=%s1

### Variable Information

%s1 = EJB application name

### Explanation

A transaction timeout occurred.

### System Action

Invalidates transaction processing.

### User Action

Determine why processing from the UserTransaction.begin method up to the UserTransaction.commit method has not completed within the time specified for transaction timeout. Check whether transaction timeout is correctly specified.

## 9.2.23 IJServer21027

---

### IJServer: ERROR: IJServer21027: Communication error occurred

### Explanation

A communications error has occurred.

### System Action

Stops the IJServer.

### User Action

The probable causes are:

- A network error has occurred.
- There is insufficient memory.

Check the network and system environments.

## 9.2.24 IJServer21029

---

### IJServer: ERROR:IJServer21029: Session timeout: NAME=%s1

### Variable Information

%s1 = EJB application name

## Explanation

A session timeout occurred while a connection was being established from a client application.

## System Action

Invalidates the connection from the client application.

## User Action

Determine why processing (from the create method to the remove method being issued from a client application) did not end within the time set for session time-out. Check whether the time setting for session timeout is appropriate.

## 9.2.25 IJServer21030

---

**IJServer: ERROR: IJServer21030: No right to access method : NAME=%s1 METHOD=%s2**

### Variable Information

%s1 = EJB application name

%s2 = Method name

### Explanation

There is no access permission the method now being called.

### System Action

Stops executing the EJB application method.

### User Action

Execute with the security roll which has the authorization of method access, or add the security roll to the corresponding method. For information about setting the security roll, contact the EJB application Bean administrator.

It is also possible that an error occurred when producing the authentication process of the user ID and the password. Check that the security management environment definition file and directory service settings are correctly set.

## 9.2.26 IJServer21031

---

**IJServer: WARNING:IJServer21031: Failure in writing to console file**

### Explanation

An error occurred when writing console information to a file.

### System Action

Continues processing.

### User Action

The possible causes are:

- No access permission exists for the console information file or folder.
- A disk input/output error occurred.
- A memory shortage occurred.
- A disk capacity shortage occurred.

Check the system environment.

## 9.2.27 IJServer21032

---

**IJServer: ERROR:IJServer21032: Error in class file created through Deployment: NAME=%s1**

## Variable Information

%s1 = EJB application name

## Explanation

A class file created through the Interstage cannot be found or is corrupt.

## System Action

- If this message is output during the start processing of IJServer, the system cancels the start processing of IJServer.
- If this message is output during the execution of a method of the EJB application, the system stops the execution of the method.

## User Action

Check whether the required class file exists in the J2EE common directory.

Also check that:

- The Home interface name defined in the deployment descriptor file matches the Home interface class name (including the package name)
- The Remote interface name defined in the deployment descriptor file matches the Remote interface class name (including the package name)

If a correct class file exists, deploy the EJB application again and start the IJServer.

Additionally, depending on the IJServer "Separate Class Loaders" settings, it may not be possible to refer from one module to another. Refer to "Designing J2EE"-"Separating Class Loaders" in the J2EE User's Guide, and check that the application configuration and class loader separation are correct.

## 9.2.28 IJServer21033

---

### IJServer: ERROR:IJServer21033: Memory shortage occurred on JavaVM: NAME=%s1

## Variable Information

%s1 = IJServer name

## Explanation

*java.lang.OutOfMemoryError* occurred. The possible causes are:

- Java VM heap memory is insufficient.
- Virtual memory is insufficient.

## System Action

- Terminates IJServer if this message is output when IJServer is started, IJServer is stopped, or an EJB application is called.
- If this message is output while the HotDeploy function of J2EE is being used and the inactivation or activation processing of a deployed module is being performed, the inactivation and activation processing of a deployed module are terminated.
- If this message is output while the automatic reload of a class and reload operation is being performed, the reload operation is canceled.

## User Action

The remedial action to follow depends on the cause:

Java VM heap memory is insufficient.

Display the [WorkUnit] > [IJServer Name] > [Monitor] window on the Interstage Management Console to view the Java VM information. Use the information displayed to determine if the maximum heap size is small compared with the amount of memory used by the application.

A heap memory shortage may have occurred in JavaVM.

On the Interstage Management Console, select [WorkUnit] and then [IJSERVER Name], to view the Java VM information. Use the information displayed to determine if the maximum heap size is too small for the memory space requirements for applications.

If the size of JavaVM memory space is too small, increase the IJSERVER multiplicity or the size of JavaVM memory:

- To increase the IJSERVER multiplicity

On the Interstage Management Console, select [WorkUnit], [IJSERVER Name], [Environment Setup], and then [WorkUnit Setting] and specify "Process Multiplicity."

For more information, refer to Interstage's Help.

- To increase the size of JavaVM memory space

On the Interstage Management Console, select [WorkUnit], [IJSERVER Name], [Environment Setup], and then [WorkUnit Setting] and specify the following at "JavaVM option":

```
-XX:MaxPermSize=[amount-of-perm-memory]m
```

For more information, refer to Interstage's Help.

Java VM heap memory is determined to be sufficient, check the following items:

- The remove method was issued while a Session Bean was invoked
- An EJB application did not illegally acquire memory
- An unnecessarily large number is not set as the initial instance count of an Entity Bean

If one of the above applies, take the following action and restart the IJSERVER.

- Modify the client application or the EJB application.
- Modify the EJB application definition information.

In addition, if the above checks have been performed, take the following measures to ensure that changes to the application and definition information take effect:

- If this message is output when IJSERVER is started or an EJB application is called, restart IJSERVER.
- If this message is output while the HotDeploy function of J2EE is being used and the inactivation or activation processing of a deployed module is being performed, execute the Reactivate processing of the module or restart IJSERVER.
- If this message is output during the execution of reload while the automatic reload function of a class is being used, execute the reload processing of the module or restart IJSERVER.

#### Virtual memory is insufficient

Use an OS function to check whether virtual memory is insufficient. If the memory is insufficient, wait for a while, then re-execute the processing.

If the IJSERVER21033 message is frequently output, see "Tuning Guide," to re-estimate the amount of memory required for running Interstage, and verify that enough memory is available.

If enough memory is available compared with the amount of memory required for Interstage, the amount of memory used by other applications may be insufficient. Re-estimate the amount of memory required for other applications running on the same machine, and check whether the amount of memory is appropriate.

If the amount of memory is determined to be insufficient, contact the system administrator. The system administrator must increase the size of the main memory, or expand the page file.

For details of action to be taken if *java.lang.OutOfMemoryError* occurs, refer to 'JDK/JRE Tuning' in the Tuning Guide.

## 9.2.29 IJSERVER21034

**IJSERVER: ERROR:IJSERVER21034: No access right to application folder: PATH="%s1"**

#### Variable Information

%s1 = Application Folder name

## Explanation

The access permission set for the Application Folder does not allow it to be accessed.

## System Action

Stops activating the IJServer.

## User Action

Change your access permission so that you can access the Application Folder, or have it accessed by a user with the required permission.

## 9.2.30 IJServer21035

---

### IJServer: ERROR:IJServer21035: Error in accessing CORBA service

#### Explanation

An abnormality occurred while accessing the CORBA Service.

The possible causes are:

- The CORBA Service is not running normally.
- The startup count of the EJB application exceeded 255, the maximum value for process multiplicity.
- The system memory volume is insufficient.
- The system failed to connect the CORBA Service because the Java environment setup file contained erroneous data.

#### System Action

Stops the IJServer or the execution of a method of the EJB application.

#### Windows32/64

#### User Action

- Check the CORBA Service operation status.
- Limit the startup count of the IJServer to 255 or less.
- Increase real memory and swap area.
- Check that the Java VM initial heap memory volume is not excessively high.
- Check that the max\_IJOP\_resp\_requests value set in the following file is not excessively high.
  - Interstage install directory \ODWin\etc\config

For information about the estimated values, refer to "CORBA service operation environment file" in the Tuning Guide.

- Re-estimate the memory volume required to operate Interstage, referring to the Tuning Guide, and check whether memory is sufficiently prepared.

#### Linux32/64

#### User Action

- Check the CORBA Service operation status.
- Limit the startup count of the IJServer to 255 or less.
- Increase real memory and swap area.
- There may have been an error when the EJB application was transferred. Check the following items and then transfer the EJB application again.
  - The transfer mode must be binary mode.
  - The upper and lower cases of file names must not be changed.
- Check that the Java VM initial heap memory volume is not excessively high.

- Check that the max\_IIOp\_resp\_requests value set in the following file is not excessively high.

**Solaris32/64**

```
/opt/FSUNod/etc/config
```

**Linux32/64**

```
/opt/FJSVod/etc/config
```

For information about the estimated values, refer to "CORBA service operation environment file" in the Tuning Guide.

- Re-estimate the memory volume required to operate Interstage, referring to the Tuning Guide and check whether memory is sufficiently prepared.

## 9.2.31 IJServer21036

---

**IJServer: ERROR:IJServer21036: Error in EJB Service operating environment: NAME=%s1**

### Variable Information

%s1 = EJB application name

### Explanation

There is an error in the system files created at EJB Service installation.

### System Action

Stops activating the IJServer.

### User Action

Reinstall the EJB Service, and then activate the IJServer.

## 9.2.32 IJServer21037

---

**IJServer: ERROR:IJServer21037: Error in EJB application operating environment: NAME=%s1**

### Variable Information

%s1 = EJB application name

### Explanation

The file storing the EJB application may be corrupt.

### System Action

If this message is output during activation processing of the IJServer, activation processing of the IJServer is stopped.

If this message is output when the HotDeploy function of J2EE is being used to perform activation processing, the system stops activation processing and puts the corresponding deployed module in the inactivated state.

### User Action

Deploy the EJB application again, and then re-execute the process.

## 9.2.33 IJServer21038

---

**IJServer: ERROR:IJServer21038: Error in transaction attribute specification: NAME=%s1**

### Variable Information

%s1 = EJB application name

## Explanation

The transaction attribute specification is incorrect.

## System Action

- If this message is output during the start processing of IJServer, the system cancels the start processing of IJServer.
- If this message is output while the HotDeploy function of J2EE is being used to perform the activation processing, the system stops the activation processing and puts the corresponding deployed module in the inactivated state.

## User Action

Check the transaction attribute.

Confirm the transaction attribute of Rapid Invoking Bean and Rapid Invoked Bean when using Rapid Invocation.

---

## 9.2.34 IJServer21039

---

**IJServer: ERROR:IJServer21039: EJB application does not exist: NAME=%s1**

### Variable Information

%s1 = EJB application name

### Explanation

The EJB application may have already been deleted.

### System Action

Stops activating the IJServer.

### User Action

Re-deploy the EJB application, and then activate the IJServer.

---

## 9.2.35 IJServer21040

---

**IJServer: ERROR:IJServer21040: Activation of EJB application failed for being installed, uninstalled, or customized: NAME=%s1**

### Variable Information

%s1 = EJB application name

### Explanation

Activation of EJB application failed for being installed, uninstalled, or customized.

### System Action

Stops activating the IJServer.

### User Action

In case of it being installed or customized:

After it completes, execute it again.

In case of it being uninstalled:

If it completed successfully, the IJServer cannot be activated. If it failed, it might not be able to activate the IJServer if its configuration is wrong.

---

## 9.2.36 IJServer21041

---

**IJServer: ERROR: IJServer21041: No access permission to file: NAME=%s1 FILE="%s2"**

### Variable Information

%s1 = EJB application name

%s2 = File name

### Explanation

IJServer failed to start up because there was no authority to access the file.

### System Action

Stops startup of IJServer.

### User Action

Check whether there is sufficient authority to access the file, and assign it if there is none. Alternatively, restart IJServer as a user with access authority.

## 9.2.37 IJServer21042

---

### IJServer: ERROR: IJServer21042: Error in runtime environment: NAME=%s1

#### Variable Information

%s1 = EJB application name

#### Explanation

Processing failed because of an error in the runtime environment.

#### System Action

Stops the startup of the IJServer.

#### User Action

Check that:

- An error does not exist in the environment variable (CLASSPATH, PATH, etc.).
- The correct version of JDK is used.

After removing the cause of the problem, re-execute the processing.

## 9.2.38 IJServer21043

---

### IJServer: ERROR:IJServer21043:Failure in loading class file: NAME=%s1

#### Variable Information

%s1 = EJB application name

#### Explanation

A class file required by the EJB application cannot be found or is corrupt.

#### System Action

- If this message is output during the start processing of IJServer, the system cancels the start processing of IJServer.
- If this message is output while the HotDeploy function of J2EE is being used to perform the activation processing, the system stops the activation processing and puts the corresponding deployed module in the inactivated state.
- If this message is output during the automatic reload processing of a class, the system stops the reload processing of the class and puts the relevant deployed module in the inactivated state.

Windows32/64

## User Action

Depending on the IJServer "Separate Class Loaders" settings, it may not be possible to refer from one module to another. Refer to "Designing J2EE"- "Separating Class Loaders" in the J2EE User's Guide, and check that the application configuration and class loader separation are correct.

Check the following items:

- Check the EJB application runtime environment (CLASSPATH, etc.) for errors.
- Check whether the required EJB application class file exists in the J2EE common directory.
- Check whether the PrimaryKey class name defined in the deployment descriptor file matches the PrimaryKey class name (including the package name).
- Check whether the Enterprise Bean class name defined in the deployment descriptor file matches the Enterprise Bean class name (including the package name).
- Check whether the Home interface name defined in the deployment descriptor file matches the Home interface class name (including the package name).
- Check whether the Remote interface name defined in the deployment descriptor file matches the Remote interface class name (including the package name). If the log "java.lang.UnsupportedClassVersionError" was output in the container log, check to ensure that the EJB application class has not been compiled with a Java version newer than that specified for the IJServer.

Correct the class file or the definition file after checking the above items. Alternatively, re-compile for the correct Java version, and re-execute deployment of the EJB application, then restart the IJServer.

Alternatively, contact the EJB application Bean developer.

Solaris32/64 Linux32/64

## User Action

Carry out the following actions:

- Check the EJB application runtime environment (CLASSPATH, etc.) for errors.
- Check whether the required EJB application class file exists in the J2EE common directory.
- Check whether the PrimaryKey class name defined in the deployment descriptor file matches the PrimaryKey class name (including the package name).
- Check whether the Enterprise Bean class name defined in the deployment descriptor file matches the Enterprise Bean class name (including the package name).
- Check whether the Home interface name defined in the deployment descriptor file matches the Home interface class name (including the package name).
- Check whether the Remote interface name defined in the deployment descriptor file matches the Remote interface class name (including the package name).
- If the log "java.lang.UnsupportedClassVersionError" was output in the container log, check to ensure that the EJB application class has not been compiled with a Java version newer than that specified for the IJServer.
- There may have been an error when the EJB application was transferred. Check the following items and then transfer the EJB application again.
  - The transfer mode must be binary mode.
  - The upper and lower cases of file names must not be changed.

Correct the class file or the definition file after checking the above items. Alternatively, re-compile for the correct Java version, and if the EJB application has been transferred correctly, re-execute deployment of the EJB application, then restart the IJServer.

Alternatively, contact the EJB application Bean developer.

## 9.2.39 IJServer21044

---

---

**IJServer: ERROR: IJServer21044: The transaction is not completed in this method : NAME=%s1 METHOD =%s2****Variable Information**

%s1 = EJB application name

%s2 = Method name

**Explanation**

The transaction is not complete in the STATELESS Session Bean method.

**System Action**

Invalidates the transaction processing. When the transaction is being started, stops the start processing or throws a *RemoteException*.

**User Action**

Check the method implemented in the STATELESS Session Bean of the EJB application and correct the EJB application so that the transaction is complete in the method. Alternatively, contact the Session Bean developer of the EJB application.

---

**9.2.40 IJServer21045**

---

**IJServer: ERROR: IJServer21045: Method not available: METHOD =%s1****Variable Information**

%s1 = Method name

**Explanation**

Take one of the following actions:

- The method specified with %s1 cannot be used from the following EJB application methods:

*setSessionContext*

*ejbCreate*

*ejbRemove*

*setEntityContext*

- The EJB application method represented by %s1 cannot be used from the init method of the servlet that specified the <load-on-startup> tag in the web.xml file.

**System Action**

When the IJServer is being started, stops the IJServer.

**User Action**

There are two possible causes. Either:

- Check the EJB application in which the method specified with %s1 is being used from the following methods, and then correct the EJB application so that it does not use the method.

*setSessionContext*

*ejbCreate*

*ejbRemove*

*setEntityContext*

- Check that the EJB application method indicated by %s1 is not being used from the init method of the servlet that specified the <load-on-startup> tag in the web.xml file. If it is, either specify a different method or remove the <load-on-startup> tag specification.

## 9.2.41 IJServer21046

---

**IJServer: ERROR: IJServer21046: Status of the transaction is not active : NAME=%s1 METHOD =%s2**

### Variable Information

%s1 = EJB application name

%s2 = Method name

### Explanation

The transaction had not been started when the EJB application method was executed.

### System Action

Stops execution of the EJB application method.

### User Action

Correct the EJB application so that the EJB application method is executed when the transaction has been started (when executing an EJB application method with MANDATORY specified in the transaction attribute).

## 9.2.42 IJServer21047

---

**IJServer: WARNING: IJServer21047: Status of the transaction is marked rollback : NAME=%s1 METHOD =%s2**

### Variable Information

%s1 = EJB application name

%s2 = Method name

### Explanation

Rollback had already been specified for the transaction when the EJB application method was executed.

### System Action

Stops execution of the EJB application method.

### User Action

If rollback has been specified for the transaction, perform the following processing to rollback the transaction:

- If transaction type is Bean
  - Execute the rollback method of the UserTransaction interface.
- If transaction type is Container
  - Terminate the method.

## 9.2.43 IJServer21048

---

**IJServer: WARNING: IJServer21048: Error in snap level: NAME=%s1**

### Variable Information

%s1 = EJB application name

### Explanation

The snap output level is specified incorrectly. IJServer start processing continues, but data output to the snap file is not performed.

### System Action

Continues IJServer start processing.

## User Action

Specify the correct snap output level to obtain a snap, and then restart the IJServer.

## 9.2.44 IJServer21052

---

### IJServer: ERROR: IJServer21052: Unable to execute method in Session Bean: NAME=%s1

#### Variable Information

%s1 = EJB application name

#### Explanation

The following methods can not be used in Session Bean.

*getPrimaryKey()*

*remove(PrimaryKey pk)*

*getHomeHandle()*

#### System Action

- When the *getPrimaryKey()* is used  
*RemoteException* will be thrown.
- When *remove(PrimaryKey pk)* is used  
*RemoveException* will be thrown.
- When *getHomeHandle()* is used  
*RemoteException* will be thrown.

#### User Action

In Session Bean, do not use the following methods.

*getPrimaryKey()*

*remove(PrimaryKey pk)*

*getHomeHandle()*

## 9.2.45 IJServer21053

---

### IJServer: ERROR: IJServer21053: Reentrant not available : NAME=%s1

#### Variable Information

%s1 = EJB application name

#### Explanation

Reentrant calling can not be made.

#### System Action

Stops executing the EJB application method.

#### User Action

- In case of Session Bean  
Correct the EJB application method so that it will not make a reentrant calling.

- In case of Entity Bean

Correct the EJB application method so that it will not make a reentrant calling when Nonreentrant is specified to the reentrant kind of the deployment descriptor.

Specify reentrant to the reentrant kind of the deployment descriptor when reentrant calling is to be made in the EJB application method.

## 9.2.46 IJServer21054

---

**IJServer: INFO: IJServer21054: The transaction is rollbacked: NAME=%s1 METHOD =%s2**

### Variable Information

%s1 = EJB application name

%s2 = Method name

### Explanation

The transaction which is started has been rollbacked.

## 9.2.47 IJServer21055

---

**IJServer: ERROR: IJServer21055: Internal error occurred in transaction executed: NAME=%s1 CODE = %s2**

### Variable Information

%s1 = EJB application name

%s2 = System code

### Explanation

An internal error occurred due to some reason while the transaction was being executed.

### System Action

Stops executing the EJB application method.

### User Action

If the distributed transaction is used, use "otstranlist" of the OTS command to roll back pending transactions.

Write down this message information and the following information, use the *iscollectinfo* command to collect the diagnostic information, and then contact a Fujitsu systems engineer.

When the distributed transaction is used, use "otstranlist" of the OTS command to roll back pending transactions.

- When the distributed transaction is used:
  - Whether or not the transaction timeout occurred.
  - Whether or not the OTS system worked wrong.
- When the distributed transaction is not used:
  - Whether or not the transaction timeout occurred.

## 9.2.48 IJServer21056

---

**IJServer: ERROR: IJServer21056: The transaction attribute in this method is not specified: NAME=%s1 METHOD =%s2**

### Variable Information

%s1 = EJB application name

%s2 = System code

#### Explanation

The transaction attribute is not specified in the EJB application method which was to be executed.

#### System Action

Stops executing the EJB application method.

#### User Action

Specify the transaction attribute to the method and execute the method of the EJB application.

### 9.2.49 IJServer21061

---

**IJServer: ERROR: IJServer21061: Status of the transaction is active: NAME=%s1 METHOD =%s2**

#### Variable Information

%s1 = EJB application name

%s2 = Method name

#### Explanation

The transaction is already started when the method of the corresponding EJB application is executed.

#### System Action

Stops executing the EJB application method.

#### User Action

The probable causes are:

- An attempt was made to execute a method of an EJB application in which Never is specified as the transaction attribute after transactions were started.
- An attempt was made to execute the *ejbRemove* method of a STATEFUL Session Bean in which Container is specified as the transaction type after transactions were started.

Be sure to start either of the above methods in a state in which no transaction is started.

### 9.2.50 IJServer21062

---

**IJServer: ERROR: IJServer21062: The STATEFUL Session Bean instance is already in transaction: NAME=%s1 METHOD =%s2**

#### Variable Information

%s1 = EJB application name

%s2 = Method name

#### Explanation

The instance has already joined the transaction when the STATEFUL Session Bean method is executed.

#### System Action

Stops executing the EJB application method.

#### User Action

When the method of the STATEFUL Session Bean with NotSupported or RequiresNew specified in the transaction attribute is to be executed, correct the EJB application so that the STATEFUL Session Bean is executed when the instance has not joined the transaction.

## 9.2.51 IJServer21063

---

**IJServer: INFO: IJServer21063: Status of the transaction marked rollback : NAME=%s1 METHOD =%s2**

### Variable Information

%s1 = EJB application name

%s2 = Method name

### Explanation

Rollback was specified to the transaction which is already started.

## 9.2.52 IJServer21066

---

**IJServer: WARNING: IJServer21066: Registration of this Resource failed: RESOURCE=%s1 REASON = %s2**

### Variable Information

%s1 = Resource name

%s2 = Reason code

### Explanation

The resource specified in Interstage cannot be used.

### System Action

Continues processing.

### User Action

The probable causes are:

- The JDBC driver is not properly installed.
- The JDBC driver environment settings are incorrect.
- The JDBC environment CLASSPATH setup is incorrect.
- An incorrect driver name is specified for the Datasource defined in the Interstage Management Console.
- Datasource INITIAL CONTEXT FACTORY defined in the Interstage Management Console is incorrect.
- Datasource PROVIDER URL defined in the Interstage Management Console is incorrect.
- JDBC2.X Datasource name for the Datasource defined in the Interstage Management Console is incorrect.
- When the Datasource defined in the Interstage Management Console uses JDBC2.X, the JDBC driver Naming Service has not been activated.
- If the IJServer is being used, the IJServer definition file can specify usage of the distributed transaction function, however, the associated resources may not match.
- If the IJServer is being used, the IJServer definition file can specify non-usage of the distributed transaction function, however, the associated resources may not match.

If the relevant resource is being used, correct the error, and then restart the IJServer. When the EJB application does not use the corresponding resource, there is no effect to the operation.

## 9.2.53 IJServer21067

---

**IJServer: WARNING: IJServer21067: Registration of JMSConnectionFactory failed: RESOURCE=%s1 REASON =%s2**

### Variable Information

%s1 = JMS connection factory name

%s2 = Detailed message

### Explanation

The specified JMS connection factory cannot be used.

### System Action

Continues processing.

### User Action

The probable causes are:

- JMS is not installed correctly.
- The naming service of JMS is not activated.
- The JMS connection factory name is specified incorrectly.

To use the JMS connection factory, remove the relevant cause, and then reactivate the IJServer.

## 9.2.54 IJServer21068

---

**IJServer: ERROR: IJServer21068: Error in security information specification: NAME=%s1 RESOURCE = %s2**

### Variable Information

%s1 = EJB application name

%s2 = Resource name

### Explanation

No security information is transferred from the client application.

### System Action

Resource connection processing is stopped.

### User Action

If "Application" is specified as the resource connector, be sure to make corrections so that security information is transferred from the client application.

## 9.2.55 IJServer21069

---

**IJServer: WARNING: IJServer21069: Registration of MAIL Session failed: RESOURCE=%s1 REASON = %s2**

### Variable Information

%s1 = MAIL Session name

%s2 = Detailed message

### Explanation

The specified MAIL Session cannot be used.

### System Action

Continues processing.

## User Action

The probable causes are:

- The mail server is not active.
- The MAIL Session name is incorrectly specified.

To use the MAIL Session, remove the relevant cause, and then reactivate the IJServer.

## 9.2.56 IJServer21070

---

**IJServer: WARNING: IJServer21070: Registration of Resource Adapter failed: RESOURCE=%s1 REASON=%s2 CODE=%s3**

### Variable Information

%s1 = Name of Resource adaptor that could not be used

%s2 = Detailed message

%s3 = Internal code

### Explanation

Resource adaptor cannot be used.

### System Action

Continues processing.

### User Action

Remove the cause of the error as outlined in the detailed messages.

Probable causes are:

Environmental setup

- Resource adaptor was no deployed.
- Resource name to lookup in the application is incorrect.
- CLASSPATH not set correctly to use resource adaptor.

Resource adaptor

- Failed to create instance of ManagedConnectionFactory (Exception occurred in constructor).
- Failed to call the createConnectionFactory method of ManagedConnectionFactory.
- Setter method for config-property does not exist in the ManagedConnectionFactory.
- Type information of config-property and the value of config-property do not match.

Additionally, depending on the IJServer "Separate Class Loaders" settings, it may not be possible to refer from one module to another. Refer to "Designing J2EE"-"Separating Class Loaders" in the J2EE User's Guide, and check that the application configuration and class loader separation are correct.

## 9.2.57 IJServer21071

---

**IJServer: WARNING: IJServer21071: Registration of URL failed: RESOURCE=%s1 REASON =%s2**

### Variable Information

%s1 = URL name

%s2 = Detailed message

## Explanation

The specified URL cannot be used.

## System Action

Continues processing.

## User Action

The probable cause is: Contents of the Interstage are incorrect.

To use the URL, remove the relevant cause, and then reactivate the IJServer.

## 9.2.58 IJServer21072

---

**IJServer: WARNING: IJServer21072: Failure in reading a file of name convert definition: NAME=%s1**

### Variable Information

%s1 = EJB application name

## Explanation

Failed to read the name conversion file.

The name conversion of EJB cannot be used in the specified EJB application.

## System Action

Activation processing is continued.

## User Action

Check whether the name conversion file is set correctly.

## 9.2.59 IJServer21074

---

**IJServer: ERROR: IJServer21074: Error in accessing OTS Service**

### Explanation

An error occurred when the OTS Service is accessed.

### System Action

Stops the startup processing.

### User Action

The OTS Service or the resource control program may not be started. When using the distributed transaction linkage, check the OTS Service operating environment.

## 9.2.60 IJServer21075

---

**IJServer: WARNING: IJServer21075: JDBC log file name is invalid: Value=%s1**

### Variable Information

%s1 = Specified JDBC log file name

## Explanation

JDBC log file name (JDBC\_log\_file) specified in the FJEJBconfig.properties file is invalid.

## System Action

Continue processing. No output of JDBC log.

## User Action

Check the following for the value of JDBC log file name (JDBC\_log\_file) specified in the FJEJBconfig.properties file.

- Check if there is an appropriate access right.
- Check if the specified directory exists.
- Check if the directory is specified.
- Check if the specified directory has enough free space.
- Check if it is specified with single-byte characters (double-byte characters are not allowed)

## 9.2.61 IJServer21076

---

**IJServer: WARNING: IJServer21076: FJEJBconsole file size(FJEJBconsole\_file\_size) is invalid. :Value=%s1**

### Variable Information

%s1 = Specified value

### Explanation

FJEJBconsole file size (FJEJBconsole\_file\_size) specified in the FJEJBconfig.properties file is invalid.

### System Action

FJEJBconsole file with default size (100Kbyte) is created.

### User Action

Set the FJEJBconsole file size (FJEJBconsole\_file\_size) specified in the FJEJBconfig.properties file to a value in the range of 20-30 Kbytes.

## 9.2.62 IJServer21077

---

**IJServer: WARNING: IJServer21077: System File does not exist: FILE=%s1**

### Variable Information

%s1 = File name

### Explanation

System file does not exist.

Therefore, the following function cannot be used.

**Windows32/64**

```
C:\Interstage\EJB\etc\FJlogging.properties
```

**Solaris32/64** **Linux32/64**

```
/opt/FJSVejb/etc/FJlogging.properties
```

Debug information of the EJB application cannot be output to the snap file.

The processing of the EJB application will continue and snap information other than debug information of EJB application goes to the snap file normally.

### System Action

Continues the startup processing of the IJServer.

## User Action

Reinstall the EJB Service.

### 9.2.63 IJServer21078

---

**IJServer: WARNING: IJServer21078: The value of userID , password which is closely geared to securityrole specified in securityidentity is invalid. : NAME=%s1 ROLENAME=%s2**

#### Variable Information

%s1 = EJB application name

%s2 = Value for the securityrole name specified in securityidentity

#### Explanation

The values of userID and password in directory service that correspond to securityrole name of securityidentity are not set properly, or userID and password are not set in the Interstage.

#### System Action

- If this message is output during the start processing of IJServer, the system cancels the start processing of IJServer.
- If this message is output while the HotDeploy function of J2EE is being used to perform the activation processing, the system stops the activation processing and puts the corresponding deployed module in the inactivated state.

#### User Action

There are two possible causes for this error. Either:

- "User ID" or "Password" is not specified in [Security Identity], which is displayed by selecting [WorkUnit], [IJServer Name], and then [Application Environment Definition] on the Interstage.
- The "User ID" or "Password" specified at [Security Identity], which is displayed by selecting [WorkUnit], [IJServer Name], and then [Application Environment Definition] on the Interstage, is not specified in directory service. Alternatively, the security role defined on the security identity tag is not assigned.

To ensure correct operation of the security function, also do the following, and then reactivate the IJServer:

When the module enters the inactivated state, select [Module] > [Status] from the Interstage Management Console. In the [Status] window, click the reload button to activate the corresponding deployed module.

- If "User ID" or "Password" is not specified at [Security Identity], which is displayed by selecting [WorkUnit], [IJServer Name], and then [Application Environment Definition] on the Interstage :

Specify the user ID or password, which is assigned to the security role of the security identity in [Security Identity].

- If "User ID" or "Password" is specified at [Security Identity], which is displayed by selecting [WorkUnit], [IJServer Name], and then [Application Environment Definition] on the Interstage :

Check the settings in directory service to make sure that the user ID, password, and security role are set correctly. For information about security role settings, contact the Bean administrator.

### 9.2.64 IJServer21079

---

**IJServer: ERROR: IJServer21079: Unable to access InfoDirectory. : NAME=%s1**

#### Variable Information

%s1 = EJB application name

#### Explanation

Failed to access the Directory Service.

## System Action

- If this message is output during the start processing of IJServer, the system cancels the start processing of IJServer.
- If this message is output while the HotDeploy function of J2EE is being used to perform the activation processing, the system stops the activation processing and puts the corresponding deployed module in the inactivated state.
- If this message is output during the automatic reload processing of a class, the system stops the reload processing of the class and puts the relevant deployed module in the inactivated state.

## User Action

If the security function is used by the called EJB application, make sure that Directory Service has been activated correctly, and then reactivate the IJServer.

When the module enters in the inactivated state, select [Module] > [Status] from the Interstage Management Console. In the [Status] window, click the Reactivate button to activate the corresponding deployed module.

## 9.2.65 IJServer21081

---

**IJServer: ERROR: IJServer21081: Reached upper limit of create-method numbers for SessionBean : NAME=%s1**

### Variable Information

%s1 = EJB application name

### Explanation

The create method was aborted because the number of times the create method was executed via the client application reached the upper limit.

## System Action

Outputs *FJTooManyObjectsException* to the following log file, and stops executing the EJB application method:

**Windows32/64**

[J2EE common directory]\ijserver\[IJServer name]\log\[process serial number]\container.log

**Solaris32/64 Linux32/64**

[J2EE common directory]/ijserver/[IJServer name]/log/[process serial number]/container.log

## User Action

Check the following items and take action:

1. The EJB object of a STATEFUL Session Bean generated using the *create* method needs to be deleted using the *remove* method at the termination of processing. Then, restart the IJServer and re-execute the client application. If the *remove* method is not executed, correct the client application.
2. Check the upper limit of "Number of concurrently connected Stateful beans" on the Interstage Management Console: open [WorkUnit] > [IJServer Name] > [EJB Application] > [EJB Application Name] to display this data. If the upper limit is too low, change the limit and restart the IJServer.
3. If a client application is forcibly terminated before the remove method is executed, the EJB object remains undeleted. In this case, each unnecessary EJB object needs to be automatically deleted using the idle monitoring function for STATEFUL Session Beans. Display [WorkUnit] > [IJServer Name] > [EJB Application] > [EJB Application Name] on the Interstage Management Console and check the value of "Idle Monitoring Time." If the time is too short, change the time and restart the IJServer.

## 9.2.66 IJServer21082

---

**IJServer: WARNING: IJServer21082: JDBC Driver is not supporting batch updates : Name=%s1**

### Variable Information

%s1 = EJB application name

### Explanation

Used JDBC driver does not supporting batch updates.

### System Action

Executes an update process for each item as opposed to a batch update.

### User Action

Check whether a JDBC driver that supports the batch update is provided. If the driver is provided, please use it.

If the JDBC driver is not provided, continue the process, ignoring this message (The update process is executed one item at a time).

## 9.2.67 IJServer21083

---

**IJServer: WARNING: IJServer21083: Initial processing of the performance monitoring function of EJB went wrong: NAME=%s1**

### Variable Information

%s1 = EJB application name

### Explanation

Failed initial processing of the performance monitoring function of EJB.

### System Action

Continues processing. The performance monitoring function of EJB cannot be used.

### User Action

Write down this message information and the information collected using the *iscollectinfo* command, and then contact a Fujitsu systems engineer.

## 9.2.68 IJServer21084

---

**IJServer: WARNING: IJServer21084: The notice of the performance surveillance information on EJB went wrong: NAME=%s1 METHOD=%s2**

### Variable Information

%s1 = EJB application name

%s2 = Method name

### Explanation

Failed initial processing of the performance monitoring function of EJB.

### System Action

Continue processing. Do not notify method (%s2) performance.

### User Action

Write down this message information and the information collected using the *iscollectinfo* command, and then contact a Fujitsu systems engineer.

## 9.2.69 IJServer21085

---

---

**IJServer: WARNING: IJServer21085: The performance monitoring function of EJB cannot be used : NAME=%s1****Variable Information**

%s1 = EJB application name

**Explanation**

An EJB application that is deployed in Interstage V3 or Interstage V4 cannot use the performance monitoring function of EJB.

**System Action**

Continue processing. The performance monitoring function of EJB cannot be cannot be used.

**User Action**

To use the performance monitoring function of EJB, use an EJB application that is deployed in Interstage V5 or later.

---

**9.2.70 IJServer21087**

---

**IJServer: ERROR: IJServer21087: Abnormalities occurred with CORBA service :NAME=%s1 REASON=%s2****Variable Information**

%s1 = EJB application name

%s2 = Reason code

**Explanation**

An abnormality occurred in the CORBA Service as shown in the reason code (%s2).

**System Action**

Stops the IJServer.

**User Action**

According to the reason code (%s2), do as follows.

In case of code 1, reactivate the IJServer. If the error still occurs, the environment setting might be wrong. Reinstall Interstage and re-execute again.

In case of code 2, reactivate Interstage and reactivate the EJB application.

---

**9.2.71 IJServer21088**

---

**IJServer: ERROR: IJServer21088:An error is in specification of the number of threads of EJB application at the time of distributed transaction use :NAME=%s1****Variable Information**

%s1 = EJB application name

**Explanation**

The maximum Number of Concurrent Processes in the IJServer WorkUnit setting is set to 1. If a distributed transaction is to be used, the maximum Number of Concurrent Processes must be set to 2 or greater.

**System Action**

Stops the startup processing of the IJServer.

**User Action**

On the Interstage, select [WorkUnit], [IJServer Name], [Environment Setup], and then [EJB Container Setting], and set 2 or a greater number in the maximum Number of Concurrent Processes. Then redeploy the EJB application.

## 9.2.72 IJServer21089

---

**IJServer:WARNING: IJServer21089: Registration of JMS Destination failed: RESOURCE=%s1 REASON = %s2**

### Variable Information

%s1 = JMS connection factory name

%s2 = Detailed message

### Explanation

The specified Destination cannot be used.

### System Action

Continues the processing.

### User Action

This error may have been caused by:

- JMS not installed correctly.
- The JMS Naming Service not been activated.
- The JMSDestination name specified incorrectly

Rectify as necessary, and then reactivate the IJServer.

## 9.2.73 IJServer21091

---

**IJServer: WARNING: IJServer21091: When Global Transaction mode, Registration of this ResourceAdapter for Local Transaction failed: RESOURCE=%s1 CODE=%s2 %s3**

### Variable Information

%s1 = Name of Resource adaptor that could not be used

%s2 = Detailed message1

%s3 = Detailed message2

### Explanation

When a distributed transaction is used, resource adapter for a local transaction cannot be used.

### System Action

Continues processing.

### User Action

An IJServer runs with a distributed transaction, but the resource adapter is for a local transaction.

Use an IJServer which does not use the distributed transaction linkage.

Alternatively, when a resource adapter for a distributed transaction is available, deploy and use the resource adapter.

## 9.2.74 IJServer21092

---

**IJServer: ERROR: IJServer21092: created EJB object is deleted: NAME=%1 CODE=%2**

### Variable Information

%s1 = EJB application name

%s2 = EJB Object identifier

## Explanation

Processing of a method was aborted because the method was executed for a nonexistent EJB object from a client application.

An EJB object may be deleted due to a number of causes. Often Interstage will produce a related error message identifying the cause and display that message just before the IJServer21092 error message. The user makes reference to the both error messages to determine what action to take, see details below.

## System Action

Returns `java.rmi.NoSuchObjectException` to the client application and continues processing.

## User Action

The appropriate user response is often dictated by an associated error message displayed shortly before the IJServer21092 error message:

### Associated error code: EXTP4401

If, immediately before this message (IJServer21092), the message EXTP4401 is output, the IJServer may have been stopped during the execution of the client application, and then restarted.

If this error occurs and the system returns `java.rmi.NoSuchObjectException` to the client application, in order to continue processing, the `create` method needs to be executed in the client application to recreate the EJB object.

If processing has been performed as above, you need to take no action. If processing has not been performed as above, correct and re-execute the client application.

### Associated error code: IJServer21033

If, immediately before this message (IJServer21092), the message IJServer21033 is output for the same EJB application, the memory on the Java VM may have become insufficient, and the IJServer may have terminated during the execution of the client application.

As a result, the IJServer may have been restarted (alternatively, a process abnormally terminated by a WorkUnit function may automatically have been restarted).

If this error occurs and the system returns `java.rmi.NoSuchObjectException` to the client application, in order to continue processing, the `create` method needs to be executed in the client application to recreate the EJB object.

If processing has been performed as above, you need to take no action. If processing has not been performed as above, correct and re-execute the client application.

### Associated error code: EXTP4657

If, immediately before this message (IJServer21092), the message EXTP4657 is output for the IJServer which caused the error, immediately before this message, the IJServer may have terminate because the maximum application processing time for the WorkUnit has elapsed during the execution of the client application.

As a result, the IJServer may have been restarted (alternatively, a process abnormally terminated by a WorkUnit function may automatically have been restarted).

If this error occurs and the system returns `java.rmi.NoSuchObjectException` to the client application, in order to continue processing, the `create` method needs to be executed in the client application to recreate the EJB object.

If processing has been performed as above, you need to take no action. If processing has not been performed as above, correct and re-execute the client application.

### Associated error code: IJServer21104

If, before this message (IJServer21092), the message IJServer21104 is output for the same EJB application, a timeout may have been caused by the idle monitoring function for STATEFUL Session Beans and an EJB object may automatically have been deleted.

Check whether the EJB object identifier output as variable information of this message, and that output as variable information of message IJServer21104, are the same.

If the EJB object identifiers are the same, an EJB object *created* using the `create` method may have been deleted by the idle monitoring function for STATEFUL Session Beans. Take either of the following actions:

- Display [WorkUnit] > [IJSERVER Name] > [EJB Application] > [EJB Application Name] on the Interstage Management Console to check the value of "Idle Monitoring Time." If the time is too short, change the time and restart the IJSERVER. After restarting the IJSERVER, re-execute the client application.
- If the system returns *java.rmi.NoSuchObjectException* to the client application, in order to continue processing, the *create* method needs to be executed in the client application to recreate the EJB object. If processing has been performed as above, you need to take no action. If processing has not been performed as above, correct and re-execute the client application.

Associated error code: IJSERVER21096

If, before this message (IJSERVER21092), the message IJSERVER21096 is output for the same EJB application, a system exception may have occurred during the execution of a method of the EJB application and an EJB object may automatically have been deleted.

The EJB container deleted the EJB object because it determined that processing could not be continued due to the occurrence of a system exception in preprocessing, in which an error had occurred.

Remove the cause of the system exception, and re-execute the client application.

EJB object deleted by EJB Home.remove or object.remove method

In circumstances where:

- An EJB object has already been deleted by executing the EJB *Home.remove* method in the client application, or
- An EJB object has already been deleted by execution the EJB *object.remove* method in the client application.

Take either of the following actions:

- Check whether an invalid remove method is executed in the client application. If an invalid remove method is executed, correct and re-execute the client application.
- If an application always executes the remove method so that no EJB object remains undeleted after postprocessing for an error, the remove method may be issued twice. In this case, the error causes no problem. Continue processing.

## 9.2.75 IJSERVER21093

---

**IJSERVER: ERROR: IJSERVER21093: EJB object(Entity Bean) is deleted : NAME=%1**

Variable Information

%s1 = EJB application name

Explanation

The EJB object generated in the create or finder method is already deleted.

System Action

Stops execution of the EJB application method.

User Action

Consider the following, then rectify as necessary:

- EJBHome.remove method issued twice for a client application
- *EJBObject.remove* method issued twice for a client application
- Appropriate value specified in the EJB object timeout parameter of Entity Bean

## 9.2.76 IJSERVER21095

---

**IJSERVER: ERROR: IJSERVER21095: Error in transaction attribute specification: NAME=%1 TRANSACTION=%2 REASON=%3**

Variable Information

%s1 = EJB application name

%s2 = Transaction attribute

%s3 = Detailed message

### Explanation

The transaction attribute was specified incorrectly.

### System Action

- If this message is output during the start processing of IJServer, the system cancels the start processing of IJServer.
- If this message is output while the HotDeploy function of J2EE is being used to perform the activation processing, the system stops the activation processing and puts the corresponding deployed module in the inactivated state.

### User Action

Examine any detail messages, and then correct the error. Do the following for each detail message:

#### Detail message:01

##### Explanation

Transaction attributes are not specified for the Session Bean, Message-driven Bean, and Entity Bean when "Container" has been specified as the transaction management type.

##### User Action

If "Container" has been specified as the transaction management type, you must specify transaction attributes for the Session Bean, Message-driven Bean, and Entity Bean.

#### Detail message:02

##### Explanation

An incorrect transaction attribute was specified for the Message-driven Bean when "Container" has been specified as the transaction management type.

##### User Action

If "Container" has been specified as the transaction management type, you can only specify one of the following transaction attributes for the Message-driven Bean.

Required

NotSupported

#### Detail message:05

##### Explanation

An unsupported transaction attribute was specified.

##### User Action

- Ensure that all transaction attributes are correctly specified
- If the distributed transaction function is used, ensure that "NotSupported," "Supports," or "Never" were specified as the transaction attribute of the Entity Bean method.
- If using the EJB timer service functionality, check that "Mandatory" is specified in the transaction attribute.

#### Detail message:08

##### Explanation

"NoCache" has been specified for the Entity Bean instance control mode, but an unsupported transaction attribute has been specified.

##### User Action

Ensure that "NotSupported", "Supports", or "Never" has been specified for the transaction attribute.

## 9.2.77 IJServer21096

---

**IJServer: ERROR: IJServer21096: System Exception is occurred during business method called: NAME=%1 METHOD=%2 CODE=%3**

### Variable Information

%s1 = EJB application name

%s2 = Method name

%s3 = EJB object identifier (For EJB applications that share EJB objects, null is displayed.)

### Explanation

A system exception was received during processing of a business method of the EJB application.

### System Action

Stops execution of the EJB application method to delete the EJB object.

### User Action

Investigate likely causes. Consider contacting the developer of the Session Bean for the EJB application.

## 9.2.78 IJServer21099

---

**IJServer: ERROR: IJServer21099: Failure in reading a Container definition file: NAME=%s1 REASON=%s2**

### Variable Information

%s1 = IJServer name

%s2 = Detailed message

### Explanation

The IJServer definition file could not be read.

### System Action

Stops activation of the IJServer.

### User Action

Inspect the detail messages to correct the error. Do the following for each detail message:

#### Detail message:01

##### Explanation

An invalid value was specified for the IJServer definition item, or a required item was omitted.

##### User Action

Specify the correct values for the IJServer definition items.

#### Detail message:02

##### Explanation

Either an alphanumeric string item has been specified by a value other than an alphanumeric string, or a value outside the range of int has been specified (-2147483648 to 2147483647).

##### User Action

Specify a correct alphanumeric string.

#### Detail message:03

##### Explanation

An XML file could not be read.

#### User Action

Delete the relevant IJServer and then recreate an IJServer.

## 9.3 IJServer21100 to IJServer21199

---

### 9.3.1 IJServer21100

---

**IJServer: ERROR: IJServer21100: CLASSPATH required at the time of operation of EJB application is insufficient: NAME=%s1 CLASS=%s2**

#### Variable Information

%s1 = EJB application name

%s2 = Remote interface class name

#### Explanation

A class developed by the EJB application developer that is referenced by the EJB application was not specified in CLASSPATH.

#### System Action

Stops execution of the EJB application method.

#### User Action

Ensure that the relevant classes of the EJB application are specified in CLASSPATH.

Additionally, depending on the IJServer "Separate Class Loaders" settings, it may not be possible to refer from one module to another. Refer to "Designing J2EE"-"Separating Class Loaders" in the J2EE User's Guide, and check that the application configuration and class loader separation are correct.

### 9.3.2 IJServer21101

---

**IJServer: ERROR: IJServer21101: The same Home interface name or the Remote interface name is used with two or more EJB applications: NAME=%s**

#### Variable Information

%s1 = Home interface name or Remote interface name

#### Explanation

Two or more EJB applications having the same Home interface or Remote interface name were placed in the same IJServer.

#### System Action

- If this message is output during the start processing of IJServer, the system cancels the start processing of IJServer.
- If this message is output while the HotDeploy function of J2EE is being used to perform the activation processing, the system stops the activation processing and puts the corresponding deployed module in the inactivated state.

#### User Action

If the relevant EJB application is invoked only from another EJB application that was deployed to the same IJServer, do as follows: On the Interstage, select [WorkUnit], [IJServer Name], [EJB Application Name], [Application Environment Definition], and then [Interstage Extended Information] and specify "Enable" for "Local Invocation." Then, restart the IJServer.

When the module enters in the inactivated state, select [Module] > [Status] from Interstage Management Console. In the [Status] window, click the Reactivate button to activate the corresponding deployed module.

### 9.3.3 IJServer21102

---

---

**IJServer: ERROR: IJServer21102: CMP20 Bean is not supporting NoCache instance management mode: NAME=%1****Variable Information**

%s1 = EJB application name

**Explanation**

An invalid instance management mode is specified for the CMP2.0 EJB application.

**System Action**

Stops execution of the EJB application method.

**User Action**

For the CMP2.0 EJB application, specify an instance management mode other than NoCache.

---

**9.3.4 IJServer21103**

---

**IJServer: ERROR: IJServer21103: EJB application can not use because there implements both Local I/F and Remote I/F: NAME=%1****Variable Information**

%s1 = EJB application name

**Explanation**

The Local interface and Remote instance are mounted in the EJB application.

**System Action**

Stops execution of the EJB application method.

**User Action**

Generate EJB applications separately for the Local interface and Remote instance - one for the Local interface, the other for the Remote instance.

---

**9.3.5 IJServer21104**

---

**IJServer: INFO: IJServer21104: EJB object is deleted by SessionIdleTimeout: NAME=%s1 CODE=%s2****Variable Information**

%s1 = EJB application name

%s2 = EJB object identifier

**Explanation**

The no-communication monitoring function for STATEFUL Session Bean deleted the EJB object that exceeded the specified time.

**System Action**

Returns `java.rmi.NoSuchObjectException` to the client application.

**User Action**

Take the following action:

- From the Interstage Management Console, display the [WorkUnit] > [IJServer Name] > [EJB Application] > [EJB Application Name] screen to check the value of "Idle Monitoring Time." If the time is too short, change the time and restart IJServer. After restarting the IJServer, re-execute the client application.

- If this error occurs and the system returns *java.rmi.NoSuchObjectException* to the client application, in order to continue processing, the *create* method needs to be executed in the client application to recreate the EJB object.

If processing has been performed as above, you need to take no action. If processing has not been performed as above, correct and re-execute the client application.

## 9.3.6 IJServer21105

---

**IJServer: WARNING: IJServer21105: Not correct a file name of convert definition Environment properties designated: FILE=%s1**

### Variable Information

%s1 = Nonexistent file name

### Explanation

The name conversion file specified in an environment variable is not found.

### System Action

Continues start processing.

### User Action

Check whether an existing name conversion file is correctly set up in an environment variable. If not, set up a valid name conversion file correctly and restart the EJB application.

If an existing name conversion file is set up correctly, check the access permission for the specified name conversion file. If no access permission is granted, grant access permission and restart the EJB application, or restart the EJB application as a user having access permission.

## 9.3.7 IJServer21106

---

**IJServer: WARNING: IJServer21106: EJB application does not exist in specified IJServer: NAME=%s1**

### Variable Information

%s1 = EJB container name

### Explanation

No EJB application has been deployed to the IJServer.

If "Operation of only EJB applications" is specified for the IJServer operation mode, an EJB application must be deployed in advance.

### System Action

Stops start processing.

### User Action

Deploy an EJB application to the IJServer, and then restart the IJServer.

## 9.3.8 IJServer21107

---

**IJServer: ERROR: IJServer21107: A distributed transaction is un-supported in specified IJServer type: NAME=%s1**

### Explanation

The distributed transaction function cannot be used with the specified IJServer.

### System Action

Stops IJServer start processing.

## User Action

If the distributed transaction function is to be used, the operation mode of the IJServer must match one of the following. Change the IJServer operation mode as needed:

- Operation of only EJB applications
- Operation of Web application and EJB application on separate JavaVMs (\*1)

\*1 Usable only from the EJB application

## 9.3.9 IJServer21108

---

### IJServer21108: Failure in reading an IJServer definition file NAME=%s1 REASON=%s2

#### Variable Information

%s1 = EJB container name

%s2 = Detailed message

#### Explanation

The IJServer definition file could not be read.

#### System Action

Stops IJServer start processing.

#### User Action

Remove the error cause according to the detail message. The corrective measures to be taken for individual detail messages are explained below:

##### Detail message: 01

###### Explanation

An invalid value is specified for an IJServer definition item, or an item that cannot be omitted is omitted.

###### User Action

Specify a valid value for the IJServer definition item.

##### Detail message: 02

###### Explanation

A non-numeric character string is specified for a numeric character string item, or a value outside the int range (-2147483648 to 2147483647) is specified.

###### User Action

Specify a valid numeric character string.

##### Detail message: 03

###### Explanation

The XML file could not be read.

###### User Action

Delete the relevant IJServer and then recreate an IJServer.

## 9.3.10 IJServer21109

---

### IJServer: ERROR: IJServer21109: Failure in reading an IJServer List definition file: NAME=%s1 REASON=%s2

### Variable Information

%s1 = EJB container name

%s2 = Detailed message

### Explanation

The IJServer list definition file could not be read.

### System Action

Stops IJServer start processing.

### User Action

Reinstall Interstage.

## 9.3.11 IJServer21110

---

**IJServer: WARNING: IJServer21106: EJB application does not exist in specified IJServer: NAME=%s1**

### Variable Information

%s1 = Data source name

### Explanation

The pooling connection time monitoring function deleted the JDBC connection that exceeded the time from the pool.

### System Action

Closes the JDBC connection and deletes it from the pool.

## 9.3.12 IJServer21111

---

**IJServer: WARNING: IJServer21111: Previous-connection over the max-connection you set :DATASOURCE=%s1 PRECONNECT=%s2 MAXCONNECT=%s3**

### Variable Information

%s1 = Data source name

%s2 = Pre-opened connection count

%s3 = Maximum connection count

### Explanation

The specified pre-opened connection count exceeds the specified maximum connection count.

### System Action

Performs pre-opened connection processing for the number specified for the maximum connection count.

### User Action

Specify a greater value for the maximum connection count than that for the pre-opened connection count.

## 9.3.13 IJServer21112

---

**IJServer: ERROR: IJServer21112: JDBC Connection-timeout was occurred: DATASOURCE=%s1**

### Variable Information

%s1 = Data source name

## Explanation

A connection timeout occurred during execution of a JDBC connection request.

## System Action

Throws an SQLException.

## User Action

Ensure that adequate values are specified for the connection timeout time and maximum connection count.

In the Interstage Management Console, select [WorkUnit], "WorkUnit Name", and then [Monitor]. Check the Connection Waiting Count in Data Source Information. If this value is too large, Connection.close may be issued. In this case, confirm that the application releases the JDBC connection.

## 9.3.14 IJServer21113

---

**IJServer: ERROR: IJServer21113: A definition of startupClass or shutdownClass is invalid: NAME=%s1**

### Variable Information

%s1 = IJServer name

### Explanation

The startup class or shutdown class definition contains an error.

### System Action

Stops IJServer start processing.

### User Action

Review the startup class or shutdown class definition by referring to the following log file:

**Windows32/64**

[J2EE common directory]\ijserver\[IJServer name]\log\[process serial number]\container.log

**Solaris32/64 Linux32/64**

[J2EE common directory]/ijserver/[IJServer name]/log/[process serial number]/container.log

## 9.3.15 IJServer21114

---

**IJServer: ERROR: IJServer21114: Error in startupClass or shutdownClass executing environment: NAME=%s1**

### Variable Information

%s1 = IJServer name

### Explanation

An internal error occurred during invocation of a startup class or shutdown class.

### System Action

Stops IJServer start processing.

### User Action

Write down the following log file information and the check information collected using the *iscollectinfo* command, and then contact a Fujitsu systems engineer.

**Windows32/64**

[J2EE common directory]\ijserver\[IJServer name]\log\[process serial number]\container.log

**Solaris32/64 Linux32/64**

[J2EE common directory]/ijserver/[IJServer name]/log/[process serial number]/container.log

## 9.3.16 IJServer21115

---

### IJServer: ERROR: IJServer21115: Failure in executing startupClass: NAME=%s1

#### Variable Information

%s1 = IJServer name

#### Explanation

The startup class could not be invoked.

#### System Action

Stops IJServer start processing.

#### User Action

Check the environment settings for the startup class and the processing in the startup class by referring to the following log file:

**Windows32/64**

[J2EE common directory]\ijserver\[IJServer name]\log\[process serial number]\container.log

**Solaris32/64 Linux32/64**

[J2EE common directory]/ijserver/[IJServer name]/log/[process serial number]/container.log

## 9.3.17 IJServer21116

---

### IJServer: WARNING: IJServer21116: Failure in executing startupClass or shutdownClass: NAME=%s1

#### Variable Information

%s1 = IJServer name

#### Explanation

The startup class or shutdown class could not be invoked.

#### System Action

Continues IJServer start processing.

#### User Action

Check the environment settings for the startup or shutdown class and the processing in the startup or shutdown class by referring to the following log file:

**Windows32/64**

[J2EE common directory]\ijserver\[IJServer name]\log\[process serial number]\container.log

**Solaris32/64 Linux32/64**

[J2EE common directory]/ijserver/[IJServer name]/log/[process serial number]/container.log

Note: If the processing in the startup or shutdown class is required, remove the above cause of failure, and then restart the IJServer.

## 9.3.18 IJServer21117

---

---

**IJServer: ERROR: IJServer21117: Internal error occurred in JDBC connection-timeout observation :NAME=%s1 DATASOURCE=%s2****Variable Information**

%s1 = IJServer name

%s2 = Data source name

**Explanation**

An internal error occurred during JDBC connection timeout monitoring.

**System Action**

Stops the IJServer.

**User Action****Windows32/64**

Collect [J2EE common directory]\ijserver\[IJServer name]\log\[process serial number]\container.log, collect the check information using the *iscollectinfo* command, and then contact a Fujitsu systems engineer.

**Solaris32/64 Linux32/64**

Collect [J2EE common directory]\ijserver\[IJServer name]\log\[process serial number]\container.log, collect the check information using the *iscollectinfo* command, and then contact a Fujitsu systems engineer.

Note various types of IJServer log, collect the check information using the *iscollectinfo* command, and then contact a Fujitsu systems engineer.

---

**9.3.19 IJServer21118**

---

**IJServer: INFO: IJServer21118: IJServer EJB container is started****Explanation**

The IJServer has been started successfully.

**System Action**

Started the IJServer.

**User Action**

None.

---

**9.3.20 IJServer21119**

---

**IJServer: INFO: IJServer21119: IJServer EJB container is stopped****Explanation**

The IJServer has been stopped successfully.

**System Action**

Stopped the IJServer.

**User Action**

None.

---

**9.3.21 IJServer21120**

---

**IJServer: ERROR: IJServer21120: IJServer EJB container starting up is aborted**

## Explanation

The IJServer could not be started.

## System Action

Stops IJServer start processing.

## User Action

**Windows32/64**

Refer to the event log, the container log, and the activation information under [J2EE-common-directory]\ijserver\[IJServer-name]\log\[serial-number-by-process], remove the cause, and restart IJServer.

**Solaris32/64 Linux32/64**

Refer to the system log, the container log and the activation information under [J2EE common directory]\ijserver\[IJServer-name]\log\[serial-number-by-process], remove the cause, and restart IJServer.

---

## 9.3.22 IJServer21121

---

### **IJServer: ERROR: IJServer21121 Unable to execute EJB application in IJServer: NAME=%s1**

## Explanation

An EJB application created under Interstage V5.1 or an earlier version cannot be used for IJServer.

## System Action

Stops IJServer start processing.

## User Action

Deploy the EJB application in a V6.0 environment, and start the IJServer.

---

## 9.3.23 IJServer21122

---

### **IJServer: ERROR: IJServer21122: DB Exception was occurred during getting JDBC connections. Check a DB condition: DATASOURCE=%s1**

## Variable Information

%s1 = Data source name

## Explanation

An exception was thrown from the database during acquisition of a JDBC connection.

## System Action

Throws an SQL Exception.

## User Action

Remove the error cause according to the detail message of the JDBC driver.

Possible causes are as follows:

- DBMS is stopped.
- An error occurred in the network.

Remove the cause of failure to set up a connection to the database, and re-execute processing.

---

## 9.3.24 IJServer21123

---

---

**IJServer: WARNING: IJServer21123 Generation of a IJServer Container log failed: FILE=%s1****Explanation**

IJServerContainer logging failed.

**System Action**

Continues IJServer start processing but does not perform logging to the IJServer log file.

**User Action**

Possible causes are as follows:

- Access permission is not granted to the folder specified for IJServerContainer log output destination.
- A disk I/O error occurred.
- The disk is short of free space.

Check the environment and then restart the IJServer.

---

**9.3.25 IJServer21124**

---

**IJServer: WARNING: IJServer21124 Initialization of MBeanServer was unsuccessful: NAME=%s1****Variable Information**

%s1 = IJServer name

**Explanation**

Access to the Interstage JMX Service failed.

**System Action**

Continues IJServer start processing.

**User Action**

The Interstage JMX Service may be stopped. Check whether the Interstage JMX Service is active. If it is active, the definition file required for operation of the Interstage JMX Service may be damaged or may not exist. Reinstall Interstage to restore the required definition file.

Note that if the Interstage is not to be used, this error does not affect the operation of the applications deployed to the IJServer.

---

**9.3.26 IJServer21125**

---

**IJServer: WARNING: IJServer21125 Registration of MBean was unsuccessful: NAME=%s1 RESOURCE=%2****Variable Information**

%s1 = IJServer name

%s2 = MBean name

**Explanation**

Access to the Interstage JMX Service failed.

**System Action**

Continues processing.

**User Action**

Possible causes are as follows:

- The Interstage JMX Service is stopped.

- A memory shortage occurred.

If the Interstage JMX Service is stopped, stop the IJServer and then start the Interstage JMX Service.

If a memory shortage occurred, remove the shortage cause by referring to the exception logged into the JMX log file.

### 9.3.27 IJServer21126

---

**IJServer: WARNING: IJServer21126 Communication of MBeanServer cannot be starting: NAME=%s1**

#### Variable Information

%s1 = IJServer name

#### Explanation

Access to the Interstage JMX Service failed.

#### System Action

Continues IJServer start processing.

#### User Action

The Interstage JMX Service may be stopped. Check whether the Interstage JMX Service is active.

If the Interstage JMX Service is active, remove the failure cause by referring to the exception logged into the JMX log file.

### 9.3.28 IJServer21127

---

**IJServer: WARNING: IJServer21127 Communication of MBeanServer cannot be stopping: NAME=%s1**

#### Variable Information

%s1 = IJServer name

#### Explanation

Access to the Interstage JMX Service failed.

#### System Action

Continues IJServer stop processing.

#### User Action

This message is output when the Interstage JMX Service is stopped. It does not affect system operation.

### 9.3.29 IJServer21128

---

**IJServer: WARNING: IJServer21128 Unregistration of MBean was unsuccessful: NAME=%s1  
RESOURCE=%2**

#### Variable Information

%s1 = IJServer name

%s2 = MBean name

#### Explanation

Access to the Interstage JMX Service failed.

#### System Action

Continues processing.

## User Action

This message is output when the Interstage JMX Service is stopped. It does not affect system operation.

### 9.3.30 IJServer21129

---

**IJServer: WARNING: IJServer21129 Release of MBeanServer was unsuccessful: NAME=%s1**

#### Variable Information

%s1 = IJServer name

#### Explanation

Access to the Interstage JMX Service failed.

#### System Action

Continues IJServer stop processing.

#### User Action

This message is output when the Interstage JMX Service is stopped. It does not affect system operation.

### 9.3.31 IJServer21130

---

**IJServer: ERROR: IJServer21130 Internal error occurred in PooingConnection idle-timeout: NAME=%s1 DATASOURCE=%s2**

#### Variable Information

%s1 = IJServer name

%s2 = Data source name

#### Explanation

An internal error occurred during processing of the pooling connection time monitoring function.

#### System Action

Stops the IJServer.

#### User Action

**Windows32/64**

Collect [J2EE common directory]\ijserver\[IJServer name]\log\[process serial number]\container.log, collect the check information using the *iscollectinfo* command, and then contact a Fujitsu systems engineer.

**Solaris32/64 Linux32/64**

Collect [J2EE common directory]/ijserver/[IJServer name]/log/[process serial number]/container.log, collect the check information using the *iscollectinfo* command, and then contact a Fujitsu systems engineer.

### 9.3.32 IJServer21131

---

**IJServer: ERROR: IJServer21131 Unable to access directory service: NAME=%s1**

#### Variable Information

%s1 = EJB application name

#### Explanation

The system failed to access the directory service.

## System Action

- If this message is output during the start processing of IJServer, the system cancels the start processing of IJServer.
- If this message is output while the HotDeploy function of J2EE is being used to perform the activation processing, the system stops the activation processing and puts the corresponding deployed module in the inactivated state.
- If this message is output during the automatic reload processing of a class, the system stops the reload processing of the class and puts the relevant deployed module in the inactivated state.

## User Action

The directory service is not running, or there is an abnormality in the environment. Verify that the directory service is normally running.

If you want to use the security function in the called EJB application, first verify that the directory service is normally running, and then restart the IJServer.

When the module enters in the inactivated state, select [Module] > [Status] from Interstage Management Console. In the [Status] window, click the reload button to activate the corresponding deployed module.

## 9.3.33 IJServer21141

---

**IJServer: ERROR: IJServer21141: While using a distributed transaction,not supported for multi processes to start: NAME=%s1**

### Variable Information

%s1 = IJServer name

### Explanation

While the distributed transaction function is being used, multiple IJServer processes cannot be started.

### System Action

Cancels the start of IJServer.

### User Action

When the distributed transaction function is used, start only one IJServer process.

## 9.3.34 IJServer21142

---

**IJServer: ERROR: IJServer21142:Failure in reading an EJB Application definition file :NAME=%s1  
DETAIL=%s2**

### Variable Information

%s1 = EJB module name

%s2 = Detailed error information

### Explanation

An attempt to read the definition file failed.

### System Action

- If this message is output while an IJServer is starting, the IJServer startup process is canceled.
- If this message is output during an activation process that uses J2EE's HotDeploy function, the activation process will be interrupted and the status of the relevant deployed module will change to inactive.

### User Action

Use the detailed error information to check if there's a problem with the definition file. Rerun the process after eliminating any problems found.

The most likely problems are listed below:

- If the detailed error information contains a message such as 'Invalid encoding name', verify that the XML parser used by the IJServer supports the encoding settings in the definition file.

If the definition file contains settings for encoding not supported by the XML parser, either select an XML parser that can use the specified encoding or change the encoding specified in the definition file.

- If the definition file is not located in the normal directory, redeploy the EJB application and then rerun the process.
- If the definition file contains an illegal or invalid tag configuration, redeploy the EJB application and then rerun the process.
- If the definition file contains a tag with the name space prefix, delete the prefix from the tag, redeploy the EJB application and then execute the process again.

If the problem cannot be identified, redeploy the EJB application and rerun the process.

### 9.3.35 IJServer21143

---

**IJServer: INFO: IJServer21143:EJB Timer has been created: NAME=%s1**

#### Variable Information

%s1 = EJB application name

#### Explanation

The EJB Timer has been created.

#### System Action

Starts timer monitoring.

### 9.3.36 IJServer21144

---

**IJServer: INFO: IJServer21144:EJB Timer has been canceled: NAME=%s1**

#### Variable Information

%s1 = EJB application name

#### Explanation

The EJB Timer was canceled for one of the following reasons:

- The timer interface cancel method was invoked
- A transaction was rolled back when the timer was created

#### System Action

Terminate timer monitoring. If timer monitoring is cancelled during call back processing, the next and subsequent callback will be cancelled.

### 9.3.37 IJServer21145

---

**IJServer: INFO: IJServer21145:The callback process which was invoked from the EJB Timer Service has ended normally: NAME=%s1**

#### Variable Information

%s1 = EJB application name

#### Explanation

The callback (ejbTimeout method) invoked from the EJB Timer Service ended normally.

## System Action

The EJB timer callback (ejbTimeout method) execution is complete. Monitoring continues if the EJB Timer is set to repeat.

### 9.3.38 IJServer21146

---

**IJServer: WARNING: IJServer21146:The callback process which was retried from the EJB Timer Service has ended normally: NAME=%s1**

#### Variable Information

%s1 = EJB application name

#### Explanation

The callback that was executed using the EJB Timer Service (the ejbTimeout method) did not end normally (a rollback or Exception occurred).

The callback was retried and ended normally.

#### System Action

The EJB timer callback (ejbTimeout method) execution is complete. Monitoring continues if the EJB Timer is set to repeat.

#### User Action

Check if the EJB application callback (ejbTimeout method) is causing a rollback. If an Exception occurs, the Exception stack trace is output to the container log. Take appropriate corrective action for the Exception, if applicable.

### 9.3.39 IJServer21147

---

**IJServer: WARNING: IJServer21147:The callback process which was retried from the EJB Timer Service did not end normally. This process has been interrupted. The repeating EJB Timer will continue: NAME=%s1**

#### Variable Information

%s1 = EJB application name

#### Explanation

The callback executed using the EJB Timer Service (the ejbTimeout method) did not end normally (a rollback or Exception occurred).

The callback was retried and did not end normally.

#### System Action

Aborts the callback. Monitoring continues if the EJB Timer is set to repeat.

Check if the EJB application callback (ejbTimeout method) is causing a rollback. If an Exception occurs, the Exception stack trace will be output in the container log. Take appropriate corrective action for the Exception, if applicable.

### 9.3.40 IJServer21148

---

**IJServer: ERROR: IJServer21148:IJServer can not start under multiprocessing settings while using the EJB Timer Service: NAME=%s1**

#### Variable Information

%s1 = EJB application name

#### Explanation

IJServers cannot start with multiprocessing set when the EJB Timer Service is used.

## System Action

- If this message is output during the JJSERVER startup, aborts the startup.
- If this message is output during the activation using the J2EE HotDeploy functionality, terminate activation, and change the relevant deployment module to a non-active state.

## User Action

If deploying an application that uses the EJB Timer Service, set the process concurrency to 1 and then restart the JJSERVER.

## 9.3.41 JJSERVER21149

---

**JJSERVER: WARNING: JJSERVER21149: The EJB Timer Service does not support Entity Beans in this version: NAME=%s1**

### Variable Information

%s1 = EJB application name

### Explanation

The EJB Timer Service does not support Entity Beans in this version.

### System Action

Continues processing.

### User Action

If the EJB timer service is not being used with an Entity Bean, ignore this message. When using the EJB timer service, use and implement with a STATELESS Session Bean or Message-driven Bean.

## 9.3.42 JJSERVER21150

---

**JJSERVER: WARNING: JJSERVER21150: Registration of Service failed: RESOURCE=%s1 REASON=%s2**

### Variable Information

%s1 = Name of the Service that cannot be used

%s2 = Detailed message

### Explanation

Service registration failed

### System Action

Continues processing.

### User Action

Refer to the message output in the detailed message information and rectify the cause of error.

Possible causes are:

- Environment settings
  - Web service settings are incorrect
  - Required class path is not set for the Web service to be used.
- Web service client application
  - An error occurred in the relevant Service

For Web service environment settings, refer to "Interstage Web Service Operation" in the "J2EE User's Guide".

For Web service client applications, refer to the Messages Manual for information on the items in %s2 (detailed message), and take the action described.

When the application uses the relevant Service, rectify the cause of error and then restart the IJServer.

No effect on the operation if the applicable Service is not used.

### 9.3.43 IJServer21151

---

**IJServer: ERROR: IJServer21151: Registration of Administered Object failed: RESOURCE=%s1 REASON=%s2**

#### Variable Information

%s1 = Administered object name

%s2 = Detailed message

#### Explanation

The specified Administered object cannot be used.

#### System Action

Continues processing.

#### User Action

Possible causes are:

- A non-existent Administrator object definition name was used
- The administrator object definition name set in the resource adapter is incorrect.
- Class load of the Administrator object failed.
- Administrator object instance creation failed.

When the application uses the applicable Administrator object, rectify the cause of the problem and then restart the IJServer. There is no effect on the operation if the applicable Service is not used.

## 9.4 IJServer21200 to IJServer21299

---

This section details the messages with message numbers between IJServer21200 and IJServer21299.

### 9.4.1 IJServer21201

---

**IJServer: ERROR:IJServer21201: Creation of initial context failed**

#### Explanation

A system error occurred.

#### System Action

Stops activating the IJServer.

#### User Action

Check whether the product is properly installed.

### 9.4.2 IJServer21202

---

**IJServer: WARNING: IJServer21202: Registration of all Datasources failed**

## Explanation

None of the Datasources defined in the Interstage Management Console can be used.

## System Action

Continues processing.

## User Action

The probable causes are:

- The Interstage has been started.
- The JDBC driver is not properly installed.
- The JDBC driver environment settings are incorrect.
- The driver name of the Datasource specified in the Interstage Management Console is incorrect.

If the Datasources are to be used, eliminate the cause of the error then restart the IJServer.

### 9.4.3 IJServer21203

---

**IJServer: WARNING: IJServer21203: Registration of some Datasources failed: DATASOURCES=%s1**

#### Variable Information

%s1 = Datasource name that could not be used

## Explanation

Some Datasources defined in the Interstage Management console cannot be used.

## System Action

Continues processing.

## User Action

The probable causes are:

- The Interstage has been started.
- The JDBC driver is not properly installed.
- The JDBC driver environment settings are incorrect.
- The driver name of the Datasource specified in the Interstage Management Console is incorrect.

If these Datasources are to be used, eliminate the cause of the error then restart the IJServer.

### 9.4.4 IJServer21204

---

**IJServer: ERROR: IJServer21204: Attempted connection not available: METHOD=%s1**

#### Variable Information

%s1 = Method name

## Explanation

An attempt was made to use a Connection class method for an already closed connection. Or, if the distributed transaction function is used, the value specified in the JTS resource definition file of the database linkage service is incorrect.

## System Action

Throws SQLException.

## User Action

The probable causes are:

- A connection that had issued `Connection.close` was used to issue a `Connection` class method.
- A `UserTransaction.rollback` or `UserTransaction.commit` was issued before a `Connection` class method was issued.
- The connection use time has exceeded the time set for the 'connection use monitor time', and the container issued a `Connection` class method using a connection to which `Connection.close` was issued.

Issue a `Connection` class method while the connection is open.

If the distributed transaction function is used, the following causes are also probable.

- The JTS resource definition file of the database linkage service may be incorrect in the following points:
  - Incorrect `lookupName`
  - Incorrect `InitialContextFactory`
  - Incorrect `ProviderURL`
- The resource definition file of the datasource used by the EJB application for the database linkage service has not been registered.

When the "connection use monitor time" is used, the following cause may also be considered:

- The value set for the "connection use monitor time" is small, so a timeout was generated even though the connection is being used.

Specify a value larger than the anticipated maximum connection time as the "connection use monitor time".

If the container is not required to issue `Container.close`, make the "Close the connection at timeout" setting invalid.

If the "connection use monitor time" function is not required, set the function as invalid.

If necessary, contact the EJB application Bean developer.

## 9.4.5 IJServer21205

---

### IJServer: ERROR:IJServer21205: Inappropriate transaction instruction executed: METHOD=%s1

#### Variable Information

%s1 = Method name

#### Explanation

The commit or rollback method of the JDBC Connection class cannot be used after `UserTransaction.begin` has been issued.

#### System Action

Throws `SQLException`.

#### User Action

Issue the JDBC commit or rollback method without `UserTransaction.begin` being issued.

If necessary, contact the EJB application Bean developer.

## 9.4.6 IJServer21206

---

### IJServer: ERROR:IJServer21206: setAutoCommit method not available

#### Explanation

The `setAutoCommit` method of the JDBC Connection class cannot be used after `UserTransaction.begin` has been issued.

#### System Action

Throws `SQLException`.

#### User Action

Issue the setAutoCommit method of the JDBC Connection class without UserTransaction.begin being issued.

If necessary, contact the EJB application Bean developer.

### 9.4.7 IJServer21207

---

#### **IJServer: ERROR:IJServer21207: setReadOnly method not available**

##### Explanation

The setReadOnly method of the JDBC Connection class cannot be used after Usertransaction.begin has been issued.

##### System Action

Throws SQLException.

##### User Action

Issue the setReadOnly method of the JDBC Connection class without UserTransaction.begin being issued.

If necessary, contact the EJB application Bean developer.

### 9.4.8 IJServer21208

---

#### **IJServer: ERROR: IJServer21208: setTransactionIsolation method not available**

##### Explanation

The setTransactionIsolation method of the JDBC Connection class cannot be used after Usertransaction.begin has been issued.

##### System Action

Throws SQLException.

##### User Action

Issue the setTransactionIsolation method of the JDBC Connection class without UserTransaction.begin being issued.

If necessary, contact the EJB application Bean developer.

### 9.4.9 IJServer21209

---

#### **IJServer: WARNING: IJServer21209: Closing of a connection failed**

##### Explanation

The database connection could not be closed.

##### System Action

Throws SQLException.

##### User Action

The probable causes are:

- The connection has already been disconnected.
- Network failure.
- DBMS is not active.

Remove the cause of the failure, and then retry processing.

### 9.4.10 IJServer21210

---

---

## IJServer: ERROR:IJServer21210: Acquiring a connection failed

### Explanation

The execution of a getConnection method failed.

### System Action

Throws SQLException.

### User Action

The probable causes are:

- The Interstage Management Console is incorrect.
- JDBC driver is not properly installed.
- JDBC driver environment settings are incorrect.
- DBMS is not active.
- The maximum number of JDBC driver connections has been exceeded.
- The user ID or password specified in the getConnection argument is incorrect.
- There is a network error.
- There is an error in the DBMS operating environment.
- The number of connections being used reached the upper limit of the connections set for the JDBC driver, so a connection could not be acquired. Consider increasing the value of the maximum number of connections defined in the DB connection setting of the JDBC driver or the IJServer after examining the DB server specifications. Alternatively, increase the timeout value defined in the DB connection setting of the JDBC driver or the IJServer to avoid a timeout for the client.
- Check the application if there is any connection which is not closed.

Remove the cause of the failure, and then retry processing.

---

## 9.4.11 IJServer21211

---

### IJServer: ERROR:IJServer21211: Error in unsetEntityContext method: NAME=%s1 METHOD=%s2

#### Variable Information

%s1 = EJB application name

%s2 = Method name

#### Explanation

An EJB application processing error occurred during unsetEntityContext method processing.

#### System Action

- If this message is output during the stop processing of IJServer, the system cancels the stop processing.
- If this message is output while the inactivation processing is being performed by the J2EE HotDeploy function, the system continues inactivation processing.
- If this message is output while the automatic reload of a class is being performed, the system continues the reload operation of the class.

#### User Action

Check if an exception occurred during the EJB application processing specified in the unsetEntityContext method.

If necessary, contact the EJB application Bean developer.

## 9.4.12 IJServer21212

---

### IJServer: ERROR:IJServer21212: Generation of an instance failed: NAME=%s1

#### Variable Information

%s1 = EJB application name

#### Explanation

An insufficient number of Entity Bean instances has been provided.

#### System Action

Throws *RemoteException*.

#### User Action

On the Interstage, select [WorkUnit], [IJServer Name], [EJB Application Name], [Application Environment Definition], and then [Interstage Extended Information] and increase the value specified for Instance Count.

## 9.4.13 IJServer21214

---

### IJServer: ERROR: IJServer21214: EJB object associated with EntityContext not found: NAME=%s1

#### Variable Information

%s1 = EJB application name

#### Explanation

The *EntityContext* method could not be used because it was invoked incorrectly.

#### System Action

Throws *IllegalStateException*.

#### User Action

The EntityContext method can be called using the following methods.

- When the *getEJBObject* method is used:
  - *ejbActivate* method
  - *ejbPassivate* method
  - *ejbPostCreate* method
  - *ejbRemove* method
  - *ejbLoad* method
  - *ejbStore* method
  - Business method
- When the *getPrimaryKey* method is used:
  - *ejbActivate* method
  - *ejbPassivate* method
  - *ejbPostCreate* method
  - *ejbRemove* method
  - *ejbLoad* method
  - *ejbStore* method

- Business method

Make corrections so that the *EntityContext* method is invoked correctly. If necessary, contact the EJB application Bean developer.

## 9.4.14 IJServer21215

---

### IJServer: ERROR: IJServer21215: Transaction postprocessing failed: NAME=%s1 METHOD=%s2

#### Variable Information

%s1 = EJB application name

%s2 = Method name

#### Explanation

Postprocessing of a transaction failed.

#### System Action

Rolls back the database transaction.

#### User Action

The probable causes are:

- Database updating failed because an error occurred in the database.
- There is an error in *ejbPassivate* method processing.

Confirm that there is no error in the database and check *ejbPassivate* method processing.

If necessary, contact the EJB application Bean developer.

## 9.4.15 IJServer21216

---

### IJServer: ERROR: IJServer21216: Error in create method: NAME=%s1

#### Variable Information

%s1 = EJB application name

#### Explanation

A create method processing error has occurred.

#### System Action

Throws Exception.

#### User Action

Refer to the messages output before and after the create method processing, and remove the cause of the error.

If necessary, contact the EJB application Bean developer.

## 9.4.16 IJServer21217

---

### IJServer: ERROR: IJServer21217: Error in findByPrimaryKey method: NAME=%s1

#### Variable Information

%s1 = EJB application name

#### Explanation

An error occurred in the *findByPrimaryKey* method.

## System Action

Throws Exception.

## User Action

Refer to the messages output before and after the *findByPrimaryKey* method processing, and remove the cause of the error.

If necessary, contact the EJB application Bean developer.

## 9.4.17 IJServer21218

---

### IJServer: ERROR: IJServer21218: Acquiring Primary Key failed: NAME=%s1 METHOD=%s2

#### Variable Information

%s1 = EJB application name

%s2 = Method name

#### Explanation

The creation of the PrimaryKey object failed.

#### System Action

Throws Exception.

#### User Action

Refer to the messages output before and after the PrimaryKey object and remove the cause of the error.

If necessary, contact the EJB application Bean developer.

## 9.4.18 IJServer21219

---

### IJServer: ERROR: IJServer21219: Database update operation failed: NAME=%s1

#### Variable Information

%s1 = EJB application name

#### Explanation

The database update operation failed.

#### System Action

Throws Exception.

#### User Action

An error has occurred during a database update. Examine the messages output before and after this error and either eliminate the cause of the problem or contact the developer of the relevant EJB application Bean.

Note also that if the conditions below are satisfied, an error will occur in the PreparedStatement.addBatch method because simultaneous use of the 'Forward CMP data using stream' function and the 'Batch update of multiple records' function is not supported by the JDBC driver:

- A JDBC driver of Oracle9i or earlier is being used
- 'Forward CMP data using stream' is set to 'Yes'.

If an error occurs, take one of the following actions and either restart the IJServer or reactivate the application:

- Change the JDBC driver to Oracle11g or later
- Change 'Update CMP1.1 records in batch' in 'Interstage Additional Settings' to 'No'.
- Change 'Map CMP DataStream' in 'CMF Mapping Definition in' to 'No'.

## 9.4.19 IJServer21220

---

### IJServer: ERROR: IJServer21220: Error in remove method: NAME=%s1

#### Variable Information

%s1 = EJB application name

#### Explanation

An error occurred in the remove method.

#### System Action

Throws Exception.

#### User Action

Refer to the messages output before and after the remove method error, and remove the cause of the error.

If necessary, contact the EJB application Bean developer.

## 9.4.20 IJServer21221

---

### IJServer: ERROR: IJServer21221: Specified EJB object already deleted: NAME=%s1

#### Variable Information

%s1 = EJB application name

#### Explanation

The EJB object that executed the remove method cannot be used.

#### System Action

Throws *NoSuchObjectException*.

#### User Action

Check if an EJB object that has executed the *EJBHome.remove* or *EJBObject.remove* method was used.

If necessary, contact the EJB application Bean developer.

## 9.4.21 IJServer21222

---

### IJServer: ERROR: IJServer21222: Activation of EJB application failed: NAME=%s1

#### Variable Information

%s1 = EJB application name

#### Explanation

The EJB application instance could not be associated with EJB object due to an inappropriate primary key value or incorrectly created EJB object.

#### System Action

Throws *SQLException*.

#### User Action

The probable cause is that an attempt was made to invoke an EJB object business method that was created using a primary key that does not exist in the database.

Check whether the primary key value is set correctly. Also check whether EJB object is created correctly after the *findByPrimaryKey* and *finder* methods are executed.

Refer to the messages output before and after this error, and remove the cause of the error. If necessary, contact the EJB application Bean developer.

## 9.4.22 IJServer21223

---

**IJServer: ERROR: IJServer21223: getUserTransaction method not available: NAME=%s1 METHOD=%s2**

### Variable Information

%s1 = EJB application name

%s2 = Method name

### Explanation

The *EntityContext.getUserTransaction* method cannot be used in the Entity Bean.

### System Action

Throws `IllegalStateException`.

### User Action

Check that the *EntityContext.getUserTransaction* method is not used in the Entity Bean. If it is, contact the EJB application Bean developer.

## 9.4.23 IJServer21224

---

**IJServer: ERROR: IJServer21224: Required object not initialized properly: NAME=%s1 METHOD=%s2**

### Variable Information

%s1 = EJB application name

%s2 = Method name

### Explanation

Processing was aborted because the required object had an incorrect value, or *EntityContext* or *EJBObject* methods were called when they could not be used.

### System Action

Stops executing the method with the method name shown in the error message.

### User Action

The probable causes are as follows:

- The reference value of the object (which is passed as an argument) is incorrect or null.
- An *EntityContext* or *EJBObject* method that cannot be used in the method was called.

An *EntityContext* or *EJBObject* method can be called in the following methods:

- `ejbActivate` method
- `ejbPassivate` method
- `ejbPostCreate` method
- `ejbRemove` method
- `ejbLoad` method
- `ejbStore` method
- Business method

Check whether the value of the object (which is passed as an argument) has been set correctly, or the calling of the method was correct.

## 9.4.24 IJServer21225

---

**IJServer: ERROR: IJServer21225: Value returned from ejbFinder method is null: NAME=%s1 METHOD=%s2**

### Variable Information

%s1 = EJB application name

%s2 = Method name

### Explanation

The value of the primary key returned from the `ejbFind<METHOD>` method is null.

### System Action

Throws *RemoteException*.

### User Action

Check if the value of the primary key returned from the `ejbFind<METHOD>` method is null.

If necessary, contact the EJB application Bean developer.

## 9.4.25 IJServer21226

---

**IJServer: ERROR: IJServer21226: Value returned from ejbCreate method is null: NAME=%s1**

### Variable Information

%s1 = EJB application name

### Explanation

The value of the primary key returned from the `ejbCreate` method is null.

### System Action

Throws *RemoteException*.

### User Action

Check if the value of the primary key returned from the `ejbCreate` method is null.

If necessary, contact the EJB application Bean developer.

## 9.4.26 IJServer21227

---

**IJServer: ERROR: IJServer21227: Primary key value is null: NAME=%s1 METHOD=%s2**

### Variable Information

%s1 = EJB application name

%s2 = Method name

### Explanation

The value of the primary key passed as an argument of the method is null.

### System Action

Throws *RemoteException*.

### User Action

Check if the argument value of the `findByPrimaryKey`, `EJBHome.remove` or `EJBObject.isIdentical` method is null.

If necessary, contact the EJB application Bean developer.

## 9.4.27 IJServer21228

---

**IJServer: ERROR: IJServer21228: EJB object generation failed: NAME=%s1 REASON=%s2 CODE=%s3**

### Variable Information

%s1 = EJB application name

%s2 = Detailed message

%s3 = System code

### Explanation

Creation of the EJB object failed.

### System Action

Throws Exception.

### User Action

When the CMP Entity Bean is used, the possible cause of the failure is an incorrect combination of data types between the CMF and DBMS. Check that the combination of data types is correct.

## 9.4.28 IJServer21229

---

**IJServer: WARNING: IJServer21229: STATUS\_ROLLEDBACK returned from commit method of UserTransaction: NAME=%s1**

### Variable Information

%s1 = EJB application name

### Explanation

An error occurred in the UserTransaction *commit* method and the transaction was rolled back.

The possible causes are:

- An error occurred in one of the following methods executed by the commit method:
  - Entity Bean *ejbStore* method
  - Entity Bean *ejbPassivate* method
  - DBMS UPDATE processing executed by the EJB container when an Entity Bean (CMP) is used
  - Session Bean *beforeCompletion*
- The EJB container set the transaction status to STATUS\_MARKED\_ROLLBACK because a system exception occurred in the EJB application during a transaction. For this reason, the transaction was rolled back at the execution of the commit method.
- The *UserTransaction setRollbackOnly* method was executed in the application. For this reason, the transaction was rolled back at the execution of the commit method.

### System Action

Rolls back the transaction and throws *HeuristicRollbackException* to the client application.

### User Action

Take action according to each cause as follows:

error in methods executed by commit method

Where an error occurred in one of the following methods executed by the *commit* method:

- Entity Bean *ejbStore* method
- Entity Bean *ejbPassivate* method
- DBMS UPDATE processing executed by the EJB container when an Entity Bean (CMP) is used
- Session Bean *beforeCompletion*

Examine why the exception occurred, following the procedure appropriate for the operating system.

1. Refer to the following log file to check the exception which occurred.

**Windows32/64**

[J2EE common directory]\jserver\[JServer name]\log\[process serial number]\container.log

**Solaris32/64 Linux32/64**

[J2EE common directory]/jserver/[JServer name]/log/[process serial number]/container.log

2. Check the stack trace to examine why the exception occurred.

For details of the causes of exceptions which frequently occur, see "Exception Information Output When You Use J2EE."

After removing the cause, re-execute the application:

If you take the above action, but cannot resolve the problem, notify a Fujitsu systems engineer of information about this message and other data.

#### roll back at execution of the commit method

Where the EJB container set the transaction status to STATUS\_MARKED\_ROLLBACK and the transaction was rolled back at the execution of the commit method.

In these circumstances, the message EJB1096 had been output before this error occurred. Examine why the error related to message EJB1096 occurred, take action, and then rerun.

#### setRollbackOnly method execution

The *UserTransaction setRollbackOnly* method was executed in the application, and the transaction was rolled back at the execution of the commit method.

In this case, check the cause of the execution of the *setRollbackOnly* method. Examine why the *setRollbackOnly* method was executed, take action, and then rerun.

## 9.4.29 IJServer21231

---

**IJServer: ERROR: IJServer21231: Error in setEntityContext method: NAME=%s1 REASON=%s2**

#### Variable Information

%s1 = EJB application name

%s2 = Detailed message

#### Explanation

An EJB application processing error occurred during setEntityContext method processing.

#### System Action

Stops EJB application startup.

#### User Action

The probable causes and required actions are:

- Confirm whether lookup processing is executed in the Entity Bean constructor. If it is executed, correct the EJB application so that lookup processing is executed in the setEntityContext method.
- Check if the data source specified in the data source lookup processing is defined on the Interstage Management Console.

- The Datasource specified in the Datasource lookup processing cannot be used.

Remove the cause of the error by referring to the messages output before and after the error if the data source cannot be used.

- The deployment descriptor reference resource that corresponds to the Datasource specified in the Datasource lookup processing is not specified correctly.

Refer to the messages output before and after the error, and remove the cause of the error.

If necessary, contact the EJB application Bean developer.

### 9.4.30 IJServer21233

---

#### IJServer: ERROR: IJServer21233: Error in ejbLoad method: NAME=%s1 REASON=%s2

##### Variable Information

%s1 = EJB application name

%s2 = Detailed message

##### Explanation

An EJB application processing error occurred during ejbLoad method processing.

##### System Action

Throws *RemoteException* or *ApplicationException*.

##### User Action

Check if an exception occurred during processing of the EJB application specified in the ejbLoad method.

If necessary, contact the EJB application Bean developer.

### 9.4.31 IJServer21234

---

#### IJServer: ERROR: IJServer21234: Error in ejbStore method: NAME=%s1 REASON=%s2

##### Variable Information

%s1 = EJB application name

%s2 = Detailed message

##### Explanation

An EJB application processing error occurred during ejbStore method processing.

##### System Action

Throws *RemoteException* or *ApplicationException*.

##### User Action

Check if an exception occurred during processing of the EJB application specified in the ejbStore method.

If necessary, contact the EJB application Bean developer.

### 9.4.32 IJServer21235

---

#### IJServer: ERROR: IJServer21235: Error in ejbRemove method: NAME=%s1 REASON=%s2

##### Variable Information

%s1 = EJB application name

%s2 = Detailed message

## Explanation

An EJB application processing error occurred during *ejbRemove* method processing.

## System Action

Throws *RemoteException* or *ApplicationException*.

## User Action

Check if an exception occurred during processing of the EJB application specified in the *ejbRemove* method.

If necessary, contact the EJB application Bean developer.

## 9.4.33 IJServer21236

---

### IJServer: ERROR: IJServer21236: Initialization of connection failed: REASON=%s1

#### Variable Information

%s1 = Detailed message

#### Note

The output message may be split up if the string for the variable information is long.

In this case, the entire variable information string may not be displayed. The complete and undivided exception information is output in the container log file, as are the stack traces. For more details, refer to this file.

## Explanation

An error occurred while initializing a connection.

## System Action

Throws *SQLException*.

## User Action

Possible causes are:

- An attempt was made to set a transaction isolation level that is not supported by the JDBC driver.

On the Internet, select [WorkUnit], [IJServer Name], [Environment Setup], and then [DB Connection Setting] and set the Isolation Level to the isolation level supported by the JDBC driver.

- If an exception was returned from the database

Remove the error cause according to the detail message from the JDBC driver.

Possible actions are as follows:

- Check the database status.
- Check the network for errors.

Remove the cause of failure to set up a connection to the database, and re-execute processing.

## 9.4.34 IJServer21238

---

### IJServer: ERROR: IJServer21238: Error in finder: NAME=%s1 METHOD=%s2

#### Variable Information

%s1 = EJB application name

%s2 = Method name

## Explanation

An error occurred in the finder method.

## System Action

Throws Exception.

## User Action

Check the messages before and after the finder method processing error and remove the cause of the error.

If necessary, contact the EJB application Bean developer.

## 9.4.35 IJServer21239

---

### IJServer: ERROR: IJServer21239: Exception from CMP Support: NAME=%s1 REASON=%s2

#### Variable Information

%s1 = EJB application name

%s2 = Detailed message

#### Note

When CMP2.0 is used, the EJB application name of changeable information [UNKNOWN] might be displayed.

The output message may be split up if the string for the variable information is long.

In such a case, the whole of the variable information string may be not displayed. The complete and undivided exception information is output in the container log file, as are the stack traces. For more details, refer to this file.

#### Explanation

A CMP processing error occurred.

#### System Action

Stops the IJServer startup according to the detailed messages, or throws Exception.

#### User Action

Remove the cause of the error as outlined in the detailed messages. Additionally, depending on the IJServer "Separate Class Loaders" settings, it may not be possible to refer from one module to another. Refer to "Designing J2EE"-"Separating Class Loaders" in the J2EE User's Guide, and check that the application configuration and class loader separation are correct.

The action required for each detailed message is outlined below.

If you are using CMP1.1, refer to [9.4.35.1 CMP1.1 Detailed Messages](#).

If you are using CMP2.x, refer to [9.4.35.2 CMP2.x Detailed Messages](#)

If reference to the detailed messages did not remedy the problem, take the following action:

1. Refer to the following log file to check the exception which occurred.

**Windows32/64**

[J2EE common directory]\ijserver\[IJServer name]\log\[process serial number]\container.log

**Solaris32/64 Linux32/64**

[J2EE common directory]/ijserver/[IJServer name]/log/[process serial number]/container.log

2. Check the stack trace to examine why the exception occurred.

For details of the causes of exceptions which frequently occur, see "Exception Information Output When You Use J2EE."

If you take the above action, but cannot resolve the problem, write down the message information, use the *iscollectinfo* command to collect the diagnostic information, and then contact a Fujitsu systems engineer.

### 9.4.35.1 CMP1.1 Detailed Messages

---

#### [CMP1] Internal Error. MESSAGE='%s1'.

## Variable Information

%s1 = JDBC driver detailed message

## Explanation

An invalid error occurred in the JDBC driver to the Client application.

## System Action

Throws *RemoteException* to the Client application.

## User Action

Check whether the DBMS is running.

If the DBMS is not running, start it, then rerun.

When the DBMS is running, remove the cause of the JDBC driver error according to the detailed message.

---

## [CMP101] Bean '%s1' is not currently deployed.

## Variable Information

%s1 = EJB application name

## Explanation

A system error has occurred.

## System Action

Throws *RemoteException*.

## User Action

Write down the message information, use the *iscollectinfo* command to collect the diagnostic information, and then contact a Fujitsu systems engineer.

---

## [CMP102] Container Managed Persistence is not currently supported for the requested Data Source.

## Explanation

A system error has occurred.

## System Action

Throws *RemoteException*.

## User Action

Write down the message information, use the *iscollectinfo* command to collect the diagnostic information, and then contact a Fujitsu systems engineer.

---

## [CMP1001] Internal Error. Finder '%s1' not found.

## Variable Information

%s1 =finder method name

## Explanation

Unable to locate the Finder definition for the finder method used.

## System Action

Throws *RemoteException*.

## User Action

The finder method definition for the Home interface and the finder definition do not match. Change the finder definition so that it matches the finder method definition.

---

## [CMP1002] The requested operation is not allowed. The bean is Read-Only.

### Explanation

A method has been executed that cannot be used when the instance management mode is ReadOnly.

### System Action

Throws *RemoteException*.

### User Action

Determine whether the instance management mode is set to ReadOnly and one of the following methods has been invoked.

*EJBHome.create*

*EJBHome.remove*

*EJBObject.remove*

---

## [CMP1003] Internal Error. Data get/set failed because of a type mismatch.

### Explanation

The specified CMF data type and the DBMS column data type cannot be converted.

### System Action

Throws *RemoteException*.

### User Action

Change the CMF data type and the DBMS column data type.

---

## [CMP1004] Internal Error. Data get/set failed because the type '%s1' is not supported.

### Variable Information

%s1 = Data type

### Explanation

The specified data type is not supported.

### System Action

Throws *RemoteException*.

### User Action

Change the data type to a type that is supported. Refer to any messages output before or after the error, and remove the cause of the error.

---

## [CMP1005] Failed to create the required DB-access command. MESSAGE='%s1'.

### Variable Information

%s1 =JDBC driver detailed message

### Explanation

An error occurred in the JDBC driver Connection.PrepareStatement.

### System Action

Throws *RemoteException*.

## User Action

Refer to the detailed message and remove the cause of the error in the JDBC driver `Connection.prepareStatement`.

The probable causes of the error are:

- An incorrect CMF definition Datasource name.
- An incorrect CMF definition schema name.
- An incorrect CMF definition table name.
- An incorrect column name in the DBMS corresponding to the CMF.
- An incorrect CMF data type.
- An incorrect column data type in the DBMS corresponding to the CMF.
- An error in the finder definition search conditions.
- An error in the Interstage or the DB access environment definition.
- one column name of DBMS is mapped to multiple CMFs.
- An error in the JDBC driver.

---

## [CMP1006] An error related to DB-access command parameter substitution occurred.

### Explanation

An error has occurred in the setting processing for the dynamic parameters of the JDBC driver `PreparedStatement`.

### System Action

Throws *RemoteException*.

### User Action

The probable causes of the error are:

- An incorrect CMF data type.
- An incorrect DBMS column data type for the CMF.
- one column name of DBMS is mapped to multiple CMFs.
- An error in the JDBC driver.
- An error in the Interstage Management Console.

Refer to any messages output before or after the error, and remove the cause of the error.

---

## [CMP1007] Failed to obtain the Finder result-set. MESSAGE='%s'.

### Variable Information

%s1 = JDBC driver detailed message

### Explanation

An error has occurred in the JDBC driver `PreparedStatement.executeQuery` method or the `ResultSet.next` method.

### System Action

Throws *RemoteException*.

### User Action

Refer to the detailed message and remove the cause of the error in the JDBC driver `PreparedStatement.executeQuery` or `ResultSet.next` method.

The probable causes of the error are:

- An incorrect CMF definition Datasource name.
- An incorrect CMF definition schema name.
- An incorrect CMF definition table name.
- An incorrect column name in the DBMS corresponding to the CMF.
- An incorrect CMF data type.
- An incorrect column data type in the DBMS corresponding to the CMF.
- An error in the finder definition search conditions.
- An error in the Interstage Management Console.
- one column name of DBMS is mapped to multiple CMFs.
- An error in the JDBC driver.

---

**[CMP1008] Failed during execution of the required DB-access command. MESSAGE='%s1'.****Variable Information**

%s1 = JDBC driver detailed message

**Explanation**

An error has occurred in the JDBC driver *PreparedStatement.executeUpdate* method.

**System Action**

Throws *RemoteException*.

**User Action**

Refer to the detailed message and remove the cause of the error in the JDBC driver *PreparedStatement.executeUpdate* method.

The probable causes of the error are:

- An incorrect CMF definition Datasource name.
- An incorrect CMF definition schema name.
- An incorrect CMF definition table name.
- An incorrect column name in the DBMS corresponding to the CMF.
- An incorrect CMF data type.
- An incorrect column data type in the DBMS corresponding to the CMF.
- An incorrect Interstage Management Console.
- One column name of DBMS is mapped to multiple CMFs.
- An error in the JDBC driver.

---

**[CMP1009] Unable to set Container Managed Fields in bean.****Explanation**

Values cannot be set for the CMF.

**System Action**

Throws *RemoteException*.

**User Action**

The probable causes of the error are:

- A CMF data type for which null cannot be set is used.

- A CMF data type that truncates character strings is used.
- An incorrect CMF data type.
- one column name of DBMS is mapped to multiple CMFs.
- An incorrect column data type in the DBMS corresponding to the CMF.
- An error in the JDBC driver.

Refer to any other messages output before or after the error, and remove the cause of the error.

---

### [CMP1010] Failed to instantiate the Primary Key '%s1'.

#### Variable Information

%s1 = Primary Key class name

#### Explanation

Primary Key object creation failed.

#### System Action

Throws *RemoteException*.

#### User Action

Check if an exception has occurred in the Primary Key class constructor.

---

### [CMP1011] Unable to assign a Database NULL value to primitive CMF '%s1' in the Bean.

#### Variable Information

%s1 = CMF field name.

#### Explanation

A database null value cannot be set for CMF.

#### System Action

Throws *RemoteException*.

#### User Action

Change the CMF data type to one for which database null values can be set.

---

### [CMP1012] The Field-type '%s1' was not recognized so cannot be mapped.

#### Variable Information

%s1 = CMF data type

#### Explanation

The data type specified in the CMF definition is not supported.

#### System Action

Execute either of the following processings:

- Stop the startup processing for IJServer if this message is output during startup processing for IJServer.
- Abort activation if this message is output during activation using the J2EE HotDeploy function. Change the deployment module to "deactivated" status.

#### User Action

Change the CMF data type to a supported data type. Restart IJServer.

If the status of the module is "deactivated", in the Interstage Management Console, click [Module] > [Status]. Select the deployment module in the [Status] window, and then click the Reactivate button to activate the deployment module.

---

### [CMP1013] The Finder Argument-type '%s1' was not recognized so cannot be mapped.

#### Variable Information

%s1 = Argument data type for finder method

#### Explanation

The data type specified in the finder method argument is not supported.

#### System Action

Stops IIServer startup.

#### User Action

The probable causes are:

- The data types that can be specified in the finder method arguments are the same as the data types that can be used for CMF.  
Change the data type to a data type that can be specified in finder method arguments.
- Specify the data type package name in the finder method argument if it has been omitted.

If the data type is changed, restart IIServer.

If the status of the module is "deactivated", in the Interstage Management Console, click [Module] > [Status]. Select the deployment module in the [Status] window, and then click the Reactivate button to activate the deployment module.

---

### [CMP1014] DataSource '%s1' not found (it may not be registered in JNDI).

#### Variable Information

%s1 = Datasource name

#### Explanation

Datasource cannot be used.

#### System Action

Throws *RemoteException*.

#### User Action

The probable cause is that the Datasource name in the CMF definition is incorrect. The specified Datasource cannot be used or an IIServer21243 message has been output. If the Datasource cannot be used, refer to the IIServer21243 message output and remove the cause of the error.

---

### [CMP1015] Duplicate Key. MESSAGE='%s1'.

#### Variable Information

%s1 = JDBC detailed message

#### Explanation

A unique constraint error has occurred in the JDBC driver.

#### System Action

Throws *DuplicateKeyException*.

#### User Action

Refer to the detailed message and remove the cause of the unique constraint error in the JDBC driver.

The probable cause is that a row with the same key value already exists in the database table.

---

**[CMP1016] Failed to instantiate the Primary Key '%s1' for <primkey-field> '%s2'.****Variable Information**

%s1 = Primary Key class name

%s2 = primkey-field name

**Explanation**

A system error has occurred.

**System Action**

Throws *RemoteException*.

**User Action**

Write down the message information, use the *iscollectinfo* command to collect the diagnostic information, and then contact a Fujitsu systems engineer.

---

**[CMP1017] Data truncated for CMF '%s1'.****Variable Information**

%s1 = CMF field name

**Explanation**

Character strings have been truncated.

**System Action**

Throws *RemoteException*.

**User Action**

Check whether the CMF obtains the char or java.lang.Character data type of more than one character.

---

**[CMP1018] Field '%s1' is not a supported type for <primkey-field>.****Variable Information**

%s1 = CMF field name

**Explanation**

A CMF of a data type that cannot be specified in the Primary Key field has been specified.

**System Action**

Throws *RemoteException*.

**User Action**

Specify a CMF of one of the following data types in the Primary Key field.

- java.lang.Boolean
- java.lang.Byte
- java.lang.Character
- java.lang.Short
- java.lang.Integer
- java.lang.Long
- java.lang.Float
- java.lang.Double

- java.math.BigDecimal
- java.sql.Date
- java.sql.Time
- java.sql.Timestamp
- java.lang.String

---

### [CMP1019] Error in finder: %s1. Unexpectedly found > 1 rows.

#### Variable Information

%s1 = finder method name

#### Explanation

The finder method that returns a single search result has returned more than one search result.

#### System Action

Throws *FinderException*.

#### User Action

Check whether the finder method that returns a single search result has returned more than one search result. Alternatively, contact the EJB application Bean developer.

---

### [CMP1020] Failed to serialize CMF object: '%s1'

#### Variable Information

%s1 = find CMF field name

#### Explanation

The object specified in the CMF could not be serialized.

#### System Action

Throws *RemoteException*.

#### User Action

Check whether a data type that cannot be serialized is specified in the CMF.

---

### [CMP1021] Failed to serialize the Finder argument object '%s1'.

#### Variable Information

%s1 = Argument data type for finder method

#### Explanation

The object specified in the argument of the finder method could not be serialized.

#### System Action

Throws *RemoteException*.

#### User Action

Check whether a data type that cannot be serialized is specified in the argument of the finder method.

---

### [CMP10001] There are no more elements in this Enumeration.

#### Explanation

All elements have already been fetched from Enumeration or Collection.

## System Action

Throws *RemoteException*.

## User Action

Check that the *Enumeration.nextElement* method or the *Iterator.next* method is not being used after true has been returned in the *Enumeration.hasMoreElements* method or *Iterator.hasNext* method.

---

### [CMP20003] Class not found - '%s1'.

## Variable Information

%s1 = Class name

## Explanation

Cannot read the class file.

## System Action

Execute either of the following processings:

- Stop the startup processing for IJServer if this message is output during startup processing for IJServer.
- Abort activation if this message is output during activation using the J2EE HotDeploy function. Change the deployment module to "deactivated" status.

## User Action

Execute either of the following processings:

- Stop the startup processing for IJServer if this message is output during startup processing for IJServer.

If the status of the module is "deactivated", in the Interstage Management Console, click [Module] > [Status]. Select the deployment module in the [Status] window, and then click the Reactivate button to activate the deployment module.

---

### [CMP20007] Table name not specified.

## Explanation

The table name has not been specified in the CMF definitions.

## System Action

Execute either of the following processings:

- Stop the startup processing for IJServer if this message is output during startup processing for IJServer.
- Abort activation if this message is output during activation using the J2EE HotDeploy function. Change the deployment module to "deactivated" status.

## User Action

Check that the table name has been specified in the CMF definition, and then restart IJServer.

If the status of the module is "deactivated", in the Interstage Management Console, click [Module] > [Status]. Select the deployment module in the [Status] window, and then click the Reactivate button to activate the deployment module.

---

### [CMP20009] No fields were specified.

## Explanation

No field name is specified in the CMF definitions.

## System Action

Execute either of the following processings:

- Stop the startup processing for IJServer if this message is output during startup processing for IJServer.

- Abort activation if this message is output during activation using the J2EE HotDeploy function. Change the deployment module to "deactivated" status.

### User Action

Check that the table name has been specified in the CMF definition, and then restart IJServer.

If the status of the module is "deactivated", in the Interstage Management Console, click [Module] > [Status]. Select the deployment module in the [Status] window, and then click the Reactivate button to activate the deployment module.

---

## [CMP20010] Field '%s1' not a member of '%s2' class.

### Variable Information

%s1 = CMF field name

%s2 = Entity Bean class name

### Explanation

The Entity Bean class field corresponding to the CMF cannot be located.

### System Action

Execute either of the following processings:

- Stop the startup processing for IJServer if this message is output during startup processing for IJServer.
- Abort activation if this message is output during activation using the J2EE HotDeploy function. Change the deployment module to "deactivated" status.

### User Action

Possible actions are:

- Check if the Entity Bean class field corresponding to the CMF has been defined.
- Check if public is specified in the Entity Bean class field corresponding to the CMF.

If the changed, restart IJServer.

If the status of the module is "deactivated", in the Interstage Management Console, click [Module] > [Status]. Select the deployment module in the [Status] window, and then click the Reactivate button to activate the deployment module.

---

## [CMP20012] Column name mapping not specified for field '%s1'.

### Variable Information

%s1 = CMF field name

### Explanation

The CMF specified in the finder definition search conditions is not defined in the CMF definitions, or the CMF definitions contain an error.

### System Action

Execute either of the following processings:

- Stop the startup processing for IJServer if this message is output during startup processing for IJServer.
- Abort activation if this message is output during activation using the J2EE HotDeploy function. Change the deployment module to "deactivated" status.

### User Action

The probable causes are:

- The CMF specified in the finder definition search conditions is not defined in the CMF definitions.
- The CMF specified in the finder definition search conditions does not correspond to the correct DB column name.

If the changed, restart IJServer.

If the status of the module is "deactivated", in the Interstage Management Console, click [Module] > [Status]. Select the deployment module in the [Status] window, and then click the Reactivate button to activate the deployment module.

---

### [CMP20013] Invalid finder name specification: '%s1'.

#### Variable Information

%s1 = finder method name

#### Explanation

An incorrect method name is specified in the finder definition.

#### System Action

Execute either of the following processings:

- Stop the startup processing for IJServer if this message is output during startup processing for IJServer.
- Abort activation if this message is output during activation using the J2EE HotDeploy function. Change the deployment module to "deactivated" status.

#### User Action

Check if the method name specified in the finder definition is correct.

If the changed, restart IJServer.

If the status of the module is "deactivated", in the Interstage Management Console, click [Module] > [Status]. Select the deployment module in the [Status] window, and then click the Reactivate button to activate the deployment module.

---

### [CMP20014] Invalid finder parameter marker.

#### Explanation

Incorrect parameters are specified in the finder definition search conditions.

#### System Action

Execute either of the following processings:

- Stop the startup processing for IJServer if this message is output during startup processing for IJServer.
- Abort activation if this message is output during activation using the J2EE HotDeploy function. Change the deployment module to "deactivated" status.

#### User Action

Check whether the parameters specified in the finder definition search conditions are in the following format:

- ?paramN? (N is a natural number)
- N is 1 or more and does not exceed the finder method parameter value.

If the changed, restart IJServer.

If the status of the module is "deactivated", in the Interstage Management Console, click [Module] > [Status]. Select the deployment module in the [Status] window, and then click the Reactivate button to activate the deployment module.

---

### [CMP20017] The field name was not specified.

#### Explanation

No field name is specified in the CMF definitions.

#### System Action

Execute either of the following processings:

- Stop the startup processing for IJServer if this message is output during startup processing for IJServer.
- Abort activation if this message is output during activation using the J2EE HotDeploy function. Change the deployment module to "deactivated" status.

#### User Action

Check if the field name is specified in the CMF definitions.

If the changed, restart IJServer.

If the status of the module is "deactivated", in the Interstage Management Console, click [Module] > [Status]. Select the deployment module in the [Status] window, and then click the Reactivate button to activate the deployment module.

---

### [CMP20019] Error loading CMP meta-data from FJCMP file '%s1'. Exception = '%s2'.

#### Variable Information

%s1 = CMF definition file name

%s2 = Detailed message

#### Explanation

The CMF definition file could not be read.

#### System Action

Execute either of the following processings:

- Stop the startup processing for IJServer if this message is output during startup processing for IJServer.
- Abort activation if this message is output during activation using the J2EE HotDeploy function. Change the deployment module to "deactivated" status.

#### User Action

The environment setting might be wrong. Check files in the J2EE common directory

It is possible that No CMF has been defined. Define necessary CMFs.

If the changed, restart IJServer.

If the status of the module is "deactivated", in the Interstage Management Console, click [Module] > [Status]. Select the deployment module in the [Status] window, and then click the Reactivate button to activate the deployment module.

---

### [CMP20020] Invalid finder query string. Finder = '%s1'. Query string = '%s2'.

#### Variable Information

%s1 = finder method name

%s2 = finder definition search conditions

#### Explanation

The finder definition search conditions contain an error.

#### System Action

Execute either of the following processings:

- Stop the startup processing for IJServer if this message is output during startup processing for IJServer.
- Abort activation if this message is output during activation using the J2EE HotDeploy function. Change the deployment module to "deactivated" status.

#### User Action

The probable causes are:

- There are invalid parameter specifications in the finder definition search conditions.

- The CMF specified in the finder definition search conditions has not been defined in the CMF definitions.

Refer to any messages output before or after the error, and remove the cause of the error. Restart IJServer.

If the status of the module is "deactivated", in the Interstage Management Console, click [Module] > [Status]. Select the deployment module in the [Status] window, and then click the Reactivate button to activate the deployment module.

---

### [CMP20021] Datasource name not specified.

#### Explanation

No Datasource name is specified in the CMF definitions.

#### System Action

Execute either of the following processings:

- Stop the startup processing for IJServer if this message is output during startup processing for IJServer.
- Abort activation if this message is output during activation using the J2EE HotDeploy function. Change the deployment module to "deactivated" status.

#### User Action

Check if a Datasource name is specified in the CMF definitions.

If the changed, restart IJServer.

If the status of the module is "deactivated", in the Interstage Management Console, click [Module] > [Status]. Select the deployment module in the [Status] window, and then click the Reactivate button to activate the deployment module.

---

### [CMP20022] No primary key field was found for this bean.

#### Explanation

Cannot find a Primary Key class field that corresponds to the CMF Primary Key.

#### System Action

Execute either of the following processings:

- Stop the startup processing for IJServer if this message is output during startup processing for IJServer.
- Abort activation if this message is output during activation using the J2EE HotDeploy function. Change the deployment module to "deactivated" status.

#### User Action

Possible actions are:

- Check if the Primary Key, CMF, has been defined.
- Check if a CMF with the same name as the Primary Key class field has been specified in the CMF definitions.
- Check if public is specified in the Primary Key class field with the same name as the Primary Key, CMF.

If the changed, restart IJServer.

If the status of the module is "deactivated", in the Interstage Management Console, click [Module] > [Status]. Select the deployment module in the [Status] window, and then click the Reactivate button to activate the deployment module.

---

### [CMP20025] Failed in the execution of the snap '%s1'.

#### Variable Information

%s1 = error code

#### Explanation

The snap function could not be executed.

## System Action

Throws *RemoteException*.

## User Action

Check the system environment. Possible causes are as follows:

### Windows32/64

- Access permission is not granted to the subordinates of [J2EE common directory]\ijserver\[IJServer name]\log\[process serial number].
- A disk I/O error occurred.
- A memory shortage occurred.
- A disk space shortage occurred.

If the snap file output function is used, check the system environment, redefine snap acquisition, and run the IJServer.

### Solaris32/64 Linux32/64

- Access permission is not granted to the subordinates of [J2EE common directory]/ijserver/[IJServer name]/log/[process serial number].
- A disk I/O error occurred.
- A memory shortage occurred.
- A disk space shortage occurred.

If the snap file output function is used, check the system environment, redefine snap acquisition, and run the IJServer.

## 9.4.35.2 CMP2.x Detailed Messages

---

### [CMP2.x-0001] Could not find home class %s1.

#### Variable Information

%s1 = Home interface Name

#### Explanation

The Home interface or LocalHome interface is not found.

#### System Action

ClassNotFoundException occurred, which stops deployment.

#### User Action

This error may have been caused by:

- An invalid Home interface name defined in the deployment descriptor.
- The Home interface not included in the ejb-jar file.
- Class path not specified for a class referenced by the Home interface.

Rectify as necessary, and then re-execute deployment.

---

### [CMP2.x-0002] Bean class %s1 not found.

#### Variable Information

%s1 = EJB application

#### Explanation

The Enterprise Bean class is not found.

## System Action

ClassNotFoundException occurred, which stops deployment.

## User Action

This error may have been caused by:

- An invalid Home interface name defined in the deployment descriptor.
- The Home interface not included in the ejb-jar file.
- Class path is not specified for a class referenced by the Home interface.

Rectify as necessary, and then re-execute deployment.

---

## [CMP2.x-0003] Wrong arity.

### Explanation

EJB QL analysis has failed.

### System Action

Execute either of the following processings:

- Stop the startup processing for IJServer if this message is output during startup processing for IJServer.
- Abort activation if this message is output during activation using the J2EE HotDeploy function. Change the deployment module to "deactivated" status.

### User Action

Check that the EJB QL query has been described correctly. For details on the EJB QL usage, refer to the EJB2.0 specifications.

Possible causes are shown below.

- There was an error in the left or right part of the specified comparison operator (<, >, =, <=, >=, <>).
- There was an error in the left or right part of the specified arithmetic operator (+, -, \*, /).
- There was an error in the specified CONCAT function.
- There was an error in the specified FROM clause.
- There was an error in the specified MEMBER expression.

---

## [CMP2.x-0004] Wrong expression type.

### Explanation

EJB QL analysis has failed.

### System Action

Stops activating the IJServer.

### User Action

Check that the EJB QL query has been described correctly. For details on the EJB QL usage, refer to the EJB2.0 specifications.

Correct the EJB QL query and redeploy the EJB application.

---

## [CMP2.x-0005] The finder query SELECT clause must have a return type matching the Local or Remote interface of the EJB for which it is defined.

### Explanation

The type of the return value of the finder method, in which the SELECT clause is defined, does not match a local or remote interface.

## System Action

Execute either of the following processings:

- Stop the startup processing for IJServer if this message is output during startup processing for IJServer.
- Abort activation if this message is output during activation using the J2EE HotDeploy function. Change the deployment module to "deactivated" status.

## User Action

This error may have been caused by:

- Invalid finder method definition.
- Incorrect EJB QL query definition.
- The abstraction schema name is not defined in EJB QL.

Rectify as necessary, redeploy the EJB application.

---

## [CMP2.x-0006] Query returning local ejbs must have local interface defined.

### Explanation

When the query result type (result-type-mapping) is Local, the EJB application must have the Local interface.

### System Action

Execute either of the following processings:

- Stop the startup processing for IJServer if this message is output during startup processing for IJServer.
- Abort activation if this message is output during activation using the J2EE HotDeploy function. Change the deployment module to "deactivated" status.
- Throws *EJBException*.

### User Action

This error may have been caused by:

- Invalid result type (result-type-mapping) specified in the deployment descriptor.
- The Local interface is defined in the EJB application.

Rectify as necessary, and then redeploy the EJB application.

---

## [CMP2.x-0007] Query returning remote ejbs must have remote interface defined.

### Explanation

When the query result type (result-type-mapping) is Local, the EJB application must have the Local interface.

### System Action

Execute either of the following processings:

- Stop the startup processing for IJServer if this message is output during startup processing for IJServer.
- Abort activation if this message is output during activation using the J2EE HotDeploy function. Change the deployment module to "deactivated" status.
- Throws *EJBException*.

### User Action

This error may have been caused by:

- Invalid result type (result-type-mapping) specified in the deployment descriptor.
- The Remote interface is defined in the EJB application.

Rectify as necessary, and then re-deploy the EJB application.

---

### **[CMP2.x-0008] Wrong expression type.**

#### **Explanation**

EJB QL analysis has failed.

#### **System Action**

Execute either of the following processings:

- Stop the startup processing for IJServer if this message is output during startup processing for IJServer.
- Abort activation if this message is output during activation using the J2EE HotDeploy function. Change the deployment module to "deactivated" status.

#### **User Action**

Check that the EJB QL query has been described correctly. For details on the EJB QL usage, refer to the EJB2.0 specifications.

Possible causes are shown below.

- There was an error in the left or right part of the specified logical operator (AND,OR).
- There was an error in the specified LIKE expression.
- There was an error in the specified LOCATE function.
- There was an error in the specified SUBSTRING function.
- There was an error in the specified CONCAT function.

---

### **[CMP2.x-0009] Wrong parity.**

#### **Explanation**

EJB QL analysis has failed.

#### **System Action**

Execute either of the following processings:

- Stop the startup processing for IJServer if this message is output during startup processing for IJServer.
- Abort activation if this message is output during activation using the J2EE HotDeploy function. Change the deployment module to "deactivated" status.

#### **User Action**

Check that the EJB QL query has been described correctly. For details on the EJB QL usage, refer to the EJB2.0 specifications.

Possible causes are shown below.

- There was an error in the specified NOT.
- There was an error in the specified monadic operator (+,-).

---

### **[CMP2.x-0010] Wrong expression type.**

#### **Explanation**

EJB QL analysis has failed.

#### **System Action**

Execute either of the following processings:

- Stop the startup processing for IJServer if this message is output during startup processing for IJServer.
- Abort activation if this message is output during activation using the J2EE HotDeploy function. Change the deployment module to "deactivated" status.

## User Action

Check that the EJB QL query has been described correctly. For details on the EJB QL usage, refer to the EJB2.0 specifications.

Possible causes are shown below.

- There was an error in the specified NOT.
- There was an error in the specified monadic operator (+,-).

---

## **[CMP2.x-0011] The finder query SELECT clause must have a return type matching the Local or Remote interface of the ejb for which it is defined.**

### Explanation

An invalid abstraction schema name is specified or a return type that matches the Local or Remote interface of the EJB application (for which the finder method is defined) must be specified for the SELECT clause of the query.

### System Action

Execute either of the following processings:

- Stop the startup processing for IJServer if this message is output during startup processing for IJServer.
- Abort activation if this message is output during activation using the J2EE HotDeploy function. Change the deployment module to "deactivated" status.

### User Action

Ensure that the abstraction schema name is correct and the interface (Remote or Home) of the EJB application for which the finder method is defined, is specified for the SELECT clause of query.

Rectify as necessary, and then re-execute deployment.

---

## **[CMP2.x-0012] The SELECT clause has a return type that does not match the return type of the select query for which it is defined.**

### Explanation

The type returned from EJB QL query, in which the SELECT clause is defined, does not match the type of the return value of the query method.

### System Action

Execute either of the following processings:

- Stop the startup processing for IJServer if this message is output during startup processing for IJServer.
- Abort activation if this message is output during activation using the J2EE HotDeploy function. Change the deployment module to "deactivated" status.

### User Action

This error may have been caused by:

- incorrect EJB QL definition.
- Incorrect return value of the select method.
- incorrect return value of the finder method.
- return value of the finder method is java.util.Enumeration. Bear in mind that CMP2.0 can be used only for java.util.Collection.

Rectify as necessary,

---

## **[CMP2.x-0013] Can't find CMP field: %s1**

### Variable Information

%s1 = CMP Field name

## Explanation

The CMP field associated with the abstract method is not found.

## System Action

Execute either of the following processings:

- Stop the startup processing for IJServer if this message is output during startup processing for IJServer.
- Abort activation if this message is output during activation using the J2EE HotDeploy function. Change the deployment module to "deactivated" status.

## User Action

Define the CMP field associated with the abstract method defined in the Enterprise Bean class on the Deployment descriptor.

Rectify as necessary, and then re-execute deployment.

---

## [CMP2.x-0014] Missing local and remote interface for %s1

### Variable Information

%s1 = EJB application name

## Explanation

The finder method is not found in the Home and LocalHome interfaces.

## System Action

Execute either of the following processings:

- Stop the startup processing for IJServer if this message is output during startup processing for IJServer.
- Abort activation if this message is output during activation using the J2EE HotDeploy function. Change the deployment module to "deactivated" status.

## User Action

Define the finder method in the Home and LocalHome interfaces.

If the changed, then re-execute deployment.

---

## [CMP2.x-0015] %s1 does not have a parameter corresponding to input parameter ?%s2

### Variable Information

%1 = Query method name

%2 = Parameter number

## Explanation

There are no parameters for the numbers corresponding to the parameters (?1, ?2, ?3, ---) specified in EJB QL query.

## System Action

Execute either of the following processings:

- Stop the startup processing for IJServer if this message is output during startup processing for IJServer.
- Abort activation if this message is output during activation using the J2EE HotDeploy function. Change the deployment module to "deactivated" status.

## User Action

This error may have been caused by:

- invalid EJB QL parameter specified.
- Insufficient parameters for the query method.

Rectify as necessary, and then re-execute deployment.

---

**[CMP2.x-0016] Identification variable %s1 cannot have the same name as an ejb name or abstract schema name.**

**Variable Information**

%1 = Identifier

**Explanation**

The identifier must not be the same as the EJB application name or abstract schema name.

**System Action**

Execute either of the following processings:

- Stop the startup processing for IJServer if this message is output during startup processing for IJServer.
- Abort activation if this message is output during activation using the J2EE HotDeploy function. Change the deployment module to "deactivated" status.

**User Action**

If the specified identifier is the same as the EJB application name or abstract schema name, change the identifier.

If the changed, then re-execute deployment.

---

**[CMP2.x-0017] Illegal use of navigation operator %s1**

**Variable Information**

%1: The navigation operator is not used correctly

**Explanation**

The specified navigation operator (.) is incorrect.

**System Action**

Execute either of the following processings:

- Stop the startup processing for IJServer if this message is output during startup processing for IJServer.
- Abort activation if this message is output during activation using the J2EE HotDeploy function. Change the deployment module to "deactivated" status.

**User Action**

Check that the EJB QL query has been described correctly. For details on the EJB QL usage, refer to the EJB2.0 specifications.

Correct the EJB QL and re-deploy the EJB application.

---

**[CMP2.x-0018] The collection designated in an IS EMPTY expression must not appear in the FROM clause %s1**

**Variable Information**

%1: Wrong expression

**Explanation**

The collection specified in the EMPTY expression of the WHERE clause cannot be specified in the FROM clause.

**System Action**

Execute either of the following processings:

- Stop the startup processing for IJServer if this message is output during startup processing for IJServer.

- Abort activation if this message is output during activation using the J2EE HotDeploy function. Change the deployment module to "deactivated" status.

#### User Action

Check that the EJB QL query has been described correctly. For details on the EJB QL usage, refer to the EJB2.0 specifications.

---

### [CMP2.x-0019] Invalid type for expression %s1

#### Variable Information

%1: Wrong expression

#### Explanation

An invalid type is specified in the EJB QL operator.

#### System Action

Execute either of the following processings:

- Stop the startup processing for IJServer if this message is output during startup processing for IJServer.
- Abort activation if this message is output during activation using the J2EE HotDeploy function. Change the deployment module to "deactivated" status.

#### User Action

Check that the EJB QL query has been described correctly. For details on the EJB QL usage, refer to the EJB2.0 specifications.

---

### [CMP2.x-0020] Invalid or missing FROM clause.

#### Explanation

There was an error in the specified FROM clause.

#### System Action

Execute either of the following processings:

- Stop the startup processing for IJServer if this message is output during startup processing for IJServer.
- Abort activation if this message is output during activation using the J2EE HotDeploy function. Change the deployment module to "deactivated" status.

#### User Action

Check that the EJB QL query has been described correctly. For details on the EJB QL usage, refer to the EJB2.0 specifications.

Correct the EJB QL query and redeploy the EJB application.

---

### [CMP2.x-0021] EJB QL query must start with a SELECT clause.

#### Explanation

EJB QL must begin with the SELECT clause.

#### System Action

Execute either of the following processings:

- Stop the startup processing for IJServer if this message is output during startup processing for IJServer.
- Abort activation if this message is output during activation using the J2EE HotDeploy function. Change the deployment module to "deactivated" status.

#### User Action

Check that the EJB QL query has been described correctly. For details on the EJB QL usage, refer to the EJB2.0 specifications.

Correct the EJB QL query and redeploy the EJB application.

---

**[CMP2.x-0023] Cannot add roles when the descriptor is not part of a bundle.****Explanation**

If the descriptor is not a part of a bundle, a role cannot be added (Internal error)

**System Action**

Execute either of the following processings:

- Stop the startup processing for IJServer if this message is output during startup processing for IJServer.
- Abort activation if this message is output during activation using the J2EE HotDeploy function. Change the deployment module to "deactivated" status.

**User Action**

Write down the message information, use the *iscollectinfo* command to collect the diagnostic information, and then contact a Fujitsu systems engineer.

---

**[CMP2.x-0024] Cannot set type on an entity bean.****Explanation**

Any type cannot be specified on Entity Bean (Internal error)

**System Action**

Execute either of the following processings:

- Stop the startup processing for IJServer if this message is output during startup processing for IJServer.
- Abort activation if this message is output during activation using the J2EE HotDeploy function. Change the deployment module to "deactivated" status.

**User Action**

Write down the message information, use the *iscollectinfo* command to collect the diagnostic information, and then contact a Fujitsu systems engineer.

---

**[CMP2.x-0025] This application has no beans of name %s1****Variable Information**

%s1 = EJB application name

**Explanation**

The EJB application name is not found (Internal error)

**System Action**

Execute either of the following processings:

- Stop the startup processing for IJServer if this message is output during startup processing for IJServer.
- Abort activation if this message is output during activation using the J2EE HotDeploy function. Change the deployment module to "deactivated" status.

**User Action**

Write down the message information, use the *iscollectinfo* command to collect the diagnostic information, and then contact a Fujitsu systems engineer.

---

**[CMP2.x-0026] Unknown ContainerTransaction type: %s1****Variable Information**

%s1 = Transaction attribute

## Explanation

An invalid transaction attribute has been specified.

## System Action

Execute either of the following processings:

- Stop the startup processing for IJServer if this message is output during startup processing for IJServer.
- Abort activation if this message is output during activation using the J2EE HotDeploy function. Change the deployment module to "deactivated" status.

## User Action

Some value other than one listed below has been specified for the transaction attribute. Provide the correct transaction attribute.

If the attribute changed, restart IJServer.

Mandatory

Required

Supports

RequiresNew

NotSupported

Never

If the status of the module is "deactivated", in the Interstage Management Console, click [Module] > [Status]. Select the deployment module in the [Status] window, and then click the Reactivate button to activate the deployment module.

---

## [CMP2.x-0027] Referencing error: this bundle has no bean of name: %s1

### Variable Information

%s1 = Enterprise Bean name

## Explanation

The EJB application is not found (Internal error)

## System Action

Execute either of the following processings:

- Stop the startup processing for IJServer if this message is output during startup processing for IJServer.
- Abort activation if this message is output during activation using the J2EE HotDeploy function. Change the deployment module to "deactivated" status.

## User Action

Write down the message information, use the *iscollectinfo* command to collect the diagnostic information, and then contact a Fujitsu systems engineer.

---

## [CMP2.x-0028] Error loading the ejb class %s1 in getField on EjbDescriptor %s2

### Variable Information

%s1 = Enterprise Bean class

%s2 = Detailed message

## Explanation

An error occurred when the Enterprise Bean class was being loaded.

## System Action

Execute either of the following processings:

- Stop the startup processing for IJServer if this message is output during startup processing for IJServer.
- Abort activation if this message is output during activation using the J2EE HotDeploy function. Change the deployment module to "deactivated" status.

#### User Action

This error may have been caused by:

- Enterprise Bean class does not exist in the disposed ejb-jar file.
- The class passing is not set to the class referred to by the Enterprise Bean class.

Rectify as necessary, and then restart the IJServer.

If the status of the module is "deactivated", in the Interstage Management Console, click [Module] > [Status]. Select the deployment module in the [Status] window, and then click the Reactivate button to activate the deployment module.

---

### [CMP2.x-0029] Error loading class %s1

#### Variable Information

%s1 = Class name

#### Explanation

An error occurred when the class was being loaded.

#### System Action

Execute either of the following processings:

- Stop the startup processing for IJServer if this message is output during startup processing for IJServer.
- Abort activation if this message is output during activation using the J2EE HotDeploy function. Change the deployment module to "deactivated" status.

#### User Action

This error may have been caused by:

- Enterprise Bean class does not exist in the disposed ejb-jar file.
- The class passing is not set to the class referred to by the Enterprise Bean class.

Rectify as necessary, and then restart the IJServer.

If the status of the module is "deactivated", in the Interstage Management Console, click [Module] > [Status]. Select the deployment module in the [Status] window, and then click the Reactivate button to activate the deployment module.

---

### [CMP2.x-0030] Entity beans can only have Container transaction type. The type was being set to %s1

#### Variable Information

%s1 = Transaction type

#### Explanation

A value other than Container is specified for the Transaction management type of Entity Bean.

#### System Action

Execute either of the following processings:

- Stop the startup processing for IJServer if this message is output during startup processing for IJServer.
- Abort activation if this message is output during activation using the J2EE HotDeploy function. Change the deployment module to "deactivated" status.

## User Action

Specify the Container for the management type of the deployment descriptor then redeploy the EJB application.

---

### [CMP2.x-0031] %s1 is not a legal value for entity reentrancy.

#### Variable Information

%s1 = EJB application name

#### Explanation

An invalid value is specified in reentrancy of the EJB application.

#### System Action

Execute either of the following processings:

- Stop the startup processing for IJServer if this message is output during startup processing for IJServer.
- Abort activation if this message is output during activation using the J2EE HotDeploy function. Change the deployment module to "deactivated" status.

## User Action

Specify a valid value in re-entrancy. Then re-deploy the EJB application.

---

### [CMP2.x-0032] %s1 is not an allowed persistence type.

#### Variable Information

%s1 = Persistence type

#### Explanation

An invalid value is specified in persistence type.

#### System Action

Execute either of the following processings:

- Stop the startup processing for IJServer if this message is output during startup processing for IJServer.
- Abort activation if this message is output during activation using the J2EE HotDeploy function. Change the deployment module to "deactivated" status.

## User Action

Only Container (CMP) and Bean (BMP) can be specified for the Persistence type of the deployment descriptor. Correct the deployment descriptor, and then re-deploy the EJB application.

---

### [CMP2.x-0033] %s1 not found in %s2

#### Variable Information

%s1 = Method object ID

%s2 = EjbDescriptor Method object ID

#### Explanation

The method is not found in the EJB application.

#### System Action

Execute either of the following processings:

- Stop the startup processing for IJServer if this message is output during startup processing for IJServer.
- Abort activation if this message is output during activation using the J2EE HotDeploy function. Change the deployment module to "deactivated" status.

## User Action

Write down the message information, use the *iscollectinfo* command to collect the diagnostic information, and then contact a Fujitsu systems engineer.

---

## [CMP2.x-0034] Error building allSqlStatementedMethods %s1

### Variable Information

%s1 = Internal message

### Explanation

An error occurred during configuration of allSqlStatementdMethods.

### System Action

Execute either of the following processings:

- Stop the startup processing for IJServer if this message is output during startup processing for IJServer.
- Abort activation if this message is output during activation using the J2EE HotDeploy function. Change the deployment module to "deactivated" status.

## User Action

Write down the message information, use the *iscollectinfo* command to collect the diagnostic information, and then contact a Fujitsu systems engineer.

---

## [CMP2.x-0035] Field name %s1 exceeds the maximum length (%s2) allowed.1

### Variable Information

%s1 = Field name

%s2 = Maximum number of characters

### Explanation

The specified column name or the default column name that was created when the column name was not specified has exceeded the maximum length allowed for the DBMS identifier.

### System Action

Execute either of the following processings:

- Stop the startup processing for IJServer if this message is output during startup processing for IJServer.
- Abort activation if this message is output during activation using the J2EE HotDeploy function. Change the deployment module to "deactivated" status.

## User Action

Specify a correct column name using the Interstage Management Console and then restart IJServer.

If the status of the module is "deactivated", in the Interstage Management Console, click [Module] > [Status]. Select the deployment module in the [Status] window, and then click the Reactivate button to activate the deployment module.

---

## [CMP2.x-0036] EJB in runtime info not known: %s1

### Variable Information

%s1 = Enterprise Bean name

### Explanation

There was an error in the Runtime file of the J2EE common directory.

## System Action

Execute either of the following processings:

- Stop the startup processing for IJServer if this message is output during startup processing for IJServer.
- Abort activation if this message is output during activation using the J2EE HotDeploy function. Change the deployment module to "deactivated" status.

## User Action

Undeploy the EJB application and re-execute the deployment.

If this trouble occurs frequently, use the `iscollectinfo` command to collect investigation information. Send the error information to a Systems Engineer.

---

### [CMP2.x-0037] Join object in runtime info not known: %s1

#### Variable Information

%s1 = Join Object name

#### Explanation

There was an error in the Runtime file of the J2EE common directory.

## System Action

Execute either of the following processings:

- Stop the startup processing for IJServer if this message is output during startup processing for IJServer.
- Abort activation if this message is output during activation using the J2EE HotDeploy function. Change the deployment module to "deactivated" status.

## User Action

Undeploy the EJB application and re-execute the deployment.

If this problem occurs frequently, use the `iscollectinfo` command to collect investigation information. Send the error information to a Systems Engineer.

---

### [CMP2.x-0038] CMP20Info for EJB not found: %s1

#### Variable Information

%s1 = EJB application name

#### Explanation

CMP20Info is not found in the EJB application (Internal error)

## System Action

Execute either of the following processings:

- Stop the startup processing for IJServer if this message is output during startup processing for IJServer.
- Abort activation if this message is output during activation using the J2EE HotDeploy function. Change the deployment module to "deactivated" status.

## User Action

Use the `iscollectinfo` command to collect the diagnostic information, and then contact a Fujitsu systems engineer.

---

### [CMP2.x-0039] DataSource for %s1 is not specified.

#### Variable Information

%s1 = EJB application name

## Explanation

A data source name is not specified.

## System Action

Execute either of the following processings:

- Stop the startup processing for IJServer if this message is output during startup processing for IJServer.
- Abort activation if this message is output during activation using the J2EE HotDeploy function. Change the deployment module to "deactivated" status.

## User Action

Specify a data source name with the Interstage, then restart the IJServer.

If the status of the module is "deactivated", in the Interstage Management Console, click [Module] > [Status]. Select the deployment module in the [Status] window, and then click the Reactivate button to activate the deployment module.

---

## **[CMP2.x-0040] Invalid XML : Bean %s1 does not define a local home or home interface.**

## Variable Information

%s1 = EJB application name

## Explanation

The LocalHome or Home interface is not defined in the deployment descriptor.

## System Action

Execute either of the following processings:

- Stop the startup processing for IJServer if this message is output during startup processing for IJServer.
- Abort activation if this message is output during activation using the J2EE HotDeploy function. Change the deployment module to "deactivated" status.

## User Action

Define the LocalHome or Home interface in the deployment descriptor, and then re-deploy the EJB application.

---

## **[CMP2.x-0041] ERROR: Cascade-delete can only be specified if the other role has a multiplicity of ONE.**

## Explanation

Cascade-delete can be specified only if the multiplicity of another role is ONE.

## System Action

Execute either of the following processings:

- Stop the startup processing for IJServer if this message is output during startup processing for IJServer.
- Abort activation if this message is output during activation using the J2EE HotDeploy function. Change the deployment module to "deactivated" status.

## User Action

Correct the deployment descriptor, and then re-deploy the EJB application.

---

## **[CMP2.x-0042] All CMP20 beans in the group must have the same datasource.**

## Explanation

For all CMP2.0 of ejb-jar EJB applications in the same IJServer, use the same data source.

## System Action

Execute either of the following processings:

- Stop the startup processing for IJServer if this message is output during startup processing for IJServer.
- Abort activation if this message is output during activation using the J2EE HotDeploy function. Change the deployment module to "deactivated" status.

#### User Action

Change the data source, and then restart the IJServer.

If the status of the module is "deactivated", in the Interstage Management Console, click [Module] > [Status]. Select the deployment module in the [Status] window, and then click the Reactivate button to activate the deployment module.

---

### [CMP2.x-0043] ERROR! This is wrapper implementation for CMP 2.x

#### Explanation

This is a wrapper for CMP 2.x.

#### System Action

Execute either of the following processings:

- Stop the startup processing for IJServer if this message is output during startup processing for IJServer.
- Abort activation if this message is output during activation using the J2EE HotDeploy function. Change the deployment module to "deactivated" status.

#### User Action

Use the *iscollectinfo* command to collect the diagnostic information, and then contact a Fujitsu systems engineer.

---

### [CMP2.x-0044] ERROR! This is wrapper implementation for CMP 2.x

#### Explanation

This is wrapper implementation for CMP 2.x. (Internal error)

#### System Action

Execute either of the following processings:

- Stop the startup processing for IJServer if this message is output during startup processing for IJServer.
- Abort activation if this message is output during activation using the J2EE HotDeploy function. Change the deployment module to "deactivated" status.

#### User Action

Use the *iscollectinfo* command to collect the diagnostic information, and then contact a Fujitsu systems engineer.

---

### [CMP2.x-0045] Bad primitive class.

#### Explanation

An invalid primitive class is specified (Internal error)

#### System Action

Execute either of the following processings:

- Stop the startup processing for IJServer if this message is output during startup processing for IJServer.
- Abort activation if this message is output during activation using the J2EE HotDeploy function. Change the deployment module to "deactivated" status.

#### User Action

Use the *iscollectinfo* command to collect the diagnostic information, and then contact a Fujitsu systems engineer.

---

### [CMP2.x-0046] Can't find cmr field: %s1

## Variable Information

%s1 = CMR field name

## Explanation

The CMR field is not found.

## System Action

Execute either of the following processings:

- Stop the startup processing for IJServer if this message is output during startup processing for IJServer.
- Abort activation if this message is output during activation using the J2EE HotDeploy function. Change the deployment module to "deactivated" status.

## User Action

Define the CMR field, and then re-deploy the EJB application.

---

## [CMP2.x-0047] EJB QL query not initialized.

### Explanation

EJB-QL is not initialized or, SELECT clause is null (Internal error)

### System Action

Execute either of the following processings:

- Stop the startup processing for IJServer if this message is output during startup processing for IJServer.
- Abort activation if this message is output during activation using the J2EE HotDeploy function. Change the deployment module to "deactivated" status.

### User Action

Use the *iscollectinfo* command to collect the check information, and then contact a Fujitsu systems engineer.

---

## [CMP2.x-0048] getLiteral not applicable.

### Explanation

getLiteral cannot be executed (Internal error)

### System Action

Execute either of the following processings:

- Stop the startup processing for IJServer if this message is output during startup processing for IJServer.
- Abort activation if this message is output during activation using the J2EE HotDeploy function. Change the deployment module to "deactivated" status.

### User Action

Use the *iscollectinfo* command to collect the diagnostic information, and then contact a Fujitsu systems engineer.

---

## [CMP2.x-0049] Abstract schema not defined for nav. exprs ending in cmp field.

### Explanation

No abstract schema name is defined in a navigator that ends with the CMP field of EJB QL.

### System Action

Execute either of the following processings:

- Stop the startup processing for IJServer if this message is output during startup processing for IJServer.

- Abort activation if this message is output during activation using the J2EE HotDeploy function. Change the deployment module to "deactivated" status.

#### User Action

Correct the expression of the navigation in a navigator that ends with the CMP field of EJB QL, and then re-deploy the EJB application.

---

### [CMP2.x-0050] Invalid join table field = %s1 : %s2

#### Variable Information

%s1 = Table name

%s2 = Column name

#### Explanation

An invalid Join table field is specified (Internal error)

#### System Action

Execute either of the following processings:

- Stop the startup processing for IJServer if this message is output during startup processing for IJServer.
- Abort activation if this message is output during activation using the J2EE HotDeploy function. Change the deployment module to "deactivated" status.

#### User Action

Use the *iscollectinfo* command to collect the diagnostic information, and then contact a Fujitsu systems engineer.

---

### [CMP2.x-0051] No join table for %s1

#### Variable Information

%s1 = CMR Field name

#### Explanation

The Join table associated with CMR is not found (Internal error)

#### System Action

Execute either of the following processings:

- Stop the startup processing for IJServer if this message is output during startup processing for IJServer.
- Abort activation if this message is output during activation using the J2EE HotDeploy function. Change the deployment module to "deactivated" status.

#### User Action

Use the *iscollectinfo* command to collect the diagnostic information, and then contact a Fujitsu systems engineer.

---

### [CMP2.x-0052] Only applicable for select queries returning ejbs.

#### Explanation

Only select method can return the Local interface.

#### System Action

Execute either of the following processings:

- Stop the startup processing for IJServer if this message is output during startup processing for IJServer.
- Abort activation if this message is output during activation using the J2EE HotDeploy function. Change the deployment module to "deactivated" status.

## User Action

Either change the return value of the finder method to the Remote interface, or change the method to the select method. Or use the *iscollectinfo* command to collect the diagnostic information, and then contact a Fujitsu systems engineer.

---

### [CMP2.x-0053] Warning -- pkey class pkey fields not available for %s1

#### Variable Information

%s1 = EJB application name

#### Explanation

The primary key class is not defined in the deployment descriptor.

#### System Action

Continues processing.

#### User Action

No action necessary.

---

### [CMP2.x-0054] CMP 2.x Entity EJB %s1 has an empty abstract schema name.

#### Variable Information

%s1 = EJB application name

#### Explanation

The abstract schema name of COMP2.x Entity Bean is not specified.

#### System Action

Execute either of the following processings:

- Stop the startup processing for IJServer if this message is output during startup processing for IJServer.
- Abort activation if this message is output during activation using the J2EE HotDeploy function. Change the deployment module to "deactivated" status.

#### User Action

Define the abstract schema name, and then re-deploy the EJB application.

---

### [CMP2.x-0055] Invalid escape character at line %s1, column %s2.

#### Variable Information

%s1 = Internal information

%s2 = Internal information

#### Explanation

An invalid escape character is specified in the EJB QL query.

#### System Action

Execute either of the following processings:

- Stop the startup processing for IJServer if this message is output during startup processing for IJServer.
- Abort activation if this message is output during activation using the J2EE HotDeploy function. Change the deployment module to "deactivated" status.

#### User Action

Correct the escape character, and then redeploy the EJB application.

---

**[CMP2.x-0056] Illegal cmr field = %s1****Variable Information**

%s1 = CMR Field name

**Explanation**

An invalid CMR field is specified in Enterprise Bean other than CMP2.x.

**System Action**

Execute either of the following processings:

- Stop the startup processing for IJServer if this message is output during startup processing for IJServer.
- Abort activation if this message is output during activation using the J2EE HotDeploy function. Change the deployment module to "deactivated" status.

**User Action**

Ensure the version of Enterprise Bean (for which the CMR field is specified) is CMP2.x.

---

**[CMP2.x-0057] Missing return statement in function.****Variable Information**

%s1 = CMR Field name

**Explanation**

There is no return statement (Internal error)

**System Action**

Execute either of the following processings:

- Stop the startup processing for IJServer if this message is output during startup processing for IJServer.
- Abort activation if this message is output during activation using the J2EE HotDeploy function. Change the deployment module to "deactivated" status.

**User Action**

Use the *iscollectinfo* command to collect the diagnostic information, and then contact a Fujitsu systems engineer.

---

**[CMP2.x-0058] cmr-field-type is %s1, must be java.util.Collection or java.util.Set****Variable Information**

%s1 = CMR Field name

**Explanation**

The type of the CMR field must be java.util.Collection or java.util.Set.

**System Action**

Execute either of the following processings:

- Stop the startup processing for IJServer if this message is output during startup processing for IJServer.
- Abort activation if this message is output during activation using the J2EE HotDeploy function. Change the deployment module to "deactivated" status.

**User Action**

Correct the CLR field, and then re-deploy the EJB application.

---

**[CMP2.x-0059] Illegal ejb version: %s1**

## Variable Information

%s1 = EJB Version

## Explanation

An illegal EJB version is specified.

## System Action

Execute either of the following processings:

- Stop the startup processing for IJServer if this message is output during startup processing for IJServer.
- Abort activation if this message is output during activation using the J2EE HotDeploy function. Change the deployment module to "deactivated" status.

## User Action

Ensure that the supported version is correct.

---

## **[CMP2.x-0060] ejb-jar doesn't have a finder table base name.**

## Variable Information

%s1 = EJB Version

## Explanation

The table name is not found.

## System Action

Execute either of the following processings:

- Stop the startup processing for IJServer if this message is output during startup processing for IJServer.
- Abort activation if this message is output during activation using the J2EE HotDeploy function. Change the deployment module to "deactivated" status.

## User Action

Define the table name, and then restart the IJServer.

---

## **[CMP2.x-0061] Invalid CMP version: %s1**

## Variable Information

%s1 = CMP Version

## Explanation

An invalid CMP version is defined in the deployment descriptor.

## System Action

Execute either of the following processings:

- Stop the startup processing for IJServer if this message is output during startup processing for IJServer.
- Abort activation if this message is output during activation using the J2EE HotDeploy function. Change the deployment module to "deactivated" status.

## User Action

Only 2.x and 1.x are available in the CMP version. Ensure that the deployment descriptor and EJB application are defined appropriately.

---

## **[CMP2.x-0062] Cannot set use-caller-identity for Message Driven beans.**

## Explanation

Use-caller-identify cannot be specified in a Message-driven Bean.

## System Action

Execute either of the following processings:

- Stop the startup processing for IJServer if this message is output during startup processing for IJServer.
- Abort activation if this message is output during activation using the J2EE HotDeploy function. Change the deployment module to "deactivated" status.

## User Action

Use the *iscollectinfo* command to collect the diagnostic information, and then contact a Fujitsu systems engineer.

---

## **[CMP2.x-0063] Cannot add roles when the bundle does not have them.**

## Explanation

A role not defined in the method permission has been specified.

## System Action

Execute either of the following processings:

- Stop the startup processing for IJServer if this message is output during startup processing for IJServer.
- Abort activation if this message is output during activation using the J2EE HotDeploy function. Change the deployment module to "deactivated" status.

## User Action

Correct the role in the deployment descriptor, and then restart the IJServer.

---

## **[CMP2.x-0064] Cannot add roles when the descriptor is not part of a bundle.**

## Explanation

No role can be added for an undefined EJC application.

## System Action

Execute either of the following processings:

- Stop the startup processing for IJServer if this message is output during startup processing for IJServer.
- Abort activation if this message is output during activation using the J2EE HotDeploy function. Change the deployment module to "deactivated" status.

## User Action

Use the *iscollectinfo* command to collect the diagnostic information, and then contact a Fujitsu systems engineer.

---

## **[CMP2.x-0066] cmp-field or cmr-field name cannot be empty strings.**

## Explanation

An empty String value cannot be specified in the CMF or CMR field.

## System Action

Execute either of the following processings:

- Stop the startup processing for IJServer if this message is output during startup processing for IJServer.

Abort activation if this message is output during activation using the J2EE HotDeploy function. Change the deployment module to "deactivated" status.

User Action

Ensure that the CMF or CMR field is specified correctly for the deployment descriptor.

Correct deployment descriptor and then re-deploy.

---

**[CMP2.x-0067] cmp-field or cmr-field %s1 must begin with a letter.**

**Variable Information**

%s1 = CMF or CMR field name

**Explanation**

The CMF or CMR field must begin with a character.

**System Action**

Execute either of the following processings:

- Stop the startup processing for IJServer if this message is output during startup processing for IJServer.
- Abort activation if this message is output during activation using the J2EE HotDeploy function. Change the deployment module to "deactivated" status.

**User Action**

Ensure that the CMF or CMR field begins with a character for the deployment descriptor.

Correct the deployment descriptor and then re-deploy.

---

**[CMP2.x-0068] cmp-field or cmr-field %s1 must begin with a lowercase letter.**

**Variable Information**

%s1 = CMF or CMR field name

**Explanation**

The CMF or CMR field must begin with a lowercase character.

**System Action**

Execute either of the following processings:

- Stop the startup processing for IJServer if this message is output during startup processing for IJServer.
- Abort activation if this message is output during activation using the J2EE HotDeploy function. Change the deployment module to "deactivated" status.

**User Action**

Ensure that the CMF or CMR field begins with a lowercase character for the deployment descriptor.

Correct the deployment descriptor and then re-deploy.

---

**[CMP2.x-0069] Method %s1 is not on any EJB interface.**

**Variable Information**

%s1 = Method name

**Explanation**

The specified method is found in an interface of the EJB application.

**System Action**

Execute either of the following processings:

- Stop the startup processing for IJServer if this message is output during startup processing for IJServer.
- Abort activation if this message is output during activation using the J2EE HotDeploy function. Change the deployment module to "deactivated" status.

## User Action

This error may have been caused by:

- The method does not exist in the EJB application class.
- An invalid interface is registered in the method.

Establish the cause described above and re-execute the deployment.

---

## [CMP2.x-0070] CMRFieldInfo not found for field %s1

### Variable Information

%s1 = Field name

### Explanation

Information on the CMR field is not found.

### System Action

Execute either of the following processings:

- Stop the startup processing for IJServer if this message is output during startup processing for IJServer.
- Abort activation if this message is output during activation using the J2EE HotDeploy function. Change the deployment module to "deactivated" status.

## User Action

Ensure that the CMR field is specified.

Establish the cause described above and re-execute the deployment.

---

## [CMP2.x-0071] No local interface for target bean of CMR field.

### Explanation

The Local interface is not found in the EJB application defined as the CMR field.

### System Action

Execute either of the following processings:

- Stop the startup processing for IJServer if this message is output during startup processing for IJServer.
- Abort activation if this message is output during activation using the J2EE HotDeploy function. Change the deployment module to "deactivated" status.

## User Action

Ensure that the EJB application defined a correct CMF in EJB QL

Establish the cause described above and re-execute the deployment.

---

## [CMP2.x-0072] PersistentFieldInfo not found for field %s1

### Variable Information

%s1 = CMF name

### Explanation

Information on the CMF definition for CMF is not found.

### System Action

Execute either of the following processings:

- Stop the startup processing for IJServer if this message is output during startup processing for IJServer.

- Abort activation if this message is output during activation using the J2EE HotDeploy function. Change the deployment module to "deactivated" status.

#### User Action

Ensure that CMF is defined.

Establish the cause described above and re-execute the deployment.

---

### [CMP2.x-0073] PersistentFieldInfo not found for pkey field %s1

#### Variable Information

%s1 = Primary key Field name

#### Explanation

Information on the CMF definition for a primary key class field is not found (Internal error)

#### System Action

Execute either of the following processings:

- Stop the startup processing for IJServer if this message is output during startup processing for IJServer.

Abort activation if this message is output during activation using the J2EE HotDeploy function. Change the deployment module to "deactivated" status. User Action

Use the *iscollectinfo* command to collect the diagnostic information, and then contact a Fujitsu systems engineer.

---

### [CMP2.x-0074] Primary Key field name %s1 is not a known cmp-field.

#### Variable Information

%s1 = Primary key Field name

#### Explanation

CMF is not specified for the primary key class field name.

#### System Action

Execute either of the following processings:

- Stop the startup processing for IJServer if this message is output during startup processing for IJServer.
- Abort activation if this message is output during activation using the J2EE HotDeploy function. Change the deployment module to "deactivated" status.

#### User Action

This error may have been caused by:

- CMF not specified for the primary key.
- CMF not having the same name as the primary key class field specified in the CMF definition.

Rectify as necessary.

- CMF not having the private field in the CMF definition.

Establish the cause described above and re-execute the deployment.

---

### [CMP2.x-0075] Cannot find accessor %s1 for CMP field %s2

#### Variable Information

%s1 = Abstract accessor method name

%s2 = CMF

## Explanation

The abstract accessor method for CMF is not found.

## System Action

Execute either of the following processings:

- Stop the startup processing for IJServer if this message is output during startup processing for IJServer.
- Abort activation if this message is output during activation using the J2EE HotDeploy function. Change the deployment module to "deactivated" status.

Ensure that the abstract accessor method for CMF is defined in the Enterprise Bean class.

If changed, re-deploy.

---

## [CMP2.x-0076] Can't find CMP field %s1 in class %s2

### Variable Information

%s1 = Class name

%s2 = CMF

## Explanation

Class on the CMF is not found

## System Action

Execute either of the following processings:

- Stop the startup processing for IJServer if this message is output during startup processing for IJServer.
- Abort activation if this message is output during activation using the J2EE HotDeploy function. Change the deployment module to "deactivated" status.

## User Action

Ensure that the CMF is defined in the specified class and re-deploy the EJB application. If this error persists.

---

## [CMP2.x-0077] Can't find CMP field %s1 in class %s2

### Explanation

A system error has occurred.

## System Action

Execute either of the following processings:

- Stop the startup processing for IJServer if this message is output during startup processing for IJServer.

Abort activation if this message is output during activation using the J2EE HotDeploy function. Change the deployment module to "deactivated" status.

Use the *iscollectinfo* command to collect the diagnostic information, and then contact a Fujitsu systems engineer.

---

## [CMP2.x-0078] Can't find CMP field %s1 in class %s2

### Variable Information

%s1 = State

## Explanation

A system error has occurred.

## System Action

Stops activating the IIServer.

## User Action

Use the *iscollectinfo* command to collect the diagnostic information, and then contact a Fujitsu systems engineer.

---

## **[CMP2.x-0079] Unable to serialize container-managed field. Exception: %s1**

### Variable Information

%s1 = JDBC driver's detailed message

### Explanation

The system failed to serialize CMF.

### System Action

Throws *RemoteException* or *EJBException*.

### User Action

Ensure that a serialization disabled data type is specified for CMF.

---

## **[CMP2.x-0080] Unsupported JDBC type: %s1**

### Variable Information

%s1 = Type of unsupported JDBC.

### Explanation

The type of JDBC is not supported.

### System Action

Throws *RemoteException* or *EJBException*.

### User Action

Provide the correct JDBC driver, as indicated by the detail message.

---

## **[CMP2.x-0081] Field not accessible. Exception: %s1**

### Variable Information

%s1 = Detailed message

### Explanation

Cannot access CMF.

### System Action

Throws *RemoteException* or *EJBException*.

### User Action

This error may have been caused by an incorrect CMF definition and accessor method from a detailed message. Rectify as necessary.

---

## **[CMP2.x-0082] Unable to deserialize field. Exception: %s1**

### Variable Information

%s1 = Exception

### Explanation

Deserializing field is not correctly associated with CMF.

## System Action

Throws *RemoteException* or *EJBException*.

## User Action

Byte data of the column may not correspond with the CMF type about to be loaded in the database. Ensure that a deserialization disabled data type is specified in CMF.

---

### [CMP2.x-0083] Unable to deserialize object. Exception: %s1

#### Variable Information

%s1 = Exception

#### Explanation

Deserializing object is not correctly associated with CMF.

#### System Action

Throws *RemoteException* or *EJBException*.

#### User Action

Byte data of the column may not correspond with the object about to be loaded in the database. Ensure that a deserialization disabled data type is specified in CMF.

---

### [CMP2.x-0084] Object has been deleted.

#### Explanation

The object has been deleted.

#### System Action

Throws *RemoteException* or *EJBException*.

#### User Action

Ensure that the object that has already been deleted or the object that does not exist is specified.

---

### [CMP2.x-0085] Primary key field must not be set after `ejbCreate`.

#### Explanation

A primary key cannot be set after `ejbCreate`.

#### System Action

Throws *RemoteException* or *EJBException*.

#### User Action

Ensure that a deserialization disabled data type is specified in CMF.

---

### [CMP2.x-0086] Entity object is already removed.

#### Explanation

The EJB object has already been deleted in the same transaction.

#### System Action

Throws *NoSuchObjectException* or *EJBException*.

#### User Action

Ensure that an EJB object is used that `EJBHome.remove` or `EJBObject.remove` is executed.

---

**[CMP2.x-0087] Primary key fields of bean not initialized.****Explanation**

Primary key is not specified in the *ejbCreate* method that is invoked.

**System Action**

Throws *RemoteException* or *EJBException*.

**User Action**

Ensure that the primary key is correctly specified in the *ejbCreate* method.

---

**[CMP2.x-0088] Duplicate primary key.****Explanation**

A uniqueness restriction error occurred.

**System Action**

Throws *Javax.ejb.DuplicateKeyException*.

**User Action**

A record having the same primary key already exists. Ensure that the primary key is correctly specified.

---

**[CMP2.x-0089] No database row for primary key.****Explanation**

The record of the specified primary key does not exist.

**System Action**

*Javax.ejb.ObjectNotFoundException* was generated.

**User Action**

Investigate whether an undefined record is searched or invalid primary key is specified. Rectify as necessary.

---

**[CMP2.x-0090] ERROR initializing EJB field %s1****Explanation**

An error occurred during initialization of CMF

**System Action**

Execute either of the following processings:

- Stop the startup processing for *IJServer* if this message is output during startup processing for *IJServer*.
- Abort activation if this message is output during activation using the *J2EE HotDeploy* function. Change the deployment module to "deactivated" status.

**User Action**

Ensure that the CMF definition is correct. If this error persists, use the *iscollectinfo* command to collect the diagnostic information, and then contact a Fujitsu systems engineer.

---

**[CMP2.x-0091] ERROR in SQL SELECT: No database row for EJB.****Explanation**

The record of the correspondence does not exist in the database.

**System Action**

Throws *NoSuchEntityException* or *NoSuchObjectLocalException*.

#### User Action

Investigate whether an undefined record is searched. Rectify as necessary.

---

#### **[CMP2.x-0092] ERROR in removeRow!! resultCount = %s1**

##### Variable Information

%s1 = resultCount

##### Explanation

An error occurred at removal of a line (Internal error)

##### System Action

Throws *RemoteException*.

##### User Action

The error occurred while deleting a line of the database. Contact the development engineer of the associated EJB Bean application.

---

#### **[CMP2.x-0093] Internal Error:.ejbStore called for deleted bean.**

##### Explanation

An internal error. `ejbStore` has been called for a deleted EJB application.

##### System Action

Throws *RemoteException* or *EJBException*.

##### User Action

Ensure that the EJB application described in the `ejbStore` method has already been deleted, or use the `iscollectinfo` command to collect the diagnostic information, and then contact a Fujitsu systems engineer.

---

#### **[CMP2.x-0094] ERROR in storeRow!! resultCount = %s1**

##### Variable Information

%s1 = Internal information

##### Explanation

An error occurred during update of a line.

##### System Action

Throws *RemoteException* or *EJBException*.

##### User Action

The error occurred in updating a line of the database. The deletion and updating processes may occur at the same time.

---

#### **[CMP2.x-0095] Unable to get JDBC DataSource for CMP EntityBean state.**

##### Explanation

The data source cannot be acquired.

##### System Action

Throws *RemoteException* or *EJBException*.

##### User Action

This error may have been caused by:

- An invalid or incorrectly expressed data source name in the CMF definition.

- Incorrect data source usage. Ensure that the specified data source is correct from the subsequent message output. Define a correct data source name with the Interstage, then restart the IJServer.

---

**[CMP2.x-0096] ERROR in createRow!! resultCount = %s1****Variable Information**

%s1 = Internal information

**Explanation**

An error occurred while creating a database row.

**System Action**

Throws *RemoteException* or *EJBException*.

**User Action**

The error occurred in creating a line of the database. Contact the development engineer of the associated EJB Bean application.

---

**[CMP2.x-0097] Unable to get JDBC DataSource for CMP EntityBean state.****Explanation**

The specified data source cannot be acquired.

**System Action**

Throws *RemoteException* or *EJBException*.

**User Action**

This error may have been caused by:

- An invalid or incorrectly expressed data source name in the CMF definition.
- Incorrect data source use. Ensure that the specified data source is correct from the subsequent message output. Define a correct data source name with the Interstage, then restart the IJServer.
- If the module is de-activated, click [Module] > [Status] in the Interstage Management Console. In the Status window, select the deployment module, and then click the Remote button to activate the deployment module.

If the status of the module is "deactivated", in the Interstage Management Console, click [Module] > [Status]. Select the deployment module in the [Status] window, and then click the Reactivate button to activate the deployment module.

---

**[CMP2.x-0098] Error creating table. Table may already exist. SQL: %s1****Variable Information**

%s1 = SQL Sentence

**Explanation**

The system failed to create a table. The table may already exist.

**System Action**

Execute either of the following processings:

- Stop the startup processing for IJServer if this message is output during startup processing for IJServer.
- Abort activation if this message is output during activation using the J2EE HotDeploy function. Change the deployment module to "deactivated" status.

User Action  
Use an already created table to restart the IJServer.

---

**[CMP2.x-0099] Error dropping table. Table may not exist. SQL: %s1**

## Variable Information

%s1 = SQL Sentence

## Explanation

An error occurred during deletion of a table. A table already exists.

## System Action

Continues processing because the table has already been deleted.

## User Action

No action necessary.

---

## [CMP2.x-0100] Internal Error: Instance is null.

## Explanation

An internal error. The instance is null.

## System Action

Throws *EJBException*

## User Action

Use the *iscollectinfo* command to collect the diagnostic information, and then contact a Fujitsu systems engineer.

---

## [CMP2.x-0101] ReplaceObject: Not implemented!

## Explanation

A system error has occurred.

## System Action

Throws *EJBException*

## User Action

Use the *iscollectinfo* command to collect the diagnostic information, and then contact a Fujitsu systems engineer.

---

## [CMP2.x-0102] No database specified for CMP EntityBeans' persistent state.

## Explanation

The database is not specified for CMF (Internal error)

## System Action

Execute either of the following processings:

- Stop the startup processing for IJServer if this message is output during startup processing for IJServer.
- Abort activation if this message is output during activation using the J2EE HotDeploy function. Change the deployment module to "deactivated" status.

## User Action

Use the *iscollectinfo* command to collect the diagnostic information, and then contact a Fujitsu systems engineer.

---

## [CMP2.x-0103] No SQL type found for Class %s1

## Variable Information

%s1 = Class name

## Explanation

SQL type to the class is not found (Internal error)

## System Action

Execute either of the following processings:

- Stop the startup processing for IJServer if this message is output during startup processing for IJServer.
- Abort activation if this message is output during activation using the J2EE HotDeploy function. Change the deployment module to "deactivated" status.

## User Action

Write the message information and use the *iscollectinfo* command to collect the diagnostic information, and then contact a Fujitsu systems engineer.

---

## [CMP2.x-0104] Generating SQL for database: %s1

### Variable Information

%s1 = SQL

### Explanation

SQL of the database is generated.

### System Action

Generates an SQL statement fitting to a database.

### User Action

No action necessary.

---

## [CMP2.x-0105] Error connecting to database. Exception: %s1

### Variable Information

%s1 = Message

### Explanation

A database connectivity error occurred.

### System Action

Start processing is discontinued.

### User Action

This error may have been caused by:

- The specified data source has not been defined.
- The data source definition is incorrect.
- JDBC driver not correctly installed.
- Incorrect JDBC driver environment setup.
- DBMS not started.
- Exceeding the maximum number of connections available for the JDBC driver.
- Invalid user ID or password specified in the getConnection argument.
- A network error occurred.
- Incorrect DBMS operating environment.

- The distributed transactions feature was used (it cannot be used in CMP2.0).

Rectify as necessary, then re-execute.

---

### [CMP2.x-0106] No SQL statement for method %s1

#### Variable Information

%s1 = Finder method name or select method name

#### Explanation

There is no SQL sentence of the method.

#### System Action

Throws *RemoteException* or *EJBException*.

#### User Action

Undeploy the EJB application and re-execute the deployment.

Or write the message information and use the *iscollectinfo* command to collect the diagnostic information, and then contact a Fujitsu systems engineer.

---

### [CMP2.x-0107] Bad SQL query for method %s1

#### Variable Information

%s1 = Method name

#### Explanation

SQL query to the method is wrong.

#### System Action

Throws *RemoteException*.

#### User Action

Or write the message information and use the *iscollectinfo* command to collect the diagnostic information, and then contact a Fujitsu systems engineer.

---

### [CMP2.x-0108] Bad parameter number %s1 in SQL query for method %s2

#### Variable Information

%s1 = Argument number

%s2 = Method name

#### Explanation

An invalid argument is specified in the SQL query of the method.

#### System Action

Throws *RemoteException*.

#### User Action

Or write the message information and use the *iscollectinfo* command to collect the diagnostic information, and then contact a Fujitsu systems engineer.

---

### [CMP2.x-0109] No database row found for finder %s1

#### Variable Information

%s1 = Finder method name

### Explanation

A database row was not found for the finder method.

### System Action

Throws `ObjectNotFoundException` `NotFoundException`.

### User Action

Ensure there is a row in the database corresponding to the finder method

---

## [CMP2.x-0110] More than one row returned by SQL query for single-object finder %s1

### Variable Information

%s1 = Finder method name

### Explanation

More than one result was returned using the finder method for a single SQL search.

### System Action

Throws `FinderException`.

### User Action

Ensure that more than one result is not returned using the finder method for a single SQL search.

---

## [CMP2.x-0111] Invalid return type for finder %s1

### Variable Information

%s1 = Finder method name

### Explanation

The type of the return value of the finder method is invalid.

### System Action

Throws `FinderException`.

### User Action

Ensure that the type of the return value of the finder method is either the `Remove` interface type or `java.util.Collection` interface of Enterprise Bean.

---

## [CMP2.x-0112] No EJB QL defined for %s1

### Variable Information

%s1 = EJB application name

### Explanation

EJB QL is not defined in the EJB application.

### System Action

Throws `RemoteException` or `EJBException`.

### User Action

Ensure that EJB QL is correctly defined in the query definition.

---

## [CMP2.x-0113] java.util.Set is not an allowed return type for finder

## Variable Information

%s1 = finder Method name

## Explanation

java.util.Set cannot be returned as a return value of the finder method.

## System Action

ThrowsEJBException.

## User Action

Ensure that java.util.Set is defined in the type of the return value of the finder method.

---

## [CMP2.x-0114] More than one row returned by EJB-QL query for single-object finder %s1

## Variable Information

%s1 = finder Method name

## Explanation

More than one result was returned using the finder method for a single EJB QL.

## System Action

Throws FinderException.

## User Action

Ensure that more than one result is not returned using the finder method for a single EJB QL

---

## [CMP2.x-0115] %s1 has a single-valued return type but results of query contained %s2

## Variable Information

%s1 = Method name

%s2 = Retrieval result rows

## Explanation

More than one or zero result was returned using the finder method for a single search result.

## System Action

Throws ObjectNotFound or FinderException Exception.

## User Action

Ensure that more than one or zero result was not returned using the finder method for a single search result.

---

## [CMP2.x-0116] Could not get primary key for input parameter %s1 : %s2

## Variable Information

%s1 = Value of input argument

%s2 = Class of argument

## Explanation

A primary key to the input argument was not able to be acquired.

## System Action

Execute either of the following processings:

- Stop the startup processing for IJServer if this message is output during startup processing for IJServer.

- Abort activation if this message is output during activation using the J2EE HotDeploy function. Change the deployment module to "deactivated" status. User Action

This error may have been caused by:

- Incorrect input argument return type, which should be EJBObject or EJBLocalObject.
- Undefined Primary Key or CMF.
- CMF with the same name as the Primary Key class field not specified in the CMF definitions.

Rectify as necessary.

If changed, re-deploy.

---

### **[CMP2.x-0117] Unknown param type = %s1**

#### Variable Information

%s1 = Type of input argument

#### Explanation

Unknown argument type.

#### System Action

Throws *EJBException*.

#### User Action

Ensure that EJB QL is correctly defined in the query definition.

---

### **[CMP2.x-0118] Argument must be a local object type.**

#### Explanation

The argument should be a local object type.

#### System Action

Throws *IllegalArgumentException*.

#### User Action

Check that the local object type has been set in the corresponding search method argument.

---

### **[CMP2.x-0119] Object has been deleted.**

#### Explanation

The object has been deleted.

#### System Action

Throws *EJBException* or *IllegalArgumentException*, *RemoteException*.

#### User Action

Ensure a deleted object is specified.

---

### **[CMP2.x-0120] Argument to Collection-valued set must not be null.**

#### Explanation

Null is passed to the CMR set method indicating the Bean with the Many relationship.

#### System Action

Throws *EJBException* or *IllegalArgumentException*, *RemoteException*.

#### User Action

Correct so that null cannot be passed to the CMR set method. To delete the relation, pass empty java.util.Collection implementation classes.

---

### [CMP2.x-0121] Argument to Collection-valued set must be a java.util.Collection type.

#### Explanation

The argument of the Collection value must be set java.util.Collection, or the class that inherits java.util.Collection.

#### System Action

Throws *RemoteException* or *EJBException*.

#### User Action

Ensure that the only value set for a Collection value argument is of the class type that does not inherit java.util.Collection.

---

### [CMP2.x-0122] Bad argument type for collection add.

#### Explanation

An invalid argument type was specified for an added Collection.

The type of an unjustified argument was specified for the addition of Collection.

#### System Action

Throws *RemoteException* or *EJBException*.

#### User Action

When adding the relation to the set method, check that the class used to inherit the EJBLocal object that has been specified in the argument type is correct.

---

### [CMP2.x-0123] Error: Join Table has more than 1 row for many-1 relationship.

#### Explanation

The Join Table has more than one row for a many-to-one relationship.

#### System Action

Throws *RemoteException* or *EJBException*.

#### User Action

A Join table is specified that does not correspond with the relation definition. Reevaluate the table configuration, and then re-execute the command. If this error persists, use the *iscollectinfo* command to collect the diagnostic information, and then contact a Fujitsu systems engineer.

---

### [CMP2.x-0124] Collection may have been accessed after transaction completion.

#### Explanation

Collection cannot be accessed after the transaction is completed.

#### System Action

Throws *IllegalStateException*.

#### User Action

Correct the application and make it access Collection in the transaction.

---

### [CMP2.x-0125] Cannot add null to a relationship.

## Explanation

Null cannot be added to the relationship.

## System Action

Throws *EJBException* or *IllegalArgumentException*, *RemoteException*.

## User Action

Null cannot be passed to the Collection add method.

---

## [CMP2.x-0126] Collection modified or transaction completed.

## Explanation

The Iterator method cannot be called after Collection has been changed, or after the transaction is completed.

## System Action

Throws *IllegalStateException*.

## User Action

Correct the application and re-deploy.

---

## [CMP2.x-0128] Illegal null argument to ObjectInputStreamWithLoader.

## Explanation

A system error has occurred.

## System Action

Throws *Exception*.

## User Action

Write the message information and use the *iscollectinfo* command to collect the diagnostic information, and then contact a Fujitsu systems engineer.

---

## [CMP2.x-0129] Encountered "%s1" at line %s2, column %s3.Was expecting:%s4

## Variable Information

%s1 = Invalid character string

%s2 = Internal information

%s3 = Internal information

%s4 = Correct mark

## Explanation

Stops activating the IJServer.

## System Action

Execute either of the following processings:

- Stop the startup processing for IJServer if this message is output during startup processing for IJServer.
- Abort activation if this message is output during activation using the J2EE HotDeploy function. Change the deployment module to "deactivated" status.

## User Action

Check that the EJB QL query has been described correctly. For details on the EJB QL usage, refer to the EJB2.0 specifications.

---

## [CMP2.x-0130] Encountered "%s1" at line %s2, column %s3.Was expecting one of:%s4

## Variable Information

- %s1 = Invalid character string
- %s2 = Internal information
- %s3 = Internal information
- %s4 = List of correct mark

## Explanation

The EJB QL definition is incorrect.

## System Action

Execute either of the following processings:

- Stop the startup processing for IJServer if this message is output during startup processing for IJServer.
- Abort activation if this message is output during activation using the J2EE HotDeploy function. Change the deployment module to "deactivated" status.

## User Action

If the status of the module is "deactivated", in the Interstage Management Console, click [Module] > [Status]. Select the deployment module in the [Status] window, and then click the Reactivatebutton to activate the deployment module.

---

## [CMP2.x-0131] Lexical error at line %s1, column %s2. Encountered %s3 after %s4

## Variable Information

- %s1 = Invalid character string
- %s2 = Internal information
- %s3 = Internal information
- %s4 = After character strings

## Explanation

The EJB QL definition is incorrect.

## System Action

Execute either of the following processings:

- Stop the startup processing for IJServer if this message is output during startup processing for IJServer.
- Abort activation if this message is output during activation using the J2EE HotDeploy function. Change the deployment module to "deactivated" status.

## User Action

This error may have been caused by:

- single quotation marks double quotation marks
- The sign which cannot be specified besides the character string literal is specified.
- The em-size character is specified besides the character string literal.

---

## [CMP2.x-0132] Unknown class: %s1

## Variable Information

- %s1 = Class name

## Explanation

The class is not found.

## System Action

Stops the deployment process.

## User Action

Write the message information and use the *iscollectinfo* command to collect the diagnostic information, and then contact a Fujitsu systems engineer.

---

### [CMP2.x-0133] Table name %s1 exceeds the maximum length (%s2) allowed.

## Variable Information

%s1 = Table name

%s2 = Maximum length

## Explanation

The specified table name or the default table name that was created (when the table name was not specified) has exceeded the maximum length allowed for the DBMS identifier.

## System Action

Execute either of the following processings:

- Stop the startup processing for IJServer if this message is output during startup processing for IJServer.
- Abort activation if this message is output during activation using the J2EE HotDeploy function. Change the deployment module to "deactivated" status.

## User Action

Specify a correct table name using the Interstage Management Console and restart IJServer.

If the status of the module is "deactivated", in the Interstage Management Console, click [Module] > [Status]. Select the deployment module in the [Status] window, and then click the Reactivate button to activate the deployment module.

---

### [CMP2.x-0134] The parameter class %s1 listed for the ejb selector or ejb finder method %s2 could not be found.

## Variable Information

%s1 = Class name

%s2 = Fine Method name

## Explanation

The class of the parameter of the select method or the finder method is not found.

## System Action

Execute either of the following processings:

- Stop the startup processing for IJServer if this message is output during startup processing for IJServer.
- Abort activation if this message is output during activation using the J2EE HotDeploy function. Change the deployment module to "deactivated" status.

## User Action

The following can be considered as possible causes.

- There was an error in the parameter class name defined in deployment descriptor.
- The parameter class was not included in the ejb-jar file.
- The parameter class was not set in the class path.

Establish the cause of the failure and re-deploy.

---

**[CMP2.x-0135] The ejb selector method %s1 was not found in the bean class %s2.**

%s1 = EJBSelect Method

%s2 = Enterprise Bean Class name

**Explanation**

The EJB selector method was not found in the EJB application class.

**System Action**

Stops the startup processing.

**User Action**

Check that the ejbSelect method has been defined in the Enterprise Bean class. Additionally, check whether the ejbSelect method parameter defined in the Enterprise Bean class is different to the ejbSelect method parameter defined in deployment descriptor. Correct and re-deploy the EJB application.

---

**[CMP2.x-0136] The ejb finder method %s1 was not found in the home interface class(es) for this ejb.****Variable Information**

%s1 = Finder Method

%s2 = Home interface for EJB application

**Explanation**

The finder method is not found in the Home interface or LocalHome interface for EJB application.

**System Action**

Execute either of the following processings:

- Stop the startup processing for IJServer if this message is output during startup processing for IJServer.
  - Abort activation if this message is output during activation using the J2EE HotDeploy function. Change the deployment module to "deactivated" status.
- User Action

Define the finder method in the Home interface or LocalHome interface.

Additionally, check whether the finder method parameter defined in the interface is different to the finder method parameter defined in deployment descriptor.

---

**[CMP2.x-0137] Unknown def type.****Explanation**

The definition type is not found.

**System Action**

Execute either of the following processings:

- Stop the startup processing for IJServer if this message is output during startup processing for IJServer.

Abort activation if this message is output during activation using the J2EE HotDeploy function. Change the deployment module to "deactivated" status.

User Action

Write the message information and use the *iscollectinfo* command to collect the diagnostic information, and then contact a Fujitsu systems engineer.

---

**[CMP2.x-0138] No information is available for bean deployed under the name %s1.****Variable Information**

%s1 = EJB application name

## Explanation

Internal error.

## System Action

Throw does Exception with the Interstage.

## User Action

Record relevant message details, use the *iscollectinfo* command to collect the diagnostic information, and then contact a Fujitsu systems engineer.

---

## [CMP2.x-0139] Invalid deployment descriptor detected for %s1. %s2.

### Variable Information

%s1 = EJB application name

%s2 = Unjustified tag in deployment descriptor

## Explanation

Exception occurred while analyzing selected deployment descriptor.

## System Action

Throw does Exception with the Interstage.

## User Action

Correct deployment descriptor according to the error message.

---

## [CMP2.x-0140] Schema name %s1 exceeds the maximum length (%s2) allowed..

### Variable Information

%s1 = Schema name

%s2 = Maximum length of schema name supported with DBMS

## Explanation

The schema name exceeded the maximum length allowed by the data source.

## System Action

Execute either of the following processings:

- Stop the startup processing for IJServer if this message is output during startup processing for IJServer.
- Abort activation if this message is output during activation using the J2EE HotDeploy function. Change the deployment module to "deactivated" status.

## User Action

Correct the schema name to not exceed the maximum length.

If the module is deactivated, click [Module] > [Status] in the Interstage Management Console. In the Status window, select the deployment module, and then click the Reactivate button to activate the deployment module.

---

## [CMP2.x-0141] Invalid deployment descriptors detected for the following related beans:%s1.

### Variable Information

%s1 = List of EJB applications that have an invalid definition among the related EJB application

## Explanation

Some of the listed beans have deployment descriptors that are invalid.

## System Action

Interstage Exception.

## User Action

Correct the deployment descriptors for the listed beans and re-activate the Interstage.

---

### [CMP2.x-0142] %s1 is not a CMP2.X bean.

## Variable Information

%s1 = EJB application name

## Explanation

Internal error.

## System Action

Interstage Exception.

## User Action

Record the relevant message details, use the *iscollectinfo* command to collect the diagnostic information, and then contact a Fujitsu systems engineer.

---

### [CMP2.x-0143] SQL database exception encountered: %s1.

## Variable Information

%s1 = Detailed message of SQLException

## Explanation

An SQL exception occurred while accessing the underlying datasource

## System Action

Execute either of the following processings:

- Stop the startup processing for IJServer if this message is output during startup processing for IJServer.
- Abort activation if this message is output during activation using the J2EE HotDeploy function. Change the deployment module to "deactivated" status.

## User Action

When the DISTINCT clause is used in an EJB QL query, the FOR UPDATE clause cannot be used. Define a query that does not use the CMP2.0 simultaneous update data integrity guarantee function or change the application so that the DISTINCT clause is not used.

Refer to java.sql.SQLException and take necessary action.

If the status of the module is "deactivated", in the Interstage Management Console, click [Module] > [Status]. Select the deployment module in the [Status] window, and then click the Reactivate button to activate the deployment module.

---

### [CMP2.x-0144] EJBException caused by: %s1.

## Variable Information

%s1 = Detailed message of exception

## Explanation

An exception occurred (internal error)

## System Action

Throws a *RemoteException* or *EJBException* during application runtime

## User Action

Rectify as necessary, according to the detailed exception message. If the exception appears to have been caused by an internal error, use the *iscollectinfo* command to collect the diagnostic information, and then contact a Fujitsu systems engineer.

---

### [CMP2.x-0145] Unable to get database connection. Exception = %s1.

#### Variable Information

%s1 = Detailed message of SQLException

#### Explanation

An SQLException occurred while attempting to connect to the database

#### System Action

Execute either of the following processings:

- Stop the startup processing for IJServer if this message is output during startup processing for IJServer.
- Abort activation if this message is output during activation using the J2EE HotDeploy function. Change the deployment module to "deactivated" status.

## User Action

Rectify as necessary, according to "java.sql.SQLException".

If the status of the module is "deactivated", in the Interstage Management Console, click [Module] > [Status]. Select the deployment module in the [Status] window, and then click the Reactivate button to activate the deployment module.

---

### [CMP2.x-0146] Unable to load database row for entity. Exception = %s1.

#### Variable Information

%s1 = Detailed message of exception

#### Explanation

An exception occurred while attempting to load a row from the database

#### System Action

Throws a RemoteException or an EJBException.

## User Action

If 'java.lang.ClassCastException' is output in the message details, verify that the CMF class specified in the primkey-field tag in the deployment descriptor file is the same as the class specified in the prim-key-class tag.

If it is different, take the following action based on the application configuration:

- If the Primary Key class is used, delete the primkey-field tag and specify the name of the Primary Key class in the prim-key-class tag.
- If the Primary Key class is not used, in the prim-key-class tag, specify the CMF class name that is specified in the primkey-field tag.

In other cases, refer to 'java.sql.SQLException' and take the appropriate action.

If the problem cannot be resolved, use the *iscollectinfo* command to collect data for investigation and then contact a Fujitsu service engineer.

---

### [CMP2.x-0147] Unable to check primary key for entity. Exception = %s1.

#### Variable Information

%s1 = Detailed message of exception

## Explanation

An exception occurred while attempting to check the database for the existence of the primary key.

## System Action

Throws a *RemoteException* or *EJBException*.

## User Action

Rectify as necessary, according to the detailed exception message

---

## [CMP2.x-0148] Unable to load database relationship data for entity. Exception = %s1.

### Variable Information

%s1 = Detailed message of exception

## Explanation

An exception occurred while attempting to update join table data (for 1:N or N:N relationships)

## System Action

Throws an *EJBException*.

## User Action

Rectify as necessary, according to the detailed exception message.

---

## [CMP2.x-0149] Unable to load database relationship data for entity. Exception = %s1.

### Variable Information

%s1 = Detailed message of exception

## Explanation

An exception occurred while attempting to INSERT a row into the database.

## System Action

Throws a *RemoteException* or *EJBException*.

## User Action

Rectify as necessary, according to the detailed exception message.

---

## [CMP2.x-0150] Unable to remove database row for entity. Exception = %s1.

### Variable Information

%s1 = Detailed message of exception

## Explanation

An exception occurred while attempting to DELETE a row from the database.

## System Action

Throws a *RemoteException* or *EJBException*.

## User Action

Rectify as necessary, according to the detailed exception message.

---

## [CMP2.x-0151] Unable to update database row for entity. Exception = %s1.

### Variable Information

%s1 = Detailed message of exception

## Explanation

An exception occurred while attempting to UPDATE a row in the database.

## System Action

Throws a *RemoteException* or *EJBException*.

## User Action

Rectify as necessary, according to the detailed exception message.

---

## **[CMP2.x-0152] ERROR: The ORDER BY item %s1 is not a valid orderable type.**

### Variable Information

%s1 = Value expression in the ORDER BY clause

## Explanation

An unsortable type is specified in the ORDER BY clausevalue expression.

## System Action

Execute either of the following processings:

- Stop the startup processing for IJServer if this message is output during startup processing for IJServer.
- Abort activation if this message is output during activation using the J2EE HotDeploy function. Change the deployment module to "deactivated" status.

## User Action

The relevant section is "Entity Bean Executable Environment" - "EJB QL". Correct the ORDER BY clause specified in the EJB QL query and re-execute the EJB application. For details on the EJB QL usage, refer to the EJB2.0 specifications.

---

## **[CMP2.x-0153] ERROR: The same ORDER BY item %s1 appears multiple times.**

### Variable Information

%s1 = Variable in the ORDER BY clause

## Explanation

The same argument cannot be specified more than once in the ORDER BY clause.

## System Action

Execute either of the following processings:

- Stop the startup processing for IJServer if this message is output during startup processing for IJServer.
- Abort activation if this message is output during activation using the J2EE HotDeploy function. Change the deployment module to "deactivated" status.

## User Action

Correct the ORDER BY clause of the EJB QL query and redeploy the EJB application.

---

## **[CMP2.x-0154] ERROR: The ORDER BY item %s1 does not have the same abstract schema as the SELECT clause.**

### Variable Information

%s1 = Value expression in the ORDER BY clause

## Explanation

The ORDER BY clause variable differs from the abstract schema type to be returned by the SELECT clause.

## System Action

Execute either of the following processings:

- Stop the startup processing for IJServer if this message is output during startup processing for IJServer.
- Abort activation if this message is output during activation using the J2EE HotDeploy function. Change the deployment module to "deactivated" status.

## User Action

The ORDER BY clause variable must be the same type as the abstract schema to be returned by the SELECT clause. Correct the ORDER BY clause of the EJB QL query and redeploy the EJB application.

---

**[CMP2.x-0155] ERROR: The ORDER BY item %s1 must be the same cmp-field as specified in the SELECT clause.**

## Variable Information

%s1 = Value expression in the ORDER BY clause.

## Explanation

CMF specified by the ORDER BY clause variable differs in abstract schema type from the one to be returned by the SELECT clause.

## System Action

Execute either of the following processings:

- Stop the startup processing for IJServer if this message is output during startup processing for IJServer.
- Abort activation if this message is output during activation using the J2EE HotDeploy function. Change the deployment module to "deactivated" status.

## User Action

The ORDER BY clause variable must specify the same CMF as that of the abstract schema type to be returned by the SELECT clause. Correct the ORDER BY clause of the EJB QL query and redeploy the EJB application.

---

**[CMP2.x-0156] ERROR: EJB QL containing aggregate functions cannot be specified for a finder method.**

## Explanation

An aggregation function cannot be used in the finder method EJB QL query.

## System Action

Execute either of the following processings:

- Stop the startup processing for IJServer if this message is output during startup processing for IJServer.
- Abort activation if this message is output during activation using the J2EE HotDeploy function. Change the deployment module to "deactivated" status.

## User Action

Move the finder method EJB QL query to the select method and redeploy the EJB application.

If the status of the module is "deactivated", in the Interstage Management Console, click [Module] > [Status]. Select the deployment module in the [Status] window, and then click the Reactivatebutton to activate the deployment module.

---

**[CMP2.x-0157] EJB QL query clauses are not in correct order. Usage: select\_clause from\_clause [where\_clause] [orderby\_clause]**

## Explanation

The order of clauses specified in the EJB QL is incorrect.

## System Action

Execute either of the following processings:

- Stop the startup processing for IJServer if this message is output during startup processing for IJServer.
- Abort activation if this message is output during activation using the J2EE HotDeploy function. Change the deployment module to "deactivated" status.

## User Action

Place the ORDER BY clause after the FROM and WHERE clauses in the query. If the order of these clauses is incorrect, the following errors occur when the EJB application is started.

- Correct the order of EJBQL query clauses and redeploy the EJB application.
- Correct order: select\_clause from\_clause [where\_clause] [orderby\_clause]

---

### [CMP2.x-0158] NULL result from method: %s1

#### Variable Information

%s1 = SELECT method name

#### Explanation

A Java primitive type is set as the select method return value type, but the retrieval result was a NULL value.

#### System Action

Throws ObjectNotFoundException.

#### User Action

Change the select method return value to a type where the database NULL value is allowed.

---

### [CMP2.x-0159] Cannot assign NULL to primitive cmp-field %s1

#### Variable Information

%s1 = CMP field name

#### Explanation

The NULL value of the database cannot be set to CMF of the Java primitive type.

#### System Action

Throws a RemoteException or EJBException.

#### User Action

Refer to "Correspondence between the Java data type defined with CMP and the SQL data type of DBMS" in J2EE User's Guide to change the data type of CMF to one to which the NULL value of the database can be set.

---

### [CMP2.x-0160] ERROR: Invalid use of DISTINCT.

#### Explanation

The usage of the DISTINCT specification contains an error.

#### System Action

Execute either of the following processings:

- Stop the startup processing for IJServer if this message is output during startup processing for IJServer.
- Abort activation if this message is output during activation using the J2EE HotDeploy function. Change the deployment module to "deactivated" status.

## User Action

Correct the DISTINCT specification of the EJB QL query, and re-deploy the EJB application.

---

**[CMP2.x-0161] The function to prevent data inconsistencies caused by simultaneous updates is not supported for this database. Database: %s1**

## Variable Information

%s1 = Database name

## Explanation

The Guarantee consistency when data is updated simultaneously function is not compatible with this database.

## System Action

Executes either of the following processes:

- Stops the IJServer startup process if this message is output during startup.
- Stops the activation process and deactivates the relevant deployment module if this message is output during activation with the J2EE HotDeploy function.

## User Action

Do not use the Guarantee consistency when data is updated simultaneously function if this database is to be used.

---

**[CMP2.x-0162] The simultaneous updates cannot be used with Bean which has Relationships, in this database. Database: %s1**

## Variable Information

%s1 = Database name

## Explanation

This database does not support use of the Guarantee consistency when data is updated simultaneously function with the CMP2.0 relation function.

## System Action

Executes either of the following processes:

- Stops the IJServer startup process if this message is output during startup.
- Stops the activation process and deactivates the relevant deployment module if this message is output during activation with the J2EE HotDeploy function.

## User Action

When using this database, do not use the Guarantee consistency when data is updated simultaneously function and the CMP2.0 relation function together.

## 9.4.36 IJServer21240

---

**IJServer: ERROR: IJServer21240: Error in remove method: NAME=%s1**

## Variable Information

%s1 = EJB application name

## Explanation

An error has occurred in the *EJBHome.remove* method.

## System Action

Throws Exception.

#### User Action

Check if an error has occurred in the `ejbFindByPrimaryKey` method invoked from the `EJBHome.remove` method.

Refer to any messages output before or after the error, and remove the cause of the error.

If necessary, contact the EJB application Bean developer.

### 9.4.37 IJServer21241

---

**IJServer: WARNING: IJServer21241: EJB object was not found: NAME=%s1**

#### Variable Information

%s1 = EJB application name

#### Explanation

The EJB object that corresponds to the Primary Key specified in the `EJBHome.remove` method argument was not found.

#### System Action

Returns `RemoveException`.

#### User Action

Determine whether the Primary Key value in the `EJBHome.remove` method argument is correct.

If necessary, contact the EJB application Bean developer.

### 9.4.38 IJServer21242

---

**IJServer: ERROR: IJServer21242: Unable to execute method in specified instance managed mode : NAME=%s1 METHOD=%s2**

#### Variable Information

%s1 = EJB application name

%s2 = Method name

#### Explanation

A method that cannot be used in the specified instance management mode has been executed.

#### System Action

Stops execution of the method named in the error message.

#### User Action

Check for the following probable causes:

- One of the following methods is invoked with `ReadOnly` specified in the instance management mode.
  - `EJBHome.create`
  - `EJBHome.remove`
  - `EJBObject.remove`
- The following method is invoked with `NoCache` specified in the instance management mode.
  - A finder method that returns `java.util.Collection` as a return value.

### 9.4.39 IJServer21243

---

---

**IJServer: WARNING: IJServer21243: Registration of Datasource failed: DATASOURCE=%s1 REASON=%s2****Variable Information**

%s1 = Unusable Datasource name

%s2 = Detailed message

**Explanation**

The Datasource specified in the Interstage Management Console cannot be used.

**System Action**

Continues processing.

**User Action**

Remove the cause of the error in accordance with the detailed messages. The probable causes are:

- The JDBC driver has not been properly installed.
- The JDBC driver class path is not set (for details on the environment setting where JDBC is used, refer to "Environment setting where JDBC is viewed" in the J2EE User's Guide.)
- The Datasource is not registered.
- A registered data source definition contains an error (Review all items such as the database type and version).
- When JDBC connection pooling is performed by Symfoware, the data source is not registered in the JDBC driver naming service, the registered definition information contains an error, or the naming service has not been activated
- The user does not have access permission for the JDBC driver
- In the data source definition "Use the Oracle connection pooling" is specified as the "data source type" but the JDBC driver of Oracle versions 10g or later cannot be used
- An unsupported database or version was used.
- A new JDBC data source was added or the definition was updated after activating the IJServer (definitions must be updated before activating the IJServer).
- The IJServer is compatible with V8.0 mode (or with that of an 8.0 or earlier environment) and uses the data source of Oracle or SQL Server database type, but the "Use File System Service Provider" box has not been checked in the JDBC data source environment setting.
- In IJServer of V8.0 compatible mode, or IJServers migrated from an Application Server 8.0 or earlier environment, the database type is Symfoware, and "Use Interstage connection pooling" is specified for the database.

If the Datasource is to be used, remove the cause of the error and restart the IJServer.

When the EJB application does not use the Datasource, normal operation is assumed.

---

**9.4.40 IJServer21244**

---

**IJServer: ERROR: IJServer21244: Method parameter is null: NAME=%s1 METHOD=%s2****Variable Information**

%s1 = EJB application name

%s2 = Method name

**Explanation**

The value passed to the method parameters is null.

**System Action**

Throws *RemoteException*.

## User Action

Check if the argument value in the `findByPrimaryKey`, `EJBHome.remove`, or `EJBObject.isIdentical` method is null.

If necessary, contact the EJB application Bean developer.

## 9.4.41 IJServer21245

---

**IJServer: ERROR: IJServer21245: Error in instance management mode specification: NAME=%s1**

### Variable Information

%s1 = EJB application name

### Explanation

Instance management mode specification is incorrect.

### System Action

- If this message is output during the start processing of IJServer, the system cancels the start processing of IJServer.
- If this message is output while the HotDeploy function of J2EE is being used to perform the activation processing, the system stops the activation processing and puts the corresponding deployed module in the inactivated state.

### User Action

Confirm that the instance management mode of the EJB application below is not set to Sequential, and restart the IJServer. When the module enters the inactivated state, select [Module] > [Status] from the Interstage Management Console. In the [Status] window, click the Reactivate button to activate the corresponding deployed module.

- An Entity Bean called directly from a client
- An Entity Bean that is deployed to IJServer and for which "Do not use" is specified for [Local Invocation], which can be displayed by selecting [WorkUnit], [IJServer Name], [EJB Application Name], [Application Environment Definition], and then [Interstage Extended Information] on the Interstage.

## 9.4.42 IJServer21247

---

**IJServer: ERROR: IJServer21247: Cannot use connection-class which is already closed: METHOD=%1 RESOURCE=%2**

### Variable Information

%s1 = Method name

%s2 = Data source name

### Explanation

A method of the Connection class was used for a closed connection.

### System Action

Throws an SQLException.

### User Action

This error may have been caused by:

- A method of the Connection class was issued because a connection that issued `Connection.close` was used.
- A method of the Connection class was issued after `UserTransaction.rollback`, or `UserTransaction.commit` was issued.
- The connection use time has exceeded the time set as the 'connection use monitor time', and the container issued a Connection class method using the connection to which `Connection.close` was issued.

To resolve, issue a method of the Connection class in an open state.

When the "connection use monitor time" function is used, the following cause may also be considered:

- The value set for the "connection use monitor time" is small, so a timeout was generated even though the connection is being used.

Specify a value larger than the anticipated maximum connection time as the "connection use monitor time".

If the container is not required to issue Container.close, make the "Close the connection at timeout" setting invalid.

If the "connection use monitor time" function is not required, set the function as invalid.

### 9.4.43 IJServer21248

---

**IJServer: ERROR: IJServer21248: Cannot issue getConnection method because Transaction is non-active: METHOD=%1 RESOURCE=%**

#### Variable Information

%s1 = Method name

%s2 = Data source name

#### Explanation

An attempt was made to issue the getConnection method when no transactions were active.

#### System Action

Throws an SQLException.

#### User Action

If using distributed transaction processing, issue the getConnection method only if a transaction is active and is not marked rollback.

This message is also output if the distributed transaction function is used when the type of the EJB application is CMP2.0. Note that the distributed transaction function cannot be used when CMP2.0 is used.

### 9.4.44 IJServer21249

---

**IJServer: ERROR: IJServer21249: JTS Exception is occurred when you get JDBCConnection: METHOD=%1 RESOURCE=%**

#### Variable Information

%s1 = Method name

%s2 = Data source name

#### Explanation

If using distributed transaction processing, an exception occurred during acquisition of a JDBC connection.

#### System Action

Throws an SQL Exception.

#### User Action

Ensure that the resource definition file of the database used by the EJB application is registered with the database linkage service. If it is registered, check for definition errors in the resource definition file such as the following:

- lookupName is incorrect.
- InitialContextFactory is incorrect.
- ProviderURL is incorrect.

### 9.4.45 IJServer21250

---

---

**IJServer: ERROR: IJServer21250: Failed in the Recovery of the DB Connection access error: DATASOURCE=%1****Variable Information**

%s1 = Data source name

**Explanation**

Processing for recovery from a DB connection error failed. (Automatic reconnection timeout for a JDBC connection)

**System Action**

Stops DB connection processing and returns an SQLException.

**User Action**

Check whether the adequate values are specified for the interval time and retry count.

---

**9.4.46 IJServer21251**

---

**IJServer: WARNING: IJServer21251:JDBCdriver classes in classpath is not specified: DATASOURCE=%s1****Variable Information**

%s1 = Data source name

**Explanation**

No JDBC driver class is specified in CLASSPATH.

Alternatively, a JDBC driver module specified in the J2EE properties class path or in the IJServer class path may have been placed in the "WEB-INF/lib" directory in the Web application directory structure.

**System Action**

Continues processing, assuming that Reconnection is set to "No" if Reconnection is set to "Yes" for the automatic reconnection function for JDBC connections.

**User Action**

Check whether a JDBC driver class is specified in CLASSPATH in the WorkUnit definition on the Interstage Management Console.

If a JDBC driver module specified in the J2EE properties class path or in the IJServer class path has been placed in the "WEB-INF/lib" directory in the Web application directory structure, delete the module. Then specify the JDBC driver module in either the J2EE properties class path or in the IJServer class path.

---

**9.4.47 IJServer21254**

---

**IJServer: WARNING: IJServer21254: The high-performance option for multi-object finder methods is set, but as the EJB QL query for this finder method uses the DISTINCT clause the option will be ignored: Bean=%s1 Method=%s2****Variable Information**

%s1 = Enterprise Bean name

%s2 = finder method name

**Explanation**

Since the EJB QL query of this finder method uses the DISTINCT clause, the multi-item search acceleration option is ignored.

**System Action**

Continues processing.

## User Action

To speed up search processing for this finder method, change the application and define a query that does not use the DISTINCT clause.

## 9.4.48 IJServer21255

---

**ERROR:IJServer21255: Failed to setup web server connection information: MSG=%s**

### Variable Information

%s = Symfoware detail message

### Explanation

The Web server connection information could not be set up in the access log.

### Cause

The following causes are possible:

1. In Symfoware, the access log is not set up or the access log setting is not valid.
2. Symfoware Server V8 or earlier is used.

### System Action

Returns SQLException to the client.

### User Action

Perform the following actions:

1. Specify the parameter for the access log in the system operation environment file, and then re-execute Symfoware.
2. The access log must be for Symfoware Server 9.0 or later. Change the JDBC data source definitions so that the Web server connection information is not output in the access log.

## 9.4.49 IJServer21256

---

**IJServer: WARNING: IJServer21256: Cannot use abnormal reconnection function with this datasource : DATASOURCE=%s1**

### Variable Information

%s1 = Datasource name

### Explanation

The auto-reconnection function is set to 'Yes' even though the auto-reconnection function cannot be used for the data source.

### System Action

Continues processing as if the JDBC connection auto-reconnection function is set to "No".

### User Action

Set "No" for the "Re-connection at the time of error" item in the DB connection settings for the corresponding data source.

## 9.4.50 IJServer21257

---

**IJServer: ERROR: IJServer21257: Cannot use CMP1.1 Entity Bean, CMP2.0 Entity Bean for datasources created with all-purpose definition: DATASOURCE=%s1**

### Variable Information

%s1 = Datasource name

## Explanation

Data source definitions created in the general definition cannot be used by the CMP1.1 Entity Bean or the CMP2.0 Entity Bean.

## System Action

Performs one of the following:

- If this message is output during an activation process, the system will stop activation of the IJServer.
- If this message is output while the HotDeploy function of J2EE is being used to perform activation processing, the system stops the activation processing and puts the corresponding deployed module in the inactivated state.

## User Action

Change the setting so that the data source definition corresponding to the message will not be used by the CMP1.1 Entity Bean or the CMP2.0 Entity Bean.

To enable the CMP1.1 Entity Bean or the CMP2.0 Entity Bean to temporarily use the corresponding data source definitions, set the option so that the system will not perform an error check at startup. For option details, refer to "EJB CMP1.1 Entity Bean and CMP2.0 Entity Bean" in "Environment set up when generically-defined data sources are used" in the "J2EE User's Guide"

## 9.4.51 IJServer21258

---

### **ISJ2EE: ERROR: IJServer21258:Cannot use Oracle Notification Service**

## Explanation

The Oracle Notification Service cannot be used.

## Cause

The following causes are possible:

- The Oracle Notification Service is not set up correctly.
- The Oracle Notification Service is not activated.

## System Action

Throws an SQLException which is wrapped in an ONSEException

## User Action

Remove the cause of the error, and then re-execute.

Refer to the Oracle manual for details on how to build and activate the Oracle Notification Service.

## 9.4.52 IJServer21259

---

### **IJServer: INFO: IJServer21259:All JDBC connections that is being pooled has been destroyed: IJServer=%s1 DATASOURCE=%s2 PID=%s3**

## Variable Information

%s1 = IJServer name

%s2 = Datasource name (displayed only when the "s" option is specified)

%s3 = Process ID

## Explanation

All of the pooled JDBC connections have been destroyed.

## 9.4.53 IJServer21260

---

---

**IJServer: ERROR: IJServer21260: Failed to get previous connection after initializing JDBC connection pool: IJServer=%s1 DATASOURCE=%s2 PID=%s3**

**Variable Information**

- %s1 = IJServer name
- %s2 = Datasource name
- %s3 = Process ID

**Explanation**

The JDBC connection pool has been initialized, but getting the previous connection after initialization failed.

**Cause**

The following causes are possible:

- The DBMS has stopped.
- An error has been generated on the network.

**System Action**

Stops the command processing.

**User Action**

Refer to the JDBC driver detailed message, remove the cause of the failure to connect to the database, and then re-execute.

---

### 9.4.54 IJServer21261

---

**IJServer: INFO: IJServer21261: Initialized JDBC connection pool, but connections being used by application remains. Connections being used will be destroyed after transaction has completed: IJServer=%s1 DATASOURCE=%s2 PID=%s3**

**Variable Information**

- %s1 = IJServer name
- %s2 = Datasource name
- %s3 = Process ID

**Explanation**

The JDBC connection pool was initialized, but a connection used by the application remains.

**System Action**

After initializing the JDBC connection pool, destroys the connections being used by the application after the transaction is completed.

---

### 9.4.55 IJServer21262

---

**IJServer: INFO: IJServer21262: All connections that were being used by application at the time of JDBC connection pool initialization has been destroyed: IJServer=%s1 DATASOURCE=%s2 PID=%s3**

**Variable Information**

- %s1 = IJServer name
- %s2 = Datasource name
- %s3 = Process ID

**Explanation**

The connections that were used by the application and could not be released have been released at the time of initializing the JDBC connection pool.

## 9.4.56 IJServer21263

---

**IJServer: WARNING: IJServer21263: The JDBC connection not closed for a long time after it had been acquired was detected: IJSERVER=%s1 DATASOURCE=%s2 NAME=%s3 TIME=%s4**

### Variable Information

%s1 = IJServer name

%s2 = Datasource name

%s3 = Application name (\*1)

%s4 = Setting value of the connection use monitor time

\*1 A one-byte null value is output if the application cannot be acquired. This applies to messages such as the one output when the connection acquired by the execution class at the time of activation has exceeded the use monitor time.

### Explanation

A connection that was not closed after exceeding the connection use monitor time was detected in the JDBC connections being used by the application.

### System Action

Continues processing the application

### User Action

Check if an appropriate value is set for the connection use monitor time.

If an appropriate value is set, it is possible that the JDBC connection being used by the application (Connection.close ()) is not closed. In this case, review the application to ensure there are no JDBC connections which are not closed.

## 9.4.57 IJServer21264

---

**IJServer: WARNING: IJServer21264: The JDBC connection not closed for a long time after it had been acquired was returned to the connection pool: IJSERVER=%s1 DATASOURCE=%s2 NAME=%s3 TIME=%s4**

### Variable Information

%s1 = IJServer name

%s2 = Datasource name

%s3 = Application name (\*1)

%s4 = Setting value of the connection use monitor time

\*1 A byte null value is output if the application cannot be acquired. This applies to messages such as the one output when the connection acquired by the execution class at the time of activation has exceeded the connection use monitor time.

### Explanation

A connection that was not closed after exceeding the connection use monitor time was detected in the JDBC connections being used by the application. The detected connection was closed and returned to the connection pool.

### System Action

Closes the detected connection and returns it to the connection pool if the "Close the connection at timeout" setting of the [Connection Use Monitor Time] of [WorkUnit] > "WorkUnit name" > [Environment Settings] in the Interstage Management Console is valid.

### User Action

Check if an appropriate value is set for the connection use monitor time.

If an appropriate value is set, it is possible that the JDBC connection being used by the application (Connection.close ()) is not closed. In this case, review the application to ensure there no JDBC connections which are not closed.

## 9.4.58 IJServer21265

---

**IJServer: WARNING: IJServer21265: SQL execution time exceeded the communication waiting time: IJServer=%s1 DATASOURCE=%s2 NAME=%s3 TIME=%s4 METHOD=%s5**

### Variable Information

- %s1 = IJServer name
- %s2 = Datasource name
- %s3 = Application name
- %s4 = Setting value of the communication waiting time
- %s5 = API of JDBC executed

### Explanation

The execution result of the SQL statement executed by the application did not return after the communication waiting time lapsed.

### System Action

Continues the application processing

### User Action

- The execution result of the JDBC API output to %s5 in the variable information did not return due to an unknown error in the JDBC driver or database processing. Investigate the cause of the error.
- If the message is output during normal operation because the communication waiting time is set to too low a value, review the communication waiting time value in "IJServer Environment Settings: DB Connection Settings" in the corresponding data source.

## 9.4.59 IJServer21266

---

**IJServer: WARNING: IJServer21266: SQL execution time exceeded the communication waiting time: IJServer=%s1 DATASOURCE=%s2 NAME=%s3 TIME=%s4 METHOD=%s5 SQL=%s6**

### Variable Information

- %s1 = IJServer name
- %s2 = Datasource name
- %s3 = Application name
- %s4 = Setting value of the communication waiting time
- %s5 = API of JDBC executed
- %s6 = SQL statement (\*1)

\*1 When "Output the SQL statement in the log" is set to "On" in the communication waiting time setting of "IJServer Environment Settings: DB Connection Settings", the SQL statement will be output to %s6. (Note that if the total size of the log exceeds 300 bytes, the statement will be truncated.)

If the SQL statement cannot be clearly identified, for example, at a batch update, a null value will be output. In this case, refer to the JDBC API output to %s5.

### Explanation

The execution result of the SQL statement executed by the application did not return after the communication waiting time had lapsed.

### System Action

Continues the application processing

## User Action

- The execution result of the JDBC API output to %s5 in the variable information was not returned due to an unknown error in the JDBC driver or database processing. Investigate the cause of the error.
- If the message is output during normal operations because the communication waiting time is set at too low a value, review the communication waiting time value in "IJSERVER Environment Settings: DB Connection Settings" in the corresponding data source.
- When the CMP Entity Bean is in use, query the database from the SQL statement output to %s6 in the variable information.

## 9.4.60 IJSERVER21267

---

**IJSERVER:ERROR:Due to memory shortage, replacement of the user id from the web server connection information using com.fujitsu.interstage.j2ee.security.AccessLog class's setUserID(String id) has failed : UID=%s**

### Variable Information

%s = User ID

### Explanation

A memory shortage was generated when the authentication information specified in the argument of the setUserID(String id) method of the com.fujitsu.interstage.j2ee.security.AccessLog class executed by the J2EE application was specified as the user ID value of the Web server authentication information to be passed.

### System Action

Stops method execution

### User Action

To use the authentication information specified in the setUserID(String id) method of the AccessLog class, take action in accordance with the CORBA message od15000 output in the event log or the system log that was output at the same time as this message.

## 9.4.61 IJSERVER21268

---

**IJSERVER:ERROR:IJSERVER21268:Error has occurred in accessing CORBA service : METHOD=%s1  
DETAIL=%s2**

### Variable Information

%s1 = Name of API abnormally ended in CORBA service

%s2 = Detailed information of CORBA service error

### Explanation

An error was generated when calling the CORBA service during application method execution processing.

### System Action

Stops executing the application method

### User Action

Use the *iscollectinfo* command to collect diagnostic information, and then contact a Fujitsu systems engineer.

## 9.4.62 IJSERVER21269

---

**IJSERVER:WARNING:IJSERVER21269: Failed to update connection pool information. Will stop update process: DATASOURCE=%s1**

### Variable Information

%s1 = Data source name

## Explanation

Updating of the connection pool information failed.

## System Action

Stops updating the connection pool information. The following items in the IJServer monitor display '0'.

- Current number of physical connections
- Number of free connections
- Number of connections being used

Continues the application processing

## User Action

Record the information in the corresponding message, use the *iscollectinfo* command to collect diagnostic information, and then contact a Fujitsu systems engineer.

## 9.5 IJServer21300 to IJServer21399

---

This section details the messages with message numbers between IJServer21300 and IJServer21399.

### 9.5.1 IJServer21350

---

**IJServer: ERROR: IJServer21350: Customize tool is active: NAME = %s1**

#### Variable Information

%s1 = EJB application name

#### Explanation

The Customize Tool is active.

#### System Action

Stops the startup of the EJB application.

#### User Action

Close the Customize Tool and re-start the EJB application.

### 9.5.2 IJServer21351

---

**IJServer: ERROR: IJServer21351: Reading of DB access environment definition file failed: NAME=%s1**

#### Variable Information

%s1 = EJB application name

#### Explanation

Reading of the DB Access Environment Definition file failed.

#### System Action

Stops the startup of the IJServer.

#### User Action

The environment setting might be wrong. Reinstall Interstage.

## 9.5.3 IJServer21352

---

**IJServer: ERROR: IJServer21352: Acquiring a connection failed: NAME=%s1 DATASOURCE=%s2 REASON=%s3**

### Variable Information

%s1 = IJServer name

%s2 = Datasource name

%s3 = JDBC driver detailed message

### Explanation

Acquisition of pre-opened connection failed.

### System Action

Stops the startup of the IJServer.

### User Action

Remove the cause of the database connection error in accordance with the JDBC driver detailed message and rerun the job.

The probable causes are:

- The Datasource specifying the pre-opened connection count cannot be used. Refer to the messages output before or after the error and remove the cause of the error.
- For the application using a data source set in the pre-opened connection, check that the deployment descriptor reference resource of the EJB is set correctly. Also check that the data source described in the EntityBean CMP CMF mapping definition data source is set correctly.
- In case the EJB application is using a data source that has pre-opened connections enabled, check that the resource reference in its deployment descriptor is set correctly. Also, check that the data source described in the EntityBean CMP CMF mapping definition is set correctly.
- If the EJB application using the data source set in the pre-opened connection is not found, delete the data source from the pre-opened connection.
- The JDBC driver is not properly installed.
- The JDBC driver environment settings are incorrect.
- DBMS has not been activated.
- The specified pre-opened connection count exceeds the maximum number of connections allowed for the JDBC driver.
- There is a network error.

There is an error in the DBMS operating environment.

## 9.5.4 IJServer21353

---

**IJServer: WARNING: IJServer21353: Datasource specified by previous connection is failed: NAME=%s1 DATASOURCE=%s2 REASON=%s3**

### Variable Information

%s1 = IJServer name

%s2 = Data source name

%s3 = Detail message of JDBC driver

### Explanation

A pre-opened connection for the specified data source failed.

## System Action

Continues start processing.

## User Action

The following table shows possible causes, and describes how to resolve the problem in each case.

Explanation	Action
A data source specified for a pre-opened connection was not defined.	Define the data source. This can be done from IJServer - Environment Settings - DB Connection Settings in the Interstage Management Console.
A JDBC driver was not specified in either the J2EE properties class path or in the IJServer class path.	If a JDBC driver specified in the J2EE properties class path or in the IJServer class path was placed in the "WEB-INF/lib" directory in the Web application directory structure, delete the JDBC driver. Then specify the JDBC driver in either the J2EE properties class path or in the IJServer class path again.
A JDBC driver that was specified in the J2EE properties class path or in the IJServer class path was placed in the "WEB-INF/lib" directory in the Web application directory structure.	

If none of the above is the reason for the error, refer to the messages output before and after this message.

If the relevant data source is not to be used, cancel the setting for 'pre-opened connection'.

## 9.5.5 IJServer21354

---

**IJServer: WARNING: IJServer21354: JDBC Driver does not support streaming for data of type %s1: Name=%s2 DATASOURCE=%s3**

### Variable Information

%s1 = Data type

%s2 = EJB application name

%s3 = Data source name

### Explanation

The JDBC driver being used does not support stream transfer of the data type indicated by the variable information %s1.

### System Action

The value bound to the data type specified in the serialized field is limited by the allowable values of the JDBC driver.

### User Action

Refer to the DBMS manual to check if the JDBC driver being used supports stream transfers.

If it does not, ignore this message and continue processing (if data that exceeds the allowable values of the JDBC driver is sent, an error will be returned from the JDBC).

## 9.6 IJServer21400 to IJServer21499

---

This section details the messages with message numbers between IJServer21400 and IJServer21499.

### 9.6.1 IJServer21401

---

**IJServer: ERROR: IJServer21401: JMS initialization failed: NAME=%s1 CODE=%s2**

### Variable Information

%s1 = EJB application name

%s2 = Internal code

## Explanation

An error occurred while initializing JMS.

## System Action

Stops the startup of the IJServer.

## User Action

The possible causes are:

- JMS is not properly installed.
- An error occurred in JMS.
- An error occurred in the EJB application.
- Memory shortage occurred.

If one of these applies, do the following:

- JMS is not properly installed.
- Check if JMS is installed.
- An error occurred in JMS.

If JMS message is outputted before/after this message, execute it in accordance with JMS message.

- An error occurred in the EJB application.

If EJB message is outputted before/after this message, execute it in accordance with EJB message.

- Memory shortage occurred.

Confirm that there is enough memory.

If none of the above causes apply, note the message information, use the *iscollectinfo* command to collect the diagnostic information, and then contact a Fujitsu systems engineer.

## 9.6.2 IJServer21403

---

**IJServer: ERROR: IJServer21403: Exception from JMS provider: NAME=%s1 REASON=%s2 CODE=%s3**

### Variable Information

%s1 = EJB application name

%s2 = Detailed message

%s3 = Internal code

### Note

The output message may be split up if the string for the variable information is long.

In such a case, the whole of the variable information string may be not displayed. The complete and undivided exception information is output in the container log file, as are the stack traces. For more details, refer to this file.

## Explanation

An error occurred in JMS API.

## System Action

Stops execution of the method.

## User Action

Take corrective action according to the message.

## 9.6.3 IJServer21404

---

**IJServer: ERROR: IJServer21404: Failed to start JMS message receive thread: NAME=%s1 CODE=%s2**

### Variable Information

%s1 = EJB application name

%s2 = Internal code

### Explanation

Failed to start thread.

### System Action

Stops the IJServer.

### User Action

Note the message information and use the *iscollectinfo* command to collect the diagnostic information, and then contact a Fujitsu systems engineer.

## 9.6.4 IJServer21406

---

**IJServer: ERROR: IJServer21406: Failed to re-start thread: NAME=%s1 CODE=%s2**

### Variable Information

%s1 = EJB application name

%s2 = Internal code

### Explanation

Failed to start thread.

### System Action

Stops the IJServer.

### User Action

Note the message information, use the *iscollectinfo* command to collect the diagnostic information, and then contact a Fujitsu systems engineer.

## 9.6.5 IJServer21407

---

**IJServer: ERROR: IJServer21407: Failed to wait JMS receive thread: NAME=%s1 CODE=%s2**

### Variable Information

%s1 = EJB application name

%s2 = Internal code

### Explanation

Failed to wait receiving JMS message.

### System Action

Stops the IJServer.

### User Action

Note the message information, use the *iscollectinfo* command to collect the diagnostic information, and then contact a Fujitsu systems engineer.

## 9.6.6 IJServer21410

---

**IJServer: ERROR: IJServer21410: Failed backup to file: NAME=%s1 FILE=%s2 REASON=%s3 CODE=%s4**

### Variable Information

%s1 = EJB application name

%s2 = File name for backup

%s3 = Detailed message

%s4 = Internal code

### Note

The output message may be split up if the string for the variable information is long.

In such a case, the whole of the variable information string may be not displayed. The complete and undivided exception information is output in the container log file, as are the stack traces. For more details, refer to this file.

### Explanation

Although a system error occurred in the onMessage method of the EJB application with 'Required' transaction attribute, failed to make backup to the file.

### System Action

Stops the IJServer.

### User Action

Remove the cause of the system error that occurred in the EJB application, and then restart the IJServer.

Also confirm that there is enough disk space in the following place.

**Windows32/64**

C:\Interstage\EJB\var

**Solaris32/64 Linux32/64**

/opt/FJSVejb/var

## 9.6.7 IJServer21411

---

**IJServer: ERROR: IJServer21411: JMS Message not serializable: NAME=%s1 CODE=%s2**

### Variable Information

%s1 = EJB application name

%s2 = Internal code

### Explanation

Although a system error occurred in the onMessage method of the EJB application with 'Required' transaction attribute, failed to make backup to file because it is not serializable.

### System Action

Stops the IJServer.

### User Action

Remove the cause of the system error that occurred in the EJB application, and then restart the IJServer.

## 9.6.8 IJServer21412

---

**IJServer: WARNING: IJServer21412: JMS Message backup failed: NAME=%s1 CODE=%s2**

### Variable Information

%s1 = EJB application name

%s2 = File name for backup

%s3 = Detailed message

%s4 = Internal code

### Explanation

Although a system error occurred in the onMessage method of the EJB application with "Required" transaction attribute, failed to make a backup to file for some reason.

### System Action

Stops the IJServer.

### User Action

Take corrective action according to the message that is outputted before this error message.

## 9.6.9 IJServer21413

---

**IJServer: ERROR: IJServer21413: JMS Destination type is invalid: NAME=%s1 CODE=%s2**

### Variable Information

%s1 = EJB application name

%s2 = Internal code

### Explanation

JMS Destination type of the deployment descriptor is invalid.

### System Action

- If this message is output while an IJServer is starting, startup is canceled.
- If this message is output during an activation process that uses J2EE's HotDeploy function, the activation process will be interrupted and the status of the relevant deployed module will change to inactive.

### User Action

Specify either the following JMS Destination types in the deployment descriptor:

- javax.jms.Topic
- javax.jms.Queue

The receiver type is incorrect. When linking a resource adapter, change this to "resourceadapter". Restart the IJServer after making the correction.

If the module has been deactivated, from the Interstage Management Console, select [WorkUnit] > [WorkUnit Name] > [Application Status] > [Status]. Select the deployed module and click the 'Reactivate' button to activate it.

## 9.6.10 IJServer21415

---

**IJServer: ERROR: IJServer21415: Subscription durability is Invalid: NAME=%s1 CODE=%s2**

### Variable Information

%s1 = EJB application name

%s2 = Internal code

### Explanation

The value of subscription durability of the deployment descriptor is invalid.

### System Action

- If this message is output while an IJServer is starting, startup is canceled.
- If this message is output during an activation process that uses J2EE's HotDeploy function, the activation process will be interrupted and the status of the relevant deployed module will change to inactive.

### User Action

Specify either the following subscription durability in the deployment descriptor:

- Durable
- NonDurable

Restart the IJServer after making the correction.

If the module has been deactivated, from the Interstage Management Console, select [WorkUnit] > [WorkUnit Name] > [Application Status] > [Status]. Select the deployed module and click the 'Reactivate' button to activate it.

## 9.6.11 IJServer21416

---

**IJServer: ERROR: IJServer21416: Transaction attribute is Invalid: NAME=%s1 CODE=%s2**

### Variable Information

%s1 = EJB application name

%s2 = Internal code

### Explanation

Transaction type of the deployment descriptor is invalid.

### System Action

- If this message is output while an IJServer is starting, startup is canceled.
- If this message is output during an activation process that uses J2EE's HotDeploy function, the activation process will be interrupted and the status of the relevant deployed module will change to inactive.

### User Action

For Message-driven Bean, specify either the following transaction types in the deployment descriptor:

- Required
- NotSupported

Restart the IJServer after making the correction.

If the module has been deactivated, from the Interstage Management Console, select [WorkUnit] > [WorkUnit Name] > [Application Status] > [Status]. Select the deployed module and click the 'Reactivate' button to activate it.

## 9.6.12 IJServer21418

---

**IJServer: ERROR: IJServer21418: Acknowledge mode is invalid: NAME=%s1 CODE=%s2**

### Variable Information

%s1 = EJB application name

%s2 = Internal code

## Explanation

Acknowledge mode of the deployment descriptor is invalid.

## System Action

- If this message is output while an IJServer is starting, startup is canceled.
- If this message is output during an activation process that uses J2EE's HotDeploy function, the activation process will be interrupted and the status of the relevant deployed module will change to inactive.

## User Action

Specify either of the following acknowledge modes in the deployment descriptor:

- Auto-acknowledge
- Dups-ok-acknowledge

Restart the IJServer after making the correction.

If the module has been deactivated, from the Interstage Management Console, select [WorkUnit] > [WorkUnit Name] > [Application Status] > [Status]. Select the deployed module and click the 'Reactivate' button to activate it.

## 9.6.13 IJServer21419

---

**IJServer: ERROR: IJServer21419: The JMS ConnectionFactory for Global transaction mode must be used: NAME=%s1 CODE=%s2**

### Variable Information

%s1 = EJB application name

%s2 = Internal code

## Explanation

Global transaction mode is enabled (this is done from the Interstage Management Console, [WorkUnit] > [WorkUnit Name] > [Settings] > [EJB Container Settings]). However, the JMS Connection Factory has not been setup to use Global transaction .

## System Action

- If this message is output while an IJServer is starting, startup is canceled.
- If this message is output during an activation process that uses J2EE's HotDeploy function, the activation process will be interrupted and the status of the relevant deployed module will change to inactive.

## User Action

- For distributed transactions:
  - Change the JMS Connection Factory setup to use Global transaction mode.
- Otherwise
  - Change the IJServer definition to disable Global transaction mode.

Restart the IJServer after taking the above measures.

If the module has been deactivated, from the Interstage Management Console, select [WorkUnit] > [WorkUnit Name] > [Application Status] > [Status]. Select the deployed module and click the 'Reactivate' button to activate it.

## 9.6.14 IJServer21421

---

**IJServer: ERROR: IJServer21421 Message-driven Bean is already started: NAME=%s1 CODE=%s2**

### Variable Information

%s1 = EJB application name

%s2 = Internal code

#### Explanation

Message-driven Bean is already activated, or 2 or a greater number is specified for "Process Multiplicity" in [WorkUnit Setting], which can be displayed by selecting [WorkUnit], [JServer Name], and [Environment Setup] on the Interstage.

#### System Action

Stops the startup of the JServer.

#### User Action

In case that the concurrency of the WorkUnit definition is set to two or more, change it to one again.

### 9.6.15 JServer21422

---

**JServer: ERROR: JServer21422 Cannot release exclusive lock: NAME=%s1 FILE=%s2 CODE=%s3**

#### Variable Information

%s1 = EJB application name

%s2 = Exclusive file

%s3 = Internal code

#### Explanation

Exclusive lock cannot be released for some reason.

#### System Action

Stops the JServer.

#### User Action

There is no problem for the operation.

### 9.6.16 JServer21423

---

**JServer: WARNING: JServer21423: The backup JMS ConnectionFactory for Global transaction mode cannot be used: NAME=%s1 CONNECTIONFACTORY=%s2 CODE=%s3**

#### Variable Information

%s1 = EJB application name

%s2 = ConnectionFactory name

%s3 = Internal code

#### Explanation

For the backup JMS ConnectionFactory, the backup JMS ConnectionFactory for distributed transaction mode cannot be used.

#### System Action

Continues the startup of the JServer.

#### User Action

Change the backup JMS ConnectionFactory not to use distributed transaction, and activate the JServer again.

### 9.6.17 JServer21424

---

---

**IJServer: ERROR: IJServer21424 Exception occurred in Message-driven Bean: NAME=%s1 EXCEPTION=%s2 METHOD=%s3 CODE=%s4****Variable Information**

%s1 = EJB application name

%s2 = Detailed message

%s3 = Method name

%s4 = Internal code

**Note**

The output message may be split up if the string for the variable information is long.

In such a case, the whole of the variable information string may be not displayed. The complete and undivided exception information is output in the container log file, as are the stack traces. For more details, refer to this file.

**Explanation**

Message-driven Bean throws a system exception that is caught by Container. This applies not only to the onMessage method but to all methods.

**System Action**

- If this message is output while an IJServer is starting, startup is canceled.
- If this message is output during an activation process that uses J2EE's HotDeploy function, the activation process will be interrupted and the status of the relevant deployed module will change to inactive.
- If this message is output during receipt of the system exception thrown by the message driven Bean, the process to receive the exception is canceled.

**User Action**

Exception occurred in Message-driven Bean. Modify the EJB application then execute it again.

If the module has been deactivated, from the Interstage Management Console, select [WorkUnit] > [WorkUnit Name] > [Application Status] > [Status]. Select the deployed module and click the 'Reactivate' button to activate it.

---

**9.6.18 IJServer21428**

---

**IJServer: WARNING: IJServer21428: Specified backup JMS ConnectionFactory name or backup JMS Destination name is invalid: NAME=%s1 CODE=%s2****Variable Information**

%s1 = EJB application name

%s2 = Internal code

**Explanation**

An invalid value was specified for "JMS Connection Factory Name" or "Destination Name" in [Error Message Save Definition], which can be displayed by selecting [WorkUnit], [IJServer Name], [EJB Application Name], and then [Application Environment Definition] on the Interstage.

**System Action**

Continues the startup of the IJServer. Messages are not backed up to the backup JMS Destination.

**User Action**

Modify the backup JMS ConnectionFactory name or the backup JMS Destination name, and activates the IJServer again.

---

**9.6.19 IJServer21431**

---

---

**IJServer: ERROR: IJServer21431 Acquiring JMS ConnectionFactory failed: NAME=%s1 REASON=%s2 CONNECTIONFACTORY=%s3 CODE=%s4****Variable Information**

%s1 = EJB application name

%s2 = Detailed message

%s3 = JMS ConnectionFactory name

%s4 = Internal code

**Note**

The output message may be split up if the string for the variable information is long.

In such a case, the whole of the variable information string may be not displayed. The complete and undivided exception information is output in the container log file, as are the stack traces. For more details, refer to this file.

**Explanation**

Failed to acquire the JMS ConnectionFactory object.

**System Action**

- If this message is output while an IJServer is starting, the IJServer startup process will be canceled.
- If this message is output during an activation process that uses J2EE's HotDeploy function, the activation process will be interrupted and the status of the relevant deployed module will change to inactive.

**User Action**

Check the following items:

- Check if the JMS ConnectionFactory definition is registered.
- Check if the JMS ConnectionFactory name in Interstage is set correctly.

Remove the cause of the error, and activate the IJServer again.

If the module has been deactivated, from the Interstage Management Console, select [WorkUnit] > [WorkUnit Name] > [Application Status] > [Status]. Select the deployed module and click the 'Reactivate' button to activate it.

---

**9.6.20 IJServer21432**

---

**IJServer: ERROR: IJServer21432 Acquiring JMS Destination object failed: NAME=%s1 REASON=%s2 DESTINATION=%s3 CODE=%s4****Variable Information**

%s1 = EJB application name

%s2 = Detailed message

%s3 = JMS Destination name

%s4 = Internal code

**Note**

The output message may be split up if the string for the variable information is long.

In such a case, the whole of the variable information string may be not displayed. The complete and undivided exception information is output in the container log file, as are the stack traces. For more details, refer to this file.

**Explanation**

Failed to acquire the JMS Destination object.

## System Action

- If this message is output while an IJServer is starting, startup is canceled.
- If this message is output during an activation process that uses J2EE's HotDeploy function, the activation process will be interrupted and the status of the relevant deployed module will change to inactive.

## User Action

Confirm the following.

- Check if the JMS Destination definition is registered.
- In the Interstage Management Console, select [WorkUnit], [IJServer Name], [Module Name], [EJB Application Name], [Application Environment Definition], and then [Message-driven Bean Extended Information] and confirm that the 'Destination Name' is set correctly.

Remove the cause of the error, and activate the IJServer again.

If the module has been deactivated, from the Interstage Management Console, select [WorkUnit] > [WorkUnit Name] > [Application Status] > [Status]. Select the deployed module and click the 'Reactivate' button to activate it.

## 9.6.21 IJServer21433

---

**IJServer: ERROR: IJServer21433 Specified JMS Destination type is incompatible with the Acquired JMS ConnectionFactory type: NAME=%s1 CODE=%s2**

### Variable Information

%s1 = EJB application name

%s2 = Internal code

### Explanation

Although the JMS Destination type is defined as javax.jms.Topic in the deployment descriptor, the type of the JMS ConnectionFactory object is javax.jms.QueueConnectionFactory. Or, although the JMS Destination type is defined as javax.jms.Queue in the deployment descriptor, the type of the JMS ConnectionFactory object is javax.jms.TopicConnectionFactory.

## System Action

- If this message is output while an IJServer is starting, startup is canceled.
- If this message is output during an activation process that uses J2EE's HotDeploy function, the activation process will be interrupted and the status of the relevant deployed module will change to inactive.

## User Action

- Possible reasons are as follows.
- The type of JMS Destination is invalid.
- The JMS ConnectionFactory name in the Interstage is invalid.
- The JMS ConnectionFactory definition is invalid.

Remove the cause of the error, and activate the IJServer again.

If the module has been deactivated, from the Interstage Management Console, select [WorkUnit] > [WorkUnit Name] > [Application Status] > [Status]. Select the deployed module and click the 'Reactivate' button to activate it.

## 9.6.22 IJServer21434

---

**IJServer: ERROR: IJServer21434 Specified JMS Destination type is incompatible with the Acquired JMS Destination type: NAME=%s1 CODE=%s2**

## Variable Information

%s1 = EJB application name

%s2 = Internal code

## Explanation

Although the JMS Destination type is defined as `javax.jms.Topic` in the deployment descriptor, the type of the JMS Destination object is `javax.jms.Queue`. Or, although the JMS Destination type is defined as `javax.jms.Queue` in the deployment descriptor, the type of the JMS Destination object is `javax.jms.Topic`.

## System Action

- If this message is output while an IJServer is starting, startup is canceled.
- If this message is output during an activation process that uses J2EE's HotDeploy function, the activation process will be interrupted and the status of the relevant deployed module will change to inactive.

## User Action

- Possible reasons are as follows.
- The type of JMS Destination is invalid.
- The JMS Destination name in the Interstage is invalid.
- The JMS Destination definition is invalid.

Remove the cause of the error, and activate the IJServer again.

If the module has been deactivated, from the Interstage Management Console, select [WorkUnit] > [WorkUnit Name] > [Application Status] > [Status]. Select the deployed module and click the 'Reactivate' button to activate it.

## 9.6.23 IJServer21435

---

**IJServer: ERROR: IJServer21435 The JMS ConnectionFactory for Global transaction mode cannot be used for Bean Managed Transaction: NAME=%s1 CODE=%s2**

## Variable Information

%s1 = EJB application name

%s2 = Internal code

## Explanation

In case the transaction type is Bean, the JMS ConnectionFactory for distributed transaction cannot be used.

## System Action

- If this message is output while an IJServer is starting, startup is canceled.
- If this message is output during an activation process that uses J2EE's HotDeploy function, the activation process will be interrupted and the status of the relevant deployed module will change to inactive.

## User Action

Specify the JMS ConnectionFactory to not use the distributed transaction in the Interstage, and activate the IJServer again.

If the module has been deactivated, from the Interstage Management Console, select [WorkUnit] > [WorkUnit Name] > [Application Status] > [Status]. Select the deployed module and click the 'Reactivate' button to activate it.

## 9.6.24 IJServer21436

---

**IJServer: ERROR: IJServer21436 The JMS ConnectionFactory for Global transaction mode cannot be used for NotSupported Transaction Attribute: NAME=%s1 CODE=%s2**

## Variable Information

%s1 = EJB application name

%s2 = Internal code

## Explanation

In case of the transaction attribute is NotSupported, the JMS ConnectionFactory for distributed transaction cannot be used.

## System Action

- If this message is output while an IJServer is starting, startup is canceled.
- If this message is output during an activation process that uses J2EE's HotDeploy function, the activation process will be interrupted and the status of the relevant deployed module will change to inactive.

## User Action

Specify the JMS ConnectionFactory not to use the distributed transaction in Customize Tool, and activate the IJServer again.

If the module has been deactivated, from the Interstage Management Console, select [WorkUnit] > [WorkUnit Name] > [Application Status] > [Status]. Select the deployed module and click the 'Reactivate' button to activate it.

## 9.6.25 IJServer21437

---

**IJServer: ERROR: IJServer21437 The ConnectionFactory for Global transaction mode cannot be used: NAME=%s1 CODE=%s2**

## Variable Information

%s1 = EJB application name

%s2 = Internal code

## Explanation

The JMS ConnectionFactory for distributed transaction cannot be used because the distributed transaction is not set.

## System Action

- If this message is output while an IJServer is starting, startup is canceled.
- If this message is output during an activation process that uses J2EE's HotDeploy function, the activation process will be interrupted and the status of the relevant deployed module will change to inactive.

## User Action

On the Interstage, select [WorkUnit], [IJServer Name], [Environment Setup], and then [EJB Container Setting] and enable distributed transactions. Alternatively, define that the JMS Connection Factory will not use distributed transactions. Then restart the IJServer.

If the module has been deactivated, from the Interstage Management Console, select [WorkUnit] > [WorkUnit Name] > [Application Status] > [Status]. Select the deployed module and click the 'Reactivate' button to activate it.

## 9.6.26 IJServer21438

---

**IJServer: ERROR: IJServer21438 Failed to create JMS Subscriber or JMS Receiver: NAME=%s1 REASON=%s2 CODE=%s3**

## Variable Information

%s1 = EJB application name

%s2 = Detailed message

%s3 = Internal code

## Note

The output message may be split up if the string for the variable information is long.

In such a case, the whole of the variable information string may be not displayed. The complete and undivided exception information is output in the container log file, as are the stack traces. For more details, refer to this file.

#### Explanation

Failed to create JMS Subscriber or JMS Receiver.

#### System Action

- If this message is output while an IJServer is starting, startup is canceled.
- If this message is output during an activation process that uses J2EE's HotDeploy function, the activation process will be interrupted and the status of the relevant deployed module will change to inactive.

#### User Action

Take the required action according to the error message, and activate the IJServer again.

On the Interstage, select [WorkUnit], [IJServer Name], [EJB Application], [Application Environment Definition], and then [Message-driven Bean Extended Information] and check that a value is set for Subscriber Identifier.

If not, set a value and restart the IJServer.

If the module has been deactivated, from the Interstage Management Console, select [WorkUnit] > [WorkUnit Name] > [Application Status] > [Status]. Select the deployed module and click the 'Reactivate' button to activate it.

## 9.6.27 IJServer21439

---

**IJServer: ERROR: IJServer21439 Error in Message-driven Bean. EJB application deactivated: NAME=%s1 CODE=%s2**

#### Variable Information

%s1 = EJB application name

%s2 = Internal code

#### Explanation

Stops the IJServer because some error had occurred in Message-driven Bean

#### System Action

Stops the startup of the IJServer.

#### User Action

Take the required action according to the message of JMS or Event Service that is outputted before/after this message.

## 9.6.28 IJServer21440

---

**IJServer: ERROR: IJServer21440 Failed to complete receiving JMS message: NAME=%s1 REASON=%s2 CODE=%s3**

#### Variable Information

%s1 = EJB application name

%s2 = Detailed message

%s3 = Internal code

#### Note

The output message may be split up if the string for the variable information is long.

In such a case, the whole of the variable information string may be not displayed. The complete and undivided exception information is output in the container log file, as are the stack traces. For more details, refer to this file.

#### Explanation

Tried to commit or rollback the JMS message, but an error has occurred.

#### System Action

Stops processing of the IJServer.

#### User Action

An error has occurred in JMS. Take the required action according to the exception message, and activate the IJServer again.

### 9.6.29 IJServer21441

---

**IJServer: ERROR: IJServer21441 Failed to start JMS connection: NAME=%s1 REASON=%s2 CODE=%s3**

#### Variable Information

%s1 = EJB application name

%s2 = Detailed message

%s3 = Internal code

#### Note

The output message may be split up if the string for the variable information is long.

In such a case, the whole of the variable information string may be not displayed. The complete and undivided exception information is output in the container log file, as are the stack traces. For more details, refer to this file.

#### Explanation

Tried to start connection receiving the JMS message, but an error has occurred in JMS.

#### System Action

- If this message is output while an IJServer is starting, startup is canceled.
- If this message is output during an activation process that uses J2EE's HotDeploy function, the activation process will be interrupted and the status of the relevant deployed module will change to inactive.

#### User Action

An error has occurred in JMS. Take the required action according to the exception message, and activate the IJServer again.

If the module has been deactivated, from the Interstage Management Console, select [WorkUnit] > [WorkUnit Name] > [Application Status] > [Status]. Select the deployed module and click the 'Reactivate' button to activate it.

### 9.6.30 IJServer21442

---

**IJServer: WARNING: IJServer21442 Failed to release JMS Subscriber or JMS Receiver: NAME=%s1 REASON=%s2 CODE=%s3**

#### Variable Information

%s1 = EJB application name

%s2 = Detailed message

%s3 = Internal code

#### Note

The output message may be split up if the string for the variable information is long.

In such a case, the whole of the variable information string may be not displayed. The complete and undivided exception information is output in the container log file, as are the stack traces. For more details, refer to this file.

#### Explanation

JMS failed to close Consumer because of some JMS error.

#### System Action

Continues stop processing of the IJServer.

#### User Action

An error has occurred in JMS. Take the required action according to the exception message, and activate the IJServer again.

### 9.6.31 IJServer21443

---

**IJServer: WARNING: IJServer21443 Failed to release JMS connection: NAME=%s1 REASON=%s2 CODE=%s3**

#### Variable Information

%s1 = EJB application name

%s2 = Detailed message

%s3 = Internal code

#### Note

The output message may be split up if the string for the variable information is long.

In such a case, the whole of the variable information string may be not displayed. The complete and undivided exception information is output in the container log file, as are the stack traces. For more details, refer to this file.

#### Explanation

Tried to release JMS connection, but JMS failed to close connection.

#### System Action

Continues stop processing of the IJServer.

#### User Action

An error has occurred in JMS. Take the required action according to the exception message, and activate the IJServer again.

### 9.6.32 IJServer21444

---

**IJServer: WARNING: IJServer21444 Failed to cleanup JMS: NAME=%s1 REASON=%s2 CODE=%s3**

#### Variable Information

%s1 = EJB application name

%s2 = Detailed message

%s3 = Internal code

#### Note

The output message may be split up if the string for the variable information is long.

In such a case, the whole of the variable information string may be not displayed. The complete and undivided exception information is output in the container log file, as are the stack traces. For more details, refer to this file.

#### Explanation

JMS cleanup was executed but an error has occurred for some reason.

## System Action

Continues stop processing of the IJServer.

## User Action

An error has occurred in JMS. Take the required action according to the exception message, and activate the IJServer again.

### 9.6.33 IJServer21445

---

**IJServer: WARNING: IJServer21445 Acquiring backup JMS ConnectionFactory failed: NAME=%s1 REASON=%s2 CONNECTIONFACTORY=%s3 CODE=%s4**

#### Variable Information

%s1 = EJB application name

%s2 = Detailed message

%s3 = ConnectionFactory name

%s4 = Internal code

#### Note

The output message may be split up if the string for the variable information is long.

In such a case, the whole of the variable information string may be not displayed. The complete and undivided exception information is output in the container log file, as are the stack traces. For more details, refer to this file.

#### Explanation

Failed to acquire the backup JMS ConnectionFactory object.

## System Action

Continues startup processing of the IJServer. Does not make a backup of the JMS message to the backup JMS Destination.

## User Action

Confirm the following.

- Check if the JMS ConnectionFactory definition is registered.
- Check if the backup JMS ConnectionFactory name in Interstage is set correctly.

### 9.6.34 IJServer21446

---

**IJServer: WARNING: IJServer21446 Acquiring backup JMS Destination object failed: NAME=%s1 REASON=%s2 DESTINATION=%s3 CODE=%s4**

#### Variable Information

%s1 = EJB application name

%s2 = Detailed message

%s3 = Destination name

%s4 = Internal code

#### Note

The output message may be split up if the string for the variable information is long.

In such a case, the whole of the variable information string may be not displayed. The complete and undivided exception information is output in the container log file, as are the stack traces. For more details, refer to this file.

#### Explanation

Failed to acquire the backup JMS Destination object.

## System Action

Continues startup processing of the IJServer.

## User Action

Confirm the following.

- Check if the JMS Destination definition is registered.
- Check if the backup Destination name in the Interstage is set correctly.

## 9.6.35 IJServer21447

---

**IJServer: WARNING: IJServer21447 Backup JMS ConnectionFactory type is invalid: NAME=%s1 CONNECTIONFACTORY=%s2 CODE=%s3**

### Variable Information

%s1 = EJB application name

%s2 = ConnectionFactory name

%s3 = Internal code

### Explanation

The type of the backup JMS ConnectionFactory object is invalid.

## System Action

Continues startup processing of the IJServer

## User Action

Confirm that the JMS ConnectionFactory is defined correctly.

## 9.6.36 IJServer21448

---

**IJServer: WARNING: IJServer21448 Failed backup specified JMS Destination: NAME=%s1 REASON=%s2 CODE=%s3**

### Variable Information

%s1 = EJB application name

%s2 = Detailed message

%s3 = Internal code

### Note

The output message may be split up if the string for the variable information is long.

In such a case, the whole of the variable information string may be not displayed. The complete and undivided exception information is output in the container log file, as are the stack traces. For more details, refer to this file.

### Explanation

Although a system error occurred in the EJB application with "Required" transaction attribute, failed to back up to the backup JMS Destination.

## System Action

Backup is made to the file.

## User Action

An error has occurred in JMS. Take the required action according to the exception message, and activate the IJServer again.

## 9.6.37 IJServer21449

---

**IJServer: WARNING: IJServer21449 JMS ConnectionFactory name is not specified: NAME=%s1 CODE=%s2**

### Variable Information

%s1 = EJB application name

%s2 = Internal code

### Explanation

The JMS ConnectionFactory name is not specified in the Interstage.

### System Action

Stops the startup of the IJServer.

### User Action

Specify the JMS ConnectionFactory name in the Interstage and activate the IJServer again.

## 9.6.38 IJServer21450

---

**IJServer: ERROR: IJServer21450 JMS Destination object name is not specified: NAME=%s1 CODE=%s2**

### Variable Information

%s1 = EJB application name

%s2 = Internal code

### Explanation

The Destination name is not specified in the Interstage.

### System Action

Stops the startup of the IJServer.

### User Action

Specify the Destination name in the Interstage and activate the IJServer again.

## 9.6.39 IJServer21451

---

**IJServer: WARNING: IJServer21451 Backup JMS Message to specified backup JMS Destination: NAME=%s1 CODE=%s2**

### Variable Information

%s1 = EJB application name

%s2 = Internal code

### Explanation

Backup is done for the JMS message to the backup JMS Destination that is specified in the Interstage.

### System Action

Continues the startup of the IJServer. The message is backed up to the backup JMS Destination.

### User Action

Message backup is done because the exception has occurred in the method of Message-driven Bean. Remove the cause of the error, and execute it again.

Also, because of the message that an error has occurred had been backed up to the backup JMS Destination, receive and process it again.

## 9.6.40 IJServer21452

---

**IJServer: WARNING: IJServer21452 Backup JMS Message to specified backup file: NAME=%s1 CODE=%s2**

### Variable Information

%s1 = EJB application name

%s2 = Internal code

### Explanation

An exception occurred in the method of Message-driven Bean. Backup of the JMS message is made to the backup file.

### System Action

Continues the startup of the IJServer. The message is serialized and backed up to the following backup file.

**Windows32/64**

C:\Interstage\EJB\var

**Solaris32/64** **Linux32/64**

/opt/FJSSvejb/var

### User Action

Modify the cause of the error.

Because of the message that an error has occurred had been backed up to the backup JMS Destination, deserialize the message then process it again.

## 9.6.41 IJServer21453

---

**IJServer: WARNING: IJServer21453 Backup JMS Destination object type is invalid: NAME=%s1 DESTINATION=%s2 CODE=%s3**

### Variable Information

%s1 = EJB application name

%s2 = JMS Destination name

%s3 = Internal code

### Explanation

Specified type of the JMS Destination object is invalid.

### System Action

Continues the startup of the IJServer. The message that an exception has occurred is backed up to the backup file, not to the backup JMS Destination.

### User Action

JNDI other than the JMS Destination may be specified for the JMS Destination name.

Check if specified backup JMS Destination name is correct.

## 9.6.42 IJServer21454

---

**IJServer: WARNING: IJServer21454 Backup JMS ConnectionFactory type is incompatible with backup JMS Destination type: NAME=%s1 CODE=%s2**

### Variable Information

%s1 = EJB application name

%s2 = JMS Destination name

### Explanation

The type of backup JMS ConnectionFactory is incompatible with the type of the backup JMS Destination.

### System Action

Continues the startup of the EJB application. The message that an exception has occurred is backed up to the backup file, not to the backup JMS Destination.

### User Action

The probable causes follow. Check if specified backup JMS ConnectionFactory name or the backup JMS Destination name is correct.

- Topic for the JMS Destination and QueueConnectionFactory for the JMS ConnectionFactory are specified.
- Queue for the JMS Destination, and TopicConnectionFactory for the JMS ConnectionFactory are specified.

## 9.6.43 IJServer21455

---

**IJServer: ERROR: IJServer21455: cannot start a multiple process With the Publish/Subscribe messaging model of a message-driven bean: NAME=%s1 CODE=%s2**

### Variable Information

%s1 = EJB application name

%s2 = Internal code

### Explanation

Message-driven Bean has already started. Alternatively, "2" or more has been specified for "Process Concurrency" in the IJServer contained in the Message-driven Bean of the Publish/Subscriber messaging module.

It is not possible to start multiple processes for Publish/Subscriber messaging module in Message-driven Bean.

### System Action

Stop process.

### User Action

If "2" or more has been specified for "Process Concurrency", change the value to "1" and re-define.

## 9.6.44 IJServer21456

---

**IJServer: WARNING: IJServer21456: The minimum value of the Message-driven Bean's simultaneous processes exceeds the maximum value. Minimum value will be considered the same value as the maximum value.: NAME=%s1**

### Variable Information

%s1 = IJServer name

### Explanation

A value larger than the maximum number of simultaneously processed Message-driven Beans was set as the minimum number, so the minimum and maximum values were judged to be the same when the IJServer started.

## System Action

Continues with the processing.

## User Action

Change the settings for simultaneously processed Message-driven Beans so that the minimum number is smaller than the maximum number.

## 9.6.45 IJServer21457

---

**IJServer: ERROR: IJServer21457:Stopped receiving messages for a Message-driven Bean because an abnormality occurred in the communication with the event channel: IJServer=%s1 MDB=%s2 CHANNELHOST=%s3 CHANNEL=%s4**

### Variable Information

%s1 = IJServer name

%s2 = EJB application name

%s3 = Name of the host with the event channel

%s4 = Event channel name

### Explanation

A communication error with the event channel was generated due to a termination of the event channel, resulting in messages not being received for a Message-driven Bean.

### System Action

Stops receiving messages for a Message-driven Bean

### User Action

Check if an error is generated on the event channel or if the event channel has been stopped.

To receive messages again, remedy the cause of the error (for example, by activating the event channel, and re-activating the IJServer). Before re-activating the IJServer, check that stopping the IJServer will not cause problems with other processes using or requiring the IJServer to be running.

If "Unknown" is output as the name of the host with the event channel, the CORBA service may not have been activated. Check the Interstage activation status.

Whether the Message-driven Bean can receive messages or not can be checked by referring to [Message Receipt Status] on the Interstage management console by clicking the following screens:

- [WorkUnit], [IJServer Name], [Module Name] > [EJB Application Name] > [Monitor]

## 9.6.46 IJServer21458

---

**IJServer: ERROR: IJServer21458: The specified resource adapter name does not exist: MDB=%s1 RESOURCEADAPTER=%s2**

### Variable Information

%s1 = EJB application name

%s2 = resource adapter name

### Explanation

The specified resource adapter does not exist.

### System Action

Terminate activation of the EJB application.

## User Action

Check that the resource adapter name defined in the Message-driven Bean is correct. If incorrect, specify the correct resource adapter name. If the resource adapter does not exist (for example, because deployment of the resource adapter was canceled), deploy the resource adapter.

## 9.6.47 IJServer21459

---

**IJServer: ERROR: IJServer21459: No resource adapter class specified: MDB=%s1 RESOURCEADAPTER=%s2**

### Variable Information

%s1 = EJB application name

%s2 = resource adapter name

### Explanation

The Message-driven Bean activation failed because the resource adapter class is not defined in the resource adapter.

### System Action

Terminate activation of the EJB application.

### User Action

Resource adapters for which the ResourceAdapter class is not defined cannot be linked with Message-driven Beans. Change the resource adapter name defined in the Message-driven Bean to a resource adapter for which the ResourceAdapter class is been defined. Or, define the ResourceAdapter class in the resource adapter deployment descriptor.

## 9.6.48 IJServer21460

---

**IJServer: ERROR: IJServer21460: Failed to initialize the Message-driven Bean and the resource adapter: MDB=%s1 RESOURCEADAPTER=%s2 DETAIL=%s3**

### Variable Information

%s1 = EJB application name

%s2 = resource adapter name

%s3 = error detail

### Explanation

Failed to initialize the Message-driven Bean linked with the resource adapter.

### System Action

Terminate the activation process for the EJB application.

### User Action

Possible causes are as listed below. Correct the Message-driven Bean or the resource adapter and re-execute.

- Resource adapter activation failed
- The incorrect resource adapter name was specified in the Message-driven Bean
- Resource adapter class load failed.
- A property specified in the activation-config-property is incorrect.
- Other cause
  - the resource adapter is not in a valid state for linking with the Message-driven Bean

## 9.7 IJServer21900 to IJServer21099

---

This section details the messages with message numbers between IJServer21900 and EJB2000.

### 9.7.1 IJServer21999

---

**IJServer: ERROR: IJServer21999: System error occurred: NAME=%s1 CODE=%s2**

#### Variable Information

%s1 = EJB application name

%s2 = System code

#### Explanation

A system error occurred due to an environment abnormality or for some other reason.

#### System Action

Stops the EJB application.

#### User Action

If the system code is [TISE:0602], possible causes are as follows:

- In the IJServer used, Web and EJB applications run in the same Java VM, and the JDBC database obtained in the EJB application was used to issue the "getConnection" method in the Web application.
- In the IJServer used, Web and EJB applications run in the same Java VM, and the JDBC database obtained in the Web application was used to issue the "getConnection" method in the EJB application.

In the above cases, take the following action:

If Web and EJB applications run in the same Java VM, and the JDBC database is used in the Web and EJB applications, use the InitialContext "lookup" method to obtain the JDBC database in each application.

In all other cases, check the following:

**Windows32/64**

The possible causes are:

- The environment variable setting is incorrect.
- ISMVIDL was not executed in JDK/JRE1.2.2.
- The product was not installed correctly.
- The JDBC driver library was not specified.
- Lookup processing is being executed in the Entity Bean constructor.

If one of the above causes applies, do the following:

- If the environment variable setting is incorrect, change the environment variable setting.
- If ISMVIDL was not executed in JDK/JRE1.2.2, execute ISMVIDL in JDK/JRE1.2.2.
- If the product was not correctly installed, install it correctly.
- If the JDBC driver library was not specified, on the Interstage, select [WorkUnit], [IJServer Name], [Environment Setup], and then [WorkUnit Setting] and set a necessary JDBC driver library at "Classpath." Then restart the IJServer.
- If lookup processing is executed in the Entity Bean constructor, correct the EJB application so that lookup processing is executed in the setEntityContext method.

If none of the above causes applies, write the message information, use the *iscollectinfo* command to collect the diagnostic information, and then contact a Fujitsu systems engineer.

The possible causes are:

- The access permission to the J2EE common directory and its subordinate directories or files has been changed.
- The upper and lower cases of the file name were changed when the EJB application was being copied to the server machine after deployment.
- The environment variable setting is incorrect.
- ISMVIDL was not executed in JDK/JRE1.2.2.
- The product was not installed correctly.
- The JDBC driver library was not specified.
- Lookup processing is being executed in the Entity Bean constructor.

If one of the above causes applies, do the following:

- If the access permission to the J2EE common directory and its subordinate directories or files has been changed, check the access permission.
- If the upper and lower cases of the file name were changed when the EJB application was being copied to the server machine after deployment, check the file name after the EJB application was copied to the server machine.
- If the environment variable setting is incorrect, change the environment variable setting.
- If ISMVIDL was not executed in JDK/JRE1.2.2, execute ISMVIDL in JDK/JRE1.2.2.
- If the product was not correctly installed, install it correctly.
- If the JDBC driver library was not specified, on the Interstage, select [WorkUnit], [IJSERVER Name], [Environment Setup], and then [WorkUnit Setting] and set a necessary JDBC driver library at "Classpath." Then, restart the IJSERVER.
- If lookup processing is executed in the Entity Bean constructor, correct the EJB application so that lookup processing is executed in the setEntityContext method.

If none of the above causes applies, Note the message information, use the *iscollectinfo* command to collect the diagnostic information, and then contact a Fujitsu systems engineer.

## 9.8 IJSERVER25000 to IJSERVER25999

---

This section details the messages with message numbers between IJSERVER25000 and IJSERVER25999.

### 9.8.1 IJSERVER25200

---

**IJSERVER2: ERROR: IJSERVER25200: Unable to activate the module: IJSERVER=%s1: MODULE=%s2**

#### Variable Information

%s1 = IJSERVER name

%s2 = Module name

#### Explanation

The activation processing of the module failed.

#### System Action

Terminates the processing.

#### User Action

Refer to the system log and container log, remove the cause, and perform the operation again.

If "Separate between EARs" is selected for "Separate Class Loader" in the IJServer environment settings, all deployed ejb-jar/WAR/RARs are activated for ejb-jar/RAR activation. In this case, it may be that activation fails for all modules except those that are output in the variable information.

## 9.8.2 IJServer25201

---

**IJServer: ERROR: IJServer25201: An error occurred during module passivation: Please stop the IJServer: IJSERVER=%s1: MODULE=%s2**

### Variable Information

%s1 = IJServer name

%s2 = Module name

### Explanation

The inactivation processing of the module failed.

### System Action

Terminates the processing.

### User Action

Stop IJServer, and if necessary, restart IJServer.

If "Separate between EARs" is selected for "Separate Class Loader" in the IJServer environment settings, all deployed ejb-jar/WAR/RARs are deactivated for ejb-jar/RAR deactivation. In this case, it may be that deactivation fails for all modules except those that are output in the variable information.

## 9.8.3 IJServer25202

---

**IJServer: ERROR: IJServer25202: A timeout occurred during module activation: IJSERVER=%s1: MODULE=%s2**

### Variable Information

%s1 = IJServer name

%s2 = Module name

### Explanation

Activation processing for the module is taking longer than normal.

### System Action

Continues the activation processing.

### User Action

Check the module state, and wait until the module enters a state other than "activation in progress."

If the "activated" state is not entered, refer to the system log and container log, remove the cause, and perform the operation again.

## 9.8.4 IJServer25203

---

**IJServer: ERROR: IJServer25203: A timeout occurred during module passivation: IJSERVER=%s1: MODULE=%s2**

### Variable Information

%s1 = IJServer name

%s2 = Module name

## Explanation

Inactivation processing for the module is taking longer than normal.

## System Action

Continues the inactivation processing.

## User Action

Check the module state, and wait until the module enters a state other than "inactivation in progress." If the "inactivated" state is not entered, stop IJServer, and if necessary, restart IJServer.

## 9.8.5 IJServer25204

---

**IJServer: ERROR: IJServer25204: Unable to activate the module: IJSERVER=%s1: MODULE=%s2: STATE=%s3**

### Variable Information

%s1 = IJServer name

%s2 = Module name

%s3 = Module state

## Explanation

The activation processing of the module failed.

## System Action

Terminates the processing.

## User Action

Refer to the system log and container log, remove the cause, and perform the operation again.

If "Separate between EARs" has been selected in "Separate class loaders" in the IJServer environment settings, ejb-jar/RAR activation processing is executed for all deployed ejb-jar/WAR/RARs. For this reason, it may be that activation failed for a module that is not output in the variable information.

## 9.8.6 IJServer25205

---

**IJServer: ERROR: IJServer25205: An error occurred during module passivation: Please stop the IJServer: IJSERVER=%s1: MODULE=%s2: STATE=%s3**

### Variable Information

%s1 = IJServer name

%s2 = Module name

%s3 = Module state

## Explanation

The inactivation processing of the module failed.

## System Action

Terminates the processing.

## User Action

Stop IJServer, and if necessary, restart IJServer.

If "Separate between EARs" has been selected in "Separate class loaders" in the IJServer environment settings, ejb-jar/RAR passivation processing is executed for all deployed ejb-jar/WAR/RARs. For this reason, it may be that passivation failed for a module that is not output in the variable information.

## 9.8.7 IJServer25206

---

**IJServer: ERROR: IJServer25206: Unable to activate the module: Another process is currently running: IJSERVER=%s1: MODULE=%s2**

### Variable Information

%s1 = IJServer name

%s2 = Module name

### Explanation

Since other processing was in progress, the activation processing of the module could not be performed.

### System Action

Terminates the processing.

### User Action

Check the module state, wait until module enters the "activated" or "inactivated" state, and perform the operation again. If the module is in another state, stop IJServer, and if necessary, restart IJServer.

## 9.8.8 IJServer25207

---

**IJServer: ERROR: IJServer25207: Unable to passivate the module: Another process is currently running: IJSERVER=%s1: MODULE=%s2**

### Variable Information

%s1 = IJServer name

%s2 = Module name

### Explanation

Since other processing was in progress, the inactivation processing of the module could not be performed.

### System Action

Terminates the processing.

### User Action

Check the module state, wait until module enters the "activated" or "inactivated" state, and perform the operation again. If the module is in another state, stop IJServer, and if necessary, restart IJServer.

## 9.8.9 IJServer25208

---

**IJServer: ERROR: IJServer25208: Processing cannot proceed as the IJServer is stopped: IJSERVER=%s1: MODULE=%s2**

### Variable Information

%s1 = IJServer name

%s2 = Module name

### Explanation

Processing could not proceed because access could not be gained to the IJServer process.

## System Action

Terminates the processing.

## User Action

Start IJServer, and perform the operation again. When IJServer is started, it might cause Interstage JMX Service to restart. In this case, restart IJServer and then re-execute processing.

### Note

If IJServer is started when the above services are restarted, it will not be possible to execute monitor reference or use the HotDeploy function for that IJServer. Restart the IJServer at the same time as the above operation.

## 9.8.10 IJServer25209

---

**IJServer: ERROR: IJServer25209: Module has already been activated: IJSERVER=%s1: MODULE=%s2**

### Variable Information

%s1 = IJServer name

%s2 = Module name

### Explanation

The module has already been activated.

### System Action

Terminates the processing.

### User Action

Check the module state, and if the state is abnormal, restart IJServer.

## 9.8.11 IJServer25210

---

**IJServer: ERROR: IJServer25210: Unable to allocate memory: IJSERVER=%s1**

### Variable Information

%s1 = IJServer name

### Explanation

The memory allocation failed.

### System Action

Terminates the processing.

### User Action

Perform the operation again after a short time. If this message is output frequently, estimate the required memory space by referring to the Tuning Guide, and then check whether there is enough memory.

A memory shortage may occur if other applications are also using memory. Estimate the required memory space again for other applications that are running on the same computer, and check whether the memory space is adequate.

If after re-estimating the required memory, there is still insufficient memory space, contact the system administrator. The system administrator shall expand the main memory or the swap area.

## 9.8.12 IJServer25211

---

**IJServer: ERROR: IJServer25211: Module has already been passivated: IJSERVER=%s1: MODULE=%s2**

#### Variable Information

%s1 = IJServer name

%s2 = Module name

#### Explanation

The module has already been inactivated.

#### System Action

Terminates the processing.

#### User Action

Check the module state, and if the state is abnormal, restart IJServer.

### 9.8.13 IJServer25212

---

**IJServer: ERROR: IJServer25212: Unless the hot deploy function is to be used, the reactivate processing cannot be executed with the active IJServer**

#### Explanation

Reactivate is only possible if the hot deploy function is used

#### System Action

Terminates the processing.

#### User Action

Enable the hot deploy function and then re-execute processing.

### 9.8.14 IJServer25213

---

**IJServer: ERROR: IJServer25213: Unable to read the definition file: IJSERVER=%s1: FILE=%s2: DETAIL=%s3**

#### Variable Information

%s1 = IJServer name

%s2 = File name

%s3 = Error detail information

#### Explanation

Unable to read the definition file.

#### System Action

Terminates the processing.

#### User Action

It might be that there is no authority to access the definition file, or that the file is not ready. Change the access authority or the definition file. If this does not work, restore the file.

### 9.8.15 IJServer25214

---

**IJServer: ERROR: IJServer25214: When the class loaders are not separated, neither EAR, RAR, nor ejb-jar can use the hot deploy function**

## Explanation

The hot deploy function can only be used when the class loaders are separated.

## System Action

Terminates the processing.

## User Action

Only use the hot deploy function when the class loaders are separated.

## 9.8.16 IJServer25215

---

**IJServer: ERROR: IJServer25215: One or more modules failed to activate: Confirm the state of the modules: IJSERVER=%s1**

## Variable Information

%s1 = IJServer name

## Explanation

An error occurred during module activation.

## System Action

Stops processing.

## User Action

Check the module status. If there are any modules for which activation failed, refer to the container log to establish the cause of the error, and then change the module to active status by reactivating it.

If "Separate between EARs" has been selected in "Separate class loaders" in the IJServer environment settings, all deployed ejb-jar/WAR/RARs are activated. For this reason, it may be that activation failed for a module that is not a target of the current operation.

## 9.8.17 IJServer25216

---

**IJServer: ERROR: IJServer25216: One or more modules failed to passivate: Please stop the IJServer: IJSERVER=%s1**

## Variable Information

%s1 = IJServer name

## Explanation

The inactivation processing of the module failed.

## System Action

Stop process.

## User Action

Stop IJServer and start it again where necessary.

If "Separate between EARs" has been selected in "Separate class loaders" in the IJServer environment settings, ejb-jar/RAR passivation processing is executed for all deployed ejb-jar/WAR/RARs. For this reason, it may be that passivation failed for a module that is not output in the variable information.

## 9.8.18 IJServer25399

---

**IJServer: ERROR: IJServer25399: System error occurred: Details=%s1**

## Variable Information

%s1 = Detail error information

## Explanation

System error occurred.

## System Action

Terminates the processing.

## User Action

Collect the information of this message and collect information for investigation with the `iscollectinfo` command, and contact the technician.

## 9.9 IJServer29000 to IJServer29999

---

This section details the messages with message numbers between IJServer29000 and IJServer29999.

### 9.9.1 IJServer29999

---

**IJServer: ERROR: IJServer29999: system error occurred: NAME=%s1 CODE=%s2**

## Variable Information

%s1 = System error information 1

%s2 = System error information 2

## Explanation

An environment abnormality or system error occurred for some reason

## System Action

Stops processing

## User Action

**Windows32/64**

The probable causes are:

System error information 2	Cause	Corrective action
2	The IJServer directory was deleted.	Use the <code>ijsrestore</code> command to restore the IJServer resources.  For details of the <code>ijsrestore</code> command, refer to the Reference Manual (Command Edition).
17	The deployment source directory contains unnecessary information.	When the deployed EJB application was copied to the server machine, a directory that had been copied previously may have existed.  Delete the copied directory, and then copy the EJB application.
28	Insufficient free disk space.	Check the amount of free disk space.
110	An attempt was made to change the JNDI name and forcibly deploy an IJServer that was running.	Terminate the relevant IJServer and then forcibly deploy it.

System error information 2	Cause	Corrective action
601 614 615	An invalid environment variable was set. A jar file was deleted.	Check the following environment variable settings: IS_J2EEAPF CLASSPATH Interstage installation destination\J2EE\lib \isj2ee.jar The definition information is incorrect. Restore the resources that have been backed up. If the J2EE shared resources or Interstage EJB service are not installed, install them. If the above method does not resolve the problem, Interstage is in an inoperable state and must be reinstalled.
602	A memory shortage occurred.	Check the memory capacity.

If system error information 2 (%s2) is not listed in the above table, or if you take the action suggested in the table but the results are not satisfactory, collect the following data (if output) and information about this message (use the *iscollectinfo* command to collect the diagnostic information) and then contact a Fujitsu systems engineer:

- Current directory in which the command was entered\XXXX.trc
- C:\Interstage\EJB\var\XXXX.trc
- C:\Interstage\Td\var\td001\tmp\is\XXXX.trc

(XXXX = Arbitrary name)

**Solaris32/64** **Linux32/64**

The probable causes are:

System error information 2	Cause	Corrective action
2	The IJServer directory was deleted.	Use the <i>ijsrestore</i> command to restore the IJServer resources. For details of the <i>ijsrestore</i> command, refer to the Reference Manual (Command Edition).
13	The access permission of the IJServer directory and its subordinate directory or file was changed.	If the access permission of the IJServer directory and its subordinate directory or file was changed, use the <i>chmod</i> command to restore the access permission.
17	The deployment source directory contains unnecessary information.	When the deployed EJB application was copied to the server machine, a directory that had been copied previously may have existed. Delete the copied directory, and then copy the EJB application.
28	Insufficient free disk space.	Check the size of free disk space.
110	An attempt was made to change the JNDI name and forcibly deploy an IJServer that was running.	Terminate the relevant IJServer and then forcibly deploy it.
601 614	A jar file was deleted.	The definition information is incorrect. Restore the resources that have been backed up.

System error information 2	Cause	Corrective action
615		If the J2EE shared resources or Interstage EJB service are not installed, install them.  If the above method does not resolve the problem, Interstage is in an inoperable state and must be reinstalled.
602	A memory shortage occurred.	Check the memory capacity.

If system error information 2 (%s2 ) is not listed in the above table, or if you take the action suggested in the table but the results are not satisfactory, collect the following data (if output) and information about this message (use the *iscollectinfo* command to collect the diagnostic information) and then contact a Fujitsu systems engineer:

- Current directory in which the command was entered/XXXX.trc
- opt/FJSVejb/var/XXXX.trc
- /var/opt/FJSVj2ee/deployment/ijservice/{IJServer name}/current/XXXX.trc

(XXXX = Arbitrary name)

## 9.10 IJServer21239 CMP Message

---

The CMP messages are explained in "Detailed messages" of the exception message "IJServer21239."

If you are using CMP1.1, refer to [9.4.35.1 CMP1.1 Detailed Messages](#). If you are using CMP2.0, refer to [9.4.35.2 CMP2.x Detailed Messages](#).

# Chapter 10 Messages Beginning with 'IJSERVER3'

This chapter describes the messages displayed by the IJSERVER.

If an exception is output following a message described in this chapter, refer to the contents of the exception and remedy the cause of the error.

The Web application names output in the messages described in this chapter may contain the following:

- A '/' (slash) added to the beginning of the Web application name.
- No Web application name will be output if the Web application name is ROOT.

## 10.1 IJSERVER30001 to IJSERVER30999

This section details messages numbered between IJSERVER30001 and IJSERVER30999.

### 10.1.1 IJSERVER30001

**IJSERVER: INFO: IJSERVER30001: JVM Alert Mode is set: MODE=%s**

Variable Information

%s = Operating mode setting of the alert monitoring function ("ON" or "OFF")

Explanation

Indicates the current setting for the operating mode of the alert monitoring function. When "ON" is set for the operating mode of the alert monitoring function, this function is enabled. When "OFF" is set for the operating mode of the alert monitoring function, this function is disabled.

### 10.1.2 IJSERVER30002

**IJSERVER: WARNING: IJSERVER30002: JavaVM Monitoring is not available: ERROR=%s**

Variable Information

%s = Error information

Explanation

Collection of performance information of JavaVM cannot be used. After this warning is output, the following functions cannot be used:

- Warning Monitoring
- Collection of JavaVM information of IJSERVER monitor
  - JavaVM Perm area information
  - Garbage collection information
- JavaVM information of J2EE monitor logging
  - JavaVM Perm area information
  - Garbage collection information

This message is output when the JavaVM in use is not the one bundled with the product.

System Action

Application processing continues.

## User Action

The JavaVM bundled with the product should be used in order to execute any of the following functions; warning monitor, JavaVM information of IJServer monitor, and JavaVM information of J2EE monitor logging.

### 10.1.3 IJServer30003

**IJServer: WARNING: IJServer30003: An abnormality found in Interstage installed environment: FILE=%s1 ERROR=%s2**

#### Variable Information

%s1 = File name

%s2 = Error information

#### Explanation

An error occurred in the Interstage installed environment.

#### System Action

Application processing continues.

The collection of JavaVM performance information stops.

After this warning is output, the following function is disabled:

- Warning Monitoring

#### User Action

Reinstall Interstage.

### 10.1.4 IJServer30004

**IJServer: WARNING: IJServer30004: JavaVM may have run out of memory: MESSAGE=%s**

#### Variable Information

%s = Detailed message

#### Explanation

The JavaVM heap use quantity exceeded the specified warning value. There is a possibility of occurrence of OutOfMemoryError.

Table 10.1 Detailed Message information

Detailed message	Description (*1)	Resources to be tuned
OutOfMemoryError warning is occurred because the Perm region is exhausted: TIME={0} SIZE={1} TIME: Occurrence time SIZE: Perm area size increased rapidly (bytes)	When usage of the Perm area increases rapidly, there is a possibility that memory will be insufficient.	Perm area
It takes long time to do the garbage collections many times: TIME={0} AVERAGE={1} TIME: Occurrence time SIZE: Average of last three GC times (milliseconds)	Garbage collection takes too much time. This message displays when the CPU is overloaded due to garbage collection activities.	Heap area
Inefficient garbage collections are run with the short intervals: TIME={0} WEIGHT={1} TIME: Occurrence time	Garbage collection occurs at short intervals; this is inefficient and results in the message display.	Heap area

Detailed message	Description (*1)	Resources to be tuned
WEIGHT: Utilization of the earlier generation immediately before GC (%)		
The garbage collections are run with the short intervals because of the lack of the memory: TIME={0} SIZE={1} TIME: Occurrence time SIZE: Insufficient heap size at occurrence of the warning (bytes)	Garbage collection occurs at short intervals. Possible causes are as follows: - A memory shortage - The gc() method of a java.lang.System class is explicit with the application.	Heap area
There are possibilities of OutOfMemoryError because of the lack of the memory: TIME={0} SIZE={1} TIME: Occurrence time SIZE: Insufficient heap size at occurrence of the warning (bytes)	There is a possibility of occurrence of OutOfMemory due to a memory shortage.	Heap area
There are possibilities of OutOfMemoryError because of the lack of the Perm region: TIME={0} SIZE={1} TIME: Occurrence time SIZE: Insufficient Perm area size at occurrence of the warning (bytes)	There is a possibility of occurrence of OutOfMemory due to a Perm area shortage.	Perm area
The garbage collections are run with the short intervals: TIME={0} INTERVAL={1} TIME: Occurrence time INTERVAL: GC interval time (milliseconds)	Garbage collection occurs at short intervals.	Heap area
System.gc() are run with the short intervals: TIME={0} INTERVAL={1} TIME: Occurrence time INTERVAL: System.gc interval time (milliseconds)	System.gc occurs at short intervals.	Heap area

\*1 Garbage collection uses the Full GC information.

#### Note

The occurrence time is output in the following format:

```
year/month/day hour:minute:second.millisecond
```

#### System Action

Application processing continues.

#### User Action

View the JavaVM performance information on the monitor of the Interstage Management Console and perform the tuning necessary to remove the problem described in the detailed message.

This message may be output when starting the WorkUnit or when the system is temporarily overloaded. In such cases, ignore this message if the heap information and Perm area information in JavaVM indicate that there is no problem.

This message may be output when the gc() method of a java.lang.System class is explicit with an application while starting IJServer or during employment. In this case, check the JavaVM heap information and Perm domain information using the Interstage Management Console monitor. If there are no problems (such as memory shortage), this message can be ignored.

## 10.1.5 IJServer30005

---

**IJServer: WARNING: IJServer30005: JavaVM Monitoring is stopped due to the unexpected error: CODE=%s1 ERROR=%s2**

### Variable Information

%s1 = Error information 1

%s2 = Error information 2

### Explanation

An unexpected error occurred and collection of JavaVM performance information stopped.

### System Action

Application processing continues.

Collection of JavaVM performance information stops. After this warning message is displayed, the following functions are disabled:

- Warning Monitoring
- Collection of JavaVM information of IJServer monitor
  - JavaVM operation time
  - JavaVM heap information
  - JavaVM Perm area information
  - Garbage collection information
- Collection of JavaVM information of J2EE monitor logging
  - JavaVM operation time
  - JavaVM heap information
  - JavaVM Perm area information
  - Garbage collection information

### User Action

Remove the cause of the error by seeing error information 2.

If the problem cannot be removed, record the error information and contact the service engineer.

## 10.1.6 IJServer30006

---

**IJServer: INFO: IJServer30006: The option which did not communicate with Interstage JMX service was set.**

### Explanation

An option that does not communicate with the Interstage JMX service was specified. Functions that require communication with the Interstage JMX service (such as the monitor function and HotDeploy function) cannot be used.

## 10.2 IJServer31000 to IJServer31199

---

This section details messages numbered between IJServer31000 and IJServer31199.

### 10.2.1 IJServer31001

---

**IJServer: ERROR: IJServer31001: The XML Parser specified in the JavaVM options cannot start the IJServer: Check the environment setting for the XML Parser: NAME=%s1**

## Variable Information

%s1 = IJServer name

## Explanation

The XML Parser specified in the JavaVM options cannot be used to start the IJServer.

## Cause

The class name specified for the XML Parser is invalid, or the specified class does not exist.

## System Action

Stops the IJServer.

## User Action

Verify that the JavaVM options specify the correct XML parser.

The XML parser specified in the JavaVM options must be the same as that specified in the IJServers environment settings.

## 10.2.2 IJServer31002

---

**IJServer: ERROR: IJServer31002: The XML Parser specified in the property file (lib/jaxp.properties) in the JRE directory cannot start the IJServer: Check the environment setting for the XML Parser: NAME=%s1**

## Variable Information

%s1 = IJServer name

## Explanation

The XML Parser specified in the property file (lib/jaxp.properties) of the JRE directory cannot be used to start the IJServer.

## Cause

The class name specified for the XML Parser is invalid, or the specified class does not exist.

## System Action

Stops the IJServer.

## User Action

Verify that the description in the property file (lib/jaxp.properties) of the JRE directory is correct.

The XML parser specified in the property file must be the same as that specified in the IJServers environment settings.

## 10.2.3 IJServer31003

---

**IJServer: INFO: IJServer31003: "Parent first" has been specified as the class loader delegation policy.**

## Explanation

"Parent first" has been specified for as the class loader delegation policy.

The parent class loaders will be searched first in the class search.

## 10.2.4 IJServer31004

---

**IJServer: INFO: IJServer31004: "Parent last" has been specified as the class loader delegation policy.**

## Explanation

"Parent last" has been specified as the class loader delegation policy.

The parent class loaders will be searched last in the class search.

## 10.2.5 IJServer31005

---

**IJServer: INFO: IJServer31005: The application class loaders will be split between EARs.**

### Explanation

The application class loaders will be split between EARs.

## 10.2.6 IJServer31006

---

**IJServer: INFO: IJServer31006: The class loaders will be split between applications.**

### Explanation

The class loaders will be split between applications.

## 10.2.7 IJServer31007

---

**IJServer: INFO: IJServer31007: The application class loaders will not be split.**

### Explanation

The application class loaders will not be split.

The class loaders for the Web applications will be allocated to respective Web applications.

## 10.2.8 IJServer31008

---

**IJServer: WARNING: IJServer31008: %s1 cannot be registered in the class loader repository because it does not exist.**

### Variable Information

%s1 = JAR file name and directory

### Explanation

The JAR file and directory indicated by the variable %s1 cannot be registered in the class loader repository because it does not exist.

### System Action

Ignores the JAR file and directory indicated by the variable %s1 and continues processing.

### User Action

Check that the JAR file and directory shown in the variable information exist.

## 10.2.9 IJServer31009

---

**IJServer: INFO: IJServer31009: %s1 will be set in the repository for the %s2 class loaders.**

### Variable Information

%s1 = JAR file name or directory name

%s2 = Class loader name

The following character sequences are output by the class loader (class loader : character sequence outputted).

- Interstage class loader: Interstage
- Catalina class loader: Catalina
- Class loader shared by applications: Shared
- Application class loader: Application

- Webapp class loader: Webapp

#### Explanation

The JAR file or the directory indicated by the variable %s1 will be stored in the class loader repository under the name indicated by %s2 .

### 10.2.10 IJServer31010

---

**IJServer: INFO: IJServer31010: [%s1]: Automatic reloading of this module is enabled.**

#### Variable Information

%s1 = Module name

#### Explanation

Automatic reloading of the module indicated by the variable %1 is enabled.

### 10.2.11 IJServer31011

---

**IJServer: WARNING: IJServer31011: [%s1]: Automatic reloading of this module is disabled.**

#### Variable Information

%s1 = Module name

#### Explanation

The module indicated by the variable information cannot be reloaded automatically because the class loader split status is set to "Not to split".

#### System Action

Does not automatically reload the module indicated by the variable %1.

#### User Action

To enable automatic reloading, change the class loader split status to "Split between EARs" or "Split all".

### 10.2.12 IJServer31012

---

**IJServer: INFO: IJServer31012: Resource '%s1' was modified; Date is now: %s2 (Was: %s3)**

#### Variable Information

%s1 = Class file name

%s2 = Current time stamp

%s3 = Previous time stamp

#### Explanation

An error occurred in the Interstage installed environment.

The class file was modified.

### 10.2.13 IJServer31013

---

**IJServer: INFO: IJServer31013: Reloading of the module "%s1" has started.**

#### Variable Information

%s1 = ejb-jar file name

#### Explanation

Reloading of the ejb-jar file has started.

### 10.2.14 IJServer31014

---

**IJServer: INFO: IJServer31014: Reloading of the EJB application "%s1" has started.**

#### Variable Information

%s1 = EJB application name

#### Explanation

An error occurred in the Interstage installed environment.

#### System Action

Application processing continues.

#### User Action

Reloading of the EJB application has started.

### 10.2.15 IJServer31015

---

**IJServer: INFO: IJServer31015: Reloading of the EJB application "%s1" has completed.**

#### Variable Information

%s1 = EJB application name

#### Explanation

Reloading of the EJB application is complete.

### 10.2.16 IJServer31016

---

**IJServer: INFO: IJServer31016: Reloading of the context has started.**

#### Explanation

Reloading of the context has started.

### 10.2.17 IJServer31017

---

**IJServer: INFO: IJServer31017: Reloading of this context is complete.**

#### Explanation

Reloading of this context is complete.

### 10.2.18 IJServer31018

---

**IJServer: INFO: IJServer31018: Reloading of module "%s1" is complete.**

#### Variable Information

%s1 = ejb-jar file name

#### Explanation

Reloading of the ejb-jar file is complete.

## 10.2.19 IJServer31019

---

**IJServer: ERROR: IJServer31019: The module cannot be stopped a request is being processed: IJSERVER=%s1 MODULE=%s2**

### Variable Information

%s1 = IJServer name

%s2 = Module name

### Explanation

The module cannot be stopped because request processing is in progress.

### System Action

Stops the deactivation of the module.

### User Action

Take one of the following actions:

- Continue deactivation after the request has been processed.
- Stop the IJServer.

## 10.2.20 IJServer31020

---

**IJServer: ERROR: IJServer31020: An error was generated during module stop processing: Stop the IJServer: IJSERVER=%s1 MODULE=%s2 REASON=%s3**

### Variable Information

%s1 = IJServer name

%s2 = Module name

%s3 = Detail code

### Explanation

An error was generated during module deactivation.

### System Action

Stops the deactivation of the module.

### User Action

Stop the IJServer.

## 10.2.21 IJServer31021

---

**IJServer: ERROR: IJServer31021: The module cannot be activated: IJSERVER=%s1 MODULE=%s2**

### Variable Information

%s1 = IJServer name

%s2 = Module name

### Explanation

An error was generated during module activation.

### System Action

Stops the processing.

## User Action

Refer to the message previously output to the container log and remove the cause of the failure. Then re-start the module.

### 10.2.22 IJServer31030

---

**IJServer: INFO: IJServer31030: The interval for checking the auto reloading operation for the "%s1" module will be set at "%s2" seconds.**

#### Variable Information

%s1: Application name

%s2: Reload interval in seconds

#### Explanation

The interval for checking the auto reloading operation has been set for the module.

### 10.2.23 IJServer31031

---

**IJServer: INFO: IJServer31031: The interval for checking the auto reloading operation has not been set because auto reloading of the module "%s1" is disabled.**

#### Variable Information

%s1: Application name

#### Explanation

The interval for checking the auto reloading operation was not set because auto reloading for the module was disabled.

### 10.2.24 IJServer31032

---

**IJServer: INFO: IJServer31032: The hot deploy function of the IJServer will be enabled. IJSERVER="%s1"**

#### Variable Information

%s1: IJServer name

#### Explanation

The hot deploy function of the IJServer will be enabled.

### 10.2.25 IJServer31033

---

**IJServer: INFO: IJServer31033: The hot deploy function of the IJServer will be disabled. IJSERVER="%s1"**

#### Variable Information

%s1: IJServer name

#### Explanation

The hot deploy function of the IJServer will be disabled.

### 10.2.26 IJServer31034

---

**IJServer: ERROR: IJServer31034: The definition file "%2" of the module "%s1" could not be read.**

#### Variable Information

%s1: Application name

%s2: File name

#### Explanation

The definition file "%2" cannot be read.

#### System Action

Terminates the processing.

#### User Action

Check that the file can be located, that read right has been assigned, and that the file is not damaged.

### 10.2.27 IJServer31035

---

**IJServer: INFO: IJServer31035: The IJServer termination processing is placed on the queue because application processing is in progress.**

#### Explanation

The IJServer received a termination request but the termination processing will be queued because application processing is being executed.

### 10.2.28 IJServer31036

---

**IJServer: INFO: IJServer31036: The IJServer termination processing will begin because the application processing has been completed.**

#### Explanation

The termination processing will begin, as all the applications being executed have been completed while the IJServer termination processing was placed on the queue.

### 10.2.29 IJServer31037

---

**IJServer: WARNING: IJServer31037: The reload processing will not be performed because the IJServer is being terminated.**

#### Explanation

A reloading operation of an application has been detected, but it will be ignored as the IJServer is being terminated.

### 10.2.30 IJServer31038

---

**IJServer: ERROR: IJServer31038: The application "%s1" has already been deployed.**

#### Variable Information

%s1: Application name

#### Explanation

An application to be deployed by the hot deploy function has already been deployed as an application of the same name.

#### System Action

Terminates the processing

#### User Action

The hot deploy function may have failed to undeploy the application "%s1". Terminate the IJServer and re-execute the deployment processing.

### 10.2.31 IJServer31039

---

---

**IJServer: ERROR: IJServer31039: The application "%s1" could not be registered.****Variable Information**

%s1: Application name

**Explanation**

An error was generated while registering an application to be deployed by the hot deploy function.

**System Action**

Terminates the processing.

**User Action**

Refer to the container log, identify and remove the cause of the error, and re-execute the deployment processing.

---

**10.2.32 IJServer31040**

---

**IJServer: ERROR: IJServer31040: The application "%s1" cannot be found.****Variable Information**

%s1: Application name

**Explanation**

The application to be undeployed by the hot deploy function can not be found.

**System Action**

Terminates the processing.

**User Action**

The hot deploy function may have failed to deploy the application "%s1". Re-execute the deployment processing.

---

**10.2.33 IJServer31041**

---

**IJServer: ERROR: IJServer31041: The application "%s1" could not be deleted.****Variable Information**

%s1: Application name

**Explanation**

An error was generated while deleting an application to be undeployed by the hot deploy function.

**System Action**

Terminates the processing

**User Action**

Refer to the container log, identify and remove the cause of the error, and re-execute the undeployment processing.

---

**10.2.34 IJServer31042**

---

**IJServer: ERROR: IJServer31042: The module cannot be activated because the IJServer has been terminated. IJSERVER=%1: MODULE=%2****Variable Information**

%1: IJServer name

%2: Module name

### Explanation

The module cannot be reactivated because the IJServer had been terminated.

### System Action

Terminates the processing.

### User Action

Activate the IJServer and re-execute processing.

## 10.2.35 IJServer31043

---

**IJServer: ERROR: IJServer31043: The module cannot be activated because the IJServer is being activated. IJSERVER=%1: MODULE=%2**

### Variable Information

%1: IJServer name

%2: Module name

### Explanation

The module cannot be activated because the IJServer was being activated.

### System Action

Terminates the processing.

### User Action

After the IJServer has been activated, re-execute processing.

## 10.2.36 IJServer31044

---

**IJServer: ERROR: IJServer31044: The module cannot be activated because the IJServer is being terminated. IJSERVER=%1: MODULE=%2**

### Variable Information

%1: IJServer name

%2: Module name

### Explanation

The module cannot be activated because the IJServer was being terminated.

### System Action

Terminates the processing.

### User Action

After the IJServer has been terminated, execute the deployment processing. Alternatively, after the IJServer has been reactivated, execute the deployment processing.

## 10.2.37 IJServer31045

---

**IJServer: ERROR: IJServer31045: The module could not be activated. IJSERVER=%1: MODULE=%2: STATE=%3**

### Variable Information

%1: IJServer name

%2: Module name

%3: State

#### Explanation

An error was generated during module activation.

#### System Action

Terminates the processing.

#### User Action

Refer to the container log, identify and remove the cause of the error, and re-execute processing.

### 10.2.38 IJServer31046

---

**IJServer: WARNING: IJServer31046: Time-out was generated during the module activation processing. IJSERVER=%1: MODULE=%2**

#### Variable Information

%1: IJServer name

%2: Module name

#### Explanation

Time-out was generated during the module activation processing.

#### System Action

Continues the processing.

#### User Action

Refer to the container log, identify and remove the cause of the error, and re-execute the processing.

### 10.2.39 IJServer31047

---

**IJServer: ERROR: IJServer31047: The module cannot be deactivated because the IJServer has been terminated. IJSERVER=%1: MODULE=%2**

#### Variable Information

%1: IJServer name

%2: Module name

#### Explanation

The module could not be deactivated because the IJServer had been terminated.

#### System Action

Terminates the processing.

#### User Action

Re-activate the IJServer and re-execute processing.

### 10.2.40 IJServer31048

---

**IJServer: ERROR: IJServer31048: The module cannot be deactivated because the IJServer is being activated. IJSERVER=%1: MODULE=%2**

#### Variable Information

%1: IJServer name

%2: Module name

#### Explanation

The module cannot be deactivated because the IJServer was being activated.

#### System Action

Terminates the processing.

#### User Action

Re-activate the IJServer and re-execute processing.

### 10.2.41 IJServer31049

---

**IJServer: ERROR: IJServer31049: The module cannot be deactivated because the IJServer is being terminated. IJSERVER=%1: MODULE=%2**

#### Variable Information

%1: IJServer name

%2: Module name

#### Explanation

The module cannot be deactivated because the IJServer was being terminated.

#### System Action

Terminates the processing.

#### User Action

After the IJServer has been terminated, execute the undeployment processing. Alternatively, after the IJServer has been reactivated, execute the undeployment processing.

### 10.2.42 IJServer31050

---

**IJServer: ERROR: IJServer31050: The module could not be deactivated. IJSERVER=%1: MODULE=%2: STATE=%3**

#### Variable Information

%1: IJServer name

%2: Module name

%3: State

#### Explanation

An error was generated while the module was being deactivated.

#### System Action

Terminates the processing.

#### User Action

Refer to the container log, identify and remove the cause of the error, and re-execute processing.

## 10.2.43 IJServer31051

---

**IJServer: WARNING: IJServer31051: Time-out was generated during the module deactivation processing. IJSERVER=%1: MODULE=%2**

### Variable Information

%1: IJServer name

%2: Module name

### Explanation

Time-out was generated during the module deactivation processing.

### System Action

Continues the processing.

### User Action

Refer to the container log, identify and remove the cause of the error, and re-execute the processing.

## 10.2.44 IJServer31052

---

**IJServer: WARNING: IJServer31052: The application could not be registered. Application name = "%s1"**

### Variable Information

%s1: Application name

### Explanation

The application "%s1" could not be registered when the container was activated.

### System Action

Continues the processing.

### User Action

Refer to the container log, identify and remove the cause of the error, and re-activate the IJServer.

## 10.2.45 IJServer31053

---

**IJServer: ERROR: IJServer31053: The IJServer could not be activated.**

### Explanation

An error was generated during the IJServer activation.

### System Action

Terminates the processing.

### User Action

Refer to the container information log and the container log, identify and remove the cause of the error, and re-activate the IJServer.

## 10.2.46 IJServer31054

---

**IJServer: INFO: IJServer31054: The auto reload processing will not be performed for the class because another operation is being executed.**

### Explanation

An auto reloading operation was detected but it was ignored as another operation was being executed.

## System Action

Continues the processing.

## 10.2.47 IJServer31055

---

**IJServer: ERROR: IJServer31055: Unless the hot deploy function is to be used, the reactivate processing cannot be executed with the active IJServer.**

### Explanation

The processing cannot be continued because the reactivate processing cannot be executed with the active IJServer except when the hot deploy function is to be used.

### System Action

Interrupts the processing.

### User Action

Make the hot deploy function effective, then re-execute processing.

## 10.2.48 IJServer31056

---

**IJServer: ERROR: IJServer31056: The module cannot be activated because the module is not in the state where activation can be performed: IJSERVER=%1: MODULE=%2: STATE=%3**

### Variable Information

%1: IJServer name

%2: Module name

%3: State

### Explanation

The module cannot be activated .

### Cause

The module is not in the state where activation can be performed.

### System Action

Terminates the processing.

### User Action

Refer to the message previously output to the container log and remove the cause of the failure. Then reactivate the module.

When a timeout occurs during the activation process and the message IJServer31056 is output to the Interstage Management Console, wait for the activation process to complete and then reactivate a module.

If, after a timeout occurs, the activation process fails to complete, the application may not be able to respond. In this case, force the IJServer to stop.

## 10.2.49 IJServer31057

---

**IJServer: ERROR: IJServer31057: The module cannot be passivated because the module is not in the state where passivation can be performed: IJSERVER=%1: MODULE=%2: STATE=%3**

### Variable Information

%1: IJServer name

%2: Module name

%3: State

#### Explanation

The module cannot be deactivated.

#### Cause

The module is not in the state where deactivation can be performed.

#### System Action

Terminates the processing.

#### User Action

When a timeout occurs during deactivation and the message IJServer31057 is output to the Interstage Management Console, wait for deactivation to complete and then re-execute processing.

If, after the timeout, deactivation fails to complete, the application may be not be able to respond. In this case, force IJServer to stop.

## 10.2.50 IJServer31058

---

**IJServer: ERROR: IJServer31058: The specified XML parser cannot start the IJServer: Check the environment setting for the XML parser: NAME=%s1**

#### Variable Information

%1: IJServer name

#### Explanation

The specified XML parser cannot start the IJServer.

#### Cause

There may be a conflict in the XML parser interface.

#### System Action

Terminates the processing.

#### User Action

Verify that there are no problems (no conflicts with the interface) with the specified XML parser.

## 10.2.51 IJServer31060

---

**IJServer: ERROR: IJServer31060: The value specified for the machine peculiar ID is incorrect : %s1**

#### Variable Information

%1: machine peculiar ID

#### Explanation

Either invalid characters were specified for the machine-specific ID, or the character length exceeded the limit.

#### System Action

Terminates the processing.

#### User Action

Specify a maximum of [16] half-width alphanumeric characters for the machine-specific ID.

Check that the machine-specific ID is correct, and then restart IJServer.

## 10.3 IJServer31200 to IJServer31299

---

This section details messages numbered between IJServer31200 and IJServer31299.

### 10.3.1 IJServer31200

---

**IJServer: ERROR: IJServer31200: The module could not be activated. IJServer=%1: MODULE=%2: STATE=%3**

#### Variable Information

%1: IJServer name

%2: Module name

%3: State

#### Explanation

The module could not be activated.

#### System Action

Terminates the processing.

#### User Action

Refer to the container log, identify and remove the cause of the error, and re-execute processing.

This message is also output when IJServer is operating at reduced capacity. In this case, restore a WorkUnit if necessary and restore a process.

Alternatively, in the "ejb-jar/RAR" activation processing where "Split between EARs" has been selected in the IJServer environment setting for "Splitting of the class loaders", all the "ejb-jar/WAR/RAR" modules that are deployed will be activated. In this instance, activation of modules other than those output to the "Variable Information" may fail.

This message is also output during the degenerate operation of IJServer. In this instance, restore the work unit as required, and recover the process.

### 10.3.2 IJServer31201

---

**IJServer: WARNING: IJServer31201: Time-out was generated during the module activation processing. IJServer=%1: MODULE=%2**

#### Variable Information

%1: IJServer name

%2: Module name

#### Explanation

Time-out was generated during the module activation processing.

#### System Action

Application processing continues.

#### User Action

Refer to the container log, identify and remove the cause of the error, and re-execute the processing.

### 10.3.3 IJServer31202

---

**IJServer: ERROR: IJServer31202: An error was generated during module stop processing: Stop the IJServer: IJServer=%s1 MODULE=%s2 STATE=%s3**

#### Variable Information

%1: IJServer name  
%2: Module name  
%3: State of module

#### Explanation

An error was generated during module stop processing.

#### System Action

Terminates the processing.

#### User Action

Stop the IJServer and start IJServer if needed.

Alternatively, in the "ejb-jar/RAR" deactivation processing where "Split between EARs" has been selected for the IJServer environment setting "Splitting of the class loaders", all the "ejb-jar/WAR/RAR" modules that are deployed will be deactivated. In this instance, deactivation of modules other than those output to the "Variable Information" may fail.

### 10.3.4 IJServer31203

---

**IJServer: WARNING: IJServer31203: Time-out was generated during the module deactivation processing. IJServer=%s1: MODULE=%s2**

#### Variable Information

%1: IJServer name  
%2: Module name

#### Explanation

Time-out was generated during the module deactivation processing.

#### System Action

Application processing continues.

#### User Action

Refer to the container log, identify and remove the cause of the error, and re-execute the processing.

### 10.3.5 IJServer31204

---

**IJServer: ERROR: IJServer31204: Reactivating is not effective because the IJServer has been terminated. Activate the IJServer.**

#### Explanation

The reactivate processing cannot be continued because the IJServer has been terminated.

#### System Action

Interrupts the processing.

#### User Action

After activating the IJServer, re-execute processing.

### 10.3.6 IJServer31205

---

**IJServer: ERROR: IJServer31205: A module in an error status exists. Reactivate the IJServer.**

### Explanation

The processing cannot be continued because a module exists in an error status.

### System Action

Interrupts the processing.

### User Action

Since the module has an error status, reactivate the IJServer, then re-execute processing.

## 10.3.7 IJServer31206

---

**IJServer: ERROR: IJServer31206: Unless the hot deploy function is to be used, the reactivate processing cannot be executed with the active IJServer.**

### Explanation

The processing cannot be continued because the reactivate processing cannot be executed with the active IJServer except when the hot deploy function is to be used.

### System Action

Interrupts the processing.

### User Action

Make the hot deploy function effective, then re-execute processing.

## 10.3.8 IJServer31207

---

**IJServer: WARNING: IJServer31207: Some modules could not be activated. Check the status of the modules: IJServer name=%s1**

### Variable Information

% 1: IJServer name

### Explanation

Some modules could not be activated.

### System Action

Continues the processing.

### User Action

Check the status of the modules.

If activation of some of the modules failed, remove the cause of the failure by referring to the system log and the container log. Then, reactivate IJServer or reactivate the modules.

## 10.3.9 IJServer31208

---

**IJServer: ERROR: IJServer31208: One or more modules failed to passivate: Please stop the IJServer: IJServer=%s1**

### Variable Information

% 1: IJServer name

### Explanation

The passivate process of the module failed.

## System Action

Terminates the processing.

## User Action

Stop the IJServer and start IJServer if needed.

Alternatively, when "Split between EARs" has been selected for the IJServer environment setting "Splitting of the class loaders", all the "ejb-jar/WAR/RAR" modules that are deployed will be passivated. In this instance, attempts to passivate modules other than for operation may fail.

## 10.3.10 IJServer31209

---

**IJServer: ERROR: IJServer31209: One or more modules failed to activate: Confirm the state of the modules: IJServer=%s1**

### Variable Information

%1: IJServer name

### Explanation

An error was generated during module activation.

### System Action

Terminates the processing.

User Action
-------------

### User Action

Check the status of the modules. If activation of some of the modules failed, remove the cause of the failure by referring to the container log. Then, reactivate the modules.

Alternatively, when "Split between EARs" has been selected for the IJServer environment setting "Splitting of the class loaders", all the "ejb-jar/WAR/RAR" modules that are deployed will be passivated. In this instance, activation of modules other than for operation may fail.

## 10.3.11 IJServer31210

---

**IJServer: ERROR: IJServer31210: There are resources in the J2EE common directory: Undeploy them and delete the IJServer.**

### Explanation

There are resources in a J2EE common directory. Undeploy these resources and delete the IJServer.

### System Action

Terminates processing.

### User Action

Take one of the following actions:

- If there is an IJServer, delete it. If any IJServers were already present when Interstage was installed, delete those IJServers as well.
- If a connector has been deployed to the system resources, undeploy it.

## 10.3.12 IJServer31211

---

**IJServer: ERROR: IJServer31211: There is a file or directory in the specified J2EE common directory: Specify an empty directory, or a directory that does not exist.**

#### Explanation

There is a file or directory in the specified J2EE common directory. Specify an empty directory, or a directory that does not exist.

#### System Action

Terminates processing.

#### User Action

Specify an empty directory, or a directory that does not exist in the specified J2EE common directory.

### 10.3.13 IJServer31212

---

**IJServer: ERROR: IJServer31212: The path specified in the J2EE common directory is not a directory: Specify a directory.**

#### Explanation

The path specified for the J2EE common directory is not a directory. Specify a directory.

#### System Action

Terminates processing.

#### User Action

Specify a directory for the J2EE common directory.

### 10.3.14 IJServer31213

---

**IJServer: ERROR: IJServer31213: The path specified in the J2EE common directory is not an absolute path: Specify an absolute path.**

#### Explanation

The path specified in the J2EE common directory is not an absolute path. Specify an absolute path.

#### System Action

Terminates processing.

#### User Action

Specify an absolute path for the J2EE common directory.

### 10.3.15 IJServer31214

---

**IJServer: ERROR: IJServer31214: The J2EE properties are being accessed by another operation.**

#### Explanation

The J2EE properties are being accessed by another operation.

#### System Action

Terminates the processing.

#### User Action

Wait until the access mentioned above is complete, and then re-execute.

### 10.3.16 IJServer31215

---

**IJServer: ERROR: IJServer31215: The drive specified in the J2EE common directory was incorrect: Specify a correct drive.**

#### Explanation

The drive specified in the J2EE common directory was incorrect. Specify a valid drive.

#### System Action

Terminates the processing.

#### User Action

Specify a fixed drive in the J2EE common directory.

### 10.3.17 IJServer31216

---

**IJServer: ERROR: IJServer31216: The length of the path specified in the J2EE common directory exceeded the limit. Specify the correct path.**

#### Explanation

The length of the path specified in the J2EE common directory exceeded the limit. Specify the correct path.

#### System Action

Terminates processing.

#### User Action

Specify the correct path.

### 10.3.18 IJServer31217

---

**IJServer: ERROR: IJServer31217: Characters that cannot be used were specified in the J2EE common directory: Specify the correct path.**

#### Explanation

Invalid characters were specified in the J2EE common directory. Specify the correct path.

#### System Action

Terminates the processing.

#### User Action

Specify the correct path.

### 10.3.19 IJServer31218

---

**IJServer: ERROR: IJServer31218: The path specified for the J2EE common directory is the same as the pre-change directory path.**

#### Explanation

The path specified for the J2EE common directory is the same as the pre-change directory path.

#### System Action

Terminates the processing.

#### User Action

Specify the correct path.

### 10.3.20 IJServer31219

---

---

**IJServer: ERROR: IJServer31219: The device specified in the J2EE common directory was incorrect: Specify a correct device.**

**Explanation**

The device specified in the J2EE common directory was invalid.

**System Action**

Terminates the processing.

**User Action**

Specify a valid device.

---

### 10.3.21 IJServer31220

---

**IJServer: ERROR: IJServer31220: Paths containing shortcuts cannot be specified in the J2EE common directory.**

**Explanation**

Paths containing shortcuts cannot be specified in the J2EE common directory.

**System Action**

Terminates the processing.

**User Action**

Specify the correct path.

---

### 10.3.22 IJServer31221

---

**IJServer: ERROR: IJServer31221: The path of J2EE common directory subordinates of a default cannot be specified in the J2EE common directory.**

**Explanation**

It is not possible to specify the path under the default J2EE common directory as the J2EE common directory. The default J2EE common directory is as follows.

/opt/FJsvj2ee/var/deployment

and

/var/opt/FJsvj2ee/deployment

**System Action**

Terminates the processing.

**User Action**

Specify the correct path.

---

### 10.3.23 IJServer31299

---

**IJServer: ERROR: IJServer31299: An internal error has been generated. Detail=%s1**

**Variable Information**

%s1 = Detail message of the error

**Explanation**

An error has been generated in the internal processing.

## System Action

Interrupts the processing.

## User Action

Correct the error by referring to the message and re-executing processing.

**Windows32/64**

If this message is output when the J2EE common directory is changed, then the DOS device name may have been used for the path. Check the path that was specified.

## 10.4 IJServer31300 to IJServer31399

---

This section details messages numbered between IJServer31300 and IJServer31399.

### 10.4.1 IJServer31301

---

**IJServer: WARNING: IJServer31301: A library required for transaction analysis cannot be used.**

#### Explanation

A library required for transaction breakdown analysis cannot be used.

#### System Action

Processing is continued without transaction breakdown analysis.

#### User Action

When using transaction breakdown analysis, install the Systemwalker Service Quality Coordinator Agent. When not using transaction breakdown analysis, set up the IJServer environment in such a way as not to use transaction breakdown analysis.

### 10.4.2 IJServer31302

---

**IJServer: WARNING: IJServer31302: Error occurred in initialization of a library required for transaction analysis: REASON=%s1**

#### Variable Information

%1: Reason

#### Explanation

An error occurred in the initialization of a library required for transaction breakdown analysis.

#### System Action

Processing is continued without transaction breakdown analysis.

#### User Action

Refer to the Systemwalker Service Quality Coordinator Agent manual and remove the cause of the error based on the detailed message.

## 10.5 IJServer31900 to IJServer31999

---

This section details messages numbered between IJServer31900 and IJServer31999.

### 10.5.1 IJServer31999

---

**IJServer: ERROR: IJServer31999: An unexpected error occurred: %s1**

## Variable Information

%s1 = Detail information

## Explanation

An unexpected error occurred.

## System Action

Terminates the processing.

## User Action

Establish the cause of the error based on the detailed information, and re-execute processing.

If the above action does not solve the problem, collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

# 10.6 IJServer32000 to IJServer32099

---

This section details messages numbered between IJServer32000 and IJServer32099.

## 10.6.1 IJServer32001

---

### IJServer32001: The definition file is incorrect.: FILE=%s

#### Variable Information

%s = Definition file name

#### Explanation

The definition file is incorrect.

#### Cause

The definition file cannot be found, or the definition contains an error.

#### User Action

Refer to the exception, and establish the cause of the error.

## 10.6.2 IJServer32002

---

### IJServer32002: The definition file is incorrect.: FILE=%s1 DEFINITION=%s2

#### Variable Information

%s1 = Definition file name

%s2 = Definition name

#### Explanation

The definition file is incorrect.

#### Cause

The definition name of the definition file is incorrect.

#### User Action

Refer to the variable information and exception, and establish the cause of the error.

## 10.6.3 IJServer32003

---

---

**IJServer32003: The definition file is incorrect.: FILE=%s1 DEFINITION=%s2 VALUE=%s3****Variable Information**

%s1 = Definition file name

%s2 = Definition name

%s3 = Definition value

**Explanation**

The definition file is incorrect.

**Cause**

The definition value of the definition file is incorrect.

**User Action**

Refer to the variable information and exception, and establish the cause of the error.

---

**10.6.4 IJServer32004**

---

**IJServer32004: Failed to change the current directory.: TYPE=%s1****Variable Information**

%s1 = "Move directory" or "Create directory"

**Explanation**

An attempt to change the current directory failed.

**Cause**

The current directory does not exist or cannot be accessed.

**User Action**

Check if the access authority setting or the system files of the IJServer directory contain an error.

---

**10.6.5 IJServer32006**

---

**IJServer32006: Failed to start the application.****Explanation**

The application failed to start.

**Cause**

Refer to the exception.

**User Action**

Refer to the exception, and establish the cause of the error.

---

**10.6.6 IJServer32007**

---

**IJServer: WARNING: IJServer32007: Failed to stop the application.****Explanation**

The application failed to stop.

**Cause**

Refer to the exception.

#### System Action

Continues the processing.

### 10.6.7 IJServer32008

---

#### **IJServer: WARNING: IJServer32008: Service rollback failed.**

#### Explanation

Service rollback failed.

#### Cause

Refer to the exception.

#### System Action

Continues the processing.

### 10.6.8 IJServer32009

---

#### **IJServer: WARNING: IJServer32009: Application exit wait failed.**

#### Explanation

The application exit wait failed.

#### Cause

Refer to the exception.

#### System Action

Continues the processing.

### 10.6.9 IJServer32010

---

#### **IJServer: WARNING: Failed to stop the service.**

#### Explanation

The service failed to stop.

#### Cause

Refer to the exception.

#### System Action

Continues the processing.

### 10.6.10 IJServer32011

---

#### **IJServer: INFO: IJServer32011: IJServer is running...**

#### Explanation

The IJServer started up. The IJServer is running.

### 10.6.11 IJServer32014

---

#### **IJServer32014: Failed to start the EJB container.**

#### Explanation

The EJB container failed to start.

#### User Action

Refer to the exception, and establish the cause of the error.

### 10.6.12 IJServer32015

---

#### **IJServer32015: Failed to initialize the service. Service=%s1**

#### Variable Information

%s1 = Service name

#### Explanation

The service failed to initialize.

#### User Action

Refer to the exception, and establish the cause of the error.

### 10.6.13 IJServer32016

---

#### **IJServer32016: Failed to start the service. Service=%s1**

#### Variable Information

%s1 = Service name

#### Explanation

The service failed to start.

#### User Action

Refer to the exception, and establish the cause of the error.

### 10.6.14 IJServer32018

---

#### **IJServer: INFO: IJServer32018: Initialization processed in %s1 ms**

#### Variable Information

%s1: Processing time

#### Explanation

Initialization of the IJServer took %s1 milliseconds.

### 10.6.15 IJServer32019

---

#### **IJServer: INFO: IJServer32019: Server startup in %s1 ms**

#### Variable Information

%s1: Processing time

#### Explanation

The startup processing of the IJServer took %s1 milliseconds.

### 10.6.16 IJServer32020

---

---

**IJServer: INFO: IJServer32020: XML parser DocumentBuilderFactory implementation class has been loaded: CLASS=%s1**

Variable Information

%s1 = Implementation class name

Explanation

The implementation class of the XML parser used by the IJServer has been loaded.

Refer to "XML Parser Settings" in the "J2EE User's Guide" for details on setting the XML parser used by the IJServer.

The implementation class of the XML parser that has been set is as follows:

XML parser setting	DocumentBuilderFactoryImpl implementation class name
Xerces2	org.apache.xerces.jaxp.DocumentBuilderFactoryImpl
Fujitsu XML Processor	com.fujitsu.xml.tree.DocumentBuilderFactoryImpl
Others	Display the implementation class name of the XML parser that has been set

---

### 10.6.17 IJServer32021

**IJServer: INFO: IJServer32021: XML parser SAXParserFactory implementation class has been loaded: CLASS=%s1**

Variable Information

%s1 = Implementation class name

Explanation

The implementation class of the XML parser used by the IJServer has been loaded.

Refer to "XML Parser Settings" in the "J2EE User's Guide" for details on setting the XML parser used by the IJServer.

The implementation class of the XML parser that has been set is as follows:

XML parser setting	SAXParserFactory implementation class name
Xerces2	org.apache.xerces.jaxp.SAXParserFactoryImpl
Fujitsu XML Processor	com.fujitsu.xml.parser.SAXParserFactoryImpl
Others	Display the implementation class name of the XML parser that has been set

---

### 10.6.18 IJServer32022

**IJServer: ERROR: IJServer32022: The definition file is incorrect.: FILE=%s**

Variable Information

%s = Definition file name

Explanation

The definition file is incorrect.

Cause

The definition file cannot be found or the definition contains an error.

User Action

Refer to the exception, and establish the cause of the error.

## 10.6.19 IJServer32023

---

**IJServer: INFO: IJServer32023: Starting IJServer: %s**

Variable Information

%s = IJServer version information

Explanation

IJServer is being started.

## 10.6.20 IJServer32030

---

**IJServer: WARNING: IJServer32030: The executable class was not initialized when the server started, and so was not called at server start.**

Explanation

The executable class was not initialized when the server started,

User Action

Refer to the exception, and establish the cause of the error.

## 10.6.21 IJServer32031

---

**IJServer: WARNING: IJServer32031: The executable class was not initialized when the server stopped, and so was not called.**

Explanation

The executable class was not initialized when the server stopped,

User Action

Refer to the exception, and establish the cause of the error.

## 10.6.22 IJServer32032

---

**IJServer32032: An error occurred in the executable class when the server started.**

Explanation

An error occurred in the executable class when the server started.

User Action

Refer to the exception, and establish the cause of the error.

## 10.6.23 IJServer32033

---

**IJServer: ERROR: IJServer32033: Failed to initialize the executable class when the server started.**

Explanation

Failed to initialize the executable class when the server started.

System Action

Terminates the system.

User Action

Refer to the exception, and establish the cause of the error.

## 10.6.24 IJServer32034

---

**IJServer: ERROR: IJServer32034: The executable class was not initialized when the server started, and so was not called.**

### Explanation

The executable class was not initialized when the server started,

### System Action

Terminates the system.

### User Action

Refer to the exception, and establish the cause of the error.

## 10.6.25 IJServer32035

---

**IJServer: WARNING: IJServer32035: An error occurred in the executable class when the server was started.**

### Explanation

An error occurred in the executable class when the server was started.

### System Action

Terminates the system.

### User Action

Refer to the exception, and establish the cause of the error.

## 10.6.26 IJServer32041

---

**IJServer: WARNING: IJServer32041: Parse Warning at line %s1 column %s2: %s3**

### Variable Information

%s1 = Error line

%s2 = Error column

%s3 = Exception

### Explanation

A warning was generated during XML analysis processing. In normal circumstances, this can be ignored, but you can refer to the exception and, if required, correct the XML. If the Fujitsu XML processor is being used, the following warning may be issued, which you can choose to ignore.

- Parse Warning Error at line XX column XX: "jar:file:/C:/Interstage/F3FMjs5/common/lib/servlet-api.jar!/javax/servlet/resources/j2ee\_1\_4.xsd" has already been read. jar:file:/C:/Interstage/F3FMjs5/common/lib/servlet-api.jar!/javax/servlet/resources/jsp\_2\_0.xsd(97) : An error was detected on Column XX, Line XX.

### Cause

The XML file contains an error.

### User Action

Refer to the exception, and establish the cause of the error.

## 10.6.27 IJServer32042

---

---

**IJServer: ERROR: IJServer32042: Parse Error at line %s1 column %s2: %s3****Variable Information**

%s1 = Error line

%s2 = Error column

%s3 = Exception

**Explanation**

An error was generated during XML analysis processing.

**Cause**

The XML file contains an error.

**User Action**

Refer to the exception, and establish the cause of the error.

---

**10.6.28 IJServer32043**

---

**IJServer: ERROR: IJServer32043: Parse Fatal Error at line %s1 column %s2: %s3****Variable Information**

%s1 = Error line

%s2 = Error column

%s3 = Exception

**Explanation**

A fatal error was generated during XML analysis processing.

**Cause**

The XML file contains an error.

**User Action**

Refer to the exception, and establish the cause of the error.

---

**10.6.29 IJServer32044**

---

**IJServer: WARNING: IJServer32044: Parse Warning at line %s1 column %s2: %s3: %s4****Variable Information**

%s1 = Error line

%s2 = Error column

%s3 = Exception

%s4 = TLD file name

**Explanation**

A warning was issued during TLD file analysis processing. Refer to the exception, and correct the TLD file if required.

**Cause**

The TLD file contains an error.

**User Action**

Refer to the exception, and establish the cause of the error.

## 10.6.30 IJServer32045

---

**IJServer: ERROR: IJServer32045: Parse Error at line %s1 column %s2: %s3: %s4**

### Variable Information

%s1 = Error line

%s2 = Error column

%s3 = Exception

%s4 = TLD file name

### Explanation

An error was generated during TLD file analysis processing.

### Cause

The TLD file contains an error.

### User Action

Refer to the exception, and establish the cause of the error.

## 10.6.31 IJServer32046

---

**IJServer: ERROR: IJServer32046: Parse Fatal Error at line %s1 column %s2: %s3: %s4**

### Variable Information

%s1 = Error line

%s2 = Error column

%s3 = Exception

%s4 = TLD file name

### Explanation

A fatal error was generated during TLD file analysis processing.

### Cause

The TLD file contains an error.

### User Action

Refer to the exception, and establish the cause of the error.

## 10.7 IJServer32100 to IJServer32199

---

This section details messages numbered between IJServer32100 and IJServer32199.

### 10.7.1 IJServer32100

---

**IJServer: INFO: IJServer32100: The server application timer function has started.**

### Explanation

The server application timer function has started.

### 10.7.2 IJServer32104

---

**IJServer: INFO: IJServer32104: The server application timer function has stopped.**

## Explanation

The server application timer function has stopped.

### 10.7.3 IJServer32110

---

**IJServer: WARNING: IJServer32110: The running status of the IJServer could not be notified to the WorkUnit runtime environment: CODE=%s1**

## Variable Information

%s1 = Internal information

## Explanation

The running status of the IJServer could not be notified to the WorkUnit runtime environment.

## Cause

The execution environment for the WorkUnit of Interstage may not have been activated (may have aborted).

## System Action

Continues the processing.

## User Action

Take the required action according to the message that was output to the event log (system log).

### 10.7.4 IJServer32111

---

**IJServer: WARNING: IJServer32111: Failed to notify the running status of the IJServer repeatedly. Output of the failure message has been blocked.**

## Explanation

Failed to notify the running status of the IJServer repeatedly. Output of the failure message has been blocked.

## Cause

Refer to the message output at the same time.

## System Action

Continues the processing.

Inhibits the message advising the failure to notify the running status until a successful notification is made again.

## User Action

Refer to the message output at the same time.

### 10.7.5 IJServer32112

---

**IJServer: INFO: IJServer32112: The running status of the IJServer was notified to the WorkUnit runtime environment.**

## Explanation

The running status of the IJServer was notified to the WorkUnit runtime environment.

## System Action

Cancels the inhibiting of the output regarding the failure message.

## 10.7.6 IJServer32113

---

**IJServer: WARNING: IJServer32113: No response from the application: START=%s1 THREAD=%s2 APPLICATION=%s3**

### Variable Information

%s1 = Application processing start time

%s2 = Processing thread information

%s3 = Corresponding application (\*1)

\*1 If the application is called repeatedly in one request, for example, because of dispatching from the Servlet or calling of EJB on the same VM from the Servlet, the application specified in the variable information is output as follows:

Example: application=WEB:app1 > WEB:app2 > EJB:app3

The URI will be output for a request from a Web application. The application name will be output for a request that is not from a Web application.

### Explanation

There was no response from the application.

### Cause

- The application may have hung or the processing may be delayed.
- The timeout value specified may be too low.
- If "WEB:/@ ~" is included in the application, a timeout may have been generated internally in the control processing.

### System Action

Continues the processing when "Output a warning message" has been selected in "Control when the maximum application processing time is exceeded". Stops the IJServer process forcibly when "Stop the process forcibly" has been selected.

### User Action

- Refer to the thread dump output in the container user log (info.log), and check if the application has generated a deadlock or a loop, or a delay in processing.
- The value set for timeout may be too low. Set an appropriate value for the "application maximum processing time" in the WorkUnit environment settings (anticipated processing time).

## 10.7.7 IJServer32114

---

**IJServer: INFO: IJServer32114: An application timeout was notified to the WorkUnit runtime environment.**

### Explanation

An application timeout was notified to the WorkUnit runtime environment.

## 10.7.8 IJServer32115

---

**IJServer: WARNING: IJServer32115: The application timeout could not be notified to the WorkUnit runtime environment: CODE=%s1**

### Variable Information

%s1 = Internal information

### Explanation

The application timeout could not be notified to the WorkUnit runtime environment.

## Cause

The execution environment for the WorkUnit of Interstage may not have been activated (aborted).

## System Action

Continues the processing.

## User Action

Refer to the container log of IJServer or event log (system log), and remove the cause of the error.

---

## 10.7.9 IJServer32116

---

**IJServer: INFO: IJServer32116: IJServer initialization complete.**

### Explanation

IJServer initialization is complete.

---

## 10.7.10 IJServer32117

---

**IJServer32117: Initialization completion could not be notified to the WorkUnit runtime environment: CODE=%s1**

### Variable Information

%s1 = Internal information

### Explanation

Initialization completion could not be notified to the WorkUnit runtime environment.

## Cause

The execution environment for the WorkUnit may not have been activated.

## System Action

Refer to the container log.

## User Action

Refer to the container log of IJServer or the event log (system log), and remove the cause of the error.

---

## 10.7.11 IJServer32118

---

**IJServer: INFO: IJServer32118: IJServer continues start processing.**

### Explanation

IJServer continues start processing.

---

## 10.7.12 IJServer32119

---

**IJServer: INFO: IJServer32119: IJServer start processing is complete: INSTANCE-NO=%s1**

### Variable Information

%s1 = Instance number

### Explanation

The activation processing (preparation to call the application) for the IJServer has been completed.

The operation will not start until all of the IJServer processes enter this state.

## 10.7.13 IJServer32120

---

**IJServer32120: Start processing completion could not be notified to the WorkUnit runtime environment: CODE=%s1**

### Variable Information

%s1 = Internal information

### Explanation

Start processing completion could not be notified to the WorkUnit runtime environment.

### Cause

The execution environment for the WorkUnit may not have been activated.

### System Action

Refer to the container log.

### User Action

Refer to the container log of IJServer or the event log (system log), and remove the cause of the error.

## 10.7.14 IJServer32122

---

**IJServer: ERROR: IJServer32122: Resource recovery could not be notified to the WorkUnit runtime environment: CODE=%s1**

### Variable Information

%s1 = Internal information

### Explanation

Resource recovery could not be notified to the WorkUnit runtime environment.

### Cause

The execution environment for the WorkUnit may not have been activated.

### System Action

Refer to the container log.

### User Action

Refer to the container log of IJServer or the event log (system log), and remove the cause of the error.

## 10.7.15 IJServer32123

---

**IJServer: INFO: IJServer32123: Resource recovery has been notified to the WorkUnit runtime environment.**

### Explanation

Resource recovery has been notified to the WorkUnit runtime environment.

## 10.7.16 IJServer32124

---

**IJServer: ERROR: IJServer32124: IJServer could not stand by in readiness for stop: CODE=%s1**

### Variable Information

%s1 = Internal information

## Explanation

The WorkUnit execution environment could not be notified to wait to receive a termination request from the IJServer.

## Cause

The execution environment for the WorkUnit may not have been activated.

## System Action

Refer to the container log.

## User Action

Refer to the container log of IJServer or the event log (system log), and remove the cause of the error.

## 10.7.17 IJServer32125

---

**IJServer: WARNING: IJServer32125: The stop command was ignored because the IJServer has already begun stop processing.**

## Explanation

The stop command was ignored because the IJServer has already begun stop processing.

## System Action

Continues the processing.

## 10.7.18 IJServer32126

---

**IJServer: INFO: IJServer32126: IJServer stop processing has started.**

## Explanation

IJServer stop processing has started.

## 10.7.19 IJServer32127

---

**IJServer: ERROR: IJServer32127: The IJServer has begun forced termination processing because an unexpected exception occurred during IJServer stop processing.**

## Explanation

The IJServer has begun forced termination processing because an unexpected exception occurred during IJServer stop processing.

## Cause

An unexpected exception was generated during the IJServer termination processing.

## System Action

Stops the IJServer forcibly.

## User Action

Refer to the container log of IJServer, and remove the cause of the error.

## 10.7.20 IJServer32128

---

**IJServer: INFO: IJServer32128: IJServer forced termination processing has started.**

## Explanation

IJServer forced termination processing has started.

## 10.7.21 IJServer32130

---

**IJServer: INFO: IJServer32130: The application which was carrying out the timeout returned: START=%s1 THREAD=%s2 APPLICATION=%s3**

### Variable Information

%s1 = Application processing start time

%s2 = Processing thread information

%s3 = Corresponding application that has timed out (\*1)

\*1 If the application is called repeatedly in one request, for example, because of dispatching from the Servlet or calling of EJB on the same VM from the Servlet, the application specified in the variable information is output as follows:

Example: application=WEB:app1 > WEB:app2 > EJB:app3

A URI will be output for a request from a Web application. The application name will be output for a request that is not a Web application.

### Explanation

The application which was carrying out the timeout returned.

## 10.8 IJServer32200 to IJServer32299

---

This section details messages numbered between IJServer32200 and IJServer32299.

### 10.8.1 IJServer32200

---

**IJServer: WARNING: IJServer32200: The value that was set is incorrect.: "%s1" = %s2**

#### Variable Information

%s1 = Variable name (INITIDLE or MAXIDLE)

%s2 = Initial value or upper limit of the number of instances that are in the pool but not in use

#### Explanation

The parameter value for setting the ARM contains an error.

#### System Action

Continues the processing.

#### User Action

Check that the input value is an integer.

- When the variable name is "INITIDLE", check the value set in the System property key, "com.fujitsu.interstage.j2ee.arm.pool.initIdle".
- When the variable name is "MAXIDLE", check the value set in the System property key, "com.fujitsu.interstage.j2ee.arm.pool.maxIdle".

### 10.8.2 IJServer32201

---

**IJServer: WARNING: IJServer32201: Wrong encoding attribute: ENCODING=%s1**

#### Variable Information

%s1 = Encoding

## Explanation

Wrong encoding attribute.

## Cause

The "Encoding" settings in the Web application environment settings contain an error or encoding is not supported.

## System Action

Uses the default encoding (ISO-8859-1) for the request

## User Action

Set a correct value in the "Encoding" settings in the Web application environment settings.

## 10.9 IJServer32300 to IJServer32399

---

This section details messages numbered between IJServer32300 and IJServer32399.

### 10.9.1 IJServer32300

---

#### **IJServer32300: Failed to create the class loader.**

## Explanation

An attempt to create the class loader failed.

## Cause

A system resource may be damaged. Refer to the exception output at the same time.

## System Action

Stops creation processing of the cluster loader.

## User Action

Re-install Interstage.

If the above action does not solve the problem, collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

### 10.9.2 IJServer32301

---

#### **IJServer: WARNING: IJServer32301: Failed to register resources in the class loader.: RESOURCE=%s**

## Variable Information

%s = Resource name

## Explanation

An attempt to register resources in the class loader failed.

## Cause

An I/O error is generated in the system.

## System Action

Continues the processing without the corresponding resource registering the resources in the cluster loader

## User Action

Check that there is no error in the corresponding resource file or in the system files. Remedy the cause of the error based on the exception output at the same time.

## 10.9.3 IJServer32302

---

### IJServer32302: Failed to initialize the class loader.

#### Explanation

The class loader failed to initialize.

#### Cause

Refer to the exception output at the same time.

#### System Action

Stops initializing the class loader

#### User Action

Remove the cause of the error based on the exception output at the same time.

## 10.9.4 IJServer32303

---

### IJServer: WARNING: IJServer32303: The manifest file definition does not reference an EAR.: MANIFEST=%s1 PATH=%s2

#### Variable Information

%s1 = Manifest file path

%s2 = Resource path

#### Explanation

The resource path defined in Class-Path of the manifest file contains an error.

#### Cause

The resource path does not reference the contents of the EAR application.

#### System Action

Continues the processing without registering the corresponding resource path.

#### User Action

Check if the description in the manifest file is correct.

Specify the resource in the EAR using the relative path based on the directory of the deployed EAR application.

## 10.9.5 IJServer32304

---

### IJServer: WARNING: IJServer32304: The manifest file definition was described using an absolute path.: MANIFEST=%s1 PATH=%s2

#### Variable Information

%s1 = Manifest file path

%s2 = Resource path

#### Explanation

The resource path defined in Class-Path of the manifest file contains an error.

#### Cause

The resource path is described using the absolute path.

## System Action

Continues the processing without registering the corresponding resource path.

## User Action

Check if the description in the manifest file is correct.

Specify the resource in the EAR using the relative path based on the directory of the deployed EAR application.

## 10.9.6 IJServer32305

---

**IJServer: WARNING: IJServer32305: Failed to read the manifest file.: MANIFEST=%s1**

### Variable Information

%s1 = Manifest file name

### Explanation

The manifest file could not be read.

### Cause

An I/O error is generated in the system.

### System Action

Continues the processing without reading the manifest file.

### User Action

Check that there is no error in the manifest file.

## 10.9.7 IJServer32307

---

**IJServer: WARNING: IJServer32307: It tries to load the resource from the stopping class loader. : RESOURCE=%s**

### Variable Information

%s = Resource name

### Explanation

An attempt was made to load the resource in the class loader that has been terminated.

### Cause

Another thread is trying to load the resource while the WorkUnit has been terminated.

### System Action

Continues the processing.

### User Action

If the thread was generated by the application, ensure that the thread is terminated by the time the application termination processing is completed. The following is an example of application termination processing:

- The Servlet destruction method (when the thread was generated with the init method)
- The contextDestroyed method of Servlet ContextListener (when the thread was generated with the contextInitialized method)
- Execution class at the time of termination (when the thread was generated with the execution class at the time of activation)

When the thread is running after termination processing is completed, this message may be output if the terminated class loader is used.

## 10.10 IJServer32400 to IJServer32499

---

This section details messages numbered between IJServer32400 and IJServer32499.

### 10.10.1 IJServer32400

---

#### IJServer32400: Failed to start the class loader.: MODULE=%s1 TYPE=%s2

##### Variable Information

%s1 = Deployed module name

%s2 = Module type

The variable information may not be output if the separation type of the class loader is "split between EARs".

##### Explanation

Activation of the class loader failed. The class loader cannot be activated in this state.

##### Cause

Refer to the exception.

##### System Action

Continues the processing without activating the class loader.

##### User Action

Refer to the container log of IJServer, and remove the cause of the error.

### 10.10.2 IJServer32401

---

#### IJServer32401: Failed to stop the class loader.: MODULE=%s1 TYPE=%s2

##### Variable Information

%s1 = Deployed module name

%s2 = Module type

The variable information may not be output if the separation type of the class loader is "split between EARs".

##### Explanation

Termination of the class loader has failed. The class loader cannot be terminated in this state.

##### Cause

Refer to the exception.

##### System Action

Continues the processing without terminating the class loader

##### User Action

Refer to the container log of IJServer, and remove the cause of the error.

### 10.10.3 IJServer32402

---

#### IJServer32402: Activation processing failed.: SERVICE=%s

##### Variable Information

%s = Service name

## Explanation

An error was generated during module activation processing.

## Cause

Refer to the exception.

## System Action

Stops the IJServer.

## User Action

Refer to the container log of IJServer, and remove the cause of the error.

## 10.10.4 IJServer32403

---

### **IJServer32403: Module activation processing failed.: MODULE=%s1 TYPE=%s2**

#### Variable Information

%s1 = Deployed module name

%s2 = Module type

The variable information may not be output if the separation type of the class loader is "split between EARs".

#### Explanation

An error was generated during module activation processing. The module cannot be activated in this state.

#### Cause

Refer to the exception.

#### System Action

Stops the activation processing of the module and continues the processing.

#### User Action

Refer to the container log of IJServer, and remove the cause of the error.

## 10.10.5 IJServer32404

---

### **IJServer: ERROR: IJServer32404: Module activation processing failed.: MODULE=%s1 TYPE=%s2**

#### Variable Information

%s1 = Deployed module name

%s2 = Module type

The variable information may not be output if the separation type of the class loader is "split between EARs".

#### Explanation

An error was generated during module activation processing. The module cannot be activated in this state.

#### Cause

Refer to the exception.

#### System Action

Stops activation processing of the module.

## User Action

Refer to the container log of IJServer, and remove the cause of the error.

## 10.10.6 IJServer32405

---

### IJServer32405: Module deactivation processing failed.: MODULE=%s1 TYPE=%s2

#### Variable Information

%s1 = Deployed module name

%s2 = Module type

The variable information may not be output if the separation type of the class loader is "split between EARs".

#### Explanation

An error was generated during module deactivation processing. The module cannot be deactivated in this state.

#### Cause

Refer to the exception.

#### System Action

Stops deactivation processing of the module and continues the processing

#### User Action

Refer to the container log of IJServer, and remove the cause of the error.

## 10.10.7 IJServer32406

---

### IJServer: ERROR: IJServer32406: Module deactivation processing failed.: MODULE=%s1 TYPE=%s2

#### Variable Information

%s1 = Deployed module name

%s2 = Module type

The variable information may not be output if the separation type of the class loader is "split between EARs".

#### Explanation

An error was generated during module deactivation processing. The module cannot be deactivated in this state.

#### Cause

Refer to the exception.

#### System Action

Stops deactivation processing of the module.

#### User Action

Stop the IJServer if the module status is <Abnormal>.

Perform deactivation processing of the module again if the module status is <Being deactivated>.

Refer to the container log of IJServer, and remove the cause of the error.

## 10.10.8 IJServer32407

---

### IJServer32407: Module auto reload processing failed.: MODULE=%s1 TYPE=%s2

## Variable Information

%s1 = Deployed module name

%s2 = Module type

The variable information may not be output if the separation type of the class loader is "split between EARs".

## Explanation

An error was generated during auto-reload processing. The module cannot be auto-reloaded in this state.

## Cause

Refer to the exception.

## System Action

Stops the auto-reload processing of the module and continues the processingUser Action

Refer to the container log of IJServer, and remove the cause of the error.

## 10.10.9 IJServer32408

---

**IJServer: ERROR: IJServer32408: Module auto reload processing failed.: MODULE=%s1 TYPE=%s2**

## Variable Information

%s1 = Deployed module name

%s2 = Module type

The variable information may not be output if the separation type of the class loader is "split between EARs".

## Explanation

An error was generated during auto-reload processing. The module cannot be auto-reloaded in this state.

## Cause

Refer to the exception.

## System Action

Stops the auto-reload processing of the module

## User Action

Refer to the container log of IJServer, and remove the cause of the error.

## 10.10.10 IJServer32409

---

**IJServer: ERROR: IJServer32409: Auto reload processing failed.**

## Explanation

The auto-reload processing could not be completed because an error was generated during the auto-reload processing.

## Cause

Refer to the exception.

## System Action

Stops the auto-reload processing

## User Action

Refer to the container log of IJServer, and remove the cause of the error.

## 10.10.11 IJServer32412

---

### IJServer32412: Failed to read the definition file.

#### Explanation

The definition file could not be read.

#### Cause

Refer to the exception.

#### System Action

Stops the processing

#### User Action

Refer to the container log of IJServer, and remove the cause of the error.

## 10.10.12 IJServer32413

---

### IJServer: INFO: IJServer32413: Module auto reload has started.: MODULE=%s

#### Variable Information

%s = Deployed module name

#### Explanation

Module auto reload has started.

## 10.10.13 IJServer32414

---

### IJServer: INFO: IJServer32414: Module auto reload is complete.: MODULE=%s

#### Variable Information

%s = Deployed module name

#### Explanation

Module auto reload is complete.

## 10.10.14 IJServer32415

---

### IJServer: INFO: IJServer32415: IJServer auto reload is disabled.

#### Explanation

IJServer auto reload is disabled.

## 10.10.15 IJServer32416

---

### IJServer: INFO: IJServer32416: IJServer auto reload is enabled.: INTERVAL=%s

#### Variable Information

%s = Auto-reload monitor interval

#### Explanation

IJServer auto reload is enabled.

### 10.10.16 IJServer32418

---

**IJServer: INFO: IJServer32418: Delays IJServer stop processing because an application is being processed.**

#### Explanation

IJServer stop processing is delayed because an application is being processed.

### 10.10.17 IJServer32419

---

**IJServer: INFO: IJServer32419: IJServer stop processing will start because processing for all applications has ended.**

#### Explanation

IJServer stop processing will start because processing for all applications has ended.

### 10.10.18 IJServer32421

---

**IJServer32421: Module activation cannot be performed because the module cannot be activated with this status.: STATE=%s1 MODULE=%s2 TYPE=%s3**

#### Variable Information

%s1 = Status

%s2 = Deployed module name

%s3 = Module type

The variable information may not be output if the separation type of the class loader is "split between EARs".

#### Explanation

The module cannot be activated in this state.

#### System Action

Stops activation processing

#### User Action

Refer to the container log of IJServer, and remove the cause of the error.

### 10.10.19 IJServer32422

---

**IJServer32422: Module deactivation cannot be performed because the module cannot be deactivated with this status.: STATE=%s1 MODULE=%s2 TYPE=%s3**

### Variable Information

%s1 = Status

%s2 = Deployed module name

%s3 = Module type

The variable information may not be output if the separation type of the class loader is "split between EARs".

### Explanation

The module cannot be deactivated in this state.

### System Action

Stops deactivation processing

### User Action

Refer to the container log of IJServer, and remove the cause of the error.

## 10.10.20 IJServer32423

---

### IJServer: ERROR IJServer32423: Failed to operate the application.

#### Explanation

An error was generated during application operation.

#### Cause

Refer to the exception.

#### System Action

Stops application operation.

#### User Action

Refer to the container log of IJServer, and remove the cause of the error.

## 10.10.21 IJServer32424

---

### IJServer: INFO IJServer32424: Module activation processing has started.: MODULE=%s

#### Variable Information

%s = Deployed module name

#### Explanation

Module activation processing has started.

## 10.10.22 IJServer32425

---

### IJServer: INFO IJServer32425: Module activation processing is complete.: MODULE=%s

#### Variable Information

%s = Deployed module name

## Explanation

Module activation processing is complete.

### 10.10.23 IJServer32426

---

**IJServer: INFO IJServer32426: Module deactivation processing has started.: MODULE=%s**

#### Variable Information

%s = Deployed module name

#### Explanation

Module deactivation processing has started.

### 10.10.24 IJServer32427

---

**IJServer: INFO IJServer32427: Module deactivation processing is complete.: MODULE=%s**

#### Variable Information

%s = Deployed module name

#### Explanation

Module deactivation processing is complete.

### 10.10.25 IJServer32428

---

**IJServer: ERROR: IJServer32428: Because abnormality occurred in the module, it deactivates.: MODULE=%s**

#### Variable Information

%s = Deployed module name

#### Explanation

The module deactivated because of an abnormality in the module.

#### Cause

A processing error was generated for the module %s.

Refer to the container log.

#### System Action

Deactivates the module and continues the processing.

#### User Action

Refer to the container log of IJServer, and remove the cause of the error.

- HotDeploy is valid:

After removing the cause of an error, the module can be activated by executing reactivation processing.

- HotDeploy is not valid:

If the IJServer is running, stop the IJServer and remove the cause of the error, and then reactivate the IJServer.

## 10.10.26 IJServer32429

---

**IJServer: ERROR: IJServer32429: All the applications in the EAR module deactivate the EAR module for deactivation.: MODULE=%s**

### Variable Information

%s = Deployed module name

### Explanation

The EAR module will be deactivated because all of the applications in the EAR module are inactive .

### Cause

All of the applications in the EAR are inactive.

### System Action

Deactivates the EAR module and continues the processing

### User Action

Refer to the container log of IJServer, and remove the cause of the error.

- HotDeploy is valid:

After removing the cause of an error, the module can be activated by executing reactivation processing.

- HotDeploy is not valid:

If the IJServer is running, stop the IJServer and remove the cause of the error, and then reactivate the IJServer.

## 10.10.27 IJServer32430

---

**IJServer32430: Application already exists.: APPLICATION=%s**

### Variable Information

%s = Application name

### Explanation

An application with the same name as the application being activated already exists.

### Cause

An error may be generated in the system.

### System Action

Stops the activation processing of the application and continues the processing.

### User Action

Collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

## 10.10.28 IJServer32431

---

**IJServer32431: It failed in the registration of application.: APPLICATION=%s**

### Variable Information

%s = Application name

## Explanation

An error was generated while registering the application to be activated.

## Cause

Activation of the application may have failed during reactivation or redeployment using the HotDeploy function at the time of the IJServer startup.

## System Action

Stops activation processing of the application and continues the processing

## User Action

Refer to the container log of IJServer, and remove the cause of the error.

- HotDeploy is valid:

After remedying the cause of the error, the module can be activated by executing reactivation processing.

- HotDeploy is not valid:

If the IJServer is running, stop the IJServer and remove the cause of the error, and then reactivate the IJServer.

## 10.10.29 IJServer32432

---

### IJServer32432: Application doesn't exist.: APPLICATION=%s

#### Variable Information

%s = Application name

#### Explanation

An application to be deactivated does not exist.

#### Cause

An error may be generated in the system.

#### System Action

Stops deactivation processing of the application and continues the processing

#### User Action

Collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

## 10.11 IJServer32500 to IJServer32599

---

This section details messages numbered between IJServer32500 and IJServer32599.

### 10.11.1 IJServer32500

---

#### IJServer: WARNING: IJServer32500: The error occurred in startup class processing.

#### Explanation

An error occurred in startup class processing.

#### System Action

Continues the processing.

#### User Action

Take action according to the stack trace output immediately after this message.

### 10.11.2 IJServer32501

---

#### **IJServer: WARNING: IJServer32501: The error occurred in shutdown class processing.**

#### Explanation

An error occurred in shutdown class processing.

#### System Action

Continues the processing.

#### User Action

Take action according to the stack trace output immediately after this message.

### 10.11.3 IJServer32510

---

#### **IJServer32510: The specified encryption method cannot be used.**

#### Explanation

The encryption method specified in the SSL definition that is used for SSL communication between the Web server connector and the Servlet container cannot be used.

#### User Action

Check the setting of the encryption method specified in the SSL definition that is used for SSL communication between the Web server connector and the Servlet container. For details of the encryption methods available, refer to "is2eeadmin command" in the "Reference Manual (Command Edition)".

### 10.11.4 IJServer32511

---

#### **IJServer32511: The specified SSL protocol cannot be used.**

#### Explanation

The SSL protocol specified in the SSL definition that is used for SSL communication between the Web server connector and the Servlet container cannot be used.

#### User Action

Check the protocol version specified in the SSL definition that is used for SSL communication between the Web server connector and the Servlet container. For details of the protocols that can be set, refer to "is2eeadmin command" in the "Reference Manual (Command Edition)".

### 10.11.5 IJServer32512

---

#### **IJServer: ERROR: IJServer32512: Handshake failed. : %s1**

#### Variable Information

%s1 = Exception

#### Explanation

The SSL handshake processing has failed.

#### User Action

Take action according to the exception in the variable information.

## 10.11.6 IJServer32520

---

**IJServer: ERROR: IJServer32520: The response header size has exceeded the buffer size.**

### Explanation

The response generation processing failed because the total size of the response header exceeded 48K bytes.

### User Action

Create the application so that the total size of the response header is less than 48K bytes.

## 10.12 IJServer32900 to IJServer32999

---

This section details messages numbered between IJServer32900 and IJServer32999.

### 10.12.1 IJServer32997

---

**IJServer32997: Internal error.: DETAILS=%s**

### Variable Information

%s = Detail error information

### Explanation

An internal conflict occurred.

### User Action

Contact a service engineer.

### 10.12.2 IJServer32998

---

**IJServer: WARNING: IJServer32998: Unexpected error.**

### Explanation

An unexpected error was generated.

### System Action

Continues the processing.

### User Action

Contact a service engineer.

### 10.12.3 IJServer32999

---

**IJServer: ERROR: IJServer32999: Unexpected error.**

### Explanation

An unexpected error was generated.

### System Action

Stop the IJServer.

### User Action

Contact a service engineer.

## 10.13 IJServer33000 to IJServer33099

---

This section details messages numbered between IJServer33000 and IJServer33099.

### 10.13.1 IJServer33001

---

**IJServer: ERROR: IJServer33001: Failed to start up the resource adapter: Detail=%s**

#### Variable Information

%s = Detail information

#### Explanation

Failed to activate the resource adapter.

#### System Action

Stops the IJServer.

#### User Action

Refer to the detail information and fix the cause of the error.

### 10.13.2 IJServer33002

---

**IJServer: ERROR: IJServer33002: Failed to read the deployment descriptor file: FilePath=%s1 Detail=%s2**

#### Variable Information

%s1 = File path

%s2 = Detail information

#### Explanation

Failed to read the deployment descriptor file.

#### System Action

Stops the IJServer.

#### User Action

Check that the deployment descriptor file definition contents are correct.

### 10.13.3 IJServer33003

---

**IJServer: ERROR: IJServer33003: Failed to shut down the resource adapter: Detail=%s**

#### Variable Information

%s = Detail information

#### Explanation

Failed to deactivate the resource adapter.

#### System Action

Stops the IJServer.

#### User Action

Refer to the detail information and fix the cause of the error.

# Chapter 11 Messages Beginning with 'irep'

This chapter describes messages with message numbers beginning with 'irep'.

## 11.1 irep10000 to irep10099

---

### 11.1.1 irep10000

---

**IREP: INFO: irep10000: Repository started. [%s1]**

Variable Information

%s1 = Repository name

Explanation

The repository has started.

### 11.1.2 irep10001

---

**IREP: INFO: irep10001: Repository terminated. [%s1]**

Variable Information

%s1 = Repository name

Explanation

The repository has stopped.

### 11.1.3 irep10002

---

**IREP: INFO: irep10002: Repository restarted. %s1, count=%s2 [%s3]**

Variable Information

%s1 = Program name

%s2 = Number of restarts

%s3 = Repository name

Explanation

The repository has restarted because it stopped abnormally.

### 11.1.4 irep10003

---

**IREP: ERROR: irep10003: Failed to restart Repository. %s1, detail=%s2:%s3:%s4 [%s5]**

Variable Information

%s1 = Program name

%s2 = Detail code 1

%s3 = Detail code 2

%s4 = Detail code 3

%s5 = Repository name

Explanation

The repository ended abnormally and an attempt to restart it has been failed.

## System Action

Stops the restart processing of the repository.

## User Action

Action is not required if the irep10002 message is output for the target repository after this message.

If irep10002 is not output (and another error message relating to the target repository is output before this message), refer to the message and take the appropriate action for it.

If only this message is output concerning the target repository, restart the target repository.

### Windows32/64

Restart the repository from the Interstage Management Console or service screen.

In the Windows(R) system, login to the system with the administrator authority and select the following service from the service screen ([Control Panel] > [Service] or [Control Panel] > [Management Tool] > [Service]).

```
Interstage Directory Service(repository-name)
```

### Solaris32/64 Linux32/64

To restart the repository, use the Interstage Management Console or the *irepstop/irepstart* command. For details of *irepstop/irepstart* command, refer to 'Interstage Directory Service Operation Commands' in the Reference Manual (Command Edition).

If the above action is failed to correct the error, use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

## 11.1.5 irep10004

---

**IREP: ERROR: irep10004: Repository has terminated abnormally. %s1, pid=%s2, detail=%s3:%s4:%s5:%s6 [%s7]**

### Variable Information

%s1 = Program name  
%s2 = Process ID  
%s3 = Detail code 1  
%s4 = Detail code 2  
%s5 = Detail code 3  
%s6 = Detail code 4  
%s7 = Repository name

### Explanation

The repository has ended abnormally.

### System Action

If a recoverable process has terminated abnormally, restarts the repository configuration process.

### User Action

#### Windows32/64

If another error message relating to the target repository is output before this message, refer to the message and take the appropriate action.

If another error message relating to the target repository was not output before this message (and if the detail code 2 of %s4 is 1 or the detail code 3 of %s5 is 109), a memory shortage may have occurred. Quit any unnecessary programs, ensure that there is sufficient

memory for Interstage Directory Service operation, and restart the target repository. If this message is output when creating the repository, re-create the repository.

If the memory area is still insufficient after quitting any unnecessary programs, add memory or extend the virtual memory.

For details of the amount of memory area required for Interstage Directory Service operation, refer to 'Memory Requirements' in the Tuning Guide.

If the irep10002 message relating to the target repository is output after this message, operation can continue. If the irep10002 message is not output, restart the target repository. If this message is output when creating the repository, re-create the repository.

Restart the repository from the Interstage Management Console or service screen.

In the Windows(R) system, login to the system with administrator authority and select the following service from the service screen ([Control Panel] > [Service] or [Control Panel] > [Management Tool] > [Service]).

```
Interstage Directory Service(repository-name)
```

In other cases, use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

**Solaris32/64 Linux32/64**

If the detail code 3 of %s5 is -1 or 9, the program may have received an exit direction through an external signal. Check whether the process was ended forcibly.

If another error message relating to the target repository is output before this message, refer to the message and take the appropriate action.

If another error message relating to the target repository was not output before this message, and if the detail code 2 of %s4 is 1 or the detail code 3 of %s5 is 109, a memory shortage may have occurred. Quit any unnecessary programs, ensure that there is sufficient memory area for Interstage Directory Service operation, and restart the target repository. If this message is output when creating the repository, re-create the repository.

If the memory area is still insufficient after quitting any unnecessary programs, add memory or extend the swap memory.

For details of the amount of memory area required for Interstage Directory Service operation, refer to 'Memory Requirements' in the Tuning Guide.

If the irep10002 message relating to the target repository is output after this message, operation can continue. If the irep10002 message is not output, restart the target repository. If this message is output when creating the repository, re-create the repository.

To restart the repository, use the Interstage Management Console or the *irepstop/irepstart* command. For details of *irepstop/irepstart* command, refer to 'Interstage Directory Service Operation Commands' in the Reference Manual (Command Edition).

In other cases, use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

## 11.1.6 irep10005

**IREP: ERROR: irep10005: Repository restart stopped. %s1, detail=%s2:%s3:%s4 [%s5]**

### Variable Information

%s1 = Program name

%s2 = Detail code 1

%s3 = Detail code 2

%s4 = Detail code 3

%s5 = Repository name

### Explanation

Processing of the repository was discontinued and then restarted because consecutive abnormal terminations occurred.

### System Action

Repository restart halted because the repository's restart process failed numerous times.

## User Action

If another error message relating to the target repository is output before this message, refer to the message and take the appropriate action.

Except for the above, use the *iscollectinfo* command to collect diagnostic information, and then contact your service engineer.

## 11.1.7 irep10009

---

**IREP: INFO: irep10009: Waiting for RDB to be running. [%s1]**

### Variable Information

%s1 = Repository name

### Explanation

The repository is waiting for the activation of the RDB that is used as the repository database.

## 11.1.8 irep10010

---

**IREP: ERROR: irep10010: Failed to start Repository. detail=%s1:%s2:%s3 [%s4]**

### Variable Information

%s1 = Detail code 1

%s2 = Detail code 2

%s3 = Detail code 3

%s4 = Repository name

### Explanation

The repository failed to start.

### System Action

Stops the repository start processing.

### User Action

If another error message relating to the target repository is output before this message, refer to the message and take the appropriate action.

**Solaris32/64 Linux32/64**

If the following message is output before this message, Interstage data store may not be started.

```
Repeat connect to Broker: 0
Repeat connect to Broker: 1
Repeat connect to Broker: 2
Repeat connect to Broker: 3
Repeat connect to Broker: 4
Repeat connect to Broker: 5
```

Using the *enablerstart* command, start Interstage data store. For details of *enablerstart* command, refer to 'Interstage Directory Service Operation Commands' in the Reference Manual (Command Edition).

If no error message is output before this message, use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

## 11.1.9 irep10011

---

**IREP: ERROR: irep10011: Failed to terminate Repository. detail=%s1:%s2:%s3 [%s4]**

## Variable Information

%s1 = Detail code 1

%s2 = Detail code 2

%s3 = Detail code 3

%s4 = Repository name

## Explanation

The repository failed to stop.

## System Action

Stops the repository stop processing.

## User Action

If another error message relating to the target repository is output before this message, refer to the message and take the appropriate action.

If no error message is output before this message, use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

## 11.1.10 irep10012

---

### **IREP: ERROR: irep10012: Repository is currently starting. [%s1]**

## Variable Information

%s1 = Repository name

## Explanation

The repository is currently being started.

## System Action

Stops the processing for which execution was attempted.

## User Action

To stop the repository, wait for a while and then re-execute the stop processing.

If this message is output after repeating to stop processing several times, use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

If another error message relating to the target repository is output before this message, refer to the message and take the appropriate action.

To start the repository, check whether the specified repository name is correct. If the repository name is incorrect, specify the correct repository name and then re-execute processing.

## 11.1.11 irep10013

---

### **IREP: ERROR: irep10013: Repository is currently terminating. [%s1]**

## Variable Information

%s1 = Repository name

## Explanation

The repository is currently being stopped.

## System Action

Stops the processing for which execution was attempted.

## User Action

To start the repository, wait for a while and then re-execute the start processing.

If this message is output after repeating to start processing several times, use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

If another error message relating to the target repository is output before this message, refer to the message and take the appropriate action.

To stop the repository, check whether the specified repository name is correct.

If the repository name is incorrect, specify the correct repository name and then re-execute processing.

## 11.1.12 irep10014

---

### **IREP: ERROR: irep10014: Repository is already running. [%s1]**

#### Variable Information

%s1 = Repository name

#### Explanation

An attempt was made to perform start processing with the repository already started.

#### System Action

Stops the repository start processing.

#### User Action

Check whether the specified repository name is correct.

If the repository name is incorrect, specify the correct repository name, then re-execute processing.

If the repository name is correct, use the Interstage Management Console or *ireplist* command to check whether the target repository has already been started. For details of the *ireplist* command, refer to 'Interstage Directory Service Operation Commands' in the Reference Manual (Command Edition).

If this message is displayed even though the target repository is stopping, use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

## 11.1.13 irep10015

---

### **IREP: ERROR: irep10015: Repository is not started. [%s1]**

#### Variable Information

%s1 = Repository name

#### Explanation

An attempt was made to perform stop processing with the repository has not started.

#### System Action

Stops the repository processing.

#### User Action

Check whether the specified repository name is correct.

If the repository name is incorrect, specify the correct repository name, then re-execute processing.

If the repository name is correct, use the Interstage Management Console or *ireplist* command to check whether the target repository has already been stopped. For details of the *ireplist* command, refer to 'Interstage Directory Service Operation Commands' in the Reference Manual (Command Edition).

If this message is displayed although the target repository is running or not, use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

## 11.1.14 irep10016

---

### IREP: ERROR: irep10016: Timeout occurred while starting Repository. [%s1]

#### Variable Information

%s1 = Repository name

#### Explanation

Repository startup , or creation of the new repository did not complete within a specified time.

#### System Action

Stops the repository start processing.

#### User Action

An error occurred during repository start processing.

More than one of the following operations may have been executed concurrently for a one repository:

- Creating a repository with the Interstage Management Console
- Deleting a repository with the Interstage Management Console
- Starting a repository with the Interstage Management Console
- Stopping a repository with the Interstage Management Console
- Backing up and exporting Interstage Directory Service resources with the *irepbacksys* command
- Restoring and importing Interstage Directory Service resources with the *ireprestsys* command

#### Solaris32/64 Linux32/64

- Starting Interstage data store with the *enablerstart* command
- Starting the repository with the *irepstart* command
- Stopping the repository with the *irepstop* command

This error might occur if the address specified in [Database Hostname] and [Database Port Number] is being used by another application when the RDB repository is created. Check [Database Hostname] and [Database Port Number], and then re-create the repository.

Use the Interstage Management Console or *ireplist* command to check the status of the target repository. If the target repository is being started (Starting), restart the system, and then re-execute the operation. If the target repository is not being started (other than Starting), check that more than one the above operations are not being performed concurrently, and then re-execute the operation.

This message may be output if there are too many access control list definitions (access directives). Review the definitions by referring to the following manual, and then re-execute the operation after correcting the definitions listed in the Security System Guide.

"File Format", "Editing the Access Control List Definition Files", and "Evaluation of Access Control List Definitions" in the 'Access Control for the Interstage Directory Service' chapter of the "Security System Guide"

#### Solaris32/64 Linux32/64

This message might be displayed if a standard database is used and the hard limit for the maximum number of file descriptors for processes run with oms account privileges is greater than 65536. For details on this setting, refer to the "Tuning Guide", section "System Tuning".

If the above actions fail to correct the error, use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

## 11.1.15 irep10017

---

---

**IREP: ERROR: irep10017: Timeout occurred while terminating Repository. [%s1]****Variable Information**

%s1 = Repository name

**Explanation**

Stopping of the repository did not complete within a specified time.

**System Action**

Stops the repository stop processing.

**User Action**

An error occurred during repository stop processing.

More than one of the following operations may have been executed concurrently for a single repository:

- Creating a repository with the Interstage Management Console
- Deleting a repository with the Interstage Management Console
- Starting a repository with the Interstage Management Console
- Stopping a repository with the Interstage Management Console
- Backing up and exporting Interstage Directory Service resources with the *irepbacksys* command
- Restoring and importing Interstage Directory Service resources with the *ireprestsys* command

**Solaris32/64 Linux32/64**

- Starting Interstage data store with the *enablerstart* command
- Starting the repository with the *irepstart* command
- Stopping the repository with the *irepstop* command

Use the Interstage Management Console or *ireplist* command to check the status of the target repository. If the target repository is not being stopped (other than Stopping), check that more than one of the above operations have not being performed concurrently, then re-execute the operation.

If the above actions fail to correct the error, use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

---

**11.1.16 irep10018**

---

**IREP: INFO: irep10018: Interstage Directory Service component file is not found. path=%s1, detail=%s2:%s3:%s4 [%s5]****Variable Information**

%s1 = File name

%s2 = Detail code 1

%s3 = Detail code 2

%s4 = Detail code 3

%s5 = Repository name

**Explanation**

A file that configures Interstage Directory Service does not exist. The Interstage Directory Service environment file may have been moved or deleted.

**System Action**

Stops the repository start processing.

## User Action

Back up the created repository and re-install Interstage Directory Service. After re-installation, restore the backed up repository and correct the environment. For details of backup and restoration, refer to 'Maintenance (Resource Backup)' in the Interstage Application Server Operator's Guide. For details of re-installation, refer to the Installation Guide.

## 11.1.17 irep10019

---

**IREP: INFO: irep10019: Permission to start Repository denied. path=%s1, detail=%s2:%s3:%s4 [%s5]**

### Variable Information

- %s1 = File name
- %s2 = Detail code 1
- %s3 = Detail code 2
- %s4 = Detail code 3
- %s5 = Repository name

### Explanation

There is no permission to start the repository. The permission of the Interstage Directory Service environment file may have been changed by mistake.

### System Action

Stops the repository start processing.

### User Action

Back up the created repository and re-install Interstage Directory Service. After re-installation, restore the backed up repository and correct the environment. For details of backup and restoration, refer to 'Maintenance (Resource Backup)' in the Interstage Application Server Operator's Guide. For details of re-installation, refer to the Installation Guide.

## 11.1.18 irep10020

---

**IREP: ERROR: irep10020: Interstage Directory Service component file has been changed by mistake. path=%s1, detail=%s2:%s3:%s4 [%s5]**

### Variable Information

- %s1 = File name
- %s2 = Detail code 1
- %s3 = Detail code 2
- %s4 = Detail code 3
- %s5 = Repository name

### Explanation

A file that configures Interstage Directory Service was changed by mistake.

### System Action

Stops the repository start processing.

### User Action

The file that configures Interstage Directory Service may have been changed by mistake.

Back up the created repository and re-install Interstage Directory Service. After re-installation, restore the backed up repository and correct the environment. For details of backup and restoration, refer to 'Maintenance (Resource Backup)' in the Interstage Application Server Operator's Guide. For details of re-installation, refer to the Installation Guide.

## 11.1.19 irep10021

---

**IREP: ERROR: irep10021: Cannot start Repository. Out of memory. %s1, func=%s2, errno=%s3, detail=%s4:%s5 [%s6]**

### Variable Information

%s1 = Program name  
%s2 = Function name  
%s3 = Error number  
%s4 = Detail code 1  
%s5 = Detail code 2  
%s6 = Repository name

### Explanation

The repository failed to start because the usable memory area was insufficient.

### System Action

Stops the repository start processing.

### User Action

Quit any unnecessary programs and ensure that there is sufficient memory area for Interstage Directory Service operations, then re-execute the processing.

**Windows32/64**

If the memory area is still insufficient after quitting unnecessary programs, add memory or extend the virtual memory.

**Solaris32/64 Linux32/64**

If the memory area is still insufficient after quitting unnecessary programs, add memory or extend the swap area.

For details of the memory area required for Interstage Directory Service operations, refer to 'Memory Requirements' in the Tuning Guide.

## 11.1.20 irep10022

---

**IREP: ERROR: irep10022: Failed to start process. %s1, func=%s2, errno=%s3, detail=%s4:%s5 [%s6]**

### Variable Information

%s1 = Program name  
%s2 = Function name  
%s3 = Error number  
%s4 = Detail code 1  
%s5 = Detail code 2  
%s6 = Repository name

### Explanation

The repository failed to start.

### System Action

Stops the repository start processing.

## User Action

Use the *iscollectinfo* command to collect diagnostic information, and then contact your service engineer.

### 11.1.21 irep10023

---

**IREP: ERROR: irep10023: Cannot start command. Interstage Directory Service environment has been changed by mistake. detail=%s1:%s2:%s3 [%s4]**

#### Variable Information

%s1 = Detail code 1  
%s2 = Detail code 2  
%s3 = Error number  
%s4 = Repository name

#### Explanation

An executable file required for Interstage Directory Service operation has been damaged or does not exist.  
The Interstage Directory Service environment file may have been changed or deleted by mistake.

#### System Action

Stops the processing for which execution was attempted.

#### User Action

The Interstage Directory Service commands may have been renamed by mistake.  
Back up the created repository and re-install Interstage Directory Service. After re-installation, restore the backed-up repository and correct the environment. For details of backup and restoration, refer to 'Maintenance (Resource Backup)' in the Operator's Guide. For details of re-installation, refer to the Installation Guide.

### 11.1.22 irep10024

---

**IREP: ERROR: irep10024: Interstage Directory Service environment definition has been changed by mistake. detail=%s1:%s2:%s3 [%s4]**

#### Variable Information

%s1 = File name  
%s2 = Line number  
%s3 = errno  
%s4 = Repository name

#### Explanation

An environment definition file required for Interstage Directory Service operation has been damaged or does not exist.  
The Interstage Directory Service environment file may have been changed or deleted by mistake.

#### System Action

Stops the processing for which execution was attempted.

#### User Action

The Interstage Directory Service environment file may have been changed or deleted by mistake.  
Reconstruct the target repository using the following procedure:

- Using a standard database as the repository database

1. Create a backup of the current resources.

(Use the *irepbacksys* command, specifying the *-dataonly* option.)

2. Use the Interstage Management Console to delete the target repository.

3. Use the Interstage Management Console to create the repository to be used as a substitute for the target repository.

4. Using the backup created in Step 1, restore the resources to the repository created in Step 3.

(Use the *ireprestsys* command, specifying the *-dataonly* option.)

If backup creation fails in Step 1 'Create a backup of the current resources', use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

If repository deletion fails in Step 2 'Use the Interstage Management Console to delete the target repository', use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

- Using a relational database (RDB) as the repository database

1. Use the Interstage Management Console to delete the target repository.

2. Use the *ireprestsys* command to restore the target Repository server backup directory (in Solaris/Linux, this is the backup file).

If the error is not corrected even though using the above procedure, back up the created repository and re-install Interstage Directory Service. After re-installation, restore the backed-up repository and correct the environment.

For details of backup and restoration, refer to 'Maintenance (Resource Backup)' in the Operator's Guide. For details of re-installation, refer to the Installation Guide.

## 11.1.23 irep10025

---

**IREP: ERROR: irep10025: The process does not return the response. proc=%s1, detail=%s2:%s3:%s4 [%s5]**

### Variable Information

%s1 = Process name

%s2 = Detail code 1

%s3 = Detail code 2

%s4 = Detail code 3

%s5 = Repository name

### Explanation

Processing was canceled because the process executed in %s1 returned no response for a specified time.

### System Action

Stops the waiting for the executed process.

### User Action

The stop processing of the repository indicated in %s5 may have been failed or been delayed. It cause that the repository is not able to stop correctly.

If starting, stopping, creating or deleting the repository, re-execute the operation after the OS has restarted.

## 11.1.24 irep10030

---

**IREP: ERROR: irep10030: Package is not installed. package=%s1 [%s2]**

## Variable Information

%s1 = Package name

%s2 = Repository name

## Explanation

A package required for Interstage Directory Service operation is not installed.

## System Action

Stops the repository start processing.

## User Action

Check whether the package indicated in %s1 is installed. The following shows the meaning of the package name output in %s1.

Package name output in %s1	Meaning
FJSVawjdk	Fujitsu Java Development Kit
FJSVrdb2b	Symfoware/RDB or Symfoware client functions
FSUNrdb2b	
Symfoware	
Oracle	Oracle Database or Oracle Database Client Software

If this package is not installed, install it referring to the Installation Guide.

If the Oracle database is used as the repository database, check if the Oracle home directory is specified correctly.

If the directory is correct and there is still an error, the environment of the package indicated in %s1 may be damaged. Use the *iscollectinfo* command to collect diagnostic information, and then contact your service engineer.

**Windows32/64**

If the system was not reactivated after installing the product, reactivate the system.

## 11.1.25 irep10031

**IREP: ERROR: irep10031: The system call returned an unknown error by the check of the require package. package=%s1, func=%s2, errno=%s3, detail=%s4:%s5 [%s6]**

## Variable Information

%s1 = Package name

%s2 = Function name

%s3 = Error number

%s4 = Detail code 1

%s5 = Detail code 2

%s6 = Repository name

## Explanation

An error occurred in checking a package required for Interstage Directory Service operation.

## System Action

Stops the repository start processing.

## User Action

Use the *iscollectinfo* command to collect diagnostic information, and then contact your service engineer.

## 11.1.26 irep10032

---

**IREP: ERROR: irep10032: The environment definition file of the require package does not exist. package=%s1, path=%s2, func=%s3, errno=%s4, detail=%s5:%s6 [%s7]**

### Variable Information

%s1 = Package name  
%s2 = File name  
%s3 = Function name  
%s4 = Error number  
%s5 = Detail code 1  
%s6 = Detail code 2  
%s7 = Repository name

### Explanation

The environment definition file of a package required for Interstage Directory Service operation does not exist.

The environment of the required package may be damaged.

### System Action

Stops the repository start processing.

### User Action

Check whether the package indicated with %s1 is installed. The following shows the meaning of the package name output in %s1.

Package name output in %s1	Meaning
FJSVena	Interstage data store

If the package is not installed, install it referring to the Installation Guide.

If this message is output although the package is installed, the environment of the package indicated in %s1 may be damaged. Back up the created repository and re-install the package indicated with %s1. After re-installation, restore the backed-up repository and correct the environment.

For details of backup and restoration, refer to 'Maintenance (Resource Backup)' in the Operator's Guide. For details of re-installation, refer to the Installation Guide.

## 11.1.27 irep10033

---

**IREP: ERROR: irep10033: There is no authority to read the environment definition file of the require package. package=%s1, path=%s2, func=%s3, errno=%s4, detail=%s5:%s6 [%s7]**

### Variable Information

%s1 = Package name  
%s2 = File name  
%s3 = Function name  
%s4 = Error number  
%s5 = Detail code 1  
%s6 = Detail code 2  
%s7 = Repository name

## Explanation

There is no permission to access the environment definition file of a package required for Interstage Directory Service operation. The Interstage Directory Service operating environment permission may have been changed by mistake.

## System Action

Stops the repository start processing.

## User Action

The environment of the package indicated in %s1 has been damaged. Back up the created repository and re-install the package indicated in %s1. After re-installation, restore the backed-up repository and correct the environment. The following shows the meaning of the package name output in %s1.

Package name output in %s1	Meaning
FJSVena	Interstage data store

For details of backup and restoration, refer to 'Maintenance (Resource Backup)' in the Operator's Guide. For details of re-installation, refer to the Installation Guide.

## 11.1.28 irep10034

---

**IREP: ERROR: irep10034: The environment definition file of the require package has been changed by mistake. package=%s1, path=%s2, detail=%s3:%s4 [%s5]**

### Variable Information

%s1 = Package name

%s2 = File name

%s3 = Detail code 1

%s4 = Detail code 2

%s5 = Repository name

## Explanation

The environment definition file of a package required for Interstage Directory Service operation has been changed or deleted.

## System Action

Stops the repository start processing.

## User Action

The environment of the package indicated in %s1 has been changed by mistake. Back up the created repository and re-install the package indicated in %s1. After re-installation, restore the backed-up repository and correct the environment. The following shows the meaning of the package name output in %s1.

Package name output in %s1	Meaning
FJSVena	Interstage data store

For details of backup and restoration, refer to 'Maintenance (Resource Backup)' in the Operator's Guide. For details of re-installation, refer to the Installation Guide.

## 11.1.29 irep10050

---

**IREP: ERROR: irep10050: Repository is forced to terminate. pid=%s1 [%s2]**

### Variable Information

%s1 = Process ID

%s2 = Repository name

#### Explanation

The repository was forcibly ended because an unrecoverable error occurred.

#### System Action

Stops the repository because an unrecoverable error occurred in the repository.

#### User Action

If another error message relating to the target repository is output before this message, refer to the message and take the appropriate action.

If no error message is output before this message, use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

### 11.1.30 irep10051

---

**IREP: ERROR: irep10051: Cannot get system resources for managing the number of file descriptors(%s1). [%s2]**

#### Variable Information

%s1 = Number of file descriptors

%s2 = Repository name

#### Explanation

The system area for storing the file descriptors required for repository operations is insufficient.

#### System Action

Stops the repository start processing.

#### User Action

Use the *iscollectinfo* command to collect diagnostic information, and then contact your service engineer.

### 11.1.31 irep10052

---

**IREP: ERROR: irep10052: Failed to modify system parameter. func=%s1, errno=%s2 [%s3]**

#### Variable Information

%s1 = Function name

%s2 = Error number

%s3 = Repository name

#### Explanation

An error occurred in setting the system parameters required for repository operations.

#### System Action

Stops the repository start processing.

#### User Action

Use the *iscollectinfo* command to collect diagnostic information, and then contact your service engineer.

### 11.1.32 irep10099

---

---

**IREP: ERROR: irep10099: Slowdown occurred. Contact your service engineer. Collect troubleshooting information using iscollectinfo command. [%s1]**

Variable Information

%s1 = Repository name

Explanation

Data was collected for investigation because the repository indicated in %s1 detected a slowdown.

User Action

The amount of available physical memory may be insufficient to run the Interstage directory services. Close unnecessary programs, and obtain the memory required to run the Interstage directory services. To determine the amount of available physical memory, terminate all the repositories, terminate the Interstage data store, and check if the available physical memory is smaller than that required by Interstage directory services. Refer to the chapter 'Memory Size' of the 'Tuning Guide' for information about memory requirements.

If the memory is insufficient after terminating unnecessary programs, extend the memory size.

If the above action does not correct the error, use the *iscollectinfo* command to collect diagnostic information, and then contact your service engineer.

---

## 11.2 irep10100 to irep10199

---

### 11.2.1 irep10100

---

**IREP: WARNING: irep10100: New connection was rejected - the number of connection reached the maximum(%s1). %s2 [%s3]**

Variable Information

%s1 = Maximum number of client connections

%s2 = Information about a client terminal

%s3 = Repository name

Explanation

A connection request from a client was rejected because the maximum number of client connections was exceeded.

User Action

Perform load balancing by operating in the database-share mode, the replication mode or adding a slave server.

For details on building the database-share mode, refer to "Database Sharing" in the 'Creating a Load Distribution Environment' chapter of the "Directory Service Operator's Guide". For details of setting up the replication mode and adding slave servers, refer to 'Creating the Load Distribution Environment (Replication Mode)' in the chapter 'Environment Setup (Using the Standard Database)' of the Directory Service Operator's Guide.

If this error occurs when the number of connected clients is small, the application design may be incorrect. In either of the following cases, review the program.

- For JNDI

InitialDirContext() may be being executed repeatedly. InitialDirContext() does not need to be called several times within a thread for the same repository.

---

### 11.2.2 irep10101

---

**IREP: WARNING: irep10101: New request was rejected because of overload. %s1 [%s2]**

Variable Information

%s1 = Information about a client terminal

%s2 = Repository name

## Explanation

A new request from a client was rejected because the repository had been overloaded.

## User Action

Perform load balancing by operating in the database-share mode, the replication mode or adding a slave server.

For details of building the database-share mode, refer to "Database Sharing" in the 'Creating a Load Distribution Environment' chapter of the Directory Service Operator's Guide. For details of setting up the replication mode and adding slave servers, refer to 'Creating the Load Distribution Environment (Replication Mode)' in the chapter 'Environment Setup (Using the Standard Database)' of the Directory Service Operator's Guide.

This error may also occur if a processing request was issued to over a system scale that is supported by Interstage Directory Service.

Referring to 'Restrictions on the Interstage Directory Service' - 'Restrictions on concerning system scale' in the Product Notes manual, check whether or not the processing request was issued for a system scale larger than that supported by Interstage Directory Service, then re-execute processing.

## 11.2.3 irep10110

---

**IREP: ERROR: irep10110: Failed to create a thread which Repository requires. detail=%s1:%s2:%s3 [%s4]**

### Variable Information

%s1 = Detail code 1

%s2 = Detail code 2

%s3 = errno

%s4 = Repository name

## Explanation

A thread required for the repository failed to be generated.

## User Action

Creating a thread may have failed due to a memory shortage.

Close any unnecessary program, ensure that there is sufficient memory area for Interstage Directory Service, then re-execute processing.

**Windows32/64**

If a memory shortage recurs after closing any unnecessary programs, add memory or increase virtual memory.

**Solaris32/64 Linux32/64**

If a memory shortage recurs after closing any unnecessary programs, add memory or increase the swap area.

For the amount of memory area required for Interstage Directory Service operation, refer to 'Memory Requirements' in the Tuning Guide.

If the above actions fail to correct the error, use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

## 11.2.4 irep10120

---

**IREP: WARNING: irep10120: Unknown request received(ignored). %s1, detail=%s2:%s3 [%s4]**

### Variable Information

%s1 = Information about a client terminal

%s2 = Detail code

%s3 = Request ID

%s4 = Repository name

#### Explanation

Because the repository received an unrecognizable request, it is ignored. There may have been an invalid access.

#### User Action

Check whether there is a specific IP address that is causing this message or whether there may be a more serious access breach.

If this error occurs frequently, limit access by taking action such as constructing a firewall.

### 11.2.5 irep10121

---

**IREP: ERROR: irep10121: Program is terminated. An internal error occurred. detail=%s1:%s2:%s3 [%s4]**

#### Variable Information

%s1 = Cause code (character string)

%s2 = Source name

%s3 = Detail code

%s4 = Repository name

#### Explanation

The repository was closed because an unrecoverable internal error occurred.

#### User Action

Use the *iscollectinfo* command to collect diagnostic information, and then contact your service engineer.

### 11.2.6 irep10122

---

**IREP: ERROR: irep10122: Because of a database(%s1) error, Repository is forced to terminate. detail=%s2:%s3:%s4 [%s5]**

#### Variable Information

%s1 = Database name

%s2 = Detail code 1

%s3 = Detail code 2

%s4 = Detail code 3

%s5 = Repository name

#### Explanation

The repository is forcibly closed because an unrecoverable error occurred in database.

#### User Action

If another error message relating to the target repository is output before this message, refer to the message and take the appropriate action.

If any error message is not output before this message, use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

### 11.2.7 irep10130

---

**IREP: ERROR: irep10130: Specified port number %s1 is used by another service. func=%s2, errno=%s3(%s4) [%s5]**

## Variable Information

%s1 = Port number

%s2 = Function name

%s3 = errno

%s4 = errno character string

%s5 = Repository name

## Explanation

The repository failed to start because the port number to be used by the repository is duplicated by another program.

## User Action

Check if another program is using the port number indicated in %s1, then reinvestigate the operating policy.

To change the port number used by the repository, recreate a repository according to the following procedure:

- Using a standard database as the repository database
  1. Back up the current resources.  
(Use the *irepbacksys* command, specifying the *-dataonly* option.)
  2. Use the Interstage Management Console to delete the target repository.
  3. Use the Interstage Management Console to create a repository to be used as a substitute for the target repository.  
(In this case, change the port number to be used.)
  4. Using the resources backed up in Step 1, restore the resources to the repository created in Step 3.  
(Use the *ireprests* command, specifying the *-dataonly* option.)
- Using a relational database (RDB) as the repository database
  1. Use the Interstage Management Console to delete the target repository.
  2. Use the *ireprests* command to restore the target Repository server backup directory (in Solaris/Linux, this is the backup file).

For the backup and restoration procedure, refer to 'Backing Up and Restoring Resources' in the Operator's Guide.

To change the port number of a repository being operated in replication mode, recreate the master and slave repositories by referring to 'Monitoring of Operation in Replication Mode and Recovery' - 'Restoring the Master Repository in Replication Mode' or 'Restoring the Slave Repository in Replication Mode' in the 'Creating the Load Distribution Environment (Replication Mode)' chapter of the Directory Service Operator's Guide.

## 11.2.8 irep10131

---

**IREP: ERROR: irep10131: Failed to bind port %s1. func=%s2, errno=%s3(%s4) [%s5]**

## Variable Information

%s1 = Port number

%s2 = Function name

%s3 = errno

%s4 = errno character string

%s5 = Repository name

## Explanation

A socket failed to be established.

## User Action

Contact your network administrator. If an error occurs in the network environment (for example, setting the host file, specifying the DNS and DHCP servers to be used, and setting the DNS and DHCP servers themselves to be used), review the network environment and set it again.

If the errno indicated in %s3 is one of the following, take the corresponding action:

### Windows32/64

- If errno is 10055:

Close any unnecessary program, then ensure that there is sufficient memory area for Interstage Directory Service.

If the memory area is still insufficient after closing unnecessary programs, add memory or increase virtual memory. For details of the memory area required for Interstage Directory Service, refer to 'Memory Requirements' in the Tuning Guide.

### Solaris32/64 Linux32/64

- If errno is 12:

Close any unnecessary programs, then allocate the memory area required for Interstage Directory Service.

If the memory area is still insufficient after closing unnecessary programs, add memory or increase the swap area. For details of the memory area required for Interstage Directory Service, refer to 'Memory Requirements' in the Tuning Guide.

If any of the above actions fails to correct the error (or the errno indicates other than those shown above), use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

## 11.2.9 irep10132

---

**IREP: ERROR: irep10132: Failed to initialize the socket. func=%s1, errno=%s2, detail=%s3:%s4 [%s5]**

### Variable Information

%s1 = Function name

%s2 = Error code

%s3 = Detail code 1

%s4 = Detail code 2

%s5 = Repository name

### Explanation

The Winsock library failed to be initialized.

### User Action

Use the *iscollectinfo* command to collect diagnostic information, and then contact your service engineer.

## 11.2.10 irep10133

---

**IREP: ERROR: irep10133: Unsupported socket library. version=%s1.%s2, detail=%s3:%s4 [%s5]**

### Variable Information

%s1 = Version

%s2 = Level

%s3 = Detail code 1

%s4 = Detail code 2

%s5 = Repository name

## Explanation

An unsupported Winsock library has been detected.

%s1 and %s2 indicate the version of the Winsock library required by Interstage Directory Service.

## User Action

An old Winsock library may have been mistakenly installed in the system. Install the Winsock library required in %s1 and %s2.

If this fails to correct the error, use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

## 11.2.11 irep10134

---

**IREP: ERROR: irep10134: Failed to create the server socket. func=%s1, errno=%s2(%s3), detail=%s4 [%s5]**

### Variable Information

%s1 = Detailed information

%s2 = errno

%s3 = errno character string

%s4 = Error code

%s5 = Repository name

## Explanation

A server socket failed to be created.

## User Action

If the errno indicated in %s2 is one of the following, take the corresponding action:

### Windows32/64

- If errno is 10055:

Close any unnecessary programs, then allocate the memory area required for Interstage Directory Service.

If the memory area is still insufficient after closing unnecessary programs, add memory or increase virtual memory. For details of the memory area required for Interstage Directory Service, refer to 'Memory Requirements' in the Tuning Guide.

### Solaris32/64 Linux32/64

- If errno is 12:

Close any unnecessary programs, then allocate the memory area required for Interstage Directory Service.

If the memory area is still insufficient after closing unnecessary programs, add memory or increase the swap area. For details of the memory area required for Interstage Directory Service, refer to 'Memory Requirements' in the Tuning Guide.

If the above actions fail to correct the error (or the errno indicates other than above), use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

## 11.2.12 irep10150

---

**IREP: ERROR: irep10150: Failed to open the database(%s1). detail=%s2:%s3:%s4:%s5:%s6 [%s7]**

### Variable Information

%s1 = Database name

%s2 = Function name

%s3 = Detail code 1

%s4 = Detail code 2

%s5 = Cause code  
%s6 = Cause  
%s7 = Repository name

### Explanation

The database failed to open.

### User Action

If another error message relating to the target repository is output before this message, refer to the message and take the appropriate action.

If any error message is not output before this message, use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

## 11.2.13 irep10151

---

**IREP: WARNING: irep10151: Failed to close the database(%s1). detail=%s2:%s3:%s4:%s5:%s6 [%s7]**

### Variable Information

%s1 = Database name  
%s2 = Function name  
%s3 = Detail code 1  
%s4 = Detail code 2  
%s5 = Cause code  
%s6 = Cause  
%s7 = Repository name

### Explanation

The database failed to close.

### System Action

Continues the stop processing.

### User Action

If another error message relating to the target repository is output before this message, refer to the message and take the appropriate action.

If any error message is not output before this message, use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

## 11.2.14 irep10152

---

**IREP: ERROR: irep10152: Failed to initialize the database(%s1). detail=%s2:%s3:%s4:%s5 [%s6]**

### Variable Information

%s1 = Database name  
%s2 = Function name  
%s3 = Detail code 1  
%s4 = Detail code 2  
%s5 = Cause code  
%s6 = Repository name

## Explanation

The database failed to initialize.

## User Action

If another error message relating to the target repository is output before this message, refer to the message and take the appropriate action.

If any error message is not output before this message, use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

## 11.2.15 irep10160

---

**IREP: ERROR: irep10160: Failed to initialize the library. detail=%s1 [%s2]**

### Variable Information

%s1 = Cause

%s2 = Repository name

## Explanation

The dynamic library failed to initialize.

## User Action

If another error message relating to the target repository is output before this message, refer to the message and take the appropriate action.

If any error message is not output before this message, use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

## 11.2.16 irep10161

---

**IREP: ERROR: irep10161: Failed to load the udata. detail=%s1 [%s2]**

### Variable Information

%s1 = Error code

%s2 = Repository name

## Explanation

The Interstage Directory Service environment may have been changed by mistake.

## User Action

Back up the created repository, and then re-install Interstage Directory Service. After re-installation, restore the backed up repository to correct the environment. For details of backup and restoration, refer to 'Maintenance (Resource Backup)' in the Operator's Guide. For details of re-installation, refer to the Installation Guide.

## 11.2.17 irep10162

---

**IREP: ERROR: irep10162: Invalid definition in schema file. detail=%s1 [%s2]**

### Variable Information

%s1 = Error code

%s2 = Repository name

## Explanation

There is an incorrect definition in the schema.

## User Action

If another error message relating to the target repository is output before this message, refer to the message and take the appropriate action.

Back up the created repository, and then re-install Interstage Directory Service. After re-installation, restore the backed up repository to correct the environment. For details of backup and restoration, refer to 'Maintenance (Resource Backup)' in the Operator's Guide. For details of re-installation, refer to the Installation Guide.

## 11.2.18 irep10163

---

**IREP: ERROR: irep10163: Failed to initialize SSL library. detail=%s1:%s2:%s3 [%s4]**

### Variable Information

%s1 = Detail code 1

%s2 = Detail code 2

%s3 = Error code

%s4 = Repository name

### Explanation

An error occurred in the initialization processing of the SSL library.

### User Action

If another error message relating to the target repository is output before this message, refer to the message and take the appropriate action.

If any error message is not output before this message, use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

## 11.2.19 irep10170

---

**IREP: ERROR: irep10170: Failed to access the install information. func=%s1, detail=%s2:%s3:%s4:%s5 [%s6]**

### Variable Information

%s1 = Function name

%s2 = Detail code 1

%s3 = Detail code 2

%s4 = Return value

%s5 = errno

%s6 = Repository name

### Explanation

Reading of Interstage Directory Service installation information failed. The Interstage Directory Service environment may have been changed by mistake.

### User Action

Back up the created repository, and then re-install Interstage Directory Service. After re-installation, restore the backed up repository to correct the environment. For details of backup and restoration, refer to 'Maintenance (Resource Backup)' in the Operator's Guide. For details of re-installation, refer to the Installation Guide.

## 11.2.20 irep10171

---

---

**IREP: ERROR: irep10171: The environment is destroyed or the Install is an imperfect status. func=%s1, detail=%s2:%s3 [%s4]**

**Variable Information**

- %s1 = Function name
- %s2 = Detail code 1
- %s3 = Detail code 2
- %s4 = Repository name

**Explanation**

Interstage Directory Service installation information could not be found. The Interstage Directory Service environment may have been changed by mistake.

**User Action**

Back up the created repository, and then re-install Interstage Directory Service. After re-installation, restore the backed up repository to correct the environment. For details of backup and restoration, refer to 'Maintenance (Resource Backup)' in the Operator's Guide. For details of re-installation, refer to the Installation Guide.

---

## 11.2.21 irep10172

---

**IREP: ERROR: irep10172: The package directory does not exist. path=%s1 [%s2]**

**Variable Information**

- %s1 = Directory name
- %s2 = Repository name

**Explanation**

The package directory indicated in %s1 does not exist. The Interstage Directory Service environment may have been changed by mistake.

**User Action**

 Windows32/64

Ensure that the DOS device name has not been specified for the repository name.

Back up the created repository, and then re-install Interstage Directory Service. After re-installation, restore the backed up repository to correct the environment. For details of backup and restoration, refer to 'Maintenance (Resource Backup)' in the Operator's Guide. For details of re-installation, refer to the Installation Guide.

---

## 11.2.22 irep10173

---

**IREP: ERROR: irep10173: No access permission to the package directory. path=%s1 [%s2]**

**Variable Information**

- %s1 = Directory name
- %s2 = Repository name

**Explanation**

An access permission error occurred in checking the package configuration. The Interstage Directory Service environment may have been changed by mistake.

## User Action

Back up the created repository, then re-install Interstage Directory Service. After re-installation, restore the backed up repository to correct the environment. For details of backup and restoration, refer to 'Maintenance (Resource Backup)' in the Operator's Guide. For details of re-installation, refer to the Installation Guide.

## 11.2.23 irep10174

---

**IREP: ERROR: irep10174: Failed to check the package directory. path=%s1, errno=%s2 [%s3]**

### Variable Information

%s1 = Directory name

%s2 = errno

%s3 = Repository name

### Explanation

An error occurred in checking the package configuration. The Interstage Directory Service environment may have been changed by mistake.

### User Action

Back up the created repository, and then re-install Interstage Directory Service. After re-installation, restore the backed up repository to correct the environment. For details of backup and restoration, refer to 'Maintenance (Resource Backup)' in the Operator's Guide. For details of re-installation, refer to the Installation Guide.

## 11.2.24 irep10175

---

**IREP: ERROR: irep10175: Package file does not exist. path=%s1 [%s2]**

### Variable Information

%s1 = File name

%s2 = Repository name

### Explanation

A file required for the package does not exist. The Interstage Directory Service environment may have been changed by mistake.

### User Action

Back up the created repository, and then re-install Interstage Directory Service. After re-installation, restore the backed up repository to correct the environment. For details of backup and restoration, refer to 'Maintenance (Resource Backup)' in the Operator's Guide. For details of re-installation, refer to the Installation Guide.

## 11.2.25 irep10176

---

**IREP: ERROR: irep10176: No access permission to the package file. path=%s1 [%s2]**

### Variable Information

%s1 = File name

%s2 = Repository name

### Explanation

There is no permission to access the required file of the package. The Interstage Directory Service environment may have been changed by mistake.

## User Action

Back up the created repository, and then re-install Interstage Directory Service. After re-installation, restore the backed up repository to correct the environment. For details of backup and restoration, refer to 'Maintenance (Resource Backup)' in the Operator's Guide. For details of re-installation, refer to the Installation Guide.

## 11.2.26 irep10177

---

**IREP: ERROR: irep10177: Cannot access the package file. path=%s1 [%s2]**

### Variable Information

%s1 = File name

%s2 = Repository name

### Explanation

Interstage Directory Service cannot access the required file of the package. The Interstage Directory Service environment may have been changed by mistake.

### User Action

Back up the created repository, and then re-install Interstage Directory Service. After re-installation, restore the backed up repository to correct the environment. For details of backup and restoration, refer to 'Maintenance (Resource Backup)' in the Operator's Guide. For details of re-installation, refer to the Installation Guide.

## 11.3 irep10200 to irep10299

---

### 11.3.1 irep10200

---

**IREP: WARNING: irep10200: Out of memory. pid=%s1, tid=%s2, detail=%s3:%s4:%s5 [%s6]**

### Variable Information

%s1 = Process ID

%s2 = thread ID

%s3 = Detail code 1

%s4 = Detail code 2

%s5 = Detail code 3

%s6 = Repository name

### Explanation

The memory required for the repository operation is insufficient.

### System Action

Continues the current processing.

### User Action

Close any of unnecessary programs, then ensure that there is sufficient memory area for Interstage Directory Service.

**Windows32/64**

If the memory area is still insufficient after closing unnecessary programs, add memory or increase virtual memory.

**Solaris32/64 Linux32/64**

If the memory area is still insufficient after closing unnecessary programs, add memory or increase the swap area.

For details of the memory area required for Interstage Directory Service, refer to 'Memory Requirements' in the Tuning Guide.

## 11.3.2 irep10201

---

**IREP: ERROR: irep10201: Cannot get the required memory. pid=%s1, tid=%s2, detail=%s3:%s4:%s5 [%s6]**

### Variable Information

%s1 = Process ID  
%s2 = thread ID  
%s3 = Detail code 1  
%s4 = Detail code 2  
%s5 = Detail code 3  
%s6 = Repository name

### Explanation

The memory required for the repository failed to be acquired.

### System Action

Suspends the current processing.

### User Action

Close any of unnecessary programs, then ensure that there is sufficient memory area for Interstage Directory Service.

If this message is output during start processing, restart the repository.

**Windows32/64**

If the memory area is still insufficient after closing unnecessary programs, add memory or increase virtual memory.

**Solaris32/64 Linux32/64**

If the memory area is still insufficient after closing unnecessary programs, add memory or increase the swap area.

For details of the memory area required for Interstage Directory Service, refer to 'Memory Requirements' in the Tuning Guide.

## 11.3.3 irep10202

---

**IREP: ERROR: irep10202: Failed to initialize the exclusive resources. func=%s1, errno=%s2, detail=%s3:%s4 [%s5]**

### Variable Information

%s1 = Name of a system call  
%s2 = Error number  
%s3 = Detail code 1  
%s4 = Detail code 2  
%s5 = Repository name

### Explanation

A system error occurred in initializing the exclusive resources of the repository.

### System Action

Suspends the current processing.

### User Action

Use the *iscollectinfo* command to collect diagnostic information, and then contact your service engineer.

## 11.3.4 irep10210

---

**IREP: ERROR: irep10210: System-call error. pid=%s1, tid=%s2, func=%s3, errno=%s4, detail=%s5:%s6 [%s7]**

### Variable Information

%s1 = Process ID

%s2 = thread ID

%s3 = Name of a system call

%s4 = Error number

%s5 = Detail code 1

%s6 = Detail code 2

%s7 = Repository name

### Explanation

An uncontinuable error was detected in a system call.

### System Action

Suspends the current processing.

### User Action

If the irep10172 message is output immediately before this message, take the action specified in the irep10172 message. If that message was not output, take the following action:

- Use the *iscollectinfo* command to collect diagnostic information, and then contact your service engineer.

## 11.3.5 irep10211

---

**IREP: ERROR: irep10211: I/O error. path=%s1, func=%s2, errno=%s3 [%s4]**

### Variable Information

%s1 = File name

%s2 = Name of a system call

%s3 = Error number

%s4 = Repository name

### Explanation

An I/O error occurred.

### User Action

Take the appropriate action according to one of the following messages, which is output just after this message and relates to relevant repository names:

irep10220 to irep10232

If no relevant message is output, use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

## 11.3.6 irep10212

---

**IREP: ERROR: irep10212: No access permission to the file or the directory. path=%s1 [%s2]**

## Variable Information

%s1 = File name

%s2 = Repository name

## Explanation

There is no access permission to the file or path output in %s1.

## User Action

Take the appropriate action according to one of the following messages, which is output just after this message and relates to the same repository names:

irep10220 to irep10232

If no relevant message is output, use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

## 11.3.7 irep10213

---

**IREP: ERROR: irep10213: File or directory does not exist. path=%s1, func=%s2, errno=%s3 [%s4]**

## Variable Information

%s1 = File name

%s2 = Name of a system call

%s3 = Error number

%s4 = Repository name

## Explanation

The file or path does not exist

## User Action

Take the appropriate action according to one of the following messages, which is output just after this message and relates to the same repository name:

irep10220 to irep10232

If no relevant message is output, use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

## 11.3.8 irep10214

---

**IREP: ERROR: irep10214: Failed to open the file or the directory. path=%s1, func=%s2, errno=%s3 [%s4]**

## Variable Information

%s1 = File name

%s2 = Name of a system call

%s3 = Error number

%s4 = Repository name

## Explanation

A file or path output in %s1 failed to open.

## User Action

Use the *iscollectinfo* command to collect diagnostic information, and then contact your service engineer.

## 11.3.9 irep10215

---

---

**IREP: ERROR: irep10215: No free disk space. path=%s1, func=%s2, errno=%s3 [%s4]**

#### Variable Information

%s1 = File name

%s2 = Name of a system call

%s3 = Error number

%s4 = Repository name

#### Explanation

The disk capacity is insufficient.

#### User Action

Take appropriate action according to one of the following messages which are output just after this message and relate to the same repository names:

irep10220 to irep10232

If no relevant message is output, use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

### 11.3.10 irep10216

---

**IREP: ERROR: irep10216: Exceeded the maximum number of open files. path=%s1, func=%s2, errno=%s3 [%s4]**

#### Variable Information

%s1 = File name

%s2 = Name of a system call

%s3 = Error number

%s4 = Repository name

#### Explanation

The upper limit of the number of files that can be opened in the process has been exceeded.

#### User Action

Use the *iscollectinfo* command to collect diagnostic information, and then contact your service engineer.

### 11.3.11 irep10217

---

**IREP: WARNING: irep10217: Failed to write the access-log. No free disk space. path=%s1, func=%s2, errno=%s3 [%s4]**

#### Variable Information

%s1 = File name

%s2 = Name of a system call

%s3 = Error number

%s4 = Repository name

#### Explanation

The access log failed to be output because the disk space has been insufficient. When there is insufficient disk space, the access log is not written.

#### System Action

Continues the current processing.

## User Action

The disk space is insufficient. Delete any unnecessary files to increase the free disk space. Alternatively, change the access log storage directory to a path on a disk that has sufficient free space.

For details of the disk space required for the access log storage destination, refer to 'Disk Space Requirements' in the Tuning Guide.

If the above action cannot be taken, the disk space needs to be increased. To increase the disk space, back up the repository resources as required, and then re-install Interstage Directory Service.

For details of Interstage Directory Service installation, refer to the Installation Guide.

## 11.3.12 irep10220

---

### **IREP: ERROR: irep10220: Failed to create the trace file. [%s1]**

#### Variable Information

%s1 = Repository name

#### Explanation

The error analysis maintenance data (trace file) of the repository failed to be created.

#### System Action

If this message is output during repository operation, continues the current processing.

In other cases, suspends the current processing.

#### User Action

If one of the following messages is output immediately before this message, take the indicated action, then re-execute the processing.

- For irep10201

The memory is insufficient. Take the action indicated in the irep10201 message.

- For irep10211

An I/O error occurred. Check whether the disk unit is operating normally.

If a disk unit failure has occurred, replace the disk unit using the following procedure:

1. Back up the repository resources.
2. Replace the disk unit.
3. Re-install Interstage Directory Service.
4. Restore the repository resources backed up in Step 1 above.

- For irep10212 and irep10213

The Interstage Directory Service environment has been changed by mistake. Back up the repository resources as required, and then re-install Interstage Directory Service.

- For irep10215

The disk space is insufficient. Delete any unnecessary files, and then increase the free disk space.

If the above action cannot be taken, the disk space needs to be increased. To increase the disk space, back up the repository resources as required, and then re-install Interstage Directory Service.

If there is no relevant message or an error cannot be removed, use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

For details of Interstage Directory Service installation, refer to the Installation Guide. For details of backup and restoration of the repository resources, refer to 'Maintenance (Resource Backup)' in the Operator's Guide.

## 11.3.13 irep10221

---

### IREP: ERROR: irep10221: Failed to read the trace file. [%s1]

#### Variable Information

%s1 = Repository name

#### Explanation

The error analysis maintenance data (trace file) of the repository failed to be read.

#### System Action

Suspends the current processing.

#### User Action

If one of the following messages is output immediately before this message, take the indicated action, then re-execute the processing.

- For irep10201

The memory is insufficient. Take the action indicated in the irep10201 message.

- For irep10211

An I/O error occurred. Check whether the disk unit is operating normally.

If a disk unit failure has occurred, replace the disk unit using the following procedure:

1. Back up the repository resources.
2. Replace the disk unit.
3. Re-install Interstage Directory Service.
4. Restore the repository resources backed up in Step 1 above.

- For irep10212 and irep10213

The Interstage Directory Service environment has been changed by mistake. Back up the repository resources as required, and then re-install Interstage Directory Service.

If there is no relevant message or an error cannot be removed, use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

For details of Interstage Directory Service installation, refer to the Installation Guide. For details of backup and restoration of the repository resources, refer to 'Maintenance (Resource Backup)' in the Operator's Guide.

## 11.3.14 irep10222

---

### IREP: ERROR: irep10222: Failed to create the process management file. [%s1]

#### Variable Information

%s1 = Repository name

#### Explanation

A process management file failed to be created.

#### System Action

Suspends the current processing.

#### User Action

If one of the following messages is output immediately before this message, take the indicated action, then re-execute the processing.

- For irep10201

The memory is insufficient. Take the action indicated in the irep10201 message.

- For irep10211

An I/O error occurred. Check whether the disk unit is operating normally.

If a disk unit failure has occurred, replace the disk unit using the following procedure:

1. Back up the repository resources.
2. Replace the disk unit.
3. Re-install Interstage Directory Service.
4. Restore the repository resources backed up in Step 1 above.

- For irep10212 and irep10213

The Interstage Directory Service environment has been changed by mistake. Back up the repository resources as required, and then re-install Interstage Directory Service.

- For irep10215

The disk space is insufficient. Delete any unnecessary files, and then increase the free disk space.

If the above action cannot be taken, the disk space needs to be increased. To increase the disk space, back up the repository resources as required, and then re-install Interstage Directory Service.

If there is no relevant message or an error cannot be removed, use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

For details of Interstage Directory Service installation, refer to the Installation Guide. For details of backup and restoration of the repository resources, refer to 'Maintenance (Resource Backup)' in the Operator's Guide.

## 11.3.15 irep10223

---

### IREP: ERROR: irep10223: Failed to create the lockfile. [%s1]

#### Variable Information

%s1 = Repository name

#### Explanation

An inter-process exclusive lockfile failed to be created.

#### System Action

Suspends the current processing.

#### User Action

If one of the following messages is output immediately before this message, take the indicated action, then re-execute the processing.

- For irep10201

The memory is insufficient. Take the action indicated in the irep10201 message.

- For irep10211

An I/O error occurred. Check whether the disk unit is operating normally.

If a disk unit failure has occurred, replace the disk unit using the following procedure:

1. Back up the repository resources.
2. Replace the disk unit.
3. Re-install Interstage Directory Service.
4. Restore the repository resources backed up in Step 1 above.

- For irep10212 and irep10213

The Interstage Directory Service environment has been changed by mistake. Back up the repository resources as required, and then re-install Interstage Directory Service.

- For irep10215

The disk space is insufficient. Delete any unnecessary files, and then increase the free disk space.

If the above action cannot be taken, the disk space needs to be increased. To increase the disk space, back up the repository resources as required, and then re-install Interstage Directory Service.

If there is no relevant message or an error cannot be removed, use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

For details of Interstage Directory Service installation, refer to the Installation Guide. For details of backup and restoration of the repository resources, refer to 'Maintenance (Resource Backup)' in the Operator's Guide.

## 11.3.16 irep10224

---

### **IREP: ERROR: irep10224: Failed to read the configuration file. [%s1]**

#### Variable Information

%s1 = Repository name

#### Explanation

The configuration file failed to be read.

#### System Action

Suspends the current processing.

#### User Action

If one of the following messages is output immediately before this message, take the indicated action, then re-execute the processing.

- For irep10201

The memory is insufficient. Take the action indicated in the irep10201 message.

- For irep10211

An I/O error occurred. Check whether the disk unit is operating normally.

If a disk unit failure has occurred, replace the disk unit using the following procedure:

1. Replace the disk unit.
2. Re-install Interstage Directory Service.
3. If there are repository resources previously backed up, restore the repository resources.

- For irep10212 and irep10213

The Interstage Directory Service environment has been changed by mistake. Re-install Interstage Directory Service.

If there is no relevant message or an error cannot be removed, use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

For details of Interstage Directory Service installation, refer to the Installation Guide. For details of backup and restoration of the repository resources, refer to 'Maintenance (Resource Backup)' in the Operator's Guide.

## 11.3.17 irep10225

---

### **IREP: ERROR: irep10225: Failed to create the access-log. [%s1]**

#### Variable Information

%s1 = Repository name

## Explanation

An access log failed to be created.

## System Action

Suspends the current processing.

## User Action

If one of the following messages is output immediately before this message, take the indicated action, then re-execute the processing.

- For irep10201

The memory is insufficient. Take the action indicated in the irep10201 message.

- For irep10211

An I/O error occurred. Check whether the disk unit is operating normally.

If a disk unit failure has occurred, use the Interstage Management Console to change the [Access log storage directory] of [Access Log Settings], then restart the repository. Alternatively, replace the disk unit using the following procedure:

1. Back up the repository resources.
2. Replace the disk unit.
3. Re-install Interstage Directory Service.
4. Restore the repository resources backed up in Step 1 above.

- For irep10212

If the [Access log storage directory] of [Access Log Settings] is not set to the default, use the Interstage Management Console to confirm that [Access log storage directory] can be accessed with administrator permission. If [Access log storage directory] is the default, this indicates that the Interstage Directory Service environment was changed by mistake. Back up the repository resources as required, and then re-install Interstage Directory Service.

- For irep10213

If the [Access log storage directory] of [Access Log Settings] is not set to the default, use the Interstage Management Console to confirm that [Access log storage directory] exists. If [Access log storage directory] is the default, this indicates that the Interstage Directory Service environment was changed by mistake. Back up the repository resources as required, and then re-install Interstage Directory Service.

- For irep10215

The disk space is insufficient. Delete any unnecessary files, and then increase the free disk space.

For details of the disk space required for an access log storage destination, refer to 'Disk Space Requirements' in the Tuning Guide.

If the above action cannot be taken, the disk space needs to be increased. To increase the disk space, back up the repository resources as required, and then re-install Interstage Directory Service.

If there is no relevant message or an error cannot be removed, use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

For details of Interstage Directory Service installation, refer to the Installation Guide. For details of backup and restoration of the repository resources, refer to 'Maintenance (Resource Backup)' in the Operator's Guide.

## 11.3.18 irep10226

---

**IREP: ERROR: irep10226: Failed to create the file or the directory. [%s1]**

### Variable Information

%s1 = Repository name

### Explanation

A file or path failed to be created.

## System Action

Suspends the current processing.

## User Action

If one of the following messages is output immediately before this message, take the indicated action, then re-execute the processing.

- For irep10201

The memory is insufficient. Take the action indicated in the irep10201 message.

- For irep10211

An I/O error occurred. Check whether the disk unit is operating normally.

If a disk unit failure has occurred, replace the disk unit using the following procedure:

1. Back up the repository resources.
2. Replace the disk unit.
3. Re-install Interstage Directory Service.
4. Restore the repository resources backed up in Step 1 above.

- For irep10212 and irep10213

The Interstage Directory Service environment has been changed by mistake. Back up the repository resources as required, and then re-install Interstage Directory Service.

- For irep10215

The disk space is insufficient. Delete any unnecessary files, and then increase the free disk space.

If the above action cannot be taken, the disk space needs to be increased. To increase the disk space, back up the repository resources as required, and then re-install Interstage Directory Service.

If there is no relevant message or an error cannot be removed, use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

For details of Interstage Directory Service installation, refer to the Installation Guide. For details of backup and restoration of the repository resources, refer to 'Maintenance (Resource Backup)' in the Operator's Guide.

## 11.3.19 irep10227

---

**IREP: ERROR: irep10227: Failed to delete the file or the directory. [%s1]**

### Variable Information

%s1 = Repository name

### Explanation

A file or path failed to be deleted.

### System Action

Suspends the current processing.

### User Action

If one of the following messages is output immediately before this message, take the indicated action, then re-execute the processing.

- For irep10201

The memory is insufficient. Take the action indicated in the irep10201 message.

- For irep10211

An I/O error occurred. Check whether the disk unit is operating normally.

If a disk unit failure has occurred, replace the disk unit using the following procedure:

1. Back up the repository resources.
2. Replace the disk unit.
3. Re-install Interstage Directory Service.
4. Restore the repository resources backed up in Step 1 above.

- For irep10212

The Interstage Directory Service environment has been changed by mistake. Back up the repository resources as required, and then re-install Interstage Directory Service.

If there is no relevant message or an error cannot be removed, use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

For details of Interstage Directory Service installation, refer to the Installation Guide. For details of backup and restoration of the repository resources, refer to 'Maintenance (Resource Backup)' in the Operator's Guide.

## 11.3.20 irep10228

---

**IREP: ERROR: irep10228: Failed to read the repository file. [%s1]**

### Variable Information

%s1 = Repository name

### Explanation

The Interstage Directory Service information management file failed to be read.

### System Action

Suspends the current processing.

### User Action

If one of the following messages is output immediately before this message, take the indicated action, then re-execute the processing.

- For irep10201

The memory is insufficient. Take the action indicated in the irep10201 message.

- For irep10211

An I/O error occurred. Check whether the disk unit is operating normally.

If a disk unit failure has occurred, replace the disk unit, then re-install Interstage Directory Service.

- For irep10212 and irep10213

The Interstage Directory Service environment has been changed by mistake. Re-install Interstage Directory Service.

If there is no relevant message or an error cannot be removed, use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

For details of Interstage Directory Service installation, refer to the Installation Guide.

## 11.3.21 irep10229

---

**IREP: ERROR: irep10229: Failed to update the repository file. [%s1]**

### Variable Information

%s1 = Repository name

### Explanation

The Interstage Directory Service information management file failed to be updated.

## System Action

Suspends the current processing.

## User Action

If one of the following messages is output immediately before this message, take the indicated action, then re-execute the processing.

- For irep10201

The memory is insufficient. Take the action indicated in the irep10201 message.

- For irep10211

An I/O error occurred. Check whether the disk unit is operating normally.

If a disk unit failure has occurred, replace the disk unit, then re-install Interstage Directory Service.

- For irep10212 and irep10213

The Interstage Directory Service environment has been changed by mistake. Re-install Interstage Directory Service.

- For irep10215

The disk space is insufficient. Delete any unnecessary files, and then increase the free disk space.

If the above action cannot be taken, the disk space needs to be increased. To increase the disk space, back up the repository resources as required, and then re-install Interstage Directory Service.

If there is no relevant message or an error cannot be removed, use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

For details of Interstage Directory Service installation, refer to the Installation Guide. For details of backup and restoration of the repository resources, refer to 'Maintenance (Resource Backup)' in the Operator's Guide.

## 11.3.22 irep10230

---

**IREP: ERROR: irep10230: Cannot read the master file while configuring repository environment. [%s1]**

### Variable Information

%s1 = Repository name

### Explanation

The master information file for defining the Interstage Directory Service environment failed to be read.

### System Action

Suspends the current processing.

### User Action

This error does not affect the operation of repositories that have already been created. When a new repository is created, if one of the following messages is output immediately before this message, take the indicated action, then re-execute the processing.

- For irep10201

The memory is insufficient. Take the action indicated in the irep10201 message.

- For irep10211

An I/O error occurred. Check whether the disk unit is operating normally.

If a disk unit failure has occurred, replace the disk unit using the following procedure:

1. Back up the repository resources.
2. Replace the disk unit.
3. Re-install Interstage Directory Service.
4. Restore the repository resources backed up in Step 1 above.

- For irep10212 and irep10213

The Interstage Directory Service environment has been changed by mistake. Back up the repository resources as required, then re-install Interstage Directory Service.

If there is no relevant message or an error cannot be removed, use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

For details of Interstage Directory Service installation, refer to the Installation Guide. For details of backup and restoration of the repository resources, refer to 'Maintenance (Resource Backup)' in the Operator's Guide.

### 11.3.23 irep10231

---

**IREP: ERROR: irep10231: Cannot copy the master file while configuring repository environment. [%s1]**

#### Variable Information

%s1 = Repository name

#### Explanation

Copying of the master information file for defining the Interstage Directory Service environment failed.

#### System Action

Suspends the current processing.

#### User Action

This error does not affect the operation of repositories that have already been created. When a new repository is created, if one of the following messages is output immediately before this message, take the indicated action, then re-execute the processing.

- For irep10201

The memory is insufficient. Take the action indicated in the irep10201 message.

- For irep10211

An I/O error occurred. Check whether the disk unit is operating normally.

If a disk unit failure has occurred, replace the disk unit using the following procedure:

1. Back up the repository resources.
2. Replace the disk unit.
3. Re-install Interstage Directory Service.
4. Restore the repository resources backed up in Step 1 above.

- For irep10212 and irep10213

The Interstage Directory Service environment has been changed by mistake. Back up the repository resources as required, and then re-install Interstage Directory Service.

- For irep10215

The disk space is insufficient. Delete any unnecessary files, and then increase the free disk space.

If the above action cannot be taken, the disk space needs to be increased. To increase the disk space, back up the repository resources as required, and then re-install Interstage Directory Service.

If there is no relevant message or an error cannot be removed, use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

For details of Interstage Directory Service installation, refer to the Installation Guide. For details of backup and restoration of the repository resources, refer to 'Maintenance (Resource Backup)' in the Operator's Guide.

### 11.3.24 irep10232

---

---

**IREP: ERROR: irep10232: Pipe operation error. [%s1]****Variable Information**

%s1 = Repository name

**Explanation**

An error occurred during operation of the inter-process communication pipe.

**System Action**

Suspends the current processing.

**User Action**

If one of the following messages is output immediately before this message, take the indicated action, then re-execute the processing.

- For irep10201

The memory is insufficient. Take the action indicated in the irep10201 message.

- For irep10211

An I/O error occurred. Check whether the disk unit is operating normally.

If a disk unit failure has occurred, replace the disk unit using the following procedure:

1. Back up the repository resources.
2. Replace the disk unit.
3. Re-install Interstage Directory Service.
4. Restore the repository resources backed up in Step 1 above.

- For irep10212 and irep10213

The Interstage Directory Service environment has been changed by mistake. Back up the repository resources as required, and then re-install Interstage Directory Service.

- For irep10215

The disk space is insufficient. Delete any unnecessary files, and then increase the free disk space.

If the above action cannot be taken, the disk space needs to be increased. To increase the disk space, back up the repository resources as required, and then re-install Interstage Directory Service.

If there is no relevant message or an error cannot be removed, use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

For details of Interstage Directory Service installation, refer to the Installation Guide. For details of backup and restoration of the repository resources, refer to 'Maintenance (Resource Backup)' in the Operator's Guide.

---

**11.3.25 irep10240**

---

**IREP: ERROR: irep10240: No access permission to key-file. path=%s1, detail=%s2:%s3:%s4 [%s5]****Variable Information**

%s1 = Key file

%s2 = Detail code 1

%s3 = Detail code 2

%s4 = Error number

%s5 = Repository name

**Explanation**

There is no access permission to the management file (key file) for identifying the shared memory used for the repository.

## System Action

Suspends the current processing.

## User Action

The Interstage Directory Service environment has been changed by mistake. Back up the created repository, and then re-install Interstage Directory Service. After re-installation, restore the backed up repository to correct the environment. For details of backup and restoration, refer to 'Maintenance (Resource Backup)' in the Operator's Guide. For details of re-installation, refer to the Installation Guide.

## 11.3.26 irep10241

---

**IREP: ERROR: irep10241: Key-file does not exist. path=%s1, detail=%s2:%s3:%s4 [%s5]**

### Variable Information

%s1 = Key file  
%s2 = Detail code 1  
%s3 = Detail code 2  
%s4 = Error number  
%s5 = Repository name

### Explanation

There is no management file (key file) for identifying the shared memory used for the repository.

## System Action

Suspends the current processing.

## User Action

The management file for identifying the shared memory used for the repository may have been deleted by mistake. Use the Interstage Management Console or the *irepstop/irepstart* command to restart the target repository. For details of *irepstop/irepstart* command, refer to 'Interstage Directory Service Operation Commands' in the Reference Manual (Command Edition).

If the above actions fail to correct the error, use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

## 11.3.27 irep10242

---

**IREP: ERROR: irep10242: Failed to open key-file. path=%s1, func=%s2, errno=%s3, detail=%s4:%s5 [%s6]**

### Variable Information

%s1 = Key file  
%s2 = Name of a system call  
%s3 = Error number  
%s4 = Detail code 1  
%s5 = Detail code 2  
%s6 = Repository name

### Explanation

Opening of the management file (key file) for identifying the shared memory used for the repository failed.

## System Action

Suspends the current processing.

## User Action

Use the *iscollectinfo* command to collect diagnostic information, and then contact your service engineer.

### 11.3.28 irep10243

---

**IREP: ERROR: irep10243: Failed to get shared memory. detail=%s1:%s2 [%s3]**

#### Variable Information

%s1 = Detail code 1

%s2 = Detail code 2

%s3 = Repository name

#### Explanation

Acquisition of the shared memory used for the repository failed.

#### System Action

Suspends the current processing.

#### User Action

Review the setting values of the system parameters, and then change the settings.

For details of calculating the values to be set, refer to 'System Tuning' in the Tuning Guide.

After the system parameters are changed, the system needs to be restarted.

### 11.3.29 irep10244

---

**IREP: ERROR: irep10244: Failed to get shared memory. [%s1]**

#### Variable Information

%s1 = Repository name

#### Explanation

Acquisition of the shared memory used for the repository failed.

#### System Action

Suspends the current processing.

#### User Action

Review the setting values of the system parameters, and then change the settings.

For details of calculating the values to be set, refer to 'System Tuning' in the Tuning Guide.

After the system parameters are changed, the system need to be restarted.

### 11.3.30 irep10245

---

**IREP: ERROR: irep10245: Can not get shared memory. It is used by another. key=%s1, path=%s2, id=%s3, shmid=%s4 [%s5]**

#### Variable Information

%s1 = ftok key value

%s2 = keyfile path

%s3 = keyfile ID

%s4 = Shared memory ID

%s5 = Repository name

#### Explanation

Acquisition of the shared memory used for the repository failed because it may have conflicted with the shared memory used by another process.

#### System Action

Suspends the current processing.

#### User Action

The shared memory output in %s4 may be conflicting with another product. Take the appropriate action by referring to 'Other Customization Items' in the Tuning Guide, then re-execute processing.

If this fails to correct the error, use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

## 11.3.31 irep10246

---

**IREP: ERROR: irep10246: No access permission to shared memory. key=%s1, path=%s2, id=%s3, shmid=%s4 [%s5]**

#### Variable Information

%s1 = ftok key value

%s2 = keyfile path

%s3 = keyfile ID

%s4 = Shared memory ID

%s5 = Repository name

#### Explanation

A permission error occurred while opening the shared memory used for the repository. The shared memory may have conflicted with the shared memory used by another process.

#### System Action

Suspends the current processing.

#### User Action

The shared memory output in %s4 may be conflicting with another product. Take the appropriate action by referring to 'Other Customization Items' in the Tuning Guide, then re-execute processing.

If this fails to correct the error, use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

## 11.4 irep10300 to irep10399

---

### 11.4.1 irep10300

---

**IREP: ERROR: irep10300: %s1: line %s2: Invalid line in the environment definition file . [%s3]**

#### Variable Information

%s1 = File name

%s2 = Error line

%s3 = Repository name

#### Explanation

An environment definition in the repository has been damaged.

## System Action

The system stopped starting up the repository.

## User Action

An environment definition in the repository might have been edited without using the Interstage Management Console.

Re-create the repository as described in the following manual according to the operating mode the server was in:

- If the error occurred in the repository in standalone operating mode or database-share mode:  
'Recovery of Repository' - 'Recovery in Stand-alone Mode' - 'Environment Has been Destroyed' in the Directory Service Operator's Guide.
- If the error occurred in the repository on the master server in replication operating mode:  
'Monitoring of Operation in Replication Mode and Recovery' - 'Restoring the Master Repository in Replication Mode' - 'There are not Backed up Directories (or files)' in the Directory Service Operator's Guide.
- If the error occurred in the repository on the slave server in replication operating mode:  
'Monitoring of Operation in Replication Mode and Recovery' - 'Restoring the Slave Repository in Replication Mode' - 'Environment Has been Destroyed' in the Directory Service Operator's Guide.

## 11.4.2 irep10301

---

**IREP: ERROR: irep10301: %s1: line %s2: Missing parameter in directive '%s3'. [%s4]**

### Variable Information

- %s1 = File name
- %s2 = Error line
- %s3 = Directive
- %s4 = Repository name

### Explanation

Some environment definition in the repository has been damaged.

## System Action

The system stopped starting up the repository.

## User Action

Some environment definition of the repository might have been edited without using the Interstage Management Console.

Re-create the repository as described in the following manual suitable for the operating mode the server was in:

- If the error occurred in the repository in standalone operating mode or database-share mode:  
'Recovery of Repository' - 'Recovery in Stand-alone Mode' - 'Environment Has been Destroyed' in the Directory Service Operator's Guide.
- If the error occurred in the repository on the master server in replication operating mode:  
'Monitoring of Operation in Replication Mode and Recovery' - 'Restoring the Master Repository in Replication Mode' - 'There are not Backed up Directories (or/files)' in the Directory Service Operator's Guide.
- If the error occurred in the repository on the slave server in replication operating mode:  
'Monitoring of Operation in Replication Mode and Recovery' - 'Restoring the Slave Repository in Replication Mode' - 'Environment Has been Destroyed' in the Directory Service Operator's Guide.

## 11.4.3 irep10302

---

---

**IREP: ERROR: irep10302: %s1: line %s2: Too many parameters in directive '%s3'. [%s4]****Variable Information**

- %s1 = File name
- %s2 = Error line
- %s3 = Directive
- %s4 = Repository name

**Explanation**

Some environment definition in the repository has been damaged.

**System Action**

The system stopped starting up the repository.

**User Action**

An environment definition in the repository might possibly have been edited without using the Interstage Management Console.

Re-create the repository as described in the following manual according to the operating mode the server was in:

- If the error occurred in the repository in standalone operating mode or database-share mode:  
'Recovery of Repository' - 'Recovery in Stand-alone Mode' - 'Environment Has been Destroyed' in the Directory Service Operator's Guide.
- If the error occurred in the repository on the master server in replication operating mode:  
'Monitoring of Operation in Replication Mode and Recovery' - 'Restoring the Master Repository in Replication Mode' - 'There are not Backed up Directories (or/files)' in the Directory Service Operator's Guide.
- If the error occurred in the repository on the slave server in replication operating mode:  
'Monitoring of Operation in Replication Mode and Recovery' - 'Restoring the Slave Repository in Replication Mode' - 'Environment Has been Destroyed' in the Directory Service Operator's Guide.

## 11.4.4 irep10303

---

**IREP: ERROR: irep10303: %s1: line %s2: Invalid value of directive '%s3'. [%s4]****Variable Information**

- %s1 = File name
- %s2 = Error line
- %s3 = Directive
- %s4 = Repository name

**Explanation**

An environment definition in the repository has been damaged or the repository contains some unsupported environment definitions.

**System Action**

The system stopped starting up the repository.

**User Action**

Possible causes of the error are as follows:

An environment definition in the repository might possibly be edited without using the Interstage Management Console.

Re-create the repository as described in the following manual according to the operating mode the server was in:

- If the error occurred in the repository in standalone operating mode or database-share mode:

'Recovery of Repository' - 'Recovery in Stand-alone Mode' - 'Environment Has been Destroyed' in the Directory Service Operator's Guide.

- If the error occurred in the repository on the master server in replication operating mode:

'Monitoring of Operation in Replication Mode and Recovery' - 'Restoring the Master Repository in Replication Mode' - 'There are not Backed up Directories (or/files)' in the Directory Service Operator's Guide.

If the error occurred in the repository on the slave server in replication operating mode:

'Monitoring of Operation in Replication Mode and Recovery' - 'Restoring the Slave Repository in Replication Mode' - 'Environment Has been Destroyed' in the Directory Service Operator's Guide.

Windows32/64

An environment definition in the repository might have been restored with unsupported settings specified.

Check to see if any backup directories include unsupported settings.

## 11.4.5 irep10304

---

**IREP: ERROR: irep10304: %s1: line %s2: Specified file or directory in directive '%s3' does not exist. path=%s4 [%s5]**

### Variable Information

%s1 = File name

%s2 = Error line

%s3 = Directive

%s4 = Target file name

%s5 = Repository name

### Explanation

The file or directory indicated by %s4 could not be found.

### System Action

The system stopped starting up the repository.

### User Action

The file or directory indicated by %s4 may have been deleted or moved after the repository environment was set up. Or, only the repository environment was restored by using the *ireprestsys* command with '-confonly' option. The '-confonly' option is used to copy the repository environment from the active node to the standby node when the cluster environment is being set up. Do not use the -confonly option in normal configurations, (where the *ireprestsys* command with '-confonly' option is used to restore environments), because it might not be possible to start up the repository.

If *ireprestsys* was used, refer to the user action of the output message, and then take the necessary action.

Re-create the repository as described in the following manual according to the operating mode the server was in:

- If the error occurred in the repository in standalone operating mode or database-share mode:

'Recovery of Repository' - 'Recovery in Stand-alone Mode' - 'Environment Has been Destroyed' in the Directory Service Operator's Guide.

- If the error occurred in the repository on the master server in replication operating mode:

'Monitoring of Operation in Replication Mode and Recovery' - 'Restoring the Master Repository in Replication Mode' - 'There are not Backed up Directories (or/files)' in the Directory Service Operator's Guide.

- If the error occurred in the repository on the slave server in replication operating mode:

'Monitoring of Operation in Replication Mode and Recovery' - 'Restoring the Slave Repository in Replication Mode' - 'Environment Has been Destroyed' in the Directory Service Operator's Guide.

## 11.4.6 irep10305

---

**IREP: ERROR: irep10305: %s1: line %s2: No access permission to specified file or directory in directive '%s3'. path=%s4 [%s5]**

### Variable Information

- %s1 = File name
- %s2 = Error line
- %s3 = Directive
- %s4 = Target file name
- %s5 = Repository name

### Explanation

The command was executed without access permission to the file or directory indicated by %s4.

### System Action

The system stopped starting up the repository.

### User Action

The access permission assigned to the file or directory indicated by %s4 might have been deleted or moved after the environment of the repository was set up.

Re-create the repository as described in the following manual according to the operating mode the server was in:

- If the error occurred in the repository in standalone operating mode or database-share mode:  
'Recovery of Repository' - 'Recovery in Stand-alone Mode' - 'Environment Has been Destroyed' in the Directory Service Operator's Guide.
- If the error occurred in the repository on the master server in replication operating mode:  
'Monitoring of Operation in Replication Mode and Recovery' - 'Restoring the Master Repository in Replication Mode' - 'There are not Backed up Directories (or/files)' in the Directory Service Operator's Guide.
- If the error occurred in the repository on the slave server in replication operating mode:  
'Monitoring of Operation in Replication Mode and Recovery' - 'Restoring the Slave Repository in Replication Mode' - 'Environment Has been Destroyed' in the Directory Service Operator's Guide.

## 11.4.7 irep10306

---

**IREP: ERROR: irep10306: %s1: line %s2: Failed to open the specified file or directory in directive '%s3'. path=%s4, func=%s5, errno=%s6 [%s7]**

### Variable Information

- %s1 = File name
- %s2 = Error line
- %s3 = Directive
- %s4 = Target file name
- %s5 = System call
- %s6 = Error number

%s7 = Repository name

#### Explanation

The file or directory specified in a parameter of a directive could not be opened.

#### System Action

The system stopped starting up the repository.

#### User Action

Use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

## 11.4.8 irep10307

---

**IREP: ERROR: irep10307: %s1: line %s2: Unknown directive '%s3' in definition of backend. [%s4]**

#### Variable Information

%s1 = File name

%s2 = Error line

%s3 = Directive

%s4 = Repository name

#### Explanation

An environment definition in the repository has been damaged.

#### System Action

The system stopped starting up the repository.

#### User Action

An environment definition in the repository may have been edited without using the Interstage Management Console.

Re-create the repository as described in the following manual according to the operating mode the server was in:

- If the error occurred in the repository in standalone operating mode or database-share mode:

'Recovery of Repository' - 'Recovery in Stand-alone Mode' - 'Environment Has been Destroyed' in the Directory Service Operator's Guide.

- If the error occurred in the repository on the master server in replication operating mode:

'Monitoring of Operation in Replication Mode and Recovery' - 'Restoring the Master Repository in Replication Mode' - 'There are not Backed up Directories (or/files)' in the Directory Service Operator's Guide.

- If the error occurred in the repository on the slave server in replication operating mode:

'Monitoring of Operation in Replication Mode and Recovery' - 'Restoring the Slave Repository in Replication Mode' - 'Environment Has been Destroyed' in the Directory Service Operator's Guide.

## 11.4.9 irep10308

---

**IREP: ERROR: irep10308: %s1: line %s2: Unknown directive '%s3' in definition of database. [%s4]**

#### Variable Information

%s1 = File name

%s2 = Error line

%s3 = Directive

%s4 = Repository name

## Explanation

An environment definition in the repository has been damaged.

## System Action

The system stopped starting up the repository.

## User Action

An environment definition in the repository might have been edited without using the Interstage Management Console.

Re-create the repository as described in the following manual according to the operating mode the server was in:

- If the error occurred in the repository in standalone operating mode or database-share mode:  
'Recovery of Repository' - 'Recovery in Stand-alone Mode' - 'Environment Has been Destroyed' in the Directory Service Operator's Guide.
- If the error occurred in the repository on the master server in replication operating mode:  
'Monitoring of Operation in Replication Mode and Recovery' - 'Restoring the Master Repository in Replication Mode' - 'There are not Backed up Directories (or/files)' in the Directory Service Operator's Guide.
- If the error occurred in the repository on the slave server in replication operating mode:  
'Monitoring of Operation in Replication Mode and Recovery' - 'Restoring the Slave Repository in Replication Mode' - 'Environment Has been Destroyed' in the Directory Service Operator's Guide.

## 11.4.10 irep10309

---

**IREP: ERROR: irep10309: %s1: line %s2: Unknown directive '%s3'. [%s4]**

### Variable Information

- %s1 = File name
- %s2 = Error line
- %s3 = Directive
- %s4 = Repository name

## Explanation

An environment definition in the repository has been damaged.

## System Action

The system stopped starting up the repository.

## User Action

An environment definition in the repository might have been edited without using the Interstage Management Console.

Re-create the repository as described in the following manual according to the operating mode the server was in:

- If the error occurred in the repository in standalone operating mode or database-share mode:  
'Recovery of Repository' - 'Recovery in Stand-alone Mode' - 'Environment Has been Destroyed' in the Directory Service Operator's Guide.
- If the error occurred in the repository on the master server in replication operating mode:  
'Monitoring of Operation in Replication Mode and Recovery' - 'Restoring the Master Repository in Replication Mode' - 'There are not Backed up Directories (or/files)' in the Directory Service Operator's Guide.
- If the error occurred in the repository on the slave server in replication operating mode:  
'Monitoring of Operation in Replication Mode and Recovery' - 'Restoring the Slave Repository in Replication Mode' - 'Environment Has been Destroyed' in the Directory Service Operator's Guide.

## 11.4.11 irep10311

---

**IREP: ERROR: irep10311: %s1: line %s2: Specified attr parameter of the replica directive conflicts with the defined attr parameter '%s3'. [%s4]**

### Variable Information

%s1 = File name

%s2 = Error line

%s3 = Redundantly defined attribute

%s4 = Repository name

### Explanation

An environment definition in the repository has been damaged .

### System Action

The system stopped starting up the repository.

### User Action

An environment definition in the repository might have been edited without using Interstage Management Console.

Re-create the repository as described in the following manual according to the operating mode the server was in:

- If the error occurred in the repository in standalone operating mode or database-share mode:

'Recovery of Repository' - 'Recovery in Stand-alone Mode' - 'Environment Has been Destroyed' in the Directory Service Operator's Guide.

- If the error occurred in the repository on the master server in replication operating mode:

'Monitoring of Operation in Replication Mode and Recovery' - 'Restoring the Master Repository in Replication Mode' - 'There are not Backed up Directories (or/files)' in the Directory Service Operator's Guide.

- If the error occurred in the repository on the slave server in replication operating mode:

'Monitoring of Operation in Replication Mode and Recovery' - 'Restoring the Slave Repository in Replication Mode' - 'Environment Has been Destroyed' in the Directory Service Operator's Guide.

## 11.4.12 irep10313

---

**IREP: ERROR: irep10313: %s1: line %s2: '%s3' is already defined by another database. [%s4]**

### Variable Information

An environment definition in the repository might have been edited without using the Interstage Management Console.

Re-create the repository as described in the following manual according to the operating mode the server was in:

- If the error occurred in the repository in standalone operating mode or database-share mode:  
'Recovery of Repository' - 'Recovery in Stand-alone Mode' - 'Environment Has been Destroyed' in the Directory Service Operator's Guide.
- If the error occurred in the repository on the master server in replication operating mode:  
'Monitoring of Operation in Replication Mode and Recovery' - 'Restoring the Master Repository in Replication Mode' - 'There are not Backed up Directories (or/files)' in the Directory Service Operator's Guide.
- If the error occurred in the repository on the slave server in replication operating mode:  
'Monitoring of Operation in Replication Mode and Recovery' - 'Restoring the Slave Repository in Replication Mode' - 'Environment Has been Destroyed' in the Directory Service Operator's Guide.

## 11.4.34 irep10338

---

---

**IREP: ERROR: irep10338: %s1: line %s2: DN of the master which permits updating (%s3) is invalid. [%s4]**

#### Variable Information

- %s1 = File name
- %s2 = Error line
- %s3 = Directive name
- %s4 = Repository name

#### Explanation

An environment definition in the repository has been damaged.

#### System Action

The system stopped starting up the repository.

#### User Action

An environment definition in the repository might have been edited without using the Interstage Management Console.

Re-create the repository as described in the following manual according to the operating mode the server was in:

- If the error occurred in the repository in standalone operating mode or database-share mode:  
'Recovery of Repository' - 'Recovery in Stand-alone Mode' - 'Environment Has been Destroyed' in the Directory Service Operator's Guide.
- If the error occurred in the repository on the master server in replication operating mode:  
'Monitoring of Operation in Replication Mode and Recovery' - 'Restoring the Master Repository in Replication Mode' - 'There are not Backed up Directories (or/files)' in the Directory Service Operator's Guide.
- If the error occurred in the repository on the slave server in replication operating mode:  
'Monitoring of Operation in Replication Mode and Recovery' - 'Restoring the Slave Repository in Replication Mode' - 'Environment Has been Destroyed' in the Directory Service Operator's Guide.

---

## 11.4.35 irep10339

---

**IREP: ERROR: irep10339: %s1: line %s2: Unsupported encryption method 'CRYPT' is specified in encryption method of user password (irep\_crypt\_password). [%s3]**

#### Variable Information

- %s1 = File name
- %s2 = Error line
- %s3 = Repository name

#### Explanation

For the user password encryption method irep\_crypt\_password, an unsupported encryption method 'CRYPT' has been specified.

#### System Action

The system stopped starting up the repository.

#### User Action

Check whether an unsupported encryption method 'CRYPT' has been specified for the user password encryption method irep\_crypt\_password.

If 'CRYPT' has been specified for irep\_crypt\_password, the repository environment may have been restored using backups created with a different operating system or, the repository environment definition may have been manually modified after it was created.

- If the repository environment was restored using backups created with a different operating system, note that repository backup/restore operations can only be carried out on the same operating system.
- If the repository environment definition was manually modified after it was created, correct the environment definition to its original state then restart the repository

## 11.4.36 irep10372

---

**IREP: ERROR: irep10372: %s1: line %s2: Repository name is too long. Specify it with less than or equal to 8 bytes.**

### Variable Information

%s1 = File name

%s2 = Line number

### Explanation

An environment definition in the repository has been damaged.

### System Action

The system stopped starting up the repository.

### User Action

An environment definition in the repository might have been edited without using the Interstage Management Console.

Re-create the repository as described in the following manual according to the operating mode the server was in:

- If the error occurred in the repository in standalone operating mode or database-share mode:

'Recovery of Repository' - 'Recovery in Stand-alone Mode' - 'Environment Has been Destroyed' in the Directory Service Operator's Guide.

- If the error occurred in the repository on the master server in replication operating mode:

'Monitoring of Operation in Replication Mode and Recovery' - 'Restoring the Master Repository in Replication Mode' - 'There are not Backed up Directories (or/files)' in the Directory Service Operator's Guide.

- If the error occurred in the repository on the slave server in replication operating mode:

'Monitoring of Operation in Replication Mode and Recovery' - 'Restoring the Slave Repository in Replication Mode' - 'Environment Has been Destroyed' in the Directory Service Operator's Guide.

## 11.4.37 irep10373

---

**IREP: ERROR: irep10373: %s1: line %s2: Invalid repository name %s3.**

### Variable Information

%s1 = File name

%s2 = Line number

%s3 = Repository name

### Explanation

An environment definition in the repository has been damaged.

### System Action

The system stopped starting up the repository.

### User Action

An environment definition in the repository might have been edited without using the Interstage Management Console.

Re-create the repository as described in the following manual according to the operating mode the server was in:

- If the error occurred in the repository in standalone operating mode or database-share mode:

'Recovery of Repository' - 'Recovery in Stand-alone Mode' - 'Environment Has been Destroyed' in the Directory Service Operator's Guide.

- If the error occurred in the repository on the master server in replication operating mode:

'Monitoring of Operation in Replication Mode and Recovery' - 'Restoring the Master Repository in Replication Mode' - 'There are not Backed up Directories (or/files)' in the Directory Service Operator's Guide.

- If the error occurred in the repository on the slave server in replication operating mode:

'Monitoring of Operation in Replication Mode and Recovery' - 'Restoring the Slave Repository in Replication Mode' - 'Environment Has been Destroyed' in the Directory Service Operator's Guide.

## 11.4.38 irep10384

---

**IREP: ERROR: irep10384: Failed to initialize the database(%s1). detail=%s2 [%s3]**

### Variable Information

%s1 = DB type

%s2 = Error code

%s3 = Repository name

### Explanation

An environment definition in the repository has been damaged.

### System Action

The system stopped starting up the repository.

### User Action

If a repository message was output prior to this message, take the action indicated in the previous message. If there was no previous message, restart the repository.

If the above actions fail to correct the error, use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

## 11.4.39 irep10385

---

**IREP: ERROR: irep10385: Database is not specified. [%s1]**

### Variable Information

%s1 = Repository name

### Explanation

An environment definition in the repository has been damaged.

### System Action

The system stopped starting up the repository.

### User Action

An environment definition in the repository might have been edited without using the Interstage Management Console.

Re-create the repository as described in the following manual according to the operating mode the server was in:

- If the error occurred in the repository in standalone operating mode or database-share mode:  
'Recovery of Repository' - 'Recovery in Stand-alone Mode' - 'Environment Has been Destroyed' in the Directory Service Operator's Guide.
- If the error occurred in the repository on the master server in replication operating mode:  
'Monitoring of Operation in Replication Mode and Recovery' - 'Restoring the Master Repository in Replication Mode' - 'There are not Backed up Directories (or/files)' in the Directory Service Operator's Guide.
- If the error occurred in the repository on the slave server in replication operating mode:  
'Monitoring of Operation in Replication Mode and Recovery' - 'Restoring the Slave Repository in Replication Mode' - 'Environment Has been Destroyed' in the Directory Service Operator's Guide.

## 11.4.40 irep10387

---

**IREP: ERROR: irep10387: DN suffix in Database(%s1) is not specified. [%s2]**

### Variable Information

- %s1 = DB type
- %s2 = Repository name

### Explanation

An environment definition in the repository has been damaged.

### System Action

The system stopped starting up the repository.

### User Action

An environment definition in the repository might have been edited without using the Interstage Management Console.

Re-create the repository as described in the following manual according to the operating mode the server was in:

- If the error occurred in the repository in standalone operating mode or database-share mode:  
'Recovery of Repository' - 'Recovery in Stand-alone Mode' - 'Environment Has been Destroyed' in the Directory Service Operator's Guide.
- If the error occurred in the repository on the master server in replication operating mode:  
'Monitoring of Operation in Replication Mode and Recovery' - 'Restoring the Master Repository in Replication Mode' - 'There are not Backed up Directories (or/files)' in the Directory Service Operator's Guide.
- If the error occurred in the repository on the slave server in replication operating mode:  
'Monitoring of Operation in Replication Mode and Recovery' - 'Restoring the Slave Repository in Replication Mode' - 'Environment Has been Destroyed' in the Directory Service Operator's Guide.

## 11.4.41 irep10390

---

**IREP: ERROR: irep10390: Failed to load the library. path=%s1, detail=%s2, package=%s3 [%s4]**

### Variable Information

- %s1 = Library name
- %s2 = Cause of the error
- %s3 = Package name
- %s4 = Repository name

## Explanation

A library for the package indicated by %s3 could not be read.

## System Action

The system stopped starting up the repository.

## User Action

Check that the package indicated by %s3 has been correctly installed. If the package indicated by %s3 has not been installed, install it. For details on installation, refer to the Installation Guide.

If one of the following package names is output in %s3, 'Secure Communication Service' needs to be installed.

**Windows32/64**

- F3FMisscs
- F3FSSMEE

**Solaris32/64 Linux32/64**

- FJSVisscs
- FJSVsmee

If the above actions fail to correct the error, use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

## 11.4.42 irep10391

---

**IREP: ERROR: irep10391: Failed to read symbol information from the library. path=%s1, symbol=%s2, detail=%s3, package=%s4 [%s5]**

### Variable Information

- %s1 = Library name
- %s2 = Symbol name
- %s3 = Cause of the error
- %s4 = Package name
- %s5 = Repository name

## Explanation

Information about function symbols in a library for the package indicated by %s4 could not be read.

## System Action

The system stopped starting up the repository.

## User Action

Use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

## 11.5 irep10400 to irep10499

---

### 11.5.1 irep10400

---

**IREP: ERROR: irep10400: Option '%s1' has a wrong parameter '%s2'.**

### Variable Information

- %s1 = Option name

%s2 = Parameter

#### Explanation

A parameter for an option was incorrectly specified.

#### System Action

The system stopped the command processing.

#### User Action

Specify the option correctly according to the detailed information in the error message, then re-execute the command.

For details about the command, refer to 'Interstage Directory Service Operation Commands' in the Reference Manual (Command Edition).

## 11.5.2 irep10401

---

**IREP: ERROR: irep10401: Missing parameter in option '%s1'.**

#### Variable Information

%s1 = Option name

#### Explanation

A specified option has a missing parameter.

#### System Action

The system stopped the command processing.

#### User Action

Specify the option correctly according to the detailed information in the error message, then re-execute the command.

For details about the command, refer to 'Interstage Directory Service Operation Commands' or 'Backup Commands' in the Reference Manual (Command Edition).

## 11.5.3 irep10402

---

**IREP: ERROR: irep10402: Required option '%s1' is not specified.**

#### Variable Information

%s1 = Option name

#### Explanation

A mandatory option was not specified.

#### System Action

The system stopped the command processing.

#### User Action

Specify the option correctly according to the detailed information in the error message, then re-execute the command.

For details about the command, refer to 'Interstage Directory Service Operation Commands' or 'Backup Commands' in the Reference Manual (Command Edition).

## 11.5.4 irep10403

---

**IREP: ERROR: irep10403: Option '%s1' is duplicated.**

## Variable Information

%s1 = Option name

## Explanation

An option was duplicated

## System Action

The system stopped the command processing.

## User Action

Specify the option to be specified uniquely according to the detailed information in the error message, then re-execute the command.

For details about the command, refer to 'Interstage Directory Service Operation Commands' or 'Backup Commands' in the Reference Manual (Command Edition).

## 11.5.5 irep10404

---

**IREP: ERROR: irep10404: Undefined option '%s1'.**

## Variable Information

%s1 = Option name

## Explanation

Unsupported option was specified.

## System Action

The system stopped the command processing.

## User Action

Specify the option correctly according to the detailed information in the error message, then re-execute the command.

For details about the command, refer to 'Interstage Directory Service Operation Commands' or 'Backup Commands' in the Reference Manual (Command Edition).

## 11.5.6 irep10405

---

**IREP: ERROR: irep10405: Option '%s1' and option '%s2' cannot be specified at the same time.**

## Variable Information

%s1 = Option name 1

%s2 = Option name 2

## Explanation

Some of the specified options do not match.

## System Action

The system stopped the command processing.

## User Action

Specify options that are permitted to co-exist according to the detailed information in the error message, then re-execute the command.

For details of the command, refer to 'Interstage Directory Service Operation Commands' or 'Backup Commands' in the Reference Manual (Command Edition).

## 11.5.7 irep10406

---

---

**IREP: ERROR: irep10406: Specified file in option '%s1' does not exist.****Variable Information**

%s1 = Option name

**Explanation**

The file on the path specified in the option does not exist.

**System Action**

The system stopped the command processing.

**User Action**

Check whether the path specified in the option is correct, specify the path of an existing file, then re-execute the command.

For details of the command, refer to 'Interstage Directory Service Operation Commands' or 'Backup Commands' in the Reference Manual (Command Edition).

---

**11.5.8 irep10407**

---

**IREP: ERROR: irep10407: Specified directory in option '%s1' does not exist.****Variable Information**

%s1 = Option name

**Explanation**

The directory part of the path specified in the option does not exist.

**System Action**

The system stopped the command processing.

**User Action**

Check whether the path specified in the option is correct, specify the path of an existing file, then re-execute the command.

For details of the command, refer to 'Interstage Directory Service Operation Commands' or 'Backup Commands' in the Reference Manual (Command Edition).

---

**11.5.9 irep10408**

---

**IREP: ERROR: irep10408: No access permission to specified file in option '%s1'.****Variable Information**

%s1 = Option name

**Explanation**

There is no access permission to the path specified in the option.

**System Action**

The system stopped the command processing.

**User Action**

Check whether the path specified in the option is correct, specify the path of an existing file, then re-execute the command.

If the path was incorrect, specify it correctly then re-execute the command.

If the path was correct, set the appropriate access permission for the path then re-execute the command.

For details of the command, refer to 'Interstage Directory Service Operation Commands' or 'Backup Commands' in the Reference Manual (Command Edition).

## 11.5.10 irep10409

---

**IREP: ERROR: irep10409: Cannot open specified file in option '%s1'.**

### Variable Information

%s1 = Option name

### Explanation

A file could not be created.

### System Action

The system stopped the command processing.

### User Action

If there is some message output about the repository prior to this error message, take a measure according to the previous message.

If there was no repository message prior to this error message, use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

## 11.5.11 irep10410

---

**IREP: ERROR: irep10410: Cannot process because another command is executing. [%s1]**

### Variable Information

%s1 = Repository name

### Explanation

Processing stopped because another exclusive command was executed simultaneously.

### System Action

The system stopped the command processing.

### User Action

The following commands are exclusive:

- *irepstart* command
- *irepstop* command

Check that these exclusive commands are not executed simultaneously, then retry execution.

For details of these commands, refer to 'Interstage Directory Service Operation Commands' or 'Backup Commands' in the Reference Manual (Command Edition).

## 11.5.12 irep10411

---

**IREP: ERROR: irep10411: There is no authority to execute the program. Please execute it by the manager authority.**

### Explanation

The command was terminated because there is no execution permission.

### User Action

Execute the command with the administrator permission.

## 11.5.13 irep10412

---

---

**IREP: ERROR: irep10412: It failed in the check on the execution authority of the program. code=%s1**

Variable Information

%s1 = Detail code

Explanation

An error was detected in execution permission checking.

User Action

Use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

---

## 11.5.14 irep10413

---

**IREP: ERROR: irep10413: An error was detected in the function during processing. func=%s1, errno=%s2**

Variable Information

%s1 = Detail information

%s2 = Detail code

Explanation

An error was detected in the function during processing.

User Action

Check the following points:

- If there is write authority for the file or directory.
- If there is sufficient disk space.

In all other cases, save the message contents, use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

---

## 11.5.15 irep10414

---

**IREP: ERROR: irep10414: Configure the user PIN.**

Explanation

The user PIN was not defined. A space before or after the '=' in 'tkn\_pwd=password' also causes an error.

User Action

Define the user PIN in the specified SSL environment definition file correctly and re-execute the command.

---

## 11.5.16 irep10415

---

**IREP: INFO: irep10415: irepencupin was completed.**

Explanation

User PIN encryption completed normally.

---

## 11.5.17 irep10416

---

**IREP: ERROR: irep10416: Invalid option "%s1".**

Variable Information

%s1 = Option

## Explanation

An invalid option was specified.

## User Action

Specify the correct option based on the error message information and re-execute. For details about the commands, refer to 'Interstage Directory Service Operation Commands' or 'Backup Commands' in the Reference Manual (Command Edition).

---

## 11.5.18 irep10420

---

**IREP: INFO: irep10420: The repository has been set to start up. old=%s1, new=%s2 [%s3]**

### Variable Information

%s1 = Pre-change start method

%s2 = Post-change start method

%s3 = Repository

## Explanation

The repository startup information was changed.

---

## 11.5.19 irep10421

---

**IREP: ERROR: irep10421: Failed to update the configuration information. func=%s1, detail=%s2:%s3 [%s4]**

### Variable Information

%s1 = Detail code (function)

%s2 = Detail code (errno)

%s3 = Detail code (internal information)

%s4 = Repository

## Explanation

The attempt to change the repository definition information failed.

## User Action

Use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

---

## 11.5.20 irep10422

---

**IREP: ERROR: irep10422: The user password encryption method cannot be changed after the application starts. [%s1]**

### Variable Information

%s1 = Repository

## Explanation

After the repository application started, an attempt was made to change the user password encryption method.

## User Action

The user password encryption method can only be changed before the repository is first started following its creation.

---

## 11.5.21 irep10423

---

**IREP: INFO: irep10423: The user password encryption method was changed. [%s1]**

Variable Information

%s1 = Repository

Explanation

The user password encryption method was changed successfully.

## 11.5.22 irep10424

---

**IREP: ERROR: irep10424: The specified repository is running in the standard database. [%s1]**

Variable Information

%s1 = Repository

Explanation

The specified repository is being run as a standard database. The specified option cannot be used because it is an RDB option.

User Action

Check the specified repository or option.

## 11.5.23 irep10425

---

**IREP: ERROR: irep10425: Specify essential options.**

Explanation

An essential option is missing.

User Action

Check the options.

## 11.5.24 irep10426

---

**IREP: INFO: irep10426: The application mode for the repository was changed. %s1=%s2 [%s3]**

Variable Information

%s1 = Modified option

%s2 = Mode post-change

%s3 = Repository

Explanation

The repository application mode was changed.

## 11.5.25 irep10428

---

**IREP: ERROR: irep10428: Failed to update the dependency. func=%s1, detail=%s2:%s3 [%s4]**

Variable Information

%s1 = Function

%s2 = Detail code 1

%s3 = Detail code 2

%s4 = Repository

## Explanation

Failed to update the service dependency.

## User Action

Use the *iscollectinfo* command to collect investigation information. Send the error information to a Systems Engineer.

## 11.5.26 irep10429

---

**IREP: ERROR: irep10429: The repository does not exist. [%s1]**

## Variable Information

%s1 = Repository

## Explanation

The specified repository does not exist.

## User Action

Use the Interstage Management Console to check that the repository exists.

## 11.5.27 irep10430

---

**IREP: ERROR: irep10430: The specified service does not exist. service=%s1 [%s2]**

## Variable Information

%s1 = Service

%s2 = Repository

## Explanation

The specified service does not exist.

## User Action

Check the specified service.

## 11.5.28 irep10431

---

**IREP: ERROR: irep10431: Insufficient memory for executing the command. detail=%s1:%s2**

## Variable Information

%s1 = Detail code 1

%s2 = Detail code 2

%s3 = Repository

## Explanation

There was insufficient memory to execute the command.

## User Action

Stop unnecessary processes and re-execute the command.

## 11.5.29 irep10432

---

**IREP: ERROR: irep10432: The dependency with the specified service was not set. service=%s1 [%s2]**

#### Variable Information

%s1 = Service

%s2 = Repository

#### Explanation

Dependency with the specified service has not been set.

#### User Action

Check that the service is correct.

### 11.5.30 irep10433

---

**IREP: ERROR: irep10433: The dependency was already set. service=%s1 [%s2]**

#### Variable Information

%s1 = Service

%s2 = Repository

#### Explanation

Dependency with the specified service has already been set.

#### User Action

Check that the service is correct.

### 11.5.31 irep10434

---

#### Variable Information

%s1 = Service

%s2 = Repository

#### Explanation

Dependency with the specified service has been set.

### 11.5.32 irep10435

---

**IREP: INFO: irep10435: The dependency with the specified service removed. service=%s1 [%s2]**

#### Variable Information

%s1 = Service

%s2 = Repository

#### Explanation

Dependency with the specified service has been removed.

### 11.5.33 irep10436

---

**IREP: ERROR: irep10436: Failed to reference the definition information. func=%s1, detail=%s2:%s3 [%s4]**

#### Variable Information

%s1 = Function

%s2 = Detail code 1

%s3 = Detail code 2

%s4 = Repository

#### Explanation

Failed to reference the repository definition information.

#### User Action

Use the *iscollectinfo* command to collect investigation information. Send the error information to a Systems Engineer.

### 11.5.34 irep10437

---

**IREP: ERROR: irep10437: The read/write mode cannot be changed after the application starts. [%s1]**

#### Variable Information

%s1 = Repository

#### Explanation

An attempt was made to change the read/write mode after the repository application started.

#### User Action

Once the repository has been created, the read/write mode can only be changed prior to the first startup of the repository.

### 11.5.35 irep10438

---

**IREP: INFO: irep10438: The settings for the maximum number of connections to RDB were changed. [%s1]**

#### Variable Information

%s1 = Repository

#### Explanation

The settings for the maximum number of connections to RDB were completed normally.

### 11.5.36 irep10439

---

**IREP: INFO: irep10439: The settings for the wait for RDB automatic start were changed. [%s1]**

#### Variable Information

%s1 = Repository

#### Explanation

The settings for the wait for RDB automatic start were completed normally.

### 11.5.37 irep10440

---

**IREP: ERROR: irep10440: Stop the repository and then execute. [%s1]**

#### Variable Information

%s1 = Repository

#### Explanation

The option was specified and the command executed although the option can only be specified while the repository is not running.

## User Action

Stop the repository and then execute.

# 11.6 irep10500 to irep10599

---

## 11.6.1 irep10501

---

**IREP: INFO: irep10501: The access control list definition was updated. [%s1]**

### Variable Information

%s1 = Repository

### Explanation

The access control list definition was updated.

## 11.6.2 irep10502

---

**IREP: ERROR: irep10502: Stop the repository and then execute. [%s1]**

### Variable Information

%s1 = Repository

### Explanation

The specified repository is running. The access control list definition cannot be changed while the repository is running.

### System Action

Stops command processing.

### User Action

Stop the specified repository. Check that the repository has stopped, and then re-execute the access control list definition command.

## 11.6.3 irep10503

---

**IREP: ERROR: irep10503: The specified repository is running in previous compatibility mode. Processing of this command will stop. [%s1]**

### Variable Information

%s1 = Repository

### Explanation

Access control lists and user definition schemas cannot be registered because the specified repository is running in previous compatibility mode (the repository used to create the table for storing repository data with the irepcrttbl command).

### System Action

Stops command processing.

### User Action

Check that the specified repository is correct. To register access control lists or user definition schemas, the table configuration in the database must match the one in this version. Create the repository again in this version/level of the Interstage Directory Service and then re-execute the command. To upgrade data in a repository running in previous compatibility mode, download the stored entry information to an LDIF file using the ldapsearch command, and then import the entry information downloaded to the repository that was also created in this version/level using the ldapmodify command. For details about the ldapsearch and ldapmodify commands, refer to "Interstage Directory Service Operation Commands" in the "Reference Manual (Command Edition)".

## 11.6.4 irep10504

---

**IREP: ERROR: irep10504: There is no access control list definition statement in the specified file. [%s1]**

### Variable Information

%s1 = Repository

### Explanation

There is no access control list definition statement in the specified file.

### System Action

Stops command processing.

### User Action

Check the contents of the specified file. The definition must allow access control.

## 11.6.5 irep10505

---

**IREP: ERROR: irep10505: Failed to display the access control list definition. [%s1]**

### Variable Information

%s1 = Repository

### Explanation

Failed to display the access control list.

### System Action

Stops command processing.

### User Action

Use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

## 11.6.6 irep10506

---

**IREP: ERROR: irep10506: Failed to analyze the specified access control list definition file. [%s1]**

### Variable Information

%s1 = Repository

### Explanation

Failed to analyze the specified access control list definition file.

### System Action

Stops command processing.

### User Action

Check the message that was output immediately before, and take action.

## 11.6.7 irep10507

---

**IREP: ERROR: irep10507: "to" was specified more than once for the "access" directive. file=%s1, line=%s2 [%s3]**

## Variable Information

%s1 = Access control list definition file name

%s2 = Place where syntax error was detected

%s3 = Repository

## Explanation

"to" was specified more than once for the "access" directive used to set the access authorization.

## System Action

Stops command processing.

## User Action

Specify "to" only once for the access directive.

## 11.6.8 irep10508

---

**IREP: ERROR: irep10508: "=" is missing in "to". file=%s1, line=%s2, what="%s3" [%s4]**

## Variable Information

%s1 = Access control list definition file name

%s2 = Place where syntax error was detected

%s3 = Value specified for access

%s4 = Repository

## Explanation

"=" is missing from the value specified for access in the "to" part of the "access" directive used to set the access authorization.

## System Action

Stops command processing.

## User Action

Check if the 'to' part is specified correctly.

This message is output also when a null is inserted between 'dn' or 'attr' and '='. Do not insert a null before and/or after '=', but specify, for example, 'attr=mail'.

## 11.6.9 irep10509

---

**IREP: ERROR: irep10509: An unknown dn scope was specified in "to". file=%s1, line=%s2, scope="%s3" [%s4]**

## Variable Information

%s1 = Access control list definition file name

%s2 = Place where syntax error was detected

%s3 = Value specified for DN format

%s4 = Repository

## Explanation

An unknown dn scope was specified for the "to" part of the "access" directive used to set the access authorization.

## System Action

Stops command processing.

## User Action

Valid dn scopes are as follows:

- dn.base
- dn.one
- dn.subtree
- dn.children

Confirm that a valid scope has been specified.

This message is output also when a null is inserted between 'dn.<scope>' and '='. Do not insert a null immediately after '=' but specify, for example, 'dn.one="ou=interstage,o=fujitsu,dc=com"'.

## 11.6.10 irep10510

---

**IREP: ERROR: irep10510: An unknown attribute was specified in "attr" of "to". file=%s1, line=%s2, attr="%s3" [%s4]**

### Variable Information

- %s1 = Access control list definition file name
- %s2 = Place where syntax error was detected
- %s3 = Attribute value specified for the access target
- %s4 = Repository

### Explanation

An unknown attribute was specified for "attr" in the "to" part of the "access" directive used to set the access authorization.

### System Action

Stops command processing.

### User Action

Check whether the attribute that was specified for the "to" part is correct.

## 11.6.11 irep10511

---

**IREP: ERROR: irep10511: An access target was not specified in of "to". file=%s1, line=%s2, to="%s3" [%s4]**

### Variable Information

- %s1 = Access control list definition file name
- %s2 = Place where syntax error was detected
- %s3 = Value specified for access
- %s4 = Repository

### Explanation

An access target was not specified for the "to" part of the "access" directive used to set the access authorization.

### System Action

The system stopped processing.

### User Action

Check the details specified for "to". Check that the dn format and "attr" were specified correctly.

## 11.6.12 irep10512

---

**IREP: ERROR: irep10512: The DN is invalid. file=%s1, line=%s2, dn="%s3" [%s4]**

### Variable Information

%s1 = Access control list definition file name

%s2 = Place where syntax error was detected

%s3 = Value specified for DN

%s4 = Repository

### Explanation

The DN specified for the "to" or "by" parts of the "access" directive used to set the access authorization is incorrect.

### System Action

Stops command processing.

### User Action

Check that the DN specified for "to" or "by" is correct.

## 11.6.13 irep10513

---

**IREP: ERROR: irep10513: There is no "to" before "by" in the "access" directive. file=%s1, line=%s2 [%s3]**

### Variable Information

%s1 = Access control list definition file name

%s2 = Place where syntax error was detected

%s3 = Repository

### Explanation

There is no "to" in the "access" directive used for setting the access authorization.

### System Action

Stops command processing.

### User Action

Specify "to" before "by" in the "access" directive.

## 11.6.14 irep10514

---

**IREP: ERROR: irep10514: An access user was not specified in "by". file=%s1, line=%s2 [%s3]**

### Variable Information

%s1 = Access control list definition file name

%s2 = Place where syntax error was detected

%s3 = Repository

### Explanation

The access user was not specified in the "by" part of the "access" directive used to set the access authorization.

### System Action

Stops command processing.

## User Action

Check if the 'by' part is specified correctly.

### 11.6.15 irep10515

---

**IREP: ERROR: irep10515: An unknown scope was specified for "by". file=%s1, line=%s2, scope="%s3" [%s4]**

#### Variable Information

%s1 = Access control list definition file name

%s2 = Place where syntax error was detected

%s3 = Value specified for access user

%s4 = Repository

#### Explanation

There is an unknown scope in the "by" part of the "access" directive used to set the access authorization.

#### System Action

Stops command processing.

#### User Action

Check if the 'by' part is specified correctly.

### 11.6.16 irep10516

---

**IREP: ERROR: irep10516: "=" is missing in (or value after) "by". file=%s1, line=%s2, value="%s3" [%s4]**

#### Variable Information

%s1 = Access control list definition file name

%s2 = Place where syntax error was detected

%s3 = Value specified for access user

%s4 = Repository

#### Explanation

"=" or a value after it is missing from the "by" part of the "access" directive used to set the access authorization.

#### System Action

Stops command processing.

#### User Action

Check if the 'by' part is specified correctly.

### 11.6.17 irep10517

---

**IREP: ERROR: irep10517: More than one dn was specified in "by". file=%s1, line=%s2 [%s3]**

#### Variable Information

%s1 = Access control list definition file name

%s2 = Place where syntax error was detected

%s3 = Repository

## Explanation

An access user such as 'dn' or 'users' is specified multiple times in the 'by' part of the access directive for which the access control is set.

## System Action

Stops command processing.

## User Action

Check if the 'by' part is specified correctly. An access user or 'dn' can be specified in the 'by' part only once per specification. To specify multiple access users, specify the 'by' part multiple times.

## 11.6.18 irep10518

---

**IREP: ERROR: irep10518: The access level was not specified. file=%s1, line=%s2, what="%s3" [%s4]**

### Variable Information

%s1 = Access control list definition file name

%s2 = Place where syntax error was detected

%s3 = Value specified for access user

%s4 = Repository

### Explanation

Access authorization was not specified in the "by" part of the "access" directive used to set the access authorization.

### System Action

Stops command processing.

### User Action

Check if the 'by' part is specified correctly.

## 11.6.19 irep10519

---

**IREP: ERROR: irep10519: "to" or "by" was not specified in "access" directive. file=%s1, line=%s2, err="%s3" [%s4]**

### Variable Information

%s1 = Access control list definition file name

%s2 = Place where syntax error was detected

%s3 = Value specified for access user

%s4 = Repository

### Explanation

"to" or "by" was not specified for the "access" directive used to set the access authorization.

### System Action

Stops command processing.

### User Action

Check that the details specified for the "access" directive are correct.

## 11.6.20 irep10520

---

---

**IREP: ERROR: irep10520: An access control was not specified for the "access" directive. file=%s1, line=%s2 [%s3]**

#### Variable Information

%s1 = Access control list definition file name

%s2 = Place where syntax error was detected

%s3 = Repository

#### Explanation

An access control was not specified for the "access" directive.

#### System Action

Stops command processing.

#### User Action

Check that the details specified for the "access" directive are correct.

### 11.6.21 irep10521

---

**IREP: ERROR: irep10521: "by" was not specified for the "access" directive. file=%s1, line=%s2 [%s3]**

#### Variable Information

%s1 = Access control list definition file name

%s2 = Place where syntax error was detected

%s3 = Repository

#### Explanation

"by" was not specified for the "access" directive.

#### System Action

Stops command processing.

#### User Action

Specify "by" for the "access" directive.

### 11.6.22 irep10522

---

**IREP: ERROR: irep10522: An access level was not specified for "by". file=%s1, line=%s2 [%s3]**

#### Variable Information

%s1 = Access control list definition file name

%s2 = Place where syntax error was detected

%s3 = Repository

#### Explanation

Access authorization was not specified in the "by" part of the "access" directive used to set the access authorization.

#### System Action

Stops command processing.

#### User Action

Check the details specified for "by".

## 11.6.23 irep10523

---

**IREP: ERROR: irep10523: invalid value in "to". file=%s1, line=%s2 [%s3]**

### Variable Information

%s1 = Access control list definition file name

%s2 = Place where syntax error was detected

%s3 = Repository

### Explanation

The format or the value of the 'to' part specification is incorrect.

### System Action

Stops command processing.

### User Action

Check if the 'to' part is specified correctly.

## 11.6.24 irep10524

---

**IREP: ERROR: irep10524: invalid value in "by". file=%s1, line=%s2 [%s3]**

### Variable Information

%s1 = Access control list definition file name

%s2 = Place where syntax error was detected

%s3 = Repository

### Explanation

The format or the value of the 'by' part specification is incorrect.

### System Action

Stops command processing.

### User Action

Check if the 'by' part is specified correctly.

## 11.6.25 irep10598

---

**IREP: ERROR: irep10598: There is an invalid definition. file=%s1, line=%s2, directive="%s3" [%s4]**

### Variable Information

%s1 = Access control list definition file name

%s2 = Place where syntax error was detected

%s3 = Directive name

%s4 = Repository

### Explanation

Directive %s3 is invalid as the access control list definition.

### System Action

Stops command processing.

## User Action

If the directive name is not displayed, check if no multibyte characters such as Japanese are not specified for the code that is not UTF-8.

If the directive name is not displayed, check whether line 1 is a line containing only spaces.

If "(not printable string)" is displayed for the directive name, check whether multibyte characters, such as Japanese characters, that are not UTF-8 code type characters have been specified. Use UTF-8 if the specification includes multibyte characters.

## 11.6.26 irep10599

---

**IREP: ERROR: irep10599: An internal error occurred. [%s1]**

### Variable Information

%s1 = Repository

### Explanation

An internal error occurred during processing.

### System Action

Stops command processing.

### User Action

Use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

## 11.7 irep10600 to irep10699

---

### 11.7.1 irep10600

---

**IREP: INFO: irep10600: The user definition schema was updated. [%s1]**

### Variable Information

%s1 = Repository

### Explanation

The user definition schema was updated.

### 11.7.2 irep10601

---

**IREP: ERROR: irep10601: Stop the repository, and then re-execute. [%s1]**

### Variable Information

%s1 = Repository

### Explanation

The specified repository is running. The user definition schema cannot be changed while the repository is running.

### System Action

Stops command processing.

### User Action

Stop the specified repository. Check that the repository has stopped, and then re-execute the command.

### 11.7.3 irep10602

---

---

**IREP: ERROR: irep10602: There is no schema definition statement in the specified file. [%s1]**

Variable Information

%s1 = Repository

Explanation

There is no statement defining the schema in the specified file.

System Action

Stops command processing.

User Action

Check the contents of the specified file.

---

## 11.7.4 irep10603

---

**IREP: ERROR: irep10603: The specified definition does not exist. name=%s1 [%s2]**

Variable Information

%s1 = Attribute name or object class name

%s2 = Repository

Explanation

The definition with the name shown in %s1 does not exist.

System Action

Stops command processing.

User Action

Change the schema definition.

---

## 11.7.5 irep10604

---

**IREP: ERROR: irep10604: Failed to display the user definition schema. [%s1]**

Variable Information

%s1 = Repository

Explanation

Failed to display the user definition schema.

System Action

Stops command processing.

User Action

Use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

---

## 11.7.6 irep10605

---

**IREP: ERROR: irep10605: Failed to analyze the user definition schema. [%s1]**

Variable Information

%s1 = Repository

## Explanation

Failed to analyze the user definition schema.

## System Action

Stops command processing.

## User Action

Check the message that was output immediately before, and take action if the definition syntax is incorrect.

## 11.7.7 irep10606

---

**IREP: ERROR: irep10606: Failed to delete the user definition schema. [%s1]**

### Variable Information

%s1 = Repository

### Explanation

Failed to delete the user definition schema.

### System Action

Stops command processing.

### User Action

Check if the object class name or the attribute name specified is correct.

A definition cannot be deleted if any attribute or object class is interdependent with the definition. The definition is interdependent when it is for an essential attribute of other object class or the base organizational type of other attribute.

```
# attribute
attributetype ( 1.1.2.1.1
                NAME 'skill'
                DESC 'skill'
                EQUALITY caseIgnoreMatch
                SUBSTR caseIgnoreSubstringMatch
                SYNTAX 1.3.6.1.4.1.1466.115.121.1.15 )

# objectclass
objectclass ( 1.1.2.2.2
             NAME 'myPerson'
             DESC 'my person'
             SUP inetOrgPerson
             MUST ( employeeNumber )
             MAY skill )
```

For example,

If the above kinds of object classes and attributes are defined, the "skill" optional attribute, the "employeeNumber" essential attribute, and the "inetOrgPerson" base object class of the "myPerson" object class cannot be deleted. The "employeeNumber" attribute and the "inetOrgPerson" object class are also standard schemas provided in the Interstage Directory Service, therefore they cannot be deleted.

If the object class name or the attribute name is correct, collect the dump using the iscollectinfo command and contact your service engineer.

## 11.7.8 irep10607

---

**IREP: INFO: irep10607: The user definition schema has not been defined. [%s1]**

#### Variable Information

%s1 = Repository

#### Explanation

The user definition schema has not been defined.

### 11.7.9 irep10608

---

**IREP: WARNING: irep10608: Matching rule "%s1" that cannot be used was ignored. [%s2]**

#### Variable Information

%s1 = Matching rule

%s2 = Repository

#### Explanation

There is a matching rule that cannot be used, so the details that were specified were ignored.

#### System Action

Stops command processing.

#### User Action

Change the schema definition.

### 11.7.10 irep10609

---

**IREP: ERROR: irep10609: Syntax "%s1" in the schema is undefined. [%s2]**

#### Variable Information

%s1 = Syntax

%s2 = Repository

#### Explanation

There is undefined syntax in the schema.

#### System Action

Stops command processing.

#### User Action

Review the 'syntax' part of the schema definition specified.

### 11.7.11 irep10610

---

**IREP: ERROR: irep10610: Matching rule "%s1" in the schema is undefined. [%s2]**

#### Variable Information

%s1 = Matching rule

%s2 = Repository

#### Explanation

There is an undefined matching rule in the schema.

#### System Action

Stops command processing.

## User Action

Change the schema definition.

### 11.7.12 irep10611

---

**IREP: ERROR: irep10611: Attribute type "%s1" is incorrect. detail=%s2 near=%s3 [%s4]**

#### Variable Information

%s1 = Attribute type

%s2 = Detailed information

%s3 = Place where syntax error was detected

%s4 = Repository

#### Explanation

The specified attribute type is incorrect.

#### System Action

Stops command processing.

#### User Action

Check the error details, and then specify the value again.

### 11.7.13 irep10612

---

**IREP: ERROR: irep10612: There is no OID for attribute type "%s1". [%s2]**

#### Variable Information

%s1 = Attribute type

%s2 = Repository

#### Explanation

There is no OID for attribute type "%s1".

#### System Action

Stops command processing.

#### User Action

OID is essential. Review the schema definition and specify OID.

### 11.7.14 irep10613

---

**IREP: ERROR: irep10613: Attribute type "%s1" is incorrect. detail=%s2, "%s3" [%s4]**

#### Variable Information

%s1 = Attribute type

%s2 = Detailed information

%s3 = Place where syntax error was detected

%s4 = Repository

#### Explanation

The specified attribute type is incorrect.

#### System Action

Stops command processing.

#### User Action

Check the error details, and then specify the value again.

### 11.7.15 irep10614

---

**IREP: ERROR: irep10614: Attribute "%s1" in the schema is undefined. [%s2]**

#### Variable Information

%s1 = Attribute

%s2 = Repository

#### Explanation

There is an undefined attribute in the schema.

#### System Action

Stops command processing.

#### User Action

Change the schema definition.

### 11.7.16 irep10615

---

**IREP: ERROR: irep10615: Object class "%s1" is incorrect. detail=%s2 near=%s3 [%s4]**

#### Variable Information

%s1 = Object class name

%s2 = Detailed information

%s3 = Place where syntax error was detected

%s4 = Repository

#### Explanation

The specified object class is incorrect.

#### System Action

Stops command processing.

#### User Action

Check the error details, and then specify the value again.

%s2 = Detailed information

%s3 = Place where syntax error was detected

%s4 = Repository

#### Explanation

The specified object class is incorrect.

#### System Action

Stops command processing.

#### User Action

Check the error details, and then specify the value again.

### 11.7.19 irep10618

---

**IREP: ERROR: irep10618: Object class "%s1" in the schema is undefined. [%s2]**

#### Variable Information

%s1 = Object class name

%s2 = Repository

#### Explanation

There is an undefined object class in the schema.

#### System Action

Stops command processing.

#### User Action

Change the schema definition.

### 11.7.20 irep10619

---

**IREP: ERROR: irep10619: The object class is incorrect. file=%s1, line=%s2, detail=%s3 near="%s4" [%s5]**

#### Variable Information

%s1 = Schema definition file name

%s2 = Line number

%s3 = Detailed information

%s4 = Place where syntax error was detected

%s5 = Repository

### Explanation

The specified object class is incorrect.

### System Action

Stops command processing.

### User Action

Check the detailed information and change the value that was specified.

Check that the file format is correct. This message may also be output at the following times:

- When a character other than 1-byte null is used as a separator between items.
- When the value contains multibyte space characters such as Japanese.
- When 1 definition contains blank lines.

For details about the file and definition formats, refer to "Schema extension" - "User definition schema definition" in the "Directory Service Operator's Guide"

## 11.7.21 irep10620

---

**IREP: ERROR: irep10620: There is no OID for the object class. file=%s1, line=%s2 [%s3]**

### Variable Information

%s1 = Schema definition file name

%s2 = Line number

%s3 = Repository

### Explanation

There is no OID for the specified object class.

### System Action

Stops command processing.

### User Action

OID is essential. Review the schema definition and specify OID.

## 11.7.22 irep10621

---

**IREP: ERROR: irep10621: The object class is incorrect. file=%s1, line=%s2, detail=%s3, "%s4" [%s5]**

### Variable Information

%s1 = Schema definition file name

%s2 = Line number

%s3 = Detailed information

%s4 = Place where syntax error was detected

%s5 = Repository

### Explanation

The specified object class is incorrect.

## System Action

Stops command processing.

## User Action

Check the detailed information and change the value that was specified.

Check that the file format is correct. This message may also be output at the following times:

- When a character other than 1-byte null is used as a separator between items.
- When the value contains multibyte space characters such as Japanese.
- When 1 definition contains blank lines.

For details about the file and definition formats, refer to "Schema extension" - "User definition schema definition" in the "Directory Service Operator's Guide"

## 11.7.23 irep10622

---

**IREP: ERROR: irep10622: The attribute type is incorrect. file=%s1, line=%s2, detail=%s3 near="%s4" [%s5]**

### Variable Information

%s1 = Schema definition file name

%s2 = Line number

%s3 = Detailed information

%s4 = Place where syntax error was detected

%s5 = Repository

### Explanation

The specified attribute type is incorrect.

### System Action

Stops command processing.

### User Action

Check the detailed information and change the value that was specified.

Check that the file format is correct. This message may also be output at the following times:

- When a character other than 1-byte null is used as a separator between items.
- When the value contains multibyte space characters such as Japanese.
- When 1 definition contains blank lines.

For details about the file and definition formats, refer to "Schema extension" - "User definition schema definition" in the "Directory Service Operator's Guide"

## 11.7.24 irep10623

---

**IREP: ERROR: irep10623: There is no OID for the attribute type. file=%s1, line=%s2 [%s3]**

### Variable Information

%s1 = Schema definition file name

%s2 = Line number

%s3 = Repository

## Explanation

There is no OID for the specified attribute type.

## System Action

Stops command processing.

## User Action

OID is essential. Review the schema definition and specify OID.

## 11.7.25 irep10624

---

**IREP: ERROR: irep10624: The attribute type is incorrect. file=%s1, line=%s2, detail=%s3, "%s4" [%s5]**

### Variable Information

#### User Action

Check the contents of the detailed information and re-specify.

### 11.7.30 irep10698

---

**IREP: ERROR: irep10698: There is an invalid definition. file=%s1, line=%s2, directive="%s3" [%s4]**

#### Variable Information

%s1 = Schema definition file name

%s2 = Line number

%s3 = Directive name

%s4 = Repository

#### Explanation

Directive %s3 is invalid as the specified user definition schema.

#### System Action

Stops command processing.

#### User Action

Check if the specified file is in the definition format of the user defined schema.

If the directive name is not displayed, check whether line 1 is a line containing only spaces.

If "(not printable string)" is displayed for the directive name, check whether multibyte characters, such as Japanese characters, or multibyte spaces have been specified.

Refer to the "Creating the Repository" - "Schema Extention" - "Defining the User-Defined Schemas" for the definition format of the user-defined schemas.

### 11.7.31 irep10699

---

**IREP: ERROR: irep10699: An internal error occurred. [%s1]**

#### Variable Information

%s1 = Repository

#### Explanation

An internal error was generated during the processing

#### System Action

Stops command processing.

#### User Action

Use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

## 11.8 irep10700 to irep10799

---

### 11.8.1 irep10700

---

**IREP: ERROR: irep10700: Repository name is too long. Specify it with less than or equal to 8 bytes.**

#### Explanation

The name of a specified repository exceeded 8 bytes.

#### System Action

The system stopped processing.

#### User Action

Specify the name of the repository within 8 bytes, then re-execute the command.

### 11.8.2 irep10701

---

**IREP: ERROR: irep10701: Invalid repository name. %s1**

#### Variable Information

%s1 = Repository name

#### Explanation

An unusable character was included in the name of a specified repository.

#### System Action

The system stopped processing the command it attempted to handle.

#### User Action

Specify the name of the repository using alphanumeric characters and underscores only (use an alphabetic character at the top of the name), then re-execute the command.

### 11.8.3 irep10702

---

**IREP: ERROR: irep10702: Specified repository does not exist.**

#### Explanation

A non existing repository was specified.

#### System Action

The system stopped the processing it attempted to handle.

#### User Action

Specify the name of a repository that exists, then re-execute the command.

To check for the presence of a repository, use Interstage Management Console or execute the *ireplist* command.

### 11.8.4 irep10705

---

**IREP: ERROR: irep10705: Cannot delete Repository %s1 because it is still running.**

#### Variable Information

%s1 = Repository name

## Explanation

A specified repository could not be deleted because it has been in operation.

## System Action

The system stopped the command processing.

## User Action

First check that the specified repository is not in operation, then re-execute the command.

If this error message is output along with irep10016 or 10017 on creation of a new repository, the repository creation failed but the repository could not be deleted because the repository process was not terminated with an unknown error. Take the action described below.

### Windows32/64

1. Log in with administrator authority; open the service display ([Control Panel] > [Services], or [Control Panel] > [Administration Tool] > [Services]); select the repository service indicated by %s1; then change the "Startup type" to "Manual" or "Disable". The Interstage Directory Service service is registered with the following name:

```
Interstage Directory Service (repository name)
```

2. Restart the OS.
3. Delete the repository indicated by %s1 from the Interstage Management Console.

### Solaris32/64 Linux32/64

1. Enter the following command to view the repository's process ID:

```
cat /var/opt/FJSVirep/repository name/tmp/irepslapd.pid
```

2. Enter the following command with the output process ID from Step 1, and confirm that the process name exists in "irepslapd".

```
ps -ef | grep process ID
```

3. Enter the following command with the output process ID from Step 1 to terminate the process.

```
kill -SIGKILL process ID
```

4. Stop the repository indicated by %s1 from the Interstage Management Console.
5. Delete the repository indicated by %s1 from the Interstage Management Console.

Insufficient system resources (such as memory) may be the reason for this message being output on creation of a new repository. Close all programs that are no longer required to secure sufficient memory for the operation of Interstage Directory Service.

### Windows32/64

If this action does not secure sufficient memory, add memory or increase the amount of virtual memory.

### Solaris32/64 Linux32/64

If this action does not secure sufficient memory, add memory or increase the amount of swap area.

For details on the amount of memory required for Interstage Directory Service operation, refer to 'Memory Requirements' in the Tuning Guide.

If the above actions fail to correct the error, use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

## 11.8.5 irep10709

**IREP: ERROR: irep10709: The directory already exists. path=%s1 [%s2]**

## Variable Information

%s1 = Path name

%s2 = Repository name

## Explanation

Although an attempt was made to create a repository, there was already a file which comprises of the repository.

## System Action

The system stopped creating the repository.

## User Action

Check for the specified path indicated by %s1. If the file already exists, move it to another directory or remove it. Then, re-execute the command.

## 11.8.6 irep10710

---

**IREP: WARNING: irep10710: Failed to delete the directory. (not empty.) path=%s1 [%s2]**

## Variable Information

%s1 = Path name

%s2 = Repository name

## Explanation

Although an attempt was made to delete a repository, there was a file which is not under the control of the repository below the specified path.

If there is a program editing the file or setting the directory as a current directory below the path indicated by %s1, this error message may possibly output.

## System Action

The system stops deleting the path but continues to deleting the repository.

## User Action

There was a file which is not under control of the repository below the path indicated by %s1. Check for the path indicated by %s1, then delete it if it is no longer needed.

To delete the repository, first set the file or directory below the path indicated by %s1 so as not to be edited or used as a current directory.

If there is no other message output about the target repository than this error message, other operations than deletion are normally handled.

## 11.9 irep10900 to irep10999

---

### 11.9.1 irep10900

---

**IREP: ERROR: irep10900: There is no authority to operate service of Interstage Directory Service. Execute with Administrative right. detail=%s1:%s2:%s3 [%s4]**

## Variable Information

%s1 = Detail code 1

%s2 = Detail code 2

%s3 = Detail code 3

%s4 = Repository name

## Explanation

There is no handling permission to any service of Interstage Directory Service for current user.

## System Action

The system stopped processing.

## User Action

To handle a Interstage Directory Service service, execute with the administrator authority.

## 11.9.2 irep10901

---

**IREP: ERROR: irep10901: Service of Interstage Directory Service does not exist. Please confirm whether this service is deleted. detail=%s1:%s2:%s3 [%s4]**

### Variable Information

%s1 = Detail code 1

%s2 = Detail code 2

%s3 = Detail code 3

%s4 = Repository name

## Explanation

A service in the repository indicated by %s4 does not exist. The service might possibly be externally deleted from the repository indicated by %s4.

## System Action

The system stopped processing.

## User Action

Select [Control Panel] > [Administration Tools] > [Services] to check that the service has not been deleted from the repository indicated by %s4.

If the above actions fail to correct the error, use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

Note that Interstage Directory Service services have been registered in the form of 'Interstage Directory Service(repository name)'.

## 11.9.3 irep10902

---

**IREP: ERROR: irep10902: Because of same service existed, the service is not able to be registered. detail=%s1:%s2:%s3 [%s4]**

### Variable Information

%s1 = Detail code 1

%s2 = Detail code 2

%s3 = Detail code 3

%s4 = Repository name

## Explanation

The repository indicated by %s4 could not be created because the same service has already been registered.

## System Action

The system stopped processing.

## User Action

There might possibly be another user who created a repository using the name indicated by %s4 at the same time. Check for operations that the other user did. If there is already the repository indicated by %s4, and it is no longer needed, delete it on Interstage Management Console, and then re-create it.

Note that Interstage Directory Service services have been registered in the form of 'Interstage Directory Service (repository name).'

## 11.9.4 irep10903

---

**IREP: ERROR: irep10903: The same service name has already been registered. detail=%s1:%s2:%s3 [%s4]**

### Variable Information

%s1 = Detail code 1

%s2 = Detail code 2

%s3 = Detail code 3

%s4 = Repository name

### Explanation

The repository indicated by %s4 could not be created because the same service has already been registered.

### System Action

The system stopped processing.

### User Action

There might possibly be another user who created a repository using the name indicated by %s4 at the same time. Check for operations that the other user did. If there is already the repository indicated by %s4, and it is no longer needed, delete it on Interstage Management Console, and then re-create it.

Note that Interstage Directory Service services have been registered in the form of 'Interstage Directory Service (repository name).'

## 11.9.5 irep10904

---

**IREP: ERROR: irep10904: The service has already marked as deleted. detail=%s1:%s2:%s3 [%s4]**

### Variable Information

%s1 = Detail code 1

%s2 = Detail code 2

%s3 = Detail code 3

%s4 = Repository name

### Explanation

The service of the repository indicated by %s4 has been already deleted.

### System Action

The system stopped processing.

### User Action

There might possibly be another user who deleted the repository indicated by %s4 at the same time. Check for the operations the other user did. The repository has already been deleted, thus no user action is required.

## 11.9.6 irep10905

---

---

**IREP: ERROR: irep10905: Because the service has already marked as deleted, it is not able to be started. detail=%s1:%s2:%s3 [%s4]**

#### Variable Information

%s1 = Detail code 1  
%s2 = Detail code 2  
%s3 = Detail code 3  
%s4 = Repository name

#### Explanation

The repository indicated by %4s could not be started because it has already been deleted.

#### System Action

The system stopped processing.

#### User Action

There might possibly be another user who deleted the repository indicated by %s4 at the same time. Check for the operations the other user did.

Selecting [Control Panel] > [Administration Tools] > [Services] and deleting the repository indicated by %s4 from Interstage Management Console while the [Services] window is open may cause the error. In such a case, first close the window of the service, then re-execute the command.

Note that Interstage Directory Service services have been registered in the form of 'Interstage Directory Service (repository name).'

---

## 11.9.7 irep10906

---

**IREP: ERROR: irep10906: The service program is not found. There is a possibility that the environment may have been changed by mistake. detail=%s1:%s2:%s3 [%s4]**

#### Variable Information

%s1 = Detail code 1  
%s2 = Detail code 2  
%s3 = Detail code 3  
%s4 = Repository name

#### Explanation

The repository could not be started because a program registered in the service could not be found.

#### System Action

The system stopped processing.

#### User Action

There may possibly be damage in the Interstage Directory Service environment or registry.

Use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

---

## 11.9.8 irep10907

---

**IREP: ERROR: irep10907: Service has already been started. detail=%s1:%s2:%s3 [%s4]**

#### Variable Information

%s1 = Detail code 1  
%s2 = Detail code 2

%s3 = Detail code 3

%s4 = Repository name

#### Explanation

A service of the repository indicated by %s4 has been already started.

#### System Action

The system stopped processing.

#### User Action

There may have been another user who started the repository indicated by %s4 on Interstage Management Console or by selecting [Control Panel] > [Administration Tools] > [Services] at the same time. Check for the operations the other user did. The service of the repository has already been started, thus no user action is required.

Note that Interstage Directory Service services have been registered in the form of 'Interstage Directory Service(repository name).'

## 11.9.9 irep10908

---

**IREP: ERROR: irep10908: Because service control manager's database is locked, it is not able to execute. detail=%s1:%s2:%s3, Lock=%s4:%s5:%s6 [%s7]**

#### Variable Information

%s1 = Detail code 1

%s2 = Detail code 2

%s3 = Detail code 3

%s4 = Locking status

%s5 = Locked process

%s6 = Locking time

%s7 = Repository name

#### Explanation

The request to the service could not be accepted because another process was locking up Service Control Manager.

#### System Action

The system stopped processing.

#### User Action

Because the Service Control Manager was locked from another processing, system cannot continue processing. Wait for a while, then re-execute.

If the above actions fail to correct the error, use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

## 11.9.10 irep10909

---

**IREP: ERROR: irep10909: Whether dependency service does not exist, or deletion flag is set. detail=%s1:%s2:%s3 [%s4]**

#### Variable Information

%s1 = Detail code 1

%s2 = Detail code 2

%s3 = Detail code 3

%s4 = Repository name

### Explanation

The repository indicated by %s4 could not be started because a service dependent on the service of Interstage Directory Service has already been deleted.

### System Action

The system stopped processing.

### User Action

Check that the service dependent on the service of Interstage Directory Service has been installed. To check dependent services of the repository indicated by %s4, select [Control Panel] > [Administration Tools] > [Services], then select the [Dependencies] tab for its properties.

Note that Interstage Directory Service services have been registered in the form of 'Interstage Directory Service (repository name).'

## 11.9.11 irep10910

---

**IREP: ERROR: irep10910: The Repository is not able to be started, because dependency service failed to be started. detail=%s1:%s2:%s3 [%s4]**

### Variable Information

%s1 = Detail code 1

%s2 = Detail code 2

%s3 = Detail code 3

%s4 = Repository name

### Explanation

The service of the repository indicated by %s4 could not be started because a service dependent on the service of Interstage Directory Service could not be started;

### System Action

The system stopped processing.

### User Action

Check the status of the service dependent on the service of Interstage Directory Service. To check dependent services of the repository indicated by %s4, select [Control Panel] > [Administration Tools] > [Services], then select the [Dependencies] tab for its properties.

In addition, select [Control Panel] > [Administration Tools] > [Event Viewer], then check the event log for any error related to the service. If there is some error message about the service, take the appropriate action based on the message content.

Note that Interstage Directory Service services have been registered in the form of 'Interstage Directory Service (repository name).'

## 11.9.12 irep10911

---

**IREP: ERROR: irep10911: It is not able to execute the service because of invalidation. detail=%s1:%s2:%s3 [%s4]**

### Variable Information

%s1 = Detail code 1

%s2 = Detail code 2

%s3 = Detail code 3

%s4 = Repository name

## Explanation

A service of the repository indicated by %s4 could not be started because its status has been changed to 'disabled'.

## System Action

The system stopped processing.

## User Action

Select [Control Panel] > [Administration Tools] > [Services], then set 'Startup Type' to 'Automatic' on the [General] tab of the repository indicated by %s4.

Note that Interstage Directory Service services have been registered in the form of 'Interstage Directory Service(repository-name).'

## 11.9.13 irep10912

---

**IREP: ERROR: irep10912: To execute the thread which starts the service is failed. detail=%s1:%s2:%s3 [%s4]**

### Variable Information

%s1 = Detail code 1

%s2 = Detail code 2

%s3 = Detail code 3

%s4 = Repository name

## Explanation

A thread required to start up a service of the repository indicated by %s4 could not be started. Some system resources may possibly be missing.

## System Action

The system stopped processing.

## User Action

Close all programs that are no longer needed to secure sufficient memory for the operation of Interstage Directory Service. If this action does not secure sufficient memory, add memory or increase the amount of virtual memory.

For details on the amount of memory required for the operation of Interstage Directory Service, refer to 'Memory Requirements' in the Tuning Guide.

## 11.9.14 irep10913

---

**IREP: ERROR: irep10913: Time-out is occurred at start of the service, because of no response. detail=%s1:%s2:%s3 [%s4]**

### Variable Information

%s1 = Detail code 1

%s2 = Detail code 2

%s3 = Detail code 3

%s4 = Repository name

## Explanation

A timeout occurred in the service startup sequence because a service of the repository indicated by %s4 has made no response;

## System Action

The system stopped processing.

## User Action

Use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

## 11.9.15 irep10914

---

**IREP: ERROR: irep10914: Time-out is occurred, because the service does not respond. detail=%s1:%s2:%s3 [%s4]**

### Variable Information

%s1 = Detail code 1  
%s2 = Detail code 2  
%s3 = Detail code 3  
%s4 = Repository name

### Explanation

A timeout occurred because a service of the repository indicated by %s4 has made no response.

### System Action

The system stopped processing.

### User Action

Use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

## 11.9.16 irep10915

---

**IREP: ERROR: irep10915: It is not able to stop the service, because other running service depends on the Repository service. service=%s1, detail=%s2:%s3:%s4 [%s5]**

### Variable Information

%s1 = Interstage Directory Service-dependent service name  
%s2 = Detail code 1  
%s3 = Detail code 2  
%s4 = Detail code 3  
%s5 = Repository name

### Explanation

The service indicated by %s1 could not be stopped because it is dependent on the service of the repository indicated by %s5.

### System Action

The system stopped processing.

### User Action

Check for the status of the service indicated by the %s1 dependent on the service of Interstage Directory Service. If it is allowed to stop the service that is dependent on the service of Interstage Directory Service, stop it.

To check dependent services of the repository indicated by %s5, select [Control Panel] > [Administration Tools] > [Services], then select the [Dependencies] tab for its properties.

If the repository is used as a SSO repository for an Interstage Single Sign-on repository server, it may possibly be set to be dependent on the Interstage HTTP Server. In such a case, stop the Web server in the [System] > [Services] > [Web Server] > [Web Server : Web Server Status] window on the Interstage Management Console.

Note that Interstage Directory Service services have been registered in the form of 'Interstage Directory Service (repository name).'

## 11.9.17 irep10916

---

**IREP: ERROR: irep10916: It is not able to execute, because of the pausing service. detail=%s1:%s2:%s3 [%s4]**

### Variable Information

%s1 = Detail code 1  
%s2 = Detail code 2  
%s3 = Detail code 3  
%s4 = Repository name

### Explanation

A service could not be handled because it has been stopped.

### System Action

The system stopped processing.

### User Action

Check for the status of the services of the repository indicated by %s4. Select [Control Panel] > [Administration Tools] > [Services] to check for the service status of the repository indicated by %s4. If required services have been stopped, start them up.

Note that Interstage Directory Service services have been registered in the form of 'Interstage Directory Service (repository name).'

## 11.9.18 irep10917

---

**IREP: ERROR: irep10917: Service is not started. detail=%s1:%s2:%s3 [%s4]**

### Variable Information

%s1 = Detail code 1  
%s2 = Detail code 2  
%s3 = Detail code 3  
%s4 = Repository name

### Explanation

A service could not be started.

### System Action

The system stopped processing.

### User Action

Check for the status of the services of the repository indicated by %s4. Select [Control Panel] > [Administration Tools] > [Services] to check for the service status of the repository indicated by %s4. If the required services have been stopped, start them up.

Note that Interstage Directory Service services have been registered in the form of 'Interstage Directory Service(repository name).'

## 11.9.19 irep10918

---

**IREP: ERROR: irep10918: It is not able to execute, because of shutdown of the system. detail=%s1:%s2:%s3 [%s4]**

### Variable Information

%s1 = Detail code 1  
%s2 = Detail code 2

%s3 = Detail code 3

%s4 = Repository name

#### Explanation

A request to a service of the repository indicated by %s4 could not be accepted because the system has already been in the shutdown sequence.

#### System Action

The system stopped processing.

#### User Action

Restart the system, then re-execute.

## 11.9.20 irep10920

---

**IREP: ERROR: irep10920: The service is canceled, because an internal error occurred in the service operation. Please contact the service engineer. detail=%s1:%s2:%s3:%s4 [%s5]**

%s2 = Error code  
%s3 = Detail code 1  
%s4 = Detail code 2  
%s5 = Detail code 3  
%s6 = Repository name

## Explanation

An internal error was detected.

## System Action

The system stopped processing.

## User Action

Use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

## 11.9.32 irep10933

---

**IREP: ERROR: irep10933: Unrecoverable error occurred in initializing. Please contact the service engineer. func=%s1, err=%s2, detail=%s3:%s4:%s5:%s6 [%s7]**

### Variable Information

%s1 = Function name

%s2 = Error code

%s3 = Detail code 1

%s4 = Detail code 2

%s5 = Detail code 3

%s6 = Detail code 4

%s7 = Repository name

## Explanation

An internal error was detected.

## System Action

The system stopped processing.

## User Action

Use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

## 11.9.33 irep10934

---

**IREP: ERROR: irep10934: An internal error occurred. Please contact the service engineer. detail=%s1:%s2:%s3:%s4:%s5 [%s6]**

### Variable Information

%s1 = Detail code 1

%s2 = Detail code 2

%s3 = Detail code 3

%s4 = Detail code 4

%s5 = Detail code 5

%s6 = Repository name

## Explanation

An internal error was detected.

## System Action

The system stopped processing.

## User Action

Use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

## 11.9.34 irep10935

---

**IREP: ERROR: irep10935: The resource to acquire a shared memory is lacking. func=%s1, err=%s2, detail=%s3:%s4:%s5 [%s6]**

### Variable Information

%s1 = Function name  
%s2 = Error code  
%s3 = Detail code 1  
%s4 = Detail code 2  
%s5 = Detail code 3  
%s6 = Repository name

### Explanation

There were insufficient resources for acquiring shared memory.

### System Action

The system stopped processing.

### User Action

Close all programs no longer needed to secure sufficient memory for the operation of Interstage Directory Service. If closing all programs no longer needed cannot secure sufficient memory, add memory or increase the amount of virtual memory.

For details about the amount of memory required for the operation of Interstage Directory Service, refer to 'Memory Requirements' in the Tuning Guide.

## 11.9.35 irep10936

---

**IREP: ERROR: irep10936: To be used same name in another service cause to be not able to acquire it. key=%s1, func=%s2, err=%s3, detail=%s4:%s5:%s6 [%s7]**

%s1 = Function name  
%s2 = Error code  
%s3 = Detail code 1  
%s4 = Detail code 2  
%s5 = Repository name

### Explanation

An internal error was detected.

### System Action

The system stopped processing.

### User Action

Use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

## 11.9.45 irep10951

---

**IREP: ERROR: irep10951: An internal contradiction occurred in starting the process. Please contact the service engineer. func=%s1, err=%s2, detail=%s3:%s4 [%s5]**

### Variable Information

%s1 = Function name  
%s2 = Error code  
%s3 = Detail code 1

%s4 = Detail code 2

%s5 = Repository name

#### Explanation

An internal error was detected.

#### System Action

The system stopped processing.

#### User Action

Use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

## 11.9.46 irep10960

---

**IREP: ERROR: irep10960: An installation information of Fujitsu Enabler is not found. There is a possibility whether it has not been installed or an installation information has been changed by mistake. package=%s1, detail=%s2:%s3 [%s4]**

#### Variable Information

%s1 = Package name

%s2 = Detail code 1

%s3 = Detail code 2

%s4 = Repository name

#### Explanation

Information about the installation of Interstage data store could not be read. Interstage data store may not have been installed or information about it is damaged in the registry.

#### System Action

The system stopped processing.

#### User Action

Check whether Interstage data store has been installed. If Interstage data store has not been installed, install it.

## 11.9.47 irep10961

---

**IREP: ERROR: irep10961: It failed in the reference to installation information on Fujitsu Enabler. package=%s1, func=%s2, detail=%s3:%s4:%s5:%s6 [%s7]**

#### Variable Information

%s1 = Package name

%s2 = Function name

%s3 = Detail code 1

%s4 = Detail code 2

%s5 = Detail code 3

%s6 = Detail code 4

%s7 = Repository name

#### Explanation

Information about the installation of Interstage data store could not be referenced.

### System Action

The system stopped processing.

### User Action

Use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

## 11.9.48 irep10962

---

**IREP: ERROR: irep10962: The program of an indispensable package is not found. package=%s1, path=%s2, detail=%s3:%s4 [%s5]**

### Variable Information

%s1 = Package name

%s2 = Path name

%s3 = Detail code 1

%s4 = Detail code 2

%s5 = Repository name

### Explanation

A program on the path indicated by %s2 which is included in the package indicated by %s1 does not exist. The environment may be damaged.

### System Action

The system stopped processing.

### User Action

If there is no program on the path indicated by %s2 which is included in the package indicated by %s1, the environment of the package is damaged, install it again. The table below explains the meaning of package name output in %s1.

Package name output in %s1	Meaning
Java	Fujitsu Java Development Kit
Interstage data store	Interstage data store Server

If the path %s2 exists or if re-installing the package does not have any effect, use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

## 11.9.49 irep10963

---

**IREP: ERROR: irep10963: There is no authority to operate the program of an indispensable package. package=%s1, path=%s2, detail=%s3:%s4 [%s5]**

### Variable Information

%s1 = Package name

%s2 = Path name

%s3 = Detail code 1

%s4 = Detail code 2

%s5 = Repository name

### Explanation

There is no handling permission to any service of Interstage Directory Service for the current user.

### System Action

The system stopped processing.

### User Action

To handle a service of Interstage Directory Service , execute using administrator authority.

## 11.9.50 irep10964

---

**IREP: ERROR: irep10964: It is failed to check the program of an indispensable package. package=%s1, path=%s2, func=%s3, err=%s4, detail=%s5:%s6 [%s7]**

### Variable Information

%s1 = Package name

%s2 = Path name

%s3 = Function name

%s4 = Error code

%s5 = Detail code 1

%s6 = Detail code 2

%s7 = Repository name

### Explanation

An internal error was detected.

### System Action

The system stopped processing.

### User Action

Use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

## 11.9.51 irep10980

---

**IREP: ERROR: irep10980: It is failed to start the service that a necessary memory is lacked to start the Repository service. detail=%s1:%s2 [%s3]**

### Variable Information

%s1 = Detail code 1

%s2 = Detail code 2

%s3 = Repository name

### Explanation

A service could not be started up because there is insufficient memory for start-up.

### System Action

The system stopped processing.

### User Action

Close all programs no longer needed to secure sufficient memory for the operation of Interstage Directory Service. If this action cannot secure sufficient memory, add memory or increase the amount of virtual memory.

For details on the amount of memory required for the operation of Interstage Directory Service, refer to 'Memory Requirements' in the Tuning Guide.

## 11.9.52 irep10981

---

**IREP: ERROR: irep10981: An installation information of Interstage Directory Service does not exist. There is a possibility whether it is not installed correctly or the environment is changed by mistake. detail=%s1:%s2 [%s3]**

### Variable Information

%s1 = Detail code 1

%s2 = Detail code 2

%s3 = Repository name

### Explanation

Information about installation of Interstage Directory Service could not be found in the registry. Interstage Directory Service may not have been correctly installed or the environment may be damaged.

### System Action

The system stopped processing.

### User Action

Install the Interstage Directory Service package again.

## 11.9.53 irep10982

---

**IREP: ERROR: irep10982: It is failed to read an installation information of Interstage Directory Service. detail=%s1:%s2 [%s3]**

### Explanation

The service program of Interstage Directory Service has been damaged.

## System Action

The system stopped processing.

## User Action

Install the Interstage Directory Service package again because it is damaged.

If user action does not have any effect, use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

## 11.10 irep11000 to irep11099

---

### 11.10.1 irep11000

---

**IREP: INFO: irep11000: Backup has completed. %s1 [%s2]**

### Variable Information

**Windows32/64**

%s1 = Backup directory path

%s2 = Repository name

**Solaris32/64 Linux32/64**

%s1 = Backup file path

%s2 = Repository name

### Explanation

The repository is now successfully backed up.

## 11.10.2 irep11001

---

**IREP: INFO: irep11001: Restore has completed. %s1 [%s2]**

Variable Information

**Windows32/64**

%s1 = Backup directory path

%s2 = Repository name

**Solaris32/64 Linux32/64**

%s1 = Backup file path

%s2 = Repository name

Explanation

The repository is now successfully restored.

## 11.10.3 irep11002

---

**IREP: INFO: irep11002: Command stopped. [%s1]**

Variable Information

%s1 = Repository name

Explanation

Command execution was stopped by interruption of an operator.

## 11.10.4 irep11010

---

**IREP: ERROR: irep11010: No permission to execute the command.**

Explanation

A command was executed without an appropriate permission.

User Action

Execute the command with the administrator authority.

## 11.10.5 irep11011

---

**IREP: ERROR: irep11011: Cannot execute because backup or restore command is running.**

Explanation

A backup or restore command has already been used in operation.

User Action

Wait for a while, then re-execute the command, or stop the backup or restore command currently in operation.

## 11.10.6 irep11012

---

**IREP: ERROR: irep11012: Repository environment has been changed by mistake. [%s1]**

Variable Information

%s1 = Repository name

## Explanation

The backup or restore command could not be executed because the repository environment has been damaged.

## User Action

Backup or restore command could not be executed because the repository environment has been damaged. Re-create the repository, then re-execute the command. For details of how to create a repository, refer to 'Environment Setup' in the Directory Service Operator's Guide.

## 11.10.7 irep11013

---

**IREP: ERROR: irep11013: Cannot specify characters other than .(period) and \_(underline). [%s1]**

### Variable Information

%s1 = Repository name

## Explanation

An unusable character was specified in a file name.

## User Action

Use only allowable characters to specify a file name.

## 11.10.8 irep11014

---

**IREP: ERROR: irep11014: Error in backup or restore operation. Refer to error file for details. %s1 [%s2]**

### Variable Information

%s1 = Error file path

%s2 = Repository name

## Explanation

An error occurred while data was being compressed or uncompressed by a backup or restore command.

## User Action

Check the error file indicated by %s1. Also refer to the sample description of the file below.

- tar: write error: An EOF was incorrectly detected.

Ctrl+C was pressed in command execution. Re-execute the command.

- sh: backup file path: The command failed to create a file.

There is a directory which has the name same as the backup file on the backup file path. Move the directory to another place or change the name of the backup file, then re-execute the command.

If user action does not have any effect, use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

## 11.10.9 irep11015

---

**IREP: ERROR: irep11015: Out of memory. detail=%s1 [%s2]**

### Variable Information

%s1 = Function name

%s2 = Repository name

## Explanation

Memory became insufficient.

## User Action

Close all programs no longer needed, then re-execute the command.

## 11.10.10 irep11016

---

**IREP: ERROR: irep11016: No write permission to path. %s1 [%s2]**

### Variable Information

%s1 = Path

%s2 = Repository name

## Explanation

The path has no write permission assigned.

## User Action

Check for the access permission assigned to the path, then change it.

## 11.10.11 irep11017

---

**IREP: ERROR: irep11017: No read permission to path. %s1 [%s2]**

### Variable Information

%s1 = Path

%s2 = Repository name

## Explanation

The path has no read permission assigned.

## User Action

Check for the access permission assigned to the path, then change it.

## 11.10.12 irep11019

---

**IREP: ERROR: irep11019: No read permission to environment definition path. %s1 [%s2]**

### Variable Information

%s1 = Environment definition path

%s2 = Repository name

## Explanation

The environment definition path does not have any read permission assigned.

## User Action

Change the permission assigned to the environment definition path.

## 11.10.13 irep11020

---

**IREP: ERROR: irep11020: Specified backup file (%s1) is not a file. Specify a file. [%s2]**

### Variable Information

%s1 = Backup file name

%s2 = Repository name

### Explanation

A directory is being specified.

### User Action

Specify a file name for backup.

## 11.10.14 irep11023

---

**IREP: ERROR: irep11023: Specified filename is a directory. detail=%s1 [%s2]**

### Variable Information

%s1 = Backup file name

%s2 = Repository name

### Explanation

Instead of a file name, a directory was incorrectly specified in a directive.

### User Action

Use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

## 11.10.15 irep11024

---

**IREP: ERROR: irep11024: Specified database store(%s1) is not a directory. Specify a directory. [%s2]**

### Variable Information

%s1 = Path

%s2 = Repository name

### Explanation

The backup or restore command could not operate because a file is specified for the database storage directory of the repository environment definition.

### User Action

Check for the path to the database storage directory in the error message, then take one of the measures described below:

- When the message was output to the backup command *irepbacksys*:
  - If the path to the database storage directory is a link or file:

Specify a directory for the database storage directory, re-create the repository, and then re-execute the command.

For details about how to create a repository, refer to 'Environment Setup' in the Directory Service Operator's Guide.

- If the path to the database storage directory is a directory:  
Use the `iscollectinfo` command to collect diagnostic information, then contact your service engineer.
- When the message was output to the restore command `ireprestsys`:
  - If the path to the database storage directory is a link or file:  
Move the link or file of the database storage directory, then re-execute the command.
  - If the path to the database storage directory is a directory:  
Use the `iscollectinfo` command to collect diagnostic information, then contact your service engineer.

## 11.10.16 irep11025

---

**IREP: ERROR: irep11025: Specified access-log store(%s1) is not a directory. Specify a directory. [%s2]**

### Variable Information

- %s1 = Path
- %s2 = Repository name

### Explanation

The backup or restore command could not operate because a file is specified for the directory storing the access log in the definition for the repository environment.

### User Action

Check the path to the access log storage directory in the error message, then take one of the measures described below:

- When the message was output to the backup command `irepbacksys`:
  - If the path to the access log storage directory is a link or file:  
Specify a directory for the access log storage directory, re-create the repository, and then re-execute the command.  
For details of how to create a repository, refer to 'Environment Setup' in the Directory Service Operator's Guide.
  - If the path to the access log storage directory is a directory:  
Use the `iscollectinfo` command to collect diagnostic information, then contact your service engineer.
- When the message was output to the restore command `ireprestsys`:
  - If the path to the access log storage directory is a link or file:  
Move the link or file of the access log storage directory, then re-execute the command.
  - If the path to the access log storage directory is a directory:  
Use the `iscollectinfo` command to collect diagnostic information, then contact your service engineer.

## 11.10.17 irep11026

---

**IREP: ERROR: irep11026: Specified path is not a directory. Specify a directory. detail=%s1 [%s2]**

### Variable Information

- %s1 = Path
- %s2 = Repository name

### Explanation

A file has been incorrectly specified in a directive, instead of a directory.

## User Action

Use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

## 11.10.18 irep11027

---

### **IREP: ERROR: irep11027: Backup file does not exist. [%s1]**

#### Variable Information

%s1 = Repository name

#### Explanation

The backup file does not exist.

#### User Action

Check for the backup file.

## 11.10.19 irep11028

---

### **IREP: ERROR: irep11028: Too long backup file path. max=%s1. detail=%s2 [%s3]**

#### Variable Information

%s1 = Number of characters

%s2 = Path name

%s3 = Repository name

#### Explanation

The backup or restore command could not operate because the path to the backup file was too long.

#### User Action

Move to the directory where the backup file is placed, then re-execute the command.

## 11.10.20 irep11029

---

### **IREP: ERROR: irep11029: No read permission to version information file. %s1 [%s2]**

#### Variable Information

%s1 = Version information file

%s2 = Repository name

#### Explanation

The version information file does not have a read permission assigned.

#### User Action

The environment may be damaged. Install Interstage Directory Service again.

## 11.10.21 irep11030

---

---

**IREP: ERROR: irep11030: Unknown command.****Explanation**

The name of the execution file of backup command *irepbacksys* or restore command *ireprestsys* has been changed.

**User Action**

If the name of the execution file of backup command *irepbacksys* or restore command *ireprestsys* has been changed, rename it to the original name, then re-execute the command.

If the file name has not been changed or if user action does not have any effect, the environment may possibly be damaged. Install Interstage Directory Service again.

## 11.10.22 irep11031

---

**IREP: ERROR: irep11031: Cannot get the current directory. [%s1]****Variable Information**

%s1 = Repository name

**Explanation**

The current directory has been deleted. As a result, this directory cannot be located.

**User Action**

Move to another directory, then re-execute the command.

## 11.10.23 irep11032

---

**IREP: ERROR: irep11032: Repository does not exist. [%s1]****Variable Information**

%s1 = Repository name

**Explanation**

The specified repository does not exist in the environment

**User Action**

Check that the specified repository is in the environment.

## 11.10.24 irep11033

---

**IREP: ERROR: irep11033: No data in database store. [%s1]****Variable Information**

%s1 = Repository name

**Explanation**

The database backup process was stopped because there is no data in the database storage directory.

## 11.10.25 irep11035

---

---

**IREP: ERROR: irep11035: No write permission to backup file. %s1 [%s2]****Variable Information**

%s1 = Backup file path

%s2 = Repository name

**Explanation**

The backup file has no write permission assigned.

**User Action**

Add a write permission to the backup file or the access permission of directory indicated in the error message, then re-execute the command.

## 11.10.26 irep11037

---

**IREP: ERROR: irep11037: Backup file path does not exist. [%s1]****Variable Information**

%s1 = Repository name

**Explanation**

A directory does not exist on the backup path.

**User Action**

Specify the correct backup file path, then re-execute the command.

## 11.10.27 irep11038

---

**IREP: ERROR: irep11038: No read permission to database store. %s1 [%s2]****Variable Information**

%s1 = Database storage directory path

%s2 = Repository name

**Explanation**

The database storage directory does not have a read permission assigned.

**User Action**

Add a read permission to the access permission of the path to the database storage directory indicated in the error message, then re-execute the command.

## 11.10.28 irep11039

---

**IREP: ERROR: irep11039: No read permission to access-log store. %s1 [%s2]****Variable Information**

%s1 = Access-log store path

%s2 = Repository name

## Explanation

The access log storage directory has no read permission assigned.

## User Action

Add a read permission to the access permission of the path to the access log storage directory indicated in the error message, then re-execute the command.

## 11.10.29 irep11040

---

**IREP: ERROR: irep11040: Specified repository does not exist in the backup file. [%s1]**

### Variable Information

%s1 = Repository name

### Explanation

There is no specified repository in the backup file.

### User Action

Execute *ireprestsys -f backup\_file -l*, then check for the name of the specified repository in the Repository line.

- If there is no repository with the name specified:

Specify the name of the repository written on the Repository line in the backup file to the -R option, then re-execute the command.

- If there is a repository with the name specified:

Use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

## 11.10.30 irep11041

---

**IREP: ERROR: irep11041: Cannot restore because repository already exists. [%s1]**

### Variable Information

%s1 = Repository name

### Explanation

The specified repository could not be restored because it already exists.

### User Action

- To restore data only, when using a standard database as the repository database:

Specify the -dataonly option, then re-execute the command.

- To restore the whole repository:

Check whether the restoration destination is correct. If it is correct, delete the repository, then re-execute this command.

## 11.10.31 irep11043

---

**IREP: ERROR: irep11043: Backup file version is different from installed Interstage Directory Service. [%s1]**

### Variable Information

%s1 = Repository name

## Explanation

The repository could not be restored because the version of Interstage Directory Service used to make the backup file is higher than the version of Interstage Directory Service currently used.

## User Action

Check the version of Interstage Directory Service used to make the backup file and the version of Interstage Directory Service currently used. Install the same version (or newer) of Interstage Directory Service as that installed on the repository that has been backed up, then re-execute the command.

- Check the version of Interstage Directory Service used to make the backup file:

Execute `ireprestdsys -f backup-file-name -l`, then check the `irepVL` line in the command output.

- Check the version of Interstage Directory Service used at present:

**Solaris32/64**

Execute `pkginfo -l FJSVirep`, then check the `VERSION` line in the command output.

**Linux32/64**

Execute `rpm -qi FJSVirep`, then check the `Version` line in the command output.

## 11.10.32 irep11044

---

**IREP: ERROR: irep11044: Backup data format is wrong. DB=%s1 BACKUP=%s2 [%s3]**

### Variable Information

**Windows32/64**

%s1 = Database of machine environment

%s2 = Database of backup directory

%s3 = Repository name

**Solaris32/64 Linux32/64**

%s1 = Database of machine environment

%s2 = Database of backup file

%s3 = Repository name

### Explanation

The repository could not be restored because the database used when the repository is restored is different from that used when it was backed up.

### User Action

Compare for the version of Interstage Directory Service used to make the backup file and the version of Interstage Directory Service currently used. Install Interstage Directory Service with the version according to (or newer than) the repository that has been backed up, then re-execute the command.

## 11.10.33 irep11045

---

**IREP: ERROR: irep11045: No write permission to database store. %s1 [%s2]**

### Variable Information

%s1 = Database storage directory path

%s2 = Repository name

## Explanation

The repository could not be restored because the path to the database storage directory has no write permission assigned.

## User Action

Add a write permission to the access permission of the path to the database storage directory indicated in the error message, then re-execute the command.

## 11.10.34 irep11046

---

**IREP: ERROR: irep11046: No write permission to access-log store. %s1 [%s2]**

### Variable Information

%s1 = Access log storage directory path

%s2 = Repository name

## Explanation

The repository could not be restored because the path to the access log storage directory does not have any write permission assigned.

## User Action

Add a write permission to the access permission of the path to the access log storage directory indicated in the error message, then re-execute the command.

## 11.10.35 irep11047

---

**IREP: ERROR: irep11047: Data already exists in database store. %s1 [%s2]**

### Variable Information

%s1 = Database storage directory path

%s2 = Repository name

## Explanation

The repository could not be restored because there are files, directories, and/or links in the location into which the database is to be restored.

## User Action

Move the files, directories, and/or links placed under the database storage directory indicated in the error message to another directory, then re-execute the command.

## 11.10.36 irep11048

---

**IREP: ERROR: irep11048: Data already exists in access-log store. %s1 [%s2]**

### Variable Information

%s1 = Access log storage directory path

%s2 = Repository name

## Explanation

The repository could not be restored because there are files, directories, and/or links in the location into which the access log is to be restored.

## User Action

Move the files, directories, and/or links placed under the access log storage directory indicated in the error message, then re-execute the command.

## 11.10.37 irep11049

---

### **IREP: ERROR: irep11049: Error in environment definition. (database store path) [%s1]**

#### Variable Information

%s1 = Repository name

#### Explanation

No backup could be made for the repository because there is no path to the database storage directory specified in the environment definition.

#### User Action

Check for the database storage directory on Interstage Management Console. If there is no path specified, create the repository again, then make a backup of it.

For details of how to create a repository, refer to 'Environment Setup' in the Directory Service Operator's Guide.

If the path already exists, use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

## 11.10.38 irep11050

---

### **IREP: ERROR: irep11050: Error in environment definition. (access-log store path) [%s1]**

#### Variable Information

%s1 = Repository name

#### Explanation

No backup could be made for the repository because there is no path to the access log storage directory specified in the environment definition.

#### User Action

Check for the access log storage directory on Interstage Management Console. If there is no path specified, re-execute the command, specifying an existing path for the access log storage directory. Note that no backup is made for the access log.

If the path already exists, use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

## 11.10.39 irep11051

---

### **IREP: ERROR: irep11051: Backup file has been changed by mistake. %s1 detail=%s2:%s3 [%s4]**

#### Variable Information

%s1 = Backup file path

%s2 = Information file

%s3 = Error number

%s4 = Repository name

## Explanation

The restore command could not operate because the backup file has been damaged.

## User Action

Check for the name of the backup file.

If the specified backup file name was incorrect, specify it correctly, then re-execute the command.

If the backup file was transferred between machines, check whether it failed.

If the above actions have no effect, use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

## 11.10.40 irep11052

---

**IREP: ERROR: irep11052: No environment definition in the backup file. detail=%s1 [%s2]**

### Variable Information

%s1 = Option specified when backup was made

%s2 = Repository name

## Explanation

There is no environment definition in the backup file. The backup was made with '-dataonly.'

## User Action

- To restore data only, when using a standard database as the repository database:

Re-execute the restore command, using the -dataonly option.

- To restore the whole repository:

Make a backup again without using the -confonly and -dataonly option, then restore the repository without using either of these options.

## 11.10.41 irep11053

---

**IREP: ERROR: irep11053: No data in the backup file. detail=%s1 [%s2]**

### Variable Information

%s1 = Option specified when backup was made

%s2 = Repository name

## Explanation

There is no data in the backup file. The backup was made with '-confonly.'

## User Action

- In the cluster environment:

- To restore the whole repository:

Make a backup again without using the -confonly and -dataonly option, then restore the repository without using either of these options.

- To restore the repository environment:

Re-execute the restore command, using the -confonly option.

- To restore data only, when using a standard database as the repository database:

Make a backup again using the -dataonly option, then restore the repository using -dataonly.

- In a non-cluster environment:

The option -confonly is dedicated only to the cluster environment. Do not restore data by using the backup file.

## 11.10.42 irep11054

---

**IREP: ERROR: irep11054: current OS is different from the OS at time of backup file creation. Backup=%s1 Restore=%s2 [%s3]**

### Variable Information

%s1 = Operating system name when a backup file was created

%s2 = Operating system name when the data was restored

%s3 = Repository name

### Explanation

The operating system on which the backup file was created is different from the operating system on which an attempt was made to restore data.

### User Action

There is no support to restore backup files made by a different operating system. To register information about entries in a different operating system, export and import it by using an LDIF file.

## 11.10.43 irep11055

---

**IREP: ERROR: irep11055: database store path is different from the path at time of backup file creation. Backup=%s1 Restore=%s2 [%s3]**

### Variable Information

%s1 = Database storage directory path when a backup file was created

%s2 = Database storage directory path when the data was restored

%s3 = Repository name

### Explanation

The path to the database storage directory used when the backup file was made is different from that used when an attempt was made to restore the data.

### User Action

Delete the repository where the data was to be restored. Re-create the repository, specifying the database storage directory used when the backup file was made, then re-execute the command.

## 11.10.44 irep11056

---

**IREP: ERROR: irep11056: suffix is different from the suffix at time of backup file creation. Backup=%s1 Restore=%s2 [%s3]**

### Variable Information

%s1 = Public directory used when a backup file was created

%s2 = Public directory used when the data was restored

%s3 = Repository name

### Explanation

The public directory used when the backup file was made is different from the directory when an attempt was made to restore the data.

### User Action

Delete the repository where the data was to be restored. Re-create the repository, specifying the public directory used when the backup file was made, then re-execute the command.

Note that public directories are case-sensitive. Specify a public directory to which data is restored, using the uppercase and lowercase correctly.

## 11.10.45 irep11057

---

**IREP: ERROR: irep11057: password hash algorithm is different from the format at time of backup file creation. Backup=%s1 Restore=%s2 [%s3]**

### Variable Information

%s1 = User password encryption method used when a backup file was created

%s2 = User password encryption method used when the data was restored

%s3 = Repository name

### Explanation

The user password encryption method used when the backup file was made is different from the method when an attempt was made to restore the data.

### User Action

**[V7.0]**

Delete the repository where the data was to be restored. Re-create the repository, specifying the user password encryption method used when the backup file was made, then re-execute the command.

**[8.0 or later versions]**

Consult with the salesman in charge or with the system engineer.

## 11.10.46 irep11058

---

**IREP: ERROR: irep11058: database store path does not exist. detail=%s1 [%s2]**

### Variable Information

%s1 = Database storage directory path

%s2 = Repository name

### Explanation

The repository could not be restored because the path to the database storage directory does not exist.

If the option `-confonly` was specified, the repository was successfully restored. However, there is no path to the database storage directory, therefore the repository cannot be started or deleted.

## User Action

- When the option `-confonly` was specified:

- In the cluster environment:

Switch it to operation mode.

- In a non-cluster environment:

The option `-confonly` is dedicated only to the cluster environment.

Create the path to the database storage directory indicated in the error message, delete the repository by using Interstage Management Console, then execute the command without using the `-confonly` in a non-cluster environment option.

- If the option `-confonly` was not specified:

Check for the path to the database storage directory indicated in the error message. If the path does not exist, create the path to the database storage directory, then re-execute the command.

## 11.10.47 irep11059

---

**IREP: ERROR: irep11059: access log store path does not exist. detail=%s1 [%s2]**

### Variable Information

%s1 = Access log storage directory path

%s2 = Repository name

### Explanation

The repository could not be restored because the path to the access log storage directory does not exist.

If the option `-confonly` was specified, the repository was successfully restored. However, there is no path to the access log storage directory, therefore the repository cannot be started.

### User Action

- When the option `-confonly` was specified:

- In the cluster environment:

Switch it to operation mode.

- In a non-cluster environment:

The option `-confonly` is dedicated only to the cluster environment.

Delete the repository by using Interstage Management Console, then execute the command without using the option `-confonly` in a non-cluster environment.

- If the option `-confonly` was not specified:

Check for the path to the access log storage directory indicated in the error message. If the path does not exist, create the path to the access log storage directory, then re-execute the command.

## 11.10.48 irep11060

---

**IREP: ERROR: irep11060: Error in database operation. Refer to error file for details. %s1 [%s2]**

### Variable Information

%s1 = Error file path

%s2 = Repository name

## Explanation

An error occurred for a database.

Alternatively, the FJSVirep package has been re-installed while the repository still existed.

## User Action

Check the error file indicated by %s1 and take the relevant action. Also refer to the sample description of the file below.

- -fd1: A server indicated in the directory path could not be found.

Some network environment setting may be incorrectly specified.

Contact the network administrator, and then take the following action:

- Check that a local server has been set in the hosts file.
- Check the network environment settings (for example, specification of the DNS server to be used, or settings for the DNS server to be used). If the network environment has incorrect settings, review and re-set the network environment, then re-execute the command.

**Solaris32/64 Linux32/64**

If the network environment settings have been changed, restart the system.

- -sr : Cannot connect to broker.

Usage: omsnew <datastore>

Interstage data store may not have started. Start Interstage data store, then re-execute the command.

- -sr : Enabler service broker is not started.

Usage: omsnew <datastore>

Interstage data store may not have started. Start Interstage data store, then re-execute the command.

If the FJSVirep package may have been re-installed while the repository remained existing, delete the directory according to the following steps, then re-execute the command:

1. Check that the repository to be restored does not already exist by using the Interstage Management Console.

If the repository to be restored does exist, use the iscollectinfo command to collect diagnostic information, then contact your service engineer.

2. If the repository to be restored does not already exist, check that there is a directory with the identical name of the repository to be restored under any of the following directories:

**Windows32/64**

```
C:\Interstage\Enabler\EnablerDStores\repository-name
```

**Solaris32/64**

```
/var/opt/FJSVena/EnablerDStores/repository-name
```

**Linux32/64**

```
/var/opt/FJSVena/DStores/repository-name
```

### Note:

The directory paths indicated above are those set by installing Interstage by default. If 'temporary installation files.' was changed to another directory in standard installation, replace /var/opt with the directly newly specified. If only Interstage data store was separately installed with the 'Datastores directory' changed to another directory, replace /var/opt/FJSVena/EnablerDStores (alternatively, /var/opt/FJSVena/DStores, or C:\Interstage\Enabler\EnablerDStores) with the directory newly specified.

If there is no directory of the name same with it, use the iscollectinfo command to collect diagnostic information, then contact your service engineer.

3. If there is a directory with the identical name with it, check for the following line in the omsconfig file stored in the directory:  
"OWNER irepldap ;"  
If the line indicated above is not stated in the omsconfig file, use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.
4. If the line described above exists in the omsconfig file, delete the directory with the name of the repository that has been checked in step 2.

If the actions listed above fail to correct the error, use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

## 11.10.49 irep11061

---

**IREP: ERROR: irep11061: Because repository is not in stopped state it cannot be restored. [%s1]**

### Variable Information

%s1 = Repository name

### Explanation

The data of the repository could not be restored because the repository has not been stopped.

### User Action

Check for the status of the repository by using the Interstage Management Console.

- The repository has not been stopped:

Stop the repository by using Interstage Management Console. First check that the repository stops operating, then re-execute the command.

- The repository has been stopped:

The repository may have been damaged. Use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

## 11.10.50 irep11062

---

**IREP: ERROR: irep11062: Because datastore with the same name already exists, specified repository can not be created. detail=%s1 [%s2]**

### Variable Information

%s1 = Path

%s2 = Repository name

### Explanation

The name of the specified repository may have been used as the name of a datastore.

### User Action

Interstage Directory Service uses repository names as datastore names. Creating a datastore with the name same as that of a repository of another product, disallows the repository to be restored. Take either of the following measures:

- If the specified repository name is the name of a datastore used by another product:

Creating a datastore with the name same as that of a repository of another product prevents the repository from being restored. For details about the name of a datastore used by another product, refer to manuals of Interstage Portalworks, Interstage Contentbiz, or view the Interstage Studio which uses the datastore.

- If the specified repository name is not the name of a datastore used by another product:

Take the following measures, then try to restore the repository again. If this error message is displayed again after the measures are taken, use the `iscollectinfo` command to collect diagnostic information, then contact your service engineer.

Check that the following directories exist, then delete the directories:

#### Windows32/64

- C:\Interstage\Enabler\EnablerDStores\repository-name
- C:\Interstage\Enabler\EnablerBackups\repository-name
- C:\Interstage\Enabler\EnablerATFiles\repository-name

#### Solaris32/64

- /var/opt/FJSVena/EnablerDStores/repository-name
- /var/opt/FJSVena/EnablerBackups/repository-name
- /var/opt/FJSVena/EnablerATFiles/repository-name

#### Linux32/64

- /var/opt/FJSVena/DStores/repository-name
- /var/opt/FJSVena/Backups/repository-name
- /var/opt/FJSVena/ATFiles/repository-name

#### Notes

- The directory paths indicated above are those set when installing Interstage by default.
- If 'temporary installation files.' was changed to another directory in standard installation, replace `/var/opt` with the directory newly specified.
- If only Interstage data store was separately installed with the 'Datastores directory,' 'ATFiles directory,' or 'Backups directory' changed to another directory, replace the directory path as indicated below:
  - If the 'Datastores directory' was changed to another directory, replace `/var/opt/FJSVena/EnablerDStores` (alternatively, `/var/opt/FJSVena/DStores` or `C:\Interstage\Enabler\EnablerDStores`) indicated on the line numbered 1 above to the directly newly specified.
  - If the 'Backups directory' was changed to another directory, replace `/var/opt/FJSVena/EnablerBackups` (alternatively, `/var/opt/FJSVena/Backups`, or `C:\Interstage\Enabler\EnablerBackups`) indicated on the line numbered 2 above to the directly newly specified.
  - If the 'ATFiles directory' was changed to another directory, replace `/var/opt/FJSVena/EnablerATFiles` (alternatively, `/var/opt/FJSVena/ATFiles` or `C:\Interstage\Enabler\EnablerATFiles`) indicated on the line numbered 3 above to the directly newly specified.

#### Supplementary information:

If any of the following directories exists, it is possible to see the `omsconfig` file placed in the directory and check whether the datastore had been used for Interstage Directory Service or the datastore has been used by another product.

#### Windows32/64

```
C:\Interstage\Enabler\EnablerDStores\repository-name
```

#### Solaris32/64

```
/var/opt/FJSVena/EnablerDStores/repository-name
```

#### Linux32/64

```
/var/opt/FJSVena/DStores/repository-name
```

**Note:**

The directory paths indicated above are those that are set when installing Interstage by default. If 'temporary installation files.' was changed to another directory in standard installation, replace /var/opt with the directly newly specified. If only Interstage data store was separately installed with the 'Datastores directory' changed to another directory, replace /var/opt/EnablerDStores (alternatively, /var/opt/DStores or C:\Interstage\Enabler\EnablerDStores) with the directory newly specified.

If the omsconfig file placed in the directory indicated above has the line indicated below, it indicates that the datastore had been used for Interstage Directory Service. Take the measure described in the section 'When the specified repository name is not the name of a datastore used by another product':

```
"OWNER irepldap ;"
```

If another parameter than irepldap is set to OWNER, take the measure described in the section 'When the specified repository name is the name of a datastore used by another product.'

## 11.10.51 irep11063

---

**IREP: ERROR: irep11063: Because repository is not in stopped state it cannot be backed up. [%s1]**

### Variable Information

%s1 = Repository name

### Explanation

The repository could not be backed up because the repository has not been stopped.

### User Action

Check for the status of the repository by using the Interstage Management Console.

- The repository has not been stopped:

Stop the repository by using Interstage Management Console. First check that the repository stops operating, then re-execute the command.

- The repository has been stopped:

The repository may have been damaged. Use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

## 11.11 irep11100 to irep11199

---

### 11.11.1 irep11100

---

**IREP: ERROR: irep11100: Unable to get system information. detail=%s1:%s2 [%s3]**

### Variable Information

%s1 = Function name

%s2 = Error number

%s3 = Repository name

### Explanation

Information used to make a backup or restore could not be obtained.

### User Action

Use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

## 11.11.2 irep11101

---

**IREP: ERROR: irep11101: characters passed to system function exceeded 256 characters. [%s1]**

### Variable Information

%s1 = Repository name

### Explanation

**Windows32/64**

The specified backup directory path exceeded the limit of the allowable number of characters.

**Solaris32/64 Linux32/64**

The specified backup file path exceeded the limit of the allowable number of characters.

### User Action

**Windows32/64**

If path is specified, use up to 128 characters to specify a backup directory path, then re-execute it. If the path is not specified, use up to 128 characters to specify a backup directory, then re-execute.

**Solaris32/64 Linux32/64**

If path is specified, use up to 128 characters to specify a backup file path, then re-execute it. If path is not specified, use up to 128 characters to specify a backup file name, then re-execute.

## 11.11.3 irep11102

---

**IREP: ERROR: irep11102: file name modification failed. detail=%s1:%s2 [%s3]**

### Variable Information

%s1 = Function name

%s2 = Error number

%s3 = Repository name

### Explanation

A file could not be renamed.

### User Action

Use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

## 11.11.4 irep11103

---

**IREP: ERROR: irep11103: parameter error occurred. detail=%s1 [%s2]**

### Variable Information

%s1 = Function name

%s2 = Repository name

### Explanation

An error occurred for a parameter.

### User Action

Use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

## 11.11.5 irep11104

---

**IREP: ERROR: irep11104: set directive not specified. detail=%s1 [%s2]**

### Variable Information

%s1 = Directive name

%s2 = Repository name

### Explanation

An information file has been damaged.

### User Action

Use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

## 11.11.6 irep11105

---

**IREP: ERROR: irep11105: backup file is neither absolute path nor relative path. [%s1]**

### Variable Information

%s1 = Repository name

### Explanation

A path could not be converted.

### User Action

Specify the absolute path name of the backup file, then re-execute.

## 11.11.7 irep11106

---

**IREP: ERROR: irep11106: Unable to open path. detail=%s1 [%s2]**

### Variable Information

%s1 = Path

%s2 = Repository name

### Explanation

The path indicated in the error message could not be opened.

### User Action

Memory or disk capacity may be insufficient. Close all programs no longer needed, and secure 1 megabyte or more free space for the database storage directory, then re-execute.

If the above actions fail to correct the error, use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

## 11.11.8 irep11107

---

**IREP: ERROR: irep11107: path cannot be closed. detail=%s1 [%s2]**

### Variable Information

%s1 = Path

%s2 = Repository name

## Explanation

The path indicated in the error message could not be closed.

## User Action

Memory or disk capacity may be insufficient. Close all programs no longer needed, and secure 1 megabyte or more free space for the database storage directory, then re-execute.

If the above actions fail to correct the error, use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

## 11.11.9 irep11108

---

**IREP: ERROR: irep11108: system path does not exist. detail=%s1 [%s2]**

### Variable Information

%s1 = System path

%s2 = Repository name

## Explanation

The system path indicated in the error message does not exist.

## User Action

Create the system path indicated in the error message, then re-execute the command. If the above actions fail to correct the error, the Interstage Directory Service environment may have been damaged. Use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

## 11.11.10 irep11112

---

**IREP: ERROR: irep11112: environment definition path does not exist. detail=%s1 [%s2]**

### Variable Information

%s1 = Path

%s2 = Repository name

## Explanation

The environment definition path indicated in the error message does not exist.

## User Action

Use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

## 11.11.11 irep11113

---

**IREP: ERROR: irep11113: Unable to get path. detail=%s1:%s2 [%s3]**

### Variable Information

%s1 = Function name

%s2 = Error number

%s3 = Repository name

## Explanation

Because the path to the database storage directory does not include 'data' and the path to the access log storage directory does not include 'log', the paths could not be obtained.

## User Action

The backup file or repository may have been damaged. Use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

## 11.11.12 irep11114

---

**IREP: ERROR: irep11114: Unable to get file information. detail=%s1:%s2 [%s3]**

### Variable Information

%s1 = Function name

%s2 = Error number

%s3 = Repository name

### Explanation

Information about a file could not be obtained. The file may have been damaged.

### User Action

If there is an error in the backup directory specification (-d option), this error message will be output. Confirm that the backup directory name specified is correct.

For details on specifying the backup directory name, refer to 'Backup Command' in the Reference Manual (Command Edition).

If this action has no effect, use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

## 11.11.13 irep11115

---

**IREP: ERROR: irep11115: Unable to check file in directory. detail=%s1:%s2 [%s3]**

### Variable Information

%s1 = Function name

%s2 = Error number

%s3 = Repository name

### Explanation

A file check could not be made in the directory.

### User Action

Use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

## 11.11.14 irep11116

---

**IREP: ERROR: irep11116: version information does not exist. detail=%s1 [%s2]**

### Variable Information

%s1 = Path

%s2 = Repository name

## Explanation

The version information file does not exist.

## User Action

Use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

## 11.11.15 irep11117

---

**IREP: ERROR: irep11117: Unable to get version information. detail=%s1:%s2 [%s3]**

### Variable Information

%s1 = Function name

%s2 = Error number

%s3 = Repository name

## Explanation

Version information could not be obtained. The version information may have been damaged.

## User Action

Use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

## 11.11.16 irep11119

---

**IREP: ERROR: irep11119: Unable to link database store. detail=%s1:%s2:%s3:%s4 [%s5]**

### Variable Information

%s1 = Function name

%s2 = Error number

%s3 = Path through which link was made

%s4 = Path through which linking was attempted

%s5 = Repository name

## Explanation

A link to the database storage directory could not be created.

## User Action

Check for the permission assigned to the path to be linked with it, which is indicated by %s4, then add a write permission if no permission has been assigned to the path.

## 11.11.17 irep11121

---

**IREP: ERROR: irep11121: Unable to link access-log store. detail=%s1:%s2:%s3:%s4 [%s5]**

### Variable Information

%s1 = Function name

%s2 = Error number

%s3 = Path through which the link was made

%s4 = Path through which linking was attempted

%s5 = Repository name

#### Explanation

A link to the access log storage directory could not be created.

#### User Action

Check for the permission assigned to the path to be linked with it, which is indicated by %s4, then add a write permission if no permission has been assigned to the path.

## 11.11.18 irep11122

---

**IREP: ERROR: irep11122: Unable to delete link path. detail=%s1:%s2 [%s3]**

#### Variable Information

%s1 = Error number

%s2 = Linked path

%s3 = Repository name

#### Explanation

The path could not be unlinked.

#### User Action

Delete the linked path indicated by %s2. If the user action does not take effect, use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

## 11.11.19 irep11127

---

**IREP: ERROR: irep11127: directory deletion failed. detail=%s1:%s2 [%s3]**

#### Variable Information

%s1 = Error number

%s2 = Directory

%s3 = Repository name

#### Explanation

The directory could not be deleted.

#### User Action

Delete the directory indicated by %s2. If the user action does not take effect, use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

## 11.11.20 irep11128

---

**IREP: ERROR: irep11128: Getting repository's state failed. detail=%s1:%s2 [%s3]**

#### Variable Information

%s1 = Function name

%s2 = Return value

%s3 = Repository name

### Explanation

Status data of the repository to be restored could not be obtained.

### User Action

The possible causes of the error are as follows:

- Contention with deletion of the repository:

Check that the repository to be restored exists by using Interstage Management Console. If the repository does not exist, re-create it, then re-execute the command.

For details about how to create a repository, refer to 'Environment Setup' in the Directory Service Operator's Guide.

- Repository control file damaged:

Use the iscollectinfo command to collect diagnostic information, then contact your service engineer.

## 11.11.21 irep11129

---

**IREP: ERROR: irep11129: Database is not installed. detail=%s1 [%s2]**

### Variable Information

%s1 = Error number

%s2 = Repository name

### Explanation

The database has not been installed or may have been incorrectly installed.

### User Action

Check that the database that Interstage Directory Service needs to use exists and has been correctly installed. If the database has not been installed, install it, then re-execute the command.

Interstage data store must have been installed for the database that Interstage Directory Service needs to access.

Check that the data to be restored was specified correctly. For details, refer to (2) Viewing Backup Directory (or File) Information under The ireprestsys Command in the Reference Manual (Command Edition).

## 11.11.22 irep11130

---

**IREP: ERROR: irep11130: Establish file's ownership failed. detail=%s1:%s2:%s3:%s4 [%s5]**

### Variable Information

%s1 = File path

%s2 = User ID

%s3 = Group ID

%s4 = Error number

%s5 = Repository name

### Explanation

An ownership could not be set to the file.

## User Action

Check for the file system.

If there is an error found in the file system, correct it, then re-execute the command. If no error is found, use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

# 11.12 irep11200 to irep11299

---

## 11.12.1 irep11200

---

**IREP: ERROR: irep11200: Unable to copy directory. detail=%s1:%s2:%s3 [%s4]**

### Variable Information

%s1 = Path through which copy was made

%s2 = Path through which copying was attempted

%s3 = Error number

%s4 = Repository name

### Explanation

A directory could not be copied.

### User Action

Use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

## 11.12.2 irep11201

---

**IREP: ERROR: irep11201: Specified backup directory(%s1) is not a directory. Specify a directory. [%s2]**

### Variable Information

%s1 = Backup directory name

%s2 = Repository name

### Explanation

A file was incorrectly specified.

### User Action

Specify the backup directory.

## 11.12.3 irep11202

---

**IREP: ERROR: irep11202: Backup directory does not exist. [%s1]**

### Variable Information

%s1 = Repository name

### Explanation

The backup directory does not exist.

### User Action

Check for the backup directory.

## 11.12.4 irep11203

---

**IREP: ERROR: irep11203: Too long backup directory path. max=%s1. detail=%s2 [%s3]**

### Variable Information

%s1 = Number of characters

%s2 = Path name

%s3 = Repository name

### Explanation

The backup or restore command could not operate because the backup directory path was too long.

### User Action

Move to a directory on the backup directory path, then re-execute the command.

## 11.12.5 irep11204

---

**IREP: ERROR: irep11204: No write permission to backup directory path. %s1 [%s2]**

### Variable Information

%s1 = Backup directory path

%s2 = Repository name

### Explanation

The backup directory path has no write permission assigned.

### User Action

Add a write permission to the backup directory path indicated by %s1, then re-execute.

## 11.12.6 irep11205

---

**IREP: ERROR: irep11205: Backup directory path does not exist. [%s1]**

### Variable Information

%s1 = Repository name

### Explanation

The backup directory does not exist.

### User Action

Specify the correct path to a backup file directory, then re-execute.

## 11.12.7 irep11206

---

**IREP: ERROR: irep11206: Specified repository does not exist in the backup directory. [%s1]**

### Variable Information

%s1 = Repository name

### Explanation

The specified repository does not exist in the backup directory.

## User Action

Execute `ireprestsys -d backup_directory -l`, then check for the name of the specified repository in the Repository line.

- If there is no repository with the name specified:

Specify the name of the repository written on the Repository line in the backup directory to the `-R` option, then re-execute the command.

- If there is a repository with the name specified:

Use the `iscollectinfo` command to collect diagnostic information, then contact your service engineer.

## 11.12.8 irep11207

---

**IREP: ERROR: irep11207: Backup directory version is different from installed Interstage Directory Service. Backup=%s1 IREP=%s2 [%s3]**

### Variable Information

%s1 = Version of backup directory

%s2 = Version of Interstage Directory Service

%s3 = Repository name

### Explanation

The repository could not be restored because the version of Interstage Directory Service used to make the backup directory is higher than that of Interstage Directory Service used at present.

### User Action

Check the version of Interstage Directory Service used to make the backup directory and the version of Interstage Directory Service currently used. Install the same version (or newer) of Interstage Directory Service as that installed on the repository that has been backed up, then re-execute the command.

## 11.12.9 irep11208

---

**IREP: ERROR: irep11208: Backup directory has been changed by mistake. %s1 detail=%s2:%s3 [%s4]**

### Variable Information

%s1 = Backup directory path

%s2 = Detailed information 1

%s3 = Detailed information 2

%s4 = Repository name

### Explanation

The backup or restore command could not operate because the backup directory has been damaged.

### User Action

Check for the name of the backup directory.

If the specified name of the backup directory was incorrect, specify it correctly, then re-execute the command.

If the name of the backup directory was specified correctly, use the `iscollectinfo` command to collect diagnostic information, then contact your service engineer.

## 11.12.10 irep11209

---

**IREP: ERROR: irep11209: No environment definition in the backup directory. detail=%s1 [%s2]**

## Variable Information

%s1 = Option specified when backup was made

%s2 = Repository name

## Explanation

There is no environment definition in the backup directory.

The backup was made with '-dataonly.'

## User Action

- To restore data only, when using a standard database as the repository database:

Re-execute the restore command again, using the -dataonly option.

- To restore the whole repository:

Make a backup again without using the -confonly and -dataonly option, then restore the repository without using either of these options.

## 11.12.11 irep11210

---

**IREP: ERROR: irep11210: No data in the backup directory. detail=%s1 [%s2]**

## Variable Information

%s1 = Option specified when backup was made

%s2 = Repository name

## Explanation

There is no data in the backup directory.

The backup was made with '-confonly.'

## User Action

- In the cluster environment:

- To restore the repository:

Make a backup again without using the -confonly and -dataonly option, then restore the repository without using either of these options.

- To restore the repository environment:

Re-execute the restore command, using the -confonly option.

- To restore data only, when using a standard database as the repository database:

Make a backup again using the -dataonly option, then restore the repository using the -dataonly option.

- In a non-cluster environment:

The option -confonly is dedicated only to the cluster environment. Do not restore data by using the backup directory.

## 11.12.12 irep11211

---

**IREP: ERROR: irep11211: current OS is different from the OS at time of backup directory creation. Backup=%s1 Restore=%s2 [%s3]**

## Variable Information

%s1 = Operating system name when a backup directory was created

%s2 = Operating system name when the data was restored

%s3 = Repository name

## Explanation

The operating system on which the backup directory was created is different from the operating system on which an attempt was made to restore the repository.

## User Action

Restoration of backup files that are created by a different operating system is not supported. To register information about entries in a different operating system, export and import it by using an LDIF file.

## 11.12.13 irep11212

---

**IREP: ERROR: irep11212: database store path is different from the path at time of backup directory creation. Backup=%s1 Restore=%s2 [%s3]**

## Variable Information

%s1 = Database storage directory path when a backup directory was created

%s2 = Database storage directory path when the data was restored

%s3 = Repository name

## Explanation

The path to the database storage directory used when the backup directory was made is different from the path that is used when an attempt was made to restore the data.

## User Action

Delete the repository in which the data is to be restored, re-create the repository, specifying the database storage directory used when the backup file was made, then re-execute the command.

## 11.12.14 irep11213

---

**IREP: ERROR: irep11213: suffix is different from the suffix at time of backup directory creation. Backup=%s1 Restore=%s2 [%s3]**

## Variable Information

%s1 = Public directory used when a backup directory was created

%s2 = Public directory used when the data was restored

%s3 = Repository name

## Explanation

The public directory used when the backup directory was made is different from that used when an attempt was made to restore the data.

## User Action

Delete the repository where the data is to be restored, re-create the repository, specifying the public directory used when the backup file was made, then re-execute the command.

Note that public directories are case-sensitive. Specify a public directory to which data is restored, using the uppercase and lowercase correctly.

## 11.12.15 irep11214

---

**IREP: ERROR: irep11214: password hash algorithm is different from the format at time of backup directory creation. Backup=%s1 Restore=%s2 [%s3]**

### Variable Information

%s1 = User password encryption method used when a backup directory was created

%s2 = User password encryption method used when the data was restored

%s3 = Repository name

### Explanation

The user password encryption method used when the backup file was made is different from that used when an attempt was made to restore the data.

### User Action

**[V7.0]**

Delete the repository where the data is to be restored, re-create the repository, specifying the user password encryption method used when the backup file was made, then re-execute the command.

**[8.0 or later versions]**

Consult with the salesman in charge or with the system engineer.

## 11.12.16 irep11215

---

**IREP: ERROR: irep11215: backup directory is neither absolute path nor relative path. [%s1]**

### Variable Information

%s1 = Repository name

### Explanation

A path could not be converted.

### User Action

Specify the absolute path name to the backup directory, then re-execute the command.

## 11.12.17 irep11216

---

**IREP: ERROR: irep11216: Unable to copy file. detail=%s1 %s2 %s3:%s4:%s5 [%s6]**

### Variable Information

%s1 = Detailed information

%s2 = Path through which copy was made

%s3 = Path through which copying was attempted

%s4 = Error number

%s5 = Error details

%s6 = Repository name

### Explanation

A file could not be copied.

### User Action

Check to ensure there is enough space in the drive where the target path indicated in the error message is placed.

If there is not enough space in the drive, move the target path into a drive with sufficient free space.

If there is enough space in the drive, check for the access permissions assigned to the source path and target path indicated in the error message.

- If the source path has no read permission assigned and the target path has no write permission assigned:  
Add a read permission to the source path and add a write permission to the target path, then re-execute the command.
- If the source path has a read permission assigned and the target path has a write permission assigned:  
Use the iscollectinfo command to collect diagnostic information, then contact your service engineer.

## 11.12.18 irep11217

---

**IREP: ERROR: irep11217: Unable to create directory. detail=%s1:%s2:%s3 [%s4]**

### Variable Information

%s1 = Detailed information 1

%s2 = Detailed information 2

%s3 = Directory path

%s4 = Repository name

### Explanation

The directory could not be created.

### User Action

Check for the access permission of the path to the directory in the error message.

- The directory path has no write permission assigned:  
Add a write permission to the directory path, then re-execute the command.
- The directory path has a write permission assigned:  
Use the iscollectinfo command to collect diagnostic information, then contact your service engineer.

## 11.12.19 irep11218

---

**IREP: ERROR: irep11218: Unable to get user permission. detail=%s1:%s2**

### Variable Information

%s1 = Detailed information 1

%s2 = Detailed information 2

### Explanation

A user permission could not be obtained.

## User Action

Use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

## 11.12.20 irep11219

---

**IREP: ERROR: irep11219: Invalid to assign characters use for backup directory name. detail=%s1 [%s2]**

### Variable Information

%s1 = Character type unspecifiable for a backup directory name

%s2 = Repository name

### Explanation

An unusable character was specified in a backup directory name.

### User Action

The character type indicated by %s1 is unspecifiable for a backup directory name. Use only allowable characters to specify a backup directory name.

For details of the specifiable character types, refer to 'Backup Commands' in the Reference Manual (Command Edition).

## 11.12.21 irep11220

---

**IREP: ERROR: irep11220: Backup directory already exists. detail=%s1 [%s2]**

### Variable Information

%s1 = Backup directory path

%s2 = Repository name

### Explanation

The backup command was stopped because the specified backup directory already exists.

### User Action

Specify any non-existing directory name for a backup directory path.

## 11.13 irep13000 to irep13099

---

### 11.13.1 irep13000

---

**IREP: ERROR: irep13000: Package is not installed. package=%s1**

### Variable Information

%s1 = Package name

### Explanation

Some required package has not been installed.

### System Action

The system stopped processing.

## User Action

Install the package indicated in the error message.

### 11.13.2 irep13001

---

**IREP: ERROR: irep13001: The indispensable package is not installed.**

#### Explanation

A mandatory package has not been installed.

#### System Action

The system stopped processing.

#### User Action

Install the following packages, then re-execute the command:

Fujitsu Java Development Kit

Fujitsu XML Processor

### 11.14 irep13500 to irep13599

---

#### 11.14.1 irep13500

---

**IREP: ERROR: irep13500: Please specify the '-D binddn'.**

#### Explanation

An administrator DN is not specified. Be sure to specify an administrator DN.

#### User Action

Specify an administrator DN in the -D option, then re-execute the command. For details on the -D option, refer to 'Interstage Directory Service Operation Commands' in the Reference Manual (Command Edition).

#### 11.14.2 irep13501

---

**IREP: ERROR: irep13501: Please specify the '-D binddn' only once.**

#### Explanation

Two or more administrator DNs are specified. Two or more administrator DNs cannot be specified.

#### User Action

Specify only one administrator DN in the -D option, then re-execute the command. For details on the -D option, refer to 'Interstage Directory Service Operation Commands' in the Reference Manual (Command Edition).

#### 11.14.3 irep13502

---

**IREP: ERROR: irep13502: Please specify the '-w passwd'.**

#### Explanation

The administrator DN password is not specified. Be sure to specify an administrator DN password.

#### User Action

Specify an administrator DN password in the -w option, then re-execute the command. For details on the -w option, refer to 'Interstage Directory Service Operation Commands' in the Reference Manual (Command Edition).

## 11.14.4 irep13503

---

**IREP: ERROR: irep13503: Please specify the '-w passwd' only once.**

### Explanation

The plural administrator DN passwords are specified. The plural administrator DN passwords cannot be specified.

### User Action

Specify only one administrator DN password in the -w option, then re-execute the command. For details on the -w option, refer to 'Interstage Directory Service Operation Commands' in the Reference Manual (Command Edition).

## 11.14.5 irep13504

---

**IREP: ERROR: irep13504: Please specify the '-r rule-file'.**

### Explanation

The rule file is not specified. Be sure to specify a rule file.

### User Action

Specify a rule file in the -r option, then re-execute the command. For details on the -r option, refer to 'Interstage Directory Service Operation Commands' in the Reference Manual (Command Edition).

## 11.14.6 irep13505

---

**IREP: ERROR: irep13505: Please specify the '-r rule-file' only once.**

### Explanation

The plural rule files are specified. The plural rule files cannot be specified.

### User Action

Specify only one rule file in the -r option, then re-execute the command. For details on the -r option, refer to 'Interstage Directory Service Operation Commands' in the Reference Manual (Command Edition).

## 11.14.7 irep13506

---

**IREP: ERROR: irep13506: Please specify the '-i csv-file'.**

### Explanation

The CSV file is not specified. Be sure to specify a CSV file.

### User Action

Specify a CSV file in the -i option, then re-execute the command. For details on the -i option, refer to 'Interstage Directory Service Operation Commands' in the Reference Manual (Command Edition).

## 11.14.8 irep13507

---

**IREP: ERROR: irep13507: Please specify the '-b dn'.**

### Explanation

The registration destination entry DN for role definition is not specified. Be sure to specify a registration destination entry DN for role definition.

### User Action

Specify a registration destination entry DN for role definition in the -b option, then re-execute the command. For details on the -b option, refer to 'Interstage Directory Service Operation Commands' in the Reference Manual (Command Edition).

## 11.14.9 irep13508

---

**IREP: ERROR: irep13508: Please specify the '-b dn' only once.**

### Explanation

The plural registration destination entry DNs for role definition are specified. The plural registration destination entry DNs for role definition cannot be specified.

### User Action

Specify only one registration destination entry DN for role definition in the -b option, then re-execute the command. For details on the -b option, refer to 'Interstage Directory Service Operation Commands' in the Reference Manual (Command Edition).

## 11.14.10 irep13514

---

**IREP: ERROR: irep13514: The mistake is found in the rule-file.  
%s1**

### Variable Information

%s1 = Error information

### Explanation

The contents of the specified rule file are incorrect.

### User Action

An XML syntax error was detected in the specified rule file. Check if the file specified in the argument of the -r option is the rule file.

If the file specified in the argument of the -r option is the rule file, refer to the error output following this message and check the XML syntax of the rule file. For example, you can check the XML syntax by displaying the rule file with Internet Explorer 6.0.

## 11.14.11 irep13515

---

**IREP: ERROR: irep13515: The rule-file does not exist.**

### Explanation

A nonexistent rule file is specified.

### User Action

A nonexistent rule file is specified. Check if the specified rule file exists or the specified contents are correct, specify the correct rule file, and then re-execute the command.

## 11.14.12 irep13516

---

**IREP: ERROR: irep13516: The rule-file can not be read.**

### Explanation

The specified rule file cannot be read.

### User Action

Check the permission of the specified rule file, make the rule file readable, then re-execute the command.

If user action is not successful, contact your system administrator.

## 11.14.13 irep13518

---

### IREP: ERROR: irep13518: In the rule-file, 'objectClass' is not specified.

#### Explanation

The objectClass tag is not specified in the rule file or the specified objectClass tag is incorrect.

Example of incorrect objectClass tag specification (incorrect hierarchy location)

```
.....
  <Csv2Directory>
    <objectClass>top</objectClass>
    <objectClass>person</objectClass>
    <objectClass>organizationalPerson</objectClass>
    <objectClass>inetOrgPerson</objectClass>
    <Rule>
      <name>sso rule</name>
    </Rule>
  </Csv2Directory>
.....
```

Example of correct objectClass tag specification

```
.....
  <Csv2Directory>
    <Rule>
      <name>sso rule</name>
      <objectClass>top</objectClass>
      <objectClass>person</objectClass>
      <objectClass>organizationalPerson</objectClass>
      <objectClass>inetOrgPerson</objectClass>
    </Rule>
  </Csv2Directory>
.....
```

#### User Action

Edit the rule file, specify the objectClass tag, then re-execute the command.

If the objectClass tag already exists, check if the element hierarchy is correct by referencing the following, edit the rule file, then re-execute the command:

"Creating Data" - "Using the CSV Files Extracted from the Database" in the Directory Service Operator's Guide.

## 11.14.14 irep13519

---

### IREP: ERROR: irep13519: In the rule-file, The name of 'objectClass' overlaps.

#### Explanation

In the rule file, an objectClass tag that has a duplicated value is specified. An objectClass tag cannot be specified that has a duplicated value.

Example of incorrect objectClass tag specification

```
.....
  <objectClass>top</objectClass>
  <objectClass>person</objectClass>
  <objectClass>organizationalPerson</objectClass>
  <objectClass>inetOrgPerson</objectClass>
  <objectClass>inetOrgPerson</objectClass>
.....
```

Example of correct objectClass tag specification

```
.....
  <objectClass>top</objectClass>
  <objectClass>person</objectClass>
  <objectClass>organizationalPerson</objectClass>
  <objectClass>inetOrgPerson</objectClass>
.....
```

### User Action

An objectClass tag cannot be specified with a duplicated value. Edit the rule file, modify or delete the duplicated value specified in the objectClass tag, then re-execute the command. For details on the rule file, refer to "Creating Data" - "Using the CSV Files Extracted from the Database" in the Directory Service Operator's Guide.

## 11.14.15 irep13520

---

### **IREP: ERROR: irep13520: In the rule-file, the 'baseDn' is not specified.**

#### Explanation

The baseDn tag is not specified in the rule file. Be sure to specify a baseDn tag in the rule file.

#### User Action

Edit the rule file, specify a baseDn tag in the rule file, then re-execute the command.

If a baseDn tag already exists, check if the element hierarchy is correct by referencing the following, edit the rule file, then re-execute the command:

"Creating Data" - "Using the CSV Files Extracted from the Database" in the Directory Service Operator's Guide.

## 11.14.16 irep13521

---

### **IREP: ERROR: irep13521: In the rule-file, two or more 'baseDn' are specified.**

#### Explanation

The plural baseDn tags are specified in the rule file. The plural baseDn tags cannot be specified in the rule file.

#### User Action

Edit the rule file, specify only one baseDn tag in the rule file, and then re-execute the command.

For details on the rule file, refer to "Creating Data" - "Using the CSV Files Extracted from the Database" in the Directory Service Operator's Guide.

## 11.14.17 irep13522

---

### **IREP: ERROR: irep13522: In the rule-file, the 'Rdn' is not specified.**

#### Explanation

The Rdn tag is not specified in the rule file. Be sure to specify an Rdn tag in the rule file.

#### User Action

Edit the rule file, specify an Rdn tag in the rule file, then re-execute the command.

If an Rdn tag already exists, check if the element hierarchy is correct by referencing the following, edit the rule file, then re-execute the command:

"Creating Data" - "Using the CSV Files Extracted from the Database" in the Directory Service Operator's Guide.

## 11.14.18 irep13523

---

**IREP: ERROR: irep13523: In the rule-file, there is no value of 'Rdn'.**

### Explanation

An incorrect Rdn value is specified in the specified rule file. In the Rdn tag, a CSV item number without the corresponding attribute name is specified.

Example of incorrect Rdn tag value specification:

```
.....
  <Csv2Directory>
    <Rule>
      ....
      <Rdn>1</Rdn>
      ....
      <CSV>
        <Attribute>
          <sn>2</sn>
          <uid>3</uid>
          <mail>4</mail>
        </Attribute>
      </CSV>
.....
```

Example of correct Rdn tag value specification:

```
.....
  <Csv2Directory>
    <Rule>
      ....
      <Rdn>1</Rdn>
      ....
      <CSV>
        <Attribute>
          <cn>1</cn>
          <sn>2</sn>
          <uid>3</uid>
          <mail>4</mail>
        </Attribute>
      </CSV>
.....
```

### User Action

Edit the rule file, modify the Rdn tag value or specify the attribute name tag corresponding to the specified CSV item number, then re-execute the command.

For details on the rule file, refer to "Creating Data" - "Using the CSV Files Extracted from the Database" in the Directory Service Operator's Guide.

## 11.14.19 irep13524

---

**IREP: ERROR: irep13524: In the rule file, the value of 'Rdn' is wrong.**

### Explanation

An incorrect Rdn tag value is specified in the specified rule file. In the Rdn tag, a CSV item number without the corresponding attribute name is specified.

## User Action

Associate the Rdn tag with a unique attribute name. Edit the rule file, take any of the following actions, and then re-execute the command:

- When an attribute name without a CSV item number is specified that corresponds to the Rdn tag

Modify the Rdn tag value or specify the attribute name tag corresponding to the Rdn tag value.

Example of incorrect Rdn tag value specification:

```
.....
  <Csv2Directory>
    <Rule>
      ....
      <Rdn>cn</Rdn>
      ....
      <CSV>
        <Attribute>
          <sn>2</sn>
          <uid>3</uid>
          <mail>4</mail>
        </Attribute>
      </CSV>
    </Rule>
  </Csv2Directory>
.....
```

Example of correct Rdn tag value specification:

```
.....
  <Csv2Directory>
    <Rule>
      ....
      <Rdn>cn</Rdn>
      ....
      <CSV>
        <Attribute>
          <cn>1</cn>
          <sn>2</sn>
          <uid>3</uid>
          <mail>4</mail>
        </Attribute>
      </CSV>
    </Rule>
  </Csv2Directory>
.....
```

- When the plural attribute name tags that correspond to the Rdn tag exist, edit the rule file so that only one attribute name tag (that consists of the specified attribute names) is specified in the Rdn tag.

Example of incorrect Rdn tag value specification:

```
.....
  <Csv2Directory>
    <Rule>
      ....
      <Rdn>cn</Rdn>
      ....
      <CSV>
        <Attribute>
          <cn>1</cn>
          <cn>2</cn>
          <uid>3</uid>
          <mail>4</mail>
        </Attribute>
      </CSV>
    </Rule>
  </Csv2Directory>
.....
```

Example of correct Rdn tag value specification:

```

.....
  <Csv2Directory>
    <Rule>
      ....
      <Rdn>cn</Rdn>
      ....
      <CSV>
        <Attribute>
          <cn>1</cn>
          <sn>2</sn>
          <uid>3</uid>
          <mail>4</mail>
        </Attribute>
      </CSV>
.....

```

For details on the rule file, refer to "Creating Data" - "Using the CSV Files Extracted from the Database" in the Directory Service Operator's Guide.

## 11.14.20 irep13525

### IREP: ERROR: irep13525: In the rule file, the name of 'Rdn' overlaps.

#### Explanation

An Rdn tag with a duplicated value is specified in the specified rule file. An Rdn tag cannot be specified that has a duplicated value.

Example of incorrect Rdn tag specification:

```

.....
  <Csv2Directory>
    <Rule>
      ....
      <Rdn>cn</Rdn>
      <Rdn>1</Rdn>
      ....
      <CSV>
        <Attribute>
          <cn>1</cn>
          <sn>2</sn>
          <uid>3</uid>
          <mail>4</mail>
        </Attribute>
      </CSV>
.....

```

Example of correct Rdn tag specification:

```

.....
  <Csv2Directory>
    <Rule>
      ....
      <Rdn>cn</Rdn>
      ....
      <CSV>
        <Attribute>
          <cn>1</cn>
          <sn>2</sn>
          <uid>3</uid>
          <mail>4</mail>
        </Attribute>
.....

```

```
.....
    </CSV>
```

### User Action

An Rdn tag cannot be specified with a duplicated value. Edit the rule file, modify the value specified in the Rdn tag or delete the Rdn tag with a duplicated value, then re-execute the command.

For details on the rule file, refer to "Creating Data" - "Using the CSV Files Extracted from the Database" in the Directory Service Operator's Guide.

## 11.14.21 irep13526

### IREP: ERROR: irep13526: In the rule-file, 'Rdn' cannot be uniquely decided.

#### Explanation

In the specified rule file, the value specified in the RDN tag is associated with the plural attribute names. Associate the RDN tag with a unique attribute name.

#### User Action

Associate the Rdn tag with a unique attribute name. Edit the rule file, take the following action, and then re-execute the command:

If a CSV item number is specified in the Rdn tag, edit the rule file so that the CSV item number specified in the Rdn tag serves as the value of one attribute name tag.

For details on the rule file, refer to "Creating Data" - "Using the CSV Files Extracted from the Database" in the Directory Service Operator's Guide.

Example of incorrect Rdn tag specification:

```
.....
    <Csv2Directory>
      <Rule>
        ....
        <Rdn>1</Rdn>
        ....
        <CSV>
          <Attribute>
            <cn>1</cn>
            <description>1</description>
            <sn>2</sn>
            <uid>3</uid>
            <mail>4</mail>
          </Attribute>
        </CSV>
      </Rule>
    </Csv2Directory>
  .....
```

Example of correct Rdn tag specification:

```
.....
    <Csv2Directory>
      <Rule>
        ....
        <Rdn>1</Rdn>
        ....
        <CSV>
          <Attribute>
            <cn>1</cn>
            <sn>2</sn>
            <uid>3</uid>
            <mail>4</mail>
          </Attribute>
        </CSV>
      </Rule>
    </Csv2Directory>
  .....
```

```
        </Attribute>
    </CSV>
.....
```

## 11.14.22 irep13527

---

### IREP: ERROR: irep13527: In the rule-file, a negative value cannot be specified for 'Rdn'.

#### Explanation

In the rule file, a negative value is specified in the Rdn tag. The negative value can not be specified in the Rdn tag.

#### User Action

Specify a numeric value over 0 in the Rdn tag. However, change value 0 to 1 or higher because 0 is reserved for entry operations (locations where ADD, MOD, and DEL are specified), then re-execute the command.

For details on the rule file, refer to "Creating Data" - "Using the CSV Files Extracted from the Database" in the Directory Service Operator's Guide.

## 11.14.23 irep13528

---

### IREP: ERROR: irep13528: In the rule-file, two or more 'midDn' are specified.

#### Explanation

The plural midDn tags are specified in the rule file. The plural midDn tags cannot be specified in the rule file.

#### User Action

The plural midDn tags cannot be specified in the rule file. Edit the rule file, specify only one midDn tag, and then re-execute the command.

For details on the rule file, refer to "Creating Data" - "Using the CSV Files Extracted from the Database" in the Directory Service Operator's Guide.

## 11.14.24 irep13529

---

### IREP: ERROR: irep13529: In the rule-file, the value of 'midDn' is unjustified.

#### Explanation

An incorrect midDn tag value is specified in the rule file. In the character string specified as a midDn tag value, a non CSV item number is specified as the attribute value.

Example of incorrect midDn tag specification:

```
.....
    <Csv2Directory>
        <Rule>
            ....
            <midDn>ou=8,ou=9,ou=eng_div</midDn>
.....
```

Example of correct midDn tag specification:

```
.....
    <Csv2Directory>
        <Rule>
            ....
```

```
<midDn>ou=8,ou=9,ou=10</midDn>
```

```
.....
```

### User Action

A valid midDn tag value consists of a series of 'attribute-name=csv-item-number' strings separated by commas (see the example code above). Edit the rule file, correct the midDn tag value, and then re-execute the command.

For details on the rule file, refer to "Creating Data" - "Using the CSV Files Extracted from the Database" in the Directory Service Operator's Guide.

## 11.14.25 irep13530

### IREP: ERROR: irep13530: a negative value cannot be specified for 'midDn'.

#### Explanation

An incorrect midDn tag value is specified in the rule file. In the character string specified as an midDn tag value, a negative value is specified as an attribute value.

#### User Action

A valid midDn tag value consists of a series of 'attribute-name=csv-item-number' strings, separated by commas. Change CSV item number 0 to 1 or higher because it is reserved for entry operations (locations where ADD, MOD, and DEL are specified), and then re-execute the command.

For details on the rule file, refer to "Creating Data" - "Using the CSV Files Extracted from the Database" in the Directory Service Operator's Guide.

## 11.14.26 irep13531

### IREP: ERROR: irep13531: In the rule-file, the specification of 'midDn' is wrong.

#### Explanation

An incorrect midDn tag value is specified in the rule file. Interstage Directory Service cannot interpret the value specified in the midDn tag.

Example 1 of incorrect midDn tag specification:

```
.....
  <Csv2Directory>
    <Rule>
      ....
        <midDn>ouabc</midDn>
.....
```

Example 2 of incorrect midDn tag specification:

```
.....
  <Csv2Directory>
    <Rule>
      ....
        <midDn>ou=7,=8</midDn>
.....
```

Example 3 of incorrect midDn tag specification:

```
.....
  <Csv2Directory>
    <Rule>
      ....
```

```
.....
    <midDn>ou=
```

Example of correct midDn tag specification:

```
.....
    <Csv2Directory>
      <Rule>
        ....
          <midDn>ou=7,ou=8,ou=9
```

### User Action

A valid midDn tag value consists of a series of 'attribute-name=csv-item-number' strings, separated by commas. Edit the rule file, correct the midDn tag value, and then re-execute the command.

For details on the rule file, refer to "Creating Data" - "Using the CSV Files Extracted from the Database" in the Directory Service Operator's Guide.

## 11.14.27 irep13532

### IREP: ERROR: irep13532: In the rule-file, 'Attributes' is not specified.

#### Explanation

No Attribute element is specified in the rule file or an Attribute element without a valid value is specified in the rule file. An Attribute element is necessary to be specified with a valid value in the rule file.

Example 1 of incorrect Attribute element specification:

```
.....
    <Csv2Directory>
      <Rule>
        ....
          <CSV>
            <Attribute>
            </Attribute>
          </CSV>
        .....
```

Example 2 of incorrect Attribute element specification:

```
.....
    <Csv2Directory>
      <Rule>
        ....
          <CSV>
            <Attribute>
              <cn></cn>
              <sn></sn>
            </Attribute>
          </CSV>
        .....
```

Example of correct Attribute element specification:

```
.....
    <Csv2Directory>
      <Rule>
        ....
          <CSV>
            <Attribute>
```

```
        <cn>1</cn>
        <sn>2</sn>
        <uid>3</uid>
        <mail>4</mail>
    </Attribute>
</CSV>
.....
```

### User Action

Attribute element specification is essential. You must also set a valid value in the Attribute element. Edit the rule file, specify an Attribute element with a valid value, then re-execute the command.

If the Attribute element already exists, check if the element hierarchy is correct, then re-execute the command.

For details on the rule file, refer to "Creating Data" - "Using the CSV Files Extracted from the Database" in the Directory Service Operator's Guide.

## 11.14.28 irep13533

**IREP: ERROR: irep13533: In the csv-file, there is no data corresponding to 'Rdn'. : %s1 LINE (%s2)**

### Variable Information

%s1 = CSV file name

%s2 = Line in which incorrect description is specified

### Explanation

An incorrect Rdn tag value is specified in the rule file. Alternatively, an incorrect CSV item number is specified as an Rdn tag value.

Example 1 of incorrect Rdn tag specification:

- Rule file

```
.....
  <Csv2Directory>
    <Rule>
      ....
      <Rdn>10</Rdn>
      ....
      <CSV>
        <Attribute>
          <cn>10</cn>
          <sn>2</sn>
          <uid>3</uid>
          <mail>4</mail>
        </Attribute>
      </CSV>
.....
```

- CSV file

```
ADD,FUJITSU User001,FUJITSU,fj100,f@fujitsu.com
```

The 10th item is missing from the CSV file.

Example 1 of correct Rdn tag specification:

- Rule file

```
.....
  <Csv2Directory>
    <Rule>
```

```
.....
  <Rdn>1</Rdn>
  ....
  <CSV>
    <Attribute>
      <cn>1</cn>
      <sn>2</sn>
      <uid>3</uid>
      <mail>4</mail>
    </Attribute>
  </CSV>
.....
```

- CSV file

```
ADD,FUJITSU User001,FUJITSU,fj100,f@fujitsu.com
```

Example 2 of incorrect Rdn tag specification:

- Rule file

```
.....
  <Csv2Directory>
    <Rule>
      ....
      <Rdn>cn</Rdn>
      ....
      <CSV>
        <Attribute>
          <cn>10</cn>
          <sn>2</sn>
          <uid>3</uid>
          <mail>4</mail>
        </Attribute>
      </CSV>
.....
```

- CSV file

```
ADD,FUJITSU User001,FUJITSU,fj100,f@fujitsu.com
```

The 10th item is missing from the CSV file.

Example 2 of correct Rdn tag specification:

- Rule file

```
.....
  <Csv2Directory>
    <Rule>
      ....
      <Rdn>cn</Rdn>
      ....
      <CSV>
        <Attribute>
          <cn>1</cn>
          <sn>2</sn>
          <uid>3</uid>
          <mail>4</mail>
        </Attribute>
      </CSV>
.....
```

- CSV file

```
ADD,FUJITSU User001,FUJITSU,fj100,f@fujitsu.com
```

### User Action

The item corresponding to a CSV item number (that can be specified as an Rdn tag value) must exist in the CSV file specified in the -i option. Edit the rule file, correct the Rdn tag value or check the CSV file specified in the -i option, then re-execute the command.

For details on the rule file, refer to "Creating Data" - "Using the CSV Files Extracted from the Database" in the Directory Service Operator's Guide.

## 11.14.29 irep13534

**IREP: ERROR: irep13534: In the csv-file, there is no data corresponding to 'midDn'. : %s1 LINE (%s2)**

### Variable Information

%s1 = CSV file name

%s2 = Line in which incorrect description is specified

### Explanation

An invalid CSV item number (invalid for specifying an attribute value) is specified in the character string as a midDn tag value. Example of incorrect midDn tag specification:

- Rule file

```
.....
  <Csv2Directory>
    <Rule>
      ....
        <midDn>ou=8,ou=9,ou=10</midDn>
      ....
    .....
```

- CSV file

```
ADD,FUJITSU User001,FUJITSU,fj100,f@fujitsu.com,1002,User001,0010111,Aprj, Bdept
```

The 10th item is missing from the CSV file.

Example of correct midDn tag specification:

- Rule file

```
.....
  <Csv2Directory>
    <Rule>
      ....
        <midDn>ou=8,ou=9,ou=10</midDn>
      ....
    .....
```

- CSV file

```
ADD,FUJITSU User001,FUJITSU,fj100,f@fujitsu.com,1002,User001,0010111,Aprj, Bdept,Cdiv
```

### User Action

A valid midDn tag value consists of a series of 'attribute-name=csv-item-number' strings, separated by commas. Also the item corresponding to a CSV item number specified as a midDn tag value, must exist in the CSV file specified in the -i option.

Edit the rule file, correct the midDn tag value or check the CSV file specified in the -i option, then re-execute the command.

For details on the rule file, refer to "Creating Data" - "Using the CSV Files Extracted from the Database" in the Directory Service Operator's Guide.

### 11.14.30 irep13535

---

#### **IREP: ERROR: irep13535: Cannot open csv-file.**

##### Explanation

The CSV file could not be opened.

##### User Action

Check if the CSV file indicated by the specified path exists, check the permission of the CSV file, or check if the specified path is correct, specify the correct path, then re-execute the command.

### 11.14.31 irep13536

---

#### **IREP: ERROR: irep13536: Cannot read csv-file.**

##### Explanation

A CSV file is specified that cannot be read.

##### User Action

Check the permission of the specified CSV file to ensure the file is readable, then re-execute the command. If the user action is not successful, contact your system administrator.

### 11.14.32 irep13538

---

#### **IREP: ERROR: irep13538: Cannot close csv-file.**

##### Explanation

CSV file read could not be terminated normally.

##### User Action

CSV file read could not be terminated normally. It is possible that a fatal error has occurred in the OS, or the device, during command execution. Contact your system administrator.

### 11.14.33 irep13539

---

#### **IREP: ERROR: irep13539: It is an internal error.**

##### Explanation

An internal error occurred.

##### User Action

Possible causes of this error are the following:

- There is insufficient memory for operation.

Add memory.

- A failure occurred in the network when the command was being executed via the network.

Check if the network function is operating normally on the machine where the repository is operating.

Save the message displayed in the window.

Use the *iscollectinfo* command to collect investigation information, then contact your service engineer.

## 11.14.34 irep13541

---

### IREP: ERROR: irep13541: In the rule-file, two or more 'op' are specified.

#### Explanation

In the rule file, the contents below the ldapop tag are modified.

#### User Action

Check and correct the contents below the ldapop tag.

For details on the rule file, refer to "Creating Data" - "Using the CSV Files Extracted from the Database" in the Directory Service Operator's Guide.

```
.....
  <Csv2Directory>
    <Rule>
      ....
      <CSV>
        <ldapop>
          <op>0</op>
          <ldapadd>ADD</ldapadd>
          <ldapdelete>DEL</ldapdelete>
          <ldapmodify>MOD</ldapmodify>
        </ldapop>
        ....
      </CSV>
.....
```

## 11.14.35 irep13542

---

### IREP: ERROR: irep13542: In the rule file, please specify the figure for 'op'.

#### Explanation

In the rule file, the contents below the ldapop tag are modified.

#### User Action

Check and correct the contents below the ldapop tag.

For details on the rule file, refer to "Creating Data" - "Using the CSV Files Extracted from the Database" in the Directory Service Operator's Guide.

```
.....
  <Csv2Directory>
    <Rule>
      ....
      <CSV>
        <ldapop>
          <op>0</op>
          <ldapadd>ADD</ldapadd>
          <ldapdelete>DEL</ldapdelete>
          <ldapmodify>MOD</ldapmodify>
        </ldapop>
        ....
      </CSV>
.....
```

```
        </ldapop>
        ....
    </CSV>
.....
```

## 11.14.36 irep13543

**IREP: ERROR: irep13543: In the rule-file, a negative value cannot be specified for 'op'.**

### Explanation

In the rule file, the contents below the ldapop tag are modified.

### User Action

Check and correct the contents below the ldapop tag.

For details on the rule file, refer to "Creating Data" - "Using the CSV Files Extracted from the Database" in the Directory Service Operator's Guide.

```
.....
    <Csv2Directory>
        <Rule>
            ....
            <CSV>
                <ldapop>
                    <op>0</op>
                    <ldapadd>ADD</ldapadd>
                    <ldapdelete>DEL</ldapdelete>
                    <ldapmodify>MOD</ldapmodify>
                </ldapop>
                ....
            </CSV>
.....
```

## 11.14.37 irep13544

**IREP: ERROR: irep13544: In the rule-file, two or more 'ldapadd' are specified.**

### Explanation

In the rule file, the contents below the ldapop tag are modified.

### User Action

Check and correct the contents below the ldapop tag.

For details on the rule file, refer to "Creating Data" - "Using the CSV Files Extracted from the Database" in the Directory Service Operator's Guide.

```
.....
    <Csv2Directory>
        <Rule>
            ....
            <CSV>
                <ldapop>
                    <op>0</op>
                    <ldapadd>ADD</ldapadd>
                    <ldapdelete>DEL</ldapdelete>
                    <ldapmodify>MOD</ldapmodify>
                </ldapop>
            </CSV>
.....
```

```
.....  
</CSV>  
.....
```

## 11.14.38 irep13545

---

**IREP: ERROR: irep13545: In the rule-file, two or more 'ldapdelete' are specified.**

### Explanation

In the rule file, the contents below the ldapop tag are modified.

### User Action

Check and correct the contents below the ldapop tag.

For details on the rule file, refer to "Creating Data" - "Using the CSV Files Extracted from the Database" in the Directory Service Operator's Guide.

```
.....  
  <Csv2Directory>  
    <Rule>  
      .....  
        <CSV>  
          <ldapop>  
            <op>0</op>  
            <ldapadd>ADD</ldapadd>  
            <ldapdelete>DEL</ldapdelete>  
            <ldapmodify>MOD</ldapmodify>  
          </ldapop>  
          .....  
        </CSV>  
      .....  
.....
```

## 11.14.39 irep13546

---

**IREP: ERROR: irep13546: In the rule-file, two or more 'ldapmodify' are specified.**

### Explanation

In the rule file, the contents below the ldapop tag are modified.

### User Action

Check and correct the contents below the ldapop tag.

For details on the rule file, refer to "Creating Data" - "Using the CSV Files Extracted from the Database" in the Directory Service Operator's Guide.

```
.....  
  <Csv2Directory>  
    <Rule>  
      .....  
        <CSV>  
          <ldapop>  
            <op>0</op>  
            <ldapadd>ADD</ldapadd>  
            <ldapdelete>DEL</ldapdelete>  
            <ldapmodify>MOD</ldapmodify>  
          </ldapop>  
          .....  
        </CSV>  
      .....  
.....
```

```
</CSV>
```

```
.....
```

## 11.14.40 irep13547

**IREP: ERROR: irep13547: In the rule file, 'ldapadd', 'ldapdelete', and 'ldapmodify' have the same value.**

### Explanation

In the rule file, the contents below the ldapop tag are modified.

### User Action

Check and correct the contents below the ldapop tag.

For details on the rule file, refer to "Creating Data" - "Using the CSV Files Extracted from the Database" in the Directory Service Operator's Guide.

```
.....
  <Csv2Directory>
    <Rule>
      ....
      <CSV>
        <ldapop>
          <op>0</op>
          <ldapadd>ADD</ldapadd>
          <ldapdelete>DEL</ldapdelete>
          <ldapmodify>MOD</ldapmodify>
        </ldapop>
        ....
      </CSV>
    .....
```

## 11.14.41 irep13548

**IREP: ERROR: irep13548: In the rule-file, a negative value cannot be specified for 'unique'.**

### Explanation

In the specified rule file, a negative value is specified in the unique tag. The negative value cannot be specified in the unique tag.

### User Action

Specify a numeric value over 0 in the unique tag. However, change value 0 to 1 or higher because it is reserved for entry operations (locations where ADD, MOD, and DEL are specified), then re-execute the command.

For details on the rule file, refer to "Creating Data" - "Using the CSV Files Extracted from the Database" in the Directory Service Operator's Guide.

## 11.14.42 irep13549

**IREP: ERROR: irep13549: In the rule file, the value of 'unique' is wrong.**

### Explanation

An incorrect unique tag value is specified in the specified rule file. In the unique tag, a CSV item number without the corresponding attribute name is specified.

## User Action

It is necessary to associate the unique tag with a unique attribute name. Edit the rule file, take any of the following actions, and then re-execute the command.

For details on the rule file, refer to "Creating Data" - "Using the CSV Files Extracted from the Database" in the Directory Service Operator's Guide.

- When an attribute name without a CSV item number is specified that corresponds to the unique tag modify the unique tag value or specify the attribute name tag corresponding to the unique tag value.

Example 1 of incorrect unique tag specification:

```
.....
  <Csv2Directory>
    <Rule>
      ....
      <unique>uid</unique>
      ....
      <CSV>
        <Attribute>
          <cn>1</cn>
          <sn>2</sn>
          <mail>4</mail>
        </Attribute>
      </CSV>
    .....
```

Example 1 of correct unique tag specification:

```
.....
  <Csv2Directory>
    <Rule>
      ....
      <unique>uid</unique>
      ....
      <CSV>
        <Attribute>
          <cn>1</cn>
          <sn>2</sn>
          <uid>3</uid>
          <mail>4</mail>
        </Attribute>
      </CSV>
    .....
```

- If plural attribute name tags exist (that correspond to the unique tag) - edit the rule file so only one attribute name tag (consisting of the specified attribute names) is specified in the unique tag.

Example 2 of incorrect unique tag specification:

```
.....
  <Csv2Directory>
    <Rule>
      ....
      <unique>uid</unique>
      ....
      <CSV>
        <Attribute>
          <cn>1</cn>
          <sn>2</sn>
          <uid>3</uid>
          <uid>4</uid>
        </Attribute>
      </CSV>
    .....
```

```
.....  
    </CSV>
```

Example 2 of correct unique tag specification:

```
.....  
    <Csv2Directory>  
        <Rule>  
            ....  
            <unique>uid</unique>  
            ....  
            <CSV>  
                <Attribute>  
                    <cn>1</cn>  
                    <sn>2</sn>  
                    <uid>3</uid>  
                    <mail>4</mail>  
                </Attribute>  
            </CSV>  
        </Rule>  
    </Csv2Directory>  
.....
```

## 11.14.43 irep13550

---

**IREP: ERROR: irep13550: In the rule file, the name of 'unique' overlaps.**

### Explanation

A unique tag with a duplicated value is specified in the specified rule file. A unique tag cannot be specified with a duplicated value.

Example of incorrect unique tag specification:

```
.....  
    <Csv2Directory>  
        <Rule>  
            ....  
            <unique>uid</unique>  
            <unique>3</unique>  
            ....  
            <CSV>  
                <Attribute>  
                    <cn>1</cn>  
                    <sn>2</sn>  
                    <uid>3</uid>  
                    <mail>4</mail>  
                </Attribute>  
            </CSV>  
        </Rule>  
    </Csv2Directory>  
.....
```

Example of correct unique tag specification:

```
.....  
    <Csv2Directory>  
        <Rule>  
            ....  
            <unique>uid</unique>  
            ....  
            <CSV>  
                <Attribute>  
                    <cn>1</cn>  
                    <sn>2</sn>  
                    <uid>3</uid>  
                    <mail>4</mail>  
                </Attribute>  
            </CSV>  
        </Rule>  
    </Csv2Directory>
```

```
        </Attribute>
    </CSV>
```

.....

### User Action

A unique tag cannot be specified with a duplicated value. Edit the rule file, modify the value specified in the unique tag, or delete the unique tag with a duplicated value, and then re-execute the command.

For details on the rule file, refer to 'Using the Command to Manage Entries' - 'CSV and Rule Files' in the Directory Service Operator's Guide.

## 11.14.44 irep13551

### IREP: ERROR: irep13551: In the rule-file, there is no value of 'unique'.

#### Explanation

An incorrect unique tag value is specified in the specified rule file. In the unique tag, a CSV item number without the corresponding attribute name is specified.

Example of incorrect unique tag specification:

```
.....
    <Csv2Directory>
        <Rule>
.....
            <unique>7</unique>
            ....
            <CSV>
                <Attribute>
                    <cn>1</cn>
                    <sn>2</sn>
                    <uid>3</uid>
                    <mail>4</mail>
                </Attribute>
            </CSV>
.....
```

Example of correct unique tag specification:

```
.....
    <Csv2Directory>
        <Rule>
.....
            <unique>3</unique>
            ....
            <CSV>
                <Attribute>
                    <cn>1</cn>
                    <sn>2</sn>
                    <uid>3</uid>
                    <mail>4</mail>
                </Attribute>
            </CSV>
.....
```

### User Action

In the unique tag, a CSV item number, without the corresponding attribute name, is specified.

Edit the rule file, modify the unique tag value or specify the attribute name tag corresponding to the specified CSV item number, then re-execute the command.

For details on the rule file, refer to "Creating Data" - "Using the CSV Files Extracted from the Database" in the Directory Service Operator's Guide.

## 11.14.45 irep13552

### IREP: ERROR: irep13552: In the rule-file, 'unique' cannot be uniquely decided.

#### Explanation

In the specified rule file, the value specified in the unique tag is associated with plural attribute names. Associate the unique tag with a unique attribute name.

#### User Action

It is necessary to associate the unique tag with a unique attribute name. Edit the rule file, take any of the following actions, and then re-execute the command.

If a CSV item number is specified in the unique tag, edit the rule file so that the CSV item number specified in the unique tag serves as the value of one attribute name tag.

Example of incorrect unique tag specification:

```
.....
  <Csv2Directory>
    <Rule>
      ....
      <unique>3</unique>
      ....
      <CSV>
        <Attribute>
          <cn>1</cn>
          <sn>2</sn>
          <uid>3</uid>
          <mail>4</mail>
          <description>3</description>
        </Attribute>
      </CSV>
    </Rule>
  </Csv2Directory>
.....
```

Example of correct unique tag specification:

```
.....
  <Csv2Directory>
    <Rule>
      ....
      <unique>3</unique>
      ....
      <CSV>
        <Attribute>
          <cn>1</cn>
          <sn>2</sn>
          <uid>3</uid>
          <mail>4</mail>
        </Attribute>
      </CSV>
    </Rule>
  </Csv2Directory>
.....
```

For details on the rule file, refer to "Creating Data" - "Using the CSV Files Extracted from the Database" in the Directory Service Operator's Guide.

## 11.14.46 irep13553

---

### IREP: ERROR: irep13553: In the rule-file, two or more 'DnChange' are specified.

#### Explanation

The plural DnChange tags are specified in the rule file. The plural DnChange tags cannot be specified in the rule file.

#### User Action

The plural DnChange tags cannot be specified in the rule file. Edit the rule file, specify only one DnChange tag, and then re-execute the command.

For details on the rule file, refer to "Creating Data" - "Using the CSV Files Extracted from the Database" in the Directory Service Operator's Guide.

## 11.14.47 irep13554

---

### IREP: ERROR: irep13554: Cannot connect Repository.

%s1

#### Variable Information

%s1 = Error information

#### Explanation

Connection to the repository failed.

#### User Action

Check if specification of '-h host-name', '-p port-number', '-D administrator-dn', and '-w administrator-dn-password' in the argument is correct.

If the specification is correct, use the Interstage Management Console of the connection destination to check if the repository is active.

If the repository is not activated, activate it.

The irepaddrole and irepmodifynt commands do not support connection to SSL ports. Check if the repository is connected to an SSL port. If the repository is connected to an SSL port, specify a non-SSL port.

In cases except the above, it is possible that the network is problematic. Use the ping command to check if the repository is connected via a network.

If an LDAP error code is output, take any of the following actions:

LDAP error code	Action taken
34(0x22)	<p>The distinguished name (DN) format is incorrect.</p> <ul style="list-style-type: none"><li>- The Administrator DN format is incorrect. Check the Administrator DN specification.</li><li>- The DN format of the entry to be operated is incorrect.</li></ul> <p>Check the baseDn tag value, Rdn tag value, and midDn tag value in the rule file.</p> <p>Check if the DN is correct by verifying the Rdn and midDn tag values with the line where a CSV file error occurred.</p> <ul style="list-style-type: none"><li>- If an error occurs in the irepaddrole command, check if the DN to create the role information specified in the -b option is correct, or whether the DN exists in the repository.</li></ul>
49(0x31)	<p>Authentication failed because the specified DN or password is incorrect.</p>

LDAP error code	Action taken
	Authentication failed because binddn of '-D binddn' or passwd of '-w passwd' specified in the command argument is incorrect. Check binddn specification and passwd specification.  If a password is interactively entered without '-w passwd' specified in the command argument, check the entered password.
80(0x50) 81(0x51)	Communication with the repository failed.  Use the iscollectinfo command to collect the materials showing the current status and then use the Interstage Management Console of the connection destination to check if the repository is active. If the repository is not active, activate it. If the repository cannot be activated or is unstable, contact your service engineer.

If an LDAP error code except the above is output, refer to 'LDAP Error Codes' in "Error Codes to be Reported from Interstage Directory Service".

## 11.14.48 irep13555

### IREP: ERROR: irep13555: Cannot disconnect Repository.

%s1

#### Variable Information

%s1 = Error information

#### Explanation

Disconnection with the repository failed.

#### User Action

If an LDAP error code is output, take the following action:

LDAP error code	Action taken
80(0x50)	A non LDAP error code is detected. Communication with the repository failed.
81(0x51)	Use the iscollectinfo command to collect information regarding the current status and then use the Interstage Management Console on the connection server to check whether the repository is active. If the repository is not active, activate it. If the repository cannot be activated or is unstable, contact your service engineer.

If an LDAP error code (except the above) is output, refer to 'LDAP Error Codes' in "Error Codes to be Reported from Interstage Directory Service".

## 11.14.49 irep13556

### IREP: ERROR: irep13556: The entry deletion to the Repository failed.

%s1 LINE (%s2)

%s3

#### Variable Information

%s1 = CSV file name

%s2 = Line in which incorrect description is specified

%s3 = Error information

## Explanation

The entry could not be deleted.

## User Action

If an LDAP error code is output, take any of the following actions:

LDAP error code	Action taken
32(0x20)	<p>The entry does not exist.</p> <p>Check the baseDn tag value, Rdn tag value, and midDn tag value in the rule file.</p> <p>Check if the DN is correct by verifying the Rdn and midDn tag values with the line where a CSV file error occurred.</p> <p>Also check the repository to see if the entry to be operated exists.</p>
34(0x22)	<ul style="list-style-type: none"><li>- The distinguished name (DN) format is incorrect.</li><li>- The administrator DN format is incorrect. Check administrator DN specification.</li><li>- The DN format of the entry to be operated is incorrect.</li></ul> <p>Check the baseDn tag value, Rdn tag value, and midDn tag value in the rule file.</p> <p>Check if the DN is correct by verifying the Rdn and midDn tag values with the line where a CSV file error occurred.</p> <ul style="list-style-type: none"><li>- If an error occurs in the irepaddrole command, check if the DN to create the role information specified in the -b option is correct or if the DN exists in the repository.</li></ul>
50(0x32)	<p>The request is made without an appropriate permission.</p> <p>Check if the administrator DN (set when a repository is created), is specified in binddn of '-D binddn' of the command argument.</p>
52(0x34)	<p>The repository is not in service.</p> <p>Use the Interstage Management Console on the connection server to check whether the repository is active. If the repository is not active, activate it. If the repository is unstable, reactivate the machine. If this action is not successful, use the iscollectinfo command to collect investigation information, then contact your service engineer.</p>
53(0x35)	<p>The repository rejected the request.</p> <p>The host of the repository to be specified in the command, must be operated in either standalone, database-share, or master mode. Use the Interstage Management Console of the connection destination to check.</p>
66(0x42)	<p>The requested operation cannot be executed for entries, except leaf entries.</p> <ul style="list-style-type: none"><li>- Check if the character string at column 0 of the line where a CSV file error occurred is 'DEL.' If the character string is DEL, also check the following:</li><li>- Check the baseDn tag value, Rdn tag value, and midDn tag value in the rule file. If the tag value is incorrect, correct it and then re-execute the command.</li><li>- Verify the Rdn and midDn tag values with the line where a CSV file error occurred, connect the baseDn tag value, and check the repository to see if the DN to be generated is a leaf entry. If the generated DN is not a leaf entry, but its entry is necessary to be deleted, delete it with the entry administration tool.</li></ul>
80(0x50)	<p>An error code other than LDAP is detected. Communication with the repository failed.</p>
81(0x51)	<p>Use the iscollectinfo command to collect the materials showing the current status and then use the Interstage Management Console on the connection destination to check if the repository is active. If the repository is not active, activate it. If the repository cannot be activated or is unstable, contact your service engineer.</p>

If an LDAP error code except the above is output, refer to 'LDAP Error Codes' in "Error Codes to be Reported from Interstage Directory Service".

## 11.14.50 irep13557

### IREP: ERROR: irep13557: The entry addition to Repository failed.

%s1 LINE (%s2)

%s3

#### Variable Information

%s1 = CSV file name

%s2 = Line in which incorrect description is specified

%s3 = Error information

#### Explanation

The entry could not be added.

#### User Action

If an LDAP error code is output, take any of the following actions:

LDAP error code	Action taken
1(0x01)	<p>The specified object class is incorrect. A necessary attribute is not specified for the object class, or an unusable attribute is specified for the object class.</p> <ul style="list-style-type: none"><li>- Check if the objectClass tag value in the rule file is correct.</li><li>- Check if the objectClass tag in the rule file includes an object class of structure type (STRUCTURAL).</li><li>- Check if necessary attributes are specified in the Attribute element or fixed element for the object class, which is specified in the objectClass tag in the rule file.</li><li>- Check if unusable attributes are specified in the Attribute element, or fixed element for the object class, which is specified in the objectClass tag in the rule file.</li></ul> <p>For values that can be specified in the Attribute element or fixed element, refer to 'List of Object Classes' in the Directory Service Operator's Guide.</p>
16(0x10)	<p>The attribute is not found.</p> <p>Check if an invalid attribute is specified in the Attribute element for the object class, which is specified in the objectClass tag in the rule file. If the repository is not active, activate it. If the repository cannot be activated or is unstable, contact your service engineer.</p>

If an LDAP error code except the above is output, refer to 'LDAP Error Codes' in "Error Codes to be Reported from Interstage Directory Service".

## 11.14.53 irep13560

### **IREP: ERROR: irep13560: The entry retrieval to the Repository failed.**

**%s1 LINE (%s2)  
%s3**

#### Variable Information

%s1 = CSV file name

%s2 = Line in which incorrect description is specified

%s3 = Error information

#### Explanation

The entry could not be searched for.

#### User Action

If this error message is output when the irepmodifyent command is being executed, check if the baseDn tag value is correct and the entry exists in the repository.

If this error message is output when the irepaddrole command is being executed, check if the value of DN to create the role definition specified in the -b option is correct and the entry exists in the repository.

If an LDAP error code is output, take any of the following actions:

LDAP error code	Action taken
16(0x10)	The attribute is not found. Check if an invalid attribute is specified in the Attribute element for the object class, which is specified in the objectClass tag in the rule file. For values that can be specified in the Attribute element, refer to 'List of Object Classes' in the Directory Service Operator's Guide.
17(0x11)	An undefined attribute name is specified. Check if an invalid attribute name is specified in the Attribute element or fixed element in the rule file. For valid attribute names, refer to 'List of Attributes' in the Directory Service Operator's Guide.
21(0x15)	The contents of the specified attribute value violate the attribute syntax. The character in the item string in the CSV file corresponding to the attribute element specified in the Rule file is invalid. Therefore, the string cannot be set as the attribute value. Check the following: Check if an incorrect attribute name is set in the Attribute element in the rule file. Check if the item location corresponding to the attribute name tag is correct. Check if the item character string in the CSV file is correct. Check if the unique tag in the rule file is specified three times or more. The unique tag can be specified only twice.
34(0x22)	The distinguished name (DN) format is incorrect. The administrator DN format is incorrect. Check administrator DN specification. The DN format of the entry to be operated is incorrect. Check the baseDn tag value, Rdn tag value, and midDn tag value in the rule file. Check if the DN is correct by verifying the Rdn and midDn tag values with the line where a CSV file error occurred. If an error occurs in the irepaddrole command, check if the DN to create the role information specified in the -b option is correct or if the DN exists in the repository.
50(0x32)	The request is made without an appropriate permission. Check if the administrator DN set when a repository is created is specified in binddn of '-D binddn' specified in the command argument.
52(0x34)	The repository is not in service. Use the Interstage Management Console of the connection destination to check if the repository is active. If the repository is not active, activate it. If the repository is unstable, reactivate the machine. If this action is not successful, use the iscollectinfo command to collect investigation information, then contact your service engineer.
80(0x50) 81(0x51)	An error other except LDAP error codes is detected. Communication with the repository failed. Use the iscollectinfo command to collect the materials showing the current status and then use the Interstage Management Console on the connection server to check whether the repository is active. If the repository is not active, activate it. If the repository cannot be activated or is unstable, contact your service engineer.

If an LDAP error code except the above is output, refer to 'LDAP Error Codes' in "Error Codes to be Reported from Interstage Directory Service".

## 11.14.54 irep13562

---

**IREP: ERROR: irep13562: The entry movement to the Repository failed.**  
%s1

## Variable Information

%s1 = Error information

## Explanation

The entry could not be moved to the repository server.

## User Action

If an LDAP error code is output, take any of the following actions:

LDAP error code	Action taken
1(0x01)	<p>The specified object class is incorrect. A necessary attribute is not specified for the object class or an unusable attribute is specified for the object class.</p> <ul style="list-style-type: none"><li>- Check if the objectClass tag value in the rule file is correct.</li><li>- Check if the objectClass tag in the rule file includes an object class of structure type (STRUCTURAL).</li><li>- Check if necessary attributes are specified in the Attribute element or fixed element for the object class, which is specified in the objectClass tag in the rule file.</li><li>- Check if unusable attributes are specified in the Attribute element or fixed element for the object class, which is specified in the objectClass tag in the rule file.</li></ul> <p>For values that can be specified in the Attribute element or fixed element, refer to 'List of Object Classes' in the Directory Service Operator's Guide.</p>
16(0x10)	<p>The attribute is not found.</p> <p>Check if an invalid attribute is specified in the Attribute element for the object class, which is specified in the objectClass tag in the rule file. For values that can be specified in the Attribute element, refer to 'List of Object Classes' in the Directory Service Operator's Guide.</p>
17(0x11)	<p>An undefined attribute name is specified.</p> <p>Check if an invalid attribute name is specified in the Attribute element or fixed element in the rule file. For valid attribute names, refer to 'List of Attributes' in the Directory Service Operator's Guide.</p>
21(0x15)	<p>The contents of the specified attribute value violate the attribute syntax.</p> <p>The item character string in the CSV file corresponding to the attribute specified in the Attribute element in the rule file cannot be set as an attribute value, because the character type of the character string is incorrect. Check the following:</p> <ul style="list-style-type: none"><li>- Check if an incorrect attribute name is set in the Attribute element in the rule file.</li><li>- Check if the item location corresponding to the attribute name tag is correct.</li><li>- Check if the item character string in the CSV file is correct.</li></ul>

Check administrator DN specification.</li><li>- The DN format of the entry to be operated is incorrect.</li></ul> <p>Check the baseDn tag value, Rdn tag value, and midDn tag value in the rule file.</p> <p>Check if the DN is correct by verifying the Rdn and midDn tag values with the line where a CSV file error occurred.</p> <ul style="list-style-type: none"><li>- If an error occurs in the irepaddrole command, check if the DN to create the role information specified in the -b option is correct or if the DN exists in the repository.</li></ul>
50(0x32)	<p>The request is made without an appropriate permission.</p>

LDAP error code	Action taken
	Check if the administrator DN set when a repository is created is specified in binddn of '-D binddn' specified in the command argument.
52(0x34)	The repository is not in service. Use the Interstage Management Console on the connection server to check whether the repository is active. If the repository is not active, activate it. If the repository is unstable, reactivate the machine. If this action is not successful, use the iscollectinfo command to collect diagnostic information, then contact your service engineer.
53(0x35)	The repository rejected the request. The host of the repository to be specified in the command must be operated either in standalone, database-share, or master mode. Use the Interstage Management Console of the connection destination to check this.
65(0x41)	The specified object class is incorrect. A necessary attribute is not specified for the object class or an unusable attribute is specified for the object class. <ul style="list-style-type: none"> <li>- Check if the objectClass tag value in the rule file is correct.</li> <li>- Check if the objectClass tag in the rule file includes an object class of structure type (STRUCTURAL).</li> <li>- Check if necessary attributes are specified in the Attribute element or fixed element for the object class, which is specified in the objectClass tag in the rule file.</li> <li>- Check if unusable attributes are specified in the Attribute element or fixed element for the object class, which is specified in the objectClass tag in the rule file.</li> </ul> For values that can be specified in the Attribute element or fixed element, refer to 'List of Object Classes' in the Directory Service Operator's Guide.
80(0x50)	A non LDAP error code is detected. Communication with the repository failed.
81(0x51)	Use the iscollectinfo command to collect the materials showing the current status and then use the Interstage Management Console on the connection server to check whether the repository is active. If the repository is not active, activate it. If the repository cannot be activated or is unstable, contact your service engineer.

If an LDAP error code except the above is output, refer to 'LDAP Error Codes' in "Error Codes to be Reported from Interstage Directory Service".

## 11.14.55 irep13564

### IREP: ERROR: irep13564: The state of the Repository contradicts the rule-file.

#### Explanation

An attempt is made to change an entry DN, with a combination of the specified rule file and the CSV file, but a duplicated attribute (the attribute specified in the Rdn tag is the same as that in the unique tag) was detected in the existing repository entry. The attribute specified in the unique tag must be unique.

#### User Action

Possible causes of this error are the following:

- An incorrect value is specified in the unique tag of the rule file.
- The contents of the repository that is already registered are incorrect.
- The description of the CSV file is incorrect.

Take any of the following actions, then re-execute the command:

- Edit the rule file and change the value specified in the unique tag.

- Modify the contents of the repository that is already registered, from the information in the line where the CSV file error occurred and output the message.
- Modify the value of the item specified in the unique tag, about the line where the CSV file error occurred, and output the message.

When modifying the contents of the repository that is already registered, refer to 'Managing Entries' in the Directory Service Operator's Guide.

For details on the rule file, refer to "Creating Data" - "Using the CSV Files Extracted from the Database" in the Directory Service Operator's Guide.

## 11.14.56 irep13565

---

**IREP: ERROR: irep13565: The entry change failed to keep RDN to be unique with the Repository. : %s1  
LINE (%s2)**

### Variable Information

%s1 = CSV file name

%s2 = Line in which incorrect description is specified

### Explanation

When an attempt is made to change an entry DN, with a combination of the specified rule file and the CSV file, a duplicate attribute is directed, so that the attribute specified in the Rdn tag is the same as that in the unique tag. The attribute specified in the unique tag must be unique.

### User Action

Possible causes of this error are the following:

- An incorrect value is specified in the unique tag of the rule file.
- The contents of the repository that is already registered are incorrect.
- The description of the CSV file is incorrect.

Take any of the following actions, then re-execute the command:

- Edit the rule file and change the value specified in the unique tag.
- Modify the contents of the repository that is already registered, from the information in the line where the CSV file error occurred, and output the message.
- Modify the value of the item specified in the unique tag, about the line where the CSV file error occurred, and output the message.

When modifying the contents of the repository that is already registered, refer to 'Managing Entries' in the Directory Service Operator's Guide.

For details on the rule file, refer to "Creating Data" - "Using the CSV Files Extracted from the Database" in the Directory Service Operator's Guide.

## 11.14.57 irep13566

---

**IREP: ERROR: irep13566: The entry with the attribute value which cannot overlap cannot be added. : %s1  
LINE (%s2)**

### Variable Information

%s1 = CSV file name

%s2 = Line in which incorrect description is specified

## Explanation

When an attempt is made to change an entry DN with a combination of the specified rule file and the CSV file, a duplicate attribute is directed so that the attribute specified in the Rdn tag is the same as that in the unique tag. The attribute specified in the unique tag is necessary to be a unique.

## User Action

Possible causes of this error are the following:

- An incorrect value is specified in the unique tag of the rule file.
- The contents of the repository that is already registered are incorrect.
- The description of the CSV file is incorrect.

Take any of the following actions, then re-execute the command:

- Edit the rule file and change the value specified in the unique tag.
- Modify the contents of the repository that is already registered, from the information in the line where the CSV file error occurred, and output the message.
- Modify the value of the item specified in the unique tag, about the line where the CSV file error occurred, and output the message.

When modifying the contents of the repository that is already registered, refer to 'Managing Entries' in the Directory Service Operator's Guide.

For details on the rule file, refer to "Creating Data" - "Using the CSV Files Extracted from the Database" in the Directory Service Operator's Guide.

## 11.14.58 irep13567

---

**IREP: ERROR: irep13567: It is not revokable because of the attribute value which cannot overlap. : %s1  
LINE (%s2)**

### Variable Information

%s1 = CSV file name %s2 = Line in which incorrect description is specified

## Explanation

An attempt is made to change an entry DN, with a combination of the specified rule file and the CSV file, a duplicate attribute is directed so that the attribute specified in the Rdn tag, is the same as that in the unique tag. The attribute specified in the unique tag must be unique.

## User Action

Possible causes of this error are the following:

- An incorrect value is specified in the unique tag of the rule file.
- The contents of the repository that is already registered are incorrect.
- The description of the CSV file is incorrect.

Take any of the following actions, then re-execute the command:

- Edit the rule file and change the value specified in the unique tag.
- Using the message information output in the on the line in the CSV file where the error occurred, modify the contents of the registered repository.
- Modify the value of the item which has been specified in the unique tag, referencing the line where the error occurred in the CSV file from the output message.

When modifying the contents of the repository that is already registered, refer to 'Managing Entries' in the Directory Service Operator's Guide.

For details on the rule file, refer to "Creating Data" - "Using the CSV Files Extracted from the Database" in the Directory Service Operator's Guide.

## 11.14.59 irep13568

---

**IREP: ERROR: irep13568: -%s1 is illegal option.**

### Variable Information

%s1 = Illegal option character

### Explanation

An unusable argument is specified.

### User Action

Specify a valid argument.

## 11.14.60 irep13569

---

**IREP: ERROR: irep13569: The specification of '-C type' is wrong.**

### Explanation

The specified character encoding is invalid. Specify a valid character encoding.

### User Action

Specify a valid character encoding in the -C option, then re-execute. For details on the -C option, refer to 'Interstage Directory Service Operation Commands' in the Reference Manual (Command Edition).

## 11.14.61 irep13570

---

**IREP: INFO: irep13570: adding new entry [%s1]**

### Variable Information

%s1 = DN of the entry added

### Explanation

The entry is added.

## 11.14.62 irep13571

---

**IREP: INFO: irep13571: modifying entry [%s1]**

### Variable Information

%s1 = DN of the entry added

### Explanation

The entry is modified.

## 11.14.63 irep13572

---

**IREP: INFO: irep13572: deleting entry [%s1]**

### Variable Information

%s1 = DN of the deleted entry

### Explanation

The entry is deleted.

## 11.15 irep14000 to irep14099

---

### 11.15.1 irep14001

---

**IREP: ERROR: irep14001: %s1: Unknown option. "%s2"**

### Variable Information

%s1 = Command name

%s2 = Option

### Explanation

The specified option %s2 is not supported, or it was specified incorrectly.

### User Action

Check the specified option and re-execute. For details about the command options, refer to 'Interstage Directory Service Operation Commands' in the 'Reference Manual (Command Edition)'.

### 11.15.2 irep14002

---

**IREP: ERROR: irep14002: %s1: Option %s2 was specified more than once.**

### Variable Information

%s1 = Command

%s2 = Option

### Explanation

Option %s2 was specified more than once.

### User Action

Check the specified option and re-execute. For details about the command options, refer to 'Interstage Directory Service Operation Commands' in the 'Reference Manual (Command Edition)'.

### 11.15.3 irep14003

---

**IREP: ERROR: irep14003: %s1: Options %s2 and %s3 cannot be specified together.**

### Variable Information

%s1 = Command

%s2 = Option

%s3 = Option

## Explanation

Options %s2 and %s3 were specified together. Options %s2 and %s3 cannot be specified together.

## User Action

Check the specified option and re-execute. For details about the command options, refer to 'Interstage Directory Service Operation Commands' in the 'Reference Manual (Command Edition)'.

## 11.15.4 irep14004

---

**IREP: ERROR: irep14004: %s1: The character code specified in the -G option is not supported.**

### Variable Information

%s1 = Command

## Explanation

The character encoding specified in the -G option is not supported.

## User Action

Check the character encoding specified in the -G option and re-execute. For details of character encodings that can be specified, refer to 'Interstage Directory Service Operation Commands' in the 'Reference Manual (Command Edition)'.

## 11.15.5 irep14005

---

**IREP: ERROR: irep14005: %s1: The URI specified in the -H option is incorrect. "%s2"**

### Variable Information

%s1 = Command

%s2 = URI

## Explanation

The specified -H option is incorrect.

## User Action

If the -H and -Z options are specified together, check that the parameter specified in the -H option ("ldaps://") is specified to use SSL, and re-execute. If the -Z option is not specified, check that the parameter specified in the -H option ("ldap://") is specified so that SSL is not used, and re-execute. For details about the command options, refer to 'Interstage Directory Service operation commands' in the 'Reference Manual (Command Edition)'.

## 11.15.6 irep14010

---

**IREP: ERROR: irep14010: ldapmodify: The LDIF description format is incorrect. (line %s1 entry: "%s2") # Error: %s3 (%s4).**

### Variable Information

%s1 = Line (comment lines are not included)

%s2 = Entry

%s3 = LDAP error code message

%s4 = LDAP error code

## Explanation

The update format described in the entry update information is incorrect.

## User Action

Check that the format of entry %s2 line %s1 is correct. For details about the update format described in the entry update information, refer to "Creating Data" - "Using the LDAP Data Exchange format (LDIF)" of the Directory Service Operator's Guide.

If binary data (Base64 encoding) is specified for the attribute, check that the correct data is defined.

If an external file is specified, check that the file was specified correctly.

If the specified format is correct, use the *iscollectinfo* command to collect investigation information, then contact your service engineer.

## 11.15.7 irep14011

---

**IREP: ERROR: irep14011: ldapmodify: The contents specified in LDIF version line %s1 are incorrect. These contents will be ignored. (line %s2)**

### Variable Information

%s1 = Version

%s2 = Line (comment lines are not included)

### Explanation

The LDIF file "version" line described in the entry information is incorrect. It was processed as an invalid line.

### User Action

In Interstage Directory Service, version "1" must be specified. Check that the specified version %s1 is correct. Check also that the format of the specified line %s2 is correct. For details about the LDIF file format described in the entry information, refer to "Creating Data" - "Using the LDAP Data Exchange format (LDIF)" of the Directory Service Operator's Guide.

If the specified version or format is correct, use the *iscollectinfo* command to collect investigation information, then contact your service engineer.

## 11.15.8 irep14012

---

**IREP: ERROR: irep14012: ldapmodify: The space character after the "changetype: %s1" line is invalid. (line %s2 entry:"%s3")**

### Variable Information

%s1 = changetype

%s2 = Line (comment lines are not included)

%s3 = Entry

### Explanation

The update format described in the entry update information is incorrect.

### User Action

changetype is incorrect. Check that the format of entry %s3 line %s2 is correct. For details about the LDIF file format described in the entry update information, refer to "Creating Data" - "Using the LDAP Data Exchange format (LDIF)" of the Directory Service Operator's Guide.

If the specified format is correct, use the *iscollectinfo* command to collect investigation information, then contact your service engineer.

## 11.15.9 irep14013

---

**IREP: ERROR: irep14013: ldapmodify: changetype "%s1" is incorrect. (line %s2 entry:"%s3")**

### Variable Information

%s1 = changetype

%s2 = Line (comment lines are not included)

%s3 = Entry

#### Explanation

The update format described in the entry update information is incorrect.

#### User Action

changetype is incorrect. Check that the format of entry %s3 line %s2 is correct. For details about the LDIF file format described in the entry update information, refer to "Creating Data" - "Using the LDAP Data Exchange format (LDIF)" of the Directory Service Operator's Guide.

If the specified format is correct, use the *iscollectinfo* command to collect investigation information, then contact your service engineer.

## 11.15.10 irep14014

---

**IREP: ERROR: irep14014: ldapmodify: The space character after the attribute change method "%s1: %s2" is invalid. (line %s3 entry:"%s4").**

#### Variable Information

%s1 = Attribute update type

%s2 = Value specified for the attribute update type

%s3 = Line (comment lines are not included)

%s4 = Entry

#### Explanation

The update format described in the entry update information is incorrect.

#### User Action

The attribute update type is incorrect. Check that the format of entry %s4 line %s3 is correct. For details about the LDIF file format described in the entry update information, refer to "Creating Data" - "Using the LDAP Data Exchange format (LDIF)" of the Directory Service Operator's Guide.

If the specified format is correct, use the *iscollectinfo* command to collect investigation information, then contact your service engineer.

## 11.15.11 irep14015

---

**IREP: ERROR: irep14015: ldapmodify: Expecting "%s1:" for modrdn, but saw "%s2:" . (line %s3 entry:"%s4")**

#### Variable Information

%s1 = Line type required for changing the identifier

%s2 = Specified line type

%s3 = Line (comment lines are not included)

%s4 = Entry

#### Explanation

The update format described in the entry update information is incorrect.

## User Action

The entry identifier update is incorrect. Check that the format of entry %s4 line %s3 is correct. For details about the LDIF file format described in the entry update information, refer to "Creating Data" - "Using the LDAP Data Exchange format (LDIF)" of the Directory Service Operator's Guide.

If the specified format is correct, use the *iscollectinfo* command to collect investigation information, then contact your service engineer.

## 11.15.12 irep14016

---

**IREP: ERROR: irep14016: Idapmodify: The modrdn specification is incorrect. (line %s1 entry:"%s2").**

### Variable Information

%s1 = Line (comment lines are not included)

%s2 = Entry

### Explanation

The update format described in the entry update information ended on an invalid line.

### User Action

The entry identifier update is incorrect. Check that the format of entry %s2 line %s1 is correct. For details about the LDIF file format described in the entry update information, refer to "Creating Data" - "Using the LDAP Data Exchange format (LDIF)" of the Directory Service Operator's Guide.

If the specified format is correct, use the *iscollectinfo* command to collect investigation information, then contact your service engineer.

## 11.15.13 irep14017

---

**IREP: ERROR: irep14017: Idapmodify: Specify the attribute to be changed or added. (entry= "%s1").**

### Variable Information

%s1 = Entry

### Explanation

The attribute to be updated was not specified.

### User Action

Check that the contents of the attribute to be updated in entry %s1 are correct and re-execute. For details about updating entries, refer to "Creating Data" - "Using the LDAP Data Exchange format (LDIF)" of the Directory Service Operator's Guide.

## 11.15.14 irep14018

---

**IREP: ERROR: irep14018: Idapmodify: There is no value for attribute "%s1". (entry="%s2").**

### Variable Information

%s1 = Attribute

%s2 = Entry

### Explanation

The attribute to be updated was not specified.

## User Action

Check that the contents of the attribute %s1 to be updated in entry %s2 are correct and re-execute. For details about updating entries, refer to "Creating Data" - "Using the LDAP Data Exchange format (LDIF)" of the Directory Service Operator's Guide.

## 11.15.15 irep14019

---

### **IREP: ERROR: irep14019: ldapmodify: invalid control line %s1. : %s2.**

#### Variable Information

%s1 = Line

%s2 = LDAP error code message

#### Explanation

The update format described in the entry update information is incorrect.

#### User Action

Check that the format of entry %s2 line %s1 is correct. For details about the update format described in the entry update information, refer to "Creating Data" - "Using the LDAP Data Exchange format (LDIF)" of the Directory Service Operator's Guide.

If the specified format is correct, use the *iscollectinfo* command to collect investigation information, then contact your service engineer.

## 11.15.16 irep14020

---

### **IREP: ERROR: irep14020: ldapsearch: The specified timelimit(%s1) is incorrect.**

#### Variable Information

%s1 = Specified parameter

#### Explanation

The specified -l option (search time limit) parameter is incorrect.

#### User Action

Check that the specified option parameter is correct and re-execute. For details about the command options, refer to 'Interstage Directory Service Operation Commands' in the 'Reference Manual (Command Edition)'.

## 11.15.17 irep14021

---

### **IREP: ERROR: irep14021: ldapsearch: Specify one of base, one, or sub for the search scope.**

#### Explanation

The specified -s option (search scope) parameter is incorrect.

#### User Action

Check that the specified option parameter is correct and re-execute. For details about the command options, refer to 'Interstage Directory Service Operation Commands' in the 'Reference Manual (Command Edition)'.

## 11.15.18 irep14022

---

### **IREP: ERROR: irep14022: ldapsearch: The specified search sizelimit(%s1) is incorrect.**

## Variable Information

%s1 = Specified parameter

## Explanation

The specified -z option (search size limit) parameter is incorrect.

## User Action

Check that the specified option parameter is correct and re-execute. For details about the command options, refer to 'Interstage Directory Service Operation Commands' in the 'Reference Manual (Command Edition)'.

## 11.15.19 irep14023

---

### **IREP: ERROR: irep14023: Idapsearch: Specify an essential option. %s1**

## Variable Information

%s1 = Essential option

## Explanation

The essential option %s1 was not specified.

## User Action

Check that the specified option parameter is correct and re-execute. Specify the *Idapsearch* command 'filter' and 'attributes' options last. For details about the command options, refer to 'Interstage Directory Service Operation Commands' in the 'Reference Manual (Command Edition)'.

## 11.15.20 irep14030

---

### **IREP: ERROR: irep14030: %s1: Failed to open the specified file. %s2.**

## Variable Information

%s1 = Command

%s2 = Specified file

## Explanation

An error occurred when the specified file %s2 was opened.

## User Action

Check that the file specified in the command option exists, or that there is file reference authority. If there is no improvement after the above action is taken, it is possible that there are insufficient resources (memory resources) on the machine used to execute the command. Close unnecessary programs and re-execute.

**Windows32/64**

If there is insufficient system memory, increase the memory or extend the virtual memory.

**Solaris32/64 Linux32/64**

If there is insufficient system memory, increase the memory or extend the swap area. For details about the memory required for running Interstage Directory Service, refer to 'Memory Requirements' in 'Resource Requirements' of the 'Tuning Guide'.

## 11.15.21 irep14031

---

---

**IREP: ERROR: irep14031: %s1: Failed to create the file %s for storing the search result. %s2.****Variable Information**

%s1 = Command

%s2 = File

**Explanation**

An error occurred when file %s2 for storing the search result was created.

**User Action**

Check that the directory specified in the -T option or in the TMPDIR, TMP, or TEMP environment variable exists, or that there is write authority. Check also that there is sufficient space on the disk on which the specified directory is located.

If there is no improvement after the above action is taken, it is possible that there are insufficient resources (memory resources) on the machine used to execute the command. Close unnecessary programs and re-execute.

**Windows32/64**

If there is insufficient system memory, increase the memory or extend the virtual memory.

**Solaris32/64 Linux32/64**

If there is insufficient system memory, increase the memory or extend the swap area. For details about the memory required for running Interstage Directory Service, refer to 'Memory Requirements' in 'Resource Requirements' of the 'Tuning Guide'.

---

## 11.16 irep14100 to irep14199

---

### 11.16.1 irep14100

---

**IREP: ERROR: irep14100: %s1: The Interstage Directory Service environment has been changed by mistake. ldap\_get\_option****Variable Information**

%s1 = Command

**Explanation**

The Interstage Directory Service environment is broken.

**User Action**

The Interstage Directory Service environment was changed by mistake. Back up the resources and reinstall Interstage Directory Service if necessary.

If there is no improvement after the above action is taken, use the *iscollectinfo* command to collect investigation information, then contact your service engineer. For details about installing Interstage Directory Service, refer to the 'Installation Guide'. For details about backing up and restoring resources, refer to 'Maintenance (Resource Backup)' in the Operator's Guide.

---

### 11.16.2 irep14101

---

**IREP: ERROR: irep14101: The Interstage Directory Service SDK environment has been changed by mistake. API\_INFO\_VERSION:%s1 exp:%s2****Variable Information**

%s1 = SDK version installed

%s2 = SDK version required for the command

**Explanation**

The Interstage Directory Service environment is broken.

## User Action

The Interstage Directory Service environment was changed by mistake. Back up the resources and reinstall Interstage Directory Service if necessary.

If there is no improvement after the above action is taken, use the *iscollectinfo* command to collect investigation information, then contact your service engineer.

For details about installing Interstage Directory Service, refer to the 'Installation Guide'. For details about backing up and restoring resources, refer to 'Maintenance (Resource Backup)' in the Operator's Guide.

## 11.16.3 irep14102

---

**IREP: ERROR: irep14102: The Interstage Directory Service SDK environment has been changed by mistake. API\_VERSION:%s1 exp:%s2**

### Variable Information

%s1 = Command

%s2 = SDK version required for the command

### Explanation

The Interstage Directory Service environment is broken.

### User Action

The Interstage Directory Service environment was changed by mistake. Back up the resources and reinstall Interstage Directory Service if necessary.

If there is no improvement after the above action is taken, use the *iscollectinfo* command to collect investigation information, then contact your service engineer.

For details about installing Interstage Directory Service, refer to the 'Installation Guide'. For details about backing up and restoring resources, refer to 'Maintenance (Resource Backup)' in the Operator's Guide.

## 11.16.4 irep14103

---

**IREP: ERROR: irep14103: The Interstage Directory Service SDK environment has been changed by mistake. VENDER:%s1 exp:%s2**

### Variable Information

%s1 = Command

%s2 = SDK version required for the command

### Explanation

The Interstage Directory Service environment is broken.

### User Action

The Interstage Directory Service environment was changed by mistake. Back up the resources and reinstall Interstage Directory Service if necessary.

If there is no improvement after the above action is taken, use the *iscollectinfo* command to collect investigation information, then contact your service engineer.

For details about installing Interstage Directory Service, refer to the 'Installation Guide'. For details about backing up and restoring resources, refer to 'Maintenance (Resource Backup)' in the Operator's Guide.

## 11.16.5 irep14104

---

---

**IREP: ERROR: irep14104: The Interstage Directory Service SDK environment has been changed by mistake. VENDER\_VERSION:%s1 exp:%s2**

#### Variable Information

%s1 = SDK header version

%s2 = SDK version required for the command

#### Explanation

The Interstage Directory Service environment is broken.

#### User Action

Reinstall Interstage Directory Service SDK.

If there is no improvement after the above action is taken, use the *iscollectinfo* command to collect investigation information, then contact your service engineer.

For details about installing Interstage Directory Service SDK, refer to the 'Installation Guide'.

---

## 11.16.6 irep14105

---

**IREP: ERROR: irep14105: %s1: %s2: There is not enough memory available.  
%s3: %s4 (%s5).  
%s6  
%s7**

#### Variable Information

%s1 = Command

%s2 = Detail information

%s3 = "ldap\_add", "ldap\_modify", or "Error"

%s4 = LDAP error code message

%s5 = LDAP error code

%s6 = DN information showing the scope of conditions that matched for the operation. This is not always output.

%s7 = Additional error information. This is not always output.

#### Explanation

There is insufficient memory.

#### User Action

Close unnecessary programs and re-execute.

 Windows32/64

If there is insufficient system memory, increase the memory or extend the virtual memory.

 Solaris32/64 Linux32/64

If there is insufficient system memory, increase the memory or extend the swap area. For details about the memory required for running Interstage Directory Service, refer to 'Memory Requirements' in 'Resource Requirements' of the 'Tuning Guide'.

---

## 11.16.7 irep14150

---

**IREP: ERROR: irep14150: Failed to open the specified SSL environment definition file. %s1**

#### Variable Information

%s1 = SSL environment definition file

## Explanation

The specified SSL environment definition file could not be opened.

## User Action

Check that the SSL environment definition file specified in the `-Z` option exists, or that there is SSL environment definition file reference authority.

If there is no improvement after the above action is taken, it is possible that there are insufficient resources (memory resources) on the machine used to execute the command. Close unnecessary programs and re-execute.

**Windows32/64**

If there is insufficient system memory, increase the memory or extend the virtual memory.

**Solaris32/64 Linux32/64**

If there is insufficient system memory, increase the memory or extend the swap area. For details about the memory required for running Interstage Directory Service, refer to 'Memory Requirements' in 'Resource Requirements' of the 'Tuning Guide'.

## 11.16.8 irep14151

---

**IREP: ERROR: irep14151: %s1: line %s2: The description format of SSL environment definition file is incorrect. The contents will be ignored.**

### Variable Information

%s1 = SSL environment definition file

%s1 = Line

## Explanation

The format described in line %s2 of the SSL environment definition file %s1 is incorrect. It was processed as an invalid line.

## User Action

Check that the format in line %s2 of the SSL environment definition file %s1 is correct. For details about the SSL environment definition file, refer to "Setting up an Environment for SSL Communication" - "Creating the Environment on the Client" - "Setting an SSL Environment Definition File (Client)" in the 'Directory Service Operator's Guide'.

## 11.16.9 irep14152

---

**IREP: ERROR: irep14152: %s1: line %s2: The value for the configuration option in SSL environment definition file is incorrect.**

### Variable Information

%s1 = SSL environment definition file

%s2 = Line

## Explanation

The definition option settings value was not specified in line %s2 of the SSL environment definition file %s1, or it is incorrect.

## User Action

Check that the definition option settings value in line %s2 of the SSL environment definition file %s1 is correct and re-execute. For details about the SSL environment definition file, refer to "Setting up an Environment for SSL Communication" - "Creating the Environment on the Client" - "Setting an SSL Environment Definition File (Client)" in the 'Directory Service Operator's Guide'.

## 11.16.10 irep14153

---

---

**IREP: ERROR: irep14153: %s1: line %s2: The value for configuration option %s3 in SSL environment definition file is incorrect.**

#### Variable Information

%s1 = SSL environment definition file

%s2 = Line

%s3 = Definition option

#### Explanation

The string specified in the definition option %s3 in line %s2 of the SSL environment definition file %s1 is incorrect.

#### User Action

Check that line %s2 of the SSL environment definition file %s1 is correct and re-execute. For details about the SSL environment definition file, refer to "Setting up an Environment for SSL Communication" - "Creating the Environment on the Client" - "Setting an SSL Environment Definition File (Client)" in the 'Directory Service Operator's Guide'.

## 11.16.11 irep14154

---

**IREP: ERROR: irep14154: %s1: line %s2: The directory path specified for configuration option %s3 in SSL environment definition file is incorrect.**

#### Variable Information

%s1 = SSL environment definition file

%s2 = Line

%s3 = Definition option

#### Explanation

The directory path specified in the definition option %s3 in line %s2 of the SSL environment definition file %s1 is incorrect.

#### User Action

Check that line %s2 of the SSL environment definition file %s1 is correct and re-execute. For details about the SSL environment definition file, refer to "Setting up an Environment for SSL Communication" - "Creating the Environment on the Client" - "Setting an SSL Environment Definition File (Client)" in the 'Directory Service Operator's Guide'.

## 11.16.12 irep14155

---

**IREP: ERROR: irep14155: %s1: line %s2: The user PIN specified for configuration option tkn\_pwd in SSL environment definition file is incorrect.**

#### Variable Information

%s1 = SSL environment definition file

%s2 = Line

#### Explanation

The user PIN specified in the tkn\_pwd definition option in line %s2 of the SSL environment definition file %s1 is incorrect, or was not encrypted.

#### User Action

Check that line %s2 of the SSL environment definition file %s1 is correct and re-execute. If there is no improvement after the above action is taken, use the *irepencupin* command to encrypt the user PIN specified in the SSL environment definition file. For details

about the SSL environment definition file, refer to "Setting up an Environment for SSL Communication" - "Creating the Environment on the Client" - "Setting an SSL Environment Definition File (Client)" in the 'Directory Service Operator's Guide'.

### 11.16.13 irep14156

---

**IREP: ERROR: irep14156: %s1: line %s2: Configuration option "%s3" in SSL environment definition file is invalid.**

#### Variable Information

%s1 = SSL environment definition file

%s2 = Line

%s3 = Invalid definition option

#### Explanation

The definition option %s3 in line %s2 of the SSL environment definition file %s1 is invalid.

#### User Action

Check that line %s2 of the SSL environment definition file %s1 is correct and re-execute. For details about the SSL environment definition file, refer to "Setting up an Environment for SSL Communication" - "Creating the Environment on the Client" - "Setting an SSL Environment Definition File (Client)" in the 'Directory Service Operator's Guide'.

### 11.16.14 irep14157

---

**IREP: ERROR: irep14157: The description format of the SSL environment definition file is incorrect.**

#### Explanation

The description format of the SSL environment definition file is incorrect.

#### User Action

Check that the description format of the SSL environment definition file is correct. For details about the SSL environment definition file, refer to "Setting up an Environment for SSL Communication" - "Creating the Environment on the Client" - "Setting an SSL Environment Definition File (Client)" in the 'Directory Service Operator's Guide'.

### 11.16.15 irep14158

---

**IREP: ERROR: irep14158: The user PIN specified in the SSL environment definition file has been changed by mistake.**

#### Explanation

The user PIN specified in the `tkn_pwd` definition option in the SSL environment definition file is incorrect, or was not encrypted.

#### User Action

There is a possibility that the user PIN specified in the `tkn_pwd` definition option of the SSL environment definition file was not encrypted, or that it was changed after encryption. Specify the correct user PIN, and then use the `irepencupin` command to encrypt the user PIN again. For details about the SSL environment definition file, refer to "Setting up an Environment for SSL Communication" - "Creating the Environment on the Client" - "Setting an SSL Environment Definition File (Client)" in the 'Directory Service Operator's Guide'.

## 11.16.16 irep14159

---

**IREP: ERROR: irep14159: Specify an essential configuration option for SSL environment definition file. %s1**

### Variable Information

%s1 = SSL environment definition file

### Explanation

An essential definition option was not specified in the SSL environment definition file %s1.

### User Action

Check that the essential definition option was specified and re-execute. For details about the SSL environment definition file, refer to "Setting up an Environment for SSL Communication" - "Creating the Environment on the Client" - "Setting an SSL Environment Definition File (Client)" in the 'Directory Service Operator's Guide'.

## 11.16.17 irep14170

---

**IREP: ERROR: irep14170: The certificate environment is incorrect. %s1 ( %s2 )**

### Variable Information

%s1 = SSL error code

%s2 = SSL detail code

### Explanation

The application management directory is incorrect.

### User Action

Change the SSL environment definition file application management directory (cert\_path) to the certificate/key management environment application management directory and re-execute processing. For details about the SSL environment definition file application management directory (cert\_path), refer to "Setting up an Environment for SSL Communication" - "Creating the Environment on the Client" - "Setting an SSL Environment Definition File (Client)" in the 'Directory Service Operator's Guide'.

For details about the SSL error codes, refer to 'SSL Error Codes' in "Error Codes to be Reported from Interstage Directory Service".

## 11.16.18 irep14171

---

**IREP: ERROR: irep14171: There is not enough memory available for SSL. %s1 ( %s2 )**

### Variable Information

%s1 = SSL error code

%s2 = SSL detail code

### Explanation

There is not enough memory available in the SSL library.

### User Action

Close unnecessary programs and re-execute.

 Windows32/64

If there is insufficient system memory, increase the memory or extend the virtual memory.

**Solaris32/64** **Linux32/64**

If there is insufficient system memory, increase the memory or extend the swap area. For details about the memory required for running Interstage Directory Service, refer to 'Memory Requirements' in the Tuning Guide.

## 11.16.19 irep14172

---

**IREP: ERROR: irep14172: There is not enough memory available for SSL. %s1 ( %s2 )**

### Variable Information

%s1 = SSL error code

%s2 = SSL detail code

### Explanation

There is not enough memory available in the SSL library.

### User Action

Close unnecessary programs and re-execute.

**Windows32/64**

If there is insufficient system memory, increase the memory or extend the virtual memory.

**Solaris32/64** **Linux32/64**

If there is insufficient system memory, increase the memory or extend the swap area. For details about the memory required for running Interstage Directory Service, refer to 'Memory Requirements' in the Tuning Guide.

## 11.16.20 irep14173

---

**IREP: ERROR: irep14173: There was a timeout during the SSL connection. %s1 ( %s2 )**

### Variable Information

%s1 = SSL error code

%s2 = SSL detail code

### Explanation

There was a timeout during the SSL connection.

### User Action

If the connection repository does not run normally, check and fix the connection server side.

If the connection repository runs normally, possible causes are as follows:

- Heavy Repository server load

Re-execute the command.

If the number of clients and access frequency to the Repository server are both great when SSL is used for communication with the Repository server, there might be no improvement after the above action is taken. If there is no improvement, use SSL Accelerator to investigate ways of reducing the server load.

- Other

There is a possibility that the timer value is too small. Increase the SSL environment definition file timer (ssl\_timer) and re-execute the command.

For details about the SSL environment definition file timer (`ssl_timer`), refer to "Setting up an Environment for SSL Communication" - "Creating the Environment on the Client" - "Setting an SSL Environment Definition File (Client)" in the 'Directory Service Operator's Guide'.

If there is no improvement after the above action is taken, use the `iscollectinfo` command to collect investigation information, then contact your service engineer.

For details about the SSL error codes, refer to "SSL Error Codes" in "Error Codes to be Reported from Interstage Directory Service".

## 11.16.21 irep14174

---

**IREP: ERROR: irep14174: The Site certificate has expired. %s1 ( %s2 ).**

### Variable Information

%s1 = SSL error code

%s2 = SSL detail code

### Explanation

The Site certificate has expired.

### User Action

Refer to 'When the Site certificate has expired' in "Error Codes to be Reported from Interstage Directory Service" for details on how to obtain the new Site certificate from the CA, and register it in the certificate/key management environment. For details about the SSL error codes, refer to 'SSL Error Codes' in the same chapter.

## 11.16.22 irep14175

---

**IREP: ERROR: irep14175: The CA certificate has expired. %s1 ( %s2 )**

### Variable Information

%s1 = SSL error code

%s2 = SSL detail code

### Explanation

The CA certificate (issuer certificate) has expired.

### User Action

Refer to 'When the CA certificate has expired' in "Error Codes to be Reported from Interstage Directory Service" for details on how to obtain the new CA certificate from the CA, and register it in the certificate/key management environment. For details about the SSL error codes, refer to 'SSL Error Codes' in the same chapter.

## 11.16.23 irep14176

---

**IREP: ERROR: irep14176: Failed to verify the CA certificate or Site certificate. %s1 ( %s2 )**

### Variable Information

%s1 = SSL error code

%s2 = SSL detail code

### Explanation

Verification of the CA or Site certificate failed.

## User Action

There is a possibility that the registration order of the certificates for verification of the certificate shown in the certificate nickname is incorrect.

Refer to 'When the certificate registration order is incorrect' in "Error Codes to be Reported from Interstage Directory Service" and re-register the CA certificate in the certificate/key management environment starting with the root certificate first. For details about the SSL error codes, refer to 'SSL Error Codes' in the same file.

## 11.16.24 irep14177

---

### **IREP: ERROR: irep14177: Failed to decrypt the private key. %s1 ( %s2 )**

#### Variable Information

%s1 = SSL error code

%s2 = SSL detail code

#### Explanation

Failed to decrypt the private key.

#### User Action

Refer to 'Broken certificate environments' in "Error Codes to be Reported from Interstage Directory Service" and correct the certificate/key management environment. If there is no improvement after the above action is taken, use the *iscollectinfo* command to collect investigation information, then contact your service engineer.

## 11.16.25 irep14178

---

### **IREP: ERROR: irep14178: The Site certificate of the server to you want to access has expired. %s1 ( %s2 )**

#### Variable Information

%s1 = SSL error code

%s2 = SSL detail code

#### Explanation

The connection Site certificate has expired.

#### User Action

Refer to 'When the Site certificate has expired' in "Error Codes to be Reported from Interstage Directory Service" for details on how to obtain the new Site certificate from the CA, and register it in the Interstage Certificate Environment. For details about the SSL error codes, refer to 'SSL Error Codes' in the same chapter.

## 11.16.26 irep14179

---

### **IREP: ERROR: irep14179: Failed to verify the Site certificate of the server you want to access. %s1 ( %s2 )**

#### Variable Information

%s1 = SSL error code

%s2 = SSL detail code

#### Explanation

Verification of the connection Site certificate failed.

## User Action

The CA certificate required for verification of the connection Site certificate must be registered in the certificate/key management environment starting with the root certificate. For details about re-registering certificates, refer to 'When the certificate registration order is incorrect' in "Error Codes to be Reported from Interstage Directory Service". For details about the SSL error codes, refer to 'SSL Error Codes' in the same chapter.

## 11.16.27 irep14180

---

**IREP: ERROR: irep14180: The Site certificate that was received has expired. %s1 ( %s2 )**

### Variable Information

%s1 = SSL error code

%s2 = SSL detail code

### Explanation

Access from the connection was denied because an expired Site certificate was received.

### User Action

Obtain the latest Site certificate from the CA, and register it in the Interstage Certificate Environment or certificate/key management environment. For details about obtaining and registering new Site certificates, refer to 'When the Site certificate has expired' in "Error Codes to be Reported from Interstage Directory Service". For details about the SSL error codes, refer to 'SSL Error Codes' in the same chapter.

## 11.16.28 irep14181

---

**IREP: ERROR: irep14181: Failed to verify the Site certificate that was received. %s1 ( %s2 )**

### Variable Information

%s1 = SSL error code

%s2 = SSL detail code

### Explanation

Verification of the received Site certificate failed.

### User Action

Obtain the CA certificate required for verification of the connection Site certificate and register in the certificate/key management environment starting with the root certificate first. For details about re-registering certificates, refer to 'When the certificate registration order is incorrect' in "Error Codes to be Reported from Interstage Directory Service". For details about the SSL error codes, refer to 'SSL Error Codes' in the same chapter.

## 11.16.29 irep14182

---

**IREP: ERROR: irep14182: The private key for the Site certificate is not in the certificate environment. %s1 ( %s2 )**

### Variable Information

%s1 = SSL error code

%s2 = SSL detail code

## Explanation

The private key for the Site certificate is not in the certificate/private key management environment.

## User Action

Register the private key for the Site certificate certificate/key management environment. For details about registering the private key, refer to *cmenterkey* in the 'Reference Manual (Command Edition)'.

If there is no improvement after the above action is taken, it is possible that the certificate/key management environment is broken. Restore the certificate/key management environment from the backed up resources. Restore the certificate/key management environment using a program that does not use the certificate/key management environment. To restore the certificate/key management environment, use the same method as for creating the backup.

If there is no improvement after the above action is taken, or the resources are not backed up, set up the certificate/key management environment again. For details about setting up the certificate/key management environment, refer to 'Environment Setting for Certificate/Key Management Environment' in 'Setting and Use of the Certificate/Key Management Environment Using the SMEE Command' in the 'Security System Guide'.

For details about the SSL error codes, refer to 'SSL Error Codes' in "Error Codes to be Reported from Interstage Directory Service".

## 11.16.30 irep14183

---

### IREP: ERROR: irep14183: SSL cannot be used for the repository. %s1 ( %s2 )

#### Variable Information

%s1 = SSL error code

%s2 = SSL detail code

#### Explanation

Could not communicate with the repository.

#### User Action

Take the following action and re-execute.

- Check the connection repository hostname and port number.
- Check that the connection repository information and command parameters are correct.
- If SSL is used, check whether the connection was made to the correct hostname and port number, and that the connection repository information and command parameters are correct.
- If SSL is not used, check whether the SSL environment definition file was specified in the -Z option. If SSL is unnecessary, the -Z option is also unnecessary.
- If the network environment (for example, the hosts file settings, the DNS/DHCP server used, and the DNS/DHCP server settings) is incorrect, contact the network administrator. Reset the network environment.
- SSL error code: 0x00400004, SSL detail code: 145(0x91)

These are sometimes output when the Repository server load is heavy. In this case, re-execute the command.

If the number of clients and access frequency to the Repository server are both great when SSL is used for communication with the Repository server, there might be no improvement after the above action is taken. If there is no improvement, use SSL Accelerator to investigate ways of reducing the server load.

For details about the SSL error codes, refer to "SSL error codes" in "Error Codes to be Reported from Interstage Directory Service".

- [Solaris32/64](#) [Linux32/64](#)

If a relational database is using a standard database as the repository database, check whether the connection omsservd process is running using the *ps* command. If it is not running, start it using the *enablerstart* command. After the omsservd process is started, restart the repository and re-execute the entry operation.

If there is no improvement after the above action is taken, use the *iscollectinfo* command to collect investigation information, then contact your service engineer.

## 11.16.31 irep14184

---

### **IREP: ERROR: irep14184: An error occurred using SSL. %s1 ( %s2 )**

#### Variable Information

%s1 = SSL error code

%s2 = SSL detail code

#### Explanation

An SSL error occurred.

#### User Action

Take action according to SSL error code %s1. For details about the SSL error codes, refer to 'SSL Error Codes' in "Error Codes to be Reported from Interstage Directory Service". If there is no improvement after the above action is taken, use the *iscollectinfo* command to collect investigation information, then contact your service engineer.

## 11.17 irep14200 to irep14299

---

### 11.17.1 irep14200

---

#### **IREP: ERROR: irep14184: %s1: Failed to open the session.**

#### Variable Information

%s1 = Command

#### Explanation

An error occurred when the repository session was opened.

#### User Action

Check that the Repository server hostname or IP address specified in the -h option parameter are correct and re-execute. For details about the command options, refer to 'Interstage Directory Service Operation Commands' in the 'Reference Manual (Command Edition)'.

If there is no improvement after the above action is taken, it is possible that there are insufficient resources (memory resources) on the machine used to execute the command. Close unnecessary programs and re-execute.

**Windows32/64**

If there is insufficient system memory, increase the memory or extend the virtual memory.

**Solaris32/64 Linux32/64**

If there is insufficient system memory, increase the memory or extend the swap area. For details about the memory required for running Interstage Directory Service, refer to 'Memory' in the 'Tuning Guide'.

### 11.17.2 irep14201

---

#### **IREP: ERROR: irep14201: %s1: Failed to open the SSL session.**

#### Variable Information

%s1 = Command

## Explanation

An error occurred when the SSL repository session was opened.

## User Action

Check that the Repository server hostname or IP address specified in the `-h` option parameter are correct and re-execute. For details about the command options, refer to 'Interstage Directory Service Operation Commands' in the 'Reference Manual (Command Edition)'.

If there is no improvement after the above action is taken, it is possible that there are insufficient resources (memory resources) on the machine used to execute the command. Close unnecessary programs and re-execute.

**Windows32/64**

If there is insufficient system memory, increase the memory or extend the virtual memory.

**Solaris32/64 Linux32/64**

If there is insufficient system memory, increase the memory or extend the swap area. For details about the memory required for running Interstage Directory Service, refer to 'Memory Requirements' in the Tuning Guide.

## 11.17.3 irep14202

---

**IREP: ERROR: irep14202: %s1: Failed to open the session.**

### Variable Information

%s1 = Command

## Explanation

An error occurred when the repository session was opened.

## User Action

Check that the URI specified in the `-h` option parameter is correct and re-execute. For details about the command options, refer to 'Interstage Directory Service Operation Commands' in the 'Reference Manual (Command Edition)'.

If there is no improvement after the above action is taken, it is possible that there are insufficient resources (memory resources) on the machine used to execute the command. Close unnecessary programs and re-execute.

**Windows32/64**

If there is insufficient system memory, increase the memory or extend the virtual memory.

**Solaris32/64 Linux32/64**

If there is insufficient system memory, increase the memory or extend the swap area.

For details about the memory required for running Interstage Directory Service, refer to 'Memory Requirements' in the Tuning Guide.

## 11.17.4 irep14204

---

**IREP: ERROR: irep14204: Failed to bind to the repository. %s1 (%s2).**

%s3

%s4

### Variable Information

%s1 = LDAP error code message

%s2 = LDAP error code

%s3 = DN information showing the scope of conditions that matched for the operation. This is not always output.

%s4 = Additional error information. This is not always output.

## Explanation

An error occurred during repository authentication processing (Bind).

## User Action

Take action according to the LDAP error code %s2. For details about the meaning of and user action recommended for LDAP error codes, refer to 'LDAP Error Codes' in "Error Codes to be Reported from Interstage Directory Service".

If the error message is output repeatedly, take action according to the message.

## 11.17.5 irep14205

---

**IREP: ERROR: irep14205: Idapdelete: Failed to delete the entry. %s1: %s2 (%3).**  
**%s4**  
**%s5**

## Variable Information

%s1 = Detail information

%s2 = LDAP error code message

%s3 = LDAP error code

%s4 = DN information showing the scope of conditions that matched for the operation. This is not always output.

%s5 = Additional error information. This is not always output.

## Explanation

An error occurred while the entry was being deleted.

## User Action

Take action according to the LDAP error code %s3. For details about the meaning of and user action recommended for LDAP error codes, refer to 'LDAP Error Codes' in "Error Codes to be Reported from Interstage Directory Service".

## 11.17.6 irep14206

---

**IREP: ERROR: irep14206: Idapdelete: Failed to delete the entry. %s1 (%s2).**  
**%s3**  
**%s4**

## Variable Information

%s1 = LDAP error code message

%s2 = LDAP error code

%s3 = DN information showing the scope of conditions that matched for the operation. This is not always output.

%s4 = Additional error information. This is not always output.

## Explanation

An error occurred while the entry was being deleted.

## User Action

Take action according to the LDAP error code %s2. For details about the meaning of and user action recommended for LDAP error codes, refer to 'LDAP error codes' in "Error Codes to be Reported from Interstage Directory Service".

## 11.17.7 irep14207

---

**IREP: ERROR: irep14207: Idapmodify: Failed to modify the entry. %s1**  
**%s2: %s3 (%s4).**

**%s5**  
**%s6**

#### Variable Information

- %s1 = Entry
- %s2 = "ldap\_add" or "ldap\_modify"
- %s3 = LDAP error code message
- %s4 = LDAP error code
- %s5 = DN information showing the scope of conditions that matched for the operation. This is not always output.
- %s6 = Additional error information. This is not always output.

#### Explanation

An error occurred while the entry was being updated.

#### User Action

Take action according to the LDAP error code %s4. For details about the meaning of and user action recommended for LDAP error codes, refer to 'LDAP error codes' in "Error Codes to be Reported from Interstage Directory Service".

## 11.17.8 irep14208

---

**IREP: ERROR: irep14208: ldapmodify: Failed to delete the entry. %s1  
ldap\_delete: %s2 (%s3).**

#### Variable Information

- %s1 = Entry
- %s2 = LDAP error code message
- %s3 = LDAP error code

#### Explanation

An error occurred while the entry was being deleted.

#### User Action

Take action according to the LDAP error code %s3. For details about the meaning of and user action recommended for LDAP error codes, refer to 'LDAP error codes' in "Error Codes to be Reported from Interstage Directory Service".

## 11.17.9 irep14209

---

**IREP: ERROR: irep14209: ldapmodify: Failed to modify the RDN. %s1  
ldap\_modrdn: %s2 (%s3).**

#### Variable Information

- %s1 = Entry
- %s2 = LDAP error code message
- %s3 = LDAP error code

#### Explanation

An error occurred while the entry identifier was being updated.

#### User Action

Take action according to the LDAP error code %s3. For details about the meaning of and user action recommended for LDAP error codes, refer to 'LDAP error codes' in "Error Codes to be Reported from Interstage Directory Service".

## 11.17.10 irep14210

---

**IREP: ERROR: irep14210: Idpsearch: Search failed. %s1: %s2 (%s3).**

### Variable Information

%s1 = Detail information

%s2 = LDAP error code message

%s3 = LDAP error code

### Explanation

An error occurred during the entry search.

### User Action

Take action according to the LDAP error code %s3. For details about the meaning of and user action recommended for LDAP error codes, refer to 'LDAP error codes' in "Error Codes to be Reported from Interstage Directory Service".

## 11.17.11 irep14211

---

**IREP: ERROR: irep14211: Idpsearch: Search failed. %s1 (%2).**

**%s3**

**%s4**

### Variable Information

%s1 = LDAP error code message

%s2 = LDAP error code

%s3 = DN information showing the scope of conditions that matched for the operation. This is not always output.

%s4 = Additional error information. This is not always output.

### Explanation

An error occurred during the entry search.

### User Action

Take action according to the LDAP error code %s2. For details about the meaning of and user action recommended for LDAP error codes, refer to 'LDAP error codes' in "Error Codes to be Reported from Interstage Directory Service".

## 11.18 irep14300 to irep14399

---

### 11.18.1 irep14300

---

**IREP: ERROR: irep14300: %s1: The specified entry information is incorrect. (EINVAL)**

**%s2: %s3 (%s4).**

**%s5**

**%s6**

### Variable Information

%s1 = Command

%s2 = "ldap\_add", "ldap\_modify", or "Error". This is not always output.

%s3 = LDAP error code message. This is not always output.

%s4 = LDAP error code. This is not always output.

%s5 = DN information showing the scope of conditions that matched for the operation. This is not always output.

%s6 = Additional error information. This is not always output.

### Explanation

The specified entry data is incorrect, or incomplete.

### User Action

Check that the specified entry data is correct. If the specified entry data is correct, verify that the entry data character encoding and the character encoding specified in the -G option are the same. If they are different, make them the same and re-execute. If they are the same, use the *iscollectinfo* command to collect investigation information, then contact your service engineer.

## 11.18.2 irep14301

---

**IREP: ERROR: irep14301: %s1: There is not enough memory available for character code conversion. (ENOMEM)**

**%s2: %s3 (%s4).**

**%s5**

**%s6**

### Variable Information

%s1 = Command

%s2 = 'ldap\_add', 'ldap\_modify', or 'Error'. This is not always output.

%s3 = LDAP error code message. This is not always output.

%s4 = LDAP error code. This is not always output.

%s5 = DN information showing the scope of conditions that matched for the operation. This is not always output.

%s6 = Additional error information. This is not always output.

### Explanation

There is insufficient memory to convert the character encoding.

### User Action

Close unnecessary programs and re-execute.

**Windows32/64**

If there is insufficient system memory, increase the memory or extend the virtual memory.

**Solaris32/64 Linux32/64**

If there is insufficient system memory, increase the memory or extend the swap area. For details about the memory required for running Interstage Directory Service, refer to 'Memory Requirements' in the Tuning Guide.

## 11.18.3 irep14302

---

**IREP: ERROR: irep14302: %s1: The character code in the specified entry information is incorrect. (EILSEQ)**

**%s2: %s3 (%s4).**

**%s5**

**%s6**

### Variable Information

%s1 = Command

%s2 = 'ldap\_add', 'ldap\_modify', or 'Error'. This is not always output.

%s3 = LDAP error code message. This is not always output.

%s4 = LDAP error code. This is not always output.

%s5 = DN information showing the scope of conditions that matched for the operation. This is not always output.

%s6 = Additional error information. This is not always output.

#### Explanation

Character encoding contained in the specified entry data is not supported or is incorrect.

#### User Action

Check if the entry data contains data using an unsupported character encoding. Verify that the character encoding of the LDIF file and that specified in the -G option are the same.

## 11.18.4 irep14303

---

**IREP: ERROR: irep14303: %s1: There is not enough memory available for character code conversion. (E2BIG)**

**%s2: %s3 (%s4).**

**%s5**

**%s6**

#### Variable Information

%s1 = Command

%s2 = 'ldap\_add', 'ldap\_modify', or 'Error'. This is not always output.

%s3 = LDAP error code message. This is not always output.

%s4 = LDAP error code. This is not always output.

%s5 = DN information showing the scope of conditions that matched for the operation. This is not always output.

%s6 = Additional error information. This is not always output.

#### Explanation

There is insufficient memory to convert the character encoding.

#### User Action

Close unnecessary programs and re-execute.

**Windows32/64**

If there is insufficient system memory, increase the memory or extend the virtual memory.

**Solaris32/64 Linux32/64**

If there is insufficient system memory, increase the memory or extend the swap area.

For details about the memory required for running Interstage Directory Service, refer to 'Memory Requirements' in the Tuning Guide.

## 11.18.5 irep14304

---

**IREP: ERROR: irep14304: Failed to open the character code conversion library. (ENOENT)**

**%s2: %s3 (%s4).**

**%s5**

**%s6**

#### Variable Information

%s1 = Command

%s2 = 'ldap\_add', 'ldap\_modify', or 'Error'. This is not always output.

%s3 = LDAP error code message. This is not always output.

%s4 = LDAP error code. This is not always output.

%s5 = DN information showing the scope of conditions that matched for the operation. This is not always output.

%s6 = Additional error information. This is not always output.

### Explanation

The Interstage Directory Service environment is broken.

### User Action

The Interstage Directory Service environment was changed by mistake. Back up the resources and re-install Interstage Directory Service if necessary.

If there is no improvement after the above action is taken, use the *iscollectinfo* command to collect investigation information, then contact your service engineer.

For details about installing Interstage Directory Service, refer to the 'Installation Guide'. For details about backing up and restoring resources, refer to 'Maintenance (Resource Backup)' in the Operator's Guide.

## 11.18.6 irep14305

---

**IREP: ERROR: irep14305: %s1: The character code in the specified entry information is incorrect. (EBADE)**  
**%s2: %s3 (%s4).**  
**%s5**  
**%s6**

### Variable Information

%s1 = Command

%s2 = 'ldap\_add', 'ldap\_modify', or 'Error'. This is not always output.

%s3 = LDAP error code message. This is not always output.

%s4 = LDAP error code. This is not always output.

%s5 = DN information showing the scope of conditions that matched for the operation. This is not always output.

%s6 = Additional error information. This is not always output.

### Explanation

Character encoding contained in the specified entry data is not supported or is incorrect.

### User Action

Check that the character encoding in the command used to specify entry data is correct. If it is, use the *iscollectinfo* command to collect investigation information, then contact your service engineer.

## 11.18.7 irep14306

---

**IREP: ERROR: irep14306: %s1: Failed to convert the character code. (ENOEXEC)**  
**%s2: %s3 (%s4).**  
**%s5**  
**%s6**

### Variable Information

%s1 = Command

%s2 = 'ldap\_add', 'ldap\_modify', or 'Error'. This is not always output.

%s3 = LDAP error code message. This is not always output.

%s4 = LDAP error code. This is not always output.

%s5 = DN information showing the scope of conditions that matched for the operation. This is not always output.

%s6 = Additional error information. This is not always output.

### Explanation

The repository (or command) attempted to convert the character encoding in the process of handling a request, and an internal error occurred.

### User Action

Use the *iscollectinfo* command to collect investigation information, then contact your service engineer.

## 11.18.8 irep14307

---

**IREP: ERROR: irep14307: %s1: Failed to convert the character code. (ENODATA)**  
**%s2: %s3 (%s4).**  
**%s5**  
**%s6**

### Variable Information

%s1 = Command

%s2 = "ldap\_add", "ldap\_modify", or "Error". This is not always output.

%s3 = LDAP error code message. This is not always output.

%s4 = LDAP error code. This is not always output.

%s5 = DN information showing the scope of conditions that matched for the operation. This is not always output.

%s6 = Additional error information. This is not always output.

### Explanation

The repository (or command) attempted to convert the character encoding in the process of handling a request, and an internal error occurred.

### User Action

Use the *iscollectinfo* command to collect investigation information, then contact your service engineer.

## 11.18.9 irep14308

---

**IREP: ERROR: irep14308: %s1: Failed to convert the character code. (%s2)**  
**%s3: %s4 (%s5).**  
**%s6**  
**%s7**

### Variable Information

%s1 = Command

%s2 = Detail information

%s3 = 'ldap\_add', 'ldap\_modify', or 'Error'. This is not always output.

%s4 = LDAP error code message. This is not always output.

%s5 = LDAP error code. This is not always output.

%s6 = DN information showing the scope of conditions that matched for the operation. This is not always output.

%s7 = Additional error information. This is not always output.

## Explanation

Failed to convert the character encoding.

## User Action

Use the *iscollectinfo* command to collect investigation information, then contact your service engineer.

# 11.19 irep15000 to irep15099

---

## 11.19.1 irep15001

---

**IREP: ERROR: irep15001: bad config: Directive 'replica' is not specified. [%s1]**

### Variable Information

%s1 = Repository name

### Explanation

Directive 'replica' is not specified. The environment definition for the repository is damaged. It is possible that the repository environment definition has been edited without using the Interstage Management Console.

### User Action

Re-establish the repository on the master side and slave side in reference to:

'Monitoring of Operation in Replication Mode and Recovery' in the Directory Service Operator's Guide.

## 11.19.2 irep15002

---

**IREP: ERROR: irep15002: bad config: Unspecified keyword '%s1' in directive 'replica'. [%s2]**

### Variable Information

%s1 = Keyword

%s2 = Repository name

### Explanation

Directive 'replica' contains undefined data. The environment definition for the repository is damaged. It is possible that the repository environment definition has been edited without using the Interstage Management Console.

### User Action

Re-establish the repository on the master side and slave side in reference to:

'Monitoring of Operation in Replication Mode and Recovery' in the Directory Service Operator's Guide.

## 11.19.3 irep15004

---

**IREP: ERROR: irep15004: bad config: 'replica' format is wrong. [%s1]**

### Variable Information

%s1 = Repository name

### Explanation

The directive 'replica' line has a format error. The environment definition for the repository is damaged. It is possible that the repository environment definition was edited without using the Interstage Management Console.

### User Action

Re-establish the repository on the master side and slave side in reference to:

'Monitoring of Operation in Replication Mode and Recovery' in the Directory Service Operator's Guide.

## 11.19.4 irep15005

---

**IREP: ERROR: irep15005: bad config: Directive 'replugfile' is not specified. [%s1]**

### Variable Information

%s1 = Repository name

### Explanation

Directive 'replugfile' is not specified. The environment definition for the repository is damaged. It is possible that the repository environment definition was edited without using the Interstage Management Console.

### User Action

Re-establish the repository on the master side and slave side in reference to:

'Monitoring of Operation in Replication Mode and Recovery' in the Directory Service Operator's Guide.

## 11.19.5 irep15006

---

**IREP: ERROR: irep15006: bad config: Missing filename in directive 'replugfile'. [%s1]**

### Variable Information

%s1 = Repository name

### Explanation

The filename is not specified for directive 'replugfile'. The environment definition for the repository is damaged. It is possible that the repository environment definition was edited without using the Interstage Management Console.

### User Action

Re-establish the repository on the master side and slave side in reference to:

'Monitoring of Operation in Replication Mode and Recovery' in the Directory Service Operator's Guide.

## 11.19.6 irep15007

---

**IREP: WARNING: irep15007: bad config: Wrong value after filename of directive 'replugfile'. [%s1]**

### Variable Information

%s1 = Repository name

### Explanation

An indefinite value exists after the filename of directive 'replugfile'. The environment definition for the repository is damaged. It is possible that the repository was edited without using the Interstage Management Console.

### User Action

Re-establish the repository on the master side and slave side in reference to:

'Monitoring of Operation in Replication Mode and Recovery' in the Directory Service Operator's Guide.

## 11.19.7 irep15009

---

**IREP: ERROR: irep15009: bad config: Failed to open configuration file. %s1 errno=%s2 [%s3]**

### Variable Information

%s1 = File

%s2 = Detail code

%s3 = Repository name

#### Explanation

The environment definition file could not be opened. The environment of the repository on the master side is damaged.

#### User Action

Restart the repository on the master side. If the error still occurs after the restart, use the *iscollectinfo* command to collect investigation information, then contact your service engineer.

## 11.19.8 irep15010

---

**IREP: ERROR: irep15010: Failed to initialize. detail=%s1:%s2:%s3 [%s4]**

#### Variable Information

%s1 = Detail code 1

%s2 = Detail code 2

%s3 = Error number

%s4 = Repository name.

#### Explanation

The initialization processing failed due to insufficient memory.

#### User Action

Close all programs no longer needed, then restart the repository.

**Windows32/64**

If memory is insufficient over the system, add memory or extend virtual memory.

**Solaris32/64 Linux32/64**

If memory is insufficient over the system, add memory or extend the swap area.

For memory required for the operation of repository, refer to 'Memory Requirements' in the Tuning Guide.

## 11.19.9 irep15012

---

**IREP: ERROR: irep15012: Failed to initialize SSL. [%s1]**

#### Variable Information

%s1 = Repository name

#### Explanation

Initialization of the SSL failed. There is possibility that the SSL environment is not established or is damaged.

#### User Action

If the SSL environment is not established, establish the SSL environment and restart the master and slave.

If the SSL environment exists, Re-establish the SSL environment and restart the master and slave.

If user action is not successful, use the *iscollectinfo* command to collect investigation information, then contact your service engineer.

## 11.19.10 irep15014

---

---

**IREP: ERROR: irep15014: Replica data path '%s1' does not exist. [%s2]****Variable Information**

%s1 = Path name

%s2 = Repository name

**Explanation**

The directory of the path having been specified by directive 'repllogfile' does not exist. The environment of the repository on the master side is damaged.

**User Action**

Check the database storage directory path of the repository on the master side.

If the database storage directory path exists, use the *iscollectinfo* command to collect investigation information, then contact your service engineer.

If the database storage directory path does not exist, Re-establish the repository on the master side and slave side in reference to: 'Monitoring of Operation in Replication Mode and Recovery' in the Directory Service Operator's Guide.

## 11.19.11 irep15015

---

**IREP: ERROR: irep15015: No read permission to replica data path '%s1'. [%s2]****Variable Information**

%s1 = Path name

%s2 = Repository name

**Explanation**

The permission to read the directory of the path having been specified by directive 'repllogfile' is not granted. The environment of the repository on the master side is damaged.

**User Action**

Check the database storage directory path of the repository on the master side.

If the database storage directory path exists, use the *iscollectinfo* command to collect investigation information, then contact your service engineer.

If the database storage directory path does not exist, Re-establish the repository on the master side and slave side in reference to: 'Monitoring of Operation in Replication Mode and Recovery' in the Directory Service Operator's Guide.

## 11.19.12 irep15016

---

**IREP: ERROR: irep15016: No read permission to replica data file '%s1'. [%s2]****Variable Information**

%s1 = File name

%s2 = Repository name

**Explanation**

The permission to read the file having been specified by directive 'repllogfile' is not granted. The environment of the repository on the master side is damaged.

## User Action

Check the database storage directory path of the repository on the master side.

If the database storage directory path exists, use the *iscollectinfo* command to collect investigation information, then contact your service engineer.

If the database storage directory path does not exist, Re-establish the repository on the master side and slave side in reference to: 'Monitoring of Operation in Replication Mode and Recovery' in the Directory Service Operator's Guide.

## 11.19.13 irep15017

---

**IREP: ERROR: irep15017: No write permission to replica data file '%s1'. [%s2]**

### Variable Information

%s1 = Path name

%s2 = Repository name

### Explanation

The permission to write into the replica data file is not granted. The environment of the repository on the master side is damaged.

### User Action

Check the database storage directory path of the repository on the master side.

If the database storage directory path exists, use the *iscollectinfo* command to collect investigation information, then contact your service engineer.

If the database storage directory path does not exist, Re-establish the repository on the master side and slave side in reference to: 'Monitoring of Operation in Replication Mode and Recovery' in the Directory Service Operator's Guide.

## 11.19.14 irep15060

---

**IREP: WARNING: irep15060: Failed to load the replica data to memory. detail=%s1:%s2:%s3 [%s4]**

### Variable Information

%s1 = Detail code 1

%s2 = Detail code 2

%s3 = Error number

%s4: Repository name

### Explanation

While transferring the replica data to memory, insufficient memory occurred. After this message appeared, the operation was retried.

### User Action

When this message is frequently displayed, close all programs no longer needed, then restart the repository.

**Windows32/64**

If the message is still displayed after the restart or if memory is insufficient over the system, add memory or increase virtual memory.

**Solaris32/64 Linux32/64**

If the message is still displayed after the restart or if memory is insufficient over the system, add memory or increase the swap area.

## 11.19.15 irep15061

---

**IREP: WARNING: irep15061: Error occurred in internal process. detail=%s1:%s2:%s3 [%s4]**

### Variable Information

%s1 = Detail code 1

%s2 = Detail code 2

%s3 = Error number

%s4: Repository name

### Explanation

Insufficient memory occurred in the internal processing. After this message appeared, the operation was retried.

### User Action

When this message is frequently displayed, close all programs no longer needed, then restart the repository.

**Windows32/64**

If the message is still displayed after the restart or if memory is insufficient over the system, add memory or increase virtual memory.

**Solaris32/64 Linux32/64**

If the message is still displayed after the restart or if memory is insufficient over the system, add memory or increase the swap area.

## 11.19.16 irep15062

---

**IREP: WARNING: irep15062: Error occurred in replica data process. detail=%s1:%s2:%s3 [%s4]**

### Variable Information

%s1 = Detail code 1

%s2 = Detail code 2

%s3 = Error number

%s4 = Repository name

### Explanation

Insufficient memory occurred when processing the replica data. After this message appeared, the operation was retried.

### User Action

When this message is frequently displayed, close all programs no longer needed, then restart the repository.

**Windows32/64**

If the message is still displayed after the restart or if memory is insufficient over the system, add memory or increase virtual memory.

**Solaris32/64 Linux32/64**

If the message is still displayed after the restart or if memory is insufficient over the system, add memory or increase the swap area.

## 11.19.17 irep15063

---

**IREP: WARNING: irep15063: Error occurred while copying the replica data. [%s1]**

## Variable Information

%s1 = Repository name

## Explanation

Insufficient disk capacity occurred while the replica data was being copied. After this message appeared, the operation was re-tried.

## User Action

When this message is frequently displayed, the disk capacity is insufficient. Delete all files no longer needed to increase the free disk space. Alternatively, re-create the repository according to the following procedure:

1. Back up the current resources.

(Use the `ldapsearch` command to output the repository data to the LDIF file.)

2. Refer to "Monitoring of Operation in Replication Mode and Recovery"- "Restoring the Master Repository in Replication Mode"- "There are not Backed up Directories (or files)" in the Directory Service Operator's Guide to re-create the repository.

(At that time, specify the path of a disk with more free space than the current disk, as the database storage directory. When registering the user information, do not use the LDIF file created in step 1.)

If any action above cannot be taken, it is necessary to extend the disk. When extending the disk, back up the repository resources as needed, reinstall Interstage Directory Service, then re-establish the replication mode.

For installing Interstage Directory Service, refer to the Installation Guide.

## 11.19.18 irep15070

---

**IREP: ERROR: irep15070: Unable to continue all replication. [%s1]**

## Variable Information

%s1 = Repository name

## Explanation

The replication information is damaged or the replication cannot be continued because an error is reported from the slave.

## User Action

Re-establish the repository on the master side and slave side as well as the replication in reference to:

'Monitoring of Operation in Replication Mode and Recovery' in the Directory Service Operator's Guide.

## 11.19.19 irep15071

---

**IREP: ERROR: irep15071: Unable to continue part of replication process of slave %s1 is terminated. [%s2]**

## Variable Information

%s1 = Name of the host in which the replication is established

%s2 = Repository name

## Explanation

The `irep15073` error messages have been output but no action is taken. The replication processing for this slave has stopped because there are too many unresolved messages.

## User Action

Re-establish the repository on the slave side and the replication in reference to:

'Monitoring of Operation in Replication Mode and Recovery' - 'Restoring the Slave Repository in Replication Mode' - 'Data in Database Has been Destroyed' in the Directory Service Operator's Guide.

After the recovery, perform the processing for several entries and make sure that no irep15073 message has been output to the system log, then continue the processing. If the irep15073 message has been output, take action according to the detailed code.

## 11.19.20 irep15072

---

**IREP: ERROR: irep15072: error occurred during replication management of slave %s1. Replication processing is terminated. detail=%s2:%s3 [%s4]**

### Variable Information

%s1 = Name of the host in which the replication is established

%s2 = Command code

%s3 = LDAP error code

%s4 = Repository name

### Explanation

A non-continuable error occurred during the replication operation for the slave.

### User Action

Take the following action according to the LDAP error code:

LDAP error code	Action taken
32(0x20)	There is no appropriate entry. There is a difference of data between the master and the slave. There is possibility that the procedure for adding the slave is incorrect.  Re-establish the repository on the slave side and the replication in reference to:  'Monitoring of Operation in Replication Mode and Recovery' - 'Restoring the Slave Repository in Replication Mode' - 'Data in Database Has been Destroyed' in the Directory Service Operator's Guide.
66(0x42)	The requested processing can only be executed by a leaf entry.  Re-establish the repository on the slave side and the replication in reference to:  'Monitoring of Operation in Replication Mode and Recovery' - 'Restoring the Slave Repository in Replication Mode' - 'Data in Database Has been Destroyed' in the Directory Service Operator's Guide.
69(0x45)	The specified value of the object class cannot be changed. Re-establish the repository on the master side and slave side in reference to:  'Monitoring of Operation in Replication Mode and Recovery' - 'Restoring the Master Repository in Replication Mode' in the Directory Service Operator's Guide.

If the LDAP error code is not listed in the above table, Re-establish the repository on the slave side and the replication in reference to:

'Monitoring of Operation in Replication Mode and Recovery' - 'Restoring the Slave Repository in Replication Mode' - 'Environment Has been Destroyed' in the Directory Service Operator's Guide.

## 11.19.21 irep15073

---

**IREP: ERROR: irep15073: error occurred during replication management of slave %s1. Retry it. Detail=%s2:%s3 [%s4]**

## Variable Information

%s1 = Name of the host in which the replication is established

%s2 = Command code

%s3 = LDAP error code

%s4 = Repository name

## Explanation

An error occurred during the replication operation for the slave. A retry is executed.

## User Action

Review the definition according to the LDAP error code, then restart the repository:

LDAP error code	Action taken
1(0x01)	The requested processing cannot be executed as the specified objectClass does not exist. re-establish the repository on the slave side and the replication in reference to:  'Monitoring of Operation in Replication Mode and Recovery' - 'Restoring the Slave Repository in Replication Mode' - 'Environment Has been Destroyed' in the Directory Service Operator's Guide.
16(0x10)	There is no appropriate attribute. It is possible that the scheme is not extended. Re-establish the repository on the slave side and the replication in reference to:  'Monitoring of Operation in Replication Mode and Recovery' - 'Restoring the Slave Repository in Replication Mode' - 'Environment Has been Destroyed' in the Directory Service Operator's Guide.
17(0x11)	Undefined attribute name is specified. re-establish the repository on the slave side and the replication in reference to:  'Monitoring of Operation in Replication Mode and Recovery' - 'Restoring the Slave Repository in Replication Mode' - 'Environment Has been Destroyed' in the Directory Service Operator's Guide.
19(0x13)	The operation for the specified attribute is incorrect. Re-establish the repository on the slave side and the replication in reference to:  'Monitoring of Operation in Replication Mode and Recovery' - 'Restoring the Slave Repository in Replication Mode' - 'Environment Has been Destroyed' in the Directory Service Operator's Guide.
21(0x15)	The specified attribute value is against the attribute syntax. re-establish the repository on the slave side and the replication in reference to:  'Monitoring of Operation in Replication Mode and Recovery' - 'Restoring the Slave Repository in Replication Mode' - 'Environment Has been Destroyed' in the Directory Service Operator's Guide.
34(0x22)	The distinguished name (DN) has a format error. It is possible that the scheme is not extended. re-establish the repository on the slave side and the replication in reference to:  'Monitoring of Operation in Replication Mode and Recovery' - 'Restoring the Slave Repository' - 'Environment Has been Destroyed' in the Directory Service Operator's Guide.
49(0x31)	The following causes can be considered:  - There is possibility that the 'Public directory' on the master side and the slave side, do not match.  Make sure that the 'Public directory' on the master side and the slave side match. If the specifications of 'Public directory' do not match, re-establish the repository on the slave side and the replication in reference to:  'Monitoring of Operation in Replication Mode and Recovery' - 'Restoring the Slave Repository in Replication Mode' - 'Environment Has been Destroyed' in the Directory Service Operator's Guide.  - In the cases except above, use the iscollectinfo command to collect investigation information on both the master and slave sides, then contact your service engineer.
53(0x35)	The following causes can be considered:

LDAP error code	Action taken
	<ul style="list-style-type: none"> <li>- There is a possibility that 'DN for the connection' of 'Replication Connection Settings' on the master side and 'Administrator DN' on the slave side do not match.  Make sure that 'DN for the connection' of 'Replication Connection Settings' on the master side and 'Administrator DN' on the slave side match. If they do not match, re-establish the repository on the slave side and the replication in reference to:  'Monitoring of Operation in Replication Mode and Recovery' - 'Restoring the Slave Repository in Replication Mode' - 'Environment Has been Destroyed' in the Directory Service Operator's Guide.</li> <li>- There is a possibility that 'Password for the connection' of 'Replication Connection Settings' on the master side and 'Administrator DN password' on the slave side do not match.  Make sure that 'Password for the connection' of 'Replication Connection Settings' on the master side and 'Administrator DN password' on the slave side match. If they do not match, re-set the password in reference to:  'Procedure for Changing the Password for Slave during Replication Operation' in the Directory Service Operator's Guide.</li> <li>- The slave operation is not specified for the repository on the slave side.  If 'Operation mode' of 'Replication settings' is not 'Slave', re-establish the repository on the slave side and the replication in reference to:  'Monitoring of Operation in Replication Mode and Recovery' - 'Restoring the Slave Repository in Replication Mode' - 'Environment Has been Destroyed' in the Directory Service Operator's Guide.</li> <li>- In the cases except above, use the iscollectinfo command to collect investigation information on both the master and slave sides, then contact your service engineer.</li> </ul>
80(0x50) 81(0x51)	<p>The following causes can be considered:</p> <p>There is possibility that the host on the slave side or the repository on the slave side is not started.</p> <p>Start the repository on the slave side. If the slave is not being operated, delete it from the replication list. To delete it, perform the following procedure:</p> <ol style="list-style-type: none"> <li>1. By using the Interstage Management Console connected as the master of replication, stop the repository of the master operation.</li> <li>2. On the [Settings] window, click [Show Detailed Settings].</li> <li>3. On [Replication destination hosts list], check the repository in slave operation to be deleted, then click the [Delete] button.</li> <li>4. By using the Interstage Management Console connected to the machine being operated as the master of replication, start the repository of the master operation.</li> </ol> <p>There is the possibility of a timeout in the SSL, if 'Yes' is specified for 'Present client certificate?' for the SSL connection and if the replication processing is executed immediately after the start of the repository. Check the system log on the slave side to make sure that an irep66050 message is output.</p> <p>In the case of the error above, the instruction will be retried on the master side. After a while (several minutes), make sure that the data is reflected to the slave side.</p> <p>If it has is not improved after a long period (for example: 20 or 30 minutes) there is a possibility that the other cause is considered. Take the following action:</p> <p>There is a possibility that the SSL configuration specified for 'SSL configuration' of 'Replication connection settings' on the master side and the SSL configuration specified for 'SSL configuration' on the slave side do not match.</p> <p>Check the system logs on the master side and slave side to make sure that an irep66000 to irep66999 message is output. If it is output, take action according to the message. For the SSL settings, refer to 'Establishing SSL Communication Environment' in the Directory Service Operator's Guide. After completing the SSL settings, restart the repositories in the following procedure:</p>

LDAP error code	Action taken
	<p>1. Restart the repository on the slave side.</p> <p>2. If an error occurred after restarting the repository on the slave side, restart the repository on the master side.</p> <p>There is possibility that 'Port number' of 'Replication Connection Settings' on the master side and 'Port number' specified on the slave side do not match.</p> <p>Check for the port number. If the port numbers do not match, re-establish the repository on the slave side and the replication in reference to:</p> <p>'Monitoring of Operation in Replication Mode and Recovery' - 'Restoring the Slave Repository in Replication Mode' - ' Environment Has been Destroyed' in the Directory Service Operator's Guide.</p>

If the LDAP error code is not listed in the above table, refer to 'LDAP Error Codes' in "Error Codes to be Reported from Interstage Directory Service" to review the definition. Then, re-establish the repository on the slave side and the replication in reference to:

'Monitoring of Operation in Replication Mode and Recovery' - 'Restoring the Slave Repository in Replication Mode'- 'Data in Database Has been Destroyed' in the Directory Service Operator's Guide.

## 11.20 irep30000 to irep30099

---

### 11.20.1 irep30001

---

**IREP: ERROR: irep30001: Enabler Repository start failed. pid=%s1, server=%s2, datastore=%s3, reason=%s4 [%s5]**

#### Variable Information

%s1 = Process ID

%s2 = Server name

%s3 = Repository name

%s4 = Error character string

%s5 = Repository name

#### Explanation

Failed to start the Interstage data store repository.

#### System Action

Terminates the start processing for the repository.

#### User Action

Take action according to the information output for the error character string.

- Could not start datastore: Datastore kernel file does not exist.
- Could not start datastore: Datastore stopped: Lack of disk space. For details, refer to the datastore event log.
- Could not start datastore: Unspecified error: Server process ended without response (see datastore event log).
- LDAP\_OTHER: create ldap object class failed: Socket read failed
- LDAP\_OTHER: Current user 'irepldap' could not start datastore '%s6' + with recovery on server 'localhost': Unspecified error: Server process ended without response (see datastore event log).
- LDAP\_OTHER: ELdapInitialize.perform(): cannot start datastore
- LDAP\_OTHER: ELdapInitialize.perform(): Get datastore parameters failed: Broker: Datastore on another server.

- LDAP\_OTHER: ELdapInitialize.perform(): Get datastore parameters failed: Cannot connect to broker. [ Inet=%s7, ServerPort=%s8] [%s9]
- LDAP\_OTHER: ELdapInitialize.perform(): Wrong datastore parameter: CodeSet must be UNICODE
- LDAP\_OTHER: localhost: Broker: open(omsconfig) failed.
- LDAP\_OTHER: open failed: Datastore not running.[method="%10",entity="%11" ,name="%12"]
- LDAP\_OTHER: open failed: Socket read failed [method="%s13" ,entity="%s14" ,name="%s15"]
- LDAP\_OTHER: Please install Enabler %s16

Could not start datastore: Datastore kernel file does not exist.

#### Explanation and User Action

Failed to start the repository, because the management file of Interstage data store is damaged or does not exist.

From the Interstage Management Console, delete the repository causing the error, then re-create it. Caution: This operation will delete the data stored in the repository.

Could not start datastore:Datastore stopped: Lack of disk space. For details, refer to the datastore event log.

#### Explanation and User Action

The repository could not be created or started, because the disk area specified as database storage directory is insufficient.

Specify another disk that has sufficient disk area as required by the database storage directory, then Re-establish the repository.

For the disk capacity required for the database storage directory, refer to 'Disk Space Requirements ' in the Tuning Guide.

Could not start datastore: Unspecified error: Server process ended without response (see datastore event log).

#### Explanation and User Action

**Windows32/64**

Interstage data store did not return the response.

For the cause, check the description in the event log.

- Check the event log. In the case that an ENABLER9222 message is output before this message:  
Interstage data store did not return the response. The amount of memory may be insufficient or the datastore port number may be being used by another replication. Take the action indicated by the message ENABLER9222.
- In the cases except above:  
Use the iscollectinfo command to collect investigation information, then contact your service engineer.

**Solaris32/64 Linux32/64**

Interstage data store did not return the response.

Check the description output to the event log.

- Check the event log. In the case that an ENABLER9222 message is output before this message:  
Interstage data store did not return the response. The amount of memory may be insufficient or the datastore port number may be being used by another replication. Take the action indicated by the message ENABLER9222.
- In the cases except above:  
Use the iscollectinfo command to collect investigation information, then contact your service engineer.

LDAP\_OTHER: create ldap object class failed: Socket read failed

#### Explanation and User Action

Interstage data store did not return the response.

There is possibility that this error occurs when the disk area specified as the database storage directory is insufficient. If the disk area having been specified as the database storage directory does not have enough space, specify another disk that has sufficient disk area for the database storage directory, then Re-establish the repository.

For the disk capacity required for the database storage directory, refer to 'Disk Space Requirements ' in the Tuning Guide.

If the disk area having been specified as the database storage directory has enough space, use the `iscollectinfo` command to collect investigation information, then contact your service engineer.

**LDAP\_OTHER: Current user 'irepldap' could not start datastore '%s6' + with recovery on server 'localhost': Unspecified error: Server process ended without response (see datastore event log).**

#### Explanation and User Action

##### Windows32/64

- Check the event log. In the case that an ENABLER9222 message is output before this message:  
Interstage data store did not return the response. There may be insufficient memory, or the Interstage data store environment may be corrupt.  
Take the action mentioned in the ENABLER9222 message.
- In the cases except above:  
Use the `iscollectinfo` command to collect investigation information, then contact your service engineer.

##### Solaris32/64 Linux32/64

- Check the system log. In the case that an ENABLER9222 message is output before this message:  
Interstage data store did not return the response. There may be insufficient memory, or the Interstage data store environment may be corrupt.  
Take the action mentioned in the ENABLER9222 message.
- In the cases except above:  
Use the `iscollectinfo` command to collect investigation information, then contact your service engineer.

**LDAP\_OTHER: ELdapInitialize.perform(): cannot start datastore**

#### Explanation and User Action

Failed to start the repository.

If a message for the appropriate repository is output before this message, take action according to the message.

If no message for the appropriate repository is output before this message, use the `iscollectinfo` command to collect investigation information, then contact your service engineer.

**LDAP\_OTHER: ELdapInitialize.perform(): Get datastore parameters failed: Broker: Datastore on another server.**

#### Explanation and User Action

Some network environment setting may be incorrectly specified.

Contact the network administrator, and then take the following action:

- Check that a local server has been set in the hosts file.
- Check the network environment settings (for example, specification of the DNS server to be used, or settings for the DNS server to be used). If the network environment has incorrect settings, review and re-set the network environment, then re-execute the command.

##### Solaris32/64 Linux32/64

If the network environment settings have been changed, restart the system.

If the user action does not resolve the problem, use the `iscollectinfo` command to collect investigation information, then contact your service engineer.

LDAP\_OTHER: ELdapInitialize.perform(): Get datastore parameters failed: Cannot connect to broker. [ Inet=%s7, ServerPort=%s8] [%s9]

#### Explanation and User Action

Windows32/64

%7 - %9 are the detailed information.

- Check the event log. In the case that an ENABLER9222 message is output before this message:

Memory is insufficient.

Close all programs no longer needed to secure the memory area required for the operation of Interstage Directory Service, then restart the repository.

If the memory area is still insufficient after closing all programs no longer needed, add memory or extend virtual memory.

For the amount of memory area required for the operation of Interstage Directory Service, refer to 'Memory Requirements' in the Tuning Guide.

- In the cases except above:

Use the iscollectinfo command to collect investigation information, then contact your service engineer.

Solaris32/64 Linux32/64

%7 - %9 are the detailed information.

- Check the system log. In the case that an ENABLER9222 message is output before this message:

Memory is insufficient.

Close all programs no longer needed to secure the memory area required for the operation of Interstage Directory Service, then restart the repository.

If the memory area is still insufficient after closing all programs no longer needed, add memory or extend the swap area.

For the amount of memory area required for the operation of Interstage Directory Service, refer to 'Memory Requirements' in the Tuning Guide.

- In the cases except above:

Use the iscollectinfo command to collect investigation information, then contact your service engineer.

LDAP\_OTHER: ELdapInitialize.perform(): Wrong datastore parameter: CodeSet must be UNICODE

#### Explanation and User Action

The explanation and user action is the same as for "LDAP\_OTHER: ELdapInitialize.perform(): Get datastore parameters failed: Cannot connect to broker. [ Inet=%s7, ServerPort=%s8] [%s9]".

LDAP\_OTHER: localhost: Broker: open(omsconfig) failed.

#### Explanation and User Action

An inconsistency was detected in the Interstage data store datastore definition. The datastore environment may have been deleted or moved by mistake.

Windows32/64

Re-execute the operation after restarting the 'Interstage data store' service using [Control Panel] > [Administration Tool] > [Services].

Solaris32/64 Linux32/64

Re-execute the operation after restarting the OS.

LDAP\_OTHER: open failed: Datastore not running.[method="%10",entity="%11",name="%12"]

#### Explanation and User Action

%10 - %12 are the detailed information.

The repository could not be created or started up because the disk area specified for database storage was insufficient.

Specify a disk with a fully secured disk area for database storage, and then set up the repository again. Refer to "Essential disk capacity at Operation time" in the "Tuning Guide" for more information on the required disk capacity for database storage.

LDAP\_OTHER: open failed: Socket read failed [method='%s13' ,entity='%s14' ,name='%s15']

#### Explanation and User Action

%13 - %15 are the detailed information.

There is possibility that multiple operations of the following operations are executed to one repository:

- Creating the repository with the Interstage Management Console
- Deleting the repository with the Interstage Management Console
- Starting the repository with the Interstage Management Console
- Stopping the repository with the Interstage Management Console
- Backing up or exporting the resources of Interstage Directory Service by the *irepbacksys* command
- Restoring or importing the resources of Interstage Directory Service by the *ireprestsys* command

**Solaris32/64 Linux32/64**

- Starting Interstage data store by the *enablerstart* command
- Starting the repository by the *irepstart* command
- Stopping the repository by the *irepstop* command

Make sure that any of the operations above is not executed, then re-execute the operation.

LDAP\_OTHER: Please install Enabler %s16

#### Explanation and User Action

The version of Interstage data store is unmatched.

Install Interstage data store at the version indicated by %s16.

If user action is unsuccessful, use the *iscollectinfo* command to collect investigation information, then contact your service engineer.

## 11.20.2 irep30003

---

**IREP: ERROR: irep30003: Enabler Repository creation failed. pid=%s1, server=%s2, datastore=%s3, reason=%s4 [%s5]**

#### Variable Information

%s1 = Process ID

%s2 = Server name

%s3 = Repository name

%s4 = Error character string

%s5 = Repository name

#### Explanation

Failed to create the Interstage data store repository.

#### System Action

Terminates the start processing for the repository.

#### User Action

Take action according to the information output for the error character string.

Could not create datastore: Cannot create/update/re-initialize datastore files.

## Explanation and User Action

Because the disk area which can be specified in the Database Storage Directory was insufficient, the repository cannot be created. Specify a disk with sufficient disk area to the Database Storage Directory, and then re-structure the repository. For details about the disk capacity required for Database Storage Directory, refer to 'Disk Space Requirements' in the Tuning Guide.

Could not create datastore: Datastore already exists in the catalog.

## Explanation and User Action

An inconsistency was detected in the Interstage data store datastore definition. The datastore environment may have been deleted or moved by mistake.

**Windows32/64**

Re-execute the operation after restarting the 'Interstage data store' service using [Control Panel] > [Administration Tool] > [Services].

**Solaris32/64 Linux32/64**

Re-execute the operation after restarting the OS.

Could not create datastore: datastore directory: %s6 File already exists.

## Explanation and User Action

The directory or file already exists for the path indicated by %s6. There is possibility that a path inadequate to be the database storage directory is specified or the database of the repository is damaged. Make sure that the correct path is specified for the database storage directory. If the specification is correct, delete the file that already exists, then re-create the repository.

Could not create datastore: datastore directory: %s7 Directory does not exist.

## Explanation and User Action

The path indicated by %s7 does not exist. Make sure that the correct path is specified for the database storage directory.

Could not create datastore: No rights to execute function.

## Explanation and User Action

If the OS has not been restarted after Interstage had been installed, this error may occur. Re-execute the operation after restarting OS. For detail of install procedure, refer to the Installation Guide.

If user action is not successful, use the *iscollectinfo* command to collect investigation information, then contact your service engineer.

## 11.20.3 irep30005

---

**IREP: ERROR: irep30005: Enabler Directive not supported. pid=%s1, directive=%s2 [%s3]**

### Variable Information

%s1 = Process ID

%s2 = Detailed information

%s3 = Repository name

### Explanation

The environment definition for the repository is damaged.

### System Action

Terminates the start processing for the repository.

### User Action

There is possibility that the environment definition for the repository is edited without using the Interstage Management Console.

Refer to the manual that corresponds with the operating mode, to re-create the appropriate repository:

- When the error occurred during operation in the standalone mode:

'Recovery in Stand-alone Mode' - 'Environment Has been Destroyed' in the Directory Service Operator's Guide

- When the error occurred in the repository of the master server during operation in the replication mode:

'Monitoring of Operation in Replication Mode and Recovery' - 'Restoring the Master Repository in Replication Mode' - 'There are not Backed up Directories (or/files)' in the Directory Service Operator's Guide

- When the error occurred for the repository of the slave server during operation in the replication mode:

'Monitoring of Operation in Replication Mode and Recovery' - 'Restoring the Slave Repository in Replication Mode' - 'Environment Has been Destroyed' in the Directory Service Operator's Guide

If any user action does not take effect, use the *iscollectinfo* command to collect investigation information, then contact your service engineer.

## 11.20.4 irep30006

---

**IREP: ERROR: irep30006: JNI\_CreateJavaVM failed. pid=%s1, options=%s2, arg=%s3 [%s4]**

### Variable Information

%s1 = Process ID

%s2 = Detailed information 1

%s3 = Detailed information 2

%s4 = Repository name

### Explanation

Failed to start Java VM.

### System Action

Terminates the start processing for the repository.

### User Action

Close all programs that are no longer required to secure the memory area required for Interstage Directory Service operation, then restart the repository.

**Windows32/64**

If the memory area is still insufficient after closing any unnecessary programs, add memory or extend the virtual memory.

**Solaris32/64 Linux32/64**

If the memory area is still insufficient after closing any unnecessary programs, add memory or extend the swap area.

For details of the amount of memory area required for Interstage Directory Service operation, refer to 'Memory Requirements' in the Tuning Guide.

If this action has no effect, use the *iscollectinfo* command to collect investigation information, then contact your service engineer.

## 11.20.5 irep30007

---

**IREP: ERROR: irep30007: JNI FindClass failed. pid=%s1, classname=%s2, jarfile=%s3 [%s4]**

### Variable Information

%s1 = Process ID

%s2 = Class name

%s3 = jar file name

%s4 = Repository name

## Explanation

Failed to load the Java class.

## System Action

Terminates the start processing for the repository.

## User Action

The amount of memory may be insufficient or a Java library required for connecting with Interstage data store could not be located.

- If the amount of memory is insufficient:

Close all programs that are no longer required to secure the memory area required for Interstage Directory Service operation, then restart the repository.

**Windows32/64**

If the memory area is still insufficient after closing any unnecessary programs, add memory or extend the virtual memory.

**Solaris32/64 Linux32/64**

If the memory area is still insufficient after closing any unnecessary programs, add memory or extend the swap area.

For details of the amount of memory area required for Interstage Directory Service operation, refer to "Memory Requirements" in the Tuning Guide.

- In all other cases:

The package directory may have damaged, or the Java library may have overwritten by an incorrect Java library. In these cases, it is necessary to reinstall Interstage data store (FJSVena).

For details on installing Interstage data store, refer to the Installation Guide.

If these actions have no effect, use the *iscollectinfo* command to collect investigation information, then contact your service engineer.

## 11.20.6 irep30008

---

**IREP: ERROR: irep30008: JNI call failed. pid=%s1, func=%s2, arg=%s3 [%s4]**

### Variable Information

%s1 = Process ID

%s2 = Detailed information 1

%s3 = Detailed information 2

%s4 = Repository name

### Explanation

Failed to call JNI.

### System Action

Terminates the start processing for the repository.

### User Action

Use the *iscollectinfo* command to collect investigation information, then contact your service engineer.

## 11.20.7 irep30009

---

**IREP: ERROR: irep30009: Enabler ELDAP error. pid=%s1, description=%s2 [%s3]**

### Variable Information

%s1 = Process ID

%s2 = Error details

%s3 = Repository name

#### Explanation

An error occurred in the internal processing of Interstage data store.

#### System Action

Terminates the start processing for the repository.

#### User Action

Use the *iscollectinfo* command to collect investigation information, then contact your service engineer.

## 11.20.8 irep30010

---

**IREP: ERROR: irep30010: Enabler Datastore access error. pid=%s1, description=%s2 [%s3]**

#### Variable Information

%s1 = Process ID

%s2 = Error details

%s3 = Repository name

#### Explanation

An error occurred in the internal processing of Interstage data store.

#### System Action

Terminates the start processing for the repository.

#### User Action

Use the *iscollectinfo* command to collect investigation information, then contact your service engineer.

## 11.20.9 irep30013

---

**IREP: ERROR: irep30013: Enabler Service not started on server=%s1. [%s2]**

#### Variable Information

%s1 = Server name

%s2 = Repository name

#### Explanation

The Interstage data store has not been started, or it did not return a response.

#### System Action

Terminates the start processing for the repository.

#### User Action

Check the event log. If message ENABLER9222 was output before this message, Interstage data store may not have returned a response because another application is using the datastore port number.

Take the action indicated by message ENABLER9222.

If Interstage data store has not been started, start it as follows:

To start Interstage data store, use the *enablerstart* command. For details on the *enablerstart* command, refer to 'Interstage Directory Service Operation Commands' in the Reference Manual (Command Edition).

Interstage data store may not have started because the operating system was not restarted following Interstage data store installation, (Interstage data store is automatically started at operating system startup).

If the following messages were output before this message, Interstage data store may not be started.

```
Repeat connect to Broker: 0
Repeat connect to Broker: 1
Repeat connect to Broker: 2
Repeat connect to Broker: 3
Repeat connect to Broker: 4
Repeat connect to Broker: 5
```

This message might be displayed if a standard database is used and the hard limit for the maximum number of file descriptors for processes run with oms account privileges is greater than 65536. For details on this setting, refer to the "Tuning Guide", section "System Tuning".

If the user action is not successful, use the *iscollectinfo* command to collect investigation information, then contact your service engineer.

## 11.20.10 irep30016

---

**IREP: ERROR: irep30016: Server name in configuration file not known on this server. [%s1]**

### Variable Information

%s1 = Repository name

### Explanation

The host name could not be recognized.

### System Action

Terminates the start processing for the repository.

### User Action

After contacting the network administrator, if the network environment has incorrect settings, review and re-set the network environment. For example, settings in the hosts file, specifications of the DNS server/DHCP server to be used, or settings of the DNS server/DHCP server to be used.

If any user action does not take effect, use the *iscollectinfo* command to collect investigation information, then contact your service engineer.

## 11.20.11 irep30017

---

**IREP: ERROR: irep30017: Datastore start failed, because datastore has crashed. [%s1]**

### Variable Information

%s1 = Repository name

### Explanation

Failed to start the database because the database is damaged.

### System Action

Terminates the start processing for the repository.

## User Action

Refer to the manual that corresponds with the operating mode, to re-create the appropriate repository:

- When the error occurred during operation in the standalone mode:

"Recovery in Stand-alone Mode"- "Data in Database Has been Destroyed" in the Directory Service Operator's Guide

- When the error occurred for the repository of the master server during operation in the replication mode:

"Monitoring of Operation in Replication Mode and Recovery"- "Restoring the Master Repository in Replication Mode"- "There are not Backed up Directories (or/files)" in the Directory Service Operator's Guide

- When the error occurred for the repository of the slave server during operation in the replication mode:

"Monitoring of Operation in Replication Mode and Recovery"- "Restoring the Slave Repository in Replication Mode"- "Data in Database Has been Destroyed" in the Directory Service Operator's Guide

If user action is not successful, use the *iscollectinfo* command to collect investigation information, then contact your service engineer.

## 11.20.12 irep30018

---

### IREP: ERROR: irep30018: User authentication failed. [%s1]

#### Variable Information

%s1 = Repository name

#### Explanation

User authentication for Interstage data store failed.

#### System Action

Terminates the start processing for the repository.

#### User Action

Use the *iscollectinfo* command to collect investigation information, then contact your service engineer.

## 11.20.13 irep30019

---

### IREP: ERROR: irep30019: Could not open the schema file. [%s1]

#### Variable Information

%s1 = Repository name

#### Explanation

Failed to open the schema file. There is possibility that memory is insufficient.

#### System Action

Terminates the start processing for the repository.

#### User Action

Close all programs no longer needed to secure the memory area required for the operation of Interstage Directory Service.

**Windows32/64**

If the memory area is still insufficient after closing all programs no longer needed, add memory or extend virtual memory.

**Solaris32/64 Linux32/64**

If the memory area is still insufficient after closing all programs no longer needed, add memory or extend the swap area.

For the amount of memory area required for the operation of Interstage Directory Service, refer to 'Memory Requirements' in the Tuning Guide.

If user action is not successful, use the *iscollectinfo* command to collect investigation information, then contact your service engineer.

## 11.20.14 irep30020

---

**IREP: ERROR: irep30020: Datastore start failed, because shared memory is used. [%s1]**

### Variable Information

%s1 = Repository name

### Explanation

Failed to start the database because shared memory is being used by other applications.

### System Action

Terminates the start processing for the repository.

### User Action

Use the *iscollectinfo* command to collect investigation information, then contact your service engineer.

## 11.20.15 irep30021

---

**IREP: ERROR: irep30021: Datastore start failed, because shared memory is not configured or configured size is too small. [%s1]**

### Variable Information

%s1 = Repository name

### Explanation

Failed to start the database because shared memory could not be acquired.

### System Action

Terminates the start processing for the repository.

### User Action

**Windows32/64**

If closing all unnecessary programs still results in an insufficient memory area, add memory or increase virtual memory.

**Solaris32/64 Linux32/64**

If closing all unnecessary programs still results in an insufficient memory area, ensure that an adequate value is specified for the system resources required for the operation of Directory Service. For the system resources required for the operation of Directory Service, refer to 'System Tuning' in the Tuning Guide.

If the adequate value is specified for the system resources required, add memory or increase the swap area.

For memory required for the operation of Directory Service, refer to 'Memory Requirements' in the Tuning Guide.

## 11.20.16 irep30022

---

---

**IREP: ERROR: irep30022: Datastore start failed, because another administration function is executed on this datastore. [%s1]****Variable Information**

%s1 = Repository name

**Explanation**

Failed to start the database because another command is being executed.

**System Action**

Terminates start processing for the repository.

**User Action**

The repository name may be conflicting with the datastore name of the Interstage data store being used by another product on the same server. Make sure that the repository name does not conflict with the name being used by another product.

If the user action is not successful, use the *iscollectinfo* command to collect investigation information, then contact your service engineer.

## 11.20.17 irep30023

---

**IREP: ERROR: irep30023: Because of a database error, Repository is forced to terminate. reason=%s1 [%s2]****Variable Information**

%s1 = Error details

%s2 = Repository name

**Explanation**

The repository is forcibly terminated, because a non-continuable error occurred in the Interstage data store.

**System Action**

Forcibly terminates the repository.

**User Action**

The following causes can be considered:

- There is possibility that the disk area specified for the database storage directory is insufficient or is temporarily insufficient.

Check the free space of the disk to ensure the disk area specified for the database storage directory is sufficient. If the disk area is insufficient, specify another disk that has sufficient free space, then re-establish the appropriate repository from the Interstage Management Console.

For the disk capacity required for the database storage directory, refer to "Disk Space Requirements" in the Tuning Guide.

Alternatively, check the system log to see if temporary insufficient disk area occurred. If temporary insufficient disk area occurred, restarting the repository enables to continuously use the repository.

**Note**

The down recovery function of Interstage data store requires the area calculated by the following formula:

Number of repositories x 200 MB

- There is possibility that the error occurs when an inadequate entry has an extremely large number of attributes. For example, more than 1000 are to be added or updated.
- If there are too many attributes, decrease the number, restart the appropriate repository from the Interstage Management Console, then re-execute the operation.

- The maximum number of attributes that can be included without failing to be added or updated, differs with the server performance and the data size of the attribute value specified for each attribute of the entry. Therefore, decrease attributes of the entry until this error does not reoccur, then re-execute the operation.

If any user action is not successful, use the *iscollectinfo* command to collect investigation information, then contact your service engineer.

## 11.21 irep32000 to irep32099

---

### 11.21.1 irep32000

---

**IREP: ERROR: irep32000: Failed to connect to the database. database=%s1, sqlstate=%s2, sqlmsg=%s3 [%s4]**

#### Variable Information

%s1 = Database

%s2 = SQLSTATE

%s3 = SQLMSG

%s4 = Repository

#### Explanation

Failed to connect to the database.

#### User Action

Check that [Database Hostname], [Database Name], [Database Port Number], [Database User ID], and [Database Password] are correctly specified in the connection.

When the SQLSTATE value displayed is "08001", the database connection host name specified may exceed the maximum length of the host name that can be specified for the Symfoware Server. Refer to the Symfoware Server manual, and check if it is specified correctly. Check also that the specified database is running. Start the database, enter the database connection information, and then re-execute processing.

### 11.21.2 irep32001

---

**IREP: ERROR: irep32001: There is not enough memory available. database=%s1, sqlstate=%s2, sqlmsg=%s3 [%s4]**

#### Variable Information

%s1 = Database

%s2 = SQLSTATE

%s3 = SQLMSG

%s4 = Repository

#### Explanation

There is insufficient memory.

#### User Action

Close unnecessary programs and re-execute.

**Windows32/64**

If there is insufficient system memory, increase the memory or extend the virtual memory.

**Solaris32/64 Linux32/64**

If there is insufficient system memory, increase the memory or extend the swap area.

For details about the memory required for running Interstage Directory Service, refer to 'Memory Requirements' in the Tuning Guide.

## 11.21.3 irep32002

---

**IREP: ERROR: irep32002: An error occurred in database operating. database=%s1, sqlstate=%s2, sqlmsg=%s3 [%s4]**

### Variable Information

%s1 = Database

%s2 = SQLSTATE

%s3 = SQLMSG

%s4 = Repository

### Explanation

An abnormality occurred in the database.

### User Action

Error information output in the database is displayed in SQLMSG. Refer to Symfoware Server 'Messages' in the Symfoware Server (Fujitsu RDBMS) Manual and take the appropriate action for the error.

The meaning of and user action recommended for errors displayed in SQLMSG are described below:

- sqlmsg=JYP1008U "%s5" of the host name in the host name management file is missing.
- sqlmsg=JYP1087U An unknown protocol recieved during a connection operation.
- sqlmsg=JYP2501E Value of argument in CALL statement in which is to be set parameter variable "%s6" is incorrect. Detail message="JYP2063E The code conversion failed."
- sqlmsg=JYP2501E Value of argument in CALL statement in which is to be set parameter variable "%s7" is incorrect. Detail message="JYP2084E Significant characters in character data are lost."
- sqlmsg=JYP2501E Value of argument in CALL statement inwhich is to be set parameter variable "%s8" is incorrect. Detail message="JYP2504E Defined length of BLOB-type SQL variable or parameter variable too small to store data."
- sqlmsg=JYP5039E Shortage of capacity in the DSI "%s9" defined in the database "%s10".
- sqlmsg=JYP7201E Schema "%s11" not found.
- sqlmsg=JYP7203E Table "%s12" not found.
- sqlmsg=JYP7210E Database "%s13" not found.

Refer to below for full explanation of these SQLMSG messages.

sqlmsg=JYP1008U "%s5" of the host name in the host name management file is missing.

### Explanation and User Action

The database hostname is incorrect. %s5 is the IP address or hostname of the specified database hostname. The hostname specified for the database hostname must be an IP address or a name defined in the system hosts file. Specify the correct hostname and re-execute.

sqlmsg=JYP1087U An unknown protocol recieved during a connection operation.

### Explanation and User Action

The specified connection "Database Hostname" and "Database Port Number" are incorrect. An attempt was made to connect to a different protocol service.

Check that the specified "Database Hostname" and "Database Port Number" are correct, and re-execute.

sqlmsg=JYP2501E Value of argument in CALL statement in which is to be set parameter variable "%s6" is incorrect. Detail message="JYP2063E The code conversion failed."

#### Explanation and User Action

Data containing invalid character encoding was sent from the client. Check the character encoding used in the client.

sqlmsg=JYP2501E Value of argument in CALL statement in which is to be set parameter variable "%s7" is incorrect. Detail message="JYP2084E Significant characters in character data are lost."

#### Explanation and User Action

The character string data to be located has exceeded the maximum value of the character string specified when the table was created. Review the character string data to be located in the entry.

To locate the data exceeding the specified value in the entry, the table must be recreated.

sqlmsg=JYP2501E Value of argument in CALL statement in which is to be set parameter variable "%s8" is incorrect. Detail message="JYP2504E Defined length of BLOB-type SQL variable or parameter variable too small to store data."

#### Explanation and User Action

The binary data to be located has exceeded the maximum value of the binary data size specified when the table was created. Review the binary data to be located in the entry.

To locate the data exceeding the specified value in the entry, the table must be recreated.

sqlmsg=JYP5039E Shortage of capacity in the DSI "%s9" defined in the database "%s10".

#### Explanation and User Action

The capacity for storing entries in the database was exceeded. Check that the estimate for database design is sufficient.

sqlmsg=JYP7201E Schema "%s11" not found.

#### Explanation and User Action

%s11 is the schema. Schema "%s11" does not exist, so processing cannot continue. Possible causes of this error are:

- Creation of the Interstage Directory Service database is already complete.  
Specify the account that was used when the database was created in [Database User ID], and then re-create the repository.
- The database was changed by mistake.

For details about recovering the database, refer to the Symfoware Server manual, the "Symfoware Server RDB Operator's Guide".  
For details about creating the Interstage Directory Service database, refer to Setting up Symfoware/RDB in 'Database Setup' of the 'Directory Service Operator's Guide'.

sqlmsg=JYP7203E Table "%s12" not found.

#### Explanation and User Action

%s12 is the table. Table "%s12" does not exist, so processing cannot continue.

The database was changed by mistake, or creation of the Interstage Directory Service database is already complete.

For details about recovering the database, refer to the a Symfoware Server manual "Symfoware Server RDB Operator's Guide". For details about creating the Interstage Directory Service database, refer to 'Database Setup' in the 'Directory Service Operator's Guide'.

sqlmsg=JYP7210E Database "%s13" not found.

#### Explanation and User Action

%s13 is the database. Database "%s13" does not exist, so processing cannot continue.

The database was changed by mistake, or creation of the Interstage Directory Service database is already complete.

For details about recovering the database, refer to the 'Interstage Directory Service Operator's Guide'. For details about creating the Interstage Directory Service database, refer to Setting up Symfoware/RDB in 'Database Setup' of the 'Directory Service Operator's Guide'.

## 11.21.4 irep32003

---

**IREP: ERROR: irep32003: Failed to reference the database. database=%s1, err=%s2, reason=%s3 [%s4]**

### Variable Information

%s1 = Database

%s1 = Error number

%s1 = Error details

%s1 = Repository

### Explanation

An error occurred in the database application.

### User Action

- Check that the "database connection host name", "database name", "database connection port number", database connection user ID", and "database connection password" specified for the connection destination are correct. Check that the specified database has started. Start the database, enter the correct database connection destination, and then re-execute processing.
- Confirm that an error is not output when the table for storing repository data is created. If the table was not created correctly, correct it and then re-execute processing.

If any user action is not successful, use the *iscollectinfo* command to collect investigation information, then contact your service engineer.

## 11.21.5 irep32004

---

**IREP: ERROR: irep32004: A database conflict was detected. database=%s1, sqlstate=%s2, sqlmsg=%s3 [%s4]**

### Variable Information

%s1 = Database

%s1 = SQLSTATE

%s1 = SQL error

%s1 = Repository

### Explanation

An error occurred in the database application.

### User Action

Use the *iscollectinfo* command to collect investigation information, then contact your service engineer.

## 11.22 irep32100 to irep32199

---

### 11.22.1 irep32100

---

**IREP: ERROR: irep32100: Command can not be run in the current directory. %s1**

### Variable Information

%s1 = Command

### Explanation

Execute processing in the directory used to store the command, or the executable environment of the command is incorrect.

## User Action

Change to the directory used to store the command re-execute processing. If the command is executed in the directory in which the command is stored, there is a possibility that required files are missing. Check that the environment of the command was launched correctly, and then re-execute the command.

## 11.22.2 irep32101

---

### **IREP: ERROR: irep32101: The necessary file does not exist. %s1**

#### Variable Information

%s1 = Essential file

#### Explanation

The file required to execute the table creation/table definition creation/modification command does not exist.

#### User Action

Create the table creation command execution environment.

## 11.22.3 irep32102

---

### **IREP: ERROR: irep32102: The necessary command does not exist. %s1**

#### Variable Information

%s1 = Essential command

#### Explanation

The database command required to execute the table creation/table definition creation/modification command does not exist.

#### User Action

Check that the database server was installed correctly.

## 11.22.4 irep32103

---

### **IREP: ERROR: irep32103: Interstage Directory Service table creation failed.**

#### Explanation

Failed to create the Interstage Directory Service table.

#### User Action

Refer to the Symfoware Server manual, and take action according to the error output in the table creation command log file. The log file storage directory is as follows:

- Interstage Directory Service and Symfoware Server are installed on the same server

**Windows32/64**

```
C:\Interstage\IREP\bin\RDB\SYM\windows\log\sr crt.log
```

**Solaris32/64 Linux32/64**

```
/opt/FJSVirep/bin/RDB/SYM/unix/log/sr crt.log
```

- Interstage Directory Service and Symfoware Server are installed on separate servers

The log file storage directory is on the server used to install Symfoware Server. The directory is as follows:

```
Directory used to launch command environment/log/sr crt.log
```

If the log file contains the following Symfoware Server message, recreate the table.

```
The JYP5071E archive log file is insufficient.
```

All the resources under the schema must be deleted. Execute the following SQL using the WebDBtools.

```
DROP SCHEMA SRADMIN CASCADE
```

Specify the schema name specified at the time of database creation in the underlined part. For details on deleting the schema, refer to an Symfoware Server manual, "Symfoware Server RDB Operator's Guide (Database Definitions)".

Then, re-create the table using the irepcrttbl command.

## 11.22.5 irep32104

---

**IREP: INFO: irep32104: Table creation successfully.**

Explanation

The repository data storage table was created successfully.

## 11.22.6 irep32105

---

**IREP: ERROR: irep32105: Table modification failed.**

Explanation

Failed to change the repository data storage table definition.

User Action

Refer to the Symfoware Server manual, and take action according to the error output in the table modification command log file. The log file storage directory is as follows:

- Interstage Directory Service and Symfoware Server are installed on the same server

**Windows32/64**

```
C:\Interstage\IREP\bin\RDB\SYM\windows\log\sr_mod.log
```

**Solaris32/64 Linux32/64**

```
/opt/FJSVirep/bin/RDB/SYM/unix/log/sr_mod.log
```

- Interstage Directory Service and Symfoware Server are installed on separate servers

The log file storage directory is on the server used to install Symfoware Server. The directory is as follows:

```
Directory used to launch command environment /log/sr_mod.log
```

If the log file contains the following Symfoware Server message, recreate the table.

```
The JYP5071E archive log file is insufficient.
```

All the resources under the schema must be deleted. Execute the following SQL using the WebDBtools.

```
DROP SCHEMA SRADMIN CASCADE
```

Specify the schema name specified at the time of database creation in the underlined part. For details on deleting the schema, refer to an Symfoware Server manual, "Symfoware Server RDB Operator's Guide (Database Definitions)".

Then, re-create the table using the irepcrttbl command.

## 11.22.7 irep32106

---

---

**IREP: INFO: irep32106: Table modification completed successfully.****Explanation**

The repository data storage table definition was changed successfully.

---

**11.22.8 irep32107**

---

**IREP: ERROR: irep32107: Cannot modify the table definition.****Explanation**

Failed to change the repository data storage table definition.

**User Action**

Refer to the Symfoware Server manual, and check that the specified RDB system or schema exists. If the specified system or schema is incorrect, specify the correct system or schema and re-execute processing.

Alternatively, refer to the Symfoware Server manual and check whether data is already registered in the Interstage Directory Service repository environment. If data is already registered, delete it, or create a different database and re-execute processing.

---

**11.22.9 irep32108**

---

**IREP: ERROR: irep32108: Invalid attribute name has been specified. %s1****Variable Information**

%s1 = Attribute

**Explanation**

The specified attribute is incorrect.

**User Action**

Only attributes described in 'List of Attributes' in the 'Directory Service Operator's Guide' can be specified. In Windows, note that upper and lower case are treated as different. Specify the correct attribute and re-execute processing.

---

**11.22.10 irep32109**

---

**IREP: ERROR: irep32109: Database resources occupied by other users.****Explanation**

The command cannot be executed because database resources are locked by other users.

**User Action**

Check if the database resources are locked by other users. If they are, wait until they are released and re-execute the command.

---

**11.22.11 irep32110**

---

**IREP: ERROR: irep32110: System error occurred. func=%s1, err=%s2****Variable Information**

%s1 = Detail information 1

%s2 = Detail information 2

## Explanation

Execution of the command stopped because a system error occurred.

## User Action

Send the message contents to a Systems Engineer (in Symfoware Server, there is no batch information collection tool (like *iscollectinfo* command))

# 11.23 irep33000 to irep33099

---

## 11.23.1 irep33000

---

**IREP: ERROR: irep33000: The table creation command runtime environment has been mistakenly modified. path="%s1", detail="%s2"**

### Variable Information

%s1 = Path

%s2 = Detail information

## Explanation

The table creation command runtime environment has been modified. The environment for executing the table creation command may have been changed by mistake.

## User Action

- When a command in the Interstage directory service package was executed  
Back up the repositories already created. Re-install the Interstage directory service. After reinstallation, restore the repositories that were backed up and restore the environment. Refer to the "Maintenance (Resource Backup)" of the 'Operator's Guide (Basic)' on how to backup and restore. Refer to the "Installation Guide" for reinstallation.
- When the table creation command is executed from extracted compressed files  
Transfer the compressed files containing the table creation command once again, and re-execute after extracting them.

## 11.23.2 irep33001

---

**IREP: ERROR: irep33001: Failed to create the work file. path="%s1", detail="%s2"**

### Variable Information

%s1 = File name

%s2 = Detailed error information

## Explanation

Processing stops because the work file created using the table creation command cannot be created.

## User Action

Fix the error based on the detailed information and then re-execute the command.

## 11.23.3 irep33002

---

**IREP: ERROR: irep33002: Failed to read the work file. path="%s1", detail="%s2"**

### Variable Information

%s1 = File name

%s2 = Detailed error information

#### Explanation

Processing stops because the attempt to read the work file failed.

#### User Action

Fix the error based on the detailed information and then re-execute the command.

### 11.23.4 irep33003

---

**IREP: ERROR: irep33003: Failed to write to the work file. path="%s1", detail="%s2"**

#### Variable Information

%s1 = File name

%s2 = Detailed error information

#### Explanation

Processing stops because the attempt to write to the work file failed.

#### User Action

Fix the error based on the detailed information and then re-execute the command.

### 11.23.5 irep33004

---

**IREP: ERROR: irep33004: Failed to create the work directory. path="%s1", detail="%s2"**

#### Variable Information

%s1 = Path

%s2 = Detailed error information

#### Explanation

Processing stops because the attempt to create the work file failed.

#### User Action

Fix the error based on the detailed information and then re-execute the command.

### 11.23.6 irep33005

---

**IREP: ERROR: irep33005: Cannot find database command "%s1".**

#### Variable Information

%s1 = Database command

#### Explanation

Cannot find the database command used when the table was created.

#### User Action

Check that the database is installed correctly.

- When Symfoware Server is used

Symfoware/RDB or the Symfoware client function is required.

- When the Oracle database is used

The Oracle database or the Oracle client software including the Oracle Net software is required.

**Solaris32/64 Linux32/64**

Check whether the "ORACLE\_HOME" environment variable has been set correctly. If the "ORACLE\_HOME" environment variable is correct, check whether the user that executed the table creation command has administrator authority or is an Oracle software owner (oracle user).

**Windows32/64**

After installing the above software, the operating system must be re-activated.

## 11.23.7 irep33006

---

### **IREP: ERROR: irep33006: Failed to create the table.**

#### Explanation

Failed to create the table for storing repository data.

#### User Action

Refer to the Database Manual, and take action according to the error output in the table creation command log file.

The log file is output to the "ds\_gen.log" file located under the log directory in the command execution directory.

- When the Symfoware Server is used

If the log file contains the following Symfoware Server message, delete the schema using the following procedure, and recreate the table.

```
The JYP5071E archive log file is insufficient.
```

1) Delete all the resources under the schema.

2) Execute the following SQL using the command or the WebDBtools. For the schema name, specify the schema name specified when the database was created.

```
DROP SCHEMA schema-name CASCADE
```

3) Recreate the table using the irepgendb command

For details on deleting the schema, refer to the Symfoware Server manual, the "Symfoware Server RDB Operator's Guide (Database Definition)".

- When the Oracle database is used

If the log file contains the following Oracle database message, the table area (TABLESPACE area) required to locate the repository data is insufficient. Delete the schema using the following procedure, and recreate the table.

```
ORA-01659: unable to allocate MINEXTENTS beyond %s1 in tablespace %s1  
ORA-01659: MINEXTENTS that exceeds %s1 cannot be allocated to the table area %s1.
```

Delete the schema with the cascade option using the Oracle Enterprise Manager. Alternatively, delete the schema by executing the following SQL using SQL\*Plus.

```
DROP USER schema-name CASCADE;
```

## 11.23.8 irep33007

---

### **IREP: INFO: irep33007: Creation of the table was successful.**

#### Explanation

Creation of the table for storing repository data was successful.

## 11.23.9 irep33008

---

### **IREP: ERROR: irep33008: The database resources are occupied by another user.**

## Explanation

The command cannot be executed because the database resources are occupied by another user.

## User Action

Check that the database resources are not occupied by another user. Wait until execution of the command by the other user is complete, and then re-execute the command.

## 11.23.10 irep33009

---

**IREP: ERROR: irep33009: The table has already been created.**

## Explanation

Another table has already been created in the database, so the table cannot be created.

## User Action

Check that the database of the table you tried to create is correct. Note that 8.0 and 9.0 tables cannot exist together.

## 11.23.11 irep33010

---

**IREP: ERROR: irep33010: Failed to read the definition file. path="%s1", detail="%s2"**

## Variable Information

%s1 = Path

%s2 = Detail information

## Explanation

Processing stops because the attempt to read the detailed definition file failed.

## User Action

Fix the error based on the detailed information and then re-execute the command.

## 11.23.12 irep33011

---

**IREP: ERROR: irep33011: Environment variable "%s1" has not been set.**

## Variable Information

%s1 = Environment variable name

## Explanation

An environment variable required to execute the database command was not specified.

## User Action

Set the environment variable required to execute the database command and then re-execute the command.

## 11.23.13 irep33012

---

**IREP: ERROR: irep33012: Failed to create the log file. path=%s1, detail=%s2**

### Variable Information

%s1 = File path

%s2 = Detail information

### Explanation

Failed to create the log file for the table creation command.

### User Action

Fix the error based on the detailed information and then re-execute the command.

## 11.23.14 irep33013

---

**IREP: ERROR: irep33013: Failed to create the log directory. path="%s1", detail="%s2"**

### Variable Information

%s1 = Path

%s2 = Detail information

### Explanation

Failed to create the directory used for the log file of the table creation command.

### User Action

Fix the error based on the detailed information and then re-execute the command.

## 11.23.15 irep33014

---

**IREP: ERROR: irep33014: Failed to execute the command. cmd="%s1", detail="%s2"**

### Variable Information

%s1 = Command name

%s2 = Detail information

### Explanation

Failed to execute the database command during processing to create the database definition.

### User Action

Fix the error based on the detailed information and then re-execute the command.

## 11.23.16 irep33015

---

**IREP: ERROR: irep33015: An error occurred in the system function. func="%s1", err="%s2"**

### Variable Information

%s1 = Function name

%s2 = Detail information

### Explanation

Processing stops because an error was detected in the system call.

## User Action

Save the error message and the ds\_gen.log file in the log directory of the directory used to execute the command. Send the error information to a Systems Engineer.

## 11.23.17 irep33016

---

**IREP: ERROR: irep33016: There was not enough memory to execute the command. detail=%s1**

### Variable Information

%s1 = Detail information

### Explanation

There was not enough memory to execute the database command.

### User Action

**Windows32/64**

If there is not enough system memory, increase the memory or extend the virtual memory.

**Solaris32/64 Linux32/64**

If there is not enough system memory, increase the memory or extend the swap area.

## 11.23.18 irep33017

---

**IREP: ERROR: irep33017: Internal contradiction was detected. The command is ended. detail=%s1**

### Variable Information

%s1 = Path

### Explanation

Command execution was terminated because an internal error was detected and the command execution cannot be continued.

### User Action

Save the error message and the ds\_gen.log file in the log directory of the directory used to execute the command. Send the error information to a Systems Engineer.

## 11.23.19 irep33018

---

**IREP: ERROR: irep33018: Database rollback failed.**

### Explanation

Rollback of the table creation command failed.

### User Action

Refer to the "ds\_gen.log" file in the log directory of the directory used to execute the command. Fix the cause of the database error, delete and re-create the schema, and then re-execute.

- If Symfoware Server is used:

If the following Symfoware Server message is output in the log file, delete the schema as detailed below and then re-create the table.

```
JYP5071E There was insufficient space in the archive log file to store the archive log.
```

1. Delete all the resources under the schema.
2. Execute the following SQL using the command or WebDBtools. Specify the schema name that was specified when the database was created.

```
DROP SCHEMA Schema name CASCADE
```

3. Re-create the table using the iregendb command.

For details about deleting a schema, refer to the "Symfoware Server RDB Operator's Guide (Database Definition Edition)" Symfoware Server manual.

- If an Oracle database is used:

Delete the schema with the cascade option using Oracle Enterprise Manager. Alternatively, delete the schema by executing the following SQL in SQL\*Plus.

```
DROP USER Schema name CASCADE;
```

## 11.23.20 irep33019

---

**IREP: ERROR: irep33019: Command can not be run in the current directory.**

### Explanation

Execute processing in the directory in which the command has been stored. Alternatively, the runtime environment of the command is incorrect.

### User Action

Change to the directory in which the command has been stored, and then re-execute processing. If this is executed in the directory in which the command has been stored, some required files may be missing. Launch the runtime environment of the command correctly, and then re-execute.

## 11.23.21 irep33020

---

**IREP: ERROR: irep33020: An essential tag "%s1" has not been specified.**

### Variable Information

%s1 = Tag name

### Explanation

The essential tag is not specified.

### User Action

The essential tag displayed as the tag name is required. Add it to the detailed definition file.

When the tag name is <TABLE>, check that "DS\_SCOPE", "DS\_FILTER", and "DS\_ENTRY" are all defined as the specified <TABLE> value.

For more information about the detailed definition file, refer to the "Using Symfoware/RDB" - "Setting up Symfoware/RDB" - "Setting the table details" of the "Directory Service Operator's Guide". Refer to the same section also when the Oracle database is used.

## 11.23.22 irep33021

---

---

**IREP: ERROR: irep33021: No value was specified in tags "%s1". lineno=%s2****Variable Information**

%s1 = Tag name

%s2 = Line number

**Explanation**

No value was specified in the tags.

**User Action**

Specify a value in the tags.

[Incorrect Example] No value was specified in the <STRINGMAX> tags

```
:  
<STRINGMAX></STRINGMAX>  
:
```

[Correct Example] A value was specified in the tags

```
:  
<STRINGMAX> 942 </STRINGMAX>  
:
```

For details about the detailed definition file, refer to "irepgendb" in the "Reference Manual (Command Edition)".

## 11.23.23 irep33022

---

**IREP: ERROR: irep33022: Too many tags "%s1" were specified. lineno=%s2****Variable Information**

%s1 = Tag name

%s2 = Line number

**Explanation**

Too many tags were specified.

**User Action**

Too many tags were specified.

If there are 10 or more <DBSPACE> tags in the <TABLE> tags, reduce the number of <DBSPACE> tags.

For more information about the detailed definition file, refer to the "Using Symfoware/RDB" - "Setting up Symfoware/RDB" - "Setting the table details" of the "Directory Service Operator's Guide". Refer to the same section also when the Oracle database is used.

## 11.23.24 irep33023

---

**IREP: ERROR: irep33023: The tag or value that was specified is invalid. lineno=%s1****Variable Information**

%s1 = Line number

**Explanation**

The tag or value that was specified contains characters that cannot be recognized.

## User Action

Correct the invalid tag or value.

[Incorrect Example 1] The <STRINGMAX> start tag was mistakenly specified as <STRINGMAX2>

```
:  
<STRINGMAX2> 942 </STRINGMAX2>  
:
```

[Correct Example 1] The correct tag was specified

```
:  
<STRINGMAX> 942 </STRINGMAX>  
:
```

[Incorrect Example 2] The numeric value is separated by a null

```
:  
<STRINGMAX> 94 2 </STRINGMAX>  
:
```

[Correct Example 2] A null is deleted.

```
:  
<STRINGMAX> 942 </STRINGMAX>  
:
```

This error may occur even if one line is too long. To improve the readability of the detailed definition file, it is recommended that a maximum of 100 characters per line is entered .

Check that the detailed definition file is correct if the above action does not correct the error.

For more information about the detailed definition file, refer to the "Using Symfoware/RDB" - "Setting up Symfoware/RDB" - "Setting the table details" of the "Directory Service Operator's Guide" . Refer to the same section also when the Oracle database is used.

## 11.23.25 irep33030

---

### IREP: ERROR: irep33030: Specify a number in tags "%s1" for "%s2". lineno=%s3

#### Variable Information

%s1 = Tag name

%s2 = Value that was specified

%s3 = Line number

#### Explanation

The value specified as the tag must be a numeric value. The value is not a numeric value or the unit of numeric value is not specified correctly.

#### User Action

Review the value that is specified as the tag.

[An example of incorrect specification] The unit is added to the value specified as the <STRINGMAX>tag.

```
:  
<STRINGMAX> 1K </STRINGMAX>  
:
```

[Example of correction] Corrected because the value specified as the tag cannot include the unit

```
:  
<STRINGMAX> 1024 </STRINGMAX>  
:
```

Refer to the same section also when the Oracle database is used. For more information about the detailed definition file,, refer to the "Using Symfoware/RDB" - "Setting up Symfoware/RDB" - "Setting the table details" of the "Directory Service Operator's Guide" .  
Refer to the same section also when the Oracle database is used.

## 11.23.26 irep33031

---

**IREP: ERROR: irep33031: The value specified in tag "%s1" is outside the permitted range. lineno=%s2**

### Variable Information

%s1 = Tag

%s2 = Line number

### Explanation

The value specified as the tag exceeds the range permitted to set.

### User Action

Review the value specified as the tag.

[Example of incorrect specification] The value specified as the <STRINGMAX> tag is outside the range.

```
:  
<STRINGMAX> 10001 </STRINGMAX>  
:
```

[Example of correction 1] The value specified as the <STRINGMAX> tag is corrected.

```
:  
<STRINGMAX> 10000 </STRINGMAX>  
:
```

[Example of correction 2] The numeric value is separated by a null

```
:  
<STRINGMAX> 94 2 </STRINGMAX>  
:
```

[Example of correction 2] A null is deleted.

```
:  
<STRINGMAX> 942 </STRINGMAX>  
:
```

Refer to the same section also when the Oracle database is used. For more information about the detailed definition file,, refer to the "Using Symfoware/RDB" - "Setting up Symfoware/RDB" - "Setting the table details" of the "Directory Service Operator's Guide" .  
Refer to the same section also when the Oracle database is used.

## 11.23.27 irep33032

---

**IREP: ERROR: irep33032: The value specified in tags "%s1" is too long. lineno=%s2**

### Variable Information

%s1 = Tag name

%s2 = Line number

## Explanation

The value that was specified in the tag is too long.

## User Action

The value specified in the tag is too long. Change the detailed definition file.

For more information about the detailed definition file, refer to the "Using Symfoware/RDB" - "Setting up Symfoware/RDB" - "Setting the table details" of the "Directory Service Operator's Guide" . Refer to the same section also when the Oracle database is used.

## 11.23.28 irep33033

---

### IREP: ERROR: irep33033: Put tag "%s1" inside tag "%s2". lineno=%s3

#### Variable Information

%s1 = Tag name 1

%s2 = Tag name 2

%s3 = Line number

## Explanation

The location of tag name 1 is incorrect. Tag name 1 must be inside tag name 2.

## User Action

Correct the location of tag name 1.

[Incorrect Example] <TABLE> The <DBSPACE> tag is found with the DS\_SCOPE tag omitted

```
:
<STRINGMAX> 942 </STRINGMAX>
  <DBSPACE> SPACE1
    <TABLE_SIZE> 800M </TABLE_SIZE>
    <INDEX1_SIZE> 100K </INDEX1_SIZE>
  </DBSPACE>
:
```

[Correct Example] Add <TABLE> DS\_SCOPE

```
:
<STRINGMAX> 942 </STRINGMAX>
  <TABLE> DS_SCOPE
    <DBSPACE> SPACE1
      <TABLE_SIZE> 800M </TABLE_SIZE>
      <INDEX1_SIZE> 100K </INDEX1_SIZE>
    </DBSPACE>
  :
</TABLE>
:
```

For more information about the detailed definition file, refer to the "Using Symfoware/RDB" - "Setting up Symfoware/RDB" - "Setting the table details" of the "Directory Service Operator's Guide" . Refer to the same section also when the Oracle database is used.

## 11.23.29 irep33034

---

### IREP: ERROR: irep33034: On line %s1, there is no end tag for start tag "%s2". lineno=%s3

## Variable Information

%s1 = Number of the line containing the start tag

%s2 = Tag name

%s3 = Line number

## Explanation

There is no end tag for the start tag.

## User Action

Register the end tag for the start tag.

[Incorrect Example] The <TABLE> DS\_SCOPE tag is not closed

```
:
<STRINGMAX> 942 </STRINGMAX>
  <TABLE> DS_SCOPE
    <DBSPACE> SPACE1
      <TABLE_SIZE> 800M </TABLE_SIZE>
      <INDEX1_SIZE> 100K </INDEX1_SIZE>
    </DBSPACE>
  :
```

[Correct Example] Add the </TABLE> end tag

```
:
<STRINGMAX> 942 </STRINGMAX>
  <TABLE> DS_SCOPE
    <DBSPACE> SPACE1
      <TABLE_SIZE> 800M </TABLE_SIZE>
      <INDEX1_SIZE> 100K </INDEX1_SIZE>
    </DBSPACE>
  :
</TABLE>
:
```

For more information about the detailed definition file, refer to the "Using Symfoware/RDB" - "Setting up Symfoware/RDB" - "Setting the table details" of the "Directory Service Operator's Guide" . Refer to the same section also when the Oracle database is used.

## 11.23.30 irep33035

**IREP: ERROR: irep33035: The value specified in tags "%s1" for "%s2" has already been specified on line %s3. lineno=%s4**

## Variable Information

%s1 = Tag name

%s2 = Value that was specified

%s3 = Number of the line already containing the same tag

%s4 = Line number

## Explanation

This value has already been specified in tags with the same name.

## User Action

You cannot enter more than one tag value in the detailed definition file.

[Incorrect Example] "DS\_SCOPE" was mistakenly registered

```

:
<STRINGMAX> 942 </STRINGMAX>
  <TABLE> DS_SCOPE
    :
  </TABLE>
  <TABLE> DS_SCOPE
    :
  </TABLE>
:

```

[Correct Example] Correct the values specified in the <TABLE> tags

```

:
<STRINGMAX> 942 </STRINGMAX>
  <TABLE> DS_SCOPE
    :
  </TABLE>
  <TABLE> DS_FILTER
    :
  </TABLE>
:

```

For more information about the detailed definition file, refer to the "Using Symfoware/RDB" - "Setting up Symfoware/RDB" - "Setting the table details" of the "Directory Service Operator's Guide". Refer to the same section also when the Oracle database is used.

## 11.23.31 irep33036

**IREP: ERROR: irep33036: On line %s1, tag "%s2" has already been specified, so tag "%s3" cannot be specified. lineno=%s4**

### Variable Information

%s1 = Number of the line containing the mutually exclusive tags

%s1 = Tag name 1

%s1 = Tag name 2

%s2 = Line number

### Explanation

Tag name 2 cannot be specified if tag name 1 has already been specified.

### User Action

The values specified in tag name 1 and tag name 2 have a mutually exclusive relationship. Change the definition.

[Incorrect Example] In <TABLE> DS\_SCOPE, extend the <STRINGMAX> tags by specifying <INDEX2\_SIZE>. The two tags have a mutually exclusive relationship.

```

:
<STRINGMAX> 2000 </STRINGMAX>
  <TABLE> DS_SCOPE
    <DBSPACE> SPACE1
      <TABLE_SIZE> 800M </TABLE_SIZE>
      <INDEX1_SIZE> 100K </INDEX1_SIZE>
      <INDEX2_SIZE> 100K </INDEX2_SIZE>
    </DBSPACE>
    :
  </TABLE>
:

```

[Correct Example] Delete <INDEX2\_SIZE>

```

:
<STRINGMAX> 2000 </STRINGMAX>
  <TABLE> DS_SCOPE
    <DBSPACE> SPACE1
      <TABLE_SIZE> 800M </TABLE_SIZE>
      <INDEX1_SIZE> 100K </INDEX1_SIZE>
    </DBSPACE>
    :
  </TABLE>
:

```

For more information about the detailed definition file, refer to the "Using Symfoware/RDB" - "Setting up Symfoware/RDB" - "Setting the table details" of the "Directory Service Operator's Guide" . Refer to the same section also when the Oracle database is used.

## 11.23.32 irep33037

**IREP: ERROR: irep33037: Tag "%s1" has already been specified on line %s2. lineno=%s3**

### Variable Information

%s1 = Tag name

%s2 = Number of the line already containing the same tag

%s3 = Line number

### Explanation

Tags with the same name have already been specified.

### User Action

Tags with the same name cannot be registered more than once in the detailed definition file.

[Incorrect Example] The <BINARYMAX> tag is specified more than once

```

:
<STRINGMAX> 942 </STRINGMAX>
<BINARYMAX> 32K </BINARYMAX>
  <TABLE> DS_SCOPE
    :
  </TABLE>
<BINARYMAX> 128K </BINARYMAX>
:

```

[Correct Example] Correct this so that there is only one <BINARYMAX> tag

```

:
<STRINGMAX> 942 </STRINGMAX>
<BINARYMAX> 128K </BINARYMAX>
  <TABLE> DS_SCOPE
    :
  </TABLE>
:

```

For more information about the detailed definition file, refer to the "Using Symfoware/RDB" - "Setting up Symfoware/RDB" - "Setting the table details" of the "Directory Service Operator's Guide" . Refer to the same section also when the Oracle database is used.

## 11.23.33 irep33038

**IREP: ERROR: irep33038: The value specified in tags "%s1" for "%s2" is not correct. lineno=%s3**

## Variable Information

%s1 = Tag name

%s2 = Value that was specified

%s3 = Line number

## Explanation

The value specified in the tags is not correct.

## User Action

Change the value that was specified in the tags.

[Incorrect Example] The value that was specified in the <TABLE> tags contains a spelling mistake

```
:  
<STRINGMAX> 1K </STRINGMAX>  
  <TABLE> DS_ENTRYS  
:
```

[Correct Example] Correct the value that was specified in the <TABLE> tags

```
:  
<STRINGMAX> 1K </STRINGMAX>  
  <TABLE> DS_ENTRY  
:
```

For more information about the detailed definition file, refer to the "Using Symfoware/RDB" - "Setting up Symfoware/RDB" - "Setting the table details" of the "Directory Service Operator's Guide". Refer to the same section also when the Oracle database is used.

## 11.23.34 irep33039

---

### IREP: ERROR: irep33039: Tags "%s1" cannot be specified. lineno=%s2

## Variable Information

%s1 = Tag name

%s2 = Line number

## Explanation

The specified tags cannot be registered.

## User Action

Change the value that was specified in the tags.

[Incorrect Example] The <INDEX3\_SIZE> tag is registered inside DS\_ENTRY although this is impossible

```
:  
<STRINGMAX> 942 </STRINGMAX>  
<BINARYMAX> 32K </BINARYMAX>  
  <TABLE> DS_ENTRY  
    <DBSPACE> SPACE1  
      <TABLE_SIZE> 800M </TABLE_SIZE>  
      <INDEX1_SIZE> 100K </INDEX1_SIZE>  
      <INDEX2_SIZE> 100K </INDEX2_SIZE>  
      <INDEX3_SIZE> 100K </INDEX3_SIZE>  
    </DBSPACE>  
  </TABLE>  
:
```

[Correct Example] Delete the <INDEX3\_SIZE> tag

```
:
<STRINGMAX> 942 </STRINGMAX>
<BINARYMAX> 32K </BINARYMAX>
  <TABLE> DS_ENTRY
    <DBSPACE> SPACE1
      <TABLE_SIZE> 800M </TABLE_SIZE>
      <INDEX1_SIZE> 100K </INDEX1_SIZE>
      <INDEX2_SIZE> 100K </INDEX2_SIZE>
    </DBSPACE>
  </TABLE>
:
```

For more information about the detailed definition file, refer to the "Using Symfoware/RDB" - "Setting up Symfoware/RDB" - "Setting the table details" of the "Directory Service Operator's Guide". Refer to the same section also when the Oracle database is used.

## 11.23.35 irep33040

### IREP: ERROR: irep33040: Required tags are missing in tags "%s1". lineno=%s2

#### Variable Information

%s1 = Tag name

%s2 = Line number

#### Explanation

Required tags have not been registered inside the tags.

#### User Action

Put the required tags inside the tags.

[Incorrect Example] The essential tags <INDEX2\_SIZE> are not inside <TABLE> DS\_ENTRY

```
:
<STRINGMAX> 942 </STRINGMAX>
<BINARYMAX> 32K </BINARYMAX>
  <TABLE> DS_ENTRY
    <DBSPACE> SPACE1
      <TABLE_SIZE> 800M </TABLE_SIZE>
      <INDEX1_SIZE> 100K </INDEX1_SIZE>
    </DBSPACE>
  </TABLE>
:
```

[Correct Example] Add the <INDEX2\_SIZE> tags

```
:
<STRINGMAX> 942 </STRINGMAX>
<BINARYMAX> 32K </BINARYMAX>
  <TABLE> DS_ENTRY
    <DBSPACE> SPACE1
      <TABLE_SIZE> 800M </TABLE_SIZE>
      <INDEX1_SIZE> 100K </INDEX1_SIZE>
      <INDEX2_SIZE> 100K </INDEX2_SIZE>
    </DBSPACE>
  </TABLE>
:
```

For more information about the detailed definition file, refer to the "Using Symfoware/RDB" - "Setting up Symfoware/RDB" - "Setting the table details" of the "Directory Service Operator's Guide". Refer to the same section also when the Oracle database is used.

## 11.23.36 irep33041

---

**IREP: ERROR: irep33041: Put tags "%s1" before the other tags. lineno=%s2**

### Variable Information

%s1 = Tag name

%s2 = Line number

### Explanation

The specified tags cannot be registered inside other tags.

### User Action

Put the tags before the other tags.

[Incorrect Example] The <STRINGMAX> tag is registered inside the <TABLE> tags

```
:
<BINARYMAX> 32K </BINARYMAX>
  <TABLE> DS_SCOPE
    <STRINGMAX> 942
    . . . .
  </TABLE>
:
```

[Correct Example] Correct this so that the <STRINGMAX> tags are not contained inside other tags

```
:
<STRINGMAX> 942 </STRINGMAX>
<BINARYMAX> 32K </BINARYMAX>
  <TABLE> DS_SCOPE
    . . . .
  </TABLE>
:
```

[Incorrect Example] The <BINARYMAX> is started without a <STRINGMAX> end tag

```
:
<STRINGMAX> 942
<BINARYMAX> 32K </BINARYMAX>
:
```

[Correct Example] The </STRINGMAX> end tag is added

```
:
<STRINGMAX> 942 </STRINGMAX>
<BINARYMAX> 32K </BINARYMAX>
:
```

For more information about the detailed definition file, refer to the "Using Symfoware/RDB" - "Setting up Symfoware/RDB" - "Setting the table details" of the "Directory Service Operator's Guide". Refer to the same section also when the Oracle database is used.

## 11.23.37 irep33050

---

**IREP: ERROR: irep33050: In Oracle database, inside tag "%s1", tag "%s2" can only be specified once. lineno=%s3**

### Variable Information

%s1 = Tag name 1

%s2 = Tag name 2

%s3 = Line number

## Explanation

In Oracle databases, tag name 2 cannot be specified more than once inside tag name 1.

## User Action

Correct this so that tag name 2 appears as a pair only once inside tag name 1.

[Incorrect Example] More than one <DBSPACE> tag is registered in the <TABLE> tags

```
:
<STRINGMAX> 942 </STRINGMAX>
<BINARYMAX> 32K </BINARYMAX>
  <TABLE> DS_SCOPE
    <DBSPACE> SPACE1
      <TABLE_SIZE> 400M </TABLE_SIZE>
      <INDEX2_SIZE> 100K </INDEX2_SIZE>
      <INDEX3_SIZE> 100K </INDEX3_SIZE>
      <INDEX4_SIZE> 100K </INDEX4_SIZE>
      <INDEX5_SIZE> 100K </INDEX5_SIZE>
    </DBSPACE>
    <DBSPACE> SPACE2
      <TABLE_SIZE> 400M </TABLE_SIZE>
      <INDEX1_SIZE> 100K </INDEX1_SIZE>
    </DBSPACE>
  </TABLE>
:
```

[Correct Example] Correct this so that there is only one pair of <DBSPACE> tags inside the <TABLE> tags.

```
:
<STRINGMAX> 942 </STRINGMAX>
<BINARYMAX> 32K </BINARYMAX>
  <TABLE> DS_SCOPE
    <DBSPACE> SPACE1
      <TABLE_SIZE> 800M </TABLE_SIZE>
      <INDEX2_SIZE> 100K </INDEX2_SIZE>
      <INDEX3_SIZE> 100K </INDEX3_SIZE>
      <INDEX4_SIZE> 100K </INDEX4_SIZE>
      <INDEX5_SIZE> 100K </INDEX5_SIZE>
    </DBSPACE>
    <DBSPACE> SPACE2
      <INDEX1_SIZE> 100K </INDEX1_SIZE>
    </DBSPACE>
  </TABLE>
:
```

For more information about the detailed definition file, refer to the "Using Symfoware/RDB" - "Setting up Symfoware/RDB" - "Setting the table details" of the "Directory Service Operator's Guide". Refer to the same section also when the Oracle database is used.

## 11.24 irep34000 to irep34099

### 11.24.1 irep34000

**IREP: ERROR: irep34000: Failed to connect to the database. database=%s1, sqlcode=%s2, sqlmsg=%s3 [%s4]**

#### Variable Information

%s1 = Database name

%s2 = SQLCODE

%s3 = SQLMSG

%s4 = Repository

## Explanation

Failed to connect to the database.

## User Action

Information on the error generated by the database is displayed as the SQLCODE value and SQLMSG. Refer to the Oracle database manual, and take action on the error.

The main errors that may be displayed in the SQLMSG and the actions to take are shown as follows:

- sqlmsg=ORA-03114: not connected to ORACLE
- sqlmsg=ORA-12154: TNS:could not resolve the connect identifier specified
- sqlmsg=ORA-12500: TNS:listener failed to start a dedicated server process
- sqlmsg=ORA-12541: TNS:no listener

### sqlmsg=ORA-03114: not connected to ORACLE

#### Explanation and User Action

There may be a problem with the network to which the Oracle database server is connected or the server may have been disconnected from the network.

Using the ping command etc., check if it is possible to connect to the machine on which the Oracle database was activated.

### sqlmsg=ORA-12154: TNS:could not resolve the connect identifier specified

#### Explanation and User Action

The Oracle database has not been created. Alternatively, the network service name is specified incorrectly.

Check if the Oracle database has been created. Check, also, the net service name has been set correctly for the repository.

### sqlmsg=ORA-12500: TNS:listener failed to start a dedicated server process

#### Explanation and User Action

The Oracle database service may not have started, or the listener may not have been set correctly.

Check whether the Oracle database service is running, or whether the listener settings are correct.

### sqlmsg=ORA-12541: TNS:no listener

#### Explanation and User Action

The Oracle database service has not been activated.

Check if the Oracle database service has been activated.

## 11.24.2 irep34001

---

**IREP: ERROR: irep34001: There is insufficient memory. database=%s1, sqlcode=%s2, sqlmsg=%s3 [%s4]**

#### Variable Information

%s1 = Database name

%s2 = SQLCODE

%s3 = SQLMSG

%s4 = Repository

## Explanation

There is insufficient memory.

## User Action

Close unnecessary programs and re-execute.

**Windows32/64**

If there is insufficient memory in the system, increase the memory or extend the virtual memory.

**Solaris32/64 Linux32/64**

If there is insufficient memory in the system, increase the memory or extend the swap area.

For details about the memory required for running the Interstage Directory Service, refer to "Memory capacity" in the "Tuning Guide".

## 11.24.3 irep34002

---

**IREP: ERROR: irep34002: An abnormality occurred in the database application. database=%s1, sqlcode=%s2, sqlmsg=%s3 [%s4]**

### Variable Information

%s1 = Database name

%s2 = SQLCODE

%s3 = SQLMSG

%s4 = Repository

## Explanation

An abnormality occurred in the database application.

## User Action

Information on the error generated by the database is displayed as the SQLCODE value and SQLMSG. Refer to the Oracle database manual, and take action on the error.

The main errors that may be displayed in the SQLMSG and the actions to take are shown as follows:

- sqlmsg=ORA-01017: invalid username/password; logon denied
- sqlmsg=ORA-12514: TNS:listener does not currently know of service requested in connect descriptor
- sqlmsg=ORA-12545: Connect failed because target host or object does not exist
- sqlmsg=ORA-12899: value too large for column "%s1" (actual: %s2, maximum: %s3)

sqlmsg=ORA-01017: invalid username/password; logon denied

### Explanation and User Action

The database connection user ID or the database connection password is specified incorrectly.

Check if the database connection user ID or the database connection password is set correctly.

sqlmsg=ORA-01034: Oracle not available

### Explanation and User Action

Oracle is not running.

Check that Oracle has been started. If during an automatic startup of the repository it is waiting for the RDB, do not set the Oracle listener database service explicitly (in other words, do not use static configurations).

sqlmsg=ORA-12514: TNS:listener does not currently know of service request in connect description

## Explanation and User Action

The Oracle database service has not been activated. Alternatively, the communication setting is incorrect.

Check if the Oracle database service has been activated. Check, also, if communication on the Oracle database side and the Interstage Directory Service side is set correctly.

sqlmsg=ORA-12545: Connect failed because target host or object does not exist

## Explanation and User Action

The Oracle database server has not been activated.

Check if the Oracle database server has been activated.

sqlmsg=ORA-12899: value too large for column "%s1" (actual: %s2, maximum: %s3)

## Explanation and User Action

The character string data to be located has exceeded the maximum value of the character string specified when the table was created. Review the character string data to be located in the entry.

To locate the data exceeding the specified value in the entry, the table must be recreated.

## 11.24.4 irep34003

---

**IREP: ERROR: irep34003: Failed to reference the database. database=%s1, err=%s2, reason=%s3 [%s4]**

### Variable Information

%s1 = Database

%s2 = SQLCODE

%s3 = SQLMSG

%s4 = Repository

### Explanation

Failed to reference the database.

### User Action

- Check if "net service name", "Oracle home directory", "database connection user ID", and "database connection password" are specified correctly for the side connecting to. Check if the specified database has been activated. Activate the database, input information on the database for the side connecting to, and re-execute the processing.
- Check if no error was generated at the time of creating the repository data storage table. If the repository data storage table has not been created correctly, create it correctly, and re-execute the processing.

If the above actions do not resolve the error, use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

## 11.24.5 irep34004

---

**IREP: ERROR: irep34004: The database conflict was detected. database=%s1, sqlcode=%s2, sqlmsg=%s3 [%s4]**

### Variable Information

%s1 = Database

%s2 = SQLCODE

%s3 = SQLMSG

%s4 = Repository

## Explanation

Failed to reference the database.

## User Action

Use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

# 11.25 irep66000 to irep66099

---

## 11.25.1 irep66000

---

**IREP: ERROR: irep66000: Slot information directory(%s1) error. detail=%s2,%s3,%s4 [%s5]**

### Variable Information

%s1 = Slot information directory

%s2 = Detail code 1

%s3 = SSL error code

%s4 = Detail code 2

%s5 = Repository name

### Explanation

There is an error in the slot information directory.

### System Action

Stops the processing.

### User Action

Take either of the following actions depending on the certificate and private-key management environment used to perform SSL encryption communication:

- In an Interstage Certificate Environment

The Interstage Certificate Environment may have been destroyed. Refer to 'Broken Certificate Environments' in "Error Codes to be Reported from Interstage Directory Service" and correct the Interstage Certificate Environment.

- In a certificate/key management environment

Use the slot information directory (slot\_path) of the SSL environment definition file or the slot\_path of the SLENV structure as the slot information directory name of the certificate/key management environment to be used and re-execute processing. For details on the slot information directory (slot\_path) of the SSL environment definition file, refer to 'Setting an SSL Environment Definition File (Client)' in 'Environment Setup (Using the Standard Database)' of the Directory Service Operator's Guide

## 11.25.2 irep66001

---

**IREP: ERROR: irep66001: Token label(%s1) error. detail=%s2:%s3:%s4 [%s5]**

### Variable Information

%s1 = Token label

%s2 = Detail code 1

%s3 = SSL error code

%s4 = Detail code 2

%s5 = Repository name

## Explanation

There is an error in the token label.

## System Action

Stops the processing.

## User Action

Take either of the following actions depending on the certificate and private-key management environment used to perform SSL encryption communication:

- In an Interstage Certificate Environment

The Interstage Certificate Environment may have been destroyed. Refer to 'Broken certificate environments' in 'Error Codes to be Reported from Interstage Directory Service' and correct the Interstage Certificate Environment.

- In a certificate/key management environment

Use the token label (tkn\_lbl) of the SSL environment definition file or tkn\_lbl of the SSLENV structure as the token label of the certificate/key management environment to be used and re-execute processing. For details on the token label (tkn\_lbl) of the SSL environment definition file, refer to the following:

'Setting up an Environment for SSL Communication' - 'Creating the Environment on the Client' - 'Setting an SSL Environment Definition File (Client)' in the Directory Service Operator's Guide

## 11.25.3 irep66002

---

**IREP: ERROR: irep66002: Out of memory in SSL library. detail=%s1:%s2:%s3 [%s4]**

### Variable Information

%s1 = Detail code 1

%s2 = SSL error code

%s3 = Detail code 2

%s4 = Repository name

## Explanation

A memory shortage occurred in the SSL library.

## System Action

Stops the processing.

## User Action

Close any unnecessary programs or allocate sufficient memory space for Interstage Directory Service operation. For details on the memory space required for Interstage Directory Service, refer to the following:

'Memory Requirements' in the Tuning Guide.

## 11.25.4 irep66003

---

**IREP: ERROR: irep66003: Site certificate(%s1) is expired. detail=%s2:%s3:%s4 [%s5]**

### Variable Information

%s1 = Certificate nickname

%s2 = Detail code 1

%s3 = SSL error code

%s4 = Detail code 2

%s5 = Repository name

#### Explanation

The site certificate has expired.

#### System Action

Stops the processing.

#### User Action

Refer to 'When the Site certificate has expired' in "Error Codes to be Reported from Interstage Directory Service" for details on how to obtain the new Site certificate from the CA, and register it in the Interstage Certificate Environment or certificate/key management environment.

### 11.25.5 irep66004

---

**IREP: ERROR: irep66004: CA certificate is expired. detail=%s1:%s2:%s3 [%s4]**

#### Variable Information

%s1 = Detail code 1

%s2 = SSL error code

%s3 = Detail code 2

%s4 = Repository name

#### Explanation

The CA certificate (certification authority certificate) has expired.

#### System Action

Stops the processing.

#### User Action

Refer to 'When the CA certificate has expired' in "Error Codes to be Reported from Interstage Directory Service" for information on how to obtain the new CA certificate from the CA, and register it in the Interstage Certificate Environment or certificate/key management environment.

### 11.25.6 irep66005

---

**IREP: ERROR: irep66005: It failed in the verification of the CA certificate or the site certificate(%s1). detail=%s2:%s3:%s4 [%s5]**

#### Variable Information

%s1 = Certificate nickname

%s2 = Detail code 1

%s3 = SSL error code

%s4 = Detail code 2

%s5 = Repository name

#### Explanation

Verification of the CA certificate or site certificate failed.

#### System Action

Stops the processing.

## User Action

Refer to 'When the certificate registration order is incorrect' in "Error Codes to be Reported from Interstage Directory Service" and re-register the CA certificate in the Interstage Certificate Environment or certificate/key management environment starting with the root certificate first.

## 11.25.7 irep66006

---

**IREP: ERROR: irep66006: The CA certificate or the site certificate has been canceled. detail=%s1:%s2:%s3 [%s4]**

### Variable Information

- %s1 = Detail code 1
- %s2 = SSL error code
- %s3 = Detail code 2
- %s4 = Repository name

### Explanation

The CA certificate or site certificate has been canceled.

### System Action

Stops the processing.

### User Action

Acquire a new CA certificate or site certificate from the CA and register it in the Interstage Certificate Environment or certificate/key management environment.

Use either of the following methods to confirm the serial number of the canceled certificate:

- In the Windows(R) environment, save CRL in the file using 'crl' as the extension, right-click the saved file, then click [Open] on the displayed menu. The [Certificate Revocation List] window is displayed. Click the [Revocation List] tab on the [Certificate Revocation List] window and confirm the serial number of the canceled certificate.
- Register CRL in the entry using the entry administration tool, then confirm the serial number of the canceled certificate on the certificate revocation list viewer.

Confirm the canceled certificate as follows, then acquire and register a new certificate to replace the canceled certificate:

- In an Interstage Certificate Environment

Use the following procedure to confirm the canceled certificate:

1. On the Interstage Management Console, select [System] > [Security] > [Certificates] > [List] tab of [Site Certificates] (If on the Admin Server, select [Application Management] > [Interstage] > [Interstage Application Server] > [Security] > [Certificates] > [List] tab of [Site Certificates]). Click the [Refresh] button to acquire the latest information, then reference the serial number of the site certificate to confirm the canceled site certificate.
2. On the Interstage Management Console, select [System] > [Security] > [Certificates] > [List] tab of [CA Certificates] (If on the Admin Server, select [Application Management] > [Interstage] > [Interstage Application Server] > [Security] > [Certificates] > [List] tab of [CA certificates]). Click the [Refresh] button to acquire the latest information, then reference the serial number of the CA certificate to confirm the canceled CA certificate.

Refer to the following for an easy method of acquiring and registering certificates:

- 'Configuring the Interstage Certificate Environment with CSR' in the Security System Guide
- 'Configuring the Interstage Certificate Environment with PKCS#12' in the Security System Guide
- In a certificate/key management environment

Use the following procedure to confirm the canceled certificates:

1. Use the cmlistcert command to confirm the certificates registered in the certificate/key management environment.

2. Use the `cmdspcert` command to reference a serial number of each registered certificate and to confirm the canceled certificates.

For details on the `cmlistcert` and `cmdspcert` commands, refer to the following:

'SSL Environment Setting Commands' in the Reference Manual (Command Edition)

To acquire and register certificates, refer to the following in the indicated order:

1. 'Environment Setting for Certificate/Key Management Environment' - 'Creating a Private Key and Acquiring a Certificate' in the Security System Guide
2. 'Environment Setting for Certificate/Key Management Environment' - 'Registering the Certificate and CRL' in the Security System Guide.

## 11.25.8 irep66007

---

**IREP: ERROR: irep66007: The site private key is not registered in the private key management environment. name=%s1, detail=%s2:%s3:%s4 [%s5]**

### Variable Information

%s1 = Certificate nickname

%s2 = Detail code 1

%s3 = SSL error code

%s4 = Detail code 2

%s5 = Repository name

### Explanation

There is no private-key associated with the site certificate in the Interstage Certificate Environment or certificate/key management environment.

### System Action

Stops the processing.

### User Action

Take either of the following actions depending on the certificate and private-key management environment used to perform SSL encryption communication:

- In an Interstage Certificate Environment

The Interstage Certificate Environment may have been restored during Interstage Management Console operation. Stop and then restart the Interstage Management Console. For details on starting and stopping the Interstage Management Console, refer to the following:

'Starting the Interstage Management Console' or 'Stopping the Interstage Management Console' in the Operator's Guide.

If the above action has no effect, the Interstage Certificate Environment may have been destroyed. Refer to 'If the Certificate Environment is Broken' - 'Interstage certificate environment' in "Error Codes to be Reported from Interstage Directory Service" and repair the Interstage certificate environment.

- In a certificate/key management environment

Register a private-key associated with the site certificate for the certificate/key management environment.

For details on registering private-keys, refer to the following:

'SSL Environment Setting Commands' - 'cmcenterkey' in the Reference Manual (Command Edition).

If the above action has no effect, the certificate/key management environment may have been destroyed. Refer to 'If the Certificate Environment is Broken' - 'Certificate/key management environments' in "Error Codes to be Reported from Interstage Directory Service" and repair the certificate/key management environment.

## 11.25.9 irep66008

---

**IREP: ERROR: irep66008: The mistake is found in the nickname in the site certificate. detail=%s1:%s2:%s3 [%s4]**

### Variable Information

- %s1 = Detail code 1
- %s2 = SSL error code
- %s3 = Detail code 2
- %s4 = Repository name

### Explanation

There is an error in the nickname of the site certificate.

### System Action

Stops the processing.

### User Action

Take either of the following actions depending on the certificate and private-key management environment used to perform SSL encryption communication:

- In an Interstage Certificate Environment

Using the following procedure, specify the required site certificate in the SSL configuration used with the repository:

1. If the repository indicated by %s4 is active, stop the repository using the Interstage Management Console.
2. Click the [Refresh] button on the following screen to confirm the SSL configuration used with the repository:

On the Interstage Management Console, select [General Settings] of the in-use repository on the [System] > [Service] > [Status] tab of [Repository]. (If on the Admin Server, select [Application Management] > [Interstage] > [Interstage Application Server] > [Security] > [Status] tab of [Repository]).

If the repository is the master, click the [Refresh] button on the following screen to confirm the SSL configuration used by the repository for replication.

On the Interstage Management Console, select [Replication Destination Host Information] of [Detailed Setup [Show]] of the in-use repository on the [System] > [Service] > [View Status] tab of [Repository]. (If on the Admin Server, select [Application Management] > [Interstage] > [Interstage Application Server] > [Security] > [View Status] tab of [Repository]).

3. Click the [Refresh] button on the following screen, then specify the site certificate required for the SSL configuration. If no site certificate is registered, acquire and register a site certificate:

On the Interstage Management Console, select [Environment Setup] of the SSL configuration used by the repository in the [System] > [Security] > [List] tab of [SSL]. (If on the Admin Server, select [Application Management] > [Interstage] > [Interstage Application Server] > [Security] > [List] tab of [SSL])

4. Start the repository indicated by %s4.

Refer to the following for an easy method of acquiring and registering certificates:

- 'Configuring the Interstage Certificate Environment with CSR' in the Security System Guide
- 'Configuring the Interstage Certificate Environment with PKCS#12' in the Security System Guide.

- In a certificate/key management environment

Use the user certificate nickname (user\_cert\_name) of the SSL environment definition file or user\_cert of the SLENV structure as the nickname of the site certificate to be used, then re-execute the processing.

For user certificate nickname (user\_cert\_name) details, refer to the following:

'Setting up an Environment for SSL Communication ' - 'Setting an SSL Environment Definition File (Client)' in the Directory Service Operator's Guide

If the above action has no effect, the site certificate may not have been registered with the user certificate nickname (user\_cert\_name) of the SSL environment definition file or with the nickname specified with user\_cert of the SLENV structure. Specify the user certificate nickname (user\_cert\_name) of the SSL environment definition file or the nickname specified with user\_cert of the SLENV structure to register the site certificate using the cmentcert command.

For cmentcert command details, refer to the following:

'SSL Environment Setting Commands' - 'cmentcert' in the Reference Manual (Command Edition).

If the above action has no effect, the certificate registered with the user certificate nickname (user\_cert\_name) of the SSL environment definition file or with the nickname specified with user\_cert of the SLENV structure may not have been registered as the site certificate. To register the certificate as the site certificate, specify the -own option in the cmentcert command. Specify the nickname of the certificate registered as the site certificate in the user certificate nickname (user\_cert\_name) of the SSL environment definition file or in user\_cert of the SLENV structure.

For cmentcert command details, refer to the following:

'SSL Environment Setting Commands' in the Reference Manual (Command Edition).

## 11.25.10 irep66009

---

**IREP: ERROR: irep66009: The mistake is found in the nickname in the CA certificate. detail=%s1:%s2:%s3 [%s4]**

### Variable Information

- %s1 = Detail code 1
- %s2 = SSL error code
- %s3 = Detail code 2
- %s4 = Repository name

### Explanation

There is an error in the nickname of the client CA certificate.

### System Action

Stops the processing.

### User Action

Refer to 'Broken Certificate Environments' in "Error Codes to be Reported from Interstage Directory Service" and correct the Interstage Certificate Environment or certificate/key management environment.

## 11.25.11 irep66010

---

**IREP: ERROR: irep66010: The passing list in site certificate(%s1) does not exist. detail=%s2:%s3:%s4 [%s5]**

%s1 = Detail code 1

%s2 = SSL error code

%s3 = Detail code 2

%s4 = Repository name

### Explanation

The path of the CA certificate is incomplete.

### System Action

Stops the processing.

### User Action

An error occurred in the certificate registration order. Re-register the certificates, starting sequentially at the CA certificate of the root CA, in the Interstage Certificate Environment or certificate/key management environment. For details about re-registering certificates, refer to 'When the certificate registration order is incorrect' in "Error Codes to be Reported from Interstage Directory Service".

## 11.25.15 irep66014

---

**IREP: ERROR: irep66014: The CA certificate has been canceled. detail=%s1:%s2:%s3 [%s4]**

### Variable Information

%s1 = Detail code 1

%s2 = SSL error code

%s3 = Detail code 2

%s4 = Repository name

### Explanation

The CA certificate has been canceled.

### System Action

Stops the processing.

### User Action

Acquire a new CA certificate from the CA and register it in the Interstage Certificate Environment or certificate/key management environment.

By opening CRL with Internet Explorer, reference the serial number of the canceled certificate. Confirm the canceled certificate as described below, then acquire and register a new certificate to replace the canceled certificate.

- In an Interstage Certificate Environment

Use the following procedure to confirm the canceled certificate:

On the Interstage Management Console, select [System] > [Security] > [Certificates] > [List] tab of [CA Certificates]. (If on the Admin Server, select [Application Management] > [Interstage] > [Interstage Application Server] > [Security] > [Certificates] > [List] tab of [CA Certificates]). Click the [Refresh] button to acquire the latest information, then reference the serial number of the CA certificate to confirm the canceled CA certificate.

Refer to the following for an easy method of acquiring and registering certificates:

- 'Configuring the Interstage Certificate Environment with CSR' in the Security System Guide
- 'Configuring the Interstage Certificate Environment with PKCS#12' in the Security System Guide.

In a certificate/key management environment

Use the following procedure to confirm the canceled certificates:

1. Use the `cmlistcert` command to confirm the certificates registered in the certificate/key management environment.
2. Use the `cmdspcert` command to reference a serial number of each registered certificate and to confirm the canceled certificates.

For details on the `cmlistcert` and `cmdspcert` commands, refer to the following:

'SSL Environment Setting Commands' in the Reference Manual (Command Edition).

For the method of acquiring and registering certificates, refer to the following in the indicated order:

1. 'Environment Setting for Certificate/Key Management Environment' - 'Creating a Private Key and Acquiring a Certificate' in the Security System Guide
2. 'Environment Setting for Certificate/Key Management Environment' - 'Registering the Certificate and CRL' in the Security System Guide.

## 11.25.16 irep66015

---

**IREP: ERROR: irep66015: The mistake is found in user PIN(%s1). detail=%s2:%s3:%s4 [%s5]**

### Variable Information

%s1 = SSL configuration name

%s2 = Detail code 1

%s3 = SSL error code

%s4 = Detail code 2

%s5 = Repository name

### Explanation

There is an error in the User PIN.

### System Action

Stops the processing.

### User Action

Take either of the following actions depending on the certificate and private-key management environment used to perform SSL encryption communication:

- In an Interstage Certificate Environment

The Interstage Certificate Environment may have been restored during Interstage Management Console operation. Stop and then restart the Interstage Management Console. For details on starting and stopping the Interstage Management Console, refer to the following:

'Starting the Interstage Management Console' or 'Stopping the Interstage Management Console' in the Operator's Guide.

If the above action has no effect, the Interstage Certificate Environment may have been destroyed. Refer to 'Broken Certificate Environments' in "Error Codes to be Reported from Interstage Directory Service)" and correct the Interstage Certificate Environment.

- In a certificate/key management environment

Use the user PIN (tkn\_pwd) of the SSL environment definition file or tkn\_pwd of the SLENV structure as the user PIN of the certificate/key management environment to be used and re-execute the processing.

For the user PIN (tkn\_pwd) of the SSL environment definition file, correct it then encrypt it.

For details on user PIN (tkn\_pwd) of the SSL environment definition file, refer to the following:

'Setting up an Environment for SSL Communication - 'Setting an SSL Environment Definition File (Client)' in the Directory Service Operator's Guide

## 11.25.17 irep66016

---

**IREP: ERROR: irep66016: Operation management directory(%s1) error. detail=%s2:%s3:%s4 [%s5]**

### Variable Information

%s1 = Operation management directory name

%s2 = Detail code 1

%s3 = SSL error code

%s4 = Detail code 2

%s5 = Repository name

### Explanation

There is an error in the operation management directory.

### System Action

Stops the processing.

### User Action

Take either of the following actions depending on the certificate and private-key management environment used to perform SSL encryption communication:

- In an Interstage Certificate Environment

The Interstage Certificate Environment may have been destroyed. Refer to 'Broken Certificate Environments' in "Error Codes to be Reported from Interstage Directory Service" and correct the Interstage Certificate Environment.

- In a certificate/key management environment

Use the operation management directory (cert\_path) of the SSL environment definition file or cert\_path of the SLENV structure as the operation management directory of the certificate/key management environment to be used and re-execute the processing.

For details on the operation management directory (cert\_path) of the SSL environment definition file, refer to the following:

'Setting up an Environment for SSL Communication' - 'Setting an SSL Environment Definition File (Client)' in the Directory Service Operator's Guide.

## 11.25.18 irep66020

---

**IREP: ERROR: irep66020: It failed in the verification of the CA certificate. detail=%s1:%s2:%s3 [%s4]**

### Variable Information

%s1 = Detail code 1

%s2 = SSL error code  
%s3 = Detail code 2  
%s4 = Repository name

### Explanation

Verification of the CA certificate failed.

### System Action

Stops the processing.

### User Action

An error occurred in the certificate registration order. Re-register the certificates, starting sequentially at the CA certificate of the root CA, in the Interstage Certificate Environment or certificate/key management environment. For details about re-registering certificates, refer to 'When the certificate registration order is incorrect' in "Error Codes to be Reported from Interstage Directory Service".

## 11.25.19 irep66023

---

**IREP: ERROR: irep66023: The error occurred by accessing the socket while connecting SSL. errno=%s1, detail=%s2:%s3:%s4 [%s5]**

### Variable Information

%s1 = errno  
%s2 = Detail code 1  
%s3 = SSL error code  
%s4 = Detail code 2  
%s5 = Repository name

### Explanation

A socket access error occurred during use of SSL.

### System Action

Stops the processing.

### User Action

- No communication with the connection destination repository can be established. Check that the host name and port number of the connection destination are correct.
- Using the Interstage Management Console, check whether the connection destination repository is active.
  - If the repository is stopping, start it.
  - If the repository is active, stop it, then restart it.
  - If the repository is undefined, stop it, then start it.
- Report this error to the Network Administrator. If an error occurs in the network environment (for example, setting the hosts file, specifying the DNS and DHCP servers to be used, and setting the DNS and DHCP servers themselves), review and reset the network environment.
- For the error code 0x00400004 and detail code 145(0x91)

This error may occur when the load on the repository server is high.

- In the case of a user application, avoid the error by performing retry processing on error occurrence.
- In the case of the ldapmodify, ldapsearch, and ldapdelete commands, re-execute them.

- In the case of replication connection confirmation, re-confirm the connection.
- If the replication is in operation, use the above method to check whether the connection destination repository is active.

If SSL is used for the repository server and the Interstage Directory Service access frequency is high due to a large number of clients, the above actions may have no effect. If the error is not removed, consider reducing the load on the server using the SSL accelerator or another method.

If the above actions do not resolve the error, use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

## 11.25.20 irep66028

---

**IREP: ERROR: irep66028: It failed in site certificate(%s1) analysis. detail=%s2:%s3:%s4 [%s5]**

### Variable Information

- %s1 = Certificate nickname
- %s2 = Detail code 1
- %s3 = SSL error code
- %s4 = Detail code 2
- %s5 = Repository name

### Explanation

The site certificate failed to be analyzed.

### System Action

Stops the processing.

### User Action

Refer to 'Broken Certificate Environments' in "Error Codes to be Reported from Interstage Directory Service" and correct the Interstage Certificate Environment or certificate/key management environment.

If the above actions do not resolve the error, use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

## 11.25.21 irep66030

---

**IREP: ERROR: irep66030: It failed in the analysis of the CA certificate. detail=%s1:%s2:%s3 [%s4]**

### Variable Information

Register the CA certificates for verifying the connection destination site certificate, starting sequentially at the CA certificate of the root CA, in the Interstage Certificate Environment or certificate/key management environment of the local host. For details about re-registering certificates, refer to 'When the certificate registration order is incorrect' in "Error Codes to be Reported from Interstage Directory Service".

## 11.25.25 irep66035

---

**IREP: ERROR: irep66035: The route of the client certificate is imperfect. detail=%s1:%s2:%s3 [%s4]**

### Variable Information

%s1 = Detail code 1  
%s2 = SSL error code  
%s3 = Detail code 2  
%s4 = Repository name

### Explanation

The path of the received certificate is incomplete.

### System Action

Stops the processing.

### User Action

Register the CA certificates for verifying the certificate received from the connection destination, starting sequentially at the CA certificate of the root CA, in the Interstage Certificate Environment or certificate/key management environment of the local host. For details about re-registering certificates, refer to 'When the certificate registration order is incorrect' in "Error Codes to be Reported from Interstage Directory Service".

## 11.25.26 irep66036

---

**IREP: ERROR: irep66036: It failed in the analysis of client certificate. detail=%s1:%s2:%s3 [%s4]**

### Variable Information

%s1 = Detail code 1  
%s2 = SSL error code  
%s3 = Detail code 2  
%s4 = Repository name

### Explanation

Analysis of the received certificate failed.

### System Action

Stops the processing.

### User Action

Refer to 'Broken certificate environments' in "Error Codes to be Reported from Interstage Directory Service" and correct the Interstage Certificate Environment or certificate/key management environment.

If the above actions do not resolve the error, use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

## 11.25.27 irep66037

---

**IREP: ERROR: irep66037: SSL protocol version error. version=%s1, detail=%s2:%s3:%s4 [%s5]**

### Variable Information

%s1 = Version of the SSL protocol on the connection destination  
%s2 = Detail code 1  
%s3 = SSL error code  
%s4 = Detail code 2  
%s5 = Repository name

### Explanation

The SSL protocol version does not match that of the connection destination.

### System Action

Stops the processing.

### User Action

- For replication operation  
Match the SSL protocol version of the SSL configuration of the master repository with the version of the slave repository.
- For a connection between the LDAP client (ldapmodify, ldapsearch, ldapdelete, or user application) and the repository  
Match the SSL version (ssl\_version) of the LDAP client's SSL environment definition file with the SSL protocol version of the repository's SSL configuration.

- Common items

After correcting the SSL configuration, restart the repository that is using the SSL configuration to reflect the updated SSL configuration in the repository.

Confirm the system log of the connection destination. If a message is logged, ensure that the connection destination takes the action indicated by the logged message.

For details on the SSL version (`ssl_version`) and encryption algorithm (`crypt`) of the SSL environment definition file, refer to the following:

'Setting up an Environment for SSL Communication' - 'Setting an SSL Environment Definition File (Client)' in the Directory Service Operator's Guide.

For details on SSL error codes, refer to 'SSL Error Codes' in the Interstage Directory Service Operator's Guide.

If this does not resolve the error, use the `iscollectinfo` command to collect diagnostic information, then contact your service engineer.

## 11.25.28 irep66038

---

**IREP: ERROR: irep66038: The encryption method is not corresponding to the connection destination. detail=%s1:%s2:%s3 [%s4]**

### Variable Information

- %s1 = Detail code 1
- %s2 = SSL error code
- %s3 = Detail code 2
- %s4 = Repository name

### Explanation

The SSL protocol version or encryption method is inconsistent with that of the connection destination.

### System Action

Stops the processing.

### User Action

- For replication operation

Match the following SSL configuration settings between the master repository and slave repository:

- SSL protocol version
- Encryption method

- For a connection between the LDAP client (`ldapmodify`, `ldapsearch`, `ldapdelete`, or user application) and the repository

Match the following settings:

- SSL version (`ssl_version`) of the SSL environment definition file to be used by the LDAP client and SSL protocol version of the SSL configuration to be used by the repository
- Encryption algorithm (`crypt`) of the SSL environment definition file to be used by the LDAP client and the encryption method of the SSL configuration to be used by the repository

- Common items

After correcting the SSL configuration, restart the repository that is using the SSL configuration, to reflect the SSL configuration in the repository.

Confirm the system log of the connection destination. If a message is logged, have the connection destination take action according to that logged message.

For details on the SSL version (ssl\_version) and encryption algorithm (crypt) of the SSL environment definition file, refer to the following:

'Setting up an Environment for SSL Communication' - 'Setting an SSL Environment Definition File (Client)' in the Directory Service Operator's Guide.

For details on SSL error codes, refer to 'SSL Error Codes' in "Error Codes to be Reported from Interstage Directory Service".

If the above actions do not resolve the error, use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

## 11.25.29 irep66039

---

**IREP: ERROR: irep66039: The providers of digital certification services certificate to verify the client certificate is not registered. detail=%s1:%s2:%s3 [%s4]**

### Variable Information

%s1 = Detail code 1

%s2 = SSL error code

%s3 = Detail code 2

%s4 = Repository name

### Explanation

Verification of the site certificate for the connection destination failed. The CA certificate required for verification is not registered.

### System Action

Stops the processing.

### User Action

Take either of the following actions depending on the certificate and private-key management environment used to perform SSL encryption communication:

- In an Interstage Certificate Environment

If the local host is using the test certificate, stop using the test certificate, acquire the site certificate from the CA at the local host, then register the certificates (starting sequentially at the CA certificate) in the Interstage Certificate Environment of the local host.

Whether or not the local host is using the test certificate, register the CA certificates for verifying the connection destination site certificate (starting sequentially at the CA certificate of the root CA) in the Interstage Certificate Environment of the local host.

For details about re-registering certificates, refer to 'When the certificate registration order is incorrect' - 'Interstage Certificate Environments' in "Error Codes to be Reported from Interstage Directory Service".

- In a certificate/key management environment

Register the CA certificates for verifying the connection destination site certificate, starting sequentially at the CA certificate of the root CA, in the Interstage Certificate Environment or certificate/key management environment of the local host.

For details about re-registering certificates, refer to 'When the certificate registration order is incorrect' - 'Certificate/key management environments' in "Error Codes to be Reported from Interstage Directory Service".

If the above actions do not resolve the error, use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

## 11.25.30 irep66040

---

**IREP: ERROR: irep66040: The unsupported client certificate was received. detail=%s1:%s2:%s3 [%s4]**

## Variable Information

%s1 = Detail code 1  
%s2 = SSL error code  
%s3 = Detail code 2  
%s4 = Repository name

## Explanation

An unsupported site certificate has been received.

## System Action

Stops the processing.

## User Action

Have the connection destination acquire the supported site certificates from the CA, then have it register the certificates, starting sequentially at the CA certificate of the root CA, in the Interstage Certificate Environment or certificate/key management environment.

Moreover, register the CA certificates for verifying the connection destination site certificate, starting sequentially at the CA certificate of the root CA, in the Interstage Certificate Environment or certificate/key management environment of the local host.

For details about re-registering certificates, refer to 'When the certificate registration order is incorrect' in "Error Codes to be Reported from Interstage Directory Service".

For details on supported certificates, refer to the following:

'Constructing and Using the Interstage Certificate Environment' - 'Certificates and Private-keys' in the Security System Guide.

If the above actions do not resolve the error, use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

## 11.25.31 irep66043

---

**IREP: ERROR: irep66043: Client certificate was not able to be received. detail=%s1:%s2:%s3 [%s4]**

## Variable Information

%s1 = Detail code 1  
%s2 = SSL error code  
%s3 = Detail code 2  
%s4 = Repository name

## Explanation

The site certificate failed to be received for one of the following reasons:

- The site certificate is not registered in the connection destination.
- The connection destination rejected the transmission of the site certificate.

## System Action

Stops the processing.

## User Action

Have the connection destination acquire the site certificate from the CA and register the certificates, (starting sequentially at the CA certificate of the root CA), in the Interstage Certificate Environment or certificate/key management environment. Then have the connection destination send the certificates.

Register the CA certificates for verifying the connection destination site certificate (starting sequentially at the CA certificate of the root CA) in the Interstage Certificate Environment or certificate/key management environment of the local host.

For details about re-registering certificates, refer to 'When the certificate registration order is incorrect' in "Error Codes to be Reported from Interstage Directory Service".

If there is no improvement after the above action is taken, note the following points:

- Only the test site certificate can be registered at the connection destination as the site certificate. Confirm that an appropriate site certificate is registered at the connection destination. The test site certificate cannot be used for client authentication. Acquire the site certificate formally from the CA and register it in the Interstage Certificate Environment, referencing the following:  
'Setting up an Environment for SSL Communication' in the Directory Service Operator's Guide.
- If the connection destination specifies the SSL configuration in which the test site certificate is set, stop using that SSL configuration, then use the SSL configuration in which the site certificate formally acquired from the CA is set.

If the above actions do not resolve the error, use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

## 11.25.32 irep66044

---

**IREP: ERROR: irep66044: When the CA certificate of the client was referred, it became an authority error. detail=%s1:%s2:%s3 [%s4]**

### Variable Information

- %s1 = Detail code 1
- %s2 = SSL error code
- %s3 = Detail code 2
- %s4 = Repository name

### Explanation

An authorization error occurred during referencing of the CA certificate.

### System Action

Stops the processing.

### User Action

Refer to 'Broken certificate environments' in "Error Codes to be Reported from Interstage Directory Service" and correct the Interstage Certificate Environment or certificate/key management environment.

The number of usable file descriptors (fd) may be insufficient. Use *ulimit(1)* or *setrlimit(2)* to increase the usable file descriptors.

If the above actions do not resolve the error, use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

## 11.25.33 irep66045

---

**IREP: ERROR: irep66045: The mistake is found in the setting of the encryption method. detail=%s1:%s2:%s3 [%s4]**

### Variable Information

- %s1 = Detail code 1
- %s2= SSL error code
- %s3 = Detail code 2
- %s4 = Repository name

## Explanation

There is an error in the setting of the encryption method.

## System Action

Stops the processing.

## User Action

Take either of the following actions depending on the certificate and private-key management environment used to perform SSL encryption communication:

- In an Interstage Certificate Environment

The Interstage Certificate Environment may have been damaged. Refer to 'Broken certificate environments' in "Error Codes to be Reported from Interstage Directory Service" and correct the Interstage Certificate Environment.

- In a certificate/key management environment

Set the encryption algorithm (crypt) of the SSL environment definition file or crypt of the SLENV structure correctly, then re-execute the processing.

For details on the encryption algorithm (crypt) of the SSL environment definition file, refer to the following:

'Setting up an Environment for SSL Communication' - 'Setting an SSL Environment Definition File (Client)' in the Directory Service Operator's Guide.

## 11.25.34 irep66050

---

**IREP: ERROR: irep66050: SSL Handshake timeout. detail=%s1:%s2:%s3 [%s4]**

### Variable Information

%s1 = Detail code 1

%s2 = SSL error code

%s3 = Detail code 2

%s4 = Repository name

## Explanation

A timeout occurred during SSL connection.

## System Action

Stops the processing.

## User Action

- In the case of an LDAP client (ldapmodify, ldapsearch, ldapdelete, or user application)

Use the Interstage Management Console to check whether the repository for the connection destination is activating normally. If the activity is not normal, confirm the environment, configure the repository, and then restart it.

If the connection destination is in normal operation:

- The load on the repository server is high.

For a user application, the error can be avoided by performing retry processing at error occurrence.

If SSL is used for the repository server and the access frequency for Interstage Directory Service is high because of a large number of clients, the above action may have no effect. If the error is not removed, consider reducing the load on the server using the SSL accelerator, etc.

- Invalid connection to the repository server:

If using a non-SSL LDAP protocol or other protocols to connect to the [SSL Port Number] that has been set in the Interstage management console, this error occurs too. Check the setting of the original connection application.

- In other cases:

A timer value may be too short. Increase the timer value (ssl\_timer) of the SSL environment definition file or the value (ssl\_timer) of the SLENV structure, then re-execute the processing.

For details on the timer value (ssl\_timer) of the SSL environment definition file, refer to the following:

'Setting up an Environment for SSL Communication' - 'Setting an SSL Environment Definition File (Client)' in the Directory Service Operator's Guide.

If the above actions do not resolve the error, use the iscollectinfo command to collect diagnostic information, then contact your service engineer.

- In cases other than an LDAP client.

If using a non-SSL LDAP protocol or other protocols to connect to the [SSL Port Number] that has been set in the Interstage management console, this error occurs too. Check the setting of the original connection application.

If the above actions do not resolve the error, use the iscollectinfo command to collect diagnostic information, then contact your service engineer.

## 11.25.35 irep66051

---

**IREP: ERROR: irep66051: The encryption method is unsupported. detail=%s1:%s2:%s3 [%s4]**

### Variable Information

%s1 = Detail code 1

%s2 = SSL error code

%s3 = Detail code 2

%s4 = Repository name

### Explanation

An unsupported encryption method was specified.

### System Action

Stops the processing.

### User Action

Take either of the following actions depending on the certificate and private-key management environment used to perform SSL encryption communication:

- In an Interstage Certificate Environment

The Interstage Certificate Environment may have been damaged. Refer to 'Broken certificate environments' in "Error Codes to be Reported from Interstage Directory Service" and correct the Interstage Certificate Environment.

- In a certificate/key management environment

Set the encryption algorithm (crypt) of the SSL environment definition file or crypt of the SLENV structure correctly, then re-execute the processing.

For details on the encryption algorithm (crypt) of the SSL environment definition file, refer to the following:

'Setting up an Environment for SSL Communication' - 'Setting an SSL Environment Definition File (Client)' in the Directory Service Operator's Guide

## 11.25.36 irep66052

---

**IREP: ERROR: irep66052: Server certificate is expired. detail=%s1:%s2:%s3 [%s4]**

### Variable Information

- %s1 = Detail code 1
- %s2 = SSL error code
- %s3 = Detail code 2
- %s4 = Repository name

### Explanation

The connection destination site certificate has expired.

### System Action

Stops the processing.

### User Action

Have the connection destination acquire a new site certificate from the CA, then have it register the new site certification in its Interstage Certificate Environment.

For details about obtaining and registering new Site certificates, refer to 'When the Site certificate has expired' in "Error Codes to be Reported from Interstage Directory Service".

## 11.25.37 irep66053

---

**IREP: ERROR: irep66053: It failed in the analysis of the server certificate. detail=%s1:%s2:%s3 [%s4]**

### Variable Information

- %s1 = Detail code 1
- %s2 = SSL error code
- %s3 = Detail code 2
- %s4 = Repository name

### Explanation

Analysis of the connection destination site certificate failed.

### System Action

Stops the processing.

### User Action

The Interstage Certificate Environment of the connection destination may have been damaged. Refer to 'Broken certificate environments' in "Error Codes to be Reported from Interstage Directory Service" and correct the Interstage Certificate Environment.

## 11.25.38 irep66054

---

**IREP: ERROR: irep66054: It failed in the verification of the server certificate. detail=%s1:%s2:%s3 [%s4]**

### Variable Information

- %s1 = Detail code 1

%s2 = SSL error code  
%s3 = Detail code 2  
%s4 = Repository name

### Explanation

Verification of the connection destination site certificate failed.

### System Action

Stops the processing.

### User Action

To confirm that there are no errors in the connection destination, the CA certificates required for verifying the connection destination site certificate must be registered, starting sequentially at the CA certificate of the root CA, in the Interstage Certificate Environment of the local host.

For details about re-registering certificates, refer to 'When the certificate registration order is incorrect' - 'Interstage Certificate Environments' in "Error Codes to be Reported from Interstage Directory Service".

## 11.25.39 irep66055

---

**IREP: ERROR: irep66055: Internal inconsistency in SSL library occurred. detail=%s1:%s2:%s3 [%s4]**

### Variable Information

%s1 = Detail code 1  
%s2 = SSL error code  
%s3 = Detail code 2  
%s4 = Repository name

### Explanation

An internal inconsistency occurred in the SSL library.

### System Action

Stops the processing.

### User Action

Use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

## 11.25.40 irep66056

---

**IREP: ERROR: irep66056: Server certificate has no path list. detail=%s1:%s2:%s3 [%s4]**

### Variable Information

%s1 = Detail code 1  
%s2 = SSL error code  
%s3 = Detail code 2  
%s4 = Repository name

### Explanation

There is no path list in the site certificate.

## System Action

Stops the processing.

## User Action

To confirm that there are no errors in the connection destination, the CA certificates required for verifying the connection destination site certificate must be registered, starting sequentially at the CA certificate of the root CA, in the Interstage Certificate Environment of the local host.

For details about re-registering certificates, refer to 'When the certificate registration order is incorrect' - 'Interstage Certificate Environments' in "Error Codes to be Reported from Interstage Directory Service".

## 11.25.41 irep66057

---

**IREP: ERROR: irep66057: Route of the server certificate is imperfect. detail=%s1:%s2:%s3 [%s4]**

### Variable Information

%s1 = Detail code 1

%s2 = SSL error code

%s3 = Detail code 2

%s4 = Repository name

### Explanation

The site certificate path of the connection destination is incomplete.

### System Action

Stops the processing.

### User Action

If the connection destination is using the test certificate, have it stop using the test certificate and have it acquire the site certificate from the CA, then register the certificates. The certificates must be registered, starting sequentially at the CA certificate of the root CA, in its Interstage Certificate Environment.

To confirm that there are no errors in the connection destination (regardless of whether it is using the test certificate), the CA certificates required for verifying the connection destination site certificate must be registered, starting sequentially at the CA certificate of the root CA, in the Interstage Certificate Environment of the local host.

For details about re-registering certificates, refer to 'When the certificate registration order is incorrect' - 'Interstage Certificate Environments' in "Error Codes to be Reported from Interstage Directory Service".

## 11.25.42 irep66058

---

**IREP: ERROR: irep66058: It broke off the connection of SSL. Please refer to the log of the server for a detailed cause at the connection destination. detail=%s1:%s2:%s3 [%s4]**

### Variable Information

%s1 = Detail code 1

%s2 = SSL error code

%s3 = Detail code 2

%s4 = Repository name

### Explanation

SSL connection failed, or it was disconnected.

## System Action

Stops the processing.

## User Action

- For replication operation

Match the following settings of the SSL configuration to be used, between the master repository and slave repository:

- SSL protocol version
- Encryption method

- For connection between the LDAP client (ldapmodify, ldapsearch, ldapdelete, or user application) and the repository

Match the following settings:

- SSL version (ssl\_version) of the SSL environment definition file to be used by the LDAP client and SSL protocol version of the SSL configuration to be used by the repository
- Encryption algorithm (crypt) of the SSL environment definition file to be used by the LDAP client and the encryption method of the SSL configuration to be used by the repository
- Only the test site certificate may be registered as the site certificate. Confirm that an appropriate site certificate is registered. The test site certificate cannot be used for client authentication. Acquire the site certificate formally from the CA and register it in the Interstage Certificate Environment, referencing the following:  
'Setting up an Environment for SSL Communication' in the Directory Service Operator's Guide.
- If the SSL configuration in which the test site certificate is set is specified, stop using that SSL configuration, then use the SSL configuration in which the site certificate formally acquired from the CA is set.
- Common items

After correcting the SSL configuration, restart the repository that is using the SSL configuration, to reflect the SSL configuration in the repository.

Confirm the system log of the connection destination. If a message is logged, have the connection destination take the indicated action.

For details on the SSL version (ssl\_version) and encryption algorithm (crypt) of the SSL environment definition file, refer to the following:

'Setting up an Environment for SSL Communication' - 'Setting an SSL Environment Definition File (Client)' in the Directory Service Operator's Guide

For details on the SSL error code, refer to the following:

'SSL Error Codes' in the Directory Service Operator's Guide.

If the above actions do not resolve the error, use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

## 11.25.43 irep66061

---

**IREP: ERROR: irep66061: Internal error occurred. detail=%s1:%s2:%s3 [%s4]**

### Variable Information

%s1 = Source number

%s2 = Relative source number

%s3 = SSL error code

%s4 = Repository name

## Explanation

An internal inconsistency was detected.

## System Action

Stops the processing.

## User Action

Use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

## 11.25.44 irep66062

---

**IREP: ERROR: irep66062: Out of memory. detail=%s1:%s2:%s3 [%s4]**

### Variable Information

%s1 = Source number

%s2 = Relative source number

%s3 = SSL error code

%s4 = Repository name

## Explanation

A memory shortage occurred.

## System Action

Stops the processing.

## User Action

Close any unnecessary programs and check that sufficient memory space is allocated for Interstage Directory Service operation.

For details on the memory space used for Interstage Directory Service, refer to the following:

'Memory Requirements' in the Tuning Guide.

## 11.25.45 irep66063

---

**IREP: ERROR: irep66063: When the SSL portnumber is specified, the environment setting of SSL is necessary. port=%s1 [%s2]**

### Variable Information

%s1 = Port number

%s2 = Repository name

## Explanation

The SSL port number is specified, but the SSL environment is not set.

## System Action

Stops the processing.

## User Action

If using SSL, be sure to set the SSL environment.

For details on setting the SSL environment, refer to the following:

- 'Configuring Environments' in the Security System Guide
- 'Environment Setting for Certificate/Key Management Environment' in the Security System Guide.

For details on using SSL with Interstage Directory Service, refer to the following:

'Setting up an Environment for SSL Communication' in the Directory Service Operator's Guide.

If the above action does not resolve the error, use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

## 11.25.46 irep66066

---

**IREP: INFO: irep66066: Client broke off the request. detail=%s1:%s2:%s3 [%s4]**

### Variable Information

- %s1 = Detail code 1
- %s2 = SSL error code
- %s3 = Detail code 2
- %s4 = Repository name

### Explanation

The connection was disconnected during acceptance of a request from a connection destination.

### System Action

Stops the processing.

### User Action

- For replication operation

Match the following settings of the SSL configuration to be used, between the master repository and slave repository:

- SSL protocol version
- Encryption method

- For connection between the LDAP client (ldapmodify, ldapsearch, ldapdelete, or user application) and the repository

Match the following settings:

- SSL version (ssl\_version) of the SSL environment definition file to be used by the LDAP client and SSL protocol version of the SSL configuration to be used by the repository
- Encryption algorithm (crypt) of the SSL environment definition file to be used by the LDAP client and the encryption method of the SSL configuration to be used by the repository

- Common items

After correcting the SSL configuration, restart the repository that is using the SSL configuration, to reflect the SSL configuration in the repository.

Confirm the system log of the connection destination. If a message is logged, have the connection destination take the indicated action.

If using a non-SSL LDAP protocol or other protocols to connect to the [SSL Port Number] that has been set in the Interstage management console, this error occurs too. Check the setting of the original connection application.

For details on the SSL version (ssl\_version) and encryption algorithm (crypt) of the SSL environment definition file, refer to the following:

'Setting up an Environment for SSL Communication' - 'Setting an SSL Environment Definition File (Client)' in the Directory Service Operator's Guide.

For details on the SSL error code, refer to the following:

'SSL Error Codes' in the Directory Service Operator's Guide.

If the above actions do not resolve the error, use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

## 11.25.47 irep66067

%s2 = Repository name

### Explanation

The Interstage Certificate Environment does not exist.

### System Action

Stops the processing.

### User Action

Create an Interstage Certificate Environment. For details on creating an Interstage Certificate Environment, refer to the following:  
'Configuring Environments' in the Security System Guide.

## 11.25.55 irep66087

---

**IREP: ERROR: irep66087: Interstage certificate environment is destroyed. detail=%s1 [%s2]**

### Variable Information

%s1 = Detail code  
%s2 = Repository name

### Explanation

The Interstage Certificate Environment has been destroyed.

## System Action

Stops the processing.

## User Action

Refer to 'Broken certificate environments' in "Error Codes to be Reported from Interstage Directory Service" and correct the Interstage Certificate Environment.

## 11.25.56 irep66088

---

**IREP: ERROR: irep66088: The form of the encryption password stored in the Interstage certificate environment is abnormal. detail=%s1 [%s2]**

### Variable Information

%s1 = Detail code

%s2 = Repository name

### Explanation

Analysis of the encryption password stored in the Interstage Certificate Environment failed.

### System Action

Stops the processing.

### User Action

The Interstage Certificate Environment may have been damaged Refer to 'Broken certificate environments' in "Error Codes to be Reported from Interstage Directory Service" and correct the Interstage Certificate Environment.

## 11.25.57 irep66089

---

**IREP: ERROR: irep66089: A necessary handle was insufficient when Interstage certificate environment was referred. detail=%s1 [%s2]**

### Variable Information

%s1 = Detail code

%s2 = Repository name

### Explanation

There are insufficient resources for access to the Interstage Certificate Environment.

### System Action

Stops the processing.

### User Action

Close any unnecessary programs.

If this does not resolve the error, use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

## 11.25.58 irep66090

---

**IREP: ERROR: irep66090: Internal error was notified from the Interstage certificate environment. detail=%s1:%s2 [%s3]**

### Variable Information

%s1 = Internal error code

%s2 = Detail code

%s3 = Repository name

### Explanation

An internal inconsistency was detected during access to the Interstage Certificate Environment.

### System Action

Stops the processing.

### User Action

Use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

## 11.25.59 irep66099

---

**IREP: ERROR: irep66099: The unexpected error was detected by the SSL library. detail=%s1:%s2:%s3 [%s4]**

### Variable Information

%s1 = Detail code 1

%s2 = SSL error code

%s3 = Detail code 2

%s4 = Repository name

### Explanation

An unexpected error was detected in an SSL function.

### User Action

If the detail code 1 is '14' and the SSL error code is '0x5000d', the client may be using a protocol without SSL or another unrecognized protocol for access to the [SSL Port Number] which has been set by the Interstage Management Console.

Check whether the access setting for [SSL Port Number], the protocol used by the client, the connection destination host name and port number are correct.

If this does not resolve the error, use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

## 11.26 irep70000 to irep70099

---

### 11.26.1 irep70000

## Variable Information

%s1 = Repository name

## Explanation

The repository environment setting has been deleted correctly. %s1 indicates the name of the deleted repository.

---

**11.27 irep70100 to irep70199**

---

---

**11.27.1 irep70100**

---

**IREP: ERROR: irep70100: Interstage Directory Service not installed.**

## Explanation

Interstage Directory Service is not installed or the installation environment has been damaged.

## User Action

If Interstage Directory Service is not installed, install it. If Interstage Directory Service is already installed, the installation environment may have been damaged so save the resources and reinstall Interstage Directory Service.

---

**11.27.2 irep70101**

---

**IREP: ERROR: irep70101: Repository startup failed. [%s1]**

## Variable Information

%s1 = Repository name

## Explanation

The repository could not be activated. %s1 indicates the name of the repository that could not be activated.

## User Action

Take the appropriate action according to the immediately preceding message, then restart the repository.

If this does not resolve the error, collect displayed messages and log information. Use the *iscollectinfo* command to collect diagnostic information, and then contact your service engineer.

---

**11.27.3 irep70102**

---

**IREP: ERROR: irep70102: Internal inconsistency occurred.: [%s1] details: %s2**

## Variable Information

%s1 = Repository name

%s2 = Detailed information

## Explanation

An internal conflict occurred. %s1 indicates the name of the repository where the internal conflict occurred.

## User Action

Restart the Interstage Management Console.

For details on restarting the Interstage Management Console, refer to 'Starting the Interstage Management Console' or 'Stopping the Interstage Management Console' in the Operator's Guide.

If this does not resolve the error, collect displayed messages and log information. Use the *iscollectinfo* command to collect diagnostic information, and then contact your service engineer.

## 11.27.4 irep70103

---

**IREP: ERROR: irep70103: Register process error occurred. [%s1] details: %s2**

### Variable Information

%s1 = Repository name

%s2 = Detailed information

## Explanation

An error occurred during data registration in the Interstage Management Console. %s1 indicates the name of the repository where the error occurred during data registration.

## User Action

Restart the Interstage Management Console.

For details on restarting the Interstage Management Console, refer to 'Starting the Interstage Management Console' or 'Stopping the Interstage Management Console' in the Operator's Guide.

If this does not resolve the error, collect displayed messages and log information. Use the *iscollectinfo* command to collect diagnostic information, and then contact your service engineer.

## 11.27.5 irep70105

---

**IREP: ERROR: irep70105: Update process error occurred. details: %s1**

### Variable Information

%s1 = Detailed information

## Explanation

An error occurred when the Interstage Management Console was being updated.

## User Action

Restart the Interstage Management Console.

For details on restarting the Interstage Management Console, refer to 'Starting the Interstage Management Console' or 'Stopping the Interstage Management Console' in the Operator's Guide.

If this does not resolve the error, collect displayed messages and log information. Use the *iscollectinfo* command to collect diagnostic information, and then contact your service engineer.

## 11.27.6 irep70106

---

**IREP: ERROR: irep70106: Internal inconsistency occurred. details: %s1**

### Variable Information

%s1 = Detailed information

## Explanation

An internal conflict occurred.

## User Action

Restart the Interstage Management Console.

For details on restarting the Interstage Management Console, refer to 'Stopping the Interstage Management Console' or 'Stopping the Interstage Management Console' in the Operator's Guide.

If this does not resolve the error, collect displayed messages and log information. Use the *iscollectinfo* command to collect diagnostic information, and then contact your service engineer.

## 11.27.7 irep70107

---

**IREP: ERROR: irep70107: Initialization process failed. details: %s1**

### Variable Information

%s1 = Detailed information

### Explanation

The initialization process failed.

### User Action

Check whether there is a problem in the installation environment. If there is not, collect displayed messages and log information. Use the *iscollectinfo* command to collect diagnostic information, and then contact your service engineer.

## 11.27.8 irep70108

---

**IREP: ERROR: irep70108: Error occurred in Register process of SSL definition. [%s1] details: %s2**

### Variable Information

%s1 = Repository name

%s2 = Detailed information

### Explanation

An error occurred in the SSL configuration registration process. %s1 indicates the name of the repository where the error occurred in the SSL configuration registration process.

### User Action

Collect displayed messages and log information. Use the *iscollectinfo* command to collect diagnostic information, and then contact your service engineer.

## 11.27.9 irep70109

---

**IREP: ERROR: irep70109: Error occurred in Register process of SSL definition. details: %s1**

### Variable Information

%s1 = Detailed information

### Explanation

An error occurred in the SSL configuration registration process.

## User Action

Take the appropriate action according to the message displayed immediately before this message. If this does not resolve the error, collect displayed messages and log information. Use the *iscollectinfo* command to collect diagnostic information, and then contact your service engineer.

## 11.27.10 irep70110

---

**IREP: ERROR: irep70110: Error occurred in deletion process of SSL definition. [%s1] details: %s2**

### Variable Information

%s1 = Repository name

%s2 = Detailed information

### Explanation

An error occurred in the SSL configuration deletion process. %s1 indicates the name of the repository where the error occurred in the SSL configuration deletion process.

### User Action

Collect displayed messages and log information. Use the *iscollectinfo* command to collect diagnostic information, and then contact your service engineer.

## 11.27.11 irep70111

---

**IREP: ERROR: irep70111: Error occurred in deletion process of SSL definition. details: %s1**

### Variable Information

%s1 = Detailed information

### Explanation

An error occurred in the SSL configuration deletion process.

### User Action

Take the appropriate action according to the message displayed immediately before this message. If this does not resolve the error, collect displayed messages and log information. Use the *iscollectinfo* command to collect diagnostic information, and then contact your service engineer.

## 11.27.12 irep70112

---

**IREP: ERROR: irep70112: Error occurred in update process of SSL definition. [%s1] details: %s2**

### Variable Information

%s1 = Repository name

%s2 = Detailed information

### Explanation

An error occurred in the SSL configuration update process. %s1 indicates the name of the repository where the error occurred in the SSL configuration update process.

## User Action

Collect displayed messages and log information. Use the *iscollectinfo* command to collect diagnostic information, and then contact your service engineer.

## 11.27.13 irep70113

---

**IREP: ERROR: irep70113: Error occurred in update process of SSL definition. details: %s1**

### Variable Information

%s1 = Detailed information

### Explanation

An error occurred in the SSL configuration update process.

### User Action

Take the appropriate action according to the message displayed immediately before this message. If this does not resolve the error, collect displayed messages and log information. Use the *iscollectinfo* command to collect diagnostic information, and then contact your service engineer.

## 11.27.14 irep70114

---

**IREP: ERROR: irep70114: Since service is using Repository, it cannot be deleted. [%s1]**

### Variable Information

%s1 = Repository name

### Explanation

The repository cannot be deleted because it is being used by another service. %s1 indicates the name of the repository that cannot be deleted.

### User Action

The target repository cannot be deleted because it is being used by another service. Terminate the service that is using the repository and delete the service or select another repository in the service environment setup and then delete the repository again.

If no other services are using the repository, use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

## 11.27.15 irep70115

---

**IREP: ERROR: irep70115: Failed to connect with replica. Check replica hosts information. details: %s1 [%s2]**

### Variable Information

%s1 = Detailed information

%s2 = Repository name

### Explanation

Connection with the replication destination failed.

### System Action

Stops the processing.

## User Action

Take the appropriate action for the code indicated in the detailed information according to 'LDAP Error Codes' in "Error Codes to be Reported from Interstage Directory Service", then execute the command again.

If the detailed information code is 49:

The public directory specification on the master side may not match that on the slave side. If they do not match, re-build the repository on the slave side.

If the detailed information code is 53:

Review and reconfigure the repository or network. Possible causes of this error may be any of the following:

- The server on the slave side is not set so that it is operated in slave mode.
- The host name of the master specified in the slave operation settings on the slave side does not match that of the server that created the master.
- The repository name on the master side does not match that on the slave side.
- The 'DN for the connection' in the replication connection settings does not match the 'Administrator DN' on the slave side.
- The 'Password for the connection' in the replication connection settings does not match the 'Administrator DN password' on the slave side.
- The network environment is incorrect.

Example:

- Description in the hosts file on the slave side
- Specification of the DNS server/DHCP server used from the slave
- Setting of the DNS server/DHCP server used from the slave

If the detailed information code is 81:

- If the 'Port number' or the 'Enable SSL encryption?' in the replication connection settings is incorrect:  
Reset 'Replication Connection Settings'.
- If SSL configuration settings (such as the SSL configuration protocol version and encryption method) on the master side do not match those on the slave side:  
Review and reset SSL configuration settings.
- If the slave repository is not activated:  
Activate the slave repository.
- If the network environment is incorrect:  
Review and reconfigure the network environment.

Example:

- Description in the hosts file on the master side
- Specification of the DNS server/DHCP server used from the master
- Setting of the DNS server/DHCP server used from the master
- Check the system log of the connection destination server. If messages are stored in the system log, follow the instructions indicated in the messages.
- Only the site certificate for the test may have been registered as the site certificate. Check that the appropriate site certification is registered. If only the site certificate for the test is registered as the site certificate, obtain the site certificate formally from the certification authority (CA) and register it in the Interstage Certificate Environment by referencing the following:

'Setting up an Environment for SSL Communication' in the Directory Service Operator's Guide

- If the SSL configuration in which the site certificate for the test is set is specified on the slave side, stop the use of the SSL configuration on the slave side and specify the SSL configuration in which the site certificate formally obtained from the CA is set.
- If the SSL configuration in which the site certificate for the test is specified is set in the replication connection settings on the master side, stop the use of the SSL configuration on the master side and specify the SSL configuration in which the site certificate formally obtained from the CA is set.

Take the appropriate action for the LDAP error code indicated in the detailed information by referring to 'LDAP Error Codes' in "Error Codes to be Reported from Interstage Directory Service", then execute the command again.

If the same message is still displayed although the above action has been taken (or if detailed information other than the above is displayed), reset the replication connection settings according to the LDAP error code indicated in the detailed information, then execute the command again.

If a message is displayed immediately before this message, take the action indicated by that message.

## 11.27.16 irep70116

---

**IREP: ERROR: irep70116: Stop the Repository before updating the configuration of the Repository. [%s1]**

### Variable Information

%s1 = Repository name

### Explanation

An attempt was made to update the environment setup of the repository being activated. Stop the repository before updating the environment setup.

### System Action

Stops the processing.

### User Action

Stop the repository and then change the environment setup.

## 11.27.17 irep70117

---

**IREP: ERROR: irep70117: Error occurred in address solution of replica host information(%s1) to add. [%s2] details: %s3**

### Variable Information

%s1 = Host name to be added

%s2 = Repository name

%s3 = Detailed information

### Explanation

An error occurred in the address resolution of the replication connection settings to be added. %s2 indicates the name of the repository where the error occurred.

### User Action

Exception information that occurred at the address resolution is displayed as detailed information. Review the network environment according to the displayed detailed information and check that the specified host name is correct, then set up the network environment again.

If the specified host name is correct and the server machine network environment is changed when the Interstage Management Console is being activated, take one of the following actions depending on the version of JDK/JRE used in the Interstage Management Console execution environment. Once this has been done, set up the network environment again.

## 11.27.18 irep70118

---

**IREP: ERROR: irep70118: Error occurred in address solution of defined replica host information(%s1). [%s2] details: %s3**

### Variable Information

%s1 = Name of the defined host where the error occurred

%s2 = Repository name

%s3 = Detailed information

### Explanation

An error occurred in the address resolution of the defined replication connection settings. %s2 indicates the name of the repository where the error occurred.

### User Action

Exception information that occurred at the address resolution is displayed as detailed information. Review the network environment according to the displayed detailed information, then set up the network environment again.

If the server machine network environment is changed when the Interstage Management Console is being activated, take one of the following actions depending on the version of JDK or JRE used in the Interstage Management Console execution environment. Once this has been done, set up the network environment again.

## 11.27.19 irep70119

---

**IREP: ERROR: irep70119: Error occurred in address solution of server. [%s1] details: %s2**

### Variable Information

%s1 = Repository name

%s2 = Detailed information

### Explanation

An error occurred in the address resolution of the server where the repository is operating. %s1 indicates the name of the repository where the error occurred.

### User Action

Exception information that occurred at the address resolution is displayed as detailed information. Review the network environment according to the displayed detailed information, then set up the network environment again.

If the server machine network environment is changed when the Interstage Management Console is being activated, take one of the following actions depending on the version of JDK or JRE used in the Interstage Management Console execution environment. Once this has been done, set up the network environment again.

## 11.27.20 irep70120

---

**IREP: ERROR: irep70120: Error occurred in address solution of master(%s1). [%s2] details: %s3**

## Variable Information

%s1 = Master host name

%s2 = Repository name

%s3 = Detailed information

## Explanation

An error occurred in the address resolution of the specified master. %s2 indicates the name of the repository where the error occurred.

## User Action

Exception information that occurred at the address resolution is displayed as detailed information. Review the network environment according to the displayed detailed information and check that the specified host name is correct, then set up the network environment again.

If the specified host name is correct and the server machine network environment is changed when the Interstage Management Console is being activated, take one of the following actions depending on the version of JDK or JRE used in the Interstage Management Console execution environment. Once this has been done, set up the network environment again.

If this message is output when 'Stand-alone' is selected for the application type, click [Refresh] to re-obtain the environment definition contents and then re-execute processing.

## 11.27.21 irep70121

---

### **IREP: ERROR: irep70121: Repository does not exist. [%s1]**

## Variable Information

%s1 = Repository name

## Explanation

The repository does not exist. %s1 indicates the name of the non-existent repository.

The repository may have been deleted by another user.

## User Action

Acquire the latest repository information from the status display window and check if the repository exists. If the repository exists, execute the command again.

If this does not resolve the error, collect displayed messages and log information. Use the *iscollectinfo* command to collect diagnostic information, and then contact your service engineer.

## 11.27.22 irep70122

---

### **IREP: ERROR: irep70122: SSL definition does not exist. SSL definition name:%s1 [%s2]**

## Variable Information

%s1 = SSL configuration name

%s2 = Repository name

## Explanation

The specified SSL configuration does not exist.

## User Action

The specified SSL configuration may have been deleted by another user. Specify another SSL configuration or create an SSL configuration, then execute the command again.

If this does not resolve the error, collect displayed messages and log information. Use the *iscollectinfo* command to collect diagnostic information, and then contact your service engineer.

## 11.27.23 irep70123

---

**IREP: ERROR: irep70123: Internal contradiction on connection check to the replica was detected. [%s1]**

### Variable Information

%s1 = Repository name

### Explanation

An internal conflict was detected during the replication destination connection check.

### User Action

If a message was displayed immediately before this message, take the action indicated by that message, then execute the command again.

If this does not resolve the error, collect displayed messages and log information. Use the *iscollectinfo* command to collect diagnostic information, and then contact your service engineer.

## 11.27.24 irep70124

---

**IREP: ERROR: irep70124: SSL connection initialization on connection check to the replica failed. [%s1]**

### Variable Information

%s1 = Repository name

### Explanation

The SSL connection could not be initialized during the connection check with the replication destination.

### User Action

If a message was displayed immediately before this message, take the action indicated by that message, then re-execute the command.

## 11.27.25 irep70125

---

**IREP: ERROR: irep70125: Internal contradiction occurred. [%s1]**

### Variable Information

%s1 = Repository name

### Explanation

An internal conflict occurred. %s1 indicates the name of the repository where the internal conflict occurred.

### User Action

Restart the Interstage Management Console.

For details on restarting the Interstage Management Console, refer to 'Starting the Interstage Management Console' or 'Stopping the Interstage Management Console' in the Operator's Guide.

If this does not resolve the error, collect displayed messages and log information. Use the *iscollectinfo* command to collect diagnostic information, and then contact your service engineer.

## 11.27.26 irep70126

**IREP: ERROR: irep70126: Datastore with the same name already exists, specified repository can not be created. [%s1]**

### Variable Information

%s1 = Repository name

### Explanation

Interstage Directory Service uses a repository name as a datastore name.

The specified repository could not be created because datastore creation failed. Datastore creation failed because a datastore with the same name as other products already exists or, Interstage Directory Service may have been reinstalled and a repository created with an already existing name.

### User Action

Interstage Directory Service uses a repository name as a datastore name. Take any of the following actions:

- If the repository name is used as a datastore name for other products

Specify another repository name, then recreate the repository. If this does not resolve the error, collect displayed messages and log information. Use the `iscollectinfo` command to collect diagnostic information, and then contact your service engineer.

For the datastore names used by other products, refer to the manual of the Interstage Portalworks, Interstage Contentbiz, or Interstage Studio that use datastores.

- If the repository name is not used as a datastore name for other products or if Interstage Directory Service has been reinstalled. Take the following actions:

Re-start the system, then recreate the repository. If this does not resolve the error, collect displayed messages and log information. Use the `iscollectinfo` command to collect diagnostic information, and then contact your service engineer.

Check whether the following directories exist, then delete existing directories:

#### Windows32/64

1. C:\Interstage\Enabler\EnablerDStores\repository-name
2. C:\Interstage\Enabler\EnablerDStores\IREP\repository-name
3. C:\Interstage\Enabler\EnablerBackups\repository-name
4. C:\Interstage\Enabler\EnablerATFiles\repository-name

#### Solaris32/64

1. /var/opt/FJSVena/EnablerDStores/repository-name
2. /var/opt/FJSVena/EnablerDStores/FJSVirep/repository-name
3. /var/opt/FJSVena/EnablerBackups/repository-name4. /var/opt/FJSVena/EnablerATFiles/repository-name

#### Linux32/64

1. /var/opt/FJSVena/DStores/repository-name
2. /var/opt/FJSVena/DStores/FJSVirep/repository-name
3. /var/opt/FJSVena/Backups/repository-name
4. /var/opt/FJSVena/ATFiles/repository-name

### Notes

- The above directory paths are the directory paths set when Interstage was installed with initial-value paths.
- If the 'temporary installation files.' installation destination is changed in standard installation, replace /var/opt (or C:\Interstage) with the changed installation destination.

- If the 'Datastores directory,' 'ATFiles directory,' or 'Backups directory' installation destination is changed when Interstage data store is installed alone, replace the directory path for each of the changed installation destinations as follows:

#### Windows32/64

- If the 'Datastores directory' is changed, replace C:\Interstage\Enabler\EnablerDStores in 1 and 2. with the changed installation destination.
- If the 'Backups directory' is changed, replace C:\Interstage\Enabler\EnablerBackups in 3. with the changed installation destination.
- If the 'ATFiles directory' is changed, replace C:\Interstage\Enabler\EnablerATFiles in 4. with the changed installation destination.

#### Solaris32/64

- If the 'Datastores directory' is changed, replace /var/opt/FJSVena/EnablerDStores in 1 and 2. with the changed installation destination.
- If the 'Backups directory' is changed, replace /var/opt/FJSVena/EnablerBackups in 3. with the changed installation destination.
- If the 'ATFiles directory' is changed, replace /var/opt/FJSVena/EnablerATFiles in 4. with the changed installation destination.

#### Linux32/64

- If the 'Datastores directory' is changed, replace /var/opt/FJSVena/Dstores in 1 and 2. with the changed installation destination.
- If the 'Backups directory' is changed, replace /var/opt/FJSVena/Backups in 3. with the changed installation destination.
- If the 'ATFiles directory' is changed, replace /var/opt/FJSVena/ATFiles in 4. with the changed installation destination.

### Supplementary information

If the following directories exist, confirmation that the datastore is the one previously used by Interstage Directory Service or the one used by other products can be performed by checking the omsconfig file stored in the directory.

#### Windows32/64

```
C:\Interstage\Enabler\EnablerDStores\repository-name
```

#### Solaris32/64

```
/var/opt/FJSVena/EnablerDStores/repository-name
```

#### Linux32/64

```
/var/opt/FJSVena/DStores/repository-name
```

### Note

The above directory paths are the directory paths set when Interstage was installed with initial-value paths. If the 'temporary installation files' installation destination is changed in standard installation, replace /var/opt (or C:\Interstage) with the changed installation destination. If the 'Datastores directory' installation destination is changed when Interstage data store is installed alone, replace /var/opt/EnablerDStores (or /var/opt/Dstores or C:\Interstage) with the changed installation destination.

If the following line exists in the omsconfig file stored in any of the above directories, the datastore is the one previously used by Interstage Directory Service. Take the user action indicated in 'If the repository name is not used as a datastore name for other products or if Interstage Directory Service has been reinstalled.'

```
OWNER irepldap ;"
```

If a value other than irepldap is set as OWNER in the above line, take the user action indicated in 'If the repository name is used as a datastore name for other products.'

## 11.27.27 irep70127

---

### **IREP: ERROR: irep70127: Repository information acquisition failed. [%s1]**

#### Variable Information

%s1 = Repository name

#### Explanation

Detailed information could not be acquired for the repository indicated by %s1.

#### User Action

It may not have been possible to acquire detailed information because of a temporary disk read error or memory shortage.

Re-execute the process that caused this message. If the process that caused the message cannot be identified, click the [Refresh] button from the [Repository:Status] window to update the [Repository:Status] window.

If this message is not redisplayed after taking the above action, no special action is required because a temporary error is the cause.

If this message is repeatedly displayed, take the appropriate action for the repository according to the message displayed immediately before this message.

If this does not resolve the error, use the *iscollectinfo* command to collect diagnostic information, and then contact your service engineer.

## 11.28 irep70500 to irep70599

---

### 11.28.1 irep70500

---

#### **IREP: ERROR: irep70500: Out of memory. [%s1]**

#### Variable Information

%s1 = Repository name

#### Explanation

A memory shortage occurred. %s1 indicates the name of the repository where the memory shortage occurred.

#### User Action

Close all programs that are no longer required, then execute the command again.

### 11.28.2 irep70501

---

#### **IREP: ERROR: irep70501: Internal error detected in message creating. [%s1]**

#### Variable Information

%s1 = Repository name

#### Explanation

An internal conflict occurred during the creation of a processing result message.

#### User Action

Collect displayed messages and log information. Use the *iscollectinfo* command to collect diagnostic information, and then contact your service engineer.

### 11.28.3 irep70502

---

---

**IREP: ERROR: irep70502: Abnormal termination in processing result message creation was detected. Storage of Interstage Directory Service internal log does not exist. [%s1]**

Variable Information

%s1 = Repository name

Explanation

No processing result message could be created because the storage directory of the Interstage Directory Service internal log does not exist. %s1 indicates the name of the repository where this error occurred.

The storage directory of the Interstage Directory Service internal log is as follows:

**Windows32/64**

```
C:\Interstage\IREP\var\_system
```

**Solaris32/64 Linux32/64**

```
/var/opt/FJSVirep/_system
```

User Action

The Interstage Directory Service environment may have been destroyed, so save resources and then reinstall Interstage Directory Service. If Interstage Directory Service is already installed correctly, collect displayed messages and log information. Use the *iscollectinfo* command to collect diagnostic information, and then contact your service engineer.

---

## 11.28.4 irep70504

---

**IREP: ERROR: irep70504: Exceeded the number of file descriptors which can be used. [%s1]**

Variable Information

%s1 = Repository name

Explanation

Processing could not be completed because the number of usable file descriptors was exceeded. %s1 indicates the target repository name.

User Action

Change the number of usable file descriptors, then execute the command again.

---

## 11.28.5 irep70505

---

**IREP: ERROR: irep70505: Abnormal termination in processing result message creation was detected. Error occurred in accessing the Interstage Directory Service internal log. [%s1]**

Variable Information

%s1 = Repository name

Explanation

No processing result message could be created because an error occurred during access to the Interstage Directory Service internal log. %s1 indicates the name of the repository where this error occurred.

The storage directory of the Interstage Directory Service internal log is as follows:

**Windows32/64**

```
C:\Interstage\IREP\var\_system
```

**Solaris32/64 Linux32/64**

```
/var/opt/FJSVirep/_system
```

#### User Action

Check that the file system is not faulty, then execute the command again. If this does not resolve the error, collect displayed messages and log information. Use the *iscollectinfo* command to collect diagnostic information, and then contact your service engineer.

### 11.28.6 irep70506

---

**IREP: ERROR: irep70506: Permission denied - No authority for environment definition access. [%s1]**

#### Variable Information

%s1 = Repository name

#### Explanation

There is no permission to access the environment definition. %s1 indicates the target repository name.

#### User Action

Execute the command again with the appropriate access permission.

### 11.28.7 irep70507

---

**IREP: ERROR: irep70507: Environment definition access error occurred. [%s1]**

#### Variable Information

%s1 = Repository name

#### Explanation

The environment definition could not be accessed. %s1 indicates the target repository name.

#### User Action

Check whether the file system is faulty.

### 11.28.8 irep70508

---

**IREP: ERROR: irep70508: Specified repository does not exist. [%s1]**

#### Variable Information

%s1 = Repository name

#### Explanation

The specified repository does not exist. %s1 indicates the name of the non-existent repository.

#### User Action

Check that the specified repository name is correct, then execute the command again.

### 11.28.9 irep70509

---

**IREP: ERROR: irep70509: Specified database store does not exist. [%s1]**

#### Variable Information

%s1 = Repository name

## Explanation

The specified database storage directory does not exist or cannot be accessed because there is no access permission. %s1 indicates the name of the repository.

## User Action

Check the specified database storage directory.

- If the specified database storage directory does not exist

Create a database storage directory.

- If the path specified as the database storage directory exists

Check the access permissions of all of the database storage directories to be specified (the uppermost directory to the lowermost directory). For details on access permissions, refer to 'Creating a Repository' - 'Setting Items of the Interstage Management Console' in the Directory Service Operator's Guide.

Check the directories, then create a repository.

## 11.28.10 irep70510

---

**IREP: ERROR: irep70510: Specified access log store does not exist. [%s1]**

### Variable Information

%s1 = Repository name

## Explanation

The specified Access log storage directory on Access Log Settings does not exist or cannot be accessed because there is no access permission. %s1 indicates the target repository name.

## User Action

Check the specified Access log storage directory on Access Log Settings.

- If the specified Access log storage directory on Access Log Settings does not exist

Create an Access log storage directory.

- If the path specified as the Access log storage directory on Access Log Settings exists

Check the access permissions of all of the Access log storage directories on Access Log Settings to be specified (the uppermost directory to the lowermost directory). For details on access permissions, refer to 'Creating a Repository' - 'Setting Items of the Interstage Management Console' in the Directory Service Operator's Guide.

Check the directories, then re-execute the command.

## 11.28.11 irep70511

---

**IREP: ERROR: irep70511: Specified port number is used by another repository. [%s1]**

### Variable Information

%s1 = Repository name

## Explanation

If this is the specified normal (non-SSL) port number or SSL port number, then the specified port number is already defined in another repository. %s1 indicates the target repository name.

### User Action

Check whether the normal (non-SSL) port number or SSL port number is being used in another repository. Change the normal (non-SSL) port number or SSL port number, then execute the command again.

## 11.28.12 irep70512

---

**IREP: ERROR: irep70512: Specified database store is used by another repository. [%s1]**

### Variable Information

%s1 = Repository name

### Explanation

The specified database storage directory is already defined in another repository. %s1 indicates the target repository name.

### User Action

Change the database storage directory, then execute the command again.

## 11.28.13 irep70513

---

**IREP: ERROR: irep70513: Specified access log store is defined by another repository. [%s1]**

### Variable Information

%s1 = Repository name

### Explanation

The specified Access log storage directory is already defined in another repository. %s1 indicates the target repository name.

### User Action

Change the Access log storage directory on Access Log Settings, then execute the command again.

## 11.28.14 irep70514

---

**IREP: ERROR: irep70514: Process was interrupted since signal occurred. [%s1]**

### Variable Information

%s1 = Repository name

### Explanation

Processing was interrupted because a signal occurred. %s1 indicates the target repository name.

### User Action

Execute the command again. If this does not resolve the error, collect displayed messages and log information. Use the *iscollectinfo* command to collect diagnostic information, and then contact your service engineer.

## 11.28.15 irep70515

---

**IREP: ERROR: irep70515: Specified Repository already exists. [%s1]**

## Variable Information

%s1 = Repository name

## Explanation

The specified repository already exists. %s1 indicates the name of the repository that already exists.

## User Action

The specified repository name already exists. Specify a repository name that does not exist in the status window list, then execute the command again.

## 11.28.16 irep70516

---

### **IREP: ERROR: irep70516: Database store creation failed. [%s1]**

## Variable Information

%s1 = Repository name

## Explanation

The database storage directory could not be created. %s1 indicates the target repository name.

## User Action

Check that the path specified as the database storage directory is correct and the file system is not faulty, then execute the command again.

## 11.28.17 irep70517

---

### **IREP: ERROR: irep70517: Access log store creation failed. [%s1]**

## Variable Information

%s1 = Repository name

## Explanation

The Access log storage directory could not be created. %s1 indicates the target repository name.

## User Action

Check that the path specified as the Access log storage directory on Access Log Settings is correct and that the file system is not faulty, then execute the command again.

## 11.28.18 irep70518

---

### **IREP: ERROR: irep70518: Out of memory. [%s1] details: %s2**

## Variable Information

%s1 = Repository name

%s2 = Detailed information

## Explanation

A memory shortage occurred. %s1 indicates the name of the repository where the memory shortage occurred.

## User Action

Close all programs that are no longer required, then execute the command again.

## 11.28.19 irep70519

---

**IREP: ERROR: irep70519: Out of memory. details: %s1**

### Variable Information

%s1 = Detailed information

### Explanation

A memory shortage occurred.

### User Action

Close all programs that are no longer required, then execute the command again.

## 11.28.20 irep70520

---

**IREP: ERROR: irep70520: Environment definition not specified.**

### Explanation

Environment definition is not specified.

### User Action

Check that the environment definition information is correctly set. If the environment definition information is not correctly set, set it correctly, then execute the command again.

## 11.28.21 irep70522

---

**IREP: ERROR: irep70522: Open directory creation failed. details: %s1 [%s2]**

### Variable Information

%s1 = Detail code

%s2 = Repository name

### Explanation

The public directory could not be created. %s2 indicates the target repository name.

### User Action

Take the appropriate action for the displayed detail code according to 'LDAP Error Codes' in "Error Codes to be Reported from Interstage Directory Service", then execute the command again.

## 11.28.22 irep70524

---

**IREP: ERROR: irep70524: Open directory creation failed. [%s1]**

### Variable Information

%s1 = Repository name

## Explanation

The public directory could not be created. %s1 indicates the target repository name.

## User Action

Take the appropriate action according to the message displayed immediately before this message.

## 11.28.23 irep70525

---

**IREP: ERROR: irep70525: Password encoding process failed. [%s1] detail code:%s2**

### Variable Information

%s1 = Repository name

%s2 = Detail code

## Explanation

The password could not be encoded. %s1 indicates the target repository name.

## User Action

Collect displayed messages and log information. Use the *iscollectinfo* command to collect diagnostic information, and then contact your service engineer.

## 11.28.24 irep70526

---

**IREP: ERROR: irep70526: Password decoding process failed. [%s1] detail code: %s2**

### Variable Information

%s1 = Repository name

%s2 = Detail code

## Explanation

The password could not be decoded. %s1 indicates the target repository name.

## User Action

Collect displayed messages and log information. Use the *iscollectinfo* command to collect diagnostic information, and then contact your service engineer.

## 11.28.25 irep70528

---

**IREP: ERROR: irep70528: No database installed. [%s1]**

### Variable Information

%s1 = Repository name

## Explanation

The database to be used is not installed or is not installed correctly. %s1 indicates the name of the repository.

## User Action

Check that the database to be used exists and is installed correctly. If the database to be used is not installed, install it and then recreate the repository. Interstage data store must be installed in advance as the database to be used.

## 11.28.26 irep70529

---

### **IREP: ERROR: irep70529: Error in authorization setup of database store. [%s1]**

#### Variable Information

%s1 = Repository name

#### Explanation

The specified database storage directory does not exist or cannot be accessed because there is no access permission. %s1 indicates the target repository name.

#### User Action

Check the specified database storage directory.

- If the specified database storage directory does not exist

Create a database storage directory.

- If the path specified as the database storage directory exists

Check the access permission of all of the database storage directories to be specified (the uppermost directory to the lowermost directory). For details on access permission, refer to 'Creating a Repository' - 'Setting Items of the Interstage Management Console' in the Directory Service Operator's Guide.

Confirm the directories, then create a repository.

## 11.28.27 irep70530

---

### **IREP: ERROR: irep70530: Because wrong access log store, repository can not be deleted. [%s1]**

#### Variable Information

%s1 = Repository name

#### Explanation

The repository could not be deleted because the access log storage directory is invalid. %s1 indicates the name of the repository.

#### User Action

The environment definition may have been manually modified after the repository had been created. Restore the environment definition to the pre-modification environment definition, then delete the repository.

## 11.28.28 irep70531

---

### **IREP: ERROR: irep70531: Because wrong database store, repository can not be deleted. [%s1]**

#### Variable Information

%s1 = Repository name

#### Explanation

The repository could not be deleted because the database storage directory is invalid. %s1 indicates the name of the repository.

#### User Action

The environment definition may have been manually modified after the repository had been created. Restore the environment definition to the pre-modification environment definition, then delete the repository.

## 11.28.29 irep70532

---

**IREP: ERROR: irep70532: Because data already exists in access log store, repository can not be created. [%s1]**

### Variable Information

%s1 = Repository name

### Explanation

The repository could not be created because data already exists in the access log settings storage directory. %s1 indicates the name of the repository.

### User Action

Delete the data from the access log settings storage directory or specify another access log settings storage directory, then recreate the repository.

## 11.28.30 irep70533

---

**IREP: ERROR: irep70533: Because data already exists in database store, repository can not be created. [%s1]**

### Variable Information

%s1 = Repository name

### Explanation

The repository could not be created because data already exists in the database storage directory. %s1 indicates the name of the repository.

### User Action

Delete the data from the database storage directory or specify another database storage directory, then recreate the repository.

## 11.28.31 irep70534

---

**IREP: ERROR: irep70534: Since file or directory is using Repository, it cannot be deleted. path=%s1 [%s2]**

### Variable Information

%s1 = Path name

%s2 = Repository name

### Explanation

The repository cannot be deleted because the file or directory under the path indicated by %s1 is being used.

### User Action

A program exists that is editing the file or directory under the path indicated by %s1 or using it as the current directory. Terminate the program, then execute the command again.

If this does not resolve the error, collect displayed messages and log information. Use the *iscollectinfo* command to collect diagnostic information, and then contact your service engineer.

## 11.28.32 irep70535

---

**IREP: ERROR: irep70535: A fatal error occurred by the access to the database. cmd=%s1, detail=%s2 [%s3]**

### Variable Information

%s1 = Command name

%s2 = Detail code

%s3 = Repository name

### Explanation

An unrecoverable error occurred during database access.

### User Action

Restart the system.

If this does not resolve the error, collect displayed messages and log information. Use the *iscollectinfo* command to collect diagnostic information, and then contact your service engineer.

## 11.28.33 irep70536

---

**IREP: ERROR: irep70536: Failed to create the repository. The data already exists in the database for connection. Create and then specify a new database for the database for connection. [%s1]**

### Variable Information

%s1 = Repository

### Explanation

Entry data has already been stored in the database specified in [Database Name]. When the repository is created, the connection database must not contain data.

Databases running in other repositories, or databases in which there is still entry data that was used in a deleted repository cannot be used to create the repository.

The message is output also when the repository is created from the Interstage management console for the second or later machines that share the database at the time of building the environment in the database-share mode.

### User Action

Create and specify a new database.

To recreate the repository for the second or later machines that share the database at the time of building the environment in the database-share mode, restore the backup data of the repository environment of the first machine. Refer to the "Sharing the Database" in the "Directory Service Operator's Guide" for the procedure of building the environment in the database-share mode.

## 11.28.34 irep70537

---

**IREP: ERROR: irep70537: Failed to access the database. Check the database environment. [%s1]**

### Variable Information

%s1 = Repository

## Explanation

Failed to access the database because an abnormality occurred in the database connection. The maximum number of RDB connections is insufficient for the number of connections necessary for the Interstage Directory Service application.

## User Action

Check the RDB settings to establish whether the maximum number of connections to the database has been limited.

Check that the number of connections necessary for the Interstage Directory Service application has been set in the Symfoware/RDB [MAX\_CONNECT\_SYS] and [MAX\_CONNECT\_TCP] application parameters when the Symfoware Server is used for the database.

If [USER\_CONTROL= YES] (this limits the users) has been set in SYSTEM PARAMETER, check that the settings necessary for the Interstage Directory Service application have been made in the [MAX\_CONNECTION] Symfoware/RDB user parameter.

For details about the user attribute settings necessary for the Interstage Directory Service application, refer to 'Registering a User for Connecting to the Repository Database' in 'Environment Setup (Using the RDB)' of the 'Directory Service Operator's Guide'.

When the Oracle database is used as the database, check if the number of connections required to run the Interstage Directory Service is set in the "PROCESS" parameter ("SESSION" and "TRANSACTIONS") of the database initialization parameters.

For details about the RDB settings necessary for the Interstage Directory Service application, refer to "Setting up Database" in the 'Directory Service Operator's Guide'.

# 11.29 irep71000 to irep71099

---

## 11.29.1 irep71001

---

**IREP: ERROR: irep71001: Invalid Repository name.**

### Explanation

The specified repository name is incorrect.

### User Action

After correcting the characters specified for the repository name, re-execute the processing. For specifying a repository name, up to 8 bytes of alphanumeric characters and underscores (\_) can be used. It is also possible to specify an alphabetical character for the first character. Upper-case alphabetical characters are replaced with lower-case alphabetical characters.

## 11.29.2 irep71002

---

**IREP: ERROR: irep71002: Invalid rootDN.**

### Explanation

The specified administrator DN is incorrect.

### User Action

After correcting the characters specified for the administrator DN, re-execute the processing. Specify the DN (distinguished name) for the administrator who manages the repository to be created in the DN format with a character string of up to 512 bytes. For the identifiers composing the DN format, 'cn', 'ou', 'o', 'c', 'l', and 'dc' can be specified. For the value of identifier composing the DN format, alphanumeric characters, minuses (-), periods (.), and underscores (\_) can be specified. Between an identifier and the value composing the DN format, specify an equal (=).

If specifying multiple combinations of identifiers and values, separate them with comma (,).

## 11.29.3 irep71003

---

**IREP: ERROR: irep71003: Invalid password of rootDN.**

### Explanation

The specified administrator DN password is incorrect.

## User Action

After correcting the characters specified for the administrator DN password, re-execute the processing. For specifying the administrator DN password, up to 128 bytes of alphanumeric characters, commas (,), pluses (+), equals (=), minuses (-), periods (.), and underscores (\_) can be used.

If this message is output when 'No' is selected for administrator DN password change, click [Refresh] to re-obtain the environment definition contents and then re-execute processing.

## 11.29.4 irep71004

---

### **IREP: ERROR: irep71004: Invalid password of rootDN (re-entry).**

#### Explanation

The specified administrator DN password (re-entry) is incorrect.

#### User Action

After correcting the characters specified for the administrator DN password (re-entry), re-execute the processing. For specifying the administrator DN password (re-entry), up to 128 bytes of alphanumeric characters, commas (,), pluses (+), equals (=), minuses (-), periods (.), and underscores (\_) can be used.

If this message is output when 'No' is selected for administrator DN password change, click [Refresh] to re-obtain the environment definition contents and then re-execute processing.

## 11.29.5 irep71006

---

### **IREP: ERROR: irep71006: Invalid open directory.**

#### Explanation

The specified public directory is incorrect.

#### User Action

After correcting the characters specified for the public directory, re-execute the processing. Specify the top directory which releases the repository in the DN (distinguished name) format with a character string of up to 512 bytes. For the identifiers composing the DN format, 'cn', 'ou', 'o', 'c', 'l', and 'dc' can be specified. For the value of each identifier composing the DN format, alphanumeric characters, minuses (-), periods (.), and underscores (\_) can be specified. Between an identifier and the value composing the DN format, specify an equal (=). When specifying multiple of identifiers and values, separate them with a comma (,).

## 11.29.6 irep71008

---

### **IREP: ERROR: irep71008: Invalid general port number.**

#### Explanation

The specified port number is incorrect.

#### User Action

After correcting the value, re-execute the processing. A value in the range of 1 to 65535 can be specified.

## 11.29.7 irep71009

---

### **IREP: ERROR: irep71009: Invalid SSL port number.**

#### Explanation

The specified SSL port number is incorrect.

#### User Action

After correcting the value, re-execute the processing. A value in the range of 1 to 65535 can be specified.

## 11.29.8 irep71010

---

### **IREP: ERROR: irep71010: Invalid connection idle time.**

#### Explanation

The specified connection idle timeout is incorrect.

#### User Action

After correcting the value, re-execute the processing. A value in the range of 0 to 3600 seconds can be specified. When 0 is specified, the connection idle timeout is unlimited.

## 11.29.9 irep71011

---

### **IREP: ERROR: irep71011: Invalid the maximum number of entry for searching.**

#### Explanation

The specified maximum number of searchable entries is incorrect.

#### User Action

After correcting the value, re-execute the processing. A value in the range of 0 to 10000 can be specified. When 0 is specified, the maximum number of searchable entries is unlimited.

## 11.29.10 irep71012

---

### **IREP: ERROR: irep71012: Invalid search timeout.**

#### Explanation

The specified search timeout is incorrect.

#### User Action

After correcting the value, re-execute the processing. A value in the range of 0 to 3600 seconds can be specified. When 0 is specified, the search timeout is unlimited.

## 11.29.11 irep71013

---

### **IREP: ERROR: irep71013: Invalid database store.**

#### Explanation

The specified database storage directory is incorrect.

#### User Action

After correcting the database storage directory specification, re-execute the processing.

 Windows32/64

Specify the database storage directory in full-path with a character string of up to 192 bytes. The specifiable characters are:

- Alphanumeric character
- Dollar (\$)
- Ampersand (&)
- Single quotation (')

- Plus (+)
- Minus (-)
- Period (.)
- Equal (=)
- At mark (@)
- Underline (\_)
- Back quotation (`)
- Tilda (~)
- Square bracket ([ ])
- Curly bracket ( { } )
- Space ( )
- Colon (:)
- Slash (/)
- Backslash (\)

Multi-byte codes cannot be used. A colon (:) can be used only for specifying the drive characters. A backslash (\) can be used only as a separator for directories. To specify a drive, include '\' as in 'C:\'.

**Solaris32/64 Linux32/64**

Specify the database storage directory in full-path with a character string of up to 242 bytes. The specifiable characters are:

- Alphanumeric character
- Slash (/)
- Minus (-)
- Underline (\_)
- Tilda (~)

Multi-byte codes cannot be used.

## 11.29.12 irep71014

---

**IREP: ERROR: irep71014: Invalid store of access log definition.**

### Explanation

The specified access log storage directory of the access log settings is incorrect.

### User Action

After correcting the access log storage directory specification of the access log settings, re-execute the processing.

**Windows32/64**

Specify the access log storage directory of the access log settings in full-path with a character string of up to 192 bytes. The valid characters are:

- Alphanumeric character
- Dollar (\$)
- Ampersand (&)
- Single quotation (')

- Plus (+)
- Minus (-)
- Period (.)
- Equal (=)
- At mark (@)
- Underline (\_)
- Back quotation (`)
- Tilda (~)
- Square bracket ([ ])
- Curly bracket ( { } )
- Space ( )
- Colon (:)
- Slash (/)
- Backslash (\)

Multi-byte codes cannot be used. A colon (:) can be used only for specifying the drive characters. A backslash (\) can be used only as a separator for directories. To specify a drive, include '\' as in 'C:\'.

**Solaris32/64 Linux32/64**

Specify the access log storage directory of the access log settings in full-path with a character string of up to 960 bytes. The valid characters are:

- Alphanumeric character
- Slash (/)
- Minus (-)
- Underline (\_)
- Tilda (~)

Multi-byte codes cannot be used.

## 11.29.13 irep71015

---

**IREP: ERROR: irep71015: Invalid rotation type of access log definition.**

### Explanation

The specified rotation type of the access log settings is incorrect.

### User Action

After selecting the correct rotation type, re-execute the processing.

## 11.29.14 irep71016

---

**IREP: ERROR: irep71016: Invalid size of access log definition.**

### Explanation

The specified size of the access log settings is incorrect.

#### User Action

After correcting the value, re-execute the processing. Specify a value in the range of 1 MB to 1024 MB.

### 11.29.15 irep71017

---

#### **IREP: ERROR: irep71017: Invalid number of generation management access log definition.**

#### Explanation

The specified number of access log files to maintain for the access log settings is incorrect.

#### User Action

After correcting the value, re-execute the processing. Specify a value in the range of 1 to 99.

### 11.29.16 irep71018

---

#### **IREP: ERROR: irep71018: Invalid output level of access log definition.**

#### Explanation

The output types of the access log settings is incorrect.

#### User Action

After selecting the correct output types, re-execute the processing. Multiple selections are allowed.

### 11.29.17 irep71021

---

#### **IREP: ERROR: irep71021: Invalid master definition.**

#### Explanation

The specified master operation settings is incorrect.

#### User Action

After correcting the replication connection settings, re-execute the processing.

### 11.29.18 irep71024

---

#### **IREP: ERROR: irep71024: Invalid cache size.**

#### Explanation

The specified cache size is incorrect.

#### User Action

After correcting the specifiable value, re-execute the processing. Specify a value in the range of 100 to 65535 in pages. A page is 4 kilobytes.

### 11.29.19 irep71027

---

#### **IREP: ERROR: irep71027: Invalid host name of replica host.**

## Explanation

The specified host name in the replication connection settings is incorrect.

## User Action

Use up to 106 characters to specify the slave host name. Ensure that you specify a host name whose address can be resolved. Valid characters include alphanumeric characters, the minus symbol (-), the period (.), and the underscore (\_).

When the slave is in a cluster environment, specify its logical host name in the cluster environment.

## 11.29.20 irep71028

---

### **IREP: ERROR: irep71028: Invalid port number of replica host.**

## Explanation

The specified port number in the replication connection settings is incorrect.

## User Action

After specifying the correct port number, re-execute the processing. A value in the range of 1 to 65535 can be specified.

## 11.29.21 irep71031

---

### **IREP: ERROR: irep71031: Invalid connection DN of replica host.**

## Explanation

The specified DN for the connection in the replication connection settings is incorrect.

## User Action

After correcting the characters specified for the DN for the connection, re-execute the processing. For the DN for the connection (distinguished name), specify the administrator DN of the slave with a character string of up to 512 bytes. For the identifiers composing the DN format, 'cn', 'ou', 'o', 'c', 'l', and 'dc' can be specified. For the value of each identifier composing the DN format, alphanumeric characters, minuses (-), periods (.), and underscores (\_) can be specified. Between an identifier and the value composing the DN format, specify an equal (=). If specifying multiple combinations of identifiers and values, separate them with a comma (,).

## 11.29.22 irep71032

---

### **IREP: ERROR: irep71032: Invalid connection password of replica host.**

## Explanation

The specified password for the connection in the replication connection settings is incorrect.

## User Action

After correcting the characters specified for the password for the connection, re-execute the processing. For the password for the connection for connecting to the slave, specify the administrator DN (distinguished name) password of the slave with a character string of up to 128 bytes. The valid characters are alphanumeric characters, commas (,), pluses (+), equals (=), minuses (-), periods (.), and underscores (\_).

## 11.29.23 irep71034

---

### **IREP: ERROR: irep71034: Invalid master's host name of slave definition.**

## Explanation

The specified master host name in the slave operation settings is incorrect.

## User Action

Specify a specifiable host name. Specify the host name of the host that becomes the master with a character string of up to 106 bytes. The specifiable characters are alphanumeric characters, minuses (-), periods (.), and underscores (\_).

If performing the cluster operation, specify the host names of operation node and standby node separated with a comma(,)with a character string of up to 106 bytes. For example, specify them like 'cluster01,cluster02'. The same host name cannot be specified for the operation node and standby node.

## 11.29.24 irep71037

---

**IREP: ERROR: irep71037: General (non-SSL) port number and SSL port number are the same.**

## Explanation

The same port has been specified for the port number and SSL port number.

## User Action

After specifying different port numbers for the port number and SSL port number, re-execute the processing.

## 11.29.25 irep71039

---

**IREP: ERROR: irep71039: The specified database hostname is incorrect.**

## Explanation

The specified database hostname is incorrect.

## User Action

Correct the database hostname, and then re-execute processing. Specify a maximum of 106 characters for the database hostname. Alphanumerics, minus characters (-), and periods (.) can be used.

## 11.29.26 irep71040

---

**IREP: ERROR: irep71040: The specified database name is incorrect.**

## Explanation

The specified database name is incorrect.

## User Action

Correct the database name, and then re-execute processing. Specify a maximum of eight characters for the database name. The name used must consist of alphanumeric characters only and must begin with an alpha character of the range "A-z"

## 11.29.27 irep71041

---

**IREP: ERROR: irep71041: The specified database port number is incorrect.**

## Explanation

The specified database port number is incorrect.

#### User Action

Correct the database port number, and then re-execute processing. Specify a number form 1 to 65535.

### 11.29.28 irep71042

---

#### **IREP: ERROR: irep71042: The specified database user ID is incorrect.**

##### Explanation

The specified database user ID is incorrect.

##### User Action

Correct the database user ID, and then re-execute processing.

### 11.29.29 irep71043

---

#### **IREP: ERROR: irep71043: The specified database password is incorrect.**

##### Explanation

The specified database password is incorrect.

##### User Action

Correct the database password, and then re-execute processing.

### 11.29.30 irep71046

---

#### **IREP: ERROR: irep71046: The name specified for the net service is incorrect.**

##### Explanation

This indicates that the name specified for the net service is incorrect.

##### User Action

Check if the net service name is correctly specified. Correct the name specified for the net service and then re-execute processing. Specify a maximum of [128] characters for the net service name. Valid characters are alphanumeric, underscore (\_), the hash symbol (#), and dollar sign (\$).

### 11.29.31 irep71047

---

#### **IREP: ERROR: irep71047: The details specified for the Oracle home directory are incorrect. [%s1]**

##### Variable Information

%s1 = Additional error information. It is not always output.

##### Explanation

This indicates that the details specified for the Oracle home directory are incorrect.

##### User Action

Check if the Oracle home directory is correctly specified. Correct the specified for the Oracle home directory and then re-execute processing.

Specify a maximum of [256] characters for the Oracle home directory, using the full path. Characters that can be specified are as follows:

#### Windows32/64

- Alphanumeric character
- Dollar (\$)
- Ampersand (&)
- Single quotation (')
- Plus (+)
- Minus (-)
- Period (.)
- Equal (=)
- At mark (@)
- Underline (\_)
- Back quotation (`)
- Tilda (~)
- Square bracket ([])
- Curly bracket ({})
- Space ( )
- Colon (:)
- Slash (/)
- Backslash (\)

Multi-byte codes cannot be used. A colon (:) can be used only for specifying the drive characters. A backslash (\) can be used only as a separator for directories. To specify a drive, include '\' as in 'C:\'.

#### Solaris32/64 Linux32/64

- Alphanumeric character
- Slash (/)
- Minus (-)
- Period (.)
- Underline (\_)
- Tilde (~)

Multi-byte codes cannot be used.

## 11.30 irep71500 to irep71599

---

### 11.30.1 irep71502

---

**IREP: ERROR: irep71502: Cannot modify database store.**

Explanation

The database storage directory cannot be changed.

## User Action

Do not change the database storage directory.

# 11.31 irep71600 to irep71699

---

## 11.31.1 irep71603

---

**IREP: ERROR: irep71603: rootDN password (re-entry) does not correspond to rootDN password.**

### Explanation

The Administrator DN password does not match the Administrator DN password(re-entry).

### User Action

Re-enter the same Administrator DN password and Administrator DN (re-entry).

## 11.31.2 irep71605

---

**IREP: ERROR: irep71605: rootDN new password (re-entry) does not correspond to rootDN new password.**

### Explanation

The new Administrator DN password does not match the new Administrator DN password (re-entry).

### User Action

Re-enter the same new Administrator DN password and Administrator DN password (re-entry).

If this message is output when 'No' is selected for changing the Administrator DN password, click [Refresh] to change the environment configuration content, and then re-execute processing.

If this message is output when 'No' is selected for administrator DN password change, click [Refresh] to re-obtain the environment definition contents and then re-execute processing.

## 11.31.3 irep71610

---

**IREP: ERROR: irep71610: Slave information is not specified.**

### Explanation

This message might be output when 'Stand-alone' is selected for the application type.

### User Action

Click [Refresh] to re-obtain the environment definition contents and then re-execute processing.

## 11.31.4 irep71623

---

**IREP: ERROR: irep71623: The adding replica host information (%s1) already exists. [%s2]**

### Variable Information

%s1 = Name of the host to be added

%s2 = Repository name

### Explanation

The specified replication connection settings already exist. %s2 indicates the name of the repository which the error occurred.

### User Action

After deleting the existing replication connection settings, add or edit the replication connection settings.

## 11.31.5 irep71626

---

**IREP: ERROR: irep71626: Replica host information cannot be added any more. max:%s1. [%s2]**

### Variable Information

%s1 = Specifiable number of repositories

%s2 = Repository name

### Explanation

The replication connection settings reached the maximum specifiable number. %s2 indicates the name of the repository which the error occurred.

### User Action

Perform the replication operation with the specifiable replication hosts at the maximum.

## 11.31.6 irep71627

---

**IREP: ERROR: irep71627: The same host(%s1) as master cannot be added to replica hosts information. [%s2]**

### Variable Information

%s1 = Name of the host to be added

%s2 = Repository name

### Explanation

The same host as the master has been specified in the replication connection settings.

### System Action

The processing is terminated.

### User Action

The same host as the master, cannot be added as a replication host. Ensure that the replication host to be added is correct, then re-execute the processing.

## 11.31.7 irep71628

---

**IREP: ERROR: irep71628: The same host(%s1) as slave cannot be specified in master. [%s2]**

### Variable Information

%s1 = Name of the specified host

%s2 = Repository name

### Explanation

The same host as a slave cannot be specified for the master. %s2 indicates the name of the repository with the error.

### User Action

The same host as a slave cannot be specified for the master. Ensure that the master host name to be specified is correct, then re-execute the processing.

If this message is output when 'Stand-alone' is selected for the application type, click [Refresh] to re-obtain the environment definition contents and then re-execute processing.

## 11.31.8 irep71629

---

---

**IREP: ERROR: irep71629: The same host(%s1,%s2) cannot be specified in master again. [%s3]****Variable Information**

- %s1 = Name of the specified host 1
- %s2 = Name of the specified host 2
- %s3 = Repository name

**Explanation**

The same host has been specified for the master host name more than once. %s3 indicates the name of the repository with the error.

**User Action**

- After specifying the correct host names of the operation node and standby node for the master host name, re-execute the processing.
- If this message is output when 'Stand-alone' is selected for the application type, click [Refresh] to re-obtain the environment definition contents and then re-execute processing.

---

## 11.32 irep72000 to irep72099

---

### 11.32.1 irep72005

---

**IREP: WARNING: irep72005: Invalid config name (%s1) is selected in SSL configuration. [%s2]****Variable Information**

- %s1 = Name of the SSL configuration selected
- %s2 = Repository name

**Explanation**

For the repository indicated by %s2, an SSL configuration name not existing in the Interstage Certificate Environment has been selected for [SSL configuration] of [General Settings].

**User Action**

If SSL communication using the Interstage Certificate Environment, is used for the repository indicated by %s2, take the following actions on the Environment Setup window for the target repository from the Interstage Management Console:

1. If the [Enable SSL encryption?] item of [General Settings] does not appear, the Interstage Certificate Environment has not been installed.

Install the Interstage Certificate Environment, create a valid SSL configuration, and then take action 2 below.

For installing the Interstage Certificate Environment, refer to the Installation Guide.

For creating an SSL configuration, refer to the following according to the operating mode:

- In stand-alone operation or database-share mode:  
'Setting up an Environment for SSL Communication' in the Directory Service Operator's Guide
- In replication operation:  
'Setting Up an Environment for the Replication Mode' in the Directory Service Operator's Guide

2. If the [Enable SSL encryption?] item of [General Settings] appears, select an existing SSL configuration name for [SSL configuration] of [General Settings], then update the environment.

If no SSL configuration name other than %s1 appears for [SSL configuration] of [General Settings], it is necessary to create a new SSL configuration.

For details on creating an SSL configuration, refer to the following, according to the operating mode:

- In stand-alone operation or database-share mode:

'Setting up an Environment for SSL Communication' in the Directory Service Operator's Guide

- In replication operation:

'Setting Up an Environment for the Replication Mode' in the Directory Service operator's Guide

If the Interstage Certificate Environment is not used for the repository indicated by %s2, perform backup as needed, then re-create the target repository. For re-creating the repository, refer to the following in relation to the operating mode:

- In stand-alone operation or database-share mode:

'Recovery in Stand-alone Mode' in the Directory Service Operator's Guide

- In master/slave operation:

'Monitoring of Operation in Replication Mode and Recovery' in the Directory Service Operator's Guide

## 11.32.2 irep72006

---

**IREP: WARNING: irep72006: Invalid config name (%s1) is selected in replica host SSL configuration. [%s2]**

### Variable Information

%s1 = Name of the SSL configuration selected

%s2 = Repository name

### Explanation

For the repository indicated by %s2, an SSL configuration name not existing in the Interstage Certificate Environment has been selected for [SSL configuration] of [Replication connection settings].

### User Action

If the SSL communication using the Interstage Certificate Environment is used for the communication with the replication host, undertake the following action on the Environment Setup window, for the target repository from the Interstage Management Console:

1. If the [Enable SSL encryption?] item of [Replication connection settings] does not appear, the Interstage Certificate Environment has not been installed.

Install the Interstage Certificate Environment, create a valid SSL configuration, and then proceed to step 2.

For installing the Interstage Certificate Environment, refer to the Installation Guide.

For creating an SSL configuration, refer to 'Setting Up an Environment for the Replication Mode' in the Directory Service operator's Guide.

2. If the SSL client authentication is not performed in communication with the replication host, select "No" for [Present client certificate?] of [Replication connection settings], then update the replication connection settings.
3. If the SSL client authentication is performed in communication with the replication host, select an existing SSL configuration name for [SSL configuration] of [Replication connection settings], then update the environment.

If no SSL configuration name other than %s1 appears for [SSL configuration] of [Replication connection settings], it is necessary to create a new SSL configuration.

For creating an SSL configuration, refer to 'Setting Up an Environment for the Replication Mode' in the Directory Service Operator's Guide.

If the SSL communication using the Interstage Certificate Environment is not used for communication with the replication host, delete the target replication connection settings and re-create it.

## 11.32.3 irep72007

---

**IREP: WARNING: irep72007: Unavailable SSL communication mechanism was used for repository configuration. [%s1]**

## Variable Information

%s1 = Repository name

## Explanation

In an environment where the Interstage Certificate Environment cannot be used, using the SSL communication has been specified in [General settings] for the repository indicated by %s1. The secure communication service required for using the Interstage Certificate Environment has not been installed.

The following causes are possible:

- After specifying the Interstage Certificate Environment for the repository, the secure communication service was uninstalled.
- The Repository where the Interstage Certificate Environment is to be used, was restored in the environment where the secure communication service had not been installed. (Excluding the case when -dataonly is used)

## User Action

If the SSL communication must be used for the repository indicated by %s1, install the secure communication service in the server being operated, then set up the environment of the target repository again. For information on installing the secure communication service, refer to 'Setting up and using a certificate/key management environment by SMEE command' in the 'Security System Operator's Guide' and the Installation Guide.

If SSL communication is not used for the repository indicated by %s1, after taking a backup as necessary, re-create the target repository. For re-creating the repository, refer to the following according to the operating mode:

- In stand-alone operation or database-share mode:  
'Recovery in Stand-alone Mode' in the Directory Service Operator's Guide
- In master/slave operation:  
'Monitoring of Operation in Replication Mode and Recovery' in the Directory Service Operator's Guide

## 11.32.4 irep72008

---

### **IREP: WARNING: irep72008: Unavailable SSL communication mechanism was used for replica host information of repository. [%s1]**

## Variable Information

%s1 = Repository name

## Explanation

Unusable SSL setting has been specified in [Replication Connection Settings] of the repository (%1). The secure communication service required for using the Interstage Certificate Environment has not been installed.

The following causes are possible:

- After specifying the Interstage Certificate Environment for the repository, the secure communication service was uninstalled.
- The Repository where the Interstage Certificate Environment is to be used was restored to an environment where the secure communication service had not been installed. (Excluding the case when -dataonly is used)

## User Action

If SSL communication is required for communication with the replication host, install the secure communication service to the server being operated, then set up the environment of the target repository again. For installing the secure communication service, refer to 'Setting up and Use of the Certificate/Key Management Environment Using the SMEE Command' in the Security System Guide and the Installation Guide.

If SSL communication is not required for communication with the replication host, delete the target replication connection settings, then re-create it.

## 11.33 irep77200 to irep77299

---

### 11.33.1 irep77201

---

#### **IREP: WARNING: irep77201 Are you sure of terminating the Entry Administration Tool?**

##### Explanation

The Interstage Directory Service entry administration tool is to be terminated.

##### User Action

To terminate it, click the [OK] button. To restore it, click the [Cancel] button.

### 11.33.2 irep77202

---

#### **IREP: WARNING: irep77202 Are you sure of logging out?**

##### Explanation

To be logged out.

##### User Action

To logout, click the [OK] button. To restore it, click the [Cancel] button.

### 11.33.3 irep77203

---

#### **IREP: WARNING: irep77203 Are you sure of deleting the connection information?**

##### Explanation

The connection destination information is to be deleted.

##### User Action

To delete the connection destination information, click the [OK] button. To restore it, click the [Cancel] button.

### 11.33.4 irep77204

---

#### **IREP: WARNING: irep77204 Are you sure of saving the connection information?**

##### Explanation

The connection destination information is to be saved.

##### User Action

To save the connection destination information, click the [OK] button. To exit without saving, click the [Cancel] button.

## 11.34 irep77400 to irep77499

---

### 11.34.1 irep77410

---

#### **IREP: ERROR: irep77410 Already used.%s1**

##### Variable Information

%s1: Detailed information

##### Explanation

The same attribute (the specification of the attribute name and attribute value is the same) exists in the specified entry of the LDIF file.

## User Action

The same attribute cannot be added. Check that there are not multiple lines in which the same attribute is specified in the LDIF file. If there are multiple lines in which the same attribute is specified, correct them to be unique, for the attribute.

For specifying the LDIF file, refer to the following manual:

"Creating Data" - "Using the LDAP Data Exchange format (LDIF)" in the Directory Service Operator's Guide

Example:

If adding the LDIF file in which the following entry is specified:

### [Incorrect]

```
dn: cn=User001,ou=User,ou=interstage,o=fujitsu,dc=com
```

```
changetype: add
```

```
objectClass: inetOrgPerson
```

```

```

## 11.34.2 irep77411

---

**IREP: ERROR: irep77411 Unknown objectclass.%s1**

## Variable Information

%s1 = Detailed information

## Explanation

The specified object class is incorrect. An attribute necessary to the object class is not specified or an attribute unusable for the object class is specified.

## User Action

The following causes are possible:

- An object class not supported by Interstage Directory Service was specified.
- Object classes which have no inheritance relation were specified at the same time.
- The attribute required for the object class has not been specified.
- An attribute that cannot be specified for the object class was specified.
- The specifying method of the object class or the attribute in the LDIF file is incorrect.

Check whether the object class and attribute is correct, then re-execute the processing.

For details on the object classes and attributes, refer to 'List of Object Classes' or 'List of Attributes' in the Directory Service Operator's Guide.

For specifying the LDIF file, refer to "Creating Data" - "Using the LDAP Data Exchange format (LDIF)" in the Directory Service Operator's Guide.

This error may also occur if a command is issued for a function that Interstage Directory Service does not allow. Refer to the following manuals to check which functions Directory Service can use:

- 'Restrictions on the Interstage Directory Service' in the Product Notes
- 'Notes on Interstage Directory Service' in the Product Notes

Example:

If adding the LDIF file which has the following entry specified:

### **[Incorrect]**

```
dn: cn=User001,ou=User,ou=interstage,o=fujitsu,dc=com
changetype: add
objectClass: inetOrgPerson
objectClass: organizationalPersonxxxxxxxxxxxxx <-- Error

## 11.34.4 irep77413

---

### IREP: ERROR: irep77413 File i/o error.%s1

#### Variable Information

%s1 = Detailed information

#### Explanation

The LDIF file cannot be read or the contents of the LDIF file are incorrect.

#### User Action

Check that the specified file is an LDIF file. If it is an LDIF file, check the detailed information of the message to correct the contents of the LDIF file.

For specifying the LDIF file, refer to following manual:

"Creating Data" - "Using the LDAP Data Exchange format (LDIF)" in the Directory Service Operator's Guide

Example:

When adding the LDIF file in which the following entry is specified:

#### **[Incorrect]**

```
xxxxx: cn=User001,ou=User,ou=interstage,o=fujitsu,dc=com <-- Error
objectClassxxx: inetOrgPerson <-- Error
objectClass: organizationalPerson
objectClass: person
objectClass: top

## 11.34.5 irep77414

---

### IREP: ERROR: irep77414 Invalid attribute.%s1

#### Variable Information

%s1 = Detailed information

#### Explanation

The specified attribute is incorrect.

#### User Action

Check for the specification of the LDIF file. Check the detailed information of the message to correct the contents of the LDIF file.

This message is output in the following cases:

- If the specified attribute is an attribute related to RDN specified in the DN line:  
The attribute related to RDN specified in the DN line cannot be deleted.
- If a blank line is inserted in the attribute lines in one entry:  
Delete the blank line.
- If the specified attribute is different from an attribute related to RDN specified in the DN line:  
Specify RDN specified in the DN line.

For specifying the attributes, refer to the following manuals:

- 'List of Attributes' in Appendix D of the Directory Service Operator's Guide
- 'List of Objects' in Appendix C of the Directory Service Operator's Guide
- 'Schemata that can be used in Interstage Directory Service' in the Directory Service Operator's Guide

For specifying the LDIF file, refer to the following manual:

"Creating Data" - "Using the LDAP Data Exchange format (LDIF)" in the Directory Service Operator's Guide

#### Example 1:

If updating the following LDIF file in which the telephoneNumber attribute is to be deleted:

##### **Incorrect**

```
dn: cn=User001,ou=User,ou=interstage,o=fujitsu,dc=com
```

```
<-- Error (A blank line exists.)
```

```
changetype: modify
```

```
delete: telephoneNumber
```

##### **Correct**

```
dn: cn=User001,ou=User,ou=interstage,o=fujitsu,dc=com
```

```
changetype: modify
```

```
delete: telephoneNumber
```

#### Example 2:

If adding the following to the LDIF file:

**Incorrect**

```
dn: cn=User001,ou=User,ou=interstage,o=fujitsu,dc=com
changetype: add
objectClass: top
objectClass: person
objectClass: organizationalPerson
objectClass: inetOrgPerson
objectClass: ssoUser
cn: User999 <-- Error
sn: Fujitsu
```

**Correct**

```
dn: cn=User001,ou=User,ou=interstage,o=fujitsu,dc=com
changetype: add
objectClass: top
objectClass: person
objectClass: organizationalPerson
objectClass: inetOrgPerson
objectClass: ssoUser
cn: User001
sn: Fujitsu
```

Example 3:

If updating the following LDIF file in which the cn attribute having been specified in the DN line is to be deleted:

**Incorrect**

```
dn: cn=User001,ou=User,ou=interstage,o=fujitsu,dc=com
changetype: modify
delete: cn <-- Error
```

**Correct**

```
dn: cn=User001,ou=User,ou=interstage,o=fujitsu,dc=com
changetype: modify
delete: telephoneNumber <-- Specify an attribute other than the attributes having been specified in the DN line.
```

## 11.35 irep77500 to irep77599

---

### 11.35.1 irep77501

---

**IREP: ERROR: irep77501 Unable to modify it because of schema definition violated.  
%s1**

Variable Information

%s1 = Detailed information

## Explanation

An attribute could not be updated due to its incorrect definition.

## User Action

Check the detailed message information for incorrect attribute values and correct if necessary.

For details on attribute definitions, refer to the following manuals:

- 'List of Attributes' in the Directory Service Operator's Guide
- 'List of Object Classes' in the Directory Service Operator's Guide
- 'Schemata that can be used in Interstage Directory Service' in the Directory Service Operator's Guide

If the user action is not successful, refer to the following manual, then take an appropriate action according to the LDAP error code. The LDAP error code (decimal number) is output in the detailed information field of a message in the form of [LDAP error code XX ...].

'LDAP Error Codes' in "Error Codes to be Reported from Interstage Directory Service".

## 11.35.2 irep77502

---

### **IREP: ERROR: irep77502 Unable to operate specified DN%s1.**

#### Variable Information

%s1 = Detailed information

#### Explanation

The specified DN could not be handled.

#### User Action

Select the entry displayed on Entry Administration Tool and click the [Refresh] button, or double click the node entry on one layer above, and check that the specified DN exists, then re-execute the command.

If this user action is not successful, refer to the following manual, then take appropriate action based on the LDAP error code. The LDAP error code (decimal number) is output in the detailed information field of a message in the form of [LDAP error code XX ...].

'LDAP Error Codes' in "Error Codes to be Reported from Interstage Directory Service".

## 11.35.3 irep77503

---

### **IREP: ERROR: irep77503 Unable to connect with Repository. Check the state of Repository and the connection information. %s1**

#### Variable Information

%s1 = Detailed information

#### Explanation

The repository can not be connected.

#### User Action

Check the host name and port number as specified in the connection information setup window. If the host name and port number specified are correct, obtain the status of the repository by using Interstage Management Console on the connection, then check that the repository has been started. If the repository has been deactivated, start it.

If "string too long" is output in %s1, it means that the amount of binary data that can be registered in the Entry Management Tool was exceeded. Large amounts of binary data are not supported in the Entry Management Tool. For this reason, check the amount of registered binary data. If it is necessary to register a large amount of binary data, use the *ldap* command or the C API to register the data.

Note that the Entry Administration Tool does not support connection to SSL ports. Check that there is no connection to an SSL port. If there is a port number for which an SSL port has been specified, specify a non-SSL port.

Another possible cause of the error may be in the network. Check whether you can connect to the machine running the repository, by using ping or (other commands).

If this user action is not successful, refer to the following manual, then take an appropriate action based on the LDAP error code. The LDAP error code (decimal number) is output in the detailed information field of a message in the form of [LDAP error code XX ...].

'LDAP Error Codes' in "Error Codes to be Reported from Interstage Directory Service".

## 11.35.4 irep77504

---

**IREP: ERROR: irep77504 Configuration error occurred.**

**%s1**

### Variable Information

%s1 = Detailed information

### Explanation

An error occurred in the configuration.

### User Action

Restart the Entry Administration Tool, then re-execute the command.

If this user action is not successful, take the following actions:

- If the server package was installed:

Use the *iscollectinfo* command to collect diagnostic information, and then contact your service engineer.

- If the client package was installed:

Use the *iscollectinfo* command to collect diagnostic information on server machine of the connection destination, and then contact your service engineer.

## 11.35.5 irep77505

---

**IREP: ERROR: irep77505 Unable to run Rename/Move/Delete because subordinate entry does not exist or exist under entry referral.**

**%s1**

### Variable Information

%s1 = Detailed information

### Explanation

Entry could not be renamed, moved, or deleted because there are subordinate entries existed or entry referrals existed.

### User Action

If an error occurs for a command executed to rename, move, or delete an entry which has subordinate entries, display all entries below the target entry in [Tree View], then rename, move, or delete entries sequentially, starting from the lowest entries which have no subordinate entry.

## 11.35.6 irep77506

---

**IREP: ERROR: irep77506 Unable to use resource or it does not exist.**

**%s1**

### Variable Information

%s1 = Detailed information

## Explanation

Resource (memory) for the repository or client program was insufficient.

## User Action

Close all programs no longer needed, then restart Entry Administration Tool.

**Windows32/64**

If there is insufficient memory for the entire system, add memory or increase virtual memory.

**Solaris32/64 Linux32/64**

If there is insufficient memory for the entire system, add memory or increase the swap area.

For details on memory required for the operation of Interstage Directory Service, refer to the following:

'Memory Requirements' in the Tuning Guide

If this user action is not successful, refer to the following manual, then take an appropriate action based on the LDAP error code. The LDAP error code (decimal number) is output in the detailed information field of a message in the form of [LDAP error code XX ...].

'LDAP Error Codes' in "Error Codes to be Reported from Interstage Directory Service".

## 11.35.7 irep77507

---

**IREP: ERROR: irep77507 LDAP process interrupted.**  
**%s1**

### Variable Information

%s1 = Detailed information

### Explanation

LDAP process was interrupted.

### User Action

There was an interrupt to the process.

Restart the Entry Administration Tool, then re-execute the command.

If this user action is unsuccessful, take the following action

- If the server package was installed:

Use the *iscollectinfo* command to collect diagnostic information, and then contact your service engineer.

- If the client package was installed:

Use the *iscollectinfo* command to collect diagnostic information on the server machine of the connection destination, and then contact your service engineer.

## 11.35.8 irep77508

---

**IREP: ERROR: irep77508 Unable to run Modify with invalid identifier.**  
**%s1**

### Variable Information

%s1 = Detailed information

### Explanation

The attribute could not be modified because its identifier was invalid.

## User Action

Check whether the specified identifiers, of the attributes, are usable in Interstage Directory Service.

For details on identifiers of attributes, refer to:

- 'List of Attributes' in the Directory Service Operator's Guide
- 'List of Object Classes' in the Directory Service Operator's Guide
- 'Schemata that can be used in Interstage Directory Service' in the Directory Service Operator's Guide

Example:

Adding an LDIF file in which deletion of a telephoneNumber attribute is specified

**[Incorrect]**

```
dn: cn=User001,ou=User,ou=interstage,o=fujitsu,dc=com
```

```
changetype: modify
```

```
add: telephoneNumberXXX <-- Error
```

```
telephoneNumber: 123-456-7890
```

**[Correct]**

```
dn: cn=User001,ou=User,ou=interstage,o=fujitsu,dc=com
```

```
changetype: modify
```

```
add: telephoneNumber
```

```
telephoneNumber: 123-456-7890
```

## 11.35.9 irep77509

---

**IREP: ERROR: irep77509 Attribute value violated schema definition.  
%s1**

### Variable Information

%s1 = Detailed information

### Explanation

A value of an attribute violates a schema definition regulation.

### User Action

Check the detailed information in the message for incorrect attribute values. Correct if necessary.

For details on attribute and schema definitions, refer to:

- 'List of Attributes' in the Directory Service Operator's Guide
- 'List of Object Classes' in the Directory Service Operator's Guide
- 'Schemata that can be used in Interstage Directory Service' in the Directory Service Operator's Guide

## 11.35.10 irep77510

---

**IREP: ERROR: irep77510 Add/Modify an incomplete or undeserved specified attribute.  
%s1**

### Variable Information

%s1 = Detailed information

## Explanation

An attempt was made to incorrectly add or modify an attribute.

## User Action

Check for the identifier or value of the attribute according to the detailed information of the message. If the identifier or value of the attribute was incorrectly specified, specify it correctly, then re-execute the command.

For details on attribute definitions, refer to the following manuals:

- 'List of Attributes' in the Interstage Directory Service Operator's Guide
- 'List of Object Classes' in the Interstage Directory Service Operator's Guide
- 'Schemata that can be used in Interstage Directory Service' in the Directory Service Operator's Guide

If this user action is not successful, refer to the following manual, then take action according to the LDAP error code. The LDAP error code (decimal number) is output in the detailed information field of a message in the form of [LDAP error code XX ...].

'LDAP Error Codes' in "Error Codes to be Reported from Interstage Directory Service".

## 11.35.11 irep77511

---

### IREP: ERROR: irep77511 Invalid DN.

%s1

#### Variable Information

%s1 = Detailed information

#### Explanation

The specified DN is invalid.

#### User Action

Use only allowable characters for DN to rename an entry, then re-execute the command.

The following characters cannot be used to rename a DN:

\, '=', ", #, '+', '<', '>', ';', and ','

Example:

Renaming 'cn=tanaka ichiro' in a rename window

#### **[Incorrect]**

cn=<User001>

#### **[Correct]**

cn=User001

Do not rename the following entries with the Entry Administration Tool. To rename either of the entries, use the Interstage Management Console. For details, refer to the Single Sign-On Operation's Guide:

- Interstage Single Sign-on site definition (ssoSite)
- Interstage Single Sign-on path definition (ssoResource)

## 11.35.12 irep77512

---

### IREP: ERROR: irep77512 Invalid SearchControls for search operation.

%s1

#### Variable Information

%s1 = Detailed information

#### Explanation

An incorrect search condition was specified.

#### User Action

Check the search parameters on the [Options] tab in the [Search] window, then re-execute the command.

### 11.35.13 irep77513

---

**IREP: ERROR: irep77513 Invalid search filter.**

%s1

#### Variable Information

%s1 = Detailed information

#### Explanation

An invalid search filter was specified.

#### User Action

Check the specified search filter on the [Search Condition] tab in the [Search] window, then re-execute the command.

### 11.35.14 irep77514

---

**IREP: ERROR: irep77514 Process size exceeded limitation.**

%s1

#### Variable Information

%s1 = Detailed information

#### Explanation

The number of entries searched is exceeding the size limit.

#### User Action

Check the value specified for the [Size Limit] on the [Options] tab in the [Search] window.

### 11.35.15 irep77515

---

**IREP: ERROR: irep77515 Link loop error occurred.**

%s1

#### Variable Information

%s1 = Detailed information

#### Explanation

A link loop error occurred.

#### User Action

Restart the Entry Administration Tool, then re-execute the command.

If this user action is not successful, take the following action:

- If the server package was installed:

Use the *iscollectinfo* command to collect diagnostic information, and then contact your service engineer.

- If the client package was installed:

Use the *iscollectinfo* command to collect diagnostic information on the server machine of the connection destination, and then contact your service engineer.

## 11.35.16 irep77516

---

**IREP: ERROR: irep77516 Unusual link error occurred.**

%s1

### Variable Information

%s1 = Detailed information

### Explanation

An abnormal link caused an error.

### User Action

Restart the Entry Administration Tool, then re-execute the command.

If this user action is not successful, take the following action:

- If the server package was installed:

Use the *iscollectinfo* command to collect diagnostic information, and then contact your service engineer.

- If the client package was installed:

Use the *iscollectinfo* command to collect diagnostic information on the server machine of the connection destination, and then contact your service engineer.

## 11.35.17 irep77517

---

**IREP: ERROR: irep77517 Entry with the same name already exists.**

%s1

### Variable Information

%s1 = Detailed information

### Explanation

There is already an entry with the name same as the entry specified.

### User Action

You cannot an entry with the name same as that of another entry, on one layer. Rename the existing entry, or the entry to be imported, or specify another RDN, then re-execute the command.

## 11.35.18 irep77518

---

**IREP: ERROR: irep77518 Specified DN does not exist or error in specification.**

%s1

## Variable Information

%s1 = Detailed information

## Explanation

The DN is not in the directory or is incorrectly specified.

## User Action

The entry may have been modified or the DN may be incorrectly specified.

If the entry has been modified, select the entry displayed on Entry Administration Tool and click the [Refresh] button, or double click the entry, one layer above, and check that the specified DN exists. Then re-execute the command.

If the DN was incorrectly specified, specify it correctly, then re-execute the command.

This error message is displayed, if a source entry to be copied, is renamed before pasting. In that case, select the entry in [Tree View], then recopy.

## 11.35.19 irep77519

---

**IREP: ERROR: irep77519 Certification error occurred.**

%s1

## Variable Information

%s1 = Detailed information

## Explanation

An error occurred for authentication.

## User Action

Check for the administrator DN input, for connection destination information or password input, then re-execute the command.

When the LDAP error code is included in the detailed information, take action by referring to the 'LDAP Error Codes' in "Error Codes to be Reported from Interstage Directory Service".

## 11.35.20 irep77520

---

**IREP: ERROR: irep77520 Unsupported specified certification nickname.**

%s1

## Variable Information

%s1 = Detailed information

## Explanation

The specified certificate authentication is not supported.

## User Action

Interstage Directory Service does not support the specified certificate authentication.

## 11.35.21 irep77521

---

**IREP: ERROR: irep77521 Client operation is refused because of no permission.**

%s1

## Variable Information

%s1 = Detailed information

## Explanation

The command could not be handled because it did not have permission to handle the specified entry.

## User Action

Log in using a DN with permission to handle the specified entry, then re-execute the command.

## 11.35.22 irep77522

---

### **IREP: ERROR: irep77522 Unable to create initialcontext implement.**

%s1

## Variable Information

%s1 = Detailed information

## Explanation

The InitialContext implement could not be created.

## User Action

Restart the Entry Administration Tool, then re-execute the command.

If this user action is not successful, take the following actions:

- If the server package was installed:

Use the *iscollectinfo* command to collect diagnostic information, and then contact your service engineer.

- If the client package was installed:

Use the *iscollectinfo* command to collect diagnostic information on the server machine of the connection destination, and then contact your service engineer.

## 11.35.23 irep77523

---

### **IREP: ERROR: irep77523 Access object is an inexistence attribute.**

%s1

## Variable Information

%s1 = Detailed information

## Explanation

An attempt was made to access a non-existing attribute.

## User Action

Check the detailed message information for any non-existing attribute identifier specified. If the identifier or value of the attribute was incorrectly specified, specify it correctly, then re-execute the command.

For details on identifiers of attributes, refer to the following manual:

- 'List of Attributes' in the Directory Service Operator's Guide
- 'List of Object Classes' in the Directory Service Operator's Guide
- 'Schemas Usable for Interstage Directory Service' in the Directory Service Operator's Guide

## 11.35.24 irep77524

---

**IREP: ERROR: irep77524 Access object is an inexistence DN.**

**%s1**

### Variable Information

%s1 = Detailed information

### Explanation

An attempt was made to access a non-existing DN.

### User Action

Select the entry displayed on the Entry Administration Tool and click the [Refresh] button, or double click the entry on one layer above and check that the specified DN exists Then re-execute the command.

If this user action is not successful, take the following actions:

- If the server package was installed:

Use the *iscollectinfo* command to collect diagnostic information, and then contact your service engineer.

- If client package was installed:

Use the *iscollectinfo* command to collect diagnostic information on the server machine of the connection destination, and then contact your service engineer.

## 11.35.25 irep77525

---

**IREP: ERROR: irep77525 Unwilling to perform.**

**%s1**

### Variable Information

%s1 = Detailed information

### Explanation

A request to the repository was rejected.

### User Action

This message is output if:

- No password was input to login.

Enter the correct password, then re-execute the command.

- An attempt was made to modify a slave in replication mode.

Any operation to modify a slave is disallowed. Modify the master.

- Access is not permitted to a DN without a public directory.

- Any operation to a top entry is not permitted.

- It is not permitted to move to any layer above a top entry.

- It is not permitted to register any entry with the same distinguished name as the 'Administrator DN'. Additionally, it is not permitted to change the distinguished name of any entry to the same distinguished name as the 'Administrator DN'.

Windows32/64

- If the environment definition of the repository was manually modified after it was created, restore the environment definition, restart the repository, and then re-execute the command.

## 11.35.26 irep77526

---

**IREP: ERROR: irep77526 Only part of operation finished.**

**%s1**

### Variable Information

%s1 = Detailed information

### Explanation

The tree could not be expanded because there is an entry which includes a referral under an entry.

### User Action

Entries with a referral included are not supported, therefore the entry could not be expanded.

## 11.35.27 irep77527

---

**IREP: ERROR: irep77527 Referral error occurred.**

**%s1**

### Variable Information

%s1 = Detailed information

### Explanation

An error occurred in an operation to an entry referral.

### User Action

Entries with a referral included are not supported, therefore the referral entry could not be handled.

## 11.35.28 irep77528

---

**IREP: ERROR: irep77528 Schema definition violated.**

**%s1**

### Variable Information

%s1 = Detailed information

### Explanation

A definition of an attribute violates a schema definition regulation.

### User Action

Check whether an undefined attribute is used for the objectclass attribute value, or the required attribute is not specified for the objectclass of the specified entry. If there is an attribute incorrectly specified, specify it correctly, then re-execute the command

There is no referral attribute is supported and can be registered.

For details on identifiers of attributes, refer to the following manual:

- 'List of Attributes' in the Directory Service Operator's Guide
- 'List of Object Classes' in the Directory Service Operator's Guide

- 'Schemata that can be used in Interstage Directory Service' in the Directory Service Operator's Guide

When the LDAP error code is included in the detailed information, take action by referring to the 'LDAP Error Codes' in "Error Codes to be Reported from Interstage Directory Service".

## 11.35.29 irep77529

---

**IREP: ERROR: irep77529 Unable to run it because Repository cannot be used or resource of client is insufficiency.**  
**%s1**

### Variable Information

%s1 = Detailed information

### Explanation

The process could not be performed because the repository is unusable, or the machine running the Entry Administration Tool does not have sufficient resources.

### User Action

Stop the repository by using the Interstage Management Console, restart it, and then perform the process again.

If the LDAP error code is indicated, refer to the following manual, then take an appropriate action according to the LDAP error code. The LDAP error code (decimal number) is output in the detailed information field of a message in the form of [LDAP error code XX ...].

'LDAP Error Codes' in "Error Codes to be Reported from Interstage Directory Service".

If this user action is not successful, the resources of the machine running the Entry Administration Tool may be insufficient (lack of memory). Close all programs no longer needed, if any, restart the Entry Administration Tool, then re-execute the command.

**Windows32/64**

If there is insufficient memory for the entire system, add memory or increase virtual memory.

**Solaris32/64 Linux32/64**

If there is insufficient memory for the entire system, add memory or increase the swap area.

For details on memory required for the operation of Interstage Directory Service, refer to the following:

'Memory Requirements' in the Tuning Guide

## 11.35.30 irep77530

---

**IREP: ERROR: irep77530 Unusual termination since user or system setup exceeded the limitation.**  
**%s1**

### Variable Information

%s1 = Detailed information

### Explanation

A limit specified by a user or system was exceeded and the operation was abnormally terminated.

### User Action

Restart the Entry Administration Tool, then re-execute the command.

If this user action is not successful, take the following action:

- If the server package was installed:

Use the *iscollectinfo* command to collect diagnostic information, and then contact your service engineer.

- If client package was installed:

Use the *iscollectinfo* command to collect diagnostic information on the server machine of the connection destination, and then contact your service engineer.

## 11.35.31 irep77531

---

**IREP: ERROR: irep77531 Link error occurred.**  
**%s1**

### Variable Information

%s1 = Detailed information

### Explanation

A link error occurred.

### User Action

Restart the Entry Administration Tool, then re-execute the command.

If this user action is not successful, take the following actions:

- If the server package was installed:

Use the *iscollectinfo* command to collect diagnostic information, and then contact your service engineer.

- If client package was installed:

Use the *iscollectinfo* command to collect diagnostic information on the server machine of the connection destination, and then contact your service engineer.

## 11.35.32 irep77532

---

**IREP: ERROR: irep77532 Unusual security occurred.**  
**%s1**

### Variable Information

%s1 = Detailed information

### Explanation

A security exception occurred.

### User Action

Restart the Entry Administration Tool, then re-execute the command.

If this user action is not successful, take the following actions:

- If the server package was installed:

Use the *iscollectinfo* command to collect diagnostic information, and then contact your service engineer.

- If client package was installed:

Use the *iscollectinfo* command to collect diagnostic information on the server machine of the connection destination, and then contact your service engineer.

## 11.35.33 irep77533

---

**IREP: ERROR: irep77533 URL information was not able to be acquired.**

### Explanation

Information about URLs could not be obtained.

### User Action

The required amount of memory could not be secured. Wait for a while, then re-execute the command.

## 11.35.34 irep77597

---

**IREP: ERROR: irep77597 Unable to get the necessary memory.**

### Explanation

The required amount of memory could not be secured.

### User Action

Possible causes of the error are as follows:

- This message might be output if there is a large amount of binary data.

Large amounts of binary data are not supported in the Entry Management Tool. For this reason, check the amount of registered binary data. If it is necessary to register a large amount of binary data, use the *ldap* command or the C API to register the data.

- The server running the repository may possibly have a heavy load. Wait for a while, then re-execute the command.

If this user action is not successful, the resources of machine running Entry Administration Tool may be insufficient (insufficient memory). Close any programs no longer needed, restart the Entry Administration Tool, then re-execute the command.

**Windows32/64**

If there is insufficient memory for the entire system, add memory or increase virtual memory.

**Solaris32/64 Linux32/64**

If there is insufficient memory for the entire system, add memory or increase the swap area.

For details on memory required for the operation of Interstage Directory Service, refer to the following:

'Memory Requirements' in the Tuning Guide

## 11.35.35 irep77599

---

**IREP: ERROR: irep77599 System error occurred in connection process.**

**%s1**

### Variable Information

%s1 = Detailed information

### Explanation

An unidentifiable error occurred in communication with the repository.

### User Action

Re-execute the process in accordance with the detailed message information.

If the LDAP error code is indicated, refer to following manual, then take an appropriate action according to the LDAP error code. The LDAP error code (decimal number) is output in the detailed information field of a message in the form of [LDAP error code XX ...].

'LDAP Error Codes' in "Error Codes to be Reported from Interstage Directory Service".

If this user action is unsuccessful, take the following actions:

- If server package was installed:

Use the *iscollectinfo* command to collect diagnostic information, and then contact your service engineer.

- If client package was installed:

Use the *iscollectinfo* command to collect diagnostic information on the server machine of the connection destination, and then contact your service engineer.

## 11.36 irep77600 to irep77699

---

### 11.36.1 irep77601

---

**IREP: WARNING: irep77601 Process didn't finished in time limitation.**  
**%s1**

Variable Information

%s1 = Detailed information

Explanation

The operation could not end within the limit search time.

User Action

Check for the [Limit Search Time] value on the [Option] tab in the [Search] window, then reset it to an appropriate value, if necessary.

## 11.37 irep77700 to irep77799

---

### 11.37.1 irep77701

---

**IREP: ERROR: irep77701 The attribute is already used.**  
**%s1**

Variable Information

%s1 = Detailed information

Explanation

An attribute already in use was specified.

User Action

An attribute whose name is the same as the one registered in the entry, may be a 'single' attribute. Any 'single' attribute cannot be specified with multiple attribute values with an identical name. Check the attribute, specify it correctly, and then re-execute the command.

For details on identifiers of attributes, refer to the following manuals:

- 'List of Attributes' in the Directory Service Operator's Guide
- 'List of Object Classes' in the Directory Service Operator's Guide
- "Repository Design" - "Structure (schema) of Data that can be stored" in the Directory Service Operator's Guide

## 11.37.2 irep77702

---

**IREP: ERROR: irep77702 Please attest referral on directory tab.**

### Explanation

Authenticate the target of the referral on the directory tab.

### User Action

Restart the Entry Administration Tool, then re-execute the command.

If this user action is not successful, take the following action:

- If the server package was installed:

Use the *iscollectinfo* command to collect diagnostic information, and then contact your service engineer.

- If the client package was installed:

Use the *iscollectinfo* command to collect diagnostic information on the server machine of the connection destination, and then contact your service engineer.

## 11.37.3 irep77703

---

**IREP: ERROR: irep77703 Entry with same name exists in copy/move place present entry: %s1 is overwritten by the entry %s2**

**Attributes which does not exist in copy/move place are added. If the same attribute exists, only the original attribute value is held Are you sure of overwriting it?**

### Variable Information

%s1 = Name of the target entry specified in the copy or move command

%s2 = Name of the source entry specified in the copy or move command

### Explanation

There is another entry with the same name at the destination of the copy or move command.

Any attributes which are not included in the entry at the destination of the copy or move command are added. Any attributes which are included in the entry at the destination are overwritten with those in the entry to be copied or moved.

### User Action

To allow the overwrite of all attributes, click the [All OK] button. To allow the overwrite of all attributes in the entries displayed, click the [OK] button. To disallow the overwrite of all attributes in the entry displayed, click the [Cancel] button. To cancel the operation, click the [End] button.

### Note

Selecting the [All OK] button or [OK] button, will overwrite the target entry with the attributes of the source entry to be copied or moved.

## 11.38 irep78000 to irep78099

---

### 11.38.1 irep78001

---

**IREP: ERROR: irep78001 Unable to read specified binary file.**

### Explanation

The specified binary file could not be read.

#### User Action

A directory was incorrectly specified; the binary file does not exist, or the binary file has no read permission assigned. Specify a binary file with a read permission assigned, then re-execute the command.

---

### 11.38.2 irep78002

---

#### **IREP: ERROR: irep78002 Unable to read specified ldif file.**

#### Explanation

The specified LDIF file could not be read.

#### User Action

A directory was incorrectly specified; the LDIF file does not exist, or the LDIF file has no read permission assigned. Specify an LDIF file with a read permission assigned, then re-execute the command.

---

### 11.38.3 irep78003

---

#### **IREP: ERROR: irep78003 Unable to write specified binary file.**

#### Explanation

An attempt to write into the specified binary file failed.

#### User Action

The directory storing the binary file, or the file may not have write permission assigned. If no write permission has been assigned, assign it. If write permission has been assigned, the amount of unused space on the hard disk drive may be insufficient. Secure enough disk space, then re-execute the command.

---

### 11.38.4 irep78004

---

#### **IREP: ERROR: irep78004 Unable to write specified ldif file.**

#### Explanation

An attempt to write into the specified LDIF file failed.

#### User Action

The directory storing the LDIF file; or the file, may not have write permission assigned. If no write permission has been assigned, assign it. If write permission has been assigned, the amount of unused hard disk drive space may be insufficient. Secure enough disk space, then re-execute the command.

---

### 11.38.5 irep78005

---

#### **IREP: ERROR: irep78005 Unable to play audio.**

#### Explanation

Interstage Directory Service does not support the data format of the registered audio file.

#### User Action

Register the audio file with an audio format Interstage Directory Service can support, then re-execute the command again.

Interstage Directory Service supports AIFF, AU, and WAV audio formats.

---

### 11.38.6 irep78006

---

#### **IREP: ERROR: irep78006 Certificate analysis error occurred.**

## Explanation

The registered data file does not conform to the certificate format.

## User Action

Register the certificate file with the certificate format, then re-execute the command.

## 11.38.7 irep78007

---

### **IREP: ERROR: irep78007 Unusual process occurred. Stop and restart the Entry Administration Tool.**

## Explanation

An error occurred in an operation.

## User Action

Restart the Entry Administration Tool, then re-execute the command.

If this user action is not successful, take the following actions:

- If the server package was installed:

Use the *iscollectinfo* command to collect diagnostic information, and then contact your service engineer.

- If the client package was installed:

Use the *iscollectinfo* command to collect diagnostic information on the server machine of the connection destination, and then contact your service engineer.

## 11.38.8 irep78009

---

### **IREP: ERROR: irep78009 Expired certification list analysis error occurred.**

## Explanation

The registered data file does not conform to the certificate revocation list.

## User Action

Register the certificate revocation list file with the certificate revocation list format, then re-execute the command.

## 11.38.9 irep78010

---

### **IREP: ERROR: irep78010 Connection information with the same name already exists.**

## Explanation

There is another connection information name with the same name as the specified one.

## User Action

Specify another connection name.

## 11.38.10 irep78011

---

### **IREP: ERROR: irep78011 Host name not set.**

## Explanation

No host name was specified.

#### User Action

Specify a host name.

### 11.38.11 irep78012

---

#### **IREP: ERROR: irep78012 Port number not set.**

#### Explanation

No port number was specified.

#### User Action

Specify a port number.

### 11.38.12 irep78013

---

#### **IREP: ERROR: irep78013 Administrator DN not set.**

#### Explanation

No administrator DN was specified.

#### User Action

Specify an administrator DN.

### 11.38.13 irep78014

---

#### **IREP: ERROR: irep78014 The connection name not set.**

#### Explanation

No connection name was specified.

#### User Action

Specify a connection name.

### 11.38.14 irep78016

---

#### **IREP: ERROR: irep78016 Characters which cannot be used for the connection name was specified.**

#### Explanation

A character that cannot be specified, was used to specify a connection name.

#### User Action

Use up to 64 alphanumeric characters and underscores to specify a connection name, and begin it with an alphabet character.

### 11.38.15 irep78017

---

#### **IREP: ERROR: irep78017 Characters which cannot be used for administrator DN was specified.**

## Explanation

A character that cannot be specified, was used to specify an administrator DN.

## User Action

Use up to 1025 alphanumeric characters, minus characters (-), periods (.), or underscores (\_) to specify an administrator DN, and begin it with an alphabetic character.

## 11.38.16 irep78018

---

### **IREP: ERROR: irep78018 Invalid host name was specified.**

## Explanation

An invalid host name was specified.

## User Action

Use up to 106 alphanumeric characters and symbols, except control codes, to specify a host name.

## 11.38.17 irep78019

---

### **IREP: ERROR: irep78019 Specified an undeserved port number.**

## Explanation

An invalid port number was specified.

## User Action

Use a value between 1 and 65535 to specify a port number.

## 11.38.18 irep78020

---

### **IREP: ERROR: irep78020 Number of the connection name characters exceeded the maximum limitation.**

## Explanation

The number of characters specified for a connection name has exceeded the allowable limit.

## User Action

Use up to 64 alphanumeric characters to specify a connection name.

## 11.38.19 irep78021

---

### **IREP: ERROR: irep78021 Number of administrator DN characters exceeded the maximum limitation.**

## Explanation

The number of characters specified for an administrator DN has exceeded the allowable limit.

## User Action

Use up to 1025 alphanumeric characters to specify an administrator DN.

## 11.38.20 irep78022

---

**IREP: ERROR: irep78022 Number of host name characters exceeded the maximum limitation.**

### Explanation

The number of characters specified for a host name has exceeded the allowable limit.

### User Action

Use up to 106 characters to specify a host name.

## 11.38.21 irep78023

---

**IREP: ERROR: irep78023 Number of port number characters exceeded the maximum limitation.**

### Explanation

A specified port number exceeds the allowable range.

### User Action

Use a value between 1 and 65535 to specify a port number.

## 11.38.22 irep78025

---

**IREP: ERROR: irep78025 System error occurred.**

### Explanation

An error occurred with the system.

### User Action

Restart the Entry Administration Tool, then re-execute the command.

If this user action is not successful, take the following action:

- If the server package was installed:

Use the *iscollectinfo* command to collect diagnostic information, and then contact your service engineer.

- If the client package was installed:

Use the *iscollectinfo* command to collect diagnostic information on the server machine of the connection destination, and then contact your service engineer.

## 11.38.23 irep78026

---

**IREP: ERROR: irep78026 Code conversion was not completed.**

### Explanation

The specified code is incorrect.

### User Action

Specify the code of the LDIF file to be imported, then re-execute the command again.

The LDIF file supports ISO-8859-1 and UTF8 codes in the English environment. However, any external character is unusable.

## 11.38.24 irep78027

---

### **IREP: ERROR: irep78027 Cannot be connected besides Interstage Directory Service.**

#### Explanation

The Entry Administration Tool is specifically for handling Interstage Directory Service entries. It is can only be used with Interstage Directory Service.

#### User Action

Check that the target of the connection is Interstage Directory Service, then re-execute the command.

## 11.38.25 irep78028

---

### **IREP: ERROR: irep78028 Environmental file which composes the Entry Administration Tool is broken.**

#### Explanation

An environment file for the Restart Entry Administration Tool has been damaged.

#### User Action

An environment file for the Restart Entry Administration Tool may have been incorrectly modified.

- For the server package:

Use the *iscollectinfo* command to collect diagnostic information, then contact your service engineer.

- For the client package:

Re-install the Entry Administration Tool according to the description in the Installation Guide.

## 11.39 irep78100 to irep78199

---

### 11.39.1 irep78101

---

#### **IREP: WARNING: irep78101 Copy the entry?**

#### Explanation

An entry is to be copied.

#### User Action

To allow the entry to be copied, click the [OK] button. To stop the process, click the [Cancel] button.

### 11.39.2 irep78102

---

#### **IREP: WARNING: irep78102 Move the entry?**

#### Explanation

An entry is to be moved.

#### User Action

To allow the entry to be moved, click the [OK] button. To stop the process, click the [Cancel] button.

### 11.39.3 irep78103

---

---

**IREP: WARNING: irep78103 Delete the entry?****Explanation**

An entry is to be deleted.

**User Action**

To allow the entry to be deleted, click the [OK] button. To stop the process, click the [Cancel] button.

---

**11.39.4 irep78104**

---

**IREP: WARNING: irep78104 Subordinate entry exists.  
Delete all of sub entries?****Explanation**

There are subordinate entries under the entry. The all lower entries are to be deleted.

**User Action**

To allow the subordinate entries to be deleted, click the [OK] button. To stop the process, click the [Cancel] button.

---

**11.39.5 irep78106**

---

**IREP: WARNING: irep78106 File with same name exists  
Overwrite it?****Explanation**

There is an LDIF file with the same name. The file is to be overwritten.

**User Action**

To overwrite the LDIF file of the same name, click the [OK] button. To stop the process, click the [Cancel] button.

---

**11.39.6 irep78107**

---

**IREP: INFO: irep78107 Importation completed.****Explanation**

The LDIF file was successfully imported.

---

**11.39.7 irep78108**

---

**IREP: INFO: irep78108 Importation stopped.****Explanation**

The process for importing the LDIF file was canceled.

---

**11.39.8 irep78109**

---

**IREP: INFO: irep78109 Exportation completed.****Explanation**

The LDIF file was successfully exported.

---

**11.39.9 irep78110**

---

**IREP: INFO: irep78110 Exportation stopped.**

## Explanation

The process for exporting the LDIF file was canceled.

## 11.39.10 irep78111

---

### **IREP: WARNING: irep78111 Set the connection information.**

## Explanation

No information about the connection destination has been specified.

## User Action

Click the [OK] button, and then specify the connection destination information on the 'Set for connection' display.

## 11.40 irep78200 to irep78299

---

### 11.40.1 irep78201

---

#### **IREP: ERROR: irep78201 Attribute name is not inputted.**

## Explanation

No attribute name was input.

## User Action

An attribute name needs to be always specified. Specify an attribute name, then re-execute the command.

### 11.40.2 irep78202

---

#### **IREP: ERROR: irep78202 DN is not inputted.**

## Explanation

No DN was specified.

## User Action

Specify the DN of the target entry in the [DN Display/Input] field, then re-execute the command.

### 11.40.3 irep78203

---

#### **IREP: ERROR: irep78203 Specify RDN please.**

## Explanation

Specify an RDN.

## User Action

Specify the RDN, then re-execute the command.

### 11.40.4 irep78204

---

#### **IREP: ERROR: irep78204 Entry is not chosen.**

## Explanation

No entry was specified.

## User Action

Select an entry by using [Tree View] or [List View] on Entry Administration Tool or [List of Search Results] in the [Search] window, then re-execute the command.

## 11.40.5 irep78205

---

**IREP: ERROR: irep78205 Specified entry does not exist.**  
**%s1**

### Variable Information

%s1 = Name of a specified entry

### Explanation

The specified entry does not exist.

### User Action

An entry which is not in the repository, was specified. Specify an entry which is in [DN Display/Input], then re-execute the command.

## 11.40.6 irep78206

---

**IREP: ERROR: irep78206 Chosen entry does not exist.**

### Explanation

The selected entry does not exist.

### User Action

An entry which is not in the repository was selected. Click the [Refresh] button on the Entry Administration Tool to update [Tree View], then re-execute the command.

## 11.40.7 irep78207

---

**IREP: ERROR: irep78207 Specified entry does not show.**

### Explanation

The specified entry was not displayed.

### User Action

An entry which was not displayed in [Tree View] was incorrectly specified. Click the [Refresh] button on Entry Administration Tool to update [Tree View], check that the specified entry is displayed on [Tree View], then re-execute the command.

## 11.40.8 irep78208

---

**IREP: ERROR: irep78208 Upper entry of specified entry does not exist.**

### Explanation

There are no upper entries above the specified entry.

### User Action

The entry currently selected or specified is the public directory (top directory) of the repository. It is not permitted to move to any layer above the top entry.

## 11.40.9 irep78209

---

**IREP: ERROR: irep78209 Specified directory or file not found.**

## Explanation

The specified directory or file could not be found.

## User Action

Check that the specified directory or file exists, then re-execute the command.

## 11.40.10 irep78210

---

**IREP: ERROR: irep78210 File %s1 not found.**

## Variable Information

%s1 = Name of an information file about the Entry Administration Tool

## Explanation

The file could not be found.

## User Action

An information file for the Restart Entry Administration Tool has been deleted. Create an empty file for the file indicated in the message, then re-execute the command.

If this user action is not successful, install the Entry Administration Tool again, then re-execute the command.

## 11.40.11 irep78211

---

**IREP: ERROR: irep78211 Entry is not evacuated to the present buffer.**

## Explanation

An entry could not be pasted because it had not been copied or cut.

## User Action

First copy or cut an entry, then re-execute the command.

## 11.40.12 irep78212

---

**IREP: ERROR: irep78212 Entry for copy is not chosen.**

## Explanation

No target entry was specified for the copy destination.

## User Action

Select a target entry for the copy destination on [Tree View] or [List View], then re-execute the process.

## 11.40.13 irep78213

---

**IREP: ERROR: irep78213 Entry for move is not chosen.**

## Explanation

No target entry was specified for the move destination.

#### User Action

Select a target entry for the move destination on [Tree View] or [List View], then re-execute the process.

### 11.40.14 irep78214

---

**IREP: ERROR: irep78214 Unable to copy  
Entry for copy is a subordinate of original entry.**

#### Explanation

The target entry of the copy destination cannot be specified because it is subordinate to the source entry.

#### User Action

Change the target entry.

### 11.40.15 irep78215

---

**IREP: ERROR: irep78215 Unable to move  
Entry for move is a subordinate of original entry.**

#### Explanation

The target entry of the move destination cannot be specified because it is subordinate to the source entry.

#### User Action

Change the target entry.

### 11.40.16 irep78216

---

**IREP: ERROR: irep78216 Unable to copy  
Entry for copy is original entry.**

#### Explanation

The target entry of the copy destination cannot be specified because it is the source entry.

#### User Action

Change the target entry. To copy the entry, first copy it to another layer, rename it, then move it to the original layer.

### 11.40.17 irep78217

---

**IREP: ERROR: irep78217 Unable to move  
Entry for move is original entry.**

#### Explanation

The target entry of the move destination cannot be specified because it is the source entry.

#### User Action

Change the target entry.

## 11.40.18 irep78218

---

### **IREP: ERROR: irep78218 Unsupported date for forward.**

#### Explanation

Data to be forwarded is not supported.

#### User Action

Entries that can be dragged and dropped are only those displayed in [Tree View] or [List View] on Entry Administration Tool or [List of Search Results] in the [Search] window.

If multiple Entry Administration Tools have been activated, it is not permitted to drag and drop an entry from one Entry Administration Tool to another. Re-execute the process so that it is handled within one Entry Administration Tool.

## 11.40.19 irep78219

---

### **IREP: ERROR: irep78219 Unable to drop.**

#### Explanation

An entry could not be dropped.

#### User Action

Entries that can be dragged and dropped are only those displayed in [Tree View] or [List View] on Entry Administration Tool or [List of Search Results] in the [Search] window.

If multiple Entry Administration Tools have been activated, it is not permitted to drag and drop an entry from one Entry Administration Tool to another. Re-execute the process so that it is handled within one Entry Administration Tool.

## 11.40.20 irep78220

---

### **IREP: ERROR: irep78220 Add failed.**

#### Explanation

A sequence for adding an entry abnormally stopped.

#### User Action

Restart the Entry Administration Tool, then re-execute the process.

If this user action is not successful, take the following action:

- If the server package was installed:

Use the *iscollectinfo* command to collect diagnostic information, and then contact your service engineer.

- If client package was installed:

Use the *iscollectinfo* command to collect diagnostic information on the server machine of the connection destination, and then contact your service engineer.

## 11.40.21 irep78221

---

### **IREP: ERROR: irep78221 Modification failed.**

## Explanation

A sequence for modifying an entry abnormally stopped.

## User Action

Restart the Entry Administration Tool, then re-execute the command.

If this user action is not successful, take the following action:

- If the server package was installed:

Use the *iscollectinfo* command to collect diagnostic information, and then contact your service engineer.

- If client package was installed:

Use the *iscollectinfo* command to collect diagnostic information on the server machine of the connection destination, and then contact your service engineer.

## 11.40.22 irep78222

---

### **IREP: ERROR: irep78222 Rename failed.**

## Explanation

A sequence for renaming an entry abnormally stopped.

## User Action

Restart the Entry Administration Tool, then re-execute the process.

If this user action is not successful, take the following action:

- If the server package was installed:

Use the *iscollectinfo* command to collect diagnostic information, and then contact your service engineer.

- If the client package was installed:

Use the *iscollectinfo* command to collect diagnostic information on the server machine of the connection destination, and then contact your service engineer.

## 11.40.23 irep78223

---

### **IREP: ERROR: irep78223 Specified entry information get failed.**

## Explanation

A sequence for acquiring information about the specified entry abnormally stopped.

## User Action

Restart the Entry Administration Tool, then re-execute the process.

If this user action is unsuccessful, take the following actions:

- If the server package was installed:

Use the *iscollectinfo* command to collect diagnostic information, and then contact your service engineer.

- If the client package was installed:

Use the *iscollectinfo* command to collect diagnostic information on server machine of the connection destination, and then contact your service engineer.

## 11.40.24 irep78225

---

### **IREP: ERROR: irep78225 Invalid port number.**

#### Explanation

The specified port number is incorrect.

#### User Action

Use an integer between 1 and 65535 to specify a port number.

## 11.40.25 irep78226

---

### **IREP: ERROR: irep78226 Connection failed.**

#### Explanation

A connection could not be established.

#### User Action

Check for the host name and port number specified in the connection information window. IPv6 addresses cannot be used for the host name. If the host name and port number specified are correct, check that the repository has been activated by using Interstage Management Console on the connection. If the repository has been deactivated, start it.

Note that the Entry Administration Tool does not support connection to SSL ports. Check that there is no connection to an SSL port. If there is an SSL port number specified, specify a non-SSL port.

Another possible cause of the error may possibly be in the network. Check whether it is possible to connect to the machine running the repository by using ping or another command.

## 11.40.26 irep78227

---

### **IREP: ERROR: irep78227 Unable to logout.**

#### Explanation

The Entry Administration Tool prevented logout.

#### User Action

Close the Entry Administration Tool. If the Entry Administration Tool cannot be closed, take the following actions:

- If the server package was installed:

Use the *iscollectinfo* command to collect diagnostic information, and then contact your service engineer.

- If the client package was installed:

Use the *iscollectinfo* command to collect diagnostic information on the server machine of the connection destination, and then contact your service engineer.

## 11.40.27 irep78232

---

### **IREP: ERROR: irep78232 Input sizelimit please.**

#### Explanation

No value has been specified for the size limit.

#### User Action

Specify an integer between 1 and 10000 for the size limit, or select an integer from the pull-down menu in the Entry Administration Tool search option window, then re-execute the process.

### 11.40.28 irep78233

---

#### **IREP: ERROR: irep78233 Input timelimit please.**

#### Explanation

No value has been specified for the limit search time.

#### User Action

Specify an integer between 1 and 3600 for the limit search time, or select an integer from the pull-down menu in the Entry Administration Tool search option window, then re-execute the process.

### 11.40.29 irep78234

---

#### **IREP: ERROR: irep78234 Invalid sizelimit value.**

#### Explanation

The value for the size limit is incorrect.

#### User Action

Specify an integer between 1 and 10000 for the size limit, or select an integer from the pull-down menu in the Entry Administration Tool search option window, then re-execute the process.

### 11.40.30 irep78235

---

#### **IREP: ERROR: irep78235 Invalid timelimit value.**

#### Explanation

The value specified for the limit search time is incorrect.

#### User Action

Specify an integer between 1 and 3600 for the limit search time or, select an integer from the pull-down menu in the Entry Administration Tool search option window, then re-execute the process.

### 11.40.31 irep78236

---

#### **IREP: ERROR: irep78236 Search base of search is not inputted.**

#### Explanation

No search base has been specified.

#### User Action

Select an entry using [Tree View] or [List View] on Entry Administration Tool, then re-execute the process.

## 11.40.32 irep78237

---

**IREP: ERROR: irep78237 There are some items without searching condition.**

### Explanation

A search condition was not specified.

### User Action

Complete all required search condition fields, then re-execute the process.

## 11.40.33 irep78238

---

**IREP: ERROR: irep78238 Conditional expression is not chosen.**

### Explanation

No conditional expression was selected. Specify the range of a condition to be parenthesized.

### User Action

Specify the range of a condition to be parenthesized using [Search Filter], then click the [Add a Parenthesis] button.

## 11.40.34 irep78239

---

**IREP: ERROR: irep78239 Unable to insert parenthesis in selected place.**

### Explanation

It is not permitted to put parentheses in the selected location.

### User Action

Specify both ends of a condition number to be parenthesized, then click the [Add a Parenthesis] button.

## 11.40.35 irep78240

---

**IREP: ERROR: irep78240 Unable to insert parenthesis in single conditional expression.**

### Explanation

It is not permitted to put parentheses on a single conditional expression.

### User Action

Specify both ends of two or more condition numbers, then click the [Add a Parenthesis] button.

## 11.40.36 irep78241

---

**IREP: ERROR: irep78241 Unable to specify over parenthesis.**

### Explanation

There is a parenthesis missing in paired parenthesis of the parentheses to be added.

#### User Action

There is a parenthesis missing in a paired parenthesis. Add the missing parenthesis and re-execute.

### 11.40.37 irep78242

---

#### **IREP: ERROR: irep78242 Unable to set double parenthesis.**

#### Explanation

Parentheses have been already specified.

#### User Action

Parentheses cannot be added double.

### 11.40.38 irep78243

---

#### **IREP: ERROR: irep78243 Conditional expression is not chosen.**

#### Explanation

No conditional expression was selected.

#### User Action

Specify both ends of the parentheses to be deleted using [Search Filter], then re-execute the process.

### 11.40.39 irep78244

---

#### **IREP: ERROR: irep78244 Please select range of parenthesis.**

#### Explanation

Specify range of parentheses at both ends.

#### User Action

Specify both ends of the parentheses to be deleted using [Search Filter], then re-execute the process.

### 11.40.40 irep78245

---

#### **IREP: ERROR: irep78245 Correspondence of selected parenthesis is different.**

#### Explanation

The selected parentheses were incorrectly paired.

#### User Action

Specify both ends of correctly paired parentheses using [Search Filter], then re-execute the process.

### 11.40.41 irep78246

---

#### **IREP: ERROR: irep78246 Condition are too many.**

## Explanation

The number of specified search conditional expressions exceeds the allowable number.

## User Action

Only two search conditional expressions can be specified. Specify the search conditional expressions within the allowable number.

## 11.40.42 irep78247

---

### **IREP: ERROR: irep78247 Unable to combine same attribute names in multiAVA.**

## Explanation

It is not permitted to specify multiple attributes, with the same name, for any multi-AVA attributes.

## User Action

Specify correct multi-AVA attributes, then re-execute the process.

Multi-AVA indicates two or more attributes jointed with a plus (+) sign to an RDN.

Example:

Specifying attributes with the same name for a multi-AVA attribute

**[Incorrect]**

```
cn=User001+cn=User002,ou=User,ou=interstage,o=fujitsu,dc=com
```

**[Correct]**

```
cn=User001+sn=Fujitsu,ou=User,ou=interstage,o=fujitsu,dc=com
```

## 11.40.43 irep78248

---

### **IREP: ERROR: irep78248 Unable to specify RDN checkbox.**

## Explanation

The RDN check box was not selected.

## User Action

To add an entry, select the RDN checkbox.

## 11.40.44 irep78249

---

### **IREP: ERROR: irep78249 The same binary attribute cannot be specified.**

## Explanation

It is not permitted to register binary attributes with the same name and same value size into an entry.

## User Action

Specify binary attributes which have a different name and value size, then re-execute the process.

## 11.40.45 irep78250

---

---

**IREP: WARNING: irep78250 The connection information has been changed.  
Is the connection information preserved?  
%s1**

Variable Information

%s1 = Information about the connection destination

Explanation

Information about the connection destination was successfully modified but not saved.

User Action

To save the modified connection destination information, click the [OK] button. To stop the process, click the [Cancel] button.

## 11.40.46 irep78251

---

**IREP: ERROR: irep78251 The connection information on the selected the connection name is not preserved.**

Explanation

No connection information could be saved for the selected connection name.

User Action

Save new connection destination information, select the name of the connection in the connection name list, then re-execute the process.

## 11.41 irep78900 to irep78999

---

### 11.41.1 irep78901

---

**IREP: ERROR: irep78901: The indispensable package is not installed.**

Explanation

A package required to handle the command has not been installed.

User Action

Install the correct package, then re-execute the command:

- For the server package:
  - Fujitsu Java Development Kit
- For the client package:
  - JRE JBK plug-in

### 11.41.2 irep78902

---

**IREP: ERROR: irep78902: The command execution failed.  
detail=%s1**

Variable Information

%s1 = Detail code

Explanation

The Entry Administration Tool could not be started.

## User Action

Take the following action:

- If the server package was installed:

Use the *iscollectinfo* command to collect diagnostic information, and then contact your service engineer.

- If the client package was installed:

Use the *iscollectinfo* command to collect diagnostic information on the server machine of the connection destination, and then contact your service engineer.

## 11.41.3 irep78903

---

**IREP: ERROR: irep78903: No permission to execute.**

### Explanation

The Entry Administration Tool cannot be executed without required administrator authority.

### User Action

Execute the process with the administrator authority.

## 11.41.4 irep78904

---

**IREP: ERROR: irep78904: Because the necessary file does not exist, Entry Administration Tool cannot be started.  
detail=%s1**

### Variable Information

%s1 = Module name

### Explanation

The module Sun ONE Directory SDK for Java 4.1., required for using the Entry Administration Tool, has not been installed, or may have been destroyed.

### User Action

Take the following action:

- If the server package was installed:

Back up the created repository and re-install Interstage Directory Service. After re-installation, restore the backed up repository and correct the environment. For details of backup and restoration, refer to 'Backing up and Restoring Interstage Directory Service' in the Directory Service Operator's Guide. For details of re-installation, refer to the Installation Guide.

- If the client package was installed:

Re-install Interstage Directory Service. For details of re-installation, refer to the Installation Guide.

# Chapter 12 Messages Beginning with 'is'

This chapter describes the messages displayed by the Interstage system.

## 12.1 is20100 to is20199

This section details the messages with message numbers between is20100 and is20199.

### 12.1.1 is20101

#### IS: INFO: is20101:INTERSTAGE started normally

##### Explanation

Interstage started successfully.

### 12.1.2 is20102

#### IS: ERROR: is20102:INTERSTAGE unable to start Reason code(%d)

##### Variable Information

%d = Reason Code

##### Explanation

Interstage failed to start due to the reason shown in the reason code.

##### System Action

Command processing stops.

##### User Action

Carry out the actions corresponding to the reason codes in [Table 12.1 is20102 Reason Code Explanations](#).

When the CORBA Service, Interface Repository, Naming Service, Component Transaction Service, Database Linkage Service, Load Balance Option, Interstage HTTP Server, or Performance Monitoring Tool (for Windows(R) only) could not be started, check whether an error message indicating the cause of the service start failure is displayed. If such a message is displayed, take the corresponding action.

If these conditions do not apply and another message was output simultaneously, take the action indicated by that message.

If these conditions are not met, and another message is output together with this message, take action according to the other message.

When no other message is output, collect diagnostic information using the *iscollectinfo* command, record the error information, and contact your systems engineer.

##### Windows32/64

In addition, when the od10416 message is output, execute processing again.

##### Solaris32/64 Linux32/64

If the reason code is 11 or 32, and the od20001 message is output after this message is output, set the environment variable IS\_ISV\_SVCCTRL\_TIMER before executing the *isstart* command. Set the value for the environment variable IS\_ISV\_SVCCTRL\_TIMER to be the time difference (in seconds) between this message output and od20001 message output, plus 90. For example, if the message is20102 is output at 10 o'clock and od20001 is output at 10 o'clock and 10 seconds, 100 is set for the environment variable IS\_ISV\_SVCCTRL\_TIMER.

```
IS_ISV_SVCCTRL_TIMER=100
export IS_ISV_SVCCTRL_TIMER
```

If the reason code is 12, and the message od30101 is output after this message, specify the environment variable IS\_ISV\_SVCCTRL\_TIMER before executing the *isstart* command. In the environment variable IS\_ISV\_SVCCTRL\_TIMER, specify a value of the time (in seconds) between when this message is output and when the message od30101 is output plus 90.

If the reason code is 12, and "od30102:NamingService start failed. initialize(restore\_objects),..." is output after this message, execute the following procedure once only.

1. Start the CORBA Service using the *OD\_start* command.

**Solaris32/64**

```
/opt/FSUNod/bin/OD_start
```

**Linux32/64**

```
/opt/FJSVod/bin/OD_start
```

Check whether the od10002 message is output to the system log after the command is executed. If this message is output, the start can be considered complete.

2. Start the Naming Service using the *CosNaming\_s* command.

**Solaris32/64**

```
/opt/FSUNod/bin/CosNaming_s &
```

**Linux32/64**

```
/opt/FJSVod/bin/CosNaming_s &
```

Check whether the od30101 message is output to the system log after the command is executed. If this message is output, the start can be considered complete.

Note: It takes a while before the od30101 message is output.

3. Stop the CORBA Service using the *OD\_stop* command.

**Solaris32/64**

```
/opt/FSUNod/bin/OD_stop
```

**Linux32/64**

```
/opt/FJSVod/bin/OD_stop
```

Check whether the od10005 message is output to the system log after the command is executed. If this message is output, the stop can be considered complete.

4. Start Interstage using the *isstart* command.

**Solaris32/64**

```
/opt/FSUNtd/bin/isstart
```

**Linux32/64**

```
/opt/FJSVtd/bin/isstart
```

Check whether the is30140 message is output to the window that is used to execute the command after the command is executed. If this message is output, the start can be considered complete.

If Interstage fails to start, add [90] to the value that is currently set for the IS\_ISV\_SVCCTRL\_TIMER environment variable and then execute the *isstart* command. Repeat until the error is fixed.

If Interstage fails to start even if the maximum (6000) is set for the IS\_ISV\_SVCCTRL\_TIMER environment variable, collect diagnostic information using the *iscollectinfo* command, record the error information, and contact your systems engineer.

**Linux32/64**

If the reason code is 4, there is a message queue or shared memory shortage.

Refer to the Tuning Guide, reestimate the message queue or shared memory required for running Interstage, and check whether there is enough semaphore.

Tune the system parameter for message queues or shared memory if the reestimation indicates that the memory is insufficient.

Table 12.1 is20102 Reason Code Explanations

Reason code	Explanation	User response or number of the message containing the user response
1	A memory shortage occurred.	is30147
2	Interstage has not been initialized.	is30149
3	Interstage initialization failed.	is30150
4	A system resource shortage occurred.	is30153
5	An Interstage system definition has not been generated.	is30154
6	An I/O error occurred in the system file.	is30158
7	A system error occurred.	is30151
8	An internal error was detected in the system.	is30146
10	The CORBA Service could not be started.	is30141
11	The Interface Repository (standard interface) could not be started.	is30141
12	The Naming Service could not be started.	is30141
13	The Component Transaction Service could not be started.	is30141
14	The Database Linkage Service could not be started.	is30141
20	The CORBA Service could not be recovered.	is30142
21	The Interface Repository (standard interface) could not be recovered.	is30142
22	The Naming Service could not be recovered.	is30142
23	The Component Transaction Service could not be recovered.	is30142
24	The Database Linkage Service could not be recovered.	is30142
26	An error was detected in Interstage.	is30156
27	<p><b>Solaris32/64</b></p> <p>'/opt/FSUNod/lib/nt' is specified in the environment variable LD_LIBRARY_PATH.</p> <p><b>Linux32/64</b></p> <p>'/opt/FJSVod/lib/nt' is specified in the environment variable LD_LIBRARY_PATH.</p>	Correct the value specified in the environment variable LD_LIBRARY_PATH, and then reenter the command.
28	The Event Service could not be started.	is30141
30	<p><b>Windows32/64</b></p> <p>Command operation is disabled in this state.</p>	is30148
31	<p><b>Windows32/64</b></p> <p>The logon account of the Interstage Service is not a member of the Administrator's group.</p>	is30143
32	The Interface Repository (value interface) could not be started.	is30141

Reason code	Explanation	User response or number of the message containing the user response
33	The Interface Repository (value interface) could not be recovered.	is30142
35	The Load Balance Option could not be started.	is30141
36	The Load Balance Option could not be collected.	is30142
38	A component required for operation is not installed.	is30168
40	The Web Server could not be started.	is30141
41	The HTML Page Editing Service could not be started.	is30161
42	An old version of Servlet Service could not be started.	is30141
48	The FJSVis2su package is not installed.	is30911
49	The Interstage HTTP Server could not be started.	is30141
51	<b>Windows32/64</b> The Performance Monitoring Tool could not be started.	is30141
52	The Java EE Node Agent service could not be started.	is30141

### 12.1.3 is20103

**IS: ERROR: is20103: An internal error was detected while starting INTERSTAGE Error information(%d)**

#### Variable Information

%d = Error information

#### Explanation

A contradiction was found in the Interstage system, or there is a memory shortage.

#### System Action

Command processing stops.

#### User Action

**Windows32/64**

If the value indicated by %d (error information) is xxx:xxx:8, xxx:xxx:14, xxx:xxx:1455, xxx:xxx:10008, xxx:xxx:10014, or xxx:xxx:11455, there is a memory shortage.

**Solaris32/64 Linux32/64**

If the value indicated by %d (error information) is xxx:12:xxx, there is a memory shortage.

After a few moments, execute the *isstop -f* command and then reexecute the process. If executing the *isstop -f* command results in an error, restart the machine. If this message is generated frequently, refer to the Tuning Guide, reestimate the memory required to run Interstage, and check whether there is enough memory.

If there is enough memory to run Interstage, there may be inadequate memory to run other applications. Reestimate the amount of memory required for the other applications running on the same machine to determine if there is an appropriate amount of memory.

Contact your system administrator if the reestimation indicates that the memory is insufficient. Ask the system administrator to either increase the size of the main memory or to increase the size of the page file.

**Linux32/64**

If the value indicated by %d (error information) is 0x00000404:xxx:xxx, there is a semaphore shortage.

Refer to the Tuning Guide, reestimate the semaphore required for running Interstage, and check whether there is enough semaphore.

Tune the semaphore system parameter if the reestimation indicates that the memory is insufficient.

If these conditions are not met, and another message is output together with this message, take action according to the other message.

When no other message is output, collect diagnostic information using the *iscollectinfo* command, record the error information, and contact your systems engineer.

## 12.1.4 is20104

---

### IS: ERROR: is20104:A system error occurred while starting INTERSTAGE Error information(%d)

#### Variable Information

%d = Error information

#### Explanation

A system error has occurred, or there is a memory shortage.

#### System Action

Command processing stops.

#### User Action

##### Windows32/64

If the value indicated by %d (error information) is xxx:xxx:8, xxx:xxx:14, xxx:xxx:1455, xxx:xxx:10008, xxx:xxx:10014, or xxx:xxx:11455, there is a memory shortage.

##### Solaris32/64 Linux32/64

If the value indicated by %d (error information) is xxx:12:xxx, there is a memory shortage.

After a few moments, execute the *isstop -f* command and then reexecute the process. If executing the *isstop -f* command results in an error, restart the machine. If this message is generated frequently, refer to the Tuning Guide, reestimate the memory required to run Interstage, and check whether there is enough memory.

If there is enough memory to run Interstage, there may be inadequate memory to run other applications. Reestimate the amount of memory required for the other applications running on the same machine to determine if there is an appropriate amount of memory.

Contact your system administrator if the reestimation indicates that the memory is insufficient. Ask the system administrator to either increase the size of the main memory or to increase the size of the page file.

##### Linux32/64

If the value indicated by %d (error information) is xxx:28:xxx, there is a semaphore shortage.

Refer to the Tuning Guide, reestimate the semaphore required for running Interstage, and check whether there is enough semaphore.

Tune the semaphore system parameter if the reestimation indicates that the memory is insufficient.

If the value indicated by %d (error information) is 0x0000037e:4:0 and Oracle was installed, then a library with the same name as the system library in the Oracle resources (libexpat.so.0) will exist, and the path of that library will have been set in the LD\_LIBRARY\_PATH environment variable.

Make sure that the first path in the LD\_LIBRARY\_PATH environment variable is the following:

- Linux for x86/Linux for Intel64(32bit compatibility mode): "/lib"
- Linux for Intel64(64bit mode): "/lib64"

If the value indicated by %d (error information) is not xxx:xxx:8, xxx:xxx:14, xxx:xxx:1455, xxx:xxx:10008, xxx:xxx:10014, xxx:xxx:11455, xxx:12:xxx, xxx:28:xxx, or 0x0000037e:4:0, record the error information and contact your systems engineer.

If the error information indicates a value other than the above, collect diagnostic information using the *iscollectinfo* command, record the error information, and contact your systems engineer.

##### Solaris32/64 Linux32/64

Alternately, refer to the system log. If a message indicates insufficient memory or swap area, wait a moment, then reexecute the process.

## 12.1.5 is20106

---

**IS: ERROR: is20106:An error when starting INTERSTAGE is not recovered Reason code(%d)**

### Variable Information

%d = Reason Code

### Explanation

The Interstage collection process failed.

### System Action

Stops the retrieve process.

### User Action

Carry out the actions described in the reason codes for is20102 ([Table 12.1 is20102 Reason Code Explanations](#)), according to the specified reason code.

## 12.1.6 is20107

---

**IS: ERROR: is20107: An internal error was detected while recovering from an error starting INTERSTAGE Error information(%d)**

### Variable Information

%d = Error information

### Explanation

A contradiction was found in the Interstage system.

### System Action

Stops the retrieve process.

### User Action

Collect diagnostic information using the *iscollectinfo* command, record the error information, and then contact your systems engineer.

## 12.1.7 is20108

---

**IS: ERROR: is20108:A system error occurred while recovering from an error starting INTERSTAGE Error information(%d)**

### Variable Information

%d = Error information

### Explanation

A system error has occurred.

### System Action

Stops the retrieve process.

### User Action

Collect diagnostic information using the *iscollectinfo* command, record the error information, and then contact your systems engineer.

## 12.1.8 is20109

---

**IS: INFO: is20109:INTERSTAGE terminated normally**

## Explanation

Interstage has stopped successfully.

## 12.1.9 is20110

### IS: ERROR: is20110:INTERSTAGE unable to terminate Reason code(%d)

#### Variable Information

%d = Reason Code

#### Explanation

Failed to stop Interstage.

#### System Action

Command processing stops.

#### User Action

Take the appropriate user action for the message according to the reason code. If another message was output simultaneously, take the action indicated by that message.

If the reason code is '15', and message od10005 is output after this message, it may mean the CORBA service takes a while to stop. The reason for this is because many CORBA applications are running at the same time. Note that this message is output if it takes the CORBA service more than 1 minute to stop (the CORBA service stop process is continued).

If this case applies, set the IS\_ISV\_SVCCTRL\_TIMER environment variable before executing the *isstop* command. Set the value for IS\_ISV\_SVCCTRL\_TIMER that is equal to (the number of seconds from the output of message od10003 until the output of message od10005 + 60). For example, if od10003 is output at 10:00:00, and od10005 is output at 10:02:00, set '180' for the IS\_ISV\_SVCCTRL\_TIMER environment variable.

- IS\_ISV\_SVCCTRL\_TIMER=100
- export IS\_ISV\_SVCCTRL\_TIMER

When the CORBA Service, Interface Repository, Naming Service, Component Transaction Service, Database Linkage Service, Load Balance Option could not be stopped, check whether an error message indicating the cause of the service stop failure is displayed. If such a message is displayed, take the corresponding action.

When no other message is output, collect diagnostic information using the *iscollectinfo* command, record the error information, and contact your systems engineer.

Table 12.2 is20110 Reason Code Explanations

Reason code	Explanation	Response or Number of the Message Containing the Response
1	A memory shortage occurred.	is30166
4	A system resource shortage occurred.	is30170
5	An Interstage system definition has not been generated.	is30171
6	An I/O error occurred in the system file.	is30174
7	A system error occurred.	is30168
8	An internal error was detected in the system.	is30165
9	The resource control program for the Database Linkage Service could not be started.	is30172
15	The CORBA Service could not be stopped.	is30161
16	The Interface Repository (standard interface) could not be stopped.	is30161
17	The Naming Service could not be stopped.	is30161

Reason code	Explanation	Response or Number of the Message Containing the Response
18	The Component Transaction Service could not be stopped.	is30161
19	The Database Linkage Service could not be stopped.	is30161
25	An operating WorkUnit already exists.	is30175
26	An error was detected in Interstage.	is30173
29	The Event Service could not be stopped.	is30161
30	<b>Windows32/64</b> Command operation is disabled in this state.	is30167
34	The Interface Repository (value interface) could not be stopped.	is30161
37	The Load Balance Option could not be stopped.	is30161
43	An old version (V5.0.1 or earlier) of the Servlet Service could not be stopped.	is30161
45	The Web server could not be stopped.	is30161
48	The FJSVis2su package is not installed.	is30911
50	The Interstage HTTP Server could not be stopped.	is30161
52	<b>Windows32/64</b> The Performance Monitoring Tool could not be stopped.	is30161
53	The Java EE Node Agent service could not be stopped.	is30161

## 12.1.10 is20111

### IS: ERROR: is20111: An internal error was detected while terminating INTERSTAGE Error information(%d)

#### Variable Information

%d = Error information

#### Explanation

A contradiction was found in the Interstage system, or there is a memory shortage.

#### System Action

Command processing stops.

#### User Action

If the value indicated by %d (error information) is xxx:xxx:8, xxx:xxx:14, xxx:xxx:1455, xxx:xxx:10008, xxx:xxx:10014, or xxx:xxx:11455, there is a memory shortage. After a few moments, execute the *isstop -f* command and then reexecute the process. If executing the *isstop -f* command results in an error, restart the machine. If this message is generated frequently, refer to the Tuning Guide, reestimate the memory required to run Interstage, and check whether there is enough memory.

If there is enough memory to run Interstage, there may be inadequate memory to run other applications. Reestimate the amount of memory required for the other applications running on the same machine to determine if there is an appropriate amount of memory.

Contact your system administrator if the reestimation indicates that the memory is insufficient. Ask the system administrator to either increase the size of the main memory or to increase the size of the page file.

If the error information indicates a value other than the above, collect diagnostic information using the *iscollectinfo* command, record the error information, and contact your systems engineer.

## 12.1.11 is20112

---

### IS: ERROR: is20112:A system error occurred while terminating INTERSTAGE Error information(%d)

#### Variable Information

%d = Error information

#### Explanation

A system error has occurred.

#### System Action

Command processing stops.

#### User Action

**Linux32/64**

If the value indicated by %d (error information) is xxx:28:xxx, there is a semaphore shortage.

Refer to the Tuning Guide, reestimate the semaphore required for running Interstage, and check whether there is enough semaphore.

Tune the semaphore system parameter if the reestimation indicates that the memory is insufficient.

If 'stop monitor:' is displayed at the start of the error information, it means that the message is from the stop process monitoring mechanism. If the Interstage or WorkUnit stop process was completed normally, there is no problem.

If the error information indicates a value other than the above, collect diagnostic information using the *iscollectinfo* command, record the error information, and contact your systems engineer.

## 12.1.12 is20113

---

### IS: WARNING: is20113: Failure to stop service due to it being in use by another service Reason code (%d)

#### Variable Information

%d = Reason code

#### Explanation

The service for which a termination has been attempted, is a prerequisite for another service.

#### System Action

Command processing stops.

#### User Action

Terminate the service referred to in the following table, depending on the reason code. Then forcibly terminate the prerequisite service using the *isstop* command -f option.

Table 12.3 is20113 Reason Code Explanations

Reason code	Explanation
1	Another service where CORBA Service is mandatory is being operated. Stop the Systemwalker service when the operating management server of Systemwalker CentricMGR or Systemwalker Centric Manager is installed on the same machine.
2	Another service where Interface Repository (standard interface) is mandatory is being operated.
3	Another service where Naming Service is mandatory is being operated. Stop the Systemwalker service when the operating management server of Systemwalker CentricMGR or Systemwalker Centric Manager is installed on the same machine.

Reason code	Explanation
4	Another service where Component Transaction Service is mandatory is being operated.
5	Another service where Database Linkage Service is mandatory is being operated.
6	Another service where Interface Repository (value interface) is mandatory is being operated.

## 12.1.13 is20114

---

**IS: ERROR: is20114:A system contradiction detected while watching INTERSTAGE Error information(%s)**

### Variable Information

%s = Error Information

### Explanation

A conflict was detected by the Interstage monitoring process, or there is a memory shortage.

### System Action

Forcibly stops the Interstage system.

### User Action

If the value indicated by %d (error information) is xxx:8:xxx, xxx:14:xxx, xxx:1455:xxx, xxx:10008:xxx, xxx:10014:xxx, or xxx:11455:xxx, there is a memory shortage. After a few moments, execute the *isstop -f* command and then reexecute the process. If executing the *isstop -f* command results in an error, restart the machine. If this message is generated frequently, refer to the Tuning Guide, reestimate the memory required to run Interstage, and check whether there is enough memory.

If there is enough memory to run Interstage, there may be inadequate memory to run other applications. Reestimate the amount of memory required for the other applications running on the same machine to determine if there is an appropriate amount of memory.

Contact your system administrator if the reestimation indicates that the memory is insufficient. Ask the system administrator to either increase the size of the main memory or to increase the size of the page file.

If the error information indicates a value other than the above, collect diagnostic information using the *iscollectinfo* command, record the error information, and contact your systems engineer.

## 12.1.14 is20115

---

**IS: ERROR: is20115:A system error occurred while watching INTERSTAGE Error information(%s)**

### Variable Information

%s = Error Information

### Explanation

A system error was detected by the Interstage monitoring process, or there is a memory shortage.

### System Action

Forcibly stops the Interstage system.

### User Action

If the system is shut down during Interstage operation, a message in which xxxx:xxxx:1115 is set in 'Error information' may be output. In this case, however, no action is required. This message may appear if an Interstage service is stopped by a command other than *isstop*, but requires no action.

If the value indicated by %d (error information) xxx:xxx:8, xxx:xxx:14, xxx:xxx:1455, xxx:xxx:10008, xxx:xxx:10014, or xxx:xxx:11455, there is a memory shortage.

After a few moments, execute the *isstop -f* command and then reexecute the process when there is a memory shortage. If executing the *isstop -f* command results in an error, restart the machine. If this message is generated frequently, refer to the Tuning Guide, reestimate the memory required to run Interstage, and check whether there is enough memory.

If there is enough memory to run Interstage, there may be inadequate memory to run other applications. Reestimate the amount of memory required for the other applications running on the same machine to determine if there is an appropriate amount of memory.

Contact your system administrator if the reestimation indicates that the memory is insufficient. Ask the system administrator to either increase the size of the main memory or to increase the size of the page file.

In other cases, refer to the event log and handle the problem based on any other messages that were output at the same time. When no other message is output, collect diagnostic information using the *iscollectinfo* command, record the error information, and contact your systems engineer.

## 12.1.15 is20116

---

### IS: ERROR: is20116:Error in %s, terminating INTERSTAGE forcefully

#### Variable Information

%s = Service Name

#### Explanation

Either an error was detected in a service that displays variable information, or a Stop command was input for the service indicated in the variable information, and the service stopped.

#### System Action

Forcibly stops the Interstage system.

#### User Action

**Windows32/64** **Linux32/64**

Refer to the system log. If an error message is output together with this message, take action according to the other error message. When no other message is output, or if the cause of the error cannot be rectified, collect diagnostic information using the *iscollectinfo* command, and contact your systems engineer.

After taking action, execute the *isstat* command to check whether there is a service or Web server in operation.

Execute the *isstat* command to check whether any active services or Web servers exist. If they exist, use the *isstop -f* command to stop Interstage.

Note: When another product using an active service is operating, the operation of that product will be affected if the *isstop -f* command is executed.

**Linux32/64**

Refer to the system log. If an error message is output together with this message, take action according to the error message.

When no other message is output, or the cause of the error cannot be removed, collect diagnostic information using the *iscollectinfo* command, and contact your systems engineer.

## 12.1.16 is20117

---

### IS: ERROR: is20117: INTERSTAGE system contradiction detected Error information (%s1:%s2)

#### Variable Information

%s1 = Error Information1

%s2 = Error Information2

#### Explanation

A conflict was detected within the Interstage system, or there is a memory shortage.

## System Action

Stops the Interstage System.

## User Action

If the value indicated as Error Information 2 (%s2) is 8, 14, 1455, 10008, 10014, or 11455, there is a memory shortage. In this case, reexecute the processing later. If this message is generated frequently, refer to the Tuning Guide, reestimate the memory required to run Interstage, and check whether there is enough memory.

If there is enough memory to run Interstage, there may be inadequate memory to run other applications. Reestimate the amount of memory required for the other applications running on the same machine to determine if there is an appropriate amount of memory.

Contact your system administrator if the reestimation indicates that the memory is insufficient. Ask the system administrator to either increase the size of the main memory or to increase the size of the page file.

If error information 2 (%s2) indicates a value other than the above, collect diagnostic information using the *iscollectinfo* command, record the error information, and contact your systems engineer.

If the application is to be reexecuted, restart the machine.

## 12.1.17 is20118

---

### IS: ERROR: is20118: A system error occurred Error information(%s)

#### Variable Information

%s = Error Information

#### Explanation

A system error has occurred, or there is a memory shortage.

#### System Action

Processing stops.

#### User Action

If the value indicated by %s (error information) is xxx:xxx:8, xxx:xxx:14, xxx:xxx:1455, xxx:xxx:10008, xxx:xxx:10014, or xxx:xxx:11455, there is a memory shortage. After a few moments, execute the *isstop -f* command and then reexecute the process. If executing the *isstop -f* command results in an error, restart the machine. If this message is generated frequently, refer to the Tuning Guide, reestimate the memory required to run Interstage, and check whether there is enough memory.

If there is enough memory to run Interstage, there may be inadequate memory to run other applications. Reestimate the amount of memory required for the other applications running on the same machine to determine if there is an appropriate amount of memory.

Contact your system administrator if the reestimation indicates that the memory is insufficient. Ask the system administrator to either increase the size of the main memory or to increase the size of the page file.

If the value indicated by %s (error information) is not xxx:xxx:8, xxx:xxx:14, or xxx:xxx:1455, xxx:xxx:10008, xxx:xxx:10014, or xxx:xxx:11455, record the error information and contact your systems engineer.

**Solaris32/64** **Linux32/64**

If the error information indicates 'D:1 M:103 O:1 F:315 E:-1', the FSUNextp package is not installed. Install the package and then rerun the process.

If the error information indicates a message, take action for that message.

If 'stop monitor:' is displayed at the start of the error information, it means that the message is from the stop process monitoring mechanism. If the Interstage or WorkUnit stop process was completed normally, there is no problem.

If error information indicates a value other than the above, collect diagnostic information using the *iscollectinfo* command, record the error information, and contact your systems engineer.

**Solaris32/64** **Linux32/64**

Alternately, refer to the system log. If a message indicates insufficient memory or swap area, wait a moment, then reexecute the process.

## 12.1.18 is20119

---

### IS: ERROR: is20119: A shortage of memory

#### Variable Information

%s = Error Information

#### Explanation

There is a memory shortage.

#### System Action

Processing stops.

#### User Action

Reexecute processing later. If this message is generated frequently, refer to the Tuning Guide, reestimate the memory required to run Interstage, and check whether there is enough memory.

If there is enough memory to run Interstage, there may be inadequate memory to run other applications. Reestimate the amount of memory required for the other applications running on the same machine to determine if there is an appropriate amount of memory.

Contact your system administrator if the reestimation indicates that the memory is insufficient. Ask the system administrator to either increase the size of the main memory or to increase the size of the page file.

## 12.1.19 is20120

---

### IS: ERROR: is20120: Service unable to start Reason code(%d)

#### Variable Information

%d = Reason code

#### Explanation

Interstage failed to start for the reason shown in the following table.

#### System Action

Processing stops.

#### User Action

Take appropriate action according to the reason code described below.

Table 12.4 is20120 Reason Code Causes and Required Action

Reason code	Cause	User Action
1	The Interstage API service has been started.	When Interstage has a cluster configuration, do not start Interstage with one of the following methods: <ul style="list-style-type: none"><li>- Start using the Interstage Management Console</li><li>- Start using the <i>isstart</i> command</li><li>- Start using the Interstage operation tool</li><li>- Start using the Interstage service</li></ul> When Interstage does not have a cluster configuration, do not start the Interstage API service.
2	The Interstage service has been started.	

## 12.1.20 is20121

---

---

**IS: ERROR: is20121: Could not get IPC resource due to duplicated key (key=%x path=%s)****Variable Information**

%x = Key value

%s = Path name required for IPC resource retrieval

**Explanation**

IPC resource retrieval failed because the IPC resource required for Interstage operation is in use.

**System Action**

Terminates Interstage operation processing.

**User Action**

The IPC key value is duplicated and must be customized. For more information, refer to "Other Customization Items" in the "System Tuning" chapter of the Tuning Guide.

If this message is generated with the *iscreatesys* command, *isdeletesys* command, or *islistsys* command, change the contents of the IPC key value definition file in the default system.

---

**12.1.21 is20122**

---

**IS: WARNING: is20122:An error occurred in one of INTERSTAGE Services (SERVICE=%s)****Variable Information**

%s = Service name

**Explanation**

An error in the service shown in the Variable Information was detected.

**System Action**

Processing continues.

**User Action**

Check by using the *isstat* command if the service shown in the Variable Information is working or not. If that service is working, no action is needed.

If the service has stopped working and could disrupt the processing of other objects, restart Interstage.

---

**12.1.22 is20123**

---

**IS: INFO: is20123:Stop information was detected by one of INTERSTAGE Services (SERVICE=%s)****Variable Information**

%s = Service name

**Explanation**

The termination of the service shown in the Variable Information was detected.

---

**12.1.23 is20124**

---

**IS: INFO: is20124:INTERSTAGE activated normally****Explanation**

Preopened activation of Interstage succeeded.

## 12.1.24 is20125

---

### IS: INFO: is20125:Backup processing was started

#### Explanation

Backup processing started.

## 12.1.25 is20126

---

### IS: INFO: is20126:Restoration processing was started

#### Explanation

Restoration processing started.

## 12.1.26 is20127

---

### IS: INFO: is20127:The normal end of the backup processing was carried out

#### Explanation

The normal end of the backup processing was executed.

## 12.1.27 is20128

---

### IS: INFO: is20128:The normal end of the restoration processing was carried out

#### Explanation

The normal end of the restoration processing was executed.

## 12.1.28 is20129

---

### IS: ERROR: is20129:The unusual end of the backup processing was carried out

#### Explanation

The unusual end of the backup processing was executed.

#### System Action

Stops backup processing.

#### User Action

The message that shows the cause in which backup processing carried out the unusual end is output to just before. Please perform management to the message.

## 12.1.29 is20130

---

### IS: ERROR: is20130:The unusual end of the restoration processing was carried out

#### Explanation

The unusual end of the restoration processing was executed.

#### System Action

Stops restoration processing.

#### User Action

The message that shows the cause for which restoration processing carried out the unusual end is output ahead of this. Perform the management tasks according to the message.

## 12.1.30 is20131

---

### IS: ERROR: is20131:Does not have the authority to execute a command

#### Explanation

The user does not have permission to execute the command.

#### System Action

Command processing stops.

#### User Action

Execute the command with the correct permissions.

## 12.1.31 is20132

---

### IS: ERROR: is20132:INTERSTAGE is not initialized

#### Explanation

Failed to execute the process. Interstage did not initialize.

#### System Action

Processing stops.

#### User Action

Initialize Interstage using the Interstage integrated command or Interstage operation tool.

Use the *isinit* command to restore the setup environment generated at Interstage installation.

## 12.1.32 is20133

---

### IS: ERROR: is20133:A system error occurred Error information=%s

#### Variable Information

%s = Error information

#### Explanation

A system error has occurred.

#### System Action

Processing stops.

#### User Action

Collect diagnostic information using the *iscollectinfo* command, record the error information, and contact your systems engineer.

## 12.1.33 is20134

---

### IS: ERROR: is20134: Processing is interrupted by signal

#### Explanation

A signal was detected during command processing.

#### System Action

Command processing stops.

## User Action

Execute the *isstop* command to stop Interstage, and then execute the command again.

### 12.1.34 is20135

---

#### IS: ERROR: is20135:A system resource shortage occurred

##### Explanation

Insufficient resources.

##### System Action

Processing stops.

##### User Action

**Solaris32/64** **Linux32/64**

The required IPC resources may be insufficient. Refer to the Tuning Guide, and reestimate the amount of the IPC resources required for Interstage operations and check whether the resources are sufficiently provided.

Wait for a moment, then reexecute the command. If this error appears frequently, collect diagnostic information using the *iscollectinfo* command, and contact your systems engineer.

### 12.1.35 is20136

---

#### IS: ERROR: is20136 :%s is already started

##### Variable Information

%s = Service Name

##### Explanation

Failed to execute the process because the service indicated by the variable information (%s) has already started up.

If the variable information (%s) indicates 'Interstage,' Interstage may be already starting.

##### System Action

Terminates the processing.

##### User Action

If necessary, after stopping the service indicated by the variable information, reexecute the process.

### 12.1.36 is20137

---

#### IS: ERROR: is20137 :%s is not installed

##### Variable Information

%s = Service Name

##### Explanation

Failed to execute the process because the service indicated by variable information is not installed yet.

##### System Action

Terminates the processing.

##### User Action

After installing the service indicated by variable information, reexecute the process.

## 12.1.37 is20138

---

**IS: ERROR: is20138: System file access failure FILE=%s ERROR-INFORMATION(%d)**

### Variable Information

%s = Filename

%d = Error Information

### Explanation

An error has occurred during access to the system file.

### System Action

Command processing stops.

### User Action

Collect diagnostic information using the *iscollectinfo* command, make a note of the file name and error information indicated in the variable information, and contact your systems engineer.

## 12.1.38 is20139

---

**IS: ERROR: is20139: There is not space in the disk PATH=%s**

### Variable Information

%s = Path name

### Explanation

The disk with the path name indicated in the variable information has insufficient disk space available.

### System Action

Terminates the processing.

### User Action

Secure sufficient space on the disk with the path name indicated in the variable information, and then reexecute the process.

## 12.1.39 is20140

---

**IS: ERROR: is20140: A system error occurred CODE=%s**

### Variable Information

%s = Error Information

### Explanation

System error has occurred.

### System Action

Terminates the command processing.

### User Action

If the error information indicated by variable information is '0:0:0', take the appropriate measure for the service messages output immediately prior; or for the respective service messages output to the event log. Reexecute the command.

If the error information indicated by variable information is 'xxx:xxx:13', there is a possibility that editing of Interstage system file is under way. Close the file, and reexecute the command.

If the error information indicated by variable information is "1051", and the reason code for message is20110 output immediately after is 15, a Fujitsu middleware product that is integrated with the CORBA Service may have been operated. Stop the Fujitsu middleware, and then reexecute the command.

In other cases, collect diagnostic information using the *iscollectinfo* command, record the error information, and contact your systems engineer.

**Solaris32/64** **Linux32/64**

Alternately, refer to the system log. If a message indicates insufficient memory or swap area, wait a moment. Then reexecute the process.

## 12.1.40 is20141

---

**IS: ERROR: is20141:It failed in backup processing FILE=%s Error information=%d**

### Variable Information

%s = Filename

%d = Error Information

### Explanation

The backup processing of the file indicated by the variable information failed.

### System Action

Command processing stops.

### User Action

Collect diagnostic information using the *iscollectinfo* command, make a note of the file name and error information indicated in the variable information, and contact your systems engineer.

## 12.1.41 is20142

---

**IS: ERROR: is20142: It failed in backup processing PATH=%s Error information=%d**

### Variable Information

%s = Path name

%d = Error Information

### Explanation

The backup processing of the path indicated by the variable information failed.

### System Action

Terminates the command processing.

### User Action

If the path indicated by the variable information is located under the backup resource path designated by a parameter, reexecute the command.

In other cases, collect diagnostic information using the *iscollectinfo* command, make a note of the file name and error information indicated in the variable information, and then contact your systems engineer.

## 12.1.42 is20143

---

**IS: ERROR: is20143:The path which stores backup resources does not exist PATH=%s**

## Variable Information

%s = Path name

## Explanation

Failed to execute the command because the path in which the backup resources are to be stored does not exist.

## System Action

Terminates the command processing.

## User Action

After creating the path that stores the backup resources, reexecute the command.

## 12.1.43 is20144

---

**IS: ERROR: is20144: It failed in restoration processing FILE=%s Error information=%d**

## Variable Information

%s = Filename

%d = Error Information

## Explanation

Failed in the restore processing of the file (%s). If the file (%s) is located under the path of the backup resources specified in the argument, possible causes are as follows:

- The backup resources may have been corrupted.
- Interstage setup resources backed up using the *iscbackup* command may have been overwritten by Interstage setup resources backed up using the *iscbackupsys* command.

## System Action

Terminates the command processing.

## User Action

If the file (%s) belongs to the backup resource storage path specified by the argument, execute the *iscbackupsys* command, back up the Interstage setup resources, and then reexecute the command.

In other cases, collect diagnostic information using the *iscollectinfo* command, make a note of the file name and error information indicated in the variable information, and contact your systems engineer.

## 12.1.44 is20145

---

**IS: ERROR: is20145: It failed in restoration processing PATH=%s Error information=%d**

## Variable Information

%s = Path name

%d = Error Information

## Explanation

Failed in the restore processing of the path indicated by the variable information.

## System Action

Terminates the command processing.

## User Action

If the path indicated by the variable information is located under the backup resource storage path designated by the parameter, execute the *iscbackupsys* command for backing up the Interstage setup resources of the integration command. Reexecute the command.

In other cases, collect diagnostic information using the *iscollectinfo* command, make a note of the path name and error information indicated in the variable information, and contact your systems engineer.

## 12.1.45 is20146

---

### IS: ERROR: is20146: A system error occurred Error information(%s)

#### Variable Information

%s = Error Information

#### Explanation

A system error occurred.

#### System Action

Processing stops.

#### User Action

Collect diagnostic information using the *iscollectinfo* command, record the error information, and contact your systems engineer.

## 12.1.46 is20147

---

### IS: ERROR: is20147: The linkage with SystemWalker failed Error information(%s)

#### Variable Information

%s = Error Information

#### Explanation

Operation monitoring linkage to Systemwalker Centric Manager failed.

#### System Action

The system no longer performs operation monitoring that is linked to Systemwalker Centric Manager.

#### User Action

Collect diagnostic information using the *iscollectinfo* command, record the error information, and contact your systems engineer.

## 12.1.47 is20148

---

### IS: ERROR: is20148: Backup resources already exist in the specified path PATH=%s

#### Variable Information

%s = Path name

#### Explanation

Backup resource already exists in the path indicated by the variable information.

#### System Action

Terminates the command processing.

#### User Action

Designate the path other than that currently indicated by the variable information, and reexecute the command.

## 12.1.48 is20149

---

**IS: ERROR: is20149:The service under operation exists SERVICE=%s**

### Variable Information

%s = Service Name

### Explanation

Failed to execute the command because the service indicated by the variable information is already started.

### System Action

Command processing stops.

### User Action

After stopping the service indicated by the variable information, reexecute the command.

## 12.1.49 is20150

---

**IS: ERROR: is20150:Required component is not installed Error Information=%s**

### Variable Information

%s = Path name

### Explanation

Failed to execute the command because an error was detected either in service or in library.

### System Action

Command processing stops.

### User Action

Either install the necessary services or reinstall Interstage because the file is damaged.

## 12.1.50 is20151

---

**IS: ERROR: is20151:System file access failure FILE=%s Error information=%d**

### Variable Information

%s = Filename

%d = Error Information

### Explanation

An error has occurred at the access to the system file.

### System Action

Terminates the processing.

### User Action

Install the necessary components or reinstall Interstage because the system file is damaged.

## 12.1.51 is20152

---

**IS: ERROR: is20152:Backup resources do not exist in the specified path PATH=%s**

## Variable Information

%s = Path name

## Explanation

Backup resource does not exist in the path indicated by variable information.

## System Action

Terminates the command processing.

## User Action

Specify the path in which backup resource exists, and reexecute the command.

## 12.1.52 is20153

---

**IS: ERROR: is20153:Permission to access the file or path is not granted PATH=%s**

## Variable Information

%s = Filename or path name

## Explanation

The file or the path does not have access rights.

## System Action

Terminates the processing.

## User Action

Confirm the access rights of the file or the path. Either change the access right or have a user who has the access rights execute the processing.

## 12.1.53 is20154

---

**IS: ERROR: is20154:An I/O error occurred PATH=%s**

## Variable Information

%s = Filename or path name

## Explanation

Input/output error has occurred.

## System Action

Terminates the processing.

## User Action

Restore the disk device that has caused the input/output error.

This error may have occurred when a Managed Server was deleted from the site using the Admin Server Interstage Management Console as part of multiserver management.

If this message was output as part of a normal deletion, delete the Managed Server by force.

If this message was output as part of a deletion by force, execute the *isleavesite* command in the Managed Server that is the target for deletion, and then restart the Interstage JMX Service. Then, using the Admin Server Interstage Management Console, again delete the relevant Managed Server, this time by force. For details of the *isleavesite* command, refer to the Reference Manual (Command Edition).

## 12.1.54 is20155

---

---

**IS: ERROR: is20155:An internal error was detected Error information(%s)****Variable Information**

%s = Error information

**Explanation**

A conflict was detected in the Interstage system.

**System Action**

Command processing stops.

**User Action**

Collect diagnostic information using the *iscollectinfo* command, record the error information, and contact your systems engineer.

---

**12.1.55 is20156**

---

**IS: ERROR: is20156:An error occurred to get state of INTERSTAGE Error information(%d)****Variable Information**

%d = Reason Code

**Explanation**

The state of Interstage could not be obtained because of the reason indicated by the reason code.

**System Action**

Command processing stops.

**User Action**

Refer to the action for the message number corresponding to the reason code in the following table and take the action.

Table 12.5 is20156 Reason Code Explanations

Reason code	Cause	User Action
1	An illegal option has been specified.	Specify the correct option.
2	The FJSVis package is not installed.	Install the FJSVis package.
3	The specified system does not exist.	Specify a correct system name.
4	The specified system is invalid.	Specify a correct system name.
5	The specified system name is too long.	Specify a correct system name.

---

**12.1.56 is20157**

---

**IS: ERROR: is20157:It failed in restoration processing Error information =%d****Variable Information**

%s = Error information

**Explanation**

Restoration failed.

**System Action**

Command processing stops.

## User Action

Take the following action in accordance with the error information shown in Variable Information.

Table 12.6 is20157 Reason Code Explanations

Reason code	Cause	Action
<b>Solaris32/64</b> 2	If the backup source system is different from the restore destination system (the system names are different), it is necessary to specify the restore definition as the command argument.	Specify the restore definition, and execute the command again.
<b>Solaris32/64</b> 3	The backup source system is different from the restore destination system (the system names are different), but the system directories are the same.	Change the restore destination system and execute the command again.
<b>Solaris32/64</b> 4	The backup source system is the same as the restore destination system, but the system directories are different.	Change the restore destination system and execute the command again.
<b>Solaris32/64</b> 5	The backup resource of the environment initialized in TYPE2 cannot be restored to the extended system.	Change the restore destination system and execute the command again.
8	Resources of V9.3 or earlier cannot be restored to systems in which the features below have not been installed: <ul style="list-style-type: none"><li>- Multilanguage service</li><li>- J2EE compatibility</li></ul>	Change the restore destination system and execute the command again.
9	Resources backed up in systems in which the features below have not been installed cannot be restored to systems in which they have been installed: <ul style="list-style-type: none"><li>- Multilanguage service</li><li>- J2EE compatibility</li></ul>	Change the restore destination system and execute the command again.
10	Resources backed up in systems in which the features below have not been installed cannot be restored to systems in which they have not been installed: <ul style="list-style-type: none"><li>- Multilanguage service</li><li>- J2EE compatibility</li></ul>	Change the restore destination system and execute the command again.
Other cases	An internal conflict has occurred.	Collect diagnostic information using the <i>iscollectinfo</i> command, record the error information, and contact your systems engineer.

## 12.1.57 is20158

### IS: ERROR: is20158: The machine is not rebooted after package installation

#### Explanation

The machine was not rebooted after the package was installed.

#### System Action

Processing stops.

#### User Action

Reboot the machine, and execute the command again.

## 12.1.58 is20159

---

**IS: ERROR: is20159: The indispensable package is not installed Package name=%s**

### Variable Information

%s = Package name

### Explanation

The required package is not installed.

### System Action

Processing stops.

### User Action

After installing the required package specified in Variable Information, reexecute processing.

## 12.1.59 is20160

---

**IS: ERROR: is20160:INTERSTAGE start failed because server is too busy**

### Explanation

Interstage start failed because the server is too busy.

### System Action

Interstage startup is stopped.

### User Action

Wait for a moment, and reexecute the command.

## 12.1.60 is20161

---

**IS: ERROR: is20161:INTERSTAGE stop failed because server is too busy**

### Explanation

Interstage stop failed because server is too busy.

### System Action

Stopping processing of Interstage is stopped.

### User Action

Wait for a moment, and reexecute the command.

## 12.1.61 is20162

---

**IS: ERROR: is20162:A condition exists that the command cannot be executed**

### Explanation

This command cannot be executed while one of the following commands is executing:

- *isgendef* command
- *isregistdef* command
- *isinit* command
- *ismodifyservice* command

- *isstart* command
- *isstop* command
- *isstat* command

#### **Linux32/64**

- *iscreatesys* command
- *isdeletesys* command
- *islistsys* command

Using the following during Interstage start/stop may also generate this error:

- Service of a control panel is used.
- *net start* command / *net stop* command is used.

#### **System Action**

Command processing stops.

#### **User Action**

Check the state of Interstage, and if required, execute the command again.

#### **Note**

This message is sometimes output if the Interstage Management Console is operated while Interstage is starting, stopping, or being setup (during initialization or configuration updates). In this case, the message can be ignored. There is no need to take any action. .

### **12.1.62 is20163**

---

#### **IS: ERROR: is20163:INTERSTAGE initializing is not completed**

#### **Explanation**

Error in the execution of a command due to an error in Interstage initialization.

#### **System Action**

Command processing stops.

#### **User Action**

Perform initialization processing of Interstage again.

### **12.1.63 is20164**

---

#### **IS: ERROR: is20164:The definition of INTERSTAGE is not created**

#### **Explanation**

The Interstage system has not been defined. This has resulted in command execution failure.

#### **System Action**

Command processing stops.

#### **User Action**

Execute the command again after defining the Interstage system.

### **12.1.64 is20165**

---

#### **IS: ERROR: is20165:There is an error in the option**

#### Explanation

An option has been incorrectly specified.

#### System Action

Command processing stops.

#### User Action

Specify the right option and execute the command again.

---

### 12.1.65 is20166

---

#### **IS: ERROR: is20166:There is not such a system**

#### Explanation

The specified system does not exist.

#### System Action

Command processing stops.

#### User Action

Specify the correct system name and execute the command again.

---

### 12.1.66 is20167

---

#### **IS: ERROR: is20167:The system name is invalid**

#### Explanation

The system name specified is invalid

#### System Action

Command processing stops.

#### User Action

Specify a valid system name and execute the command again.

---

### 12.1.67 is20168

---

#### **IS: ERROR: is20168:The length of system name is too long**

#### Explanation

The specified system name is over 8 bytes.

#### System Action

Command processing stops.

#### User Action

Specify a valid system name and execute the command again.

---

### 12.1.68 is20169

---

#### **IS: ERROR: is20169:A system environment error was occurred**

#### Explanation

Abnormalities were detected in the system environment.

### System Action

Command processing stops.

### User Action

The object system may have been deleted in the system information by the *isdeletesys* command. In this case, delete an object system using the *isdeletesys* command, recreate the system by the *iscreatesys* command, and then execute the command again.

## 12.1.69 is20170

---

**IS: ERROR: is20170: An I/O error occurred PATH=%s**

### Variable Information

%s = File name or path name

### Explanation

An error occurred in the input/output.

### System Action

Command processing stops.

### User Action

Restore the disk equipment causing the I/O error.

## 12.1.70 is20171

---

**IS:ERROR:is20171:It failed in change processing of service SERVICE=%s Error information=%d**

### Variable Information

%s = Service name

%d = Error information

### Explanation

There was an error during change processing of the service.

### System Action

Command processing stops.

If Error information (%d) is 6, processing continues.

### User Action

Take action specified in the following table, according to the error information given in Variable Information.

Table 12.7 is20171 Reason Code Explanations

Error information	Cause	Action
1	<p>Since the service shown in variable information exists, the error occurred during addition of a service.</p> <p>Since service existed in the reference place which it was going to change when the service shown in variable information is the following, reference place change processing of service went wrong.</p> <ul style="list-style-type: none"><li>- NamingService</li><li>- InterfaceRepositoryCacheService</li></ul>	<p>Execute a command again after checking that the service which changes an addition or a reference place does not exist.</p>

Error information	Cause	Action
2	An error occurred during deletion of the service because the service shown in variable information does not exist.	Execute a command again after checking that the service to delete exists.
3	There was an error during setup processing of the service shown in variable information.	Perform the management, if there are other messages currently outputted simultaneously. When there is no message currently outputted to others, or when a cause cannot be removed, Collect diagnostic information using the <i>iscollectinfo</i> command, record the error information, and contact your systems engineer.
4	Commands cannot be executed when the employment form is TYPE2.	Change the employment form to TYPE1 or TYPE3 and execute the command again.
5	Commands cannot be executed when load balancing is used.	Change without load balance and execute the command again.
6	Failed to change the [Startup type] for the service shown in the variable information.	<p>If the [Startup Type] for the service shown in the variable information before initialization was "Manual", it may have been changed to "Automatic".</p> <p>In Windows(R), click [Control Panel] - [Administrative Tools] - [Services], and then check [Startup Type] for the following services:</p> <ul style="list-style-type: none"> <li>- InterfaceRep_Cache Service</li> <li>- InterfaceRep_Cache_e Service</li> <li>- Naming Service</li> <li>- NS LoadBalancingOption</li> </ul> <p>If [Startup Type] for the service shown above has been changed to "Automatic", change it back to "Manual".</p>
Other cases	An internal conflict has occurred.	Collect diagnostic information using the <i>iscollectinfo</i> command, record the error information, and contact your systems engineer.

## 12.1.71 is20172

### IS: ERROR: is20172: The specified path does not exist PATH=%s

#### Variable Information

%s = Path name

#### Explanation

The path shown in information does not exist.

#### System Action

Processing stops.

#### User Action

Specify the correct path name and reexecute the process.

If the Interstage JMX Service could not be started, the JDK/JRE installation folder used by the Interstage JMX Service may be specified incorrectly. Check whether the path indicated in Variable Information indicates the correct JDK/JRE installation folder.

Use the following procedure to change the setting of the JDK/JRE installation folder used by the Interstage JMX Service.

#### Windows32/64

1. Open the following file with an editor:  
[Interstage installation folder]\jmx\etc\isjmx.xml
2. Change the JDK/JRE installation folder used by the Interstage JMX Service.  
Specify the correct JDK/JRE installation folder in the 'java.home' attribute on the 'server' tag then save the file.
3. Restart the Interstage Operation Tool.

For details on isjmx.xml, refer to the Operator's Guide.

#### Solaris32/64 Linux32/64

1. Open the following file with the editor.  
/etc/opt/FJSVisjmx/isjmx.xml
2. Change the JDK/JRE installation directory used for the Interstage JMX service:  
Specify the correct JDK/JRE installation directory in the 'java.home' attribute of the 'server' tag. Change the value specified in the 'java.home' attribute of the 'server' tag and then save the file.
3. Using the *isjmxstop* and *isjmxstart* commands, restart the Interstage JMX service.

For details of isjmx.xml, refer to the Operator's Guide.

## 12.1.72 is20173

---

### IS: ERROR: is20173:Command execution failed because server is too busy

#### Explanation

The server was in a high load state, causing command execution failure.

#### System Action

Command processing stops.

#### User Action

Wait for a moment, and reexecute the command.

## 12.1.73 is20174

---

### IS: ERROR: is20174:Starting of %s failure

#### Variable Information

%s = Service name

#### Explanation

Initialization processing of Interstage is not possible due to an error during process startup of the service shown in variable information.

#### System Action

Command processing stops.

#### User Action

A start failure message is entered in the event log for each service that failed to start. Handle the error according to the message and execute the command again.

## 12.1.74 is20175

---

### IS: ERROR: is20175: The machine is not rebooted after package installation

#### Explanation

The machine was not rebooted after installation of a package.

#### System Action

Command processing stops.

#### User Action

Reboot the machine and execute the command again.

## 12.1.75 is20176

---

### IS: ERROR: is20176: Abnormality notified from ObjectDirector Error information=%d1 ExceptionID=%s minor=%d2

#### Variable Information

%d1 = Error information

%d2 = Minor code

%s = Exception information

#### Explanation

Abnormalities notified from CORBA service

#### System Action

The command under execution may fail.

#### User Action

Remove the exception information and minor code shown in the variable information. For details, refer to "CORBA Service Minor Codes" in the "Exception Information Minor Codes Reported from the CORBA Service" chapter.

When no other message is output, or the cause of the error cannot be removed, collect diagnostic information using the *iscollectinfo* command, and contact your systems engineer.

## 12.1.76 is20177

---

### IS: ERROR: is20177: The automatic setup of INTERSTAGE Application Server went wrong

#### Explanation

There was an error during automatic setup of Interstage Application Server.

#### System Action

Stops the automatic setup of Interstage Application Server.

#### User Action

Perform the management, if there are other messages currently outputted simultaneously. When there is no message currently outputted to others, run the *isinitervice* command and rebuild the Interstage environment.

## 12.1.77 is20178

---

### IS: ERROR: is20178: Service name is invalid SERVICE=%s

## Variable Information

%s = Service name

## Explanation

The service name shown in variable information is invalid.

## System Action

Processing of a command or a setup is stopped.

## User Action

If the error message is output during automatic setup of Interstage Application Server, run the *isinit* command and rebuild the Interstage environment.

Otherwise, collect diagnostic information using the *iscollectinfo* command, record the service name, and contact your systems engineer.

## 12.1.78 is20179

---

**IS: ERROR: is20179: Service does not exist SERVICE=%s**

## Variable Information

%s = Service name

## Explanation

The service shown in variable information does not exist.

## System Action

Processing of a command or setup is stopped.

## User Action

If the error message is output during automatic setup of Interstage Application Server, run the *isinit* command and rebuild the Interstage environment.

Otherwise, Collect diagnostic information using the *iscollectinfo* command, record the service name, and then contact your systems engineer.

## 12.1.79 is20180

---

**IS: ERROR: is20180: A remote host(%s) can not use the specified port number Port number =%d**

## Variable Information

%s = Host name

%d = Port number

## Explanation

The remote host (Host name) cannot use the port number (Port number).

## System Action

Command processing stops.

## User Action

If the error message is output during execution of *ismodify* service, the reference port number used by the naming service and that of the interface Repository service may be different. Specify a valid port number and execute the command again.

## 12.1.80 is20182

---

---

**IS: WARNING: is20182: IP-version definition was ignored****Explanation**

'IPv6' was specified to be an ignored IP version, as this environment cannot use that version.

**System Action**

Processing is continued

---

**12.1.81 is20184**

---

**IS: WARNING: is20184:The automatic setup of Interstage Application Server went wrong****Explanation**

The system failed in the automatic setup process for Interstage Application Server.

**System Action**

Processing is continued

**User Action**

Take appropriate action according to any subsequent messages (if generated).

---

**12.1.82 is20186**

---

**IS: ERROR: is20186:Initialization of Interstage went wrong****Explanation**

Interstage initialization failed.

**System Action**

Interrupts processing.

**User Action**

Take the action indicated by the message output immediately before this message or the message output to the event log, then reexecute processing.

---

**12.1.83 is20194**

---

**IS: INFO: is20194:Queue inhibition succeeded(%s1-%s2)****Variable Information**

%s1 = WorkUnit name

%s2 = Queue name

**Explanation**

Queue inhibition succeeded.

---

**12.1.84 is20195**

---

**IS: ERROR: is20195:Queue inhibition failed (%d)****Variable Information**

%d = Reason code

## Explanation

Queue inhibition failed as indicated by the reason code.

## System Action

Processing is stopped.

## User Action

Take appropriate action according to the reason code in the following table, then reexecute the command.

Table 12.8 is20195 Reason Code Explanations

Reason code	Cause	User Action
1	The specified application is not found	Confirm the state of the specified queue
4	The queue is already inhibited	Confirm the state of the specified queue
103	Insufficient Memory	<p>Execute the process again later. If this message is generated frequently, refer to the Tuning Guide, reestimate the memory required to run Interstage, and check whether there is sufficient memory.</p> <p>If there is, there may not be enough to run other applications. You may need to reestimate the total amount of memory required including the other applications.</p> <p>Contact your system administrator if the reestimation indicates insufficient total memory. Ask the system administrator to either increase the size of the main memory or to increase the size of the page file.</p> <p><b>Solaris32/64</b> <b>Linux32/64</b></p> <p>Alternately, refer to the system log. If a message indicates insufficient memory or swap area, wait a moment, then reexecute the process.</p>
Other cases	The error was caused by something else.	If the error cannot be resolved using the message output at the same time, collect diagnostic information using the <i>iscollectinfo</i> command, record the error information, and then contact your systems engineer.

## 12.1.85 is20196

**IS: INFO: is20196:Queue inhibition was released normally(%s1-%s2)**

### Variable Information

%s1 = WorkUnit name

%s2 = Queue name

### Explanation

The system succeeded in releasing key inhibition.

## 12.1.86 is20197

**IS: ERROR: is20197:Queue inhibition was released abnormally(%d)**

## Variable Information

%d = Reason code

## Explanation

The system failed to release key inhibition as indicated by the reason code.

## System Action

Processing is stopped.

## User Action

Take appropriate action according to the reason code in the following table, then reexecute the command.

Table 12.9 is20197 Reason Code Explanations

Reason code	Cause	User Action
1	The specified application is not found	Confirm the state of the specified queue
4	The queue is already inhibited	Confirm the state of the specified queue
103	Insufficient Memory	<p>Execute the process again later. If this message is generated frequently, refer to the Tuning Guide, reestimate the memory required to run Interstage, and check whether there is sufficient memory.</p> <p>If there is, there may not be enough to run other applications. You may need to reestimate the total amount of memory required including the other applications.</p> <p>Contact your system administrator if the reestimation indicates insufficient total memory. Ask the system administrator to either increase the size of the main memory or to increase the size of the page file.</p> <p>Contact your system administrator if the reestimation indicates that the memory is insufficient. Ask the system administrator to either increase the size of the main memory or to increase the size of the page file.</p> <p><b>Solaris32/64</b> <b>Linux32/64</b></p> <p>Alternately, refer to the system log. If a message indicates insufficient memory or swap area, wait a moment, then reexecute the process.</p>
Other cases	The error was caused by something else.	Collect diagnostic information using the <i>iscollectinfo</i> command, record the error information, and then contact your systems engineer.

## 12.1.87 is20198

**IS: ERROR: is20198: A system call error occurred(%s)**

## Variable Information

%s = Error information

## Explanation

An error was detected in the system call issued internally by Interstage.

## System Action

Command processing stops.

## User Action

A resource installed with Interstage is faulty, or a memory shortage occurred. Any of the following installed resources may not exist or may be damaged:

### Windows32/64

[Interstage installation folder]\bin\ismanage.exe

[Interstage installation folder]\bin\iswatch.exe

[Interstage installation folder]\bin\istageapid.exe

[Interstage installation folder]\bin\istagewrpd.exe

### Solaris32/64

/opt/FSUNtd/lib/ismanage

/opt/FSUNtd/lib/iswatch

/opt/FSUNtd/lib/istageapid

/opt/FSUNtd/lib/istagewrpd

### Linux32/64

/opt/FJSVtd/lib/ismanage

/opt/FJSVtd/lib/iswatch

/opt/FJSVtd/lib/istageapid

/opt/FJSVtd/lib/istagewrpd

Check the date of the file to see whether the file is damaged.

Refer to the system log to see if a message indicating a memory shortage or swap area shortage was output.

If Interstage is installed correctly, reexecute processing later. If this message is output frequently, reestimate the memory capacity required for Interstage operation by referring to the Tuning Guide.

Check whether sufficient memory is available for Interstage operation. If sufficient memory is available, the amount of memory is probably insufficient for the requirements of other applications. Reestimate the memory space requirements of other applications and check whether adequate memory is available.

If the reestimation confirms a memory shortage, ask your System Administrator to increase the main memory or swap area.

If no memory capacity problem is detected, contact your systems engineer.

When there is no problem with the value estimated for the system environment but the error message reappears, collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

## 12.2 is20200 to is20299

---

This section details the messages with message numbers between is20200 and is20299.

### 12.2.1 is20201

---

**IS: INFO: is20201: SMM started normally**

## Explanation

The SMM started successfully.

### 12.2.2 is20202

---

#### IS: INFO: is20202: SMM terminated normally

## Explanation

The SMM stopped successfully.

### 12.2.3 is20203

---

#### IS: ERROR: is20203: SMM terminated abnormally Error information(%x-%s)

## Variable Information

%x = Reason Code

%s = Error information

## Explanation

The SMM terminated abnormally due to an error shown in the reason code.

## User Action

Carry out the actions described in the following table, according to the reason code, then restart the SMM.

Table 12.10 is20203 Reason Code Causes and Required Action

Reason code	Cause	Countermeasures
2	Insufficient Memory	<p>Execute the process again later. If this message is generated frequently, refer to the Tuning Guide, reestimate the memory required to run Interstage, and check whether there is enough memory.</p> <p>If there is enough memory to run Interstage, there may be inadequate memory to run other applications. Reestimate the amount of memory required for the other applications running on the same machine to determine if there is an appropriate amount of memory.</p> <p>Contact your system administrator if the reestimation indicates that the memory is insufficient. Ask the system administrator to either increase the size of the main memory or to increase the size of the page file.</p>

For other reason codes, carry out the actions described in messages displayed at the same time. When no other message is output or the cause of the error cannot be rectified, collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

### 12.2.4 is20204

---

#### IS: INFO: is20204: SMMA started normally

## Explanation

The SMMA started successfully.

### 12.2.5 is20205

---

#### IS: INFO: is20205: SMMA terminated normally

## Explanation

The SMMA stopped successfully.

## 12.2.6 is20206

---

### IS: ERROR: is20206: SMMA terminated abnormally Error information(%x-%s)

#### Variable Information

%x = Reason Code

%s = Error information

#### Explanation

The SMMA terminated abnormally due to an error shown in the reason code.

#### User Action

Carry out the actions described below, according to the reason code in the following table, then restart the SMMA.

Table 12.11 is20206 Reason Code Causes and Required Action

Reason code	Cause	Countermeasures
2	Insufficient Memory	<p>Execute the process again later. If this message is generated frequently, refer to the Tuning Guide, reestimate the memory required to run Interstage, and check whether there is enough memory.</p> <p>If there is enough memory to run Interstage, there may be inadequate memory to run other applications. Reestimate the amount of memory required for the other applications running on the same machine to determine if there is an appropriate amount of memory.</p> <p>Contact your system administrator if the reestimation indicates that the memory is insufficient. Ask the system administrator to either increase the size of the main memory or to increase the size of the page file.</p>

For other reason codes, carry out the actions described in messages displayed at the same time.

When no other message is output, or the cause of the error cannot be removed, collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

## 12.2.7 is20207

---

### IS: INFO: is20207: Registered IP address(%s) for monitoring

#### Variable Information

%s = IP address

#### Explanation

The monitor list is registered.

## 12.2.8 is20208

---

### IS: INFO: is20208: Deleted IP address(%s) from monitoring

#### Variable Information

%s = IP address

#### Explanation

The monitor list is deleted.

## 12.2.9 is20209

---

---

**IS: ERROR: is20209: An internal error was detected Error information(%d-%s1-%s2)****Variable Information**

%d = Error information1

%s1 = Error information2

%s2 = Error information3

**Explanation**

A contradiction was found in the SMM system.

**System Action**

Terminates the SMM abnormally.

**User Action**

Collect diagnostic information using the *iscollectinfo* command, record the error information, and then contact your systems engineer.

---

**12.2.10 is20210**

---

**IS: INFO: is20210: Server(%s) down is detected****Variable Information**

%s = IP address

**Explanation**

The server is down

**System Action**

Either starts the down shell from the other server's SMM or SMMA, or reports the downed server to the load balance function.

---

**12.2.11 is20211**

---

**IS: INFO: is20211: Server(%s) recover is detected****Variable Information**

%s = IP address

**Explanation**

The server has been restored.

**System Action**

Either starts the recover shell from the other server's SMM or SMMA, or reports the restoration to the load balance function.

---

**12.2.12 is20212**

---

**IS: ERROR: is20212: Down Shell unable to start Error information(%d1-%d2)****Variable Information**

%d1 = Error information1

%d2 = Error information2

**Explanation**

An error may have occurred in the filename specified as the down shell, or the folder name.

## System Action

Failed to start the down shell.

## User Action

Carry out the actions described in the following table, according to Error Information 1:

Table 12.12 is20212 Error Information and Required Action

Error Information 1	Cause	Countermeasures
1001	Insufficient Memory.	<p>Execute the process again later. If this message is generated frequently, refer to the Tuning Guide, reestimate the memory required to run Interstage, and check whether there is enough memory.</p> <p>If there is enough memory to run Interstage, there may be inadequate memory to run other applications. Reestimate the amount of memory required for the other applications running on the same machine to determine if there is an appropriate amount of memory.</p> <p>Contact your system administrator if the reestimation indicates that the memory is insufficient. Ask the system administrator to either increase the size of the main memory or to increase the size of the page file.</p>
1002	The number of processes to be generated has exceeded the maximum limit.	Correct the system tuning parameter.
1003	The user does not have permission to access the file or folder specified for the down shell.	Check the file or folder access permissions, or execute the process with the correct access permissions.
1004	An error exists in either the filename specified as the down shell, or the folder name.	Check that the specified filename or folder name is correct. Check that the specified file exists on a machine where SMM or SMMA is operating. Check that the specified file is an executable file. For Windows NT, check that the file extension is correct. Confirm that the specified file has '.BAT' as the file extension.
9000	Command execution failed due to an unknown reason.	<p>If the value indicated by %d2 (Error Information 2) is 8, 14, or 1455, there is a memory shortage. Reexecute the process later. If this message is generated frequently, refer to the Tuning Guide, reestimate the memory required to run Interstage, and check whether there is enough memory.</p> <p>If there is enough memory to run Interstage, there may be inadequate memory to run other applications. Reestimate the amount of memory required for the other applications running on the same machine to determine if there is an appropriate amount of memory.</p> <p>Contact your system administrator if the reestimation indicates that the memory is insufficient. Ask the system administrator to either increase the size of the main memory or to increase the size of the page file. In other cases, collect diagnostic information using the <i>iscollectinfo</i> command, record the error information, and then contact your systems engineer.</p>

For other Error Information codes, carry out the actions described in messages displayed at the same time.

When no other message is output, or the cause of the error cannot be removed, collect diagnostic information using the *iscollectinfo* command, record the details displayed in Error Information (%d2 ), and contact your systems engineer.

## 12.2.13 is20213

### IS: ERROR: is20213: Recover Shell unable to start Error information(%d1-%d2)

#### Variable Information

%d1 = Error information1

%d2 = Error information2

#### Explanation

An error may have occurred in the filename specified as the recover shell, or the folder name.

#### System Action

Failed to start the recover shell.

#### User Action

Carry out the actions described in the following table, according to Error Information 1.

Table 12.13 is20213 Error Information and Required Action

Error Information 1	Cause	Countermeasures
1001	Insufficient Memory.	Execute the process again later. If this message is generated frequently, refer to the Tuning Guide, reestimate the memory required to run Interstage, and check whether there is enough memory.  If there is enough memory to run Interstage, there may be inadequate memory to run other applications. Reestimate the amount of memory required for the other applications running on the same machine to determine if there is an appropriate amount of memory.  Contact your system administrator if the reestimation indicates that the memory is insufficient. Ask the system administrator to either increase the size of the main memory or to increase the size of the page file.
1002	The number of processes to be generated has exceeded the maximum limit.	Correct the system tuning parameter
1003	The user does not have permission to access the file or folder specified for the down shell.	Check the file or folder access permissions, or execute the process with the correct access permissions.
1004	An error exists in either the filename specified as the down shell, or the folder name.	Check that the specified filename or folder name is correct. Check that the specified file exists on a machine where SMM or SMMA is operating. Check that the specified file is an executable file. For Windows NT, check that the file extension is correct. Confirm that the specified file has '.BAT' as the file extension.
9000	Command execution failed due to an unknown reason.	Collect diagnostic information using the <i>iscollectinfo</i> command, record the error information, and then contact your systems engineer.

For other Error Information codes, carry out the actions described in messages displayed at the same time. When no other message is output, or the cause of the error cannot be removed, collect diagnostic information using the *iscollectinfo* command, and record the details displayed in Error Information 2, then contact your systems engineer.

## 12.2.14 is20251

### IS: INFO: is20251:Registered SMM to service

#### Explanation

SMM is registered in Windows® service.

## 12.2.15 is20252

### IS: INFO: is20252:Removed SMM from service

#### Explanation

SMM is deleted from Windows® service.

## 12.2.16 is20253

### IS: ERROR: is20253:SMM service unable to start Error information(%d1-%s-%d2)

#### Variable Information

%d1 = Reason code

%s = Error information 1

%d2 = Error information 2

#### Explanation

Failed to start SMM service for the reason given in the following table.

Table 12.14 is20253 Reason Codes and Required Action

Reason code	Explanation	Action
1000	Number of file extensions to be used in process has reached the maximum limit.	Collect diagnostic information using the <i>iscollectinfo</i> command, record the error information, and then contact your systems engineer.
1001	Insufficient memory.	Execute the process again later. If this message is generated frequently, refer to the Tuning Guide, reestimate the memory required to run Interstage, and check whether there is enough memory.  If there is enough memory to run Interstage, there may be inadequate memory to run other applications. Reestimate the amount of memory required for the other applications running on the same machine to determine if there is an appropriate amount of memory.  Contact your system administrator if the reestimation indicates that the memory is insufficient. Ask the system administrator to either increase the size of the main memory or to increase the size of the page file.
1002	Maximum limit of process generation has been exceeded.	Correct the system tuning parameter.
1003	Do not have access permission to the file or folder.	Check and modify access permission of TD_HOME\sys\smm or TD_HOME\sys\smma or ask a user with access permission to execute the process. (Note)
1004	File or folder might have changed.	Check whether TD_HOME\sys\smm or TD_HOME\sys\smma is changed. (Note)

Reason code	Explanation	Action
1005	Abnormality is reported from OD.	Check whether OD, Naming Service, Interface Repository is started. If the error persists, collect diagnostic information using the <i>iscollectinfo</i> command, and then contact your systems engineer.
1006	Another command is being executed, therefore processing cannot be done.	Wait for a moment, and reexecute the command.
1007	I/O error has occurred.	Check whether TD_HOME\sys\smm or TD_HOME\sys\smma exists and check whether the access permission has changed.
1008	Naming service or load balance function is not started.	Start Naming Service or load balance function.
1101	TD is not installed.	Install TD, and reexecute the command.
2001	SMM or SMMA is started.	No action required.
2002	OD is not started.	Start OD. Also start, if required, the Naming Service and the Interface Repository.
9000	Failed to obtain resources to be started from service of SMM or SMMA.	<p>If the value indicated by %d2 (Error Information 2) is 8, 14, or 1455, there is a memory shortage. Reexecute the process later. If this message is generated frequently, refer to the Tuning Guide, reestimate the memory required to run Interstage, and check whether there is enough memory.</p> <p>If there is enough memory to run Interstage, there may be inadequate memory to run other applications. Reestimate the amount of memory required for the other applications running on the same machine to determine if there is an appropriate amount of memory.</p> <p>Contact your system administrator if the reestimation indicates that the memory is insufficient. Ask the system administrator to either increase the size of the main memory or to increase the size of the page file. In other cases, collect diagnostic information using the <i>iscollectinfo</i> command, and then contact your systems engineer.</p>
9001	Start procedure from service of SMM or SMMA is invalid.	<p>If the value indicated by %d2 (Error Information 2) is 8, 14, or 1455, there is a memory shortage. Reexecute the process later. If this message is generated frequently, refer to the Tuning Guide, reestimate the memory required to run Interstage, and check whether there is enough memory.</p> <p>If there is enough memory to run Interstage, there may be inadequate memory to run other applications. Reestimate the amount of memory required for the other applications running on the same machine to determine if there is an appropriate amount of memory.</p> <p>Contact your system administrator if the reestimation indicates that the memory is insufficient. Ask the system administrator to either increase the size of the main memory or to increase the size of the page file. In other cases, perform the start process of the correct service.</p>
9002	Failed to execute the command due to unknown reason.	<p>If the value indicated by %d2 (Error Information 2) is 8, 14, or 1455, there is a memory shortage. Reexecute the process later. If this message is generated frequently, refer to the Tuning Guide, reestimate the memory required to run Interstage, and check whether there is enough memory.</p> <p>If there is enough memory to run Interstage, there may be inadequate memory to run other applications. Reestimate the amount of memory required for the other applications running on the same machine to determine if there is an appropriate amount of memory.</p>

Reason code	Explanation	Action
		Contact your system administrator if the reestimation indicates that the memory is insufficient. Ask the system administrator to either increase the size of the main memory or to increase the size of the page file. In other cases, collect diagnostic information using the <i>iscollectinfo</i> command, and then contact your systems engineer.

**Note**

TD\_HOME: Interstage installation folder

**User Action**

Execute the processing according to the reason code and restart the SMM service. For reason codes not mentioned above, if another message is output at the same time, execute that process.

When no other message is output, or the cause of the error cannot be removed, collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

## 12.2.17 is20254

---

**IS: INFO: is20254:Registered SMMA to service**

**Explanation**

SMMA is registered to the Windows® service.

## 12.2.18 is20255

---

**IS: INFO: is20255:Removed SMMA from service**

**Explanation**

SMMA is deleted from the Windows® service.

## 12.2.19 is20256

---

**IS: ERROR: is20256:SMMA service unable to start Error information(%d1-%s-%d2)**

**Variable Information**

%d1 = Reason code

%s = Error information1

%d2 = Error information2

**Explanation**

Failed to start SMMA service as per the explanation given in [Table 12.14 is20253 Reason Codes and Required Action](#).

**User Action**

Execute the process as per the Reason code and restart the SMMA service.

For the reason codes not mentioned in reason code chart, if other message is output at the same time, execute that process.

When no other message is output, or the cause of the error cannot be removed, collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

## 12.2.20 is20257

---

**IS: ERROR: is20257:SMM service terminated abnormally Error information(%d1-%s- %d2)**

## Variable Information

- %d1 = Reason code
- %s = Error information1
- %d2 = Error information2

## Explanation

Failed to stop SMM service for the reason given in the following table.

## Reason Code

Table 12.15 is20257 Reason Codes and Required Action

Reason code	Explanation	Action
1001	Insufficient memory.	Execute the process again later. If this message is generated frequently, refer to the Tuning Guide, reestimate the memory required to run Interstage, and check whether there is enough memory.  If there is enough memory to run Interstage, there may be inadequate memory to run other applications. Reestimate the amount of memory required for the other applications running on the same machine to determine if there is an appropriate amount of memory.  Contact your system administrator if the reestimation indicates that the memory is insufficient. Ask the system administrator to either increase the size of the main memory or to increase the size of the page file.
1005	Abnormality notified from OD.	Check whether the OD, the Naming Service, and the Interface Repository have started. If the error persists, collect diagnostic information using the <i>iscollectinfo</i> command, and then contact your systems engineer.
1006	Since another command is being executed processing cannot be done.	Wait for a moment, and reexecute the command.
1007	I/O error has occurred.	Check whether TD_HOME\sys\smm or TD_HOME\sys\smma exists and access permission is not changed. (Note)
2002	OD is not started.	Start OD. Also start, if required, the Naming Service and the Interface Repository.
2003	SMM or SMMA is not started.	If this message appeared when SMM or SMMA is started collect diagnostic information using the <i>iscollectinfo</i> command, and then contact your systems engineer. Otherwise no action is required.
9002	Failed to execute the command due to unknown reason.	Collect diagnostic information using the <i>iscollectinfo</i> command, and then contact your systems engineer.

### Note

TD\_HOME: Interstage installation folder

## User Action

Execute the process as per the reason code, and then stop the SMM service again.

For reason codes not mentioned above, if another message was output at the same time, execute that process.

When no other message is output, or the cause of the error cannot be removed, collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

## 12.2.21 is20258

---

**IS: ERROR: is20258:SMMA service terminated abnormally Error information(%d1- %s-%d2)****Variable Information**

%d1 = Reason code  
%s = Error information1  
%d2 = Error information2

**Explanation**

Failed to stop SMMA service as per the explanation given in following table.

**User Action**

Execute the process as per the reason code, and then stop the SMMA service again.  
For reason codes not mentioned above, if another message was output at the same time, execute that process.  
When no other message is output, or the cause of the error cannot be removed, collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

---

**12.2.22 is20260**

---

**IS: INFO: is20260:The requests in the queue were canceled successfully. (%s1-%s2)****Variable Information**

%s1 = WorkUnit Name  
%s2 = Queue Name

**Explanation**

The requests in the queue were canceled successfully.

---

**12.2.23 is20270**

---

**IS: ERROR: is20270: Interstage stop processing is not responding****Explanation**

In Interstage stop processing, there is no response because the stop monitoring time has been exceeded.

**System Action**

Collects investigation data automatically, and continues Interstage stop processing.

**User Action**

Collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

---

**12.2.24 is20271**

---

**IS: ERROR: is20271: WorkUnit(%s) stop processing is not responding****Variable Information**

%s =WorkUnit name

**Explanation**

In WorkUnit stop processing, there is no response because the stop monitoring time has been exceeded.

**System Action**

Collects investigation data automatically, and continues WorkUnit stop processing.

## User Action

This message is output if the WorkUnit has not stopped even though the stop monitoring time of the WorkUnit has been exceeded. However, if this message is output when the WorkUnit has stopped normally, no action is required.

If the WorkUnit has not stopped normally, take the following action:

- Stop any applications running.
- Correct any applications that endlessly loop.
- If there is no response from the WorkUnit stop operation, then collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

---

## 12.2.25 is20275

---

**IS: INFO: is20275: The WorkUnit has been successfully recovered (%s)**

### Variable Information

%s = WorkUnit name

### Explanation

The work unit has been successfully restored.

---

## 12.2.26 is20276

---

**IS: ERROR: is20276: The WorkUnit could not be recovered. Reason code:%x**

### Variable Information

%x = Reason code

### Explanation

The work unit could not be restored for a reason shown by the reason code.

### System Action

Continues the degeneration operation.

### User Action

Refer to the reason code, remove the cause of the error, and then reexecute the command. If this user action is unsuccessful, use the *iscollectinfo* command to collect diagnostic information, and then contact your systems engineer.

---

## 12.3 is20300 to is20399

This section details the messages with message numbers between is20300 and is20399.

---

### 12.3.1 is20301

---

**IS: INFO: is20301: A performance log file was switched to file (%s)**

### Variable Information

%s = Performance Log File Path Name

### Explanation

The performance log file was switched because an opportunity to switch the performance log file was fulfilled.

### System Action

Switches the performance log file.

## 12.3.2 is20302

---

**IS: ERROR: is20302: Can not write a performance log file (%s) because of no space in hard disk**

### Variable Information

%s = Performance Log File Path Name

### Explanation

Data failed to be written to the performance log file due to insufficient disk space.

### System Action

Continues processing. However, it cannot write to the performance log file until disk space becomes available.

### User Action

Delete any unnecessary files to increase available disk space.

Execute the *ispreport* command to output the performance log file report.

If the message is30541 is output using the *ispreport* command, it means that the performance log file is damaged. Delete the performance log file as described in the [User Action] for 30541. Once there is enough disk space available, a new performance log file is created and writing of the performance data restarts.

If the *ispreport* command exits normally, writing to the performance log file restarts once there is enough disk space available.

## 12.3.3 is20303

---

**IS: ERROR: is20303: Size of performance log file (%s) is over the system maximum size**

### Variable Information

%s = Performance Log File Path Name

### Explanation

Data failed to be written to the performance log file because the file has exceeded the maximum file size.

### System Action

Stops performance monitoring and deletes the performance monitoring environment.

### User Action

Save and delete the performance log file, then restart after recreating the performance monitoring environment.

## 12.3.4 is20304

---

**IS: WARNING: is20304: It failed in measurement of performance by memory shortage: Object name=%s ProcessID=%d**

### Variable Information

%s = Name of the object that failed in performance measurement

%d = Process ID of the object that failed in performance measurement

### Explanation

Due to a memory shortage, the performance of the object indicated by the variable information could not be measured.

### System Action

Processing continues.

## User Action

When this message is output, part of the performance information may be omitted.

If this message is generated frequently, refer to the Tuning Guide, reestimate the memory that is needed to run Interstage, and confirm that there is enough memory.

If there is enough memory to run Interstage, there may be inadequate memory to run other applications. Reestimate the amount of memory needed for the other applications running on the same machine to determine if there is an appropriate amount of memory.

Contact your system administrator if the reestimation indicates that the memory is insufficient. Ask the system administrator to either increase the size of the main memory or to increase the size of the page file.

## 12.3.5 is20305

---

### **IS: ERROR: is20305: Failed in access to performance log file (%s)**

#### Variable Information

%s = Performance Log File Path Name

#### Explanation

Data failed to be written to the performance log file because access to the file failed.

#### System Action

Stops performance monitoring and deletes the performance monitoring environment.

#### User Action

After creating the performance monitoring environment, check whether the performance log file dated on this day has been deleted. Restart performance monitoring.

## 12.3.6 is20306

---

### **IS: WARNING: is20306: It failed in acquisition of performance information by memory shortage**

#### Explanation

Acquisition of performance information failed due to a memory shortage.

#### System Action

Processing continues.

#### User Action

When this message is output, part of the performance information may be omitted.

If this message is generated frequently, refer to the Tuning Guide, reestimate the memory that is needed to run Interstage, and confirm that there is enough memory.

If there is enough memory to run Interstage, there may be inadequate memory to run other applications. Reestimate the amount of memory needed for the other applications running on the same machine to determine if there is an appropriate amount of memory.

Contact your system administrator if the reestimation indicates that the memory is insufficient. Ask the system administrator to either increase the size of the main memory or to increase the size of the page file.

## 12.3.7 is20307

---

### **IS: WARNING: is20307: Since a memory is insufficient, performance superintendence cannot be performed**

#### Explanation

Due to a memory shortage, performance monitoring could not be performed.

## System Action

Processing continues.

## User Action

If this message is displayed, there is an application process for which performance information cannot be collected.

If this message is generated frequently, refer to the Tuning Guide, reestimate the memory that is needed to run Interstage, and confirm that there is enough memory.

If there is enough memory to run Interstage, there may be inadequate memory to run other applications. Reestimate the amount of memory needed for the other applications running on the same machine to determine if there is an appropriate amount of memory.

Contact your system administrator if the reestimation indicates that the memory is insufficient. Ask the system administrator to either increase the size of the main memory or to increase the size of the page file.

---

## 12.3.8 is20308

---

**IS: ERROR: is20308: Could not get IPC resource due to duplicated key(key=%x path=%s)**

### Variable Information

%x = Key value

%s = path name

### Explanation

IPC resource retrieval failed because the IPC resource required for operating the performance monitoring tool is in use.

### System Action

Fails to execute the performance monitoring tool command, or fails to collect performance information.

### User Action

The IPC key value is duplicated and must be customized. For more information, refer to "Other Customization Items" in the "System Tuning" chapter of the Tuning Guide.

---

## 12.3.9 is20311

---

**IS: INFO: is20311: Performance tool environment was created normally**

### Explanation

The performance tool environment has been created, and the performance monitor logger started normally.

### System Action

Processing continues.

---

## 12.3.10 is20312

---

**IS: INFO: is20312: Performance tool environment was deleted**

### Explanation

Performance tool environment was deleted, and performance monitor logger has been stopped without error.

### System Action

Processing continues.

---

## 12.3.11 is20314

---

---

**IS: WARNING: is20314: Performance tool shared memory is insufficient****Explanation**

Shared memory for the performance monitoring environment became insufficient and new performance information failed to be collected.

**System Action**

Processing continues. Collects performance data that is already being measured, but does not collect new performance information.

**User Action**

If further performance information is to be collected, delete the performance monitoring environment, then restart after recreating the performance monitoring environment. Be sure to review the shared memory when creating the performance monitoring environment.

---

**12.3.12 is20315**

---

**IS: ERROR: is20315: Performance tool memory is insufficient****Explanation**

There is not enough system memory.

**System Action**

Processing stops.

**User Action**

Execute the process again later. If this message is generated frequently, refer to the Tuning Guide, reestimate the memory that is needed to run Interstage, and confirm that there is enough memory.

If there is enough memory to run Interstage, there may be inadequate memory to run other applications. Reestimate the amount of memory needed for the other applications running on the same machine to determine if there is an appropriate amount of memory.

Contact your system administrator if the reestimation indicates that the memory is insufficient. Ask the system administrator to either increase the size of the main memory or to increase the size of the page file.

---

**12.3.13 is20316**

---

**IS: ERROR: is20316: Performance tool system error happened (code=%s, errno=%d)****Variable Information**

%s = Reason Code

%d = Error Information

**Explanation**

The performance monitoring tool was terminated for the reason shown in the reason code.

**System Action**

Processing stops.

**User Action**

Take the appropriate action based on the reason code and error information shown in the following table.

If the reason code (%s) or error information (%d) is not contained in the table, check the reason code and error information, collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

Table 12.16 is20316 Reason Code Causes and Required Action

Reason code	Error information	Cause	User Action
Solaris32/64 Linux32/64 ISP_close_wu003 ispzmopn002 ispsuba3002	2	Files contained in the component transaction service package are deleted.	Install the component transaction service.
ispOpenLogFile001	2	The performance log file storage location folder was deleted.	Create a performance log file storage location folder, then reexecute processing beginning with creating the performance monitoring environment.

### 12.3.14 is20317

#### IS: ERROR: is20317: System error occurred(code=%s, errno=%d)

##### Variable Information

%s = Reason Code

%d = Error Information

##### Explanation

Backup or restoring of the performance monitoring tool resource failed.

##### System Action

Processing stops.

##### User Action

Record the reason code (%s) and error information (%d), and contact your systems engineer.

Collect diagnostic information using the *iscollectinfo* command, record the error information and the reason code, and then contact your systems engineer.

### 12.3.15 is20319

#### IS: ERROR: is20319: MIB instance number was disabled

##### Explanation

The MIB instance number was disabled by execution of the *ispstart*, *isstop*, or *ispdeleteenv* command.

##### System Action

Processing continues.

##### User Action

If Systemwalker Centric Manager does real-time performance monitoring, stop that performance monitoring. Follow the procedure to restart performance monitoring. Refer to the OLTP Server User's Guide for details.

### 12.3.16 is20320

#### IS: ERROR: is20320: A shortage of memory occurred

##### Explanation

There is insufficient memory.

### System Action

Processing stops.

### User Action

Execute the process again later.

If this error occurs frequently, refer to the Tuning Guide, recalculate the memory required to run Interstage, and confirm there is sufficient memory.

There may be sufficient memory for Interstage, but inadequate memory for other applications. Reestimate the amount of memory required for other applications running on the same machine to determine if there is sufficient memory.

Contact your system administrator to increase the size of either the main memory or the swap region.

## 12.3.17 is20321

---

### IS: ERROR: is20321: An I/O error occurred PATH=%s

#### Variable Information

%s = File name or path name

#### Explanation

An I/O error occurred.

#### System Action

Processing stops.

#### User Action

Restore the disk device where the I/O error occurred.

## 12.3.18 is20322

---

### IS: ERROR: is20322: There is not space in the disk PATH=%s

#### Variable Information

%s = Path name

#### Explanation

The free disk space at path (Path name) is insufficient.

#### System Action

Processing stops.

#### User Action

Secure enough free disk space at path (Path name), and execute the command again.

## 12.3.19 is20323

---

### IS: ERROR: is20323: Performance Tool is started

#### Explanation

The processing failed because the performance monitoring tool is started.

#### System Action

Processing stops.

## User Action

Execute the *ispdeleteenv* command, delete the performance monitoring environment, stop the performance monitoring tool, and then perform the processing again.

## 12.3.20 is20324

---

**IS: ERROR: is20324: The indispensable package is not installed Package name=%s**

### Variable Information

%s = Package name

### Explanation

The package required for using the performance monitoring tool is not installed.

### System Action

Processing stops.

### User Action

Install the package shown in Variable Information and execute the command again.

## 12.3.21 is20327

---

**IS: WARNING: is20327:Performance log file is damaged. It is evacuated as file %s**

### Variable Information

%s = Path name of file

### Explanation

The performance log file was damaged, and saved under another name.

### System Action

Processing continues.

### User Action

Display a report about the damaged file on the screen, then delete the file. For the report, collate information obtained until the damage is detected.

## 12.3.22 is20335

---

**IS: ERROR: is20335:Failed in the opening of the library: PACKAGE=%s1 ERRORSTRING=%s2**

### Variable Information

%s1 = Package name

%s2 = Error information

### Explanation

The system failed to open the library.

### System Action

Cancels the start of the performance monitoring tool, or the start or stop of performance monitoring.

### User Action

Confirm that the package displayed in the message is installed, then take appropriate action indicated by the error information.

## 12.3.23 is20336

---

**IS: ERROR: is20336:Failed in the reading the function: PACKAGE=%s1 ERRORSTRING=%s2**

### Variable Information

%s1 = Package name

%s2 = Error information

### Explanation

The system failed to read a function.

### System Action

Cancels the start of the performance monitoring tool, or the start or stop of performance monitoring.

### User Action

Confirm that the version and level of the package is correctly installed, then take appropriate action indicated by the error information.

## 12.3.24 is20337

---

**IS: ERROR: is20337: Permission to access the file or parent directory is not granted: FILE=%s**

### Variable Information

%s = File name

### Explanation

The user does not have access permission for a parent directory or file.

### System Action

Cancels the start of the performance monitoring tool or performance monitoring.

### User Action

Check access permissions for the parent directory or file. Only a user granted with appropriate access permissions can perform processing.

## 12.3.25 is20338

---

**IS: ERROR: is20338: Specified file or directory does not exist: FILE=%s**

### Variable Information

%s = File name

### Explanation

The specified file or directory is not found.

### System Action

Cancels the start of the performance monitoring tool or performance monitoring.

### User Action

Reinstall the package.

## 12.3.26 is20340

---

**IS: ERROR: is20340: Line %d: Syntax error: FILE=%s**

### Variable Information

%d = Line number

%s = File name

### Explanation

A syntax error was found in the definition file.

### System Action

Cancels the start of the performance monitoring tool or performance monitoring.

### User Action

Correct the syntax in the definition file, then reexecute the command

## 12.3.27 is20341

---

**IS: ERROR: is20341: Line %d: Section duplicated: FILE=%s1 SECTION=%s2**

### Variable Information

%d = Line number

%s1 = File name

%s2 = Section name

### Explanation

A section is specified more than once.

### System Action

Cancels the start of the performance monitoring tool or performance monitoring.

### User Action

Correct the syntax in the definition file, then reexecute the command.

## 12.3.28 is20342

---

**IS: ERROR: is20342: Line %d: Number of statements that may be specified has been exceeded: FILE=%s**

### Variable Information

%d = Line number

%s = File name

### Explanation

The number of specified statements exceeds the maximum.

### System Action

Cancels the start of the performance monitoring tool or performance monitoring.

### User Action

Specify statements in the allowable range, then reexecute the command.

## 12.3.29 is20343

---

**IS: ERROR: is20343: Line %d: The application name is duplicated: FILE=%s**

### Variable Information

%d = Line number

%s = File name

### Explanation

The application name is duplicated.

### System Action

Cancels the start of the performance monitoring tool or performance monitoring.

### User Action

Correct the duplicated application name, then reexecute the command.

## 12.3.30 is20344

---

### **IS: ERROR: is20344: The specified parameter by -%s option contains an error**

### Variable Information

%s = Option name

### Explanation

An invalid option argument was specified.

### System Action

Cancels the start of the performance monitoring tool or performance monitoring.

### User Action

Specify the correct option argument, then reexecute the command.

## 12.3.31 is20345

---

### **IS: ERROR: is20345: The length of file name is too long**

### Explanation

Processing failed because the file name was too long.

### System Action

Cancels the start of the performance monitoring tool or performance monitoring.

### User Action

Specify the correct file name, then reexecute the command.

## 12.3.32 is20346

---

### **IS: ERROR: is20346: There is an error in the value specified in the %s statement**

### Variable Information

%s = Statement name

### Explanation

An invalid value was specified in a statement, so processing failed.

### System Action

Cancels the start of the performance monitoring tool or performance monitoring.

### User Action

Specify the correct value, then reexecute the command.

## 12.3.33 is20347

---

### IS: ERROR: is20347: The %s statement can't be specified in the plural

#### Variable Information

%s = Statement name

#### Explanation

Multiple identical statements were specified, so processing failed.

#### System Action

Cancels the start of the performance monitoring tool or performance monitoring.

#### User Action

Correct the syntax in the control statement file, then reexecute the command.

## 12.3.34 is20348

---

### IS: ERROR: is20348: There is an error in the description

#### Explanation

Incorrect syntax was used in a statement, so processing failed.

#### System Action

Cancels the start of the performance monitoring tool or performance monitoring.

#### User Action

Correct the syntax in the control statement file, then reexecute the command.

## 12.3.35 is20349

---

### IS: ERROR: is20349:Failed in starting Interstage Performance Tool or starting Performance superintendence

#### Explanation

The system failed to start properly because an error occurred during start processing of the performance monitoring tool or performance monitoring.

#### System Action

Cancels the start of the performance monitoring tool or of performance monitoring.

#### User Action

 Windows32/64

Rectify the error indicated by the error details recorded in the event log, then reexecute the command.

 Solaris32/64  Linux32/64

Rectify the error indicated by the error details recorded in the system log, then reexecute the command.

## 12.3.36 is20350

---

### IS: ERROR: is20350:Failed in stopping Interstage Performance Tool

#### Explanation

An error occurred preventing the performance monitoring tool from being stopped.

#### System Action

Cancels the stop of the performance monitoring tool.

#### User Action

**Windows32/64**

Rectify the error indicated by the error details recorded in the event log, then reexecute the command.

**Solaris32/64** **Linux32/64**

Rectify the error indicated by the error details recorded in the system log, then reexecute the command.

## 12.3.37 is20351

---

### IS: ERROR: is20351:Application(%s) is not defined

#### Variable Information

%s = Application name

#### Explanation

The system failed to start performance monitoring because the application to be performance-monitored was not registered.

#### System Action

Cancels the start of performance monitoring.

#### User Action

Specify the correct application, then reexecute the command.

## 12.3.38 is20352

---

### IS: ERROR: is20352:The application for performance superintendence is not specified

#### Explanation

Automatic performance monitoring failed because an application to be performance-monitored was not specified.

#### System Action

Cancels the start of performance monitoring.

#### User Action

Specify the application to be performance-monitored, then reexecute the command.

## 12.3.39 is20353

---

### IS: ERROR: is20353:The length of application name is too long

#### Explanation

Processing failed because the application name was too long.

### System Action

Cancels the start of the performance monitoring tool or performance monitoring.

### User Action

Specify the correct application name, then reexecute the command.

---

## 12.3.40 is20354

---

### IS: ERROR: is20354:Performance tool environment is not created

#### Explanation

Because the performance monitoring tool is not started, the environment required for performance monitoring is not created. So, the system failed either to stop the performance monitoring tool, or to start or stop performance monitoring.

#### System Action

Cancels the stop of the performance monitoring tool, or the start or stop of performance monitoring.

#### User Action

Start the performance monitoring tool, then reexecute the command.

---

## 12.3.41 is20355

---

### IS: WARNING: is20355:Performance superintendence is already started

#### Explanation

The system failed to start performance monitoring because it has already started.

#### System Action

Cancels the start of performance monitoring.

#### User Action

Stop performance monitoring, then reexecute the command.

---

## 12.3.42 is20356

---

### IS: WARNING: is20356:Performance superintendence is already stopped

#### Explanation

The system failed to stop performance monitoring because performance monitoring was already stopped or never started.

#### System Action

Cancels the stop of performance monitoring.

#### User Action

Start performance monitoring, then reexecute the command.

---

## 12.4 is20400 to is20499

This section details the messages with message numbers between is20400 and is20499.

---

### 12.4.1 is20400

---

#### IS: ERROR: is20400:Some error occurred Code(%s)

## Variable Information

%s = Reason Code

## Explanation

A miscellaneous error has occurred.

## System Action

Processing stops.

## User Action

Take the action indicated by the reason code (%s), then execute again.

If another message was posted at the same time, take the action appropriate for that message.

If no other messages were posted, or if the problem persists, note the reason code (%s), collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

## Reason Codes

The following table explains the causes of the various reason codes.

Table 12.17 is20400 Reason Code Explanations

Reason code	Reason
6	An application that uses Interstage operation API may have terminated abnormally.
513 769	The WorkUnit definition does not exist.
514	There is an error in the WorkUnit definition.
515	The WorkUnit has already been started.
516	The WorkUnit is currently linked and cannot be stopped.
517	The WorkUnit could not be started.
518	Failure when starting the WorkUnit.  Take the action indicated by the other message output in the event log at the same time.   Take the action indicated by the other message output in the system log at the same time.
519	Failure when stopping the WorkUnit.  Take the action indicated by the other message output in the event log at the same time.   Take the action indicated by the other message output in the system log at the same time.
520	Not the user that started the WorkUnit.
521	The WorkUnit is being started.
522	The WorkUnit is being stopped.
523	The WorkUnit is undergoing dynamic changes.
524	The WorkUnit is undergoing dynamic process concurrency changes.
525	The WorkUnit is already started.

Reason code	Reason
526	The WorkUnit is being activated.
1025 1026	The object definition does not exist.
1027	The object is already closed.
1028	The object is already released.
1029	The object failed to be closed. <b>Windows32/64</b> Take the action indicated by the other message output in the event log at the same time. <b>Solaris32/64</b> <b>Linux32/64</b> Take the action indicated by the other message output in the system log at the same time.
1030	The object failed to be released. <b>Windows32/64</b> Take the action indicated by the other message output in the event log at the same time. <b>Solaris32/64</b> <b>Linux32/64</b> Take the action indicated by the other message output in the system log at the same time.
1031	The specified object type cannot be closed or released.
2000~	System error

## 12.4.2 is20401

### IS: ERROR: is20401: The length of user name is over %d bytes

#### Variable Information

%d = User Name Maximum Length

#### Explanation

The user name length is longer than the length indicated in the variable information.

#### System Action

Processing stops.

#### User Action

Specify a correct user name, and perform the processing again.

## 12.4.3 is20402

### IS: ERROR: is20402:A system resource shortage occurred

#### Explanation

A system resource shortage has occurred.

#### System Action

Processing stops.

## User Action

**Linux32/64**

Length of the message queue or insufficient shared memory may be the cause. Refer to the Tuning Guide to recalculate the required message queue length and shared memory. Tune the relevant system parameter as appropriate.

If this error appears frequently, collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

## 12.4.4 is20403

---

### IS: ERROR: is20403:A shortage of memory

#### Explanation

A memory shortage has occurred. Alternatively, there was insufficient disk space.

#### System Action

Processing stops.

#### User Action

Execute the process again later. If this message is generated frequently, refer to the Tuning Guide, reestimate the memory required to run Interstage, and confirm that there is enough memory. Alternatively, if there is insufficient disk space, it may not be possible to use the memory swap area or work space for paging. Check that there is an appropriate amount of memory.

If there is enough memory to run Interstage, there may be inadequate memory to run other applications. Reestimate the amount of memory needed for the other applications running on the same machine to determine if there is an appropriate amount of memory.

Contact your system administrator if the reestimation indicates that the memory is insufficient. Ask the system administrator to either increase the size of the main memory or to increase the size of the page file.

## 12.4.5 is20404

---

### IS: ERROR: is20404:A system error occurred

#### Explanation

A system error has occurred.

#### System Action

Processing stops.

#### User Action

When no other message is output, collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

## 12.4.6 is20405

---

### IS: ERROR: is20405:I/O error occurred in system file

#### Explanation

An I/O Error has occurred in the system file.

#### System Action

Processing stops.

#### User Action

When no other message is output, collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

## 12.4.7 is20406

---

### IS: ERROR: is20406:Unable to start work unit

#### Explanation

There has been a failure when starting the WorkUnit.

#### System Action

Processing stops.

#### User Action

When no other message is output, collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

## 12.4.8 is20407

---

### IS: ERROR: is20407: The work unit quit abnormally

#### Explanation

The WorkUnit terminated in error.

#### System Action

Processing stops.

#### User Action

When no other message is output, collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

## 12.4.9 is20408

---

### IS: ERROR: is20408: The user is not registered

#### Explanation

The specified user is not registered to the server.

#### System Action

Processing stops.

#### User Action

Specify the correct user name and execute the process again.

## 12.4.10 is20409

---

### IS: ERROR: is20409: Interstage is already stopped

#### Explanation

Interstage is not started.

Alternatively, it may indicate that Interstage is starting up.

#### System Action

Processing stops.

#### User Action

Perform processing again after checking the state of Interstage and checking startup.

## 12.4.11 is20410

---

### **IS: ERROR: is20410: The work unit definition does not exist**

#### Explanation

The WorkUnit definition does not exist.

#### System Action

Processing stops.

#### User Action

Verify the WorkUnit name. If it is correct, register the WorkUnit definition. If the WorkUnit name was incorrect, specify the correct WorkUnit name, and execute again.

## 12.4.12 is20411

---

### **IS: ERROR: is20411: The work unit definition contains an error**

#### Explanation

There is an error in the WorkUnit definition.

#### System Action

Processing stops.

#### User Action

Correct the WorkUnit definition, and perform the process for the WorkUnit again.

## 12.4.13 is20412

---

### **IS: ERROR: is20412: This is not the user who started the work unit**

#### Explanation

Processing for the WorkUnit has stopped because the user is not the user that started the WorkUnit.

#### System Action

Stops processing on the WorkUnit.

#### User Action

The user that started the WorkUnit should perform the process for the WorkUnit again.

## 12.4.14 is20413

---

### **IS: ERROR: is20413: The work unit is being started**

#### Explanation

An attempt was made to perform an operation on a WorkUnit that is in the startup process.

#### System Action

Stops processing on the WorkUnit.

#### User Action

If there is an error in the WorkUnit name, perform the processing again with the correct WorkUnit name.

## 12.4.15 is20414

---

### IS: ERROR: is20414: The work unit is being stopped

#### Explanation

An attempt was made to perform an operation on a WorkUnit that is in the termination process.

#### System Action

Stops processing on the WorkUnit.

#### User Action

If there is an error in the WorkUnit name, perform the processing again with the correct WorkUnit name.

## 12.4.16 is20415

---

### IS: ERROR: is20415: The work unit is not starting

#### Explanation

An attempt was made to perform an operation on a WorkUnit that has not been started.

#### System Action

Stops processing on the WorkUnit.

#### User Action

If there is an error in the WorkUnit name, perform the processing again with the correct WorkUnit name.

## 12.4.17 is20416

---

### IS: ERROR: is20416: The work unit is already started(linking)

#### Explanation

The specified WorkUnit has already been started.

#### System Action

Stops processing on the WorkUnit.

#### User Action

If there is an error in the WorkUnit name, perform the processing again with the correct WorkUnit name.

## 12.4.18 is20417

---

### IS: ERROR: is20417: The work unit is already started

#### Explanation

The specified WorkUnit has already been started.

#### System Action

Stops processing on the WorkUnit.

#### User Action

If there is an error in the WorkUnit name, perform the processing again with the correct WorkUnit name.

## 12.4.19 is20418

---

---

**IS: ERROR: is20418: The specified function does not exist****Explanation**

The specified function does not exist.

**System Action**

Processing stops.

**User Action**

Specify the correct function name and perform the processing again.

---

**12.4.20 is20419**

---

**IS: ERROR: is20419: The specified library does not exist****Explanation**

The specified library does not exist.

**System Action**

Processing stops.

**User Action**

Specify the correct library name and perform the processing again.

---

**12.4.21 is20420**

---

**IS: ERROR: is20420: The specified function has already registered****Explanation**

The asynchronous communications function registration has already been completed.

**System Action**

Processing stops.

**User Action**

Perform the processing again after deleting the currently registered function.

---

**12.4.22 is20421**

---

**IS: ERROR: is20421: Required component cannot be used****Explanation**

One of the following causes is assumed:

- The features below, which are required to use the Interstage operation API, have not been installed:
  - Multilanguage service
  - J2EE compatibility
- An old version (V5.0.1 or earlier) of the Servlet service is not supported. To monitor IJServer, monitor it as the WorkUnit.

**System Action**

Processing stops.

**User Action**

Install the missing features below:

- Multilanguage service
- J2EE compatibility

## 12.4.23 is20426

---

### IS: ERROR: is20426:The servlet container is not starting

#### Explanation

The servlet container was operated to the servlet container which has not been started.

#### System Action

The processing to a servlet container is stopped.

#### User Action

When an error is in a servlet container name, please process by the right servlet container name again.

## 12.4.24 is20427

---

### IS: ERROR: is20427: Implementation Repository ID(%s) is not registered Reason code(%s)

#### Variable Information

%s = Implementation Repository ID

%d = Reason Code

#### Explanation

Implementation Repository I ID shown in variable information %s is not registered.

Reason code	Reason
1032	Specified Implementation Repository ID is not registered.

#### System Action

Processing stops.

#### User Action

Verify the interface Repository ID. If it is correct, register it. If it is incorrect, specify a valid interface Repository ID, and register it.

## 12.4.25 is20428

---

### IS: ERROR: is20428:Interface Repository ID(%s) is not registered Reason code(%s)

#### Variable Information

%s = Interface Repository ID

%d = Reason Code

#### Explanation

Interface Repository I ID shown in variable information %s, is not registered.

Reason code	Reason
1033	Specified interface Repository ID is not registered.

#### System Action

Processing stops.

## User Action

Verify the interface Repository ID. If it is correct, register it. If it is incorrect, specify a valid interface Repository ID, and register it.

### 12.4.26 is20430

---

#### **IS: ERROR: is20430:The function cannot be used in this edition**

##### Explanation

An attempt was made to use a function that cannot be used in the installed edition.

##### System Action

Processing stops.

##### User Action

None: You cannot use the function.

### 12.4.27 is20431

---

#### **IS: ERROR: is20431:%s unable to terminate**

##### Variable Information

%s = Service name

##### Explanation

An error occurred in Interstage stop processing.

##### System Action

Command processing stops.

##### User Action

Refer to the service error message and system log shown in Variable Information %s, refer to the User Action for each message before taking action, and then reexecute the command.

### 12.4.28 is20432

---

#### **IS: ERROR: is20432:A WorkUnit is active**

##### Explanation

Failed to stop Interstage because there is a WorkUnit running.

##### System Action

Processing stops.

##### User Action

Take one of the following actions:

- Stop the WorkUnit that is running, and then stop Interstage again using the Interstage Management Console or the *isstop* command.
- Either force the started service to stop using the Interstage Management Console, or specify the *-c* option force the started service to stop using the *isstop* command.

### 12.4.29 is20450

---

#### **IS: ERROR: is20450: Work unit (%s) unable to process Reason code (%d)**

## Variable Information

%s = WorkUnit Name

%d = Reason Code

## Explanation

The WorkUnit process failed for the reason shown in the reason code.

## System Action

Processing stops.

## User Action

Take action appropriate for the reason code (%d), and execute the process again.

If there is another message, take action according to that message.

When no other message is issued, or the cause of the error persists, collect diagnostic information using the *iscollectinfo* command, record the reason code, and then contact your systems engineer.

Table 12.18 is20450 Reason Code Explanations

Reason code	Reason
6	An application that uses Interstage operation API may have terminated abnormally.
513 769	The WorkUnit definition does not exist.
514	There is an error in the WorkUnit definition.
515	The WorkUnit has already been started.
516	The WorkUnit is currently linked and cannot be stopped.
517	The WorkUnit could not be started.
518	<p>Failure when starting the WorkUnit.</p> <p><b>Windows32/64</b></p> <p>Take the action indicated by the other message output in the event log at the same time. If IJServer fails to start, also check the IJServer container log as a message outlining the cause may be output to that log.</p> <p><b>Solaris32/64 Linux32/64</b></p> <p>Take the action indicated by the other message output in the system log at the same time. If IJServer fails to start, also check the IJServer container log as a message outlining the cause may be output to that log.</p> <p>Moreover, when operating a WorkUnit in a Multi Server Environment, it is necessary to register a user into each Managed Server in advance. The user name to register is a login user name to the Interstage Management Console of an Admin Server.</p> <p>Additionally, before the WorkUnit can be started in the multiserver environment automatically, it is necessary to specify the user names that will be used to start it in each Managed Server.</p>
519	<p>Failure when stopping the WorkUnit.</p> <p><b>Windows32/64</b></p> <p>Take the action indicated by the other message output in the event log at the same time. If IJServer fails to start, also check the IJServer container log as a message outlining the cause may be output to that log.</p> <p><b>Solaris32/64 Linux32/64</b></p>

Reason code	Reason
	<p>Take the action indicated by the other message output in the system log at the same time. If IJServer fails to start, also check the IJServer container log as a message outlining the cause may be output to that log.</p> <p>Moreover, when operating a WorkUnit in a Multi Server Environment, it is necessary to register a user into each Managed Server in advance. The user name to register is a login user name to the Interstage Management Console of an Admin Server.</p>
520	Not the user that started the WorkUnit.
521	The WorkUnit is being started.
522	The WorkUnit is being stopped.
523	The WorkUnit is undergoing dynamic changes.
524	The WorkUnit is undergoing dynamic process concurrency changes.
525	The WorkUnit is already started.
526	The WorkUnit is being activated.
530	<p>An error was detected in internal processing.</p> <p> Windows32/64</p> <p>Take the action indicated by the other message output in the event log at the same time.</p> <p> Solaris32/64  Linux32/64</p> <p>Take the action indicated by the other message output in the system log at the same time.</p>
531	Processing was interrupted because the specified WorkUnit was stopped forcibly.
601	<p>Failed to change the WorkUnit process concurrency.</p> <p> Windows32/64</p> <p>Take the action indicated by the other message output in the event log at the same time.</p> <p> Solaris32/64  Linux32/64</p> <p>Take the action indicated by the other message output in the system log at the same time.</p>
1025	The object definition does not exist.
1026	
1027	The object is already closed.
1028	The object is already released.
1029	<p>The object failed to be closed.</p> <p> Windows32/64</p> <p>Take the action indicated by the other message output in the event log at the same time.</p> <p> Solaris32/64  Linux32/64</p> <p>Take the action indicated by the other message output in the system log at the same time.</p>
1030	<p>The object failed to be released.</p> <p> Windows32/64</p> <p>Take the action indicated by the other message output in the event log at the same time.</p> <p> Solaris32/64  Linux32/64</p> <p>Take the action indicated by the other message output in the system log at the same time.</p>

Reason code	Reason
1031	The specified object type cannot be closed or released.
2000~	System error

### 12.4.30 is20452

---

#### IS: ERROR: is20452: The user isn't registered user name=%s

##### Variable Information

%s = User Name

##### Explanation

User indicated by the variable information not registered.

##### System Action

Processing stops.

##### User Action

Verify the user name. If the user name is correct then define the user. If the user name is incorrect, specify the correct user name and try again.

### 12.4.31 is20453

---

#### IS: ERROR: is20453: An internal error was detected Error information (%s)

##### Variable Information

%s = Error Information

##### Explanation

Interstage system-internal conflict detected.

##### System Action

Processing stops.

##### User Action

Collect diagnostic information using the *iscollectinfo* command, record the error information, and then contact your systems engineer.

### 12.4.32 is20454

---

#### IS: ERROR: is20454: A system error occurred Error information (%s)

##### Variable Information

%s = Error Information

##### Explanation

Interstage system error was detected.

##### System Action

Processing stops.

##### User Action

Refer to the system log in order to check whether the message indicating the cause of the processing failure is output. If the message is output, take appropriate action to remedy the failure.

In the case of Multi Server Environment, refer to the system log of the Managed Server in order to check whether the message indicating the cause of the processing failure is output. If the message is output, take appropriate action to remedy the failure.

If this message was output with 'D 0000ff:M 00082:O 00001:F 103:E -6: N 0' error information when Interstage was started, some services failed to start. In this situation, ignore this message and refer to other messages.

If the following error information is posted in this message, Interstage may have stopped:

D 00105:M 00075:O 00005:F 204: E 81

D 00105:M 00088:O 00004:F 205: E 81

D 00105:M 00089:O 00004:F 205: E 81

D 00105:M 00072:O 00002:F 202: E 81

D 00105:M 00073:O 00005:F 202: E 81

#### Linux32/64

When an error is output containing one of the below, it is possible that a semaphore is insufficient. Refer to the Tuning Guide to reestimate the semaphore needed, and tune the system accordingly.

'D 000ff:M 01040:O 00002:F 101:E -4'

'D 000ff:M 01012:O 00001:F 101:E -4'

'D 000ff:M 01030:O 00002:F 101:E -4'

'D 000ff:M 01020:O 00005:F 101:E -4'

'D 000ff:M 010B2:O 00002:F 101:E -4'

'D 000ff:M 010B9:O 00005:F 101:E -4'

'D 000ff:M 00021:O 00001:F 101:E -4'

'D 000ff:M 00070:O 00001:F 101:E -4'

In cases other than above, check whether the commands listed in the lower part are used together with the Interstage operation performed on the Interstage Management Console, or together with the Interstage integrated commands listed in the upper part.

If the commands in the lower part are used at the same time, restart the operation using the Interstage Management Console or Interstage integrated commands.

If not, collect diagnostic information using the *iscollectinfo* command, record the error information, and then contact your systems engineer.

- Integrated commands

- *isgendef*
- *isregistdef*
- *isinit*
- *isstart*
- *isstop*

- Commands that cannot be used with the integrated commands:

- *otssetup*
- *otsmklog*
- *tdsetup*
- *tdunsetup*
- *tdstart*
- *tdstop*
- *otsstart*

- *otsstop*
- *esunsetup*
- *esstart*
- *esstop*

**Solaris32/64** **Linux32/64**

- *odadmin*
- *S99startod*
- *CosNaming\_s*
- *InterfaceRep\_Cache\_s*
- *InterfaceRep\_Cache\_e*
- *OD\_stop*

**Solaris32/64** **Linux32/64**

Alternately, inspect the system log. If a message indicates insufficient memory or swap area, wait a moment, then reexecute the process.

### 12.4.33 is20455

---

**IS: ERROR: is20455: Object(%s)unable to process Reason code(%d)**

#### Variable Information

%s = Object Name

%d = Reason Code

#### Explanation

The object could not be closed or released for the reason indicated in the reason code.

#### System Action

Processing stops.

#### User Action

Carry out the action indicated by the Reason Code (as shown in [Table 12.17 is20400 Reason Code Explanations](#)), and restart processing.

If another message has been output in the event log, take the action indicated in that message.

When no other message is output, collect diagnostic information using the *iscollectinfo* command, and record the error information, and then contact your systems engineer.

### 12.4.34 is20456

---

**IS: ERROR: is20456: A condition exists that the Work Unit cannot be operated**

#### Explanation

The specified WorkUnit or the WorkUnit to which the specified object belongs cannot be operated.

#### System Action

Processing stops.

#### User Action

Check the status of the WorkUnit, and restart processing later.

## 12.4.35 is20457

---

### IS: ERROR: is20457: A Message unable to be sent Reason code(%s)

#### Explanation

The message could not be sent.

#### System Action

Processing stops.

#### User Action

Carry out the action indicated by the Reason Code (as shown in [Table 12.17 is20400 Reason Code Explanations](#)), and restart processing.

If another message has been output in the event log, take the action indicated in that message.

When no other message is output, collect diagnostic information using the *iscollectinfo* command, record the error information, and then contact your systems engineer.

## 12.4.36 is20458

---

### IS: ERROR: is20458: An error occurred to get information of Work Unit definition

#### Explanation

An error occurred during processing to get definition information.

#### System Action

Processing stops.

#### User Action

If another message has been output in the event log, take the action indicated in that message.

When no other message is output, collect diagnostic information using the *iscollectinfo* command, record the error information, and then contact your systems engineer.

## 12.4.37 is20459

---

### IS: ERROR: is20459:The target system does not exist

#### Explanation

The specified system does not exist.

#### System Action

Processing stops.

#### User Action

Specify the correct system name, and restart processing.

## 12.4.38 is20460

---

### IS: ERROR: is20460:The indispensable package is not installed Package name=%s

#### Variable Information

%s = Package name

#### Explanation

A required package is not installed.

## System Action

Processing stops.

## User Action

Install the required package indicated in Variable Information, and reexecute processing. Alternatively, refer to the system log. If a message indicating a memory or swap area shortage was output, reexecute processing later.

## 12.4.39 is20461

---

**IS: ERROR: is20461:The error of syntax is in a definition file FILE=%s1 Error information=%s2**

### Variable Information

%s1 = File name

%s2 = Error information

### Explanation

The file indicated in Variable Information contains a syntax error.

### System Action

Processing stops.

### User Action

Correct the syntax error in the file indicated in Variable Information %s1, and reexecute processing. If the indicated file name is *isconfig.xml*, refer to the Operator's Guide.

## 12.4.40 is20462

---

**IS: ERROR: is20462:Interstage initializing is not completed**

### Explanation

Processing failed because Interstage initialization was not complete.

### System Action

Processing stops.

### User Action

Use the Interstage integration command or Interstage Operation Tool to initialize Interstage.

Alternatively, use the *isinit* command to restore the setup environment that was created when Interstage was installed.

## 12.4.41 is20463

---

**IS: ERROR: is20463:The service under operation exists**

### Explanation

Processing failed because an active service existed.

### System Action

Processing stops.

### User Action

Check that the started service has stopped and reexecute processing.

## 12.4.42 is20464

---

**IS: ERROR: is20464:%s is specified to be an environment variable LD\_LIBRARY\_PATH**

### Variable Information

%s = Value that cannot be specified in the environment variable LD\_LIBRARY\_PATH

### Explanation

The specified value cannot be specified in the environment variable LD\_LIBRARY\_PATH.

### System Action

Processing stops.

### User Action

Remove the value indicated in the variable information, from the values specified in the environment variable LD\_LIBRARY\_PATH and then rerun the process.

## 12.4.43 is20470

---

**IS: ERROR: is20470: An exclusion operation is in progress**

### Explanation

A processing operation that cannot be performed with another operation is in progress.

### System Action

Processing stops.

### User Action

If this message is output while Interstage is being installed, finish the installation and then initialize Interstage.

In all other cases, reexecute processing later.

## 12.4.44 is20471

---

**IS: ERROR: is20471:Does not have the authority to execute**

### Explanation

The user is not authorized to execute processing.

### System Action

Processing stops.

### User Action

Log on as an authorized user and reexecute processing.

## 12.4.45 is20472

---

**IS: ERROR: is20472:The error of syntax is in the definitions**

### Explanation

The definition contains an error.

### System Action

Processing stops.

If this message is output when [System] > [Environment Settings] tab is selected for the display on the Interstage Management Console, the default value is displayed in the definition value.

#### User Action

A syntax error may occur in `isconfig.xml`. Referring to the 'Operator's Guide', correct the file contents according to the syntax.

If there is another message output together with this message, take action according to the other message and then rerun the process.

If this message is output when using the Interstage Management Console, log out of the Interstage Management Console, correct the contents defined in `isconfig.xml`, and then log into the console again.

### 12.4.46 is20473

---

#### IS: ERROR: is20473:It has been updated by the other operation

##### Explanation

Processing failed because information had been updated by another operation.

##### System Action

Processing stops.

##### User Action

Obtain the latest information, and reexecute processing if required.

### 12.4.47 is20474

---

#### IS: ERROR: is20474:Cannot operate by the specified mode

##### Explanation

An attempt was made to update a definition that could not be updated in the specified mode.

##### System Action

Processing stops.

##### User Action

Reexecute processing in forced mode, if required.

### 12.4.48 is20475

---

#### IS: ERROR: is20475:Permission to access the file or path is not granted

##### Explanation

Access authority to the file or path has not been granted.

##### System Action

Processing stops.

##### User Action

Refer to the message output to the event log to check the access authority for the file or path. Change the access authority, or execute processing as a user with access authority.

### 12.4.49 is20476

---

#### IS: ERROR: is20476:System file access failure

#### Explanation

An error occurred during access to the system file.

#### System Action

Processing stops.

#### User Action

Remove the error cause according to the message output to the event log, and reexecute processing.

### 12.4.50 is20477

---

#### **IS: ERROR: is20477:An error occurred to get information of Object(%s)**

#### Explanation

An error occurred during processing to obtain information on the object.

#### System Action

Processing stops.

#### User Action

If another message was output simultaneously, take the action indicated by that message. When no other message is output, or the cause of the error cannot be removed, collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

### 12.4.51 is20478

---

#### **IS: ERROR: is20478:The WorkUnit definition contains an error WorkUnit=%s**

#### Variable Information

%s = WorkUnit name

#### Explanation

The WorkUnit definition contains an error.

#### System Action

Processing stops.

#### User Action

Correct the WorkUnit definition and reexecute processing for the WorkUnit.

### 12.4.52 is20479

---

#### **IS: ERROR: is20479:The WorkUnit definition does not exist WorkUnit=%s**

#### Variable Information

%s = WorkUnit name

#### Explanation

The WorkUnit definition could not be found.

#### System Action

Processing stops.

## User Action

Check the WorkUnit name. If the WorkUnit name is correct, register the WorkUnit definition. If the WorkUnit name is incorrect, reexecute processing with the correct WorkUnit name specified.

## 12.4.53 is20480

---

### **IS: ERROR: is20480:The WorkUnit is already started WorkUnit=%s**

#### Variable Information

%s = WorkUnit name

#### Explanation

The specified WorkUnit is already started.

#### System Action

Stops processing for the WorkUnit.

#### User Action

If an incorrect WorkUnit name was specified, reexecute processing with the correct WorkUnit name specified.

## 12.4.54 is20481

---

### **IS: ERROR: is20481:The WorkUnit is not running WorkUnit=%s**

#### Variable Information

%s = WorkUnit name

#### Explanation

An attempt was made to operate a WorkUnit that was not started.

#### System Action

Stops processing for the WorkUnit.

#### User Action

If an incorrect WorkUnit name was specified, reexecute processing with the correct WorkUnit name specified.

## 12.4.55 is20482

---

### **IS: ERROR: is20482:The WorkUnit is being started WorkUnit=%s**

#### Variable Information

%s = WorkUnit name

#### Explanation

An attempt was made to operate a WorkUnit that was being started.

Alternatively, the WorkUnit may be already starting.

#### System Action

Stops processing for the WorkUnit.

#### User Action

If an incorrect WorkUnit name was specified, reexecute processing with the correct WorkUnit name specified.

## 12.4.56 is20483

---

**IS: ERROR: is20483:The WorkUnit is being stopped WorkUnit=%s**

### Variable Information

%s = WorkUnit name

### Explanation

An attempt was made to operate a WorkUnit that was being stopped.

### System Action

Stops processing for the WorkUnit.

### User Action

If an incorrect WorkUnit name was specified, reexecute processing with the correct WorkUnit name specified.

## 12.4.57 is20484

---

**IS: ERROR: is20484:The WorkUnit is not exists WorkUnit=%s**

### Variable Information

%s = WorkUnit name

### Explanation

The WorkUnit could not be found.

### System Action

Processing stops.

### User Action

The WorkUnit may have been deleted by other operation. If another message was output simultaneously, take the action indicated by that message. When no other message is output, or the cause of the error persists, collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

## 12.4.58 is20485

---

**IS: ERROR: is20485:This is not the user who started the WorkUnit: WorkUnit=%s1 User=%s2**

### Variable Information

%s1 = WorkUnit name

%s2 = Name of the user who performed operation

### Explanation

The user failed to perform the operation because that user has no authorization to operate the WorkUnit indicated in the variable information.

### System Action

Processing stops.

### User Action

Have the user who started the WorkUnit, or a super user who has the authorization to operate the WorkUnit, perform the operation again.

## 12.4.59 is20486

**IS: INFO: is20486:It succeeded in correlation of the resource modules of Workload Organizer Module=%s**

### Variable Information

%s = Resource module name

### Explanation

The resource module of the Workload Organizer indicated in the variable information was successfully associated with the process.

## 12.4.60 is20487

**IS: WARNING: is20487:Correlation of the resource modules of Workload Organizer went wrong Module=%s1 Error information=%s2**

### Variable Information

%s1 = Resource module name

%s2 = Error information

### Explanation

The resource module of the Workload Organizer indicated in the variable information failed to be associated with the process.

### System Action

Processing continues.

However, the linkage function with the Workload Organizer cannot be used.

### User Action

Take the following actions according to the error information indicated in the variable information:

Table 12.19 is20487 Error Information, Cause and Required Action

Error information	Cause	Action
ENAMETOOLONG	The resource module name specified in isconfig.xml is too long.	The maximum length of the resource module name is 63 bytes. Check the resource module name specified in isconfig.xml and specify a correct resource module name.
ENOENT	No resource module is defined.	Check the module name defined in Workload Organizer and specify a correct resource module name.
ENXIO	The Workload Organizer is not started.	Start the Workload Organizer. For details, see the Workload Organizer manual.
ECOMM	The linkage to the Workload Organizer failed.	Stop the Workload Organizer once and then restart it. For the restart method, see the Workload Organizer manual.  If this message is frequently output, collect diagnostic information using the <i>iscollectinfo</i> command, record the resource module name and error information indicated in the variable information, and then contact your systems engineer.
EIO	A file access error occurred.	Take action for the Workload Organizer message issued at the same time.
EOTHER	A module other than the execution resource module might be specified.	Specify the execution resource module. For details of the execution resource module, see the Workload Organizer manual.

## 12.4.61 is20488

---

**IS: ERROR: is20488:The specified application is already permitted: WorkUnit=%s1 ImplID=%s2**

### Variable Information

%s1 = WorkUnit name

%s2 = Implementation repository ID

### Explanation

The specified queue is already unblocked.

### System Action

Processing stops.

### User Action

If an error occurs in the WorkUnit name or implementation repository ID, perform the processing again with a correct WorkUnit name or implementation repository ID.

## 12.4.62 is20489

---

**IS: ERROR: is20489:This is not the user who started the WorkUnit: WorkUnit=%s1 ImplID=%s2 User=%s3**

### Variable Information

%s1 = WorkUnit name

%s2 = Implementation repository ID

%s3 = Name of the user who performed the operation

### Explanation

The user failed to perform the operation because that user has no authorization to operate the WorkUnit indicated in the variable information.

### System Action

Processing stops.

### User Action

The user who started the WorkUnit or super user has the authorization to operate the WorkUnit. Perform the operation as either of both.

## 12.4.63 is20490

---

**IS: ERROR: is20490:The specified application is already inhibited: WorkUnit=%s1 ImplID=%s2**

### Variable Information

%s1 = WorkUnit name

%s2 = Implementation repository ID

### Explanation

The specified queue is already blocked.

### System Action

Processing stops.

## User Action

If an error occurs in the WorkUnit name or implementation repository ID, perform the operation again with the correct WorkUnit name or implementation repository ID.

## 12.4.64 is20491

---

**IS: ERROR: is20491:An error occurred during permitting of application: WorkUnit=%s1 ImplID=%s2 CODE=%s3**

### Variable Information

%s1 = WorkUnit name

%s2 = Implementation repository ID

%s3 = Reason code

### Explanation

An error occurred while the application was unblocked.

### System Action

Processing stops.

### User Action

Take actions listed in the reason code table. If an error code not listed is output, collect diagnostic information using the *iscollectinfo* command, record the error code and error information, and then contact your systems engineer.

Table 12.20 is20491 Reason Code, Cause and required Action

Reason code	Cause	Action
1	There is no implementation repository ID. It may be incorrect or might be deleted.	Specify a correct implementation repository ID.
2	There is no interface repository ID. It may be incorrect or might be deleted.	Specify a correct interface repository ID.
3	An operation was executed by a user other than the user who starts the WorkUnit.	Execute the operation as the user who starts the WorkUnit.
101	Failed to initialize shared memory.	Contact your systems engineer.
102	Failed to initialize semaphore.	Contact your systems engineer.
103	Memory shortage occurred.	Finish unnecessary applications to solve the memory shortage.
104	An internal logic error occurred.	Contact your systems engineer.
105	An internal logic error occurred.	Contact your systems engineer.
-1	An internal logic error occurred.	Contact your systems engineer.

## 12.4.65 is20492

---

**IS: ERROR: is20492:An error occurred during inhibiting of application: WorkUnit=%s1 ImplID=%s2 CODE=%s3**

### Variable Information

%s1 = WorkUnit name

%s2 = Implementation repository ID

%s3 = Reason code

#### Explanation

An error occurred while the application was blocked.

#### System Action

Processing stops.

#### User Action

Take action indicated in [User Action] in the is20491 message.

---

### 12.4.66 is20493

---

**IS: ERROR: is20493:The work unit is being recovered of degeneration: WorkUnit=%s**

#### Variable Information

%s = WorkUnit name

#### Explanation

The operation used to process a WorkUnit that is being recovered following degeneration has failed.

#### System Action

Processing stops.

#### User Action

Check the WorkUnit status. Wait for a while and reexecute processing. Alternatively, if there is another message output at the same time, take action according to the message displayed.

---

### 12.4.67 is20494

---

**IS: ERROR: is20494:The work unit is not degeneration: WorkUnit=%s**

#### Variable Information

%s = WorkUnit name

#### Explanation

The operation to process a WorkUnit that is not being degenerated has failed.

#### System Action

Processing stops.

#### User Action

Check the WorkUnit status. Wait for a while and reexecute processing. Alternatively, if there is another message output at the same time, take action according to the message displayed.

---

### 12.4.68 is20495

---

**IS: ERROR: is20495:The work unit of the same name is a multiple degree of process change processing inside: WorkUnit=%s**

#### Variable Information

%s = WorkUnit name

#### Explanation

Failed to process the changing of the process concurrency for WorkUnits with the same name.

## System Action

Processing stops.

## User Action

Check the WorkUnit status. Wait for a while and reexecute processing. Alternatively, if there is another message output at the same time, take action according to the message displayed.

## 12.4.69 is20496

---

**IS: ERROR: is20496:Two work units of the same are dealing with an activated change: WorkUnit=%s**

### Variable Information

%s = WorkUnit name

### Explanation

Failed to process changing the activity for WorkUnits with the same name.

### System Action

Processing stops.

### User Action

Check the WorkUnit status. Wait for a while and reexecute processing. Alternatively, if there is another message output at the same time, take action according to the message displayed.

## 12.4.70 is20497

---

**IS: ERROR: is20497:There is not space in the disk**

### Explanation

Failed to process because there is not enough disk space.

### System Action

Processing stops.

### User Action

Increase disk space and reexecute.

## 12.4.71 is20498

---

**IS: ERROR: is20498:The specified interface is already permitted: WorkUnit=%s1 IntfID=%s2**

### Variable Information

%s1 = WorkUnit name

%s2 = Interface repository ID

### Explanation

The specified queue is already unblocked.

### System Action

Processing stops.

### User Action

If there was an error in the WorkUnit name or interface repository ID, reexecute processing, making sure that the WorkUnit name or interface repository ID is correct.

## 12.4.72 is20499

---

**IS: ERROR: is20499:The specified interface is already inhibited: WorkUnit=%s1 IntfID=%s2**

### Variable Information

%s1 = WorkUnit name

%s1 = Interface repository ID

### Explanation

The specified queue is already blocked.

### System Action

Processing stops.

### User Action

If there was an error in the WorkUnit name or interface repository ID, reexecute processing, making sure that the WorkUnit name or interface repository ID is correct.

## 12.5 is20500 to is20599

---

### 12.5.1 is20500

---

**IS: ERROR: is20500:System error occurred in performance data extraction processing: CODE='%s'**

### Variable Information

%s = Error information

### Explanation

A system error occurred during collection of WorkLoad Organizer performance information.

### System Action

Stops the collection of WorkLoad Organizer performance information.

### User Action

Collect diagnostic information using the *iscollectinfo* command, record the error information, and then contact your systems engineer.

### 12.5.2 is20501

---

**IS: ERROR: is20501:A shortage of memory was occurred in performance data extraction processing**

### Explanation

A memory shortage was detected during collection of WorkLoad Organizer performance information.

### System Action

Stops the collection of WorkLoad Organizer performance information.

### User Action

If this message is frequently output, refer to the Tuning Guide and reestimate the memory amount required to operate Interstage. Check whether the provided memory is sufficient.

When the provided memory is sufficient for the memory amount required for Interstage, the memory amount used with other applications may be insufficient. Reestimate the memory amount for the other applications that run on the same machine, and check whether the memory amount is appropriate.

As a result of the reestimation, if the user confirms the memory shortage, contact a system administrator. The system administrator will expand the main memory.

### 12.5.3 is20502

---

**IS: ERROR: is20502:Could not get IPC resource due to duplicated key(key=%x path=%s)**

#### Variable Information

%x = Key value

%s = Path name

#### Explanation

The IPC resource required to collect WorkLoad Organizer performance information failed to be acquired because it was in use.

#### System Action

Stops the collection of the WorkLoad Organizer performance information.

#### User Action

Since the IPC key value is duplicated, the user needs to customize it.

For details, refer to the Tuning Guide.

### 12.5.4 is20503

---

**IS: ERROR: is20503:Specified system dose not exist**

#### Explanation

Since the system indicated in the variable information does not exist, WorkLoad Organizer performance information failed to be collected.

#### System Action

Stops the collection of WorkLoad Organizer performance information.

#### User Action

Create the system indicated in the variable information and then rerun the process.

### 12.5.5 is20504

---

**IS: ERROR: is20504:The package is not installed: Package=%s**

#### Variable Information

%s = Package name

#### Explanation

Since the package indicated in the variable information is not installed, WorkLoad Organizer performance information failed to be collected.

#### System Action

Stops the collection of WorkLoad Organizer performance information.

#### User Action

Install the package indicated in the variable information and then rerun the process.

## 12.5.6 is20505

---

### **IS: ERROR: is20505:A system resource shortage occurred in performance data extraction processing**

#### Explanation

A system resource shortage was detected during collection of WorkLoad Organizer performance information.

#### System Action

The collection of WorkLoad Organizer performance information stops.

#### User Action

Rerun the process after some time passes. If this message is frequently output, collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

## 12.5.7 is20506

---

### **IS: ERROR: is20506:It failed in acquisition of performance information by failure of environment making**

#### Explanation

WorkLoad Organizer performance information failed to be collected because the environment for collecting WorkLoad Organizer performance information failed to be created at start of Interstage.

#### System Action

The collection of WorkLoad Organizer performance information stops.

#### User Action

To use the WorkLoad Organizer function, remove the cause of the error according to the action indicated in the error message issued at the start of Interstage, and then restart Interstage.

## 12.5.8 is20507

---

### **IS: ERROR: is20507:It failed in acquisition of performance information by failure of environment initialization**

#### Explanation

WorkLoad Organizer performance information failed to be collected because the environment for collecting WorkLoad Organizer performance information failed to be initialized.

#### System Action

The collection of WorkLoad Organizer performance information stops.

#### User Action

To use the WorkLoad Organizer function, remove the cause of the error according to the action indicated in the last error message, and then restart the WorkUnit.

## 12.5.9 is20508

---

### **IS: ERROR: is20508:There is no empty block for the performance information writing**

#### Explanation

The lack of an empty block in to which performance information can be written, prevents WorkUnit performance information from being acquired for WorkLoad Organizer.

#### System Action

Processing continues, however no more object performance information is collected.

## User Action

Stop the WorkUnit associated with the resource module of the Workload Organizer, then allocate the empty block for writing performance information.

## 12.5.10 is20550

---

**IS: ERROR: is20550:It failed in the initialization of the communication environment: System=%s**

### Variable Information

%s = System name

### Explanation

Since the communication environment failed to be initialized, the number of request processes and the number of pending requests of the WorkUnit associated with the resource module in the Workload Organizer cannot be monitored.

### System Action

The failure of the communication environment initialization prevents monitoring the number of request processes and pending requests of the WorkUnit associated with the resource module in the Workload Organizer.

### User Action

Follow the instruction indicated in the last message issued.

## 12.5.11 is20551

---

**IS: ERROR: is20551:It failed in the initialization of the performance information acquisition environment: System=%s**

### Variable Information

%s = System name

### Explanation

The number of request processes and pending requests of the WorkUnit associated with the resource module in the Workload Organizer cannot be monitored because the shared memory for obtaining Interstage performance information (performance information acquisition environment) failed to be acquired

### System Action

The number of request processes and pending requests of the WorkUnit associated with the resource module in the Workload Organizer cannot be monitored.

### User Action

Follow the instruction indicated in the last message issued.

If the machine is restarted without stopping Interstage, this message may be output when the machine is started next. Although this happens, the operation is not affected. In these circumstances, it is safe to ignore this message.

## 12.5.12 is20552

---

**IS: ERROR: is20552:Failed in the opening of the library: Package=%s1 ErrorString=%s2**

### Variable Information

%s1 = Package name

%s2 = Error information

## Explanation

The failure of the library to open prevented the monitoring of the number of request processes and pending requests of the WorkUnit associated with the resource module in the Workload Organizer.

## System Action

Monitoring the number of request processes and pending requests of the WorkUnit associated with the resource module in the Workload Organizer does not occur.

## User Action

Check whether the package indicated in the message (%s1) was installed.

When the package was installed, take action for the error information (%s).

## 12.5.13 is20553

---

**IS: ERROR: is20553:Failed in the reading the function: Package=%s1 ErrorString=%s2**

## Variable Information

%s1 = Package name

%s2 = Error information

## Explanation

The function's failure to be read prevented the monitoring of the number of request processes and pending requests of the WorkUnit associated with the resource module in the Workload Organizer.

## System Action

Monitoring the number of request processes and pending requests of the WorkUnit associated with the resource module in the Workload Organizer does not occur.

## User Action

Check the version of the package indicated in the message.

Where the correct version of the package was installed, take the action suggested in the error information (%s2).

## 12.5.14 is20554

---

**IS: ERROR: is20554:A shortage of memory was occurred**

## Explanation

A memory shortage occurred.

## System Action

A memory shortage prevented the monitoring of the number of request processes and pending requests of the WorkUnit associated with the resource module in the Workload Organizer.

## User Action

If this message is frequently output, refer to the Tuning Guide and reestimate the memory amount required to operate Interstage, then check whether the available memory is sufficient.

When the amount of memory is sufficient for Interstage's memory requirements, the memory required by other applications may be insufficient. Reestimate the memory requirements for the other applications that run on the same machine, and check whether the memory size is adequate.

If the reestimation confirms that the memory amount is insufficient, contact a system administrator. The system administrator will expand the main memory or swap area.

## 12.5.15 is20555

---

**IS: ERROR: is20555:The specified system does not exist:System=%s**

### Variable Information

%s = System name

### Explanation

There is no business system.

### System Action

Monitoring the number of request processes and pending requests of the WorkUnit associated with the resource module in the Workload Organizer cannot occur because there is no business system indicated in the variable information.

### User Action

The Interstage business system may have been deleted.

Check whether the business system indicated in the variable information exists.

If the business system does not exist, the WorkLoad Organizer cannot obtain the performance information of the relevant system.

## 12.5.16 is20556

---

**IS: ERROR: is20556:The environment to notify WorkLoad Organizer performance information does not exist:System=%s**

### Variable Information

%s = System name

### Explanation

There is no shared memory for posting the Interstage performance information to the WorkLoad Organizer (performance information acquisition environment).

### System Action

Monitoring the number of request processes and pending requests of the WorkUnit associated with the resource module in the Workload Organizer cannot occur.

### User Action

When Interstage is stopped or started, the shared memory may fail to be created.

Rectify the cause of the error according to the action indicated in the error message issued when Interstage started, and then restart Interstage.

#### Note

If the machine is restarted without stopping Interstage, this message may be output when the machine is started next. Although this happens, the operation is not affected. In these circumstances, it is safe to ignore this message.

## 12.5.17 is20557

---

**IS: ERROR: is20557:A necessary IPC resource overlaps:System=%s**

### Variable Information

%s = System name

### Explanation

The number of request processes and pending requests of the WorkUnit associated with the resource module in the Workload Organizer cannot be monitored because a required IPC resource is duplicated.

### System Action

The number of request processes and pending requests of the WorkUnit cannot be monitored.

### User Action

Since the IPC key value is duplicated, the user needs to customize it. For details, refer to the Tuning Guide.

## 12.5.18 is20558

---

**IS: ERROR: is20558:It failed in the deletion of the communication environment:System=%s**

### Variable Information

%s = System name

### Explanation

The Interstage communication environment failed to be deleted.

### System Action

Processing stops.

### User Action

Follow the instruction indicated in the last message issued.

## 12.5.19 is20559

---

**IS: ERROR: is20559:It failed in the deletion of the performance information acquisition environment:System=%s**

### Variable Information

%s = System name

### Explanation

The Interstage performance information acquisition environment was not deleted.

### System Action

Processing stops.

### User Action

Follow the instruction indicated in the last issued message.

## 12.6 is20701 to is20799

---

### 12.6.1 is20701

---

**IS: INFO: is20701:Interstage JMX Service started normally**

### Explanation

The Interstage JMX Service has started normally.

### 12.6.2 is20702

---

**IS: INFO: is20702:Interstage JMX Service terminated normally**

## Explanation

The Interstage JMX Service has stopped normally.

### 12.6.3 is20703

#### IS: INFO: is20703:Interstage JMX Service restarted normally

## Explanation

The Interstage JMX Service has been restarted because it had stopped for some reason.

### 12.6.4 is20704

#### IS: ERROR: is20704:Interstage JMX Service unable to start Error information=%s

## Variable Information

%s = Error information

## Explanation

The Interstage JMX Service failed to start for the reason indicated by the error information.

## System Action

Processing stops.

## User Action

Take the appropriate action by referring to the user response for the message number corresponding to the error information in the following table.

Table 12.21 is20704 Error Information Explanations

Error information	Explanation	User response
101	A memory shortage occurred.	Reexecute processing later. If this message is output frequently, reestimate the memory capacity required for Interstage operation by referring to the Tuning Guide.  Check whether sufficient memory is available for Interstage operation. If sufficient memory is available, the amount of memory is probably insufficient for the requirements of other applications. Reestimate the memory space requirements of other applications and check whether adequate memory is available.  If the reestimation confirms a memory shortage, ask your System Administrator to increase the main memory or swap area.
201 202 203	An internal error occurred.	Collect diagnostic information using the <i>iscollectinfo</i> command, record the error information, and then contact your systems engineer.
205	Process generation failed.	Check whether the definition information used by the Interstage JMX Service contains an error.  <b>Windows32/64</b>  The definition information is located in the following file.  [Interstage installation folder]\jmx\etc\isjmx.xml  If the definition information contains an error, correct it then start the Interstage Operation Tool Service.

Error information	Explanation	User response
		<p><b>Solaris32/64</b> <b>Linux32/64</b></p> <p>The definition information is located in the following file.</p> <p><code>/etc/opt/FJSVisjmx/isjmx.xml</code></p> <p>If there is a relevant item, correct it, execute the <code>isjmxstart</code> command, and then start the Interstage JMX service.</p> <p>If another message was output simultaneously, take the action indicated by that message. If no other message was output, check the following:</p> <ul style="list-style-type: none"> <li>- Check whether an invalid or unnecessary option was specified for the 'options' attribute on the 'server' tag. If it was, delete it and save the definition file.</li> </ul> <p><b>Windows32/64</b></p> <ul style="list-style-type: none"> <li>- Check whether a path that ends with a file separator was specified. If so, specify two file separators consecutively.</li> </ul> <p>Invalid characters may have been used in the hostname. Check and modify as necessary. For details on valid hostname characters, refer to "Notes on JDK/JRE", "Characters that can be Used in the Host Name" in the "Notes on Interstage Operation" chapter of the Product Notes.</p> <p>Alternatively, in Solaris and Linux editions, it may be that an essential package has not been installed. Check that essential packages have been installed. For details about essential packages, refer to the Installation Guide.</p> <p>If the above does not solve the problem, record the error information and collect diagnostic information using the <code>iscollectinfo</code> command, and then contact your systems engineer.</p>
207	A system error occurred.	<p><b>Windows32/64</b></p> <p>Check whether the message indicating the cause of the error is output in the event log.</p> <p>If that message is output, take action indicated in it.</p> <p>If the problem persists, collect diagnostic information using the <code>iscollectinfo</code> command, record the error information, and then contact your systems engineer.</p> <p><b>Solaris32/64</b> <b>Linux32/64</b></p> <p>Check whether the message indicating the cause of the error is output in the system log.</p> <p>If that message is output, take action indicated in it.</p> <p>If the problem persists, collect diagnostic information using the <code>iscollectinfo</code> command, record the error information, and then contact your systems engineer.</p>
208	The Interstage JMX service failed to start for a certain reason.	The message indicating the cause of the error is output in the system log, take action as recommended in that message.

Also check whether a message indicating the cause of the start failure was output. If a message was output, take the action indicated by the message.

## 12.6.5 is20705

**IS: ERROR: is20705:Interstage JMX Service unable to stop Error information=%d**

**Variable Information**

%d = Error information

**Explanation**

The Interstage JMX Service failed to stop for the reason indicated by the error information.

**System Action**

Processing stops.

**User Action**

Take the appropriate action by referring to the user response for the message number corresponding to the error information in the following table.

**Table 12.22 is20705 Error Information Explanations**

<b>Error information</b>	<b>Explanation</b>	<b>User response</b>
101	A memory shortage occurred.	<p>Reexecute processing later. If this message is output frequently, reestimate the memory capacity required for Interstage operation by referring to the Interstage Application Server Tuning Guide.</p> <p>Check whether sufficient memory is available for Interstage operation. If sufficient memory is available, the amount of memory is probably insufficient for the requirements of other applications. Reestimate the memory space requirements of other applications and check whether adequate memory is available.</p> <p>If the reestimation confirms a memory shortage, ask your System Administrator to increase the main memory or swap area.</p>
102	A system resource shortage occurred.	<p>Reexecute processing later. If this error appears frequently, collect diagnostic information using the <i>iscollectinfo</i> command, and then contact your systems engineer.</p>
201 202 203 204	An internal error occurred.	<p>Collect diagnostic information using the <i>iscollectinfo</i> command, record the error information, and then contact your systems engineer.</p>
207	A system error occurred.	<p><b>Windows32/64</b></p> <p>Check whether the message indicating the cause of the error is output in the event log.</p> <p>If that message is output, take action indicated in it.</p> <p>If the problem persists, collect diagnostic information using the <i>iscollectinfo</i> command, record the error information, and then contact your systems engineer.</p> <p><b>Solaris32/64</b> <b>Linux32/64</b></p> <p>Check whether the message indicating the cause of the error is output in the system log.</p> <p>If that message is output, take action indicated in it.</p> <p>If the problem persists, collect diagnostic information using the <i>iscollectinfo</i> command, record the error information, and then contact your systems engineer.</p>

Error information	Explanation	User response
208	The Interstage JMX service failed to stop for a certain reason.	The message indicating the cause of the error is output in the system log, take action as recommended in that message.

Also check whether a message indicating the cause of stop failure was output. If a message was output, take the action indicated by that message.

## 12.6.6 is20706

---

**IS: ERROR: is20706:Interstage JMX Service is not running normally Error information=%s**

### Variable Information

%s = Error information

### Explanation

The Interstage JMX service is not operating normally.

### System Action

Processing stops.

### User Action

**Windows32/64**

Reexecute processing later. If the problem is still not resolved, restart the Interstage Operation Tool. If error persists, collect diagnostic information using the *iscollectinfo* command, record the error information, and then contact your systems engineer.

**Solaris32/64 Linux32/64**

If the problem is not resolved after some time passes, use the *isjmxstop* and *isjmxstart* commands to restart the Interstage JMX service. If error persists, collect diagnostic information using the *iscollectinfo* command, record the error information, and then contact your systems engineer.

## 12.6.7 is20707

---

**IS: ERROR: is20707:The library does not exist Library=%s**

### Variable Information

%s = Library name

### Explanation

A library required for the Interstage JMX Service could not be found.

### System Action

Processing stops.

### User Action

Reinstall Interstage.

## 12.6.8 is20708

---

**IS: ERROR: is20708:The library is illegal Library=%s1 Error information=%s2**

### Variable Information

%s1 = Library name

%s2 = Error information

### Explanation

A library required for the Interstage JMX Service may be damaged.

### System Action

Processing stops.

### User Action

Reinstall Interstage.

## 12.6.9 is20709

---

### IS: ERROR: is20709:The port number is already in use Type=%s1 Port number=%s2

#### Variable Information

%s1 = Type

%s2 = Port number

### Explanation

The port number to be used by the Interstage JMX Service is already being used by another service.

### System Action

Processing stops.

### User Action

Specify an unused port number for the port number of the type (indicated in Variable Information) that is to be used by the Interstage JMX Service. Alternatively, terminate the service that is using the port number indicated in Variable Information.

To change the port number to be used by the Interstage JMX Service, perform the following operation:

1. Open the following file using an editor:

**Windows32/64**

[Interstage installation folder]\jmx\etc\isjmx.xml

**Solaris32/64 Linux32/64**

2. Depending on the type, edit the file with the relevant corrections and save the file:

/etc/opt/FJSVisjmx/isjmx.xml

- When the type is 'rmi':

Change the port number specified for the 'rmi' attribute on the 'port' tag to the desired port number and save the file. The port number can range from 1 to 65535. The default is 12200.

- When the type is 'internal':

Change the port number specified for the 'internal' attribute on the 'port' tag to the desired port number and save the file. The port number can range from 1 to 65535. The default is 12210.

- When the type is 'https':

Change the port number specified for the 'https' attribute on the 'port' tag to the desired port number and save the file. The port number can range from 1 to 65535. The default is 12220.

- When the type is 'rmiinvoke':

Change the port number specified for the 'rmiinvoke' attribute on the 'port' tag to the desired port number and save the file. The port number can range from 1 to 65535. The default is 12230.

- Restart the Interstage JMX service and Servlet service for the Interstage Management Console:

For details on starting and stopping the Interstage JMX service and Servlet service for the Interstage Management Console, refer to "Starting the Interstage Management Console" and "Stopping the Interstage Management Console", both in the "Configuring the Interstage Management Console" chapter of the Operator's Guide.

**Windows32/64**

Restart the Interstage JServlet (OperationManagement) service and the Interstage Operation Tool service.

**Solaris32/64 Linux32/64**

Restart the Interstage JMX service and Servlet service for the Interstage Management Console.

## 12.6.10 is20710

**IS: ERROR: is20710:Failed to get a socket for communication Error information=%s**

### Variable Information

%s = Error information

### Explanation

A communication socket could not be created for the Interstage JMX Service.

### System Action

Processing stops.

### User Action

Remove the error cause based on the error information.

## 12.6.11 is20711

**IS: ERROR: is20711:A communication error occurred Error information=%s**

### Variable Information

%s = Error information

### Explanation

A communication error occurred.

### System Action

Processing stops.

### User Action

Take the action shown in the table according to the error information displayed in the variable information.

Error information	Explanation	Action
java.rmi.UnmarshalException: Error unmarshaling return header; nested exception is: java.net.SocketTimeoutException: Read timed out or java.rmi.UnmarshalException: Error unmarshaling return header; nested exception is: java.io.InterruptedIOException: Read timed out	A communication timeout occurred.	If 'RMI' is selected as the protocol for communication with the Interstage JMX service of the Managed Server, the processing time may be longer than the time set for the communication timeout. Increase the time set for the communication timeout with the Interstage JMX service. (*1)

Error information	Explanation	Action
	A timeout may have occurred because the connection was cut when transmitting, and receiving a demand between a response could not be received.	Perform processing again after restoring the connection.
java.rmi.UnmarshalException: Error unmarshaling return header; nested exception is: java.net.SocketException: Connection reset	It may be that the network was disconnected while the request was being sent or received.	Recover the network connection and reexecute processing.
	An abnormal exit may have occurred in the Interstage JMX Service.	Check that the Interstage JMX Service of the Managed Server has started. If it has not started, start it according to Start Procedure, and reexecute processing. (*4)
java.rmi.UnmarshalException: Error unmarshaling return header; nested exception is: java.io.EOFException	An abnormal exit may have occurred in Interstage JMX Service.	Check that Interstage JMX Service of the Managed Server has started. If it has not started, start it according to Start Procedure, and reexecute processing. (*4)
<p>java.io.IOException: Failed to retrieve RMIServer stub: javax.naming.CommunicationException [Root exception is java.rmi.ConnectIOException: Exception creating connection to: [IPaddress]; nested exception is: java.net.SocketException: Network is unreachable: connect]</p> <p>or</p> <p>java.rmi.ConnectIOException: Exception creating connection to: [IPaddress]; nested exception is: java.net.SocketException: Network is unreachable: connect</p> <p>or</p> <p>java.net.SocketTimeoutException: connect timed out</p> <p>or</p> <p>java.rmi.ConnectException: Connection refused to host: [IPaddress]; nested exception is: java.net.ConnectException: Connection timed out: connect</p> <p>or</p> <p>java.io.IOException: Failed to retrieve RMIServer stub: javax.naming.NamingException:javax.naming.java.rmi.ConnectIOException: Exception creating connection to: [IPaddress]; nested exception is: java.net.SocketException: Network is unreachable: connect</p> <p>or</p> <p>java.rmi.ConnectIOException: Exception creating connection to: [IPaddress]; nested exception is:</p>	<p>Possible causes are shown below.</p> <ul style="list-style-type: none"> <li>- An IP address that cannot connect to the machine in which the Interstage JMX Service has been installed was registered in the server.</li> <li>- An IP address that cannot connect to the machine in which the Interstage JMX Service has been installed was specified in the isjmx.xml file (*2).</li> <li>- When the server IP address was changed, the IP address defined in the isjmx.xml file (*2) was not changed</li> </ul>	<p>Take one of the following actions:</p> <ul style="list-style-type: none"> <li>- Delete from the OS settings the IP address that cannot connect to the machine in which the Interstage JMX Service has been installed.</li> <li>- Set or connect the network so that the IP address can connect to the machine in which the Interstage JMX Service has been installed.</li> <li>- Specify a correct IP address in the isjmx.xml file(*2) so that it can connect to the machine in which the Interstage JMX Service has been installed. (*3)</li> <li>- When changing the server IP address, also change the IP address defined in the isjmx.xml file (*2). (*3)</li> </ul>

Error information	Explanation	Action
<p>java.net.NoRouteToHostException: No route to host: connect</p> <p>or</p> <p>java.rmi.ConnectIOException: Exception creating connection to: [IPaddress]; nested exception is: java.net.SocketTimeoutException: connect timed out</p> <p>or</p> <p>Alternatively, an unexpected IP address was output in the error information that is not shown above</p> <p>Or</p> <p>Failed to retrieve RMIServer stub: javax.naming.NamingException: java.rmi.ConnectIOException: Exception creating connection to: [Ipaddress]; nested exception is java.net.SocketException: Network is unreachable</p> <p>Or</p> <p>Failed to retrieve RMIServer stub: javax.naming.NamingException: java.rmi.ConnectException: Connection refused to host: [IPaddress]; nested exception is: java.net.ConnectException: Network is unreachable</p>		
<p>java.io.IOException: Failed to retrieve RMIServer stub: javax.naming.NamingException: java.rmi.NotBoundException: DefaultAdminServer</p> <p>or</p> <p>java.io.IOException: Failed to retrieve RMIServer stub: javax.naming.NamingException: java.rmi.ConnectException: Connection refused to host: [IPaddress]; nested exception is: java.net.ConnectException: Connection refused: connect</p> <p>or</p> <p>Failed to retrieve RMIServer stub: javax.naming.NamingException: java.rmi.ConnectException: Connection refused to host: [IPaddress]; nested exception is java.net.ConnectException: Connection refused</p>	<p>The Interstage JMX Service was started while the network was disconnected.</p>	<p>Start the Interstage JMX service according to the <a href="#">Interstage JMX service startup procedure</a> and reexecute processing.</p>
	<p>The port number entered in the Admin Server when the Managed Server was added to the site and the port number specified in the Managed Server may not match.</p>	<p>Check that the port number specified in the Admin Server when the Managed Server was added to the site and the port number specified in isjmx.xml (*2) of the Managed Server match and reexecute processing.</p>
<p>java.io.IOException: Failed to retrieve RMIServer stub: javax.naming.NamingException: java.rmi.UnknownHostException: Unknown host: [IPaddress]; nested exception is java.net.UnknownHostException</p> <p>or</p> <p>Failed to retrieve RMIServer stub: javax.naming.NamingException: java.rmi.UnknownHostException: Unknown host: [IPaddress]; nested exception is: java.net.UnknownHostException: [IPaddress]</p>	<p>The IP address entered in the Admin Server when the Managed Server was added to the site and the actual IP address specified in the Managed Server may not match.</p>	<p>Specify the correct IP address for the Managed Server, and enable the server to participate in the site again.</p>

Error information	Explanation	Action
Or java.rmi.UnknownHostException: [IPaddress]		
java.io.IOException: Failed to retrieve RMIServer stub: javax.naming.NamingException: java.rmi.ConnectIOException: error during JRMP connection establishment; nested exception is: java.net.SocketException: Connection reset by peer: socket write error	It may be that the network was disconnected while the request was being sent or received.	Recover the network connection and reexecute processing.
java.net.SocketTimeoutException: Read timed out or java.net.SocketTimeoutException: connect timed out or java.net.NoRouteToHostException: No route to host: connect or Connection refused to host: 127.0.0.1; nested exception is: java.net.ConnectException: Connection refused Or java.net.NoRouteToHostException: No route to host	A communication timeout occurred.	If 'HTTPS' is selected as the protocol for communication with the Interstage JMX service of the Managed Server, the processing time may be longer than the time set for the communication timeout. Increase the time set for the communication timeout with the Interstage JMX service>(*1)
	The IP address entered in the Admin Server when the Managed Server was added to the site and the actual IP address specified in the Managed Server may not match.	Specify the correct IP address for the Managed Server, and enable the server to participate in the site again.
	The LAN of the Managed Server and Admin Server may have been cut.	Reconnect the LAN, then login to the Interstage Management Console again and reexecute processing.
	The connected server may not have started, or may be in the process of starting.	Check whether the connected server has started.
	This status indicates that a connection cannot be created with the Interstage JMX service because there is insufficient memory on the server used for connection. It also indicates that processing requests cannot be executed because of an error in the connection server network.	Increase the memory by stopping unnecessary applications on the connection server and reexecute processing. If the problem is still not resolved, check whether there is an error in the network environment.
	If the communication protocol selected for the added server under [Detailed Settings Protocol] of the Interstage Management Console Site Management tab is "HTTPS", it means the IP address specified could not be used to connect to a machine on which the Interstage JMX service is installed.	Set or connect the network so that the IP address can connect to the machine in which the Interstage JMX Service has been installed.
java.net.SocketException: Resource temporarily unavailable	Network resources may be insufficient temporarily.	 Tune the TCP/IP parameter. Refer to "Tuning TCP/IP Parameters" in the "System

Error information	Explanation	Action
		<p>Tuning" chapter of the Tuning Guide for details of the tuning method.</p> <p><b>Linux32/64</b></p> <p>Wait a few moments, and then reexecute processing.</p>
	<p>The Interstage JMX service may have stopped or restarted.</p>	<p>Start the Interstage JMX service according to the <a href="#">Interstage JMX service startup procedure</a> and reexecute processing.</p>
<p>java.net.ConnectException: Connection refused: connect</p> <p>or</p> <p>java.net.SocketException: Connection reset</p> <p>or</p> <p>java.net.ConnectException: Connection refused</p>	<p>The number of a server on which Interstage has not been installed may have been set for the business LAN IP address.</p>	<p>Specify the correct IP address for the Managed Server, and enable the server to participate in the site again.</p>
	<p>The value specified for 'port number' for the added server in [Detailed Settings] on the Interstage Management Console Integration Management tab may not be used in the Interstage JMX service of the Managed Server.</p>	<p>Check the definition of the Managed Server isjmx.xml file (*2), and ensure that it is the same as the value specified for 'port number'. Check the following tags.</p> <ul style="list-style-type: none"> <li>- If 'RMI' is selected as the protocol for communication in the [Detailed Settings], then check the &lt;port&gt; tag 'rmi' attribute</li> <li>- If 'HTTPS' is selected as the protocol for communication in the [Detailed Settings], then check the &lt;port&gt; tag 'https' attribute</li> </ul> <p>Specify the number described in the above attribute and enable the server to participate in the site again.</p>

Error information	Explanation	Action
connection establishment; nested exception is: java.net.SocketTimeoutException: Read timed out		
java.io.IOException: Failed to retrieve RMIServer stub:javax.naming.CommunicationException [Root exception is java.rmi.ConnectIOException: Exception creating connection to: [IP address];nested exception is:java.net.NoRouteToHostException: No route to host:connect]	An error occurred when an attempt was made to connect to the Managed Server port.	Check that the startup of the Managed Server OS is complete. Additionally, check whether the status of the Managed Server is such that that connection to it is not possible because the intermediate router has crashed, for example.
or java.io.IOException: Failed to retrieve RMIServer stub:javax.naming.NamingException:java.rmi.ConnectIOException: Exception creating connection to: [IP address];nested exception is:java.net.NoRouteToHostException: No route to host:connect	Could not connect to the remote host because a firewall has been set up as an intermediary service.	Specify 'https' for the protocol for communication with a Managed Server outside the firewall and reexecute.
or Failed to retrieve RMIServer stub: javax.naming.NamingException: java.rmi.ConnectIOException: Exception creating connection to: [IP address]; nested exception is: java.net.NoRouteToHostException: No route to host	If the communication protocol for the added server under [Detailed Settings] on the Interstage Management Console Site Management tab is 'RMI', the value specified for 'port number' may be being used by a service other than the Interstage JMX service of the Managed Server.	Set or connect the network so that the IP address can connect to the machine in which the Interstage JMX Service has been installed.
java.io.IOException: Failed to retrieve RMIServer stub: [Exception information]	An error occurred when connection to the Interstage JMX service was attempted.	<p>The resources required for connection with the Interstage JMX service may be insufficient. Wait for a while, then reexecute processing.</p> <p>Refer to the relevant Java(TM) 2 Platform Standard Edition API Specification, available from <a href="http://www.oracle.com/technetwork/java/javase/documentation/index.html">http://www.oracle.com/technetwork/java/javase/documentation/index.html</a> (Java SE Documentation at a Glance).</p> <p>Check the cause of the error by referring to the output exception information, and take the required action.</p> <p>If the problem is still not resolved, check whether there is an error in the network environment.</p>
java.net.ConnectException: connect: Address is invalid on local machine, or port is not valid on remote machine	The IP address entered in the Admin Server when the Managed Server was added to the site and the actual IP address specified in the Managed Server may not match.	Check that the IP address specified in the Admin Server when the Managed Server was added to the site and the actual IP address

Error information	Explanation	Action
java.net.ConnectException: connect: Address is invalid on local machine, or port is not valid on remote machine		specified in the Managed Server match.
	The environment setup for HTTPS communication may not be carried out by the Managed Server.	Setup the environment for SSL encryption communication (HTTPS communication) from the Interstage JMX service to the Managed Server.
	The value specified in the isjmx.xml file (*2) for the port number used by the Interstage JMX service may not be incorrect.	Check the definition in the isjmx.xml file (*2) of the Managed Server. Check the following to ensure the value specified for the port number is correct: <ul style="list-style-type: none"> <li>- a value from [1] to [65535] is entered for the 'internal' attribute of the 'port' tag. If this value is omitted, [12210] is used.</li> </ul>
java.rmi.ConnectException: Connection refused to host: 127.0.0.1; nested exception is: java.net.ConnectException: Connection refused: connect	The Interstage JMX Service was started while the network was disconnected.	Start the Interstage JMX service according to the <a href="#">Interstage JMX service startup procedure</a> and reexecute processing.
java.io.IOException: Failed to retrieve RMIServer stub: javax.naming.NameNotFoundException: DefaultAdminServer	The Interstage JMX service is starting up.	Make sure the <a href="#">Interstage JMX service startup procedure</a> is complete and reexecute processing.
javax.net.ssl.SSLException: Unrecognized SSL message, plaintext connection?  Or  javax.net.ssl.SSLHandshakeException: Remote host closed connection during handshake	If the communication protocol selected in [Detailed Settings] is 'HTTPS', the value specified for the port number may be being used by a service other than the Interstage JMX service of the Managed Server.	Check the definition of the Managed Server isjmx.xml file (*2), and ensure that it is the same as the value specified for 'port number'. Check the following tag: <ul style="list-style-type: none"> <li>- &lt;port&gt; tag 'https' attribute</li> </ul> Specify the number described in the above attribute and enable the server to participate in the site again.
	If the communication protocol selected for the added server in [Detailed Settings] on the Interstage Management Console Integration Management tab is 'HTTPS', the value specified for 'port number' may be the same as the value specified for RMI communication in the Interstage JMX service of the Managed Server.	Check the definition of the Managed Server isjmx.xml file (*2), and ensure that it is the same as the value specified for 'port number'. Check the following tag: <ul style="list-style-type: none"> <li>- &lt;port&gt; tag 'rmi' attribute</li> </ul> Specify the number described in the above attribute and enable the

Error information	Explanation	Action
		server to participate in the site again.
<p>Connection of RemoteMBeanServerReceiver is failed.: Caused by:</p>	<p>A character that cannot be used in the host name has been used.</p>	<p>Use only the following characters in the host name:</p> <ul style="list-style-type: none"> <li>- Upper-case letters ('A' to 'Z') or lower-case letters ('a' to 'z')</li> <li>- Numbers ('0' to '9')</li> <li>- Hyphens ('-')</li> <li>- Periods ('.')</li> </ul> <p>If the host name is changed, restart the Interstage JMX service.</p>
	<p>Possible causes are shown below.</p> <ul style="list-style-type: none"> <li>- An IP address that cannot connect to the machine in which the Interstage JMX Service has been installed was registered in the server.</li> <li>- An IP address that cannot connect to the machine in which the Interstage JMX Service has been installed was specified in the isjmx.xml file (*2).</li> <li>- When the server IP address was changed, the IP address defined in the isjmx.xml file (*2) was not changed</li> </ul>	<p>Take one of the following actions:</p> <ul style="list-style-type: none"> <li>- Delete from the OS settings the IP address that cannot connect to the machine in which the Interstage JMX Service has been installed.</li> <li>- Set or connect the network so that the IP address can connect to the machine in which the Interstage JMX Service has been installed.</li> <li>- Specify a correct IP address in the isjmx.xml file(*2) so that it can connect to the machine in which the Interstage JMX Service has been installed. (*3)</li> <li>- When changing the server IP address, also change the IP address defined in the isjmx.xml file (*2). (*3)</li> </ul>
<p>Connection of RemoteMBeanServerReceiver is failed.</p>	<p>The value specified in the isjmx.xml file (*2) for the port number used by the Interstage JMX service may be incorrect.</p>	<p>Check the definition in the isjmx.xml file (*2) of the Managed Server. Check the following to ensure the value specified for the port number is correct:</p> <ul style="list-style-type: none"> <li>- a value from [1] to [65535] is entered for the 'rmi' attribute of the 'port' tag. If this value is omitted, [12200] is used.</li> </ul>

Error information	Explanation	Action
Failed to access Remote Server.	When a server is added from the Site Management tab of the Interstage Management Console, it is possible that the Interstage package installed on the Managed Server server is V6.0.	Check that the version of Interstage in the server that you are trying to add to the site is V7.0 or later. If this case applies, either install Interstage V7.0 or later in the server that you are trying to add to the site, or manage or operate this server separately.
java.rmi.ServerError: Error occurred in server thread; nested exception is: [Exception information]	When requests are processed on the Interstage JMX service, an error occurs with the analysis of processing requests, the recovery of request data, or the conversion of the processing result to network data.	Refer to the "Exceptions Output during J2EE Usage" chapter, or the relevant Java(TM) 2 Platform Standard Edition API Specification, available from <a href="http://www.oracle.com/technetwork/java/javase/documentation/index.html">http://www.oracle.com/technetwork/java/javase/documentation/index.html</a> (Java SE Documentation at a Glance).  Check the cause of the error by referring to the output exception information, and take the required action.
java.net.ConnectException: Connection denied.	If the Admin Server is a Solaris machine, and the communication protocol selected for the added server in [Detailed Settings] of the Interstage Management Console Integration Management tab is 'HTTPS', it may mean the following:  - The value specified for the Managed Server IP address does not match the actual IP address.  - The specified port number is not used by the Interstage JMX service of the Managed Server.	1) Specify a correct IP address for the Managed Server, and make it participate in the site again.  2) Check that the definition in the Managed Server isjmx.xml file (* 2) is the same value as the one specified in the file. Check the following tags.  - The 'https' attribute in the <port> tag  - If this case applies, specify the number entered for the above attribute and make the server participate in the site again.
java.net.ConnectException: Connection refused	The value specified for 'port number' for the added server in [Detailed Settings] on the Interstage Management Console Integration Management tab may not be used in the Interstage JMX service of the Managed Server.	Check the definition of the Managed Server isjmx.xml file (*2), and ensure that it is the same as the value specified for 'port number'. Check the following tags.  - If 'RMI' is selected as the protocol for communication in the

Error information	Explanation	Action
		<p>[Detailed Settings], then check the &lt;port&gt; tag 'rmi' attribute</p> <ul style="list-style-type: none"> <li>- If 'HTTPS' is selected as the protocol for communication in the [Detailed Settings], then check the &lt;port&gt; tag 'https' attribute</li> </ul> <p>Specify the number described in the above attribute and enable the server to participate in the site again.</p>
	The Interstage JMX Service was started while the network was disconnected.	Start the Interstage JMX service according to the <a href="#">Interstage JMX service startup procedure</a> and reexecute processing.
java.net.ConnectException: Network is unreachable	If the communication protocol selected for the added server in [Detailed Settings Protocol] of the Interstage Management Console Site Management tab is "HTTPS", it means that the IP address that was specified could not be used to connect to a machine on which the Interstage JMX service is installed.	Set or connect the network so that the IP address can connect to the machine in which the Interstage JMX Service has been installed.
A system error occurred [ Daemon Not Active ]	The Interstage JMX service is not running normally.	<p>Wait for a while and reexecute processing.</p> <p><a href="#">Windows32/64</a></p> <p>If the error cannot be resolved, restart the "Interstage Operation Tool" service.</p> <p><a href="#">Solaris32/64</a> <a href="#">Linux32/64</a></p> <p>If the error cannot be resolved, restart the Interstage JMX service using the <i>isjmxstop</i> and <i>isjmxstart</i> commands.</p>
Other	An error occurred while the Interstage JMX service was being processed.	For details of the meaning of the information that is output in the exception information, refer to 'Exceptions Output during J2EE Usage' or Java™ 2 Platform Standard Edition (J2SE) API conventions on the Oracle website. Check the cause of the error and take action.

Error information	Explanation	Action
		The network resources may be temporarily insufficient. Wait for a while, then reexecute processing. If the Interstage JMX service has restarted, reexecute processing. (* 5)

\*1 The requested process continues on Interstage, even if a communication timeout occurs.

To change the value for the communication timeout, follow the procedure below.

In a multiserver environment, execute operations for the Admin Server.

1. Open the following file using an editor:

**Windows32/64**

C:\Interstage\jmx\etc\isjmx.xml

**Solaris32/64** **Linux32/64**

/etc/opt/FJSVisjmx/isjmx.xml

2. Change the communication timeout time.

Change the following attribute values for the 'timeout' tag and save them in a file.

- If 'RMI' is selected as the timeout for communication with the Managed Server  
Select the 'rmi' attribute.
- If 'HTTPS' is selected as the timeout for communication with the Managed Server  
Select the 'https' attribute.

The value can range from 0 to 10080 minutes. The default is 20. If 0 is specified, no communication timeout occurs.

3. Restart client applications that use the Interstage JMX Service. To restart the Interstage Management Console, use the following procedure:

- **Windows32/64**

Start the Interstage JServlet (OperationManagement) service.

- **Solaris32/64** **Linux32/64**

Use the *ismngconsolestop* command to stop services that use the Interstage Management Console, and then use the *ismngconsolestart* command to start these services.

\*2 The Managed Server isjmx.xml file is stored in the following directory.

Start up the Interstage JMX service according to the following procedure file.

**Windows32/64**

C:\Interstage\jmx\etc\isjmx.xml

**Solaris32/64** **Linux32/64**

/etc/opt/FJSVisjmx/isjmx.xml

\*3 According to the following procedure, use the *isjmxchangedef* command to specify an IP address that can connect to the machine in which Interstage JMX Service has been installed. Then correct the isjmx.xml file.

1. In the *isjmxchangedef* command argument, specify an IP address that can connect to the machine in which Interstage JMX Service has been installed, and then execute the command. For details about the *isjmxchangedef* command, refer to the "Interstage JMX Service Operation Commands" chapter of the Reference Manual (Command Edition).

#### Example

- Solaris32/64 Linux32/64

isjmxchangedf IP address

- Solaris32/64 Linux32/64

/opt/FJSVisjmx/bin/isjmxchangedef IP address

2. Restart Interstage JMX Service according to the following procedure:

- Windows32/64

Start the Interstage Operation Tool service.

- Solaris32/64 Linux32/64

Stop the Interstage JMX service with the *isjmxstop* command, and then start it with the *isjmxstart* command.

\*4 Windows32/64

The Java VM finished abnormally, possibly because of insufficient memory. Refer to "Memory Requirements" in the "Resource Requirements" chapter of the Tuning Guide to check the memory, and then restart the 'Interstage Operation Tool' service.

Solaris32/64 Linux32/64

If 12.6.22 is20723 is output in the system log file, it may mean that the Java VM finished abnormally because of insufficient memory. For details about how to check this, refer to "12.6.22 is20723".

\*5 There may be insufficient file descriptors. Close unnecessary applications or stop Interstage operations to increase the number of file descriptors available in the system.

Solaris32/64 Linux32/64

The number of available file descriptors can be increased using the *ulimit* command or by editing the value in the */etc/system* file. For details on tuning file descriptors, refer to the operating system documentation.

#### Note

Node inheritance may have been set in the cluster environment. Modify the settings so that node inheritance is not used.

There could be an error in the Hostname or IP address of the server used to run the Interstage JMX Service. Check that the Hostname and IP address registered in the DNS are correct.

Specify the Hostname, and then execute the OS *ping* command. If a response is received from the correct IP address, then the IP address set is correct.

The following cannot be used in the host name:

- Upper-case letters ('A'-'Z') or lower-case letters ('a'-'z')
- Numbers ('0'-'9')
- Hyphens ('-')
- Periods ('.')

## Interstage JMX service startup procedure

Start up the Interstage JMX service according to the following procedure.

Windows32/64

Start the Interstage Operation Tool service.

Solaris32/64 Linux32/64

Stop the Interstage JMX service with the *isjmxstop* command, and then start it with the *isjmxstart* command.

If this message is output frequently, there is probably a network environment problem. If the error persists, collect diagnostic information using the *iscollectinfo* command, record the error information, and then contact your systems engineer.

## 12.6.12 is20712

---

**IS: ERROR: is20712:An illegal access occurred IP address=%s**

### Variable Information

%s = IP address

### Explanation

A request was issued to the Interstage JMX Service from an unauthorized IP address.

### System Action

Rejects the illegal access.

### User Action

It may be that the machine used for running Interstage Application Server was disconnected from the network, or that the IP address was changed because the network was changed. If this problem occurs, check the network environment. If there is no problem, reexecute processing using the procedure shown below. Before the Interstage Management Console can be used after the machine has restarted, it is necessary to log into the Interstage Management Console again.

**Windows32/64**

Start the Interstage Operation Tool service.

**Solaris32/64** **Linux32/64**

Restart the Interstage JMX service with the *isjmxstop* and *isjmxstart* commands.

There may be a network environment problem. If the error persists, collect diagnostic information using the *iscollectinfo* command, record the error information, and then contact your systems engineer.

## 12.6.13 is20713

---

**IS: ERROR: is20713:An error is in a definition file FILE=%s1 Error information=%s2**

### Variable Information

%s1 = File path

%s2 = Error information

### Explanation

The file indicated in Variable Information contains an error.

### System Action

Processing stops.

### User Action

Remove the definition error based on the error information, and reexecute processing.

## 12.6.14 is20714

---

**IS: ERROR: is20714:Interstage JMX Service is already started**

### Explanation

An attempt to start the Interstage JMX Service failed as the Interstage JMX Service was already active.

## System Action

Processing stops.

## User Action

There is no need to take any action because the Interstage JMX service has already started.

To restart the Interstage JMX service, execute the following procedure.

**Windows32/64**

Start the Interstage Operation Tool service.

**Solaris32/64** **Linux32/64**

Stop the Interstage JMX service with the *isjmxstop* command, and then start it with the *isjmxstart* command.

If necessary, stop the Interstage Operation Tool Service and reexecute processing.

## 12.6.15 is20715

---

### IS: ERROR: is20715:Interstage JMX Service is not running

#### Explanation

The Interstage JMX Service is not started.

#### System Action

Processing stops.

#### User Action

**Windows32/64**

Start the Interstage Operation Tool service and reexecute processing.

**Solaris32/64** **Linux32/64**

Stop the Interstage JMX service with the *isjmxstop* command, and then start it with the *isjmxstart* command and reexecute processing.

## 12.6.16 is20716

---

### IS: ERROR: is20716:Invalid runtime environment Error information=%s

#### Variable Information

%s = Error information

#### Explanation

The execution environment of the Interstage JMX Service contains an error.

#### System Action

Processing stops.

#### User Action

The definition information to be used by the Interstage JMX Service may contain an error.

Correct the definition according to the error information displayed in the variable information.

**Windows32/64**

The definition information is located in the following file.

C:\Interstage\jmx\etc\isjmx.xml

If the definition information contains an error, correct it and then restart the Interstage Operation Tool.

**Solaris32/64** **Linux32/64**

Specify the definition information used with the Interstage JMX service, in the following file:

/etc/opt/FJSVisjmx/isjmx.xml

If the definition information is incorrect, correct it and then restart the Interstage JMX service with the *isjmxstop* and *isjmxstart* commands.

**Note**

If there is no problem in the Interstage JMX service runtime environment, it may be possible that the file is corrupt. Reinstall Interstage.

If the problem is not resolved after the above procedure, collect diagnostic information using the *iscollectinfo* command, record the error information, and then contact your systems engineer.

## 12.6.17 is20717

---

### IS: ERROR: is20717:An abnormality occurred in the JavaVM Error information=%s

#### Variable Information

%s = Error information

#### Explanation

The error indicated by the error information was detected in the Interstage JMX Service.

#### System Action

Processing stops.

#### User Action

Refer to the error information (%s) and remove the cause of the failure.

After removing the cause of the failure, restart the Interstage JMX service using the following procedure and then rerun the process:

**Windows32/64**

Restart the 'Interstage Operation Tool' service.

**Solaris32/64** **Linux32/64**

Restart the Interstage JMX service with the *isjmxstop* and then *isjmxstart* commands.

**Note**

If the problem is not resolved after the above procedure, collect diagnostic information using the *iscollectinfo* command, record the error information, and then contact your systems engineer.

## 12.6.18 is20718

---

### IS: ERROR: is20718:A necessary file does not exist PATH=%s

#### Variable Information

%s = Path

#### Explanation

The required file indicated in Variable Information could not be found.

#### System Action

Processing stops.

#### User Action

Reinstall Interstage.

## 12.6.19 is20719

---

**IS: ERROR: is20719:An error is in the definitions Error information=%s**

### Variable Information

%s = Error information

### Explanation

The specified definition contains an error.

### System Action

Processing stops.

### User Action

Remove the error cause indicated by the error information and reexecute processing.

## 12.6.20 is20721

---

**IS: ERROR: is20721:There is an error in the value specified for %s**

### Variable Information

%s = Name of the item in which an error occurred

### Explanation

The specified value contains an error.

### System Action

Processing stops.

### User Action

Reexecute processing with a valid value specified.

If this message is output when the Interstage Management Console is used, refer to the Interstage Management Console Help, and check that the value entered is correct.

## 12.6.21 is20722

---

**IS: ERROR: is20722:The function cannot be used FUNCTION NAME(%s)**

### Variable Information

%s = Error information

### Explanation

An attempt was made to use a function that was not available for the installed edition.

### System Action

Processing stops.

### User Action

The installed edition cannot use the attempted function.

## 12.6.22 is20723

---

**IS: ERROR: is20723:Interstage JMX Service terminated abnormally Error information=%s**

## Variable Information

%s = Error information

## Explanation

The Interstage JMX service ended abnormally.

## System Action

Processing stops.

## User Action

If the following case applies, an abnormal exit may have occurred in the Java VM because of insufficient memory.

### Windows32/64

Refer to 'Memory' in the Tuning Guide, check that there is enough, and then restart the 'Interstage Operation Tool' service.

### Solaris32/64 Linux32/64

If either of the following messages is output:

- Exception java.lang.OutOfMemoryError: requested %d bytes for heap expansion. Out of swap space?
- Exception java.lang.OutOfMemoryError: requested %d bytes for GrET\* in %s.Out of swap space?

Target files : /var/opt/FJSVisjmx/trc/isjmxadmin/isjmxadmin.log

Refer to 'Memory' in the Tuning Guide, check that there is enough, and then restart the Interstage JMX Service.

Stop the Interstage JMX service with the *isjmxstop* command, and then start it with the *isjmxstart* command.

### Linux32/64

If the message below is output in /var/log/messages, it might mean that a process has been shut down because of insufficient system memory.

```
Out of Memory: Killed process %s1(%s2).  
Variable Information  
%s = Process ID  
%s = Process Name
```

If enough memory has been reserved to run Interstage, it can be considered that there is not enough memory to run other applications. Reestimate the memory needed to run other applications on the same machine, and determine the amount of memory that is required.

If reestimating the memory confirms there is not enough, contact the system administrator, and request that they increase the main memory or extend the swap area.

If these conditions are not met, and another message is output together with this message, take action according to the other message.

When no other message is output, collect diagnostic information using the *iscollectinfo* command, record the error information, and then contact your systems engineer.

### Note

If IJServer is started when the above services are restarted, it will not be possible to execute monitor reference or use the HotDeploy function for that IJServer. Restart the IJServer at the same time as the above operation.

## 12.6.23 is20724

### IS: ERROR: is20724:Could not get IPC resource due to duplicated key (key=%x path=%s)

## Variable Information

%x = key value

%s = Path name required for the acquisition of IPC resources

## Explanation

Failed to get the IPC resource required for the operation of Interstage because it is being used.

## System Action

Processing stops.

## User Action

The IPC key must be customized because the keys are duplicated. For details, refer to "Customizing the IPC Key Value of the System V IPC Resource" in the "System Tuning" chapter of the Tuning Guide.

## 12.6.24 is20725

---

### IS: ERROR: is20725: Failed to connect to the server Error information=%s

#### Variable Information

%s = Error information

#### Explanation

Failed to connect to the server. There may have been an error in the connection information (such as the IP address).

#### System Action

Processing stops.

#### User Action

This error message is output when the connection to the Interstage JMX service fails.

##### Windows32/64

Check whether the "Interstage Operation Tool" service in the connection is running.

##### Solaris32/64 Linux32/64

Check whether the Interstage JMX service in the connection is running.

If it is not running, start it and reexecute processing.

If the problem is still not resolved, check for the following:

- If the Interstage JMX service is accessed from a remote computer, the possibility that the connection information contains an error.
- The possibility that the Interstage JMX service environment settings contain an error, or that the environment settings are insufficient.
- The possibility that the Interstage JMX service is running when there is no network connection.
- The possibility that there is an abnormality in the network environment.

The error information that is usually output and the action to be taken are shown in the table below. The error information may differ slightly, depending on the OS used and the environment settings.

No	Error information	Explanation	Action
1	Failed to retrieve RMIServer stub: javax.naming.CommunicationException [Root exception is java.rmi.ConnectIOException: Exception creating connection to: [IP address]; nested exception is: java.net.SocketException: Network is unreachable: connect]	Possible causes are shown below. <ul style="list-style-type: none"><li>- An IP address that cannot connect to the machine in which the Interstage JMX Service has been installed was registered in the server.</li><li>- An IP address that cannot connect to the machine in which the Interstage JMX</li></ul>	Take one of the following actions: <ul style="list-style-type: none"><li>- Delete from the OS settings the IP address that cannot connect to the machine in which the Interstage JMX Service has been installed.</li><li>- Set or connect the network so that the IP address can connect to the machine in which the Interstage JMX Service has been installed.</li></ul>

No	Error information	Explanation	Action
		<p>Service has been installed was specified in the isjmx.xml file (*1).</p> <ul style="list-style-type: none"> <li>- When the server IP address was changed, the IP address defined in the isjmx.xml file (*1) was not changed</li> </ul>	<ul style="list-style-type: none"> <li>- Specify a correct IP address in the isjmx.xml file(*1) so that it can connect to the machine in which the Interstage JMX Service has been installed. 24	The client has been closed.	<p>The connection to the Interstage JMX service failed because the system has a high-load status.</p> <p>System resources were temporarily insufficient.</p>	<p>Wait for a while and reexecute processing.</p> <p>If this error message continues to be output, check the system configuration (hardware/software) and set up a system that is sufficient for the load. Consider upgrading the CPU if necessary.</p>

\*1 The Managed Server `isjmx.xml` file is stored in the following directory.

Start up the Interstage JMX service according to the following procedure file.

**Windows32/64**

```
C:\Interstage\jmx\etc\isjmx.xml
```

**Solaris32/64** **Linux32/64**

```
/etc/opt/FJSVisjmx/isjmx.xml
```

\*2 According to the following procedure, use the `isjmxchangedef` command to specify an IP address that can connect to the machine in which Interstage JMX Service has been installed, and then correct the `isjmx.xml` file.

1. In the `isjmxchangedef` command argument, specify an IP address that can connect to the machine in which the Interstage JMX Service has been installed, and then execute the command. For details about the `isjmxchangedef` command, refer to the "Interstage JMX Service Operation Commands" chapter of the Reference Manual (Command Edition).

Example

**Windows32/64**

```
isjmxchangedef IP address
```

**Solaris32/64** **Linux32/64**

```
/opt/FJSVisjmx/bin/isjmxchangedef IP address
```

2. Restart Interstage JMX Service according to the following procedure

**Windows32/64**

Start the Interstage Operation Tool service.

**Solaris32/64** **Linux32/64**

Stop the Interstage JMX service with the `isjmxstop` command, and then start it with the `isjmxstart` command.

Interstage JMX service startup procedure

Start up the Interstage JMX service according to the following procedure.

**Windows32/64**

Start the Interstage Operation Tool service.

**Solaris32/64** **Linux32/64**

Stop the Interstage JMX service with the `isjmxstop` command, and then start it with the `isjmxstart` command.

## Note

- Node inheritance may have been set in the cluster environment. Modify the settings so that node inheritance is not used.
- There could be an error in the Hostname or IP address of the server used to run the Interstage JMX Service. Check that the Hostname and IP address registered in the DNS are correct.

Specify the Hostname, and then execute the OS *ping* command. If a response is received from the correct IP address, then the IP address set is correct.

The following cannot be used in the host name:

- Upper-case letters ('A'-'Z') or lower-case letters ('a'-'z')
  - Numbers ('0'-'9')
  - Hyphens ('-')
  - Periods ('.')
- If this message is output frequently, there is probably a network environment problem. If the error persists, collect diagnostic information using the *iscollectinfo* command, record the error information, and then contact your systems engineer.

## 12.6.25 is20726

### IS: ERROR: is20726: Failed to connect to Interstage JMX service Error information=%s

#### Variable Information

%s = Error information

#### Explanation

Failed to connect to Interstage JMX Service for the following reasons:

- There was an error in the IP address that was specified for the Interstage JMX Service
- The LAN was disconnected when Interstage JMX Service was started.

#### System Action

Processing stops.

#### User Action

The start status of the Interstage JMX Service for connection is abnormal. Take the following action according to the error information.

No	Error information	Explanation	Action
1	Connection refused to host: [IP address]; nested exception is: java.net.ConnectException: Connection timed out: connect	Possible causes are shown below. <ul style="list-style-type: none"><li>- An IP address that cannot connect to the machine in which the Interstage JMX Service has been installed was registered in the server.</li><li>- An IP address that cannot connect to the machine in which the Interstage JMX Service has been installed was specified in the isjmx.xml file (*1).</li><li>- When the server IP address was changed, the IP address defined in the isjmx.xml file (*1) was not changed</li></ul>	Take one of the following actions: <ul style="list-style-type: none"><li>- Delete from the OS settings the IP address that cannot connect to the machine in which the Interstage JMX Service has been installed.</li><li>- Set or connect the network so that the IP address can connect to the machine in which the Interstage JMX Service has been installed.</li><li>- Specify a correct IP address in the isjmx.xml file(*1) so that it can connect to the machine in which the Interstage JMX Service has been installed. (*2)</li></ul>

No	Error information	Explanation	Action
			<ul style="list-style-type: none"> <li>- When changing the server IP address, also change the IP address defined in the isjmx.xml file (*1). (*2)</li> </ul>
2	Connection refused to host: 127.0.0.1; nested exception is: java.net.ConnectException: Connection refused: connect	The Interstage JMX Service was started while the network was disconnected.	Start the Interstage JMX service according to the <a href="#">Interstage JMX service startup procedure</a> and reexecute processing.
3	Exception creating connection to: [IP address]; nested exception is: java.net.SocketException: Network is unreachable: connect	<p>Possible causes are shown below.</p> <ul style="list-style-type: none"> <li>- An IP address that cannot connect to the machine in which the Interstage JMX Service has been installed was registered in the server.</li> <li>- An IP address that cannot connect to the machine in which the Interstage JMX Service has been installed was specified in the isjmx.xml file (*1).</li> <li>- When the server IP address was changed, the IP address defined in the isjmx.xml file (*1) was not changed</li> </ul>	<p>Take one of the following actions:</p> <ul style="list-style-type: none"> <li>- Delete from the OS settings the IP address that cannot connect to the machine in which the Interstage JMX Service has been installed.</li> <li>- Set or connect the network so that the IP address can connect to the machine in which the Interstage JMX Service has been installed.</li> <li>- Specify a correct IP address in the isjmx.xml file(*1) so that it can connect to the machine in which the Interstage JMX Service has been installed. (*2)</li> <li>- When changing the server IP address, also change the IP address defined in the isjmx.xml file (*1). (*2)</li> </ul>
5	Exception creating connection to: [IP address]; nested exception is: java.net.SocketTimeoutException: connect timed out	<p>Possible causes are shown below.</p> <ul style="list-style-type: none"> <li>- An IP address that cannot connect to the machine in which the Interstage JMX Service has been installed was registered in the server.</li> <li>- An IP address that cannot connect to the machine in</li> </ul>	<p>Take one of the following actions:</p> <ul style="list-style-type: none"> <li>- Delete from the OS settings the IP address that cannot connect to the machine in which the Interstage JMX Service has been installed.</li> <li>- Set or connect the network so that the IP address can connect to the machine</li> </ul>

No	Error information	Explanation	Action
		<p>which the Interstage JMX Service has been installed was specified in the isjmx.xml file (*1).</p> <ul style="list-style-type: none"> <li>- When the server IP address was changed, the IP address defined in the isjmx.xml file (*1) was not changed</li> <li>- "rmi" may have been specified as the protocol for communication with a Managed Server outside the firewall.</li> </ul>	<p>in which the Interstage JMX Service has been installed.</p> <ul style="list-style-type: none"> <li>- Specify a correct IP address in the isjmx.xml file(*1) so that it can connect to the machine in which the Interstage JMX Service has been installed. (*2)</li> <li>- When changing the server IP address, also change the IP address defined in the isjmx.xml file (*1). (*2)</li> <li>- If "rmi" has been specified as the protocol for communication with a Managed Server outside the firewall, specify "https" instead and reexecute processing.</li> </ul>
6	Other	An error occurred while the Interstage JMX service was being processed.	<p>For details of the meaning of the information that is output in the error information, refer to 'Exceptions Output during J2EE Usage' or Java™ 2 Platform Standard Edition (J2SE) API conventions on the Oracle website. Check the cause of the error and take action.</p> <p>The network resources may be temporarily insufficient. Wait for a while, then reexecute processing. If the Interstage JMX service has restarted, reexecute processing.</p>

\*1 The Managed Server isjmx.xml file is stored in the following directory.

Start up the Interstage JMX service according to the following procedure file.

**Windows32/64**

C:\Interstage\jmx\etc\isjmx.xml

**Solaris32/64** **Linux32/64**

/etc/opt/FJSVisjmx/isjmx.xml

\*2 According to the following procedure, use the *isjmxchangedef* command to specify an IP address that can connect to the machine in which the Interstage JMX Service has been installed, and then correct the isjmx.xml file.

1. In the *isjmxchangedef* command argument, specify an IP address that can connect to the machine in which the Interstage JMX Service has been installed, and then execute the command. For details about the *isjmxchangedef* command, refer to the "Interstage JMX Service Operation Commands" chapter of the Reference Manual (Command Edition).

Example

**Windows32/64**

isjmxchangedef IP address

**Solaris32/64** **Linux32/64**

/opt/FJSVisjmx/bin/isjmxchangedef IP address

2. Restart Interstage JMX Service according to the following procedure:

**Windows32/64**

Start the Interstage Operation Tool service.

**Solaris32/64** **Linux32/64**

Stop the Interstage JMX service with the *isjmxstop* command, and then start it with the *isjmxstart* command.

#### Interstage JMX service startup procedure

Start up the Interstage JMX service according to the following procedure.

**Windows32/64**

Start the Interstage Operation Tool service.

**Solaris32/64** **Linux32/64**

Stop the Interstage JMX service with the *isjmxstop* command, and then start it with the *isjmxstart* command.

#### Note

- Node inheritance may have been set in the cluster environment. Modify the settings so that node inheritance is not used.
- There could be an error in the Hostname or IP address of the server used to run the Interstage JMX Service. Check that the Hostname and IP address registered in the DNS are correct.

Specify the Hostname, and then execute the OS *ping* command. If a response is received from the correct IP address, then the IP address set is correct.

The following cannot be used in the host name:

- Upper-case letters ('A'-'Z') or lower-case letters ('a'-'z')
  - Numbers ('0'-'9')
  - Hyphens ('-')
  - Periods ('.')
- If this message is output frequently, there is probably a network environment problem. If the error persists, collect diagnostic information using the *iscollectinfo* command, record the error information, and then contact your systems engineer.

## 12.6.26 is20727

---

**IS: ERROR: is20727:A communication error occurred Exception=%s1 Exception message=%s2**

#### Variable Information

%s1 = Exception

%s2 = Exception message

#### Explanation

A communication error occurred.

#### System Action

Processing stops.

#### User Action

Take the action shown in the table according to the error information displayed in the variable information.

#### Exception

- [java.rmi.UnmarshalException](#)
- [java.net.SocketTimeoutException](#)
- [java.rmi.ConnectException](#)

- [javax.net.ssl.SSLException](#)
- [javax.net.ssl.SSLHandshakeException](#)
- [java.rmi.ServerError](#)
- [java.lang.ClassCastException](#)
- [java.net.UnknownHostException](#)
- Other

## Exception message

java.rmi.UnmarshalException

Processing was interrupted, causing a communication timeout during RMI communication. Take the following action according to the exception message.

No	Error information	Explanation	Action
1	Error unmarshaling return header; nested exception is: java.net.SocketTimeoutException: Read timed out	A communication timeout occurred.	If 'RMI' is selected as the protocol for communication with the Interstage JMX service of the Managed Server, the processing time may be longer than the time set for the communication timeout. Increase the time set for the communication timeout with the Interstage JMX service. (*1)
			<b>Solaris32/64</b> <b>Linux32/64</b> If this message is output from the Event Service when the Unit (storage destination) is created, check the partition size of the raw device specified for storing transaction files. This should be two gigabytes, or less. Change the raw device partition size appropriately, and then reexecute processing.
		A timeout may have occurred because the connection was cut when transmitting, and receiving a demand between a response could not be received.	Perform processing again after restoring the connection.
		The OS system time may have been changed while Interstage was running.	Restart the JMX service.
2	Error unmarshaling return header; nested exception is: java.io.InterruptedIOException: Read timed out	A communication timeout occurred.	If 'RMI' is selected as the protocol for communication with the Interstage JMX service of the Managed Server, the processing time may be longer than the time set for the

No	Error information	Explanation	Action
			communication timeout. Increase the time set for the communication timeout with the Interstage JMX service. (*1)
		A timeout may have occurred because the connection was cut when transmitting, and receiving a demand between a response could not be received.	Perform processing again after restoring the connection.
3	Error unmarshaling return header; nested exception is: java.io.EOFException	An abnormal exit may have occurred in the Interstage JMX Service.	Check that the Interstage JMX Service of the Managed Server has started. If it has not started, start it according to " <a href="#">Interstage JMX service startup procedure</a> ", and then reexecute processing. (*4)
4	Error unmarshaling return header; nested exception is: java.net.SocketException: Connection reset	It may be that the network was disconnected while the request was being sent or received.	Recover the network connection and reexecute processing.
		An abnormal exit may have occurred in the Interstage JMX Service.	Check that the Interstage JMX Service of the Managed Server has started. If it has not started, start it according to " <a href="#">Interstage JMX service startup procedure</a> ", and then reexecute processing. (*4)
5	java.lang.ClassNotFoundException: com.fujitsu.interstage.management.ssv.service.IJServerAgentConnectorParam	A required correction to upgrade a Web server connector in a Managed Server of version 8.0 or earlier has not been applied.	Apply the PG54407 correction in the Managed Server and reexecute processing.
6	java.lang.ClassNotFoundException: com.fujitsu.interstage.management.ssv.service.WebConnectorDefineInfo	A required correction to upgrade a Web server connector in a Managed Server of version 8.0 or earlier has not been applied.	Apply the PG54407 correction in the Managed Server and reexecute processing.
7	error unmarshalling return; nested exception is: java.io.StreamCorruptedException error unmarshalling return; nested exception is: java.io.NotActiveException	A required correction if an EJB application has been deployed to a Managed Server of version 8.0 or earlier has not been applied.	Apply the PG54489 correction in the Managed Server and reexecute processing.
8	Other	An error occurred while the Interstage JMX service was being processed.	Refer to the relevant Java(TM) 2 Platform Standard Edition API Specification, available from <a href="http://www.oracle.com/technetwork/java/javase/documentation/index.html">http://www.oracle.com/technetwork/java/javase/documentation/index.html</a> (Java SE Documentation at a Glance).  Check the cause of the error and take the required action.

java.net.SocketTimeoutException

A timeout occurred. Take the following action according to the exception message.

No	Error information	Explanation	Action
1	connect timed out	<p>Possible causes are shown below.</p> <ul style="list-style-type: none"> <li>- An IP address that cannot connect to the machine in which the Interstage JMX Service has been installed was registered in the server.</li> <li>- An IP address that cannot connect to the machine in which the Interstage JMX Service has been installed was specified in the isjmx.xml file (*2).</li> <li>- When the server IP address was changed, the IP address defined in the isjmx.xml file (*2) was not changed</li> </ul>	<p>Take one of the following actions:</p> <ul style="list-style-type: none"> <li>- Delete from the OS settings the IP address that cannot connect to the machine in which the Interstage JMX Service has been installed.</li> <li>- Set or connect the network so that the IP address can connect to the machine in which the Interstage JMX Service has been installed.</li> <li>- Specify a correct IP address in the isjmx.xml file(*2) so that it can connect to the machine in which the Interstage JMX Service has been installed. (*3)</li> <li>- When changing the server IP address, also change the IP address defined in the isjmx.xml file (*2). (*3)</li> </ul>
		<p>A communication timeout occurred.</p>	<p>If 'HTTPS' is selected as the protocol for communication with the Interstage JMX service of the Managed Server, the processing time may be longer than the time set for the communication timeout. Increase the time set for the communication timeout with the Interstage JMX service. (*1)</p>
		<p>The IP address entered in the Admin Server when the Managed Server was added to the site and the actual IP address specified in the Managed Server may not match.</p>	<p>Specify the correct IP address for the Managed Server, and enable the server to participate in the site again.</p>
		<p>The LAN of the Managed Server and Admin Server may have been cut.</p>	<p>Reconnect the LAN, then login to the Interstage Management Console again and reexecute processing.</p>
		<p>The connected server may not have started, or may be in the process of starting.</p>	<p>Check whether the connected server has started.</p>
2	Read timed out	<p>Possible causes are shown below.</p> <ul style="list-style-type: none"> <li>- An IP address that cannot connect to the machine in which the Interstage JMX Service has been installed was registered in the server.</li> </ul>	<p>Take one of the following actions:</p> <ul style="list-style-type: none"> <li>- Delete from the OS settings the IP address that cannot connect to the machine in</li> </ul>

No	Error information	Explanation	Action
		<ul style="list-style-type: none"> <li>- An IP address that cannot connect to the machine in which the Interstage JMX Service has been installed was specified in the isjmx.xml file (*2).</li> <li>- When the server IP address was changed, the IP address defined in the isjmx.xml file (*2) was not changed</li> </ul>	<ul style="list-style-type: none"> <li>which the Interstage JMX Service has been installed.</li> <li>- Set or connect the network so that the IP address can connect to the machine in which the Interstage JMX Service has been installed.</li> <li>- Specify a correct IP address in the isjmx.xml file(*2) so that it can connect to the machine in which the Interstage JMX Service has been installed. (*3)</li> <li>- When changing the server IP address, also change the IP address defined in the isjmx.xml file (*2). (*3)</li> </ul>
		A communication timeout occurred.	If 'HTTPS' is selected as the protocol for communication with the Interstage JMX service of the Managed Server, the processing time may be longer than the time set for the communication timeout. Increase the time set for the communication timeout with the Interstage JMX service. (*1)
		The IP address entered in the Admin Server when the Managed Server was added to the site and the actual IP address specified in the Managed Server may not match.	Specify the correct IP address for the Managed Server, and enable the server to participate in the site again.
		The LAN of the Managed Server and Admin Server may have been cut.	Reconnect the LAN, then login to the Interstage Management Console again and reexecute processing.
		The connected server may not have started, or may be in the process of starting.	Check whether the connected server has started.
		This status indicates that a connection cannot be created with the Interstage JMX service because there is insufficient memory on the server used for connection. It also indicates that processing requests cannot be executed because of an error in the connection server network.	Increase the memory by stopping unnecessary applications on the connection server and reexecute processing. If the problem is still not resolved, check whether there is an error in the network environment.
3	Read timed out]:Caused by: java.io.IOException: Failed to retrieve RMIServer stub:javax.naming.CommunicationException [Root exception is	If the communication protocol for the added server in [Detailed Settings] on the Interstage Management Console Integrated Integration Management tab is 'RMI', the value specified for 'port number' may be being used by a service	Check the definition of the Managed Server isjmx.xml file (*2), and ensure that it is the same as the value specified for 'port number'. Check the following tag:

No	Error information	Explanation	Action
	java.rmi.ConnectIOException: error during JRMP connection establishment;nested exception is:java.net.SocketTimeoutException: Read timed out]	other than the Interstage JMX service of the Managed Server.	- <port> tag 'rmi' attribute Specify the number described in the above attribute and enable the server to participate in the site again.
4	Other	An error occurred while the Interstage JMX service was being processed.	Refer to JavaTM 2 Platform Standard Edition (J2SE) API conventions on the Oracle website. Check the cause of the error and take action.

#### java.rmi.ConnectException

The start status of the Interstage JMX Service for connection is abnormal. Take the following action according to the exception message.

No	Error information	Explanation	Action
1	Connection refused to host: [IP address]; nested exception is: java.net.ConnectException: Connection timed out: connect	Possible causes are shown below. <ul style="list-style-type: none"> <li>- An IP address that cannot connect to the machine in which the Interstage JMX Service has been installed was registered in the server.</li> <li>- An IP address that cannot connect to the machine in which the Interstage JMX Service has been installed was specified in the isjmx.xml file (*2).</li> <li>- When the server IP address was changed, the IP address defined in the isjmx.xml file (*2) was not changed</li> </ul>	Take one of the following actions: <ul style="list-style-type: none"> <li>- Delete from the OS settings the IP address that cannot connect to the machine in which the Interstage JMX Service has been installed.</li> <li>- Set or connect the network so that the IP address can connect to the machine in which the Interstage JMX Service has been installed.</li> <li>- Specify a correct IP address in the isjmx.xml file(*2) so that it can connect to the machine in which the Interstage JMX Service has been installed. (*3)</li> <li>- When changing the server IP address, also change the IP address defined in the isjmx.xml file (*2). (*3)</li> </ul>
2	Connection refused to host: 127.0.0.1; nested exception is: java.net.ConnectException: Connection refused: connect	The Interstage JMX Service was started while the network was disconnected.	Start the Interstage JMX service according to the <a href="#">Interstage JMX service startup procedure</a> and reexecute processing.
3	Connection refused	The value specified for 'port number' for the added server in [Detailed Settings] on the Interstage Management Console Integration Management tab may not be used in the Interstage JMX service of the Managed Server.	Check the definition of the Managed Server isjmx.xml file (*2), and ensure that it is the same as the value specified for 'port number'. Check the following tags. <ul style="list-style-type: none"> <li>- If 'RMI' is selected as the protocol for communication in the [Detailed Settings],</li> </ul>

No	Error information	Explanation	Action
			<p>then check the &lt;port&gt; tag 'rmi' attribute</p> <p>- If 'HTTPS' is selected as the protocol for communication in the [Detailed Settings], then check the &lt;port&gt; tag 'https' attribute</p> <p>Specify the number described in the above attribute and enable the server to participate in the site again.</p>
		The Interstage JMX service of the Managed Server may have stopped.	Check that the Interstage JMX service of the Managed Server has started. If it has not started, start it using the <a href="#">Interstage JMX service startup procedure</a> and reexecute processing.
4	Network is unreachable	If the communication protocol selected for the added server in [Detailed Settings Protocol] of the Interstage Management Console Site Management tab is "HTTPS", it means that the IP address that was specified could not be used to connect to a machine on which the Interstage JMX service is installed.	Set or connect the network so that the IP address can connect to the machine in which the Interstage JMX Service has been installed.
5	Other	An error occurred while the Interstage JMX service was being processed.	Refer to JavaTM 2 Platform Standard Edition (J2SE) API conventions on the Oracle website. Check the cause of the error and take action.

#### java.net.NoRouteToHostException

Failed to connect to the server. Take the following action according to the exception message.

No	Error information	Explanation	Action
1	No route to host: connect or No route to host	A communication timeout occurred.	If 'HTTPS' is selected as the protocol for communication with the Interstage JMX service of the Managed Server, the processing time may be longer than the time set for the communication timeout. Increase the time set for the communication timeout with the Interstage JMX service. (*1)
		The IP address entered in the Admin Server when the Managed Server was added to the site and the actual IP address specified in the Managed Server may not match.	Specify the correct IP address for the Managed Server, and enable the server to participate in the site again.
		The LAN of the Managed Server and Admin Server may have been cut.	Reconnect the LAN, then login to the Interstage Management Console again and reexecute processing.

No	Error information	Explanation	Action
		The connected server may not have started, or may be in the process of starting.	Check whether the connected server has started.
		If the communication protocol selected for the added server in [Detailed Settings Protocol] of the Interstage Management Console Site Management tab is "HTTPS", it means that the IP address that was specified could not be used to connect to a machine on which the Interstage JMX service is installed.	Set or connect the network so that the IP address can connect to the machine in which the Interstage JMX Service has been installed.
2	Other	An error occurred while the Interstage JMX service was being processed.	Refer to JavaTM 2 Platform Standard Edition (J2SE) API conventions on the Oracle website. Check the cause of the error and take action.

java.net.SocketException

Failed to connect to the server. Take the following action according to the exception message.

No	Error information	Explanation	Action
1	Resource temporarily unavailable	Network resources may be insufficient temporarily.	<p><b>Windows32/64</b> <b>Solaris32/64</b></p> <p>Tune the TCP/IP parameter. Refer to "Tuning TCP/IP Parameters" in the "System Tuning" chapter of the Tuning Guide for details of the tuning method.</p> <p><b>Linux32/64</b></p> <p>Wait a few moments, then reexecute.</p>
		The Interstage JMX service may have stopped or restarted.	Start the Interstage JMX service according to the <a href="#">Interstage JMX service startup procedure</a> and reexecute processing.
2	Connection reset	The number of a server on which Interstage has not been installed may have been set for the business LAN IP address.	Specify the correct IP address for the Managed Server, and enable the server to participate in the site again.
		The value specified for 'port number' for the added server in [Detailed Settings] on the Interstage Management Console Integration Management tab may not be used in the Interstage JMX service of the Managed Server.	<p>Check the definition of the Managed Server isjmx.xml file (*2), and ensure that it is the same as the value specified for 'port number'. Check the following tags.</p> <ul style="list-style-type: none"> <li>- If 'RMI' is selected as the protocol for communication in the [Detailed Settings]&lt;port&gt; tag 'rmi' attribute</li> <li>- If 'HTTPS' is selected as the protocol for communication in</li> </ul>

No	Error information	Explanation	Action
			<p>the [Detailed Settings]&lt;port&gt; tag 'https' attribute</p> <p>Specify the number described in the above attribute and enable the server to participate in the site again.</p>
		The Interstage JMX service of the Managed Server may have stopped	Check that the Interstage JMX service of the Managed Server has started. If it has not started, start it using the <a href="#">Interstage JMX service startup procedure</a> and reexecute processing.
		The environment setup for HTTPS communication may not be carried out by the Managed Server.	Setup the environment for SSL encryption communication (HTTPS communication) from the Interstage JMX service to the Managed Server.
		When a server is added from the Site Management tab of the Interstage Management Console, and 'HTTPS' is specified as the 'communication protocol' in the Detailed Settings Protocol tab, it is possible that the Interstage package installed on the Managed Server server is V6.0 or earlier.	Check that the version of Interstage in the server that you are adding to the site is V7.0 or later. If it is not, either install Interstage V7.0 or later, or manage or operate this server separately.
3	Network is unreachable	If the communication protocol selected for the added server in [Detailed Settings Protocol] of the Interstage Management Console Site Management tab is "HTTPS", it means that the IP address that was specified could not be used to connect to a machine on which the Interstage JMX service is installed.	Set or connect the network so that the IP address can connect to the machine in which the Interstage JMX Service has been installed.
4	Other	An error occurred while the Interstage JMX service was being processed.	Refer to Java™ 2 Platform Standard Edition (J2SE) API conventions on the Oracle website. Check the cause of the error and take action.

#### java.net.ConnectException

Failed to connect to the server. Take the following action according to the exception message.

No	Error information	Explanation	Action
1	Connection refused: connect or Connection refused	<p>The number of a server on which Interstage has not been installed may have been set for the business LAN IP address.</p> <p>The value specified for 'port number' for the added server in [Detailed Settings] on the Interstage Management Console Integration Management tab may not be</p>	<p>Specify the correct IP address for the Managed Server, and enable the server to participate in the site again.</p> <p>Check the definition of the Managed Server isjmx.xml file (*2), and ensure that it is the same as the value specified for 'port number'. Check the following tags.</p>

No	Error information	Explanation	Action
		used in the Interstage JMX service of the Managed Server.	<ul style="list-style-type: none"> <li>- If 'RMI' is selected as the protocol for communication in the [Detailed Settings]&lt;port&gt; tag 'rmi' attribute</li> <li>- If 'HTTPS' is selected as the protocol for communication in the [Detailed Settings]&lt;port&gt; tag 'https' attribute</li> </ul> <p>Specify the number described in the above attribute and enable the server to participate in the site again.</p>
		The Interstage JMX service of the Managed Server may have stopped	Check that the Interstage JMX service of the Managed Server has started. If it has not started, start it using the <a href="#">Interstage JMX service startup procedure</a> and reexecute processing.
		The environment setup for HTTPS communication may not be carried out by the Managed Server.	Setup the environment for SSL encryption communication (HTTPS communication) from the Interstage JMX service to the Managed Server.
		When a server is added from the Site Management tab of the Interstage Management Console, and 'HTTPS' is specified as the 'communication protocol' in the Detailed Settings Protocol tab, it is possible that the Interstage package installed on the Managed Server server is V6.0 or earlier.	Check that the version of Interstage in the server that you are adding to the site is V7.0 or later. If it is not, either install Interstage V7.0 or later, or manage or operate this server separately.
		The value specified in the isjmx.xml file (*2) for the port number used by the Interstage JMX service may be incorrect.	<p>Check the definition in the isjmx.xml file (*2) of the Managed Server. Check the following to ensure that the value specified for the port number is correct:</p> <ul style="list-style-type: none"> <li>- a value from [1] to [65535] is entered for the 'https' attribute of the 'port' tag.</li> </ul>
2	connect: Address is invalid on local machine, or port is not valid on remote machine	The IP address entered in the Admin Server when the Managed Server was added to the site and the actual IP address specified in the Managed Server may not match.	Specify the correct IP address for the Managed Server, and enable the server to participate in the site again.
		The environment setup for HTTPS communication may not be carried out by the Managed Server.	Setup the environment for SSL encryption communication (HTTPS communication) from the Interstage JMX service to the Managed Server.
3	Connection was refused.	If the Admin Server is a Solaris machine, and the communication protocol selected for the added server in [Detailed Settings]	1) Specify a correct IP address for the Managed Server, and make it participate in the site again.

No	Error information	Explanation	Action
		<p>of the Interstage Management Console Integration Management tab is 'HTTPS', it may mean the following:</p> <ul style="list-style-type: none"> <li>- The value specified for the Managed Server IP address does not match the actual IP address.</li> <li>- The specified port number is not used by the Interstage JMX service of the Managed Server.</li> </ul>	<p>2) Check that the definition in the Managed Server isjmx.xml file (* 2) is the same value as the one specified in the file. Check the following tags.</p> <ul style="list-style-type: none"> <li>- The 'https' attribute in the &lt;port&gt; tag</li> </ul> <p>If this case applies, specify the number entered for the above attribute and make the server participate in the site again.</p>
4	Network is unreachable	The IP address entered in the Admin Server when the Managed Server was added to the site and the actual IP address specified in the Managed Server may not match.	Specify the correct IP address for the Managed Server, and enable the server to participate in the site again.
5	Other	An error occurred while the Interstage JMX service was being processed.	Refer to Java™ 2 Platform Standard Edition (J2SE) API conventions on the Oracle website. Check the cause of the error and take action.

javax.net.ssl.SSLException

HTTPS communication failed. Take the following action according to the exception message.

No	Error information	Explanation	Action
1	Unrecognized SSL message, plaintext connection?	If the communication protocol selected in [Detailed Settings] is 'HTTPS', the value specified for the port number may be being used by a service other than the Interstage JMX service of the Managed Server.	<p>Check the definition of the Managed Server isjmx.xml file (*2), and ensure that it is the same as the value specified for 'port number'. Check the following tag:</p> <ul style="list-style-type: none"> <li>- &lt;port&gt; tag 'https' attribute</li> </ul> <p>Specify the number described in the above attribute and enable the server to participate in the site again.</p>
		If the communication protocol selected for the added server in [Detailed Settings] on the Interstage Management Console Integration Management tab is 'HTTPS', the value specified for 'port number' may be the same as the value specified for RMI communication in the Interstage JMX service of the Managed Server.	<p>Check the definition of the Managed Server isjmx.xml file (*2), and ensure that it is the same as the value specified for 'port number'. Check the following tag:</p> <ul style="list-style-type: none"> <li>- &lt;port&gt; tag 'rmi' attribute</li> </ul> <p>Specify the number described in the above attribute and enable the server to participate in the site again.</p>
2	Other	An error occurred while the Interstage JMX service was being processed.	Refer to Java™ 2 Platform Standard Edition (J2SE) API conventions on the Oracle website. Check the cause of the error and take action.

javax.net.ssl.SSLHandshakeException

HTTPS communication failed. Take the following action according to the exception message.

No	Error information	Explanation	Action
1	Remote host closed connection during handshake	If the communication protocol selected in [Detailed Settings] is 'HTTPS', the value specified for the port number may be being used by a service other than the Interstage JMX service of the Managed Server.	Check the definition of the Managed Server isjmx.xml file (*2), and ensure that it is the same as the value specified for 'port number'. Check the following tag:  - <port> tag 'https' attribute  Specify the number described in the above attribute and enable the server to participate in the site again.
		If the communication protocol selected for the added server in [Detailed Settings] on the Interstage Management Console Integration Management tab is 'HTTPS', the value specified for 'port number' may be the same as the value specified for RMI communication in the Interstage JMX service of the Managed Server.	Check the definition of the Managed Server isjmx.xml file (*2), and ensure that it is the same as the value specified for 'port number'. Check the following tag:  - <port> tag 'rmi' attribute  Specify the number described in the above attribute and enable the server to participate in the site again.
2	Other	An error occurred while the Interstage JMX service was being processed.	Refer to JavaTM 2 Platform Standard Edition (J2SE) API conventions on the Oracle website. Check the cause of the error and take action.

java.rmi.ServerError

RMI communication failed. Take the following action according to the exception message.

No	Error information	Explanation	Action
1	Error occurred in server thread; nested exception is:java.lang.OutOfMemoryError	There was insufficient memory when requests were processed by the Interstage JMX service.	Expand heap and Perm for the java processes used by the Interstage JMX service.
2	Error occurred in server thread; nested exception is:[Exception]	When requests are processed by the Interstage JMX service, errors may occur during the following:  - analysis of request  - recovery of request data  - conversion of the processing result to network data	For details on the meaning of information output in the exception, refer to 'Exceptions Output during J2EE Usage' or JavaTM 2 Platform Standard Edition (J2SE) API conventions on the Oracle website. Check the cause of the error and take action.
3	Other	An error occurred while the Interstage JMX service was being processed.	Refer to JavaTM 2 Platform Standard Edition (J2SE) API conventions on the Oracle website. Check the cause of the error and take action.

java.lang.ClassCastException

The Interstage JMX Service connection was illegal. Take the following action according to the exception message.

No	Error information	Explanation	Action
1	Failed to access Remote Server.	When a server is added from the Site Management tab of the Interstage Management Console, it is possible that the Interstage package installed on the Managed Server server is V6.0.	Check that the version of Interstage in the server that you are trying to add to the site is V7.0 or later. If this case applies, either install Interstage V7.0 or later in the server that you are trying to add to the site, or manage or operate this server separately.

java.net.UnknownHostException

The connection destination host could not be found.

No	Error information	Explanation	Action
1	[IP address]	If the communication protocol selected for the added server in [Detailed Settings Protocol] of the Interstage Management Console Site Management tab is "HTTPS", it means that the IP address that was specified could not be used to connect to a machine on which the Interstage JMX service is installed.	Set or connect the network so that the IP address can connect to the machine in which the Interstage JMX Service has been installed.

Other

No	Error information	Explanation	Action
1	When the unexpected IP address is outputted	<p>Possible causes are shown below.</p> <ul style="list-style-type: none"> <li>- An IP address that cannot connect to the machine in which the Interstage JMX Service has been installed was registered in the server.</li> <li>- An IP address that cannot connect to the machine in which the Interstage JMX Service has been installed was specified in the isjmx.xml file (*2).</li> <li>- When the server IP address was changed, the IP address defined in the isjmx.xml file (*2) was not changed</li> </ul>	<p>Take one of the following actions:</p> <ul style="list-style-type: none"> <li>- Delete from the OS settings the IP address that cannot connect to the machine in which the Interstage JMX Service has been installed.</li> <li>- Set or connect the network so that the IP address can connect to the machine in which the Interstage JMX Service has been installed.</li> <li>- Specify a correct IP address in the isjmx.xml file(*2) so that it can connect to the machine in which the Interstage JMX Service has been installed. (*3)</li> <li>- When changing the server IP address, also change the IP address defined in the isjmx.xml file (*2). (*3)</li> </ul>
2	Other	A character that cannot be used in the host name has been used.	<p>Use only the following characters in the host name:</p> <ul style="list-style-type: none"> <li>- Upper-case letters ('A' to 'Z') or lower-case letters ('a' to 'z')</li> <li>- Numbers ('0' to '9')</li> </ul>

No	Error information	Explanation	Action
			<ul style="list-style-type: none"> <li>- Hyphens ('-')</li> <li>- Periods ('.')</li> </ul> <p>If the host name is changed, restart the Interstage JMX service.</p>
		An error occurred while the Interstage JMX service was being processed.	<p>For details of the meaning of the information that is output in the exception information, refer to 'Exceptions Output during J2EE Usage' or Java™ 2 Platform Standard Edition (J2SE) API conventions on the Oracle website. Check the cause of the error and take action.</p> <p>The network resources may be temporarily insufficient. Wait for a while, then reexecute processing. If the Interstage JMX service has restarted, reexecute processing. (*5)</p>

\*1 The requested process continues on Interstage, even if a communication timeout occurs.

To change the value for the communication timeout, follow the procedure below.

In a multiserver environment, execute operations for the Admin Server.

1. Open the following file using an editor:

**Windows32/64**

```
[Interstage installation folder]\jmx\etc\isjmx.xml
```

**Solaris32/64 Linux32/64**

```
/etc/opt/FJSvisjmx/isjmx.xml
```

2. Change the communication timeout time.

Change the following attribute values for the 'timeout' tag and save them in a file.

- If 'RMI' is selected as the timeout for communication with the Managed Server  
Select the 'rmi' attribute.
- If 'HTTPS' is selected as the timeout for communication with the Managed Server  
Select the 'https' attribute.

The value can range from 0 to 10080 minutes. The default is 20. If 0 is specified, no communication timeout occurs.

3. Restart client applications that use the Interstage JMX Service. To restart the Interstage Management Console, use the following procedure:

**Windows32/64**

Start the Interstage JServlet (OperationManagement) service.

**Solaris32/64 Linux32/64**

Use the *ismngconsolestop* command to stop services that use the Interstage Management Console, and then use the *ismngconsolestart* command to start these services.

\*2 The Managed Server isjmx.xml file is stored in the following directory.

Start up the Interstage JMX service according to the following procedure file.

**Windows32/64**

```
C:\Interstage\jmx\etc\isjmx.xml
```

Solaris32/64 Linux32/64

```
/etc/opt/FJSVisjmx/isjmx.xml
```

\*3 According to the following procedure, use the *isjmxchangedef* command to specify an IP address that can connect to the machine in which the Interstage JMX Service has been installed, and then correct the *isjmx.xml* file.

1. In the *isjmxchangedef* command argument, specify an IP address that can connect to the machine in which the Interstage JMX Service has been installed, and then execute the command. For details about the *isjmxchangedef* command, refer to the "Interstage JMX Service Operation Commands" chapter of the Reference Manual (Command Edition).

#### Example

Windows32/64

```
isjmxchangedef IP address
```

Solaris32/64 Linux32/64

```
/opt/FJSVisjmx/bin/isjmxchangedef IP address
```

2. Restart Interstage JMX Service according to the following procedure

Windows32/64

Start the Interstage Operation Tool service.

Solaris32/64 Linux32/64

Stop the Interstage JMX service with the *isjmxstop* command, and then start it with the *isjmxstart* command.

\*4 Windows32/64

The Java VM finished abnormally, possibly because of insufficient memory. Refer to 'Memory' in the Tuning Guide to check the memory, and then restart the 'Interstage Operation Tool' service.

Solaris32/64 Linux32/64

If 12.6.22 is20723 is output in the system log file, it might mean that the Java VM finished abnormally because of insufficient memory. For details about how to check this, refer to "12.6.22 is20723".

\*5 There may be insufficient file descriptors. Close unnecessary applications or stop Interstage operations to increase the number of file descriptors available in the system.

Solaris32/64 Linux32/64

The number of available file descriptors can be increased using the *ulimit* command or by editing the value in the */etc/system* file. For details on tuning file descriptors, refer to the operating system documentation.

#### Interstage JMX service startup procedure

Start up the Interstage JMX service according to the following procedure.

Windows32/64

Start the Interstage Operation Tool service.

Solaris32/64 Linux32/64

Stop the Interstage JMX service with the *isjmxstop* command, and then start it with the *isjmxstart* command.

#### Note

- Node inheritance may have been set in the cluster environment. Modify the settings so that node inheritance is not used.
- There could be an error in the Hostname or IP address of the server used to run the Interstage JMX Service. Check that the Hostname and IP address registered in the DNS are correct.

Specify the Hostname, and then execute the OS *ping* command. If a response is received from the correct IP address, then the IP address set is correct.

The following cannot be used in the host name:

- Upper-case letters ('A'-'Z') or lower-case letters ('a'-'z')
  - Numbers ('0'-'9')
  - Hyphens ('-')
  - Periods ('.')
- If this message is output frequently, there may be a network environment problem. If the error persists, collect diagnostic information using the *iscollectinfo* command, record the error information, and then contact your systems engineer.

## 12.6.27 is20728

---

### IS: ERROR: is20728:Operand is not specified

#### Explanation

The operand has not been specified.

#### System Action

Command processing stops.

#### User Action

Specify the correct operand and reexecute the command.

## 12.6.28 is20729

---

### IS: ERROR: is20729:Security mode is invalid MODE=%s

#### Variable Information

%s = Specified security mode

#### Explanation

The specified security mode is invalid.

#### System Action

Command processing stops.

#### User Action

Specify the correct security mode and reexecute the command.

## 12.6.29 is20730

---

### IS: ERROR: is20730:Group is not specified

#### Explanation

The group has not been specified.

#### System Action

Command processing stops.

#### User Action

Specify the correct group and reexecute the command.

## 12.6.30 is20731

---

---

**IS: ERROR: is20731:Failed to change group FILE=%s****Variable Information**

%s = Name of the file or directory for which the attempt to change the group ownership failed

**Explanation**

An attempt to change the file or directory group ownership failed.

**System Action**

Command processing stops.

**User Action**

Fix the error according to the message that was output immediately before this one.

---

**12.6.31 is20732****IS: ERROR: is20732:Failed to change mode FILE=%s****Variable Information**

%s = Name of the file or directory for which the attempt to change the access authority failed.

**Explanation**

An attempt to change the file or directory access authority failed.

**System Action**

Command processing stops.

**User Action**

Fix the error according to the message that was output immediately before this one.

---

**12.6.32 is20742****IS: ERROR: is20742:An abnormality occurred at starting JavaVM****Explanation**

Processing has been stopped because an error occurred while Java VM was starting.

**System Action**

Processing stops.

**User Action**

Check whether a message indicating the cause of the start failure was output. If a message was output, take the action indicated by that message.

If a message indicating the cause of the start failure was not output, check whether the definition information used by the Interstage JMX Service contains an error. If it contains the following error(s), correct it then start the Interstage Operation Tool.

- Check whether an invalid or unnecessary option was specified for the 'options' attribute on the 'server' tag. If so, delete it and save the definition file.

**Windows32/64**

- Check whether a path that ends with a file separator was specified. If so, specify two file separators consecutively.

**Windows32/64**

- Ensure that a single double quote (') was not set instead of or together with the value for the 'CLASSPATH' system environment variable.

If a single double quote (') was set for this value, delete it. If a single double quote (') was used with this value (for example, 'CLASSPATH or CLASSPATH'), make sure that there is a double quote before and after the value.

Set the definition information used by the Interstage JMX Service in the following file:

**Windows32/64**

```
[Interstage installation folder]\jmx\etc\isjmx.xml
```

**Solaris32/64** **Linux32/64**

```
/etc/opt/FJSVIsjmx/isjmx.xml
```

If there is an item relevant to the above confirmations, correct it and then restart the Interstage JMX service using the following procedure:

**Windows32/64**

Restart the 'Interstage Operation Tool' service.

**Solaris32/64** **Linux32/64**

Stop the Interstage JMX service with the *isjmxstop* command, then start it with the *isjmxstart* command.

#### Note

If the error persists, collect diagnostic information using the *iscollectinfo* command, record the error information, and then contact your systems engineer.

## 12.6.33 is20743

### IS: ERROR: is20743:The number of registered MBeans reached the maximum LIMIT=%d

#### Variable Information

%d = Maximum number

#### Explanation

MBean registration was interrupted because the maximum number of MBeans that can be registered was reached.

#### System Action

Terminates MBean registration.

#### User Action

Increase the maximum number of MBeans that can be registered with the Interstage JMX Service.

To change the maximum number of MBeans that can be registered, perform the following operation:

1. Open the following file with an editor:

**Windows32/64**

```
[Interstage installation folder]\jmx\etc\isjmx.xml
```

2. Change the maximum number of MBeans that can be registered by changing the value specified for the 'max' attribute on the 'registry' tag, and save the file. The value can range from 1 to 2147483647. The default is 100000.
3. Restart the Interstage JMX service:

**Windows32/64**

Start the Interstage Operation Tool service.

**Solaris32/64** **Linux32/64**

Stop the Interstage JMX service with the *isjmxstop* command, and then start it with the *isjmxstart* command.

## 12.6.34 is20744

---

**IS: WARNING: is20744: The number of registered MBeans reached the warning level WARNING=%d1 LIMIT=%d2**

### Variable Information

%d1 = Warning number

%d2 = Maximum number

### Explanation

The number of MBeans registered reached the warning number. Processing will be continued until the number of MBeans registered reaches the maximum number that can be registered.

### System Action

Processing continues.

### User Action

Increase the maximum number of MBeans that can be registered with the Interstage JMX Service.

To change the maximum number of MBeans that can be registered, perform the following operation:

1. Open the following file with an editor:

**Windows32/64**

[Interstage installation folder]\jmx\etc\isjmx.xml

2. Change the maximum number of MBeans that can be registered by changing the value specified for the 'max' attribute on the 'registry' tag, and save the file. The value can range from 1 to 2147483647. The default is 100000.
3. Restart the Interstage JMX service:

**Windows32/64**

Start the Interstage Operation Tool service.

**Solaris32/64** **Linux32/64**

Stop the Interstage JMX service with the *isjmxstop* command, and then start it with the *isjmxstart* command.

## 12.6.35 is20745

---

**IS: WARNING: is20745: Failed to register MBean Type=%s1 Error Information=%s2**

### Variable Information

%s1 = MBean type

%s2 = Error information

### Explanation

An error occurred (for the reason indicated by the error information) during registration of MBeans while the Interstage JMX Service was started. Processing for starting the Interstage JMX Service is continued.

### System Action

Processing continues.

### User Action

If the function indicated by the MBean type is to be used, remove the error cause indicated by the error information and restart the Interstage Operation Tool Service.

## Procedure to Restart Interstage JMX Service

Windows32/64

Start the Interstage Operation Tool service.

Solaris32/64 Linux32/64

Stop the Interstage JMX service with the *isjmxstop* command, and then start it with the *isjmxstart* command.

If the error persists, collect diagnostic information using the *iscollectinfo* command, record the error information, and then contact your systems engineer.

Windows32/64

[Interstage installation folder]\jmx\var folder

Solaris32/64 Linux32/64

Stop the Interstage JMX service with the *isjmxstop* command, then start it with the *isjmxstart* command.

### Note

If the problem is not resolved after this procedure, collect diagnostic information using the *iscollectinfo* command, record the error information indicated in the variable information (%s2) and the following information, and then contact your systems engineer:

Windows32/64

All files in the Interstage installation folder \jmx\var

Solaris32/64 Linux32/64

All files in the /var/opt/FJSV\jmx/ directory

## 12.6.36 is20746

---

**IS: ERROR: is20746:The target resource does not exist. It was removed by another user, or Interstage JMX Service may have been restarted.**

### Explanation

The target resource for which a request was issued could not be found.

### System Action

Processing stops.

### User Action

- Check whether the target resource for which a request was issued has been deleted on request from another user, or is in the process of being created. This can be checked by collecting a list of resources or resource status information.
- A temporary network resource shortage may have occurred. Reexecute processing later.

If the Interstage configuration was changed with Interstage integrated commands, restart the Interstage JMX service using the following procedure, and then rerun the process:

Windows32/64

Restart the 'Interstage Operation Tool' service.

Solaris32/64 Linux32/64

Restart the Interstage JMX service with the *isjmxstop* and then *isjmxstart* commands.

### Note

- The WorkUnit for which the request was issued may not exist, so execute Backup/Restore for the target server.

- If the monitor is referenced from the Interstage Management Console, the IJServer process may end abnormally. If the IJServer is not running, take the recommended user action in the message output in the event log (Windows) or system log (Solaris/Linux), and then start the IJServer.

If the IJServer process is restarted, the Interstage Management Console and IJServer can run normally and no user action is required.

- If multiserver management is used, and this message is output during an IJServer operation, the IJServer may not exist for the management target server in which the error occurred.

In this case, in the Admin Server Interstage Management Console click [Application Management] > [Interstage Management Console] > [Interstage Application Server] > [WorkUnit] > [IJServer Name] > [Operate].

In the environment settings error in this window, check whether the creation or deletion of the IJServer failed. If the creation of the IJServer failed, establish the cause, create the IJServer and then reexecute processing.

If the deletion of IJServer failed, there is no need to take action in the management target server in which this message was output. Since the attempt to delete IJServer failed in a management target server of another distribution destination, take action in that server.

- If multiserver management is used, from the Interstage Management Console, click [Site Management] > [Interstage Management Console] > [Interstage Application Server] > [Server Group] > [Server] > [System] > [WorkUnit] > [Status]. If a CORBA WorkUnit is selected from the list of WorkUnits displayed, this message is output to the event log (Windows) or system log (Solaris/Linux). In this case, the message can be ignored. There is no need to take action.

## 12.6.37 is20747

**IS: ERROR: is20747:Failed to process the request Error Information=%s**

### Variable Information

%s = Error information

### Explanation

The issued request could not be processed.

### System Action

Processing stops.

### User Action

If the error information indicates the information listed below, take the appropriate action.

Table 12.23 is20747 Error information and Actions

Error information (%s)	Action
javax.management.InstanceAlreadyExistsException:domain:name=WUName, type=CORBAWorkUnitConfig, System=default, node=node	If this error information is output with Interstage forcibly stopped, start Interstage. After that, list the latest WorkUnits on the display.
If a message in which the message ID starts with 'ots' is included	Take the action indicated by the OTS message.

If there is no relevant error information, collect diagnostic information using the *iscollectinfo* command, record the error information, and then contact your systems engineer.

## 12.6.38 is20748

**IS: INFO: is20748: User repository was changed MODE=%s**

Refer to the information shown in the error information, and then reexecute processing.

Error information (%s)	Detail/Action
Communication Failure	Communication with the directory service failed. Check that the settings for communication with the directory service are correct. Additionally, check that the directory service has started.
Service Unavailable	The directory service cannot be used at the moment. Since the directory service is currently at high-load status, there is no service offered to handle requests. Check that the directory service is running normally, and then reexecute processing.

- Check whether the repository has stopped

If the repository has stopped, start it, or change the user repository to the OS.

- Check whether a server in the Directory service has stopped  
If the server has stopped, start it, or change the user repository to the OS.
- Check that the server in the Directory service and the network are established  
If they are not established, establish them, or change the user repository to the OS.
- Check whether the Directory service has been uninstalled  
If the Directory service has been uninstalled, reinstall it, or change the user repository to the OS.

To change the user repository to the OS, log in to the OS as a user with administrator authority and then execute using the *isresetuserrep* command.

## 12.6.47 is20762

---

### IS: ERROR: is20762: Invalid setting on LDAP server (Error information=%s)

#### Variable Information

%s = Internal code

#### Explanation

The Directory service settings are invalid.

- The internal code is 'AUTHENTICATION NOT SUPPORTED'  
The security authentication method used by the accessed Directory service is not supported.
- The internal code is 'INVALID PROVIDER URL'  
The URL of the Directory server provider is invalid.

#### System Action

Processing stops.

#### User Action

Refer to the information shown in the error information, and then reexecute processing.

Error information (%s)	Detail/Action
Invalid Provider URL	The URL for the directory service provider set in the Interstage Management Console is invalid. Check that the directory service host name and port number are correct, and then reexecute processing.

## 12.6.48 is20763

---

### IS: ERROR: is20763: System error occurred

#### Explanation

A system error occurred because of an abnormality in the environment or for some other reason.

#### System Action

Processing stops.

#### User Action

Execute the *iscollectinfo* command to retrieve the investigation information, and send this together with the information in the message to your Systems Engineer.

## 12.6.49 is20764

---

---

**IS: ERROR: is20764: Can not contact this server from Admin Server****Explanation**

Access was attempted from an illegal Admin server.

**System Action**

Processing stops.

**User Action**

Possible causes include:

- In the cluster environment, the Admin Server changed over while the Managed Server was being deleted.
- The Admin Server machine was shut down, or disk trouble occurred, because of an error that occurred while the Managed Server was being deleted.
- The *isleave site* command was executed in the Managed Server.

Delete by force the Managed Server in which the problem occurred from the Admin Server Interstage Management Console. To reuse this server on the site, add the Managed Server to the site again.

If this message is output in the environment after site changeover, it might mean the following:

- Failed to import the Managed Server during site changeover.

Check the location of the customized batch file (shell script) used for the import, and then import the Managed Server again.

---

**12.6.50 is20765**

---

**IS: ERROR: is20765: Can not contact this server from remote server****Explanation**

Could not connect to the Interstage JMX server because a user ID and password were not specified when access was attempted from a remote server.

**System Action**

Processing stops.

**User Action**

Specify a user ID and password and then reattempt connection.

---

**12.6.51 is20766**

---

**IS: ERROR: is20766:One or more invalid operands are specified****Explanation**

A required operand was not specified, or the operand that was specified is unsupported.

**System Action**

Processing stops.

**User Action**

Specify the correct operand, and reexecute the command.

---

**12.6.52 is20767**

---

**IS: ERROR: is20767:You don't have the authority to access the demanded request.**

## Explanation

The request that was issued cannot be accessed with the current administrator authority.

## System Action

Processing stops.

## User Action

Cannot continue processing because there is no authority for the request that was issued.

Check the user authority.

## 12.6.53 is20768

---

**IS: ERROR: is20768: Abnormalities are in the SSL certificate/key management environment of Interstage JMX service PATH=%s**

## Variable Information

%s = Error Filename

## Explanation

There is an abnormality in the SSL certificate/key management environment of the Interstage JMX service.

## System Action

Processing stops.

## User Action

The SSL certificate/key management environment of the Interstage JMX service might be fragmented. For this reason, reinstall Interstage.

## 12.6.54 is20770

---

**IS: ERROR: is20770:File operation failed FILE=%s1 Error information=%s2**

## Variable Information

%s1 = File or directory

%s2 = Error information

## Explanation

There is no write authority for the file or directory.

## System Action

Processing stops.

## User Action

Check that there is write authority for the file or directory shown in the variable information.

## 12.6.55 is20771

---

**IS: ERROR: is20771:Specified definition does not exist %s**

## Variable Information

%s = Definition item name

#### Explanation

The specified definition item has already been deleted.

#### System Action

Processing stops.

#### User Action

Check that the specified definition item has been defined.

### 12.6.56 is20772

---

**IS: INFO: is20772:Definition successfully updated.Please restart Interstage JMX Service**

#### Explanation

Processing ended normally.

### 12.6.57 is20773

---

**IS: ERROR: is20773:Definition file is being updated**

#### Explanation

Another user is using the *isjmxchangedef* command.

#### System Action

Processing stops.

#### User Action

Wait for short period and reexecute processing.

### 12.6.58 is20774

---

**IS: ERROR: is20774:Format of IP address is invalid Error information=%s**

#### Variable Information

%s = Internal error information

#### Explanation

The IP address format contains an error.

#### System Action

Processing stops.

#### User Action

Check that the format of the specified IP address is correct.

### 12.6.59 is20775

---

**IS: ERROR: is20775:Specified IP address is not address of localhost Error information=%s**

#### Variable Information

%s = Error information

#### Explanation

The specified IP address is not a local host IP.

## System Action

Processing stops.

## User Action

Check that the specified IP address is the same as the local host IP address.

## 12.6.60 is20776

---

**IS: ERROR: is20776:Failed in changing a definition of the Interstage JMX service DETAIL=%s CODE=%d1:%d2**

### Variable Information

%d1= Internal code 1

%d2= Internal code 2

### Explanation

The attempt to change the definition information failed.

### System Action

Processing stops.

### User Action

Refer to the information shown in the variable information to establish the cause of the problem. If the problem is still not resolved, use the *iscollectinfo* command to collect diagnostic information. Send this information to a Systems Engineer.

Set the definition information to be used in Interstage JMX Service in the following file:

**Windows32/64**

```
C:\Interstage\jmx\etc\isjmx.xml
```

**Solaris32/64 Linux32/64**

```
/etc/opt/FJSVisjmx/isjmx.xml
```

## 12.6.61 is20777

---

**IS: ERROR: is20777: Invalid IPAddress is specified IP address=%s**

### Variable Information

%s= IP address

### Explanation

The specified IP address is invalid.

### System Action

Processing stops.

### User Action

The IP address specified in the 'localhost' attribute of the 'host' tag in the definition information is invalid for one of the following reasons:

- Interstage JMX Service has not been installed on the machine that was started
- There was an error in the format of the specified IP address

Set the definition information to be used in Interstage JMX Service in the following file:

Windows32/64

```
C:\Interstage\jmx\etc\isjmx.xml
```

Solaris32/64 Linux32/64

```
/etc/opt/FJSVisjmx/isjmx.xml
```

Use the *isjmxchangedef* command to specify the correct IP address, and then restart the Interstage JMX Service according to the following procedure:

Windows32/64

Start the Interstage Operation Tool service.

Solaris32/64 Linux32/64

Stop the Interstage JMX service with the *isjmxstop* command, and then start it with the *isjmxstart* command.

## 12.6.62 is20778

---

**IS: INFO: is20778:Connection reconstruction handling of Interstage JMX service was started.**

### Explanation

Connection reestablishment handling of the Interstage JMX service has started. If this connection reestablishment handling finishes after this message is output, the following message is output:

- IS: INFO: is20779:Connection reconstruction handling of Interstage JMX service was completed.

## 12.6.63 is20779

---

**IS: INFO: is20779:Connection reconstruction handling of Interstage JMX service was completed.**

### Explanation

Connection reestablishment handling of Interstage JMX service has finished. If this message is output, it means the following functions can be used:

- The IJServer HotDeploy function
- The following monitoring functions, found in the Interstage Management Console under System > WorkUnit > [WorkUnit name] > Monitor:
  - JavaVM information
  - Data source information
  - Transaction information
  - Queue information
- The following monitoring functions, found under System > WorkUnit > [WorkUnit name] > [Module name] > [Web/EJB application name] > Monitor:
  - EJB application monitor information
  - Web application monitor information

## 12.6.64 is20780

---

**IS: WARNING: is20780:Failed in connection information production of Interstage JMX service. INFO=%s**

### Variable Information

%s= Information

## Explanation

Failed to create Interstage JMX service connection information. If this message is output, it means the following functions cannot be used:

- The IJServer HotDeploy function
- The following monitoring functions, found in the Interstage Management Console under System > WorkUnit > [WorkUnit name] > Monitor:
  - JavaVM information
  - Data source information
  - Transaction information
  - Queue information
- The following monitoring functions, found under System > WorkUnit > [WorkUnit name] > [Module name] > [Web/EJB application name] > Monitor:
  - EJB application monitor information
  - Web application monitor information

## System Action

Processing continues.

## 12.6.65 is20785

---

**IS: ERROR: is20785: Failed in creation of an isjmxadmin.log file.**

## Explanation

Creation of the Interstage JMX service isjmxadmin.log file failed.

## System Action

Processing stops.

## User Action

Refer to the message output immediately before this message to fix the cause of the problem. If the problem is still cannot be resolved, use the *iscollectinfo* command to collect investigation information. Send this information to a Systems Engineer.

## 12.6.66 is20786

---

**IS: ERROR: is20786:Network setting is incorrect Error information=%s**

## Variable Information

%s= Error Information

## Explanation

The network setting is incorrect.

## System Action

Interstage JMX service start processing is aborted.

## User Action

Take the action shown in the table according to the error information displayed in the variable information.

Error information	Explanation	Action
<p>java.rmi.UnmarshalException: Error unmarshaling return header; nested exception is: java.net.SocketTimeoutException: Read timed out</p> <p>or</p> <p>java.rmi.UnmarshalException: Error unmarshaling return header; nested exception is: java.io.InterruptedIOException: Read timed out</p>	<p>A communication timeout occurred.</p> <p>A timeout may have occurred because the connection was cut when transmitting, and receiving a demand between a response could not be received.</p>	<p>If 'RMI' is selected as the protocol for communication with the Interstage JMX service of the Managed Server, the processing time may be longer than the time set for the communication timeout. Increase the time set for the communication timeout with the Interstage JMX service. (*1)</p> <p>Perform processing again after restoring the connection.</p>
<p>java.rmi.UnmarshalException: Error unmarshaling return header; nested exception is: java.net.SocketException: Connection reset</p>	<p>It may be that the network was disconnected while the request was being sent or received.</p> <p>An abnormal exit may have occurred in the Interstage JMX Service.</p>	<p>Recover the network connection and reexecute processing.</p> <p>Check that the Interstage JMX Service of the Managed Server has started. If it has not started, start it according to Start Procedure, and reexecute processing. (*4)</p>
<p>java.rmi.UnmarshalException: Error unmarshaling return header; nested exception is: java.io.EOFException</p>	<p>An abnormal exit may have occurred in Interstage JMX Service.</p>	<p>Check that Interstage JMX Service of the Managed Server has started. If it has not started, start it according to Start Procedure, and reexecute processing. (*4)</p>
<p>java.io.IOException: Failed to retrieve RMIServer stub: javax.naming.CommunicationException [Root exception is java.rmi.ConnectIOException: Exception creating connection to: [IPaddress]; nested exception is: java.net.SocketException: Network is unreachable: connect]</p> <p>or</p> <p>java.rmi.ConnectIOException: Exception creating connection to: [IPaddress]; nested exception is: java.net.SocketException: Network is unreachable: connect</p> <p>or</p> <p>java.net.SocketTimeoutException: connect timed out</p> <p>or</p> <p>java.rmi.ConnectException: Connection refused to host: [IPaddress]; nested exception is: java.net.ConnectException: Connection timed out: connect</p> <p>or</p>	<p>Possible causes are shown below.</p> <ul style="list-style-type: none"> <li>- An IP address that cannot connect to the machine in which the Interstage JMX Service has been installed was registered in the server.</li> <li>- An IP address that cannot connect to the machine in which the Interstage JMX Service has been installed was specified in the isjmx.xml file (*2).</li> <li>- When the server IP address was changed, the IP address defined in the isjmx.xml file (*2) was not changed</li> </ul>	<p>Take one of the following actions:</p> <ul style="list-style-type: none"> <li>- Delete from the OS settings the IP address that cannot connect to the machine in which the Interstage JMX Service has been installed.</li> <li>- Set or connect the network so that the IP address can connect to the machine in which the Interstage JMX Service has been installed.</li> <li>- Specify a correct IP address in the isjmx.xml file(*2) so that it can connect to the machine in which the Interstage JMX Service has been installed. (*3)</li> </ul>

Error information	Explanation	Action
<p>java.io.IOException: Failed to retrieve RMIServer stub:  javax.naming.NamingException:javax.naming.jav  a.rmi.ConnectIOException: Exception creating  connection to: [IPaddress]; nested exception is:  java.net.SocketException: Network is unreachable:  connect</p> <p>or</p> <p>java.rmi.ConnectIOException: Exception creating  connection to: [IPaddress]; nested exception is:  java.net.NoRouteToHostException: No route to  host: connect</p> <p>or</p> <p>java.rmi.ConnectIOException: Exception creating  connection to: [IPaddress]; nested exception is:  java.net.SocketTimeoutException: connect timed  out</p> <p>or</p> <p>Alternatively, an unexpected IP address was output  in the error information that is not shown above</p> <p>Or</p> <p>Failed to retrieve RMIServer stub:  javax.naming.NamingException:  java.rmi.ConnectIOException: Exception creating  connection to: [IPaddress]; nested exception is  java.net.SocketException: Network is unreachable</p> <p>Or</p> <p>Failed to retrieve RMIServer stub:  javax.naming.NamingException:  java.rmi.ConnectException: Connection refused to  host: [IPaddress]; nested exception is  java.net.ConnectException: Network is unreachable</p>		<p>- When changing the  server IP address, also  change the IP address  defined in the isjmx.xml  file (*2). (*3)</p>
<p>java.io.IOException: Failed to retrieve RMIServer  stub: javax.naming.NamingException:  java.rmi.NotBoundException: DefaultAdminServer</p> <p>or</p> <p>java.io.IOException: Failed to retrieve RMIServer  stub: javax.naming.NamingException:  java.rmi.ConnectException: Connection refused to  host: [IPaddress]; nested exception is:  java.net.ConnectException: Connection refused:  connect</p> <p>or</p> <p>Failed to retrieve RMIServer stub:  javax.naming.NamingException:  java.rmi.ConnectException: Connection refused to  host: [IPaddress]; nested exception is  java.net.ConnectException: Connection refused</p>	<p>The Interstage JMX Service was started  while the network was disconnected.</p> <p>The port number entered in the Admin  Server when the Managed Server was  added to the site and the port number  specified in the Managed Server may  not match.</p>	<p>Start the Interstage JMX  service according to the  <a href="#">Interstage JMX service  startup procedure</a> and  reexecute processing.</p> <p>Check that the port number  specified in the Admin  Server when the Managed  Server was added to the site  and the port number  specified in isjmx.xml (*2)  of the Managed Server match  and reexecute processing.</p>

Error information	Explanation	Action
<p>java.io.IOException: Failed to retrieve RMIServer stub: javax.naming.NamingException: java.rmi.UnknownHostException: Unknown host: [IPAddress]; nested exception is java.net.UnknownHostException</p> <p>or</p> <p>Failed to retrieve RMIServer stub: javax.naming.NamingException: java.rmi.UnknownHostException: Unknown host: [IPAddress]; nested exception is: java.net.UnknownHostException: [IPAddress]</p> <p>Or</p> <p>java.rmi.UnknownHostException: [IPAddress]</p>	<p>The IP address entered in the Admin Server when the Managed Server was added to the site and the actual IP address specified in the Managed Server may not match.</p>	<p>Specify the correct IP address for the Managed Server, and enable the server to participate in the site again.</p>
<p>java.io.IOException: Failed to retrieve RMIServer stub: javax.naming.NamingException: java.rmi.ConnectIOException: error during JRMP connection establishment; nested exception is: java.net.SocketException: Connection reset by peer: socket write error</p>	<p>It may be that the network was disconnected while the request was being sent or received.</p>	<p>Recover the network connection and reexecute processing.</p>
<p>java.net.SocketTimeoutException: Read timed out</p> <p>or</p> <p>java.net.SocketTimeoutException: connect timed out</p> <p>or</p> <p>java.net.NoRouteToHostException: No route to host: connect</p> <p>or</p> <p>Connection refused to host: 127.0.0.1; nested exception is: java.net.ConnectException: Connection refused</p>	<p>A communication timeout occurred.</p>	<p>If 'HTTPS' is selected as the protocol for communication with the Interstage JMX service of the Managed Server, the processing time may be longer than the time set for the communication timeout. Increase the time set for the communication timeout with the Interstage JMX service.(*1)</p>
<p>Or</p> <p>java.net.NoRouteToHostException: No route to host</p>	<p>The IP address entered in the Admin Server when the Managed Server was added to the site and the actual IP address specified in the Managed Server may not match.</p>	<p>Specify the correct IP address for the Managed Server, and enable the server to participate in the site again.</p>
	<p>The LAN of the Managed Server and Admin Server may have been cut.</p>	<p>Reconnect the LAN, then login to the Interstage Management Console again and reexecute processing.</p>
	<p>The connected server may not have started, or may be in the process of starting.</p>	<p>Check whether the connected server has started.</p>
	<p>This status indicates that a connection cannot be created with the Interstage JMX service because there is insufficient memory on the server used for connection. It also indicates that processing requests cannot be executed because of an error in the connection server network.</p>	<p>Increase the memory by stopping unnecessary applications on the connection server and reexecute processing. If the problem is still not resolved, check whether there is an error in the network environment.</p>

Error information	Explanation	Action
	If the communication protocol selected for the added server under [Detailed Settings Protocol] of the Interstage Management Console Site Management tab is "HTTPS", it means the IP address specified could not be used to connect to a machine on which the Interstage JMX service is installed.	Set or connect the network so that the IP address can connect to the machine in which the Interstage JMX Service has been installed.
java.net.SocketException: Resource temporarily unavailable	Network resources may be insufficient temporarily.	<p><b>Windows32/64 Solaris32/64</b></p> <p>Tune the TCP/IP parameter. Refer to "Tuning TCP/IP Parameters" in the "System Tuning" chapter of the Tuning Guide for details of the tuning method.</p> <p><b>Linux32/64</b></p> <p>Wait for a while, and then reexecute processing.</p>
	The Interstage JMX service may have stopped or restarted.	Start the Interstage JMX service according to the <a href="#">Interstage JMX service startup procedure</a> and reexecute processing.
java.net.ConnectException: Connection refused: connect or java.net.SocketException: Connection reset or java.net.ConnectException: Connection refused	The number of a server on which Interstage has not been installed may have been set for the business LAN IP address.	Specify the correct IP address for the Managed Server, and enable the server to participate in the site again.
	The value specified for 'port number' for the added server in [Detailed Settings] on the Interstage Management Console Integration Management tab may not be used in the Interstage JMX service of the Managed Server.	<p>Check the definition of the Managed Server isjmx.xml file (*2), and ensure that it is the same as the value specified for 'port number'. Check the following tags.</p> <ul style="list-style-type: none"> <li>- If 'RMI' is selected as the protocol for communication in the [Detailed Settings], then check the &lt;port&gt; tag 'rmi' attribute</li> <li>- If 'HTTPS' is selected as the protocol for communication in the [Detailed Settings], then check the &lt;port&gt; tag 'https' attribute</li> </ul> <p>Specify the number described in the above attribute and enable the server to participate in the site again.</p>

Error information	Explanation	Action
	The Interstage JMX service of the Managed Server may have stopped	Check that the Interstage JMX service of the Managed Server has started. If it has not started, start it using the <a href="#">Interstage JMX service startup procedure</a> and reexecute processing.
	The environment setup for HTTPS communication may not be carried out by the Managed Server.	Setup the environment for SSL encryption communication (HTTPS communication) from the Interstage JMX service to the Managed Server.
	When a server is added from the Site Management tab of the Interstage Management Console, and 'HTTPS' is specified as the 'communication protocol' in the Detailed Settings Protocol tab, it is possible that the Interstage package installed on the Managed Server server is V6.0 or earlier.	Check that the version of Interstage in the server that you are adding to the site is V7.0 or later. If it is not, either install Interstage V7.0 or later, or manage or operate this server separately.
java.net.SocketException: Network is unreachable	If the communication protocol selected for the added server under [Detailed Settings Protocol] of the Interstage Management Console Integration Management page is "HTTPS", it means that the IP address that was specified could not be used to connect to a machine on which the Interstage JMX service is installed.	Set or connect the network so the IP address can connect to the machine in which the Interstage JMX Service has been installed.
<p>java.net.SocketTimeoutException: Read timed out]:Caused by: java.io.IOException: Failed to retrieve RMIServer stub:javax.naming.CommunicationException [Root exception is java.rmi.ConnectIOException:error during JRMP connection establishment;nested exception is:java.net.SocketTimeoutException: Read timed out]</p> <p>or</p> <p>java.io.IOException: Failed to retrieve RMIServer stub: javax.naming.CommunicationException [Root exception is java.rmi.ConnectIOException: error during JRMP connection establishment; nested exception is: java.io.EOFException]</p> <p>or</p> <p>java.io.IOException: Failed to retrieve RMIServer stub: javax.naming.CommunicationException [Root exception is java.rmi.ConnectIOException: non-JRMP server at remote endpoint]</p> <p>or</p>	If the communication protocol for the added server in [Detailed Settings] on the Interstage Management Console Integration Management tab is 'RMI', the value specified for 'port number' may be being used by a service other than the Interstage JMX service of the Managed Server.	<p>Check the definition of the Managed Server isjmx.xml file (*2), and ensure that it is the same as the value specified for 'port number'. Check the following tag:</p> <ul style="list-style-type: none"> <li>- &lt;port&gt; tag 'rmi' attribute</li> </ul> <p>Specify the number described in the above attribute and enable the server to participate in the site again.</p>

Error information	Explanation	Action
<p>java.io.IOException: Failed to retrieve RMIServer stub: javax.naming.NamingException: java.rmi.ConnectIOException: non-JRMP server at remote endpoint</p>		
<p>java.io.IOException: Failed to retrieve RMIServer stub: javax.naming.ServiceUnavailableException [Root exception is java.rmi.ConnectException: Connection refused to host: [Ipaddress]; nested exception is: java.net.ConnectException: Connection refused: connect]</p> <p>or</p>	<p>The port number entered in the Admin Server when the Managed Server was added to the site and the port number specified in the Managed Server may not match.</p>	<p>Check that the port number specified in the Admin Server when the Managed Server was added to the site and the port number specified in isjmx.xml (*2) of the Managed Server match and reexecute processing.</p>
<p>java.io.IOException: Failed to retrieve RMIServer stub: javax.naming.ServiceUnavailableException [Root exception is java.rmi.ConnectException: Connection refused to host: [Ipaddress]; nested exception is: java.net.ConnectException: Connection timed out: connect]</p> <p>or</p>	<p>The Managed Server protocol entered in the Admin Server when the Managed Server was added to the site may not have been specified in the Managed Server.</p>	<p>Check that the protocol specified in the Admin Server when the Managed Server was added to the site was also specified in isjmx.xml (*2) of the Managed Server and reexecute processing.</p>
<p>java.io.IOException: Failed to retrieve RMIServer stub: javax.naming.NamingException: java.rmi.ConnectException: Connection refused to host: [IPaddress]; nested exception is: java.net.ConnectException: Connection refused: connect</p> <p>or</p>	<p>The IP address entered in the Admin Server when the Managed Server was added to the site and the actual IP address specified in the Managed Server may not match.</p>	<p>Check that the IP address specified in the Admin Server when the Managed Server was added to the site and the actual IP address specified in the Managed Server match.</p>
<p>java.io.IOException: Failed to retrieve RMIServer stub: javax.naming.NamingException: java.rmi.ConnectException: Connection refused to host: [IPaddress]; nested exception is: java.net.ConnectException: Connection timed out: connect</p>	<p>The Interstage JMX service of the Managed Server or Management Server may have stopped.</p>	<p>Check that the Interstage JMX service of the Managed Server or Management Server has started. If it has not started, start it using the <a href="#">Interstage JMX service startup procedure</a> and reexecute processing.</p>
	<p>'rmi' may have been specified as the communication protocol for a Managed Server outside the firewall.</p>	<p>Specify 'https' as the communication protocol for a Managed Server outside the firewall and reexecute processing.</p>
	<p>When a server is added from the Site Management tab of the Interstage Management Console, and 'RMI' is specified as the 'communication protocol' in the Detailed Settings Protocol tab, it is possible that the Interstage package installed on the Managed Server server is V5.0 or earlier.</p>	<p>Check that the version of Interstage in the server that you are adding to the site is V7.0 or later. If it is not, either install Interstage V7.0 or later, or manage or operate this server separately.</p>
	<p>The IP address entered in the Admin Server when the Managed Server was added to the site and the actual IP</p>	<p>Specify the correct IP address for the Managed Server, and enable the server</p>

Error information	Explanation	Action
	address specified in the Managed Server may not match.	to participate in the site again.
	The LAN of the Managed Server and Admin Server may have been cut.	Reconnect the LAN, then login to the Interstage Management Console again and reexecute processing.
	The number of a server on which Interstage has not been installed may have been set for the business LAN IP address.	Specify the correct IP address for the Managed Server, and enable the server to participate in the site again.
	The value specified for 'port number' for the added server in [Detailed Settings] on the Interstage Management Console Integration Management tab may not be used in the Interstage JMX service of the Managed Server.	<p>Check the definition of the Managed Server isjmx.xml file (*2), and ensure that it is the same as the value specified for 'port number'. Check the following tags.</p> <ul style="list-style-type: none"> <li>- If 'RMI' is selected as the protocol for communication in the [Detailed Settings]&lt;port&gt; tag 'rmi' attribute</li> <li>- If 'HTTPS' is selected as the protocol for communication in the [Detailed Settings]&lt;port&gt; tag 'https' attribute</li> </ul> <p>Specify the number described in the above attribute and enable the server to participate in the site again.</p>
	The Interstage JMX Service was started while the network was disconnected.	Start the Interstage JMX service according to the <a href="#">Interstage JMX service startup procedure</a> and reexecute processing.
<p>java.io.IOException: Failed to retrieve RMIServer stub: javax.naming.ServiceUnavailableException [Root exception is java.rmi.ConnectException: Connection refused to host: [IPaddress]; nested exception is: java.net.ConnectException: connect: Address is invalid on local machine, or port is not valid on remote machine]</p> <p>or</p> <p>java.io.IOException: Failed to retrieve RMIServer stub: javax.naming.NamingException: java.rmi.ConnectException: Connection refused to host: [IPaddress]; nested exception is: java.net.ConnectException: connect: Address is</p>	The IP address entered in the Admin Server when the Managed Server was added to the site and the actual IP address specified in the Managed Server may not match.	Specify the correct IP address for the Managed Server, and enable the server to participate in the site again.

Error information	Explanation	Action
invalid on local machine, or port is not valid on remote machine		
<p>java.io.IOException: Failed to retrieve RMIServer stub: javax.naming.CommunicationException [Root exception is java.rmi.ConnectIOException:error during JRMP connection establishment; nested exception is: java.net.SocketTimeoutException: Read timed out]</p> <p>or</p> <p>java.io.IOException: Failed to retrieve RMIServer stub: javax.naming.NamingException: java.rmi.ConnectIOException:error during JRMP connection establishment; nested exception is: java.net.SocketTimeoutException: Read timed out</p>	<p>This status indicates that a connection cannot be created with the Interstage JMX service because there is insufficient memory on the server used for connection. It also indicates that processing requests cannot be executed because of an error in the connection server network.</p>	<p>Increase the memory by stopping unnecessary applications on the connection server and reexecute processing. If the problem is still not resolved, check whether there is an error in the network environment.</p>
<p>java.io.IOException: Failed to retrieve RMIServer stub:javax.naming.CommunicationException [Root exception is java.rmi.ConnectIOException: Exception creating connection to: [IP address];nested exception is:java.net.NoRouteToHostException: No route to host:connect]</p> <p>or</p>	<p>An error occurred when an attempt was made to connect to the Managed Server port.</p>	<p>Check that the startup of the Managed Server OS is complete. Additionally, check whether the status of the Managed Server is such that that connection to it is not possible because the intermediate router has crashed, for example.</p>
<p>java.io.IOException: Failed to retrieve RMIServer stub:javax.naming.NamingException:java.rmi.ConnectIOException: Exception creating connection to: [IP address];nested exception is:java.net.NoRouteToHostException: No route to host:connect</p> <p>or</p> <p>Failed to retrieve RMIServer stub: javax.naming.NamingException: java.rmi.ConnectIOException: Exception creating connection to: [IP address]; nested exception is: java.net.NoRouteToHostException: No route to host</p>	<p>Could not connect to the remote host because a firewall has been set up as an intermediary service.</p>	<p>Specify 'https' for the protocol for communication with a Managed Server outside the firewall and reexecute.</p>
<p>java.io.IOException: Failed to retrieve RMIServer stub: [Exception information]</p>	<p>If the communication protocol for the added server under [Detailed Settings] on the Interstage Management Console Site Management tab is 'RMI', the value specified for 'port number' may be being used by a service other than the Interstage JMX service of the Managed Server.</p> <p>An error occurred when connection to the Interstage JMX service was attempted.</p>	<p>Set or connect the network so that the IP address can connect to the machine in which the Interstage JMX Service has been installed.</p> <p>Refer to Exceptions Output during J2EE Usage, the API specification of Java™ 2 Platform Standard Edition (J2SE), on the Oracle homepage.</p> <p>Check the cause of the error by referring to the output exception information.</p> <p>The resources required for connection with the Interstage JMX service may be insufficient. Wait for a while, and then reexecute processing.</p>

<p>javax.net.ssl.SSLException: Unrecognized SSL message, plaintext connection?</p> <p>Or</p> <p>javax.net.ssl.SSLHandshakeException: Remote host closed connection during handshake</p>	<p>If the communication protocol selected in [Detailed Settings] is 'HTTPS', the value specified for the port number may be being used by a service other than the Interstage JMX service of the Managed Server.</p>	<p>Check the definition of the Managed Server isjmx.xml file (*2), and ensure that it is the same as the value specified for 'port number'. Check the following tag:</p> <ul style="list-style-type: none"> <li>- &lt;port&gt; tag 'https' attribute</li> </ul> <p>Specify the number described in the above attribute and enable the server to participate in the site again.</p>
	<p>If the communication protocol selected for the added server in [Detailed Settings] on the Interstage Management Console Integration Management tab is 'HTTPS', the value specified for 'port number' may be the same as the value</p>	<p>Check the definition of the Managed Server isjmx.xml file (*2), and ensure that it is the same as the value specified for 'port number'. Check the following tag:</p>

Error information	Explanation	Action
	specified for RMI communication in the Interstage JMX service of the Managed Server.	<ul style="list-style-type: none"> <li>- &lt;port&gt; tag 'rmi' attribute</li> </ul> Specify the number described in the above attribute and enable the server to participate in the site again.
Connection of RemoteMBeanServerReceiver is failed.: Caused by:	A character that cannot be used in the host name has been used.	Use only the following characters in the host name: <ul style="list-style-type: none"> <li>- Upper-case letters ('A' to 'Z') or lower-case letters ('a' to 'z')</li> <li>- Numbers ('0' to '9')</li> <li>- Hyphens ('-')</li> <li>- Periods ('.')</li> </ul> If the host name is changed, restart the Interstage JMX service.
	Possible causes are shown below. <ul style="list-style-type: none"> <li>- An IP address that cannot connect to the machine in which the Interstage JMX Service has been installed was registered in the server.</li> <li>- An IP address that cannot connect to the machine in which the Interstage JMX Service has been installed was specified in the isjmx.xml file (*2).</li> <li>- When the server IP address was changed, the IP address defined in the isjmx.xml file (*2) was not changed</li> </ul>	Take one of the following actions: <ul style="list-style-type: none"> <li>- Delete from the OS settings the IP address that cannot connect to the machine in which the Interstage JMX Service has been installed.</li> <li>- Set or connect the network so that the IP address can connect to the machine in which the Interstage JMX Service has been installed.</li> <li>- Specify a correct IP address in the isjmx.xml file(*2) so that it can connect to the machine in which the Interstage JMX Service has been installed. (*3)</li> <li>- When changing the server IP address, also change the IP address defined in the isjmx.xml file (*2). (*3)</li> </ul>
Connection of RemoteMBeanServerReceiver is failed.	The value specified in the isjmx.xml file (*2) for the port number used by the Interstage JMX service may be incorrect.	Check the definition in the isjmx.xml file (*2) of the Managed Server. Check the following to ensure the value specified for the port number is correct:

Error information	Explanation	Action
		<ul style="list-style-type: none"> <li>- a value from [1] to [65535] is entered for the 'rmi' attribute of the 'port' tag. If this value is omitted, [12200] is used.</li> </ul>
Failed to access Remote Server.	When a server is added from the Site Management tab of the Interstage Management Console, it is possible that the Interstage package installed on the Managed Server server is V6.0.	Check that the version of Interstage in the server that you are trying to add to the site is V7.0 or later. If this case applies, either install Interstage V7.0 or later in the server that you are trying to add to the site, or manage or operate this server separately.
java.rmi.ServerError: Error occurred in server hread; nested exception is: [Exception information]	When requests are processed on the Interstage JMX service, an error occurs with the analysis of processing requests, the recovery of request data, or the conversion of the processing result to network data.	For details of the meaning of the information that is output in the exception information, refer to 'Exceptions Output during J2EE Usage' or Java™ 2 Platform Standard Edition (J2SE) API conventions on the Oracle website. Check the cause of the error and take action.
java.net.ConnectException: Connection denied.	<p>If the Admin Server is a Solaris machine, and the communication protocol selected for the added server in [Detailed Settings] of the Interstage Management Console Integration Management tab is 'HTTPS', it may mean the following:</p> <ul style="list-style-type: none"> <li>- The value specified for the Managed Server IP address does not match the actual IP address.</li> <li>- The specified port number is not used by the Interstage JMX service of the Managed Server.</li> </ul>	<ol style="list-style-type: none"> <li>1) Specify a correct IP address for the Managed Server, and make it participate in the site again.</li> <li>2) Check that the definition in the Managed Server isjmx.xml file (* 2) is the same value as the one specified in the file. Check the following tags. <ul style="list-style-type: none"> <li>- The 'https' attribute in the &lt;port&gt; tag</li> <li>- If this case applies, specify the number entered for the above attribute and make the server participate in the site again.</li> </ul> </li> </ol>
java.net.ConnectException: Connection refused	The value specified for 'port number' for the added server in [Detailed Settings] on the Interstage Management Console Integration Management tab may not be used in the Interstage JMX service of the Managed Server.	<p>Check the definition of the Managed Server isjmx.xml file (*2), and ensure that it is the same as the value specified for 'port number'. Check the following tags.</p> <ul style="list-style-type: none"> <li>- If 'RMI' is selected as the protocol for communication in the [Detailed Settings], then</li> </ul>

Error information	Explanation	Action
		<p>check the &lt;port&gt; tag 'rmi' attribute</p> <p>- If 'HTTPS' is selected as the protocol for communication in the [Detailed Settings], then check the &lt;port&gt; tag 'https' attribute</p> <p>Specify the number described in the above attribute and enable the server to participate in the site again.</p>
	<p>The Interstage JMX Service was started while the network was disconnected.</p>	<p>Start the Interstage JMX service according to the <a href="#">Interstage JMX service startup procedure</a> and reexecute processing.</p>
<p>java.net.ConnectException: Network is unreachable</p>	<p>If the communication protocol selected for the added server in [Detailed Settings Protocol] of the Interstage Management Console Site Management tab is "HTTPS", it means that the IP address that was specified could not be used to connect to a machine on which the Interstage JMX service is installed.</p>	<p>Set or connect the network so that the IP address can connect to the machine in which the Interstage JMX Service has been installed.</p>
<p>A system error occurred [ Daemon Not Active ]</p>	<p>The Interstage JMX service is not running normally.</p>	<p>Wait for a while and reexecute processing.</p> <p><a href="#">Windows32/64</a></p> <p>If the error cannot be resolved, restart the "Interstage Operation Tool" service.</p> <p><a href="#">Solaris32/64</a> <a href="#">Linux32/64</a></p> <p>If the error cannot be resolved, restart the Interstage JMX service using the <i>isjmxstop</i> and <i>isjmxstart</i> commands.</p>
<p>Other</p>	<p>An error occurred while the Interstage JMX service was being processed.</p>	<p>For details of the meaning of the information that is output in the exception information, refer to 'Exceptions Output during J2EE Usage' or Java™ 2 Platform Standard Edition (J2SE) API conventions on the Oracle website. Check the cause of the error and take action.</p>

Error information	Explanation	Action
		The network resources may be temporarily insufficient. Wait for a while, and then reexecute processing. If the Interstage JMX service has restarted, reexecute processing. (* 5)

\*1 The requested process continues on Interstage, even if a communication timeout occurs.

To change the value for the communication timeout, follow the procedure below.

In a multiserver environment, execute operations for the Admin Server.

1. Open the following file using an editor:

**Windows32/64**

C:\Interstage\jmx\etc\isjmx.xml

**Solaris32/64** **Linux32/64**

/etc/opt/FJSVisjmx/isjmx.xml

2. Change the communication timeout time.

Change the following attribute values for the 'timeout' tag and save them in a file.

- If 'RMI' is selected as the timeout for communication with the Managed Server

Select the 'rmi' attribute.

- If 'HTTPS' is selected as the timeout for communication with the Managed Server

Select the 'https' attribute.

The value can range from 0 to 10080 minutes. The default is 20. If 0 is specified, no communication timeout occurs.

3. Restart client applications that use the Interstage JMX Service. To restart the Interstage Management Console, use the following procedure:

- **Windows32/64**

Start the Interstage JServlet (OperationManagement) service.

- **Solaris32/64** **Linux32/64**

Use the *ismngconsolestop* command to stop services that use the Interstage Management Console, and then use the *ismngconsolestart* command to start these services.

\*2 The Managed Server isjmx.xml file is stored in the following directory.

Start up the Interstage JMX service according to the following procedure file.

**Windows32/64**

C:\Interstage\jmx\etc\isjmx.xml

**Solaris32/64** **Linux32/64**

/etc/opt/FJSVisjmx/isjmx.xml

\*3 According to the following procedure, use the *isjmxchangedef* command to specify an IP address that can connect to the machine in which Interstage JMX Service has been installed. Then correct the isjmx.xml file.

1. In the `isjmxchangedef` command argument, specify an IP address that can connect to the machine in which Interstage JMX Service has been installed, and then execute the command. For details about the `isjmxchangedef` command, refer to the "Interstage JMX Service Operation Commands" chapter of the Reference Manual (Command Edition).

#### Example

- **Solaris32/64** **Linux32/64**

```
isjmxchangedef IP address
```

- **Solaris32/64** **Linux32/64**

```
/opt/FJSVisjmx/bin/isjmxchangedef IP address
```

2. Restart Interstage JMX Service according to the following procedure:

- **Windows32/64**

Start the Interstage Operation Tool service.

- **Solaris32/64** **Linux32/64**

Stop the Interstage JMX service with the `isjmxstop` command, and then start it with the `isjmxstart` command.

\*4 **Windows32/64**

The Java VM finished abnormally, possibly because of insufficient memory. Refer to 'Memory' in the Tuning Guide to check the memory, and then restart the 'Interstage Operation Tool' service.

**Solaris32/64** **Linux32/64**

If `12.6.22 is20723` is output in the system log file, it may mean that the Java VM finished abnormally because of insufficient memory. For details about how to check this, refer to "`12.6.22 is20723`".

\*5 There may be insufficient file descriptors. Close unnecessary applications or stop Interstage operations to increase the number of file descriptors available in the system.

**Solaris32/64** **Linux32/64**

The number of available file descriptors can be increased using the `ulimit` command or by editing the value in the `/etc/system` file. For details on tuning file descriptors, refer to the operating system documentation.

#### Note

Node inheritance may have been set in the cluster environment. Modify the settings so that node inheritance is not used.

There could be an error in the Hostname or IP address of the server used to run the Interstage JMX Service. Check that the Hostname and IP address registered in the DNS are correct.

Specify the Hostname, and then execute the OS `ping` command. If a response is received from the correct IP address, then the IP address set is correct.

The following cannot be used in the host name:

- Upper-case letters ('A'-'Z') or lower-case letters ('a'-'z')
- Numbers ('0'-'9')
- Hyphens ('-')
- Periods ('.')

#### Interstage JMX service startup procedure

Start up the Interstage JMX service according to the following procedure.

**Windows32/64**

Start the Interstage Operation Tool service.

**Solaris32/64** **Linux32/64**

Stop the Interstage JMX service with the `isjmxstop` command, and then start it with the `isjmxstart` command.

If this message is output frequently, there is probably a network environment problem. If the error persists, collect diagnostic information using the *iscollectinfo* command, record the error information, and then contact your systems engineer.

## 12.6.67 is20787

---

**IS: ERROR: is20787:An error occured while making a request to IJServer for rollover of the log file. IJSERVER=%s1 ERROR=%s2**

### Variable Information

%s1= IJServer name

%s2= Error Information

### Explanation

An error occurred when rollover of the J2EE monitor logging file from the Interstage JMX service to IJServer was requested.

### System Action

Continues J2EE monitor logging.

### User Action

Fix the cause of the error output in the error information.

## 12.6.68 is20788

---

**IS: ERROR: is20788:An error occured while making a request to IJServer to write the log. IJSERVER=%s1 ERROR=%s2**

### Variable Information

%s1= IJServer name

%s2= Error Information

### Explanation

An error occurred during the request to the IJServer to write the J2EE monitor logging log from the Interstage JMX service.

### System Action

Continues J2EE monitor logging.

### User Action

Fix the cause of the error that is output in the error information.

## 12.6.69 is20789

---

**IS: WARNING: is20789:Failed to initialize Interstage JMX Service login log file: DETAIL=%s**

### Variable Information

%s= Detailed Information

### Explanation

Failed to initialize the Interstage JMX service login log due to the reason recorded in the detailed information. The Interstage JMX service application continues.

### System Action

Processing continues.

## User Action

Fix the cause of the error shown in the detailed information.

If this message is output, the Interstage JMX service login log is not collected. If collection of the Interstage JMX service login log is required, fix the cause of the error shown in the detailed information and then restart the Interstage JMX service.

**Windows32/64**

Stop the "Interstage Operation Tool" service, "Interstage Operation Tool(FJapache)" service, and "Interstage JServlet (OperationManagement)" service and then restart them.

**Solaris32/64** **Linux32/64**

Execute the *ismngconsolestop* command, and then execute the *ismngconsolestart* command.

## 12.6.70 is20790

---

**IS: WARNING: is20790:Failed to initialize Interstage JMX Service operation log file: DETAIL=%s**

### Variable Information

%s= Detailed Information

### Explanation

Failed to initialize the Interstage JMX service internal log due to the reason recorded in the detailed information. The Interstage JMX service application continues.

### System Action

Processing continues.

### User Action

Fix the cause of the error shown in the detailed information.

If you cannot fix the cause of the error shown in the detailed information, collect diagnostic information using the *iscollectinfo* command, record the error information, and then contact your systems engineer.

## 12.6.71 is20791

---

**IS: WARNING: is20791:Failed to roll over Interstage JMX Service login log file: DETAIL=%s**

### Variable Information

%s= Detailed Information

### Explanation

Failed to roll over the Interstage JMX service login log due to the reason recorded in the detailed information. Output of the login log continues.

### System Action

Processing continues.

### User Action

Fix the cause of the error shown in the detailed information.

If the error is not resolved after this message is output, there is no rollover of the login log, which may compress the disk resources. In this case, the log information is lost so take action immediately.

## 12.6.72 is20792

---

**IS:WARNING: is20792: Failed to roll over Interstage JMX Service operation log file: DETAIL=%s**

## Variable Information

%s= Detailed Information

## Explanation

Failed to roll over the Interstage JMX service internal log due to the reason recorded in the detailed information. Interstage JMX service processing continues.

## System Action

Processing continues.

## User Action

Fix the cause of the error shown in the detail information.

If the error is not resolved after this message is output, there is no internal log rollover, which may compress the disk resources.

The Interstage JMX service internal log is output to the following directory:

**Windows32/64**

```
C:\Interstage\jmx\var\log
```

**Solaris32/64 Linux32/64**

```
/var/opt/FJSVisjmx/log
```

---

## 12.6.73 is20793

**IS: WARNING: is20793:Failed to write Interstage JMX Service login log file: DETAIL=%s1 INFO=%s2**

## Variable Information

%s1= Detailed Information

%s2= Log Information

## Explanation

Failed to write to the Interstage JMX service login log due to the reason recorded in the detailed information. Variable information is written to the login log.

## System Action

Processing continues.

## User Action

Fix the cause of the error shown in the detailed information.

If the error is not resolved after this message is output, the log information is written to the system log continuously, which may compress the system log, so take action immediately.

---

## 12.6.74 is20794

**IS: WARNING: is20794: Failed to write Interstage JMX Service operation log file: DETAIL=%s1 INFO=%s2**

## Variable Information

%s1= Detailed Information

%s2= Log Information

## Explanation

Failed to write to the Interstage JMX service internal log due to the reason recorded in the detailed information.

## System Action

Processing continues.

## User Action

Fix the cause of the error shown in the detailed information.

If the error is not resolved after this message is output, the log information is written to the system log continuously, which may compress the system log, so take action immediately.

## 12.6.75 is20795

---

**IS: INFO: is20795:Interstage JMX Service login log file is rolled over.**

### Explanation

The Interstage JMX service login log was rolled over. Delete the login log backup file if necessary.

## 12.6.76 is20796

---

**IS: INFO: is20796:Interstage JMX Service operation log file is rolled over.**

### Explanation

The Interstage JMX service internal log was rolled over. There is no need to take action.

## 12.7 is20800 to is20899

---

This section details the messages with message numbers between is20800 and is20899.

### 12.7.1 is20800

---

**IS: ERROR: is20800: Failed to get the Managed Server list**

#### Explanation

Failed to obtain the server list.

#### System Action

Stops the processing.

#### User Action

Refer to the message output in the Interstage Management Console message window to establish the cause of the failure and reexecute.

### 12.7.2 is20801

---

**IS: ERROR: is20801: Failed to add the Managed Server to the site Server=%s**

#### Variable Information

%s = Managed Server name

#### Explanation

Failed to add the server to the site - an invalid Interstage version may have been added to the site.

#### System Action

Stops the processing.

## User Action

Refer to the message output in the Interstage Management Console message window to establish the cause of the failure and reexecute.  
If an invalid Interstage version was added to the site, then select a valid version and reexecute.

### 12.7.3 is20802

---

**IS: ERROR: is20802: Failed to delete the Managed Server from the site Managed Server=%s**

#### Variable Information

%s = Managed Server name

#### Explanation

Failed to delete the Managed Server from the site.

#### System Action

Stops the processing.

#### User Action

Refer to the message output in the Interstage Management Console message window to establish the cause of the failure and reexecute.

### 12.7.4 is20803

---

**IS: ERROR: is20803: Failed to get %s**

#### Variable Information

%s = java version or java type

#### Explanation

Failed to obtain the java information.

#### System Action

Stops the processing.

#### User Action

Use the *iscollectinfo* command to collect diagnostic information. Send the error information to a Systems Engineer.

### 12.7.5 is20804

---

**IS: ERROR: is20804: Failed to switch from the standalone server to the Admin Server Error information=%s**

#### Variable Information

%s = Error information

#### Explanation

Failed to switch from the standalone server to the Admin Server.

#### System Action

Stops the processing.

#### User Action

Refer to the message output in the Interstage Management Console message window to establish the cause of the error and reexecute the switch command.

## 12.7.6 is20805

---

**IS: ERROR: is20805: The specified Managed Server or Server Group has not been registered Name=%s**

### Variable Information

%s = Managed Server name or Server Group name

### Explanation

The specified server or Server Group has not been registered.

### System Action

Stops the processing.

### User Action

The specified server or Server Group may already have been deleted by another user. Check the status of the server or Server Group and reexecute if necessary.

## 12.7.7 is20806

---

**IS: ERROR: is20806: A Managed Server or Server Group with the same name already exists Name=%s**

### Variable Information

%s = Managed Server name or Server Group name

### Explanation

Creation of the server or Server Group failed because the specified server or Server Group already exists.

### System Action

Stops the processing.

### User Action

To create a new server or Server Group, specify the name of a server or Server Group that does not exist in the site and reexecute.

## 12.7.8 is20807

---

**IS: ERROR: is20807: Cannot add since the number registered in %s1 has exceeded the maximum limit Registered number =%s2**

### Variable Information

%s1 = Name of the item that exceeded the maximum limit

%s2 = Registered number

### Explanation

Failed to add the server to the site because the number of registered items in %s1 exceeded the maximum limit.

### System Action

Stops the processing.

### User Action

Delete the number registered in %s1 and reexecute.

## 12.7.9 is20808

---

**IS: ERROR: is20808: Already registered in the Site**

## Explanation

Failed to add the server to the site because the specified Managed Server already belongs to a site, or because there are site resources left over.

## System Action

Stops the processing.

## User Action

Take either of the following actions.

- Select a Managed Server that does not belong to another site and reexecute.
- After the specified Managed Server has been deleted from the site by force, it may not be possible to execute the *isleavesite* command. If this is the case, use the *isleavesite* command to delete the server from the site by force, and then execute this operation.
- In a Cluster Environment, during the addition of the specified Managed Server to the Site, a failover may occur in the Admin Server, causing a changeover of the Admin Server. In this case, use the *isleavesite* command to delete the specified Managed Server from the Site by force, and then reexecute the operation.

For details about the *isleavesite* command, refer to the Reference Manual (Command Edition). Alternatively, for details of the recovery method if an abnormality occurs in the Admin Server, refer to the Operator's Guide.

## 12.7.10 is20809

---

### IS: INFO: is20809: Forced deletion from the site was successful

## Explanation

Forced deletion from the site was successful.

## System Action

Continues the processing.

## 12.7.11 is20810

---

### IS: ERROR: is20810: Forced deletion from the site failed Error information=%s

## Variable Information

%s = Error information

## Explanation

Forced deletion from the site failed.

## System Action

Stops the processing.

## User Action

Take one of the following actions:

Error information	Action
No IS_HOME environment variable	The environment variable IS_HOME has not been set. Set the environment variable IS_HOME and reexecute.
ACCESS DENIED	The user who tried to delete the server does not have authority to delete servers from the site according to 'Forced Deletion'. Reexecute as a user with the required authority.
NO MEMORY	There is insufficient memory. Secure extra memory and reexecute.

Error information	Action
Others	Use the <i>iscollectinfo</i> command to collect diagnostic information. Send the error information to a Systems Engineer.

## 12.7.12 is20811

---

### IS: ERROR: is20811: Failed to get the Server Group information Server Group=%s

#### Variable Information

%s = Server Group name

#### Explanation

Failed to obtain Server Group information.

#### System Action

Stops the processing.

#### User Action

Refer to the message output in the Interstage Management Console message window to establish the cause of the failure and reexecute.

## 12.7.13 is20812

---

### IS: ERROR: is20812: Failed to get the Managed Server information Managed Server=%s

#### Variable Information

%s = Managed Server name

#### Explanation

Failed to obtain the Managed Server information.

#### System Action

Stops the processing.

#### User Action

Refer to the message output in the Interstage Management Console message window to establish the cause of the failure and reexecute.

## 12.7.14 is20813

---

### IS: ERROR: is20813: Cannot add a Managed Server of a different Interstage edition to a Server Group Server Group=%s1 Managed Server=%s2 Edition=%s3

#### Variable Information

%s1 = Server Group name

%s2 = Managed Server name

%s3 = Edition

#### Explanation

Failed to add the server to the Server Group because the Interstage edition of the Managed Server did not match the Interstage edition of the other servers or the Server Group.

#### System Action

Stops the processing.

## User Action

Select a Managed Server of the same Interstage edition as the other servers or the Server Group and reexecute.

## 12.7.15 is20814

---

**IS: ERROR: is20814: Cannot delete the specified IP address since it is in use IP address =%s**

### Variable Information

%s = IP address

### Explanation

Failed to delete the specified business LAN IP address since it is in use in IJServer or Interstage.

### System Action

Stops the processing.

### User Action

Remove the business LAN IP address from the IJServer or Interstage system settings and reexecute.

## 12.7.16 is20815

---

**IS: ERROR: is20815: The specified IP address has already been registered IP address =%s**

### Variable Information

%s = IP address

### Explanation

Failed to add the server to the site because the specified IP address has already been registered in the site.

### System Action

Stops the processing.

### User Action

Use another IP address for the server to be added to the site, or delete the Managed Server with the same IP address from the site and reexecute.

## 12.7.17 is20816

---

**IS: ERROR: is20816: The specified Managed Server cannot be deleted from the Site since it belongs to a Server Group Server Group=%s1 Managed Server=%s2**

### Variable Information

%s1 = Server Group name

%s2 = Managed Server name

### Explanation

Failed to delete the specified Managed Server from the site because it belongs to a Server Group.

### System Action

Stops the processing.

### User Action

Delete the Managed Server from the Server Group and reexecute.

## 12.7.18 is20817

### IS: ERROR: is20817: The specified value contained an error Item name=%s

#### Variable Information

%s = Item name

#### Explanation

Processing failed since the specified value contained an error.

#### System Action

Stops the processing.

#### User Action

Take the action described in the table below, according to the item (%s).

Item name (%s)	Explanation / Action
Host name of business LAN	<p>The host name associated with the business LAN IP address may be incorrect. (If the business LAN IP address has not been specified, this will be the admin LAN IP address.).</p> <p>Take the following action, and then reexecute processing:</p> <ol style="list-style-type: none"> <li>Check if the strings shown below have been set in the host name associated with the business LAN IP address. If the host name is incorrect, change it.           <ul style="list-style-type: none"> <li><b>Windows32/64</b> A string comprised of a maximum of 64 of the characters shown below. The leading and trailing characters of the string must not be a hyphen ("-") or a period ("."). "A" - "Z", "a" - "z", "0" - "9", "-", "."</li> <li><b>Solaris32/64 Linux32/64</b> A string of 64 characters or less</li> </ul> </li> <li>If the host name in 1. was changed, restart the Interstage JMX service according to the following procedure:           <ul style="list-style-type: none"> <li><b>Windows32/64</b> Restart the Interstage Operation Tool service.</li> <li><b>Solaris32/64 Linux32/64</b> Stop the Interstage JMX service using the isjmxstop command, and then start the Interstage JMX service using the isjmxstart command.</li> </ul> </li> </ol>
Platform: The platform of the specified server is not supported	<p>A server of a platform that cannot use the multiserver management function may have been added to the site.</p> <p>Specify a server of a platform that can use the multiserver management function, and then reexecute processing.</p>
All other cases	<p>If the Managed Server in the multiserver environment is a Solaris/Linux server, in WorkUnit Settings click [Start WorkUnit automatically] &gt; [User], and check that the user name registered in the Managed Server system is eight characters or less.</p> <p>In all other cases, check the specified value correct it if required, and then reexecute.</p>

## 12.7.19 is20818

### IS: ERROR: is20818: Failed to create a Server Group Server Group=%s

#### Variable Information

%s = Server Group name

## Explanation

Failed to create the Server Group.

## System Action

Stops the processing.

## User Action

Refer to the message output in the Interstage Management Console message window to establish the cause of the failure and reexecute.

## 12.7.20 is20819

---

**IS: ERROR: is20819: Failed to add the Managed Server to the Server Group Server Group=%s1 Managed Server=%s2**

## Variable Information

%s1 = Server Group name

%s2 = Managed Server name

## Explanation

Failed to add the Managed Server to the Server Group.

## System Action

Stops the processing.

## User Action

Refer to the message output in the Interstage Management Console message window to establish the cause of the failure and reexecute. The Web server connector and IJServer WorkUnit names may be different. If they are different, create the Web server connector definition again.

If the attempt to add the Reserve Server to the Server Group has failed, it is possible to switch the server to a Managed Server that is not a Reserve Server. In this case, establish the cause of the failure to add the server to the Server Group and add the server to the Server Group again. Before adding multiple Managed Servers to the Server Group, switch them to Managed Servers that are not Reserve Servers.

## 12.7.21 is20820

---

**IS: ERROR: is20820: Failed to delete the Managed Server from the Server Group Server Group=%s1 Managed Server=%s2**

## Variable Information

%s1 = Server Group name

%s2 = Managed Server name

## Explanation

Failed to delete the Managed Server from the Server Group.

## System Action

Stops the processing.

## User Action

Refer to the message output in the Interstage Management Console message window to establish the cause of the failure and reexecute.

## 12.7.22 is20821

---

---

**IS: ERROR: is20821: Failed to delete the Server Group Server Group=%s****Variable Information**

%s = Server Group name

**Explanation**

Failed to delete the Server Group.

**System Action**

Stops the processing.

**User Action**

Refer to the message output in the Interstage Management Console message window to establish the cause of the failure and reexecute.

---

**12.7.23 is20822**

---

**IS: ERROR: is20822: Failed to update the definition information of the Managed Server Managed Server=%s****Variable Information**

%s1 = Managed Server name

**Explanation**

Failed to update the definition information of the Managed Server.

**System Action**

Stops the processing.

**User Action**

Refer to the message output in the Interstage Management Console message window to establish the cause of the failure and reexecute.

---

**12.7.24 is20823**

---

**IS: ERROR: is20823: The specified Managed Server already belongs to a Server Group Server Group=%s1 Managed Server=%s2****Variable Information**

%s1 = Server Group name

%s2 = Managed Server name

**Explanation**

Failed to add the specified Managed Server to the Server Group since it already belongs to another Server Group.

**System Action**

Stops the processing.

**User Action**

To add the server to a Server Group when it already belongs to another Server Group, delete the Managed Server from the Server Group it already belongs to and reexecute.

---

**12.7.25 is20824**

---

**IS: ERROR: is20824:Internal logic error occurred (Error=%s)**

## Variable Information

%s = Error information

## Explanation

An internal logic error occurred.

## System Action

Stops the processing.

## User Action

Using the *iscollectinfo* command, record the error information, and then contact your systems engineer.

## 12.7.26 is20825

---

**IS: ERROR: is20825: Cannot add a Managed Server of a different platform to a Server Group Server Group=%s1 Managed Server=%s2 Platform=%s3**

## Variable Information

%s1 = Server Group name

%s2 = Managed Server name

%s3 = Platform

## Explanation

Failed to add the server to the Server Group because the platform of the specified server does not match the platform of the other Managed Servers or the Server Group.

## System Action

Stops the processing.

## User Action

Select a server with the same platform as the other Managed Servers or the Server Group and reexecute.

## 12.7.27 is20826

---

**IS: ERROR: is20826: Cannot add a Managed Server of a different Interstage version to a Server Group Server Group=%s1 Managed Server=%s2 Version=%s3**

## Variable Information

%s1 = Server Group name

%s2 = Managed Server name

%s3 = Version

## Explanation

Failed to add the server to the Server Group because the Interstage version of the specified server does not match the Interstage version of the other Managed Servers or the Server Group.

## System Action

Stops the processing.

## User Action

Select a server with the same Interstage version as the other Managed Servers or the Server Group and reexecute.

## 12.7.28 is20827

---

**IS: ERROR: is20827: Reference host does not exist (IP address=%s)**

### Variable Information

%s = IP address

### Explanation

- Adding a server to the site  
Failed to process because the reference host does not exist in the site.
- Adding a server to a Server Group  
Failed to process because the reference host does not exist in the Server Group.

### System Action

Stops the processing.

### User Action

Specify a correct reference host and reexecute.

On a Combined Server, use the *ismodifyservice* command to change the remote server name. From the command execution window, set the 'IS\_SSV\_DEFOP\_LOCK' environment variable to 'off', and then execute the *ismodifyservice* command.

For details about commands, refer to the Reference Manual (Command Edition).

## 12.7.29 is20828

---

**IS: ERROR: is20828: Cannot add a Managed Server of a different Interstage installation path to a Server Group Server Group=%s1 Managed Server=%s2 Installation path=%s3**

### Variable Information

%s1 = Server Group name

%s2 = Managed Server name

%s3 = Installation path

### Explanation

Failed to add the server to the Server Group because the Interstage installation path of the specified Managed Server does not match the Interstage installation path of the other Managed Servers or the Server Group.

### System Action

Stops the processing.

### User Action

Select a server with the same Interstage installation path as the other Managed Servers or the Server Group and reexecute.

 Windows32/64

The installation path in the Multi Server Environment may not have been set up correctly. Check the installation path. For details about installation path, refer to "Pre-Installation Preparations", "Notes about using the multiserver management function" in the "[Chapter 12 Messages Beginning with 'is'](#)" chapter of the Installation manual.

## 12.7.30 is20829

---

**IS: ERROR: is20829: Cannot operate since the specified Managed Server is in the process of being added Managed Server=%s**

## Variable Information

%s = Managed Server name

## Explanation

The operation failed because the specified Managed Server is in the process of being added. Alternatively, another user may be using the Managed Server or Server Group currently displayed on the screen.

## System Action

Stops the processing.

## User Action

Check the status of the server and reexecute if necessary. Alternatively, update the screen and continue operation.

## 12.7.31 is20830

---

**IS: ERROR: is20830: Cannot operate since the specified Managed Server is in the process of being deleted Managed Server=%s**

## Variable Information

%s = Managed Server name

## Explanation

The operation failed because the specified Managed Server is in the process of being deleted. Alternatively, another user may be using the Managed Server or Server Group currently displayed on the screen.

## System Action

Stops the processing.

## User Action

Check the status of the server and reexecute if necessary. Alternatively, update the screen and continue operation.

## 12.7.32 is20831

---

**IS: ERROR: is20831: Failed to get the Managed Server and Server Group lists**

## Explanation

Failed to get the Managed Server and Server Group lists.

## System Action

Stops the processing.

## User Action

Refer to the message that is output in the message window of the Interstage Management Console, establish the cause of the failure to obtain the server and Server Group lists and reexecute processing.

## 12.7.33 is20832

---

**IS: ERROR: is20832: The Managed Server or Server Group does not exist Name=%s**

## Variable Information

%s = Managed Server or Server Group name

## Explanation

Processing failed because the specified Managed Server or Server Group does not exist.

### System Action

Stops the processing.

### User Action

The specified Managed Server or Server Group may already have been deleted by another user. Check the status of the Managed Server or Server Group and reexecute if necessary.

## 12.7.34 is20833

---

**IS: ERROR: is20833: The specified Managed Server is not in the Server Group Server Group=%s1 Managed Server=%s2**

### Variable Information

%s1 = Server Group name

%s2 = Managed Server name

### Explanation

Failed to delete the server from the Server Group because the specified Managed Server is not in the Server Group.

### System Action

Stops the processing.

### User Action

Select a Managed Server that belongs to the Server Group and reexecute.

## 12.7.35 is20834

---

**IS: ERROR: is20834: Cannot operate since no Managed Servers belong to the Server Group Server Group=%s**

### Variable Information

%s = Server Group name

### Explanation

Failed to operate because no Managed Servers belong to the Server Group.

### System Action

Stops the processing.

### User Action

Add a Managed Server to the Server Group and reexecute.

## 12.7.36 is20835

---

**IS: ERROR: is20835: Cannot operate the specified Managed Server since it is in the process of being added to a Server Group Managed Server=%s**

### Variable Information

%s = Managed Server name

### Explanation

The operation failed because the specified Managed Server is in the process of being added to a Server Group. Alternatively, another user may be using the Managed Server or Server Group currently displayed on the screen.

#### System Action

Stops the processing.

#### User Action

Check the status of the server and reexecute if necessary. Alternatively, update the screen and continue operation.

### 12.7.37 is20836

---

**IS: ERROR: is20836: Cannot operate the specified Managed Server since it is in the process of being deleted from a Server Group Managed Server=%s**

#### Variable Information

%s = Managed Server name

#### Explanation

Failed to operate the specified Managed Server because it is in the process of being deleted from a Server Group. Alternatively, another user may be using the Managed Server or Server Group currently displayed on the screen.

#### System Action

Stops the processing.

#### User Action

Check the status of the server and reexecute if necessary. Alternatively, update the screen and continue operation.

### 12.7.38 is20837

---

**IS: ERROR: is20837: Failed to register the resources to the Admin Server Managed Server=%s**

#### Variable Information

%s = Managed Server name

#### Explanation

Failed to obtain resources from the Managed Server, or to register resources obtained from the Managed Server in the Admin Server.

#### System Action

Continues the processing.

#### User Action

Delete the Managed Server from the site and reexecute.

### 12.7.39 is20838

---

**IS: ERROR: is20838: Cannot add since the number of Managed Servers registered in the site has exceeded the maximum limit Registered number=%s**

#### Variable Information

%s = Registered number

#### Explanation

Failed to add the Managed Server because the number of Managed Servers registered in the site has exceeded the maximum limit.

#### System Action

Stops the processing.

## User Action

Take one of the following actions:

- Delete unnecessary servers from the site and reexecute processing.
- Edit the multiserver management definition file, increase the upper limit for servers in the site, restart the Interstage JMX service using the procedure below and reexecute processing. For details of the multiserver management definition file, refer to the "Defining the Multi Server Management Environment" appendix of the Tuning Guide.

OS	Windows32/64	Solaris32/64 Linux32/64
File path	%IS_HOME%\jmx\etc\ssv.xml	/etc/opt/FJSVisjmx/ssv.xml
Tag name	site	site
Attribute name	server.limit	server.limit

Windows32/64

Restart the 'Interstage Operation Tool' service.

Solaris32/64 Linux32/64

Use the *isjmxstop* command to stop the Interstage JMX service. Use the *isjmxstart* command to start the Interstage JMX service.

## 12.7.40 is20839

**IS: ERROR: is20839: Cannot add since the number of Server Groups registered in the site has exceeded the maximum limit Registered number=%s**

### Variable Information

%s = Registered number

### Explanation

Failed to add the Server Group because the number of Server Groups registered in the site has exceeded the maximum limit.

### System Action

Stops the processing.

### User Action

Take one of the following actions:

- Delete unnecessary Server Groups from the site and reexecute processing.
- Edit the multiserver management definition file, increase the upper limit for Server Groups in the site, restart the Interstage JMX service using the procedure below and reexecute processing. For details of the multiserver management definition file, refer to "Defining the Multi Server Management Environment" appendix of the Tuning Guide.

OS	Windows32/64	Solaris32/64 Linux32/64
File path	%IS_HOME%\jmx\etc\ssv.xml	/etc/opt/FJSVisjmx/ssv.xml
Tag name	site	site
Attribute name	Server Group.limit	Server Group.limit

Windows32/64

Restart the 'Interstage Operation Tool' service.

Solaris32/64 Linux32/64

Use the *isjmxstop* command to stop the Interstage JMX service. Use the *isjmxstart* command to start the Interstage JMX service.

## 12.7.41 is20840

---

**IS: ERROR: is20840: Cannot add since the number of Managed Servers registered in the Server Group has exceeded the maximum limit Registered number=%s**

### Variable Information

%s = Registered number

### Explanation

Failed to add the Managed Server because the number of Managed Servers registered in the Server Group has exceeded the maximum limit.

### System Action

Stops the processing.

### User Action

Take one of the following actions:

- Delete unnecessary servers from the Server Group and reexecute processing.
- Edit the multiserver management definition file, increase the upper limit for servers in the Server Group, restart the Interstage JMX service using the procedure below and reexecute processing. For details of the multiserver management definition file, refer to the "Defining the Multi Server Management Environment" appendix of the Tuning Guide.

OS	Windows32/64	Solaris32/64 Linux32/64
File path	%IS_HOME%\jmx\etc\ssv.xml	/etc/opt/FJSVisjmx/ssv.xml
Tag name	site	site
Attribute name	server.limit.inServer Group	server.limit.inServer Group

Windows32/64

Restart the 'Interstage Operation Tool' service.

Solaris32/64 Linux32/64

Use the *isjmxstop* command to stop the Interstage JMX service. Use the *isjmxstart* command to start the Interstage JMX service.

## 12.7.42 is20841

---

**IS: ERROR: is20841:Failed to process the request on all Managed Servers Operation=%s1 Server Group=%s2**

### Variable Information

%s1 = Operation name

%s2 = Server Group name

### Explanation

Processing failed in all of the Managed Servers that belong to the Server Group.

### System Action

Stops processing for all of the Managed Servers.

### User Action

Refer to the message output for each Managed Server in the message window of the Interstage Management Console, establish the cause of the processing failure and reexecute processing.

## 12.7.43 is20842

---

**IS: ERROR: is20842:Failed to process the request on some Managed Servers Operation=%s1 Server Group=%s2**

### Variable Information

%s1 = Operation name

%s2 = Server Group name

### Explanation

Processing failed in some of the Managed Servers that belong to the Server Group.

### System Action

Stops processing for some of the Managed Servers.

### User Action

Refer to the message output for each Managed Server in the message window of the Interstage Management Console, establish the cause of the processing failure and reexecute processing.

## 12.7.44 is20843

---

**IS: ERROR: is20843:Specified host is not found(host=%s)**

### Variable Information

%s = Host name

### Explanation

Processing failed because the remote hosts specified in the following services could not be found.

- Naming service
- Interface repository

### System Action

Stops the processing.

### User Action

Specify a correct host name and reexecute processing.

If the host name that was specified is correct, it may be that the name failed to be resolved on the network. Check the network environment of the host's file or DNS, and check that the name can be resolved.

For information about setting up a remote host in the above service, refer to the Operator's Guide or "inithost/initial\_hosts" in the "CORBA Service Environment Definition" appendix of the Tuning Guide.

## 12.7.45 is20844

---

**IS: INFO: is20844: The Server Group has been created Server Group=%s**

### Variable Information

%s = Server Group name

### Explanation

The Server Group has been created.

## 12.7.46 is20845

---

**IS: INFO: is20845: The Managed Server has been added to the Server Group Server Group=%s1 Managed Server=%s2**

### Variable Information

%s1 = Server Group name

%s2 = Managed Server name

### Explanation

The Managed Server has been added to the Server Group.

## 12.7.47 is20846

---

**IS: INFO: is20846: The Managed Server has been deleted from the Server Group Server Group=%s1 Managed Server=%s2**

### Variable Information

%s1 = Server Group name

%s2 = Managed Server name

### Explanation

The Managed Server has been deleted from the Server Group.

## 12.7.48 is20847

---

**IS: INFO: is20847: The Managed Server or Server Group has been deleted Name=%s**

### Variable Information

%s = Managed Server name or Server Group name

### Explanation

The Managed Server or Server Group has been deleted.

## 12.7.49 is20848

---

**IS: ERROR: is20848: Reference host is not specified**

### Explanation

Processing failed because host information was not defined in inithost or initial\_hosts.

### System Action

Stops the processing.

### User Action

Define host information in inithost or initial\_hosts and reexecute processing.

## 12.7.50 is20849

---

**IS: INFO: is20849: The standalone server has been switched to the Admin Server**

### Explanation

The switch from the standalone server to the Admin Server was successful.

## 12.7.51 is20850

---

**IS: ERROR: is20850:All Managed Servers are unable to operate because former operation has been failed Server Group=%s**

### Variable Information

%s = Server Group name

### Explanation

The operation failed because the previous processing for all of the Managed Servers that belong to the Server Group failed.

### System Action

Stops the processing.

### User Action

Refer to the environment settings error output in the Interstage Management Console, establish the cause of the processing failure for all of the Managed Servers that belong to the Server Group and reexecute processing.

## 12.7.52 is20851

---

**IS: ERROR: is20851:Managed Server is unable to operate because former operation has been failed Managed Server=%s**

### Variable Information

%s = Managed Server name

### Explanation

The operation failed because the previous processing for the Managed Server failed.

### System Action

Stops the processing.

### User Action

Refer to the environment settings error output in the Interstage Management Console, establish the cause of the processing failure for all of the Managed Servers that belong to the Server Group and reexecute processing.

## 12.7.53 is20852

---

**IS: INFO: is20852: The Managed Server has been added to the site Managed Server=%s**

### Variable Information

%s = Managed Server name

### Explanation

The Managed Server has been added to the site.

## 12.7.54 is20853

---

**IS: ERROR: is20853: The error is in the reference Server Group Server Group=%s**

### Variable Information

%s = Server Group name

## Explanation

Failed to add the server to the Server Group because there was an error in the configuration of the reference Server Group. Possible causes of the failure are as follows:

- The number of servers to be added to the Server Group exceeded the number of servers in the reference Server Group.
- The sequence numbers for the server in the Server Group and the reference Server Group do not match.

## System Action

Stops the processing.

## User Action

Correct the configuration of the reference Server Group and reexecute processing.

---

## 12.7.55 is20854

---

### IS: ERROR: is20854:The definition cannot be changed

## Explanation

Processing failed because an attempt was made to change a definition that cannot be changed.

## System Action

Stops the processing.

## User Action

The definition may have been changed by another user. Wait for a while and reexecute processing. If the same message is output even after processing is reexecuted, use the *iscollectinfo* command to collect diagnostic information. Send this information to a Systems Engineer.

---

## 12.7.56 is20855

---

### IS: ERROR: is20853: Failed to delete the Managed Server or Server Group Name=%s

## Variable Information

%s = Managed Server name or Server Group name

## Explanation

Failed to delete the Managed Server or Server Group from the site.

## System Action

Stops the processing.

## User Action

Refer to the message output in the message window of the Interstage Management Console, establish the cause of the failure to delete the Managed Server or Server Group from the site and reexecute processing.

---

## 12.7.57 is20856

---

### IS: INFO: is20856: Added to the site

## Explanation

The Managed Server was added to the site.

---

## 12.7.58 is20857

---

**IS: INFO: is20857: Deleted from the site**

**Explanation**

The Managed Server was deleted from the site.

---

## 12.7.59 is20858

---

**IS: WARNING: is20858: The business grid base definition file contents contain an error, so the init value is used Tag name=%s1 Attribute name=%s2 init value=%s3**

**Variable Information**

- %s1 = Tag name
- %s2 = Attribute name
- %s3 = init value

**Explanation**

The default value was used because there was an error in the contents described in the multiserver management definition file.

**System Action**

Continues the processing.

**User Action**

Estimate the descriptive content of the multiserver management definition file, and restart the Interstage JMX service using the following procedure. For details of the multiserver management definition file, refer to the "Defining the Multi Server Management Environment" appendix of the Tuning Guide.

OS	Windows32/64	Solaris32/64 Linux32/64
File path	%IS_HOME%\jmx\etc\ssv.xml	/etc/opt/FJSVisjmx/ssv.xml

**Windows32/64**

Restart the 'Interstage Operation Tool' service.

**Solaris32/64 Linux32/64**

Use the *isjmxstop* command to stop the Interstage JMX service. Use the *isjmxstart* command to start the Interstage JMX service.

---

## 12.7.60 is20860

---

**IS: ERROR: is20860: Cannot operate since the specified Managed Server is in the process of being changed Managed Server=%s**

**Variable Information**

- %s = Managed Server name

**Explanation**

Failed to operate because the specified Managed Server is in the process of being changed.

**System Action**

Stops the processing.

**User Action**

The operation was not possible because the specified Managed Server is in the process of being changed. Wait for a while and reexecute.

## 12.7.61 is20861

---

### IS: ERROR: is20861: Already registered in another site

#### Explanation

Failed to add the server to the site because the specified Managed Server already belongs to a site, or because there are site resources left over.

#### System Action

Stops the processing.

#### User Action

Take either of the following actions.

- The specified Managed Server may belong to another site.

Select a Managed Server that does not belong to another site and reexecute. To add a Managed Server that belongs to another site, delete the Managed Server from the site that it currently belongs to, and then execute this operation. If an abnormality occurs in the Admin Server, making it impossible to delete the Managed Server from the site, use the *isleavesite* command to delete the server by force.

- After the specified Managed Server has been deleted from the site by force, it may not be possible to execute the *isleavesite* command.

If the *isleavesite* command cannot be executed, use the *isleavesite* command to delete the site resources, and then execute this operation.

For details about the *isleavesite* command, refer to the Reference Manual (Command Edition). Alternatively, for details of the recovery method if an abnormality occurs in the Admin Server, refer to the Operator's Guide.

## 12.7.62 is20862

---

### IS: ERROR: is20862: Failed to get the host name IP address=%s1 Error information=%s2

#### Variable Information

%s1 = IP address

%s2 = Error information

#### Explanation

Failed to get the host name for the business IP address of the Managed Server.

#### System Action

Stops the processing.

#### User Action

The host name for the service LAN IP address has not been set. Register the host name setting for the service LAN IP address in the Managed Server hosts file.

Add the service LAN IP address and host name declaration to the following hosts file:

**Windows32/64**

```
<Windows installation folder>\system32\drivers\etc\hosts
```

**Solaris32/64** **Linux32/64**

```
/etc/hosts
```

- Use the following characters in the host name:

**Windows32/64**

A string (maximum 64 bytes) comprised of the characters shown below. The first character of the host name must be a letter ('A' to 'Z', 'a' to 'z') or a number ('0' to '9').

- Alphabetic capital letters ('A' to 'Z')
- Alphabetic lowercase letters ('a' to 'z')
- Numbers ('0' to '9')
- Hyphens ('-')
- Periods ('.')

**Solaris32/64 Linux32/64**

A string containing a maximum of 64 bytes.

- When defining the host name for the IP address in the hosts file, do not define any host names that are associated with other IP addresses.
- After adding the declaration to the hosts file, restart the Interstage JMX service.
- After adding the declaration, use the *ping* command to check that the host name can be resolved.

### Specifying a loopback address

If the loopback address is referenced as the local host name of the machine in the Managed Server hosts file, an error may occur when the Managed Server is operated using the Interstage Management Console. Edit the hosts file so that the loopback address is not referenced as the local host, then restart the Interstage JMX service. For details, refer to "Entering Information in the Hosts File" in the "Notes on Interstage Operation" chapter of the Product Notes.

### Procedure for restarting the Interstage JMX Service

Restart the Interstage JMX Service using the procedure below.

**Windows32/64**

Restart the 'Interstage Operation Tool' Service.

**Solaris32/64 Linux32/64**

Stop the Interstage JMX Service using the *isjmxstop* command, and then start the Interstage JMX Service using the *isjmxstart* command.

## 12.7.63 is20863

---

**IS: ERROR: is20863: Cannot operate since another process is being executed for the Managed Server or Server Group Name=%s**

### Variable Information

%s = Name

### Explanation

Failed to operate because another process is being executed for the specified Managed Server or Server Group.

### System Action

Stops the processing.

### User Action

The operation is not possible because another process is being executed for the specified Managed Server or Server Group. Wait for a while and reexecute.

## 12.7.64 is20864

---

**IS: ERROR: is20864: The Managed Server or Server Group contains resources that cannot be deleted Name=%s**

### Variable Information

%s = Resource name

### Explanation

Failed to delete the Managed Server from the Server Group, since the specified Managed Server or Server Group contains resources that cannot be deleted.

### System Action

Stops the processing.

### User Action

Delete the resources from the Managed Server or Server Group and reexecute.

## 12.7.65 is20866

---

**IS: ERROR: is20866: Internal repair processing for the Server Group failed Server Group=%s1 Error information=%s2**

### Variable Information

%s1 = Server Group name

%s2 = Error information

### Explanation

Internal repair processing was executed because an error occurred while the server was being added to or deleted from the Server Group. However, another error occurred during internal repair processing.

### System Action

Stops the processing.

### User Action

Restart the Interstage JMX service using the following procedure and reexecute processing.

**Windows32/64**

Restart the 'Interstage Operation Tool' service.

**Solaris32/64 Linux32/64**

Use the *isjmxstop* command to stop the Interstage JMX service. Use the *isjmxstart* command to start the Interstage JMX service.

## 12.7.66 is20867

---

**IS: ERROR: is20867: Failed to add the Managed Server to Server Group because Registered definition is different to the other RESOURCE=%s1 NAME=%s2 INFO=%s3 SERVER=%s4**

### Variable Information

%s1 = Resource name

%s2 = Name

%s3 = Detail information

%s4 = Managed Server name whose definition is different

## Explanation

Failed to add the Managed Server to the Server Group because the registered definition is different from the other definitions.

## System Action

Stops the processing.

## User Action

The Interstage definition for the Managed Server which belongs to the Server Group and that of the Reserve Server must be the same.

Take either of the following actions:

- If Detail information (%s3) is "Not match install state", then the installation status of Interstage on the managed server that belongs to the server group might be different from that on the reserve server that will be added. Check the installation status, and then add the server to the server group again.
- If Resource name (%s1) is "OTSSetupConfiguration", then the creation of the transaction service (JTSRMP) might have failed on the managed server added to the server group. Create the transaction service (JTSRMP) on the managed server correctly, then reexecute.
- If Resource name (%s1) is "System", Name (%s2) is "System", and Detail information (%s3) is "Definition is not in agreement", then the CORBA Service port number set for the managed server that belongs to the server group might be different from that of the reserve server that will be added.

Take the following action, then reexecute.

- Make sure that the CORBA Service port number (the value set for the "IIOP\_port" parameter in the config file) of the managed server that belongs to the server group matches that of the reserve server that will be added. In Solaris/Linux, if the parameter is commented (#IIOP\_port), then make sure that the value matches the port number (the value set for odserver) of the operating system services file (/etc/services).
- If a bulk execution sample was used for import/export, then set the CORBA Service port number in the "OD" section of the "OD\_PORT" definition in the sample and import.
- If Detailed information (%s3) is "Definition contains an abnormality", collect diagnostic information using the *iscollectinfo* command on the Managed Server which definition is different, record the error information, and then contact your systems engineer.
- **Windows32/64**

The installation path in the Multi Server Environment may not be set up correctly. Check the installation path. For details about installation path, refer to "Pre-Installation Preparations", "Notes about using the multiserver management function" in the "Chapter 12 Messages Beginning with 'is'" chapter of the Installation manual.

- If the installation directory is correct, use the backup and restore function to back up all of the Interstage services currently used by the Managed Server which belongs to the Server group. Then restore these services to the Reserve Server. Once this has been done, perform any required additional operations for the Server Group.

## 12.7.67 is20868

---

**IS: ERROR: is20868: Cannot operate since the Server Group is in the process of being added Server Group=%s**

### Variable Information

%s = Server Group name

### Explanation

The operation is not possible because the Server Group is in the process of being added by another user.

### System Action

Stops the processing.

#### User Action

Check the status of the Server Group and reexecute if necessary.

### 12.7.68 is20869

---

**IS: ERROR: is20869: Cannot operate since the Server Group is in the process of being deleted Server Group=%s**

#### Variable Information

%s = Server Group name

#### Explanation

The operation is not possible because the Server Group is in the process of being deleted from the site by another user.

#### System Action

Stops the processing.

#### User Action

Check the status of the Server Group and reexecute if necessary.

### 12.7.69 is20870

---

**IS: ERROR: is20870: Component of Application Server is not installed**

#### Explanation

One of the following causes is assumed:

- A server in which Application Server is not installed was added to the site.
- If a coexisting server is used, a server in which the J2EE feature has not been installed was added to the site.

#### System Action

Stops the processing.

#### User Action

Take one of the following actions:

- Specify a server in which Application Server is installed.
- If a coexisting server is used, install the J2EE feature on the server and add the server to the site.

### 12.7.70 is20872

---

**IS: ERROR: is20872: Cannot operate since the Server Group is in the process of being changed Server Group=%s**

#### Variable Information

%s = Server Group name

#### Explanation

Server Group operation is not possible because the Server Group is in the process of being changed by another user.

#### System Action

Stops the processing.

## User Action

Server Group operation is not possible because the Server Group is in the process of being changed. Wait for a while and reexecute.

## 12.7.71 is20873

---

**IS: ERROR: is20873: Failed to release the lock for the Managed Server or Server Group Name=%s**

### Variable Information

%s = Managed Server name or Server Group name

### Explanation

Failed to release the lock obtained while the Managed Server or Server Group was being operated.

### System Action

Stops the processing.

### User Action

The system is in a state in which no operations can be performed for the Managed Server or Server Group from an Admin Server. When operating the Managed Server or a Server Group, restart the Interstage JMX service using the following procedure and reexecute processing.

**Windows32/64**

Restart the 'Interstage Operation Tool' service.

**Solaris32/64 Linux32/64**

Use the *isjmxstop* command to stop the Interstage JMX service. Use the *isjmxstart* command to start the Interstage JMX service.

## 12.7.72 is20874

---

**IS: ERROR: is20874: Cannot add multiple Managed Servers operating alone to a Server Group**

### Explanation

Processing failed when an attempt was made to add multiple Managed Servers operating alone to Server Groups.

### System Action

Stops the processing.

### User Action

When adding a Managed Server to a Server Group, select one Managed Server operating alone.

## 12.7.73 is20875

---

**IS: ERROR: is20875: Internal repair processing for the server failed Managed Server=%s1 Error information=%s2**

### Variable Information

%s1 = Managed Server name

%s2 = Error information

### Explanation

Internal repair processing was executed because an error occurred while the Managed Server was being added to or withdrawn from the site. However, another error occurred during internal repair processing.

## System Action

Stops the processing.

## User Action

Restart the Interstage JMX service using the following procedure and reexecute processing.

**Windows32/64**

Restart the 'Interstage Operation Tool' service.

**Solaris32/64** **Linux32/64**

Use the *isjmxstop* command to stop the Interstage JMX service. Use the *isjmxstart* command to start the Interstage JMX service.

## 12.7.74 is20876

---

**IS: ERROR: is20876:Cannot delete all of IP address of business LAN set to the Managed Server Managed Server=%s**

### Variable Information

%s = Managed Server name

### Explanation

All business LAN IP addresses cannot be deleted from the Managed Server.

One or more business LAN IP addresses need to be set up for the Managed Server.

## System Action

Stops the processing.

## User Action

Specify one or more business LAN IP addresses to be set as the Managed Server, and perform again.

## 12.7.75 is20877

---

**IS: ERROR: is20877: Cannot update since this has been updated by another user Definition name=%s**

### Variable Information

%s = Registration target

### Explanation

Cannot reexecute processing because the definition has been updated by another user.

## System Action

Stops the processing.

## User Action

Obtain the updated definition, wait for a while and reexecute processing.

## 12.7.76 is20878

---

**IS: WARNING: is20878: Failed to sever contact with the Managed Server Managed Server=%s**

### Variable Information

%s = Managed Server name

## Explanation

Failed to disconnect the Managed Server.

## System Action

Stops the processing.

## User Action

There may be communication resources remaining in the Admin Server. Restart the Interstage JMX service of the Admin Server using the procedure below. If this message is output frequently, use the *iscollectinfo* command to collect diagnostic information. Send the error information to a Systems Engineer.

**Windows32/64**

Restart the 'Interstage Operation Tool' service.

**Solaris32/64** **Linux32/64**

Use the *isjmxstop* command to stop the Interstage JMX service. Use the *isjmxstart* command to start the Interstage JMX service.

## 12.7.77 is20879

---

**IS: ERROR: is20879: Failed to delete since there is a Managed Server that belongs to the Server Group Server Group=%s**

### Variable Information

%s = Server Group name

### Explanation

Could not delete the Server Group because there is a Managed Server that belongs to the Server Group.

### System Action

Stops the processing.

### User Action

Delete the Managed Server from the Server Group and reexecute processing.

## 12.7.78 is20880

---

**IS: ERROR: is20880:The server is not registered in any Site**

### Explanation

The server is not registered in any Site.

### System Action

Stops the processing.

### User Action

Perform the following check and operation (without specifying the *-s* option), in addition to restoration processing:

- The *isleavesite* command may have been executed on the server.  
When the server information remains in the Admin Server, delete the server by force from a site.
- The *-s* option may be specified for restoration processing on a Standalone Server.

## 12.7.79 is20881

---

---

**IS: ERROR: is20881: Resource of the Site information is invalid****Explanation**

Processing failed because the status of the site information resources is abnormal.

**System Action**

Stops the processing.

**User Action**

Add the Managed Server in which the problem occurred to the site again according to the following procedure:

1. Delete by force the Managed Server in which the problem occurred from the Admin Server Interstage Management Console.
2. Execute the *isleavesite* command on the Managed Server in which the problem occurred.
3. Restart Interstage JMX Service on the Managed Server in which the problem occurred.
4. Add the Managed Server in which the problem occurred to the site again using the Admin Server Interstage Management Console.

Restart Interstage JMX Service according to the following procedure.

**Windows32/64**

Restart the 'Interstage Operation Tool' service.

**Solaris32/64** **Linux32/64**

Use the *isjmxstop* and *isjmxstart* commands to first stop and then start Interstage JMX Service.

---

**12.7.80 is20882**

---

**IS: ERROR: is20882: Admin Server function is already installed.****Explanation**

Processing failed because the Admin Server function has already been installed.

**System Action**

Stops the processing.

**User Action**

Check that the server on which the *isaddadminfunc* command was executed is an Admin Server.

If it is not an Admin Server, use the *iscollectinfo* command to collect investigation information. Send the error information to a Systems Engineer.

---

**12.7.81 is20883**

---

**IS: ERROR: is20883: A command is only executable on the Standalone Server****Explanation**

The command can only be executed on the Standalone Server.

**System Action**

Stops the processing.

**User Action**

Check that the server on which the *isaddadminfunc* command was executed is an Admin Server.

If it is not an Admin Server, use the *iscollectinfo* command to collect investigation information. Send the error information to a Systems Engineer.

## 12.7.82 is20884

---

**IS: ERROR: is20884: Failed to register resources of the Site information Error information=%s**

### Variable Information

%s = Error information

### Explanation

Failed to register Site information resources.

### System Action

Stops the processing.

### User Action

Take either of the following actions:

- If there is not enough disk space:

If this message is output after executing the *isaddadminfunc* command, check that there is enough disk space in the server in which the command was executed.

If this message is output after the server is added to the Site, check that there is enough disk space in the server.

- If there is Site information left over in the Managed Server that is no longer necessary:

Execute the *isleavesite* command to delete the Site information, and then add the server to the Site again.

## 12.7.83 is20885

---

**IS: ERROR: is20885: Failed to operate the file FILE=%s**

### Variable Information

%s = File name

### Explanation

Failed to operate the Site information file.

### System Action

Stops the processing.

### User Action

If there are any applications accessing the file displayed in the variable information, close the applications and reexecute processing.

If the problem is still not resolved, use the *iscollectinfo* command to collect diagnostic information. Send the error information to a Systems Engineer.

## 12.7.84 is20886

---

**IS: ERROR: is20886: The Site environment settings failed**

### Explanation

The Site environment settings failed.

### System Action

Stops processing.

## User Action

Refer to the message output in the Interstage Management Console message window to establish the cause of the Site environment settings failure, and then execute again.

## 12.7.85 is20887

---

### **IS: ERROR: is20887: Cannot process because of an application environment settings error**

#### Explanation

The application environment settings in one of the IIServers are incorrect. As a result, the attempt to change the application operation type from management operation mode to stand-alone operation mode failed.

#### System Action

Stops processing.

#### User Action

Determine which IIServer settings are incorrect, fix the application environment settings, and then reexecute.

## 12.7.86 is20888

---

### **IS: ERROR: is20888: Cannot operate because the Site information is being changed**

#### Explanation

The operation failed because the Site information is being changed.

#### System Action

Stops processing.

#### User Action

Wait for a while and then execute processing again.

## 12.7.87 is20889

---

### **IS: ERROR: is20889: Some of the Site environment settings failed**

#### Explanation

.The Site environment settings could not be configured on some Managed Servers

#### System Action

Stops processing.

#### User Action

Establish the cause of the failure of the attempt to change the application operation type, correct it, and then reexecute.

## 12.7.88 is20890

---

### **IS: ERROR: is20890: The version of the specified server means that the server cannot be added to the Site Admin Server version=%s1 Specified server version=%s2**

#### Variable Information

%s1 = Admin Server version

%s2 = Specified server version

## Explanation

The specified server version of Interstage cannot be added to the Site.

## System Action

Stops processing.

## User Action

Select a server version that allows the server to be added to the Site, and then execute processing again.

## 12.7.89 is20891

---

**IS: ERROR: is20891: Cannot delete the Server Group because the Server Group is used to deploy multilevel IJServer Server Group=%s1 IJServer=%s2**

## Variable Information

%s1 = Server Group

%s2 = IJServer

## Explanation

The Server Group could not be deleted because it was specified in a multilevel IJServer.

## System Action

Stops processing.

## User Action

Delete the multilevel IJServer from the Server Group and reexecute processing.

## 12.7.90 is20892

---

**IS: ERROR: is20892: There was input/output trouble Error information=%s**

## Variable Information

%s = Error information

## Explanation

input/output trouble occurred.

## System Action

Stops processing.

## User Action

Recover the disk on which the input/output trouble occurred.

## 12.7.91 is20893

---

**IS: ERROR: is20893: The Managed Server application operation type could not be changed Managed Server=%s**

## Variable Information

%s = Managed Server in which the attempt to change the application operation type failed

## Explanation

Because the application environment settings in the IJServer are incorrect, the attempt to change the application operation type from management operation mode to stand-alone operation mode fails.

### System Action

Stops processing.

### User Action

Establish the cause of the failure of the attempt to change the application operation type, correct it, and then reexecute.

## 12.7.92 is20894

---

**IS: ERROR: is20894: The Managed Server application operation type is set for a stand-alone operation mode Managed Server=%s**

### Variable Information

%s = Managed Server

### Explanation

The operation failed because the application operation type for the Site is management operation mode. The application operation type for the Managed Server added to the Server Group is stand-alone operation mode.

### System Action

Stops processing.

### User Action

Delete the Managed Servers for which processing failed from the Site, and then add them again. Backup/restore the Managed Servers in the Server Group, and then execute processing again. Alternatively, change the application operation type for the Site to stand-alone operation mode, and then execute processing again.

## 12.7.93 is20895

---

**IS: ERROR: is20895: Cannot add to the Site in the installed edition**

### Explanation

The server could not be added to the Site because the installed Interstage edition does not support Site operation.

### System Action

Stops processing.

### User Action

Only servers of Interstage Enterprise Edition can be added to a Site in this version of Interstage.

If Interstage Enterprise Edition has been installed in the operation target system, check whether J2EE compatibility has been installed.

## 12.7.94 is20896

---

**IS: ERROR: is20896: Cannot operate in the installed edition**

### Explanation

The installed Interstage edition could not be executed.

### System Action

Stops processing.

### User Action

In the following cases, only Enterprise Edition products can be used:

- Restoring Admin Server functions

Check that the installed edition is Enterprise Edition.

- The '-s' option is specified in the *isjmxrestore* command

When switching Sites, check that the installed edition is Enterprise Edition. This option must only be specified for restore/import when switching Sites.

## 12.7.95 is20899

---

**IS: ERROR: is20899:A system error occurred Error information=%s**

### Variable Information

%s = Error information

### Explanation

A system error occurred.

### System Action

Stops the processing.

### User Action

Using the *iscollectinfo* command, record the error information, and then contact your systems engineer.

## 12.8 is20900 to is20999

---

This section details the messages with message numbers between is20900 and is20999.

### 12.8.1 is20901

---

**IS: ERROR: is20901:The system could not be initialized. (%s)**

### Variable Information

%s = Exception information

### Explanation

Failed to initialize the business configuration management.

### System Action

Stops the processing.

### User Action

Interstage has not been installed correctly. Reinstall it.

### 12.8.2 is20902

---

**IS: ERROR: is20902:The recovery processing of the repository could not be performed.(ID=%s1),(%s2)**

### Variable Information

%s1 = Transaction ID

%s2 = Exception information

### Explanation

The recovery of the business configuration management failed.

## System Action

Stops the processing.

## User Action

**Windows32/64**

If an error message is output before this message In the event log, take action according to the error message and then restart Interstage JMX Service.

**Solaris32/64** **Linux32/64**

If an error message is output before this message In the system log, take action according to the error message and then restart Interstage JMX Service.

If the same error message is output again, use the *iscollectinfo* command to collect investigation information. Send the error information to a Systems Engineer.

## 12.8.3 is20903

---

**IS: ERROR: is20903:The roll forward recovery processing could not be performed.(%s)**

### Variable Information

%s = Exception information

### Explanation

Processing of the roll forward of the transaction owned by the business configuration management failed.

### System Action

Stops the processing.

### User Action

Take the action indicated by the message contained in the exception information.

## 12.8.4 is20904

---

**IS: ERROR: is20904:The roll back recovery processing could not be performed.(%s)**

### Variable Information

%s = Exception information

### Explanation

Processing of the roll back of the transaction owned by the business configuration management failed.

### System Action

Stops the processing.

### User Action

Take the action indicated by the message contained in the exception information.

## 12.8.5 is20905

---

**IS: ERROR: is20905:The index of retrieval key could not be reconstructed.(%s)**

### Variable Information

%s = Exception information

## Explanation

Failed to reconstruct the index owned by the business configuration management.

## System Action

Stops the processing.

## User Action

**Windows32/64**

If an error message is output before this message In the event log, take action according to the error message and then restart the Interstage JMX Service.

**Solaris32/64** **Linux32/64**

If an error message is output before this message In the system log, take action according to the error message and then restart the Interstage JMX Service.

If the same error message is output again, use the *iscollectinfo* command to collect investigation information. Send the error information to a Systems Engineer.

## 12.8.6 is20906

---

### IS: ERROR: is20906:The parameter is incorrect.(PARAM=%s)

#### Variable Information

%s = Parameter information

#### Explanation

The operation managed by business configuration management failed because of an incorrect parameter. The specified file or directory may not exist on the file system.

#### System Action

Stops the processing.

#### User Action

Check the following factors:

- A value outside the permitted range or that cannot be specified was set in the Interstage Management Console Definition window. Refer to the Help file and change the value that was set.
- If a command that specifies a directory as the argument has been used, check that the file has been specified. Additionally, the directory path may contain a path that does not exist. Specify a correct argument. 'backup file path', 'repository.system path', or the specified argument are displayed in the parameter information.
- Incorrect information was output in internal processing of the previous operation that was just performed. Take the action indicated by the message for the operation executed immediately following this operation.

**Windows32/64**

- A directory for which there is no access authority has been specified in 'Repository Storage Directory'. Specify a disk on which the Interstage JMX service login user local system account can be operated. The local system account cannot be accessed if the disk is UNC, or access is attempted from a disk on another machine using a network drive.

## 12.8.7 is20907

---

### IS: ERROR: is20907:An I/O error has been generated.(%s)

#### Variable Information

%s = Exception information

## Explanation

The operation managed by the business configuration management failed because of an I/O error.

## System Action

Stops the processing.

## User Action

Check for the following causes:

- If there is no access authority for the repository storage directory, assign access authority.
- If the repository storage directory has not been mounted, mount it.
- A non-Interstage process may be referencing a file in the repository storage directory. For this reason, do not refer to the file.
- It may be that the disk space specified in the directory for storing the repository was insufficient. Check the disk space. If the disk space is limited, delete unnecessary files or change the directory for storing the repository and relaunch the operation.
- If the message for the operation is output immediately after this message, take the action indicated by that message.
- When this message was output after restoration of a repository, the repository may have restored during operation of the Interstage JMX service. In this case, restart the Interstage JMX service and operate it again. If the multiserver management function is used, and this message is output when a Site management operation is executed, restart the Interstage JMX Service of the Admin Server.
- If error message [12.8.24 is20950](#) (Exception information(%s):"Exception thrown in managed resource while trying to invoke operation searchResourcesEx") is output immediately after this message (Exception information(%s):"java.io.StreamCorruptedException"), an error may have occurred in the repository resources.

Use the following procedure to create the repository resources again.

### Windows32/64

1. Stop Interstage.

```
C:\Interstage\bin\isstop -f
```

2. From [Control Panel] > [Administrative Tools] > [Services], stop the services shown below, and then stop the Interstage Management Console.

- Interstage Operation Tool
- Interstage Operation Tool(FJapache)
- Interstage JServlet(OperationManagement)

3. Delete the following directory:

```
C:\Interstage\var\repository\data\datroot\compoInfo
```

4. From [Control Panel] > [Administrative Tools] > [Services], start "Interstage Operation Tool", and then start the Interstage Management Console. When the Interstage Management Console is started, the directory that was deleted in step 3 will be created.

5. Start Interstage.

```
C:\Interstage\bin\isstart
```

### Solaris32/64 Linux32/64

1. Stop Interstage.

```
/opt/FJsvtd/bin/isstop -f
```

2. Stop the Interstage Management Console.

```
/opt/FJsvigui/bin/ismngconsolestop
```

3. Delete the following directory:

```
/var/opt/FJSVisas/repository/data/datroot/compoInfo
```

4. Start the Interstage Management Console. When the Interstage Management Console is started, the directory that was deleted in step 3 will be created.

```
/opt/FJSVisgui/bin/ismngconsolestart
```

5. Start Interstage.

```
/opt/FJSVtd/bin/isstart
```

---

## 12.8.8 is20909

**IS: ERROR: is20909:The resource has already been registered.(NAME=%s)**

### Variable Information

%s = Exception information

### Explanation

The resource that was requested for operation by the business configuration management has already been registered.

### System Action

Stops the processing.

### User Action

It is output when it is going to register the already registered resources by internal processing of the previous operation that was just performed. Take the action indicated by the message for the operation that is executed immediately after.

---

## 12.8.9 is20910

**IS: ERROR: is20910:The backup processing could not be performed.(%s)**

### Variable Information

%s = Exception information

### Explanation

The backup of the repository managed by the business configuration management failed.

### System Action

Stops the processing.

### User Action

Check for the following causes:

- If there is no access authority for the repository storage directory, assign access authority.
- If the repository storage directory has not been mounted, mount it.
- A non-Interstage process may be referencing a file in the repository storage directory. For this reason, do not refer to the file.
- The disk space specified in the backup file may have been insufficient. Check the disk space. If the disk space is limited, delete unnecessary files or change the directory for storing the repository and relaunch the operation.
- If 'No file for backup' is included in the message, the information stored in the repository storage directory may be corrupt. In this case, it is recommended that the backup resources created previously are used to execute the restore process and recover the information.

- If 'repositoryRootPath does not exist' is included in the message, Interstage may not have been set up correctly. It is recommended that the backup file created previously be used to execute restore processing to recover repositoryRootPath, or that setup is reexecuted.
- If 'repositoryPath does not exist' is included in the message, Interstage may not have been set up correctly. It is recommended that the backup file created previously be used to execute restore processing to recover repositoryPath, or that setup is reexecuted.
- If the message for the operation is output immediately after this message, take the action indicated by that message.

## 12.8.10 is20911

---

### IS: ERROR: is20911:The restoration processing could not be performed.(%s)

#### Variable Information

%s = Exception information

#### Explanation

The restoration of the repository managed by the business configuration management failed.

#### System Action

Stops the processing.

#### User Action

Check for the following causes:

- If there is no access authority for the repository storage directory, assign this access authority.
- If the repository storage directory has not been mounted, mount it.
- A non-Interstage process may have referenced a file in the repository storage directory. For this reason, do not refer to the file.
- The disk space specified in the directory for storing the repository may be insufficient. Check the disk space. If the disk space is limited, delete unnecessary files or change the directory for storing the repository and relaunch the operation.
- If 'repositoryRootPath is not exist' is included in the message, Interstage may not have been set up correctly. It is recommended that the backup file created previously be used to execute restore processing to recover repositoryRootPath, or that setup is reexecuted.
- If 'repositoryPath is not exist' is included in the message, Interstage may not have been set up correctly. It is recommended that the backup file created previously be used to execute restore processing to recover repositoryPath, or that setup is reexecuted.
- If the message for the operation is output immediately after this message, take the action indicated by that message.

## 12.8.11 is20912

---

### IS: ERROR: is20912:The maximum size for the repository has been exceeded.(SIZE=%s)

#### Variable Information

%s = Current maximum size (Mbytes)

#### Explanation

The maximum value set as the capacity of the repository managed by the business configuration management has been exceeded.

#### System Action

Stops the processing.

#### User Action

To continue operation when the maximum value has been exceeded, increase the 'Repository Storage Size'.

## 12.8.12 is20913

---

**IS: ERROR: is20913:A resource that has different last-update time has been set.(NAME=%s)**

### Variable Information

%s = Detail information

### Explanation

The resource that was requested for operation by the business configuration management has already been updated by another operation.

### System Action

Stops the processing.

### User Action

The information has already been updated by another operation. Check the latest information and reexecute.

## 12.8.13 is20914

---

**IS: ERROR: is20914:The operation of the transaction processing could not be performed.(%s)**

### Variable Information

%s = Exception information

### Explanation

Failed to operate the transaction owned by the business configuration management.

### System Action

Stops the processing.

### User Action

Take the action indicated by the message in the exception information.

If this message is output, restart the Interstage JMX Service and then reexecute the operation. If the multiserver management function is used, and this message is output when a Site management operation is executed, restart the Interstage JMX Service of the Admin Server.

## 12.8.14 is20915

---

**IS: ERROR: is20915:The resource has already been deleted.(NAME=%s)**

### Variable Information

%s = Resource name

### Explanation

The resource that was requested for operation by the business configuration management has already been deleted by another operation.

### System Action

Stops the processing.

### User Action

The information has already been deleted by another operation. Check the latest information and reexecute.

## 12.8.15 is20916

---

**IS: ERROR: is20916:Repository is not in the state which can be used. (%s)**

#### Variable Information

%s = Error information

#### Explanation

Processing failed because the Configuration Manager Repository is in the process of being set up.

#### System Action

Stops the processing.

#### User Action

Finish setting up the Configuration Manager Repository and reexecute processing.

### 12.8.16 is20917

---

**IS: ERROR: is20917:There is no information on the specified server or the Server Group. (NAME=%s)**

#### Variable Information

%s = Server name or Server Group name

#### Explanation

Processing failed because the server name or Server Group name that is the target of the batch operation has already been deleted.

#### System Action

Stops the processing.

#### User Action

Obtain the latest information and reexecute.

### 12.8.17 is20918

---

**IS: ERROR: is20918:The maximum length of the specified character string has been exceeded.(NAME=%s)**

#### Variable Information

%s = Item name

#### Explanation

Processing failed because the string specified in the item name exceeded the permitted range.

#### System Action

Stops the processing.

#### User Action

Adjust the specified value and reexecute.

### 12.8.18 is20919

---

**IS: ERROR: is20919:Accessing to the specified file could not be performed.(NAME=%s)**

#### Variable Information

%s = File name

## Explanation

Processing failed because access to the specified file failed.

## System Action

Stops the processing.

## User Action

Check the following factors:

- Check the access authority to the file that is displayed and reexecute.
- If a command that specifies a file as the argument has been used, check that the directory has been specified. Additionally, the file name may contain a path that does not exist. Specify a correct argument.
- Files saved in the directory for storing the repository may have been deleted manually, or Interstage may not have been set up correctly. It is recommended that the backup file created previously be used to execute restore processing to recover the file, or that setup is reexecuted.

## 12.8.19 is20920

---

### **IS: INFO: is20920:The command was processed normally**

## Explanation

The command was processed normally.

## 12.8.20 is20921

---

### **IS: ERROR: is20921:a required file does not exist**

## Explanation

A file required for business configuration management could not be found.

## System Action

Stops the processing.

## User Action

Check that the Interstage JMX Service has been installed on the server in which the error occurred.

## 12.8.21 is20922

---

### **IS: ERROR: is20922:backup directory not found**

## Explanation

The specified directory could not be found.

## System Action

Stops the processing.

## User Action

Check that the specified directory exists, and then reexecute the command.

## 12.8.22 is20923

---

### **IS: ERROR: is20923:backup resources are not found**

## Explanation

There were no backup resources in the specified directory.

## System Action

Stops the processing.

## User Action

Check that the business configuration management backup resources are in the specified directory. The business configuration management backup resources are as follows:

- repository.dat
- repository.system

## 12.8.23 is20924

---

### IS: ERROR: is20924:fail to copy backup file

## Explanation

Failed to copy the backup resources.

## System Action

Stops the processing.

## User Action

**Windows32/64**

If this message is output during backup processing, check that the following file exists:

[C:\Interstage\etc\repository\repository.system]

If the file does not exist, restart the Interstage JMX Service of the server in which the error occurred, stop the server, and then reexecute the command. Check that access to the specified directory is possible, and then reexecute the command.

**Solaris32/64** **Linux32/64**

If this message is output during backup processing, check that the following file exists:

[/opt/FJSVisas/etc/repository/repository.system]

If the file does not exist, restart the Interstage JMX Service of the server in which the error occurred, stop the server, and then reexecute the command. Check that access to the specified directory is possible, and then reexecute the command.

## 12.8.24 is20950

---

### IS: ERROR: is20950: The system information could not be registered(%s)

## Variable Information

%s = Exception information

## Explanation

Failed to register system information.

## System Action

Stops the processing.

## User Action

Check for the following causes:

- If there is no access authority for the repository storage directory, assign this access authority.

- If the repository storage directory has not been mounted, mount it.
- A non-Interstage process may be referencing a file in the repository storage directory. For this reason, do not refer to the file.
- If the message for the operation is output immediately after this message, take the action indicated by that message. If error message is20907 (Exception information (%s):"java.io.StreamCorruptedException") is output immediately before this message (Exception information (%s):"Exception thrown in managed resource while trying to invoke operation searchResourcesEx"), refer to "[12.8.7 is20907](#)" before taking action.

## 12.8.25 is20951

---

**IS: ERROR: is20951:The system information could not be obtained.(%s)**

### Variable Information

%s = Exception information

### Explanation

Failed to get system information.

### System Action

Stops the processing.

### User Action

Check for the following causes:

- If there is no access authority for the repository storage directory, assign this access authority.
- If the repository storage directory has not been mounted, mount it.
- A non-Interstage process may be referencing a file in the repository storage directory. For this reason, do not refer to the file.
- If the message for the operation is output immediately after this message, take the action indicated by that message.

## 12.8.26 is20952

---

**IS: ERROR: is20952:The system information could not be deleted.(%s)**

### Variable Information

%s = Exception information

### Explanation

Failed to delete system information.

### System Action

Stops the processing.

### User Action

Check for the following causes:

- If there is no access authority for the repository storage directory, assign this access authority.
- If the repository storage directory has not been mounted, mount it.
- A non-Interstage process may be referencing a file in the repository storage directory. For this reason, do not refer to the file.
- If the message for the operation is output immediately after this message, take the action indicated by that message.

## 12.8.27 is20953

---

**IS: ERROR: is20953:Marshaling could not be performed.(%s)**

## Variable Information

%s = Exception information

## Explanation

Failed to marshal the system information.

## System Action

Stops the processing.

## User Action

Check for the following causes:

- If there is no access authority for the repository storage directory, assign this access authority.
- If the repository storage directory has not been mounted, mount it.
- A non-Interstage process may be referencing a file in the repository storage directory. For this reason, do not refer to the file.
- If the message for the operation is output immediately after this message, take the action indicated by that message.

## 12.8.28 is20954

---

**IS: ERROR: is20954:The system information could not be output.(%s)**

## Variable Information

%s = Exception information

## Explanation

Failed to output the system information.

## System Action

Stops the processing.

## User Action

Check for the following causes:

- If there is no access authority for the repository storage directory, assign this access authority.
- If the repository storage directory has not been mounted, mount it.
- A non-Interstage process may be referencing a file in the repository storage directory. For this reason, do not refer to the file.
- If the message for the operation is output immediately after this message, take the action indicated by that message.

## 12.8.29 is20955

---

**IS: ERROR: is20955:No authority to execute restoration command.**

## Explanation

Processing failed because there was no authority to execute the command.

## System Action

Stops the processing.

## User Action

Check the authority of the user who executed the command and reexecute.

## 12.8.30 is20956

---

**IS: ERROR: is20956:JAVA\_HOME is not JDK/JRE 1.4.**

### Explanation

Failed to process the value set in JAVA\_HOME because it is not JDK/JRE1.4.

### System Action

Stops the processing.

### User Action

Set the JDK/JRE1.4 installation directory in the JAVA\_HOME environment variable and reexecute.

## 12.8.31 is20999

---

**IS: ERROR: is20999: A system error occurred (%s)**

### Variable Information

%s = Exception information

### Explanation

An operation managed by the business configuration management failed because of a system error.

### System Action

Stops the processing.

### User Action

Take the following action for each string in the exception information.

[IOException]

- If there is no access authority for the repository storage directory, assign this access authority.
- If the repository storage directory has not been mounted, mount it.
- A non-Interstage process may be referencing a file in the repository storage directory. For this reason, do not refer to the file.
- The disk space specified in the directory for storing the repository may be insufficient. Check the disk space. If the disk space is limited, delete unnecessary files or change the directory for storing the repository and relaunch the operation.
- If the message for the operation is output immediately after this message, take the action indicated by that message.

[OutOfMemoryError]

- The Java VM memory is insufficient. Wait for a while and reexecute.

[Other cases]

- Use the *iscollectinfo* command to collect diagnostic information and send this information to a Systems Engineer.

## 12.9 is21000 to is21099

---

This section details the messages with message numbers between is21000 and is21099.

### 12.9.1 is21002

---

**IS: ERROR: is21002: An error was detected during a system call. CODE=gui-%d1-%d2-%d3-%d4**

### Variable Information

%d1 = Reason code1

%d2 = Reason code2

%d3= Reason code3

%d4 = Reason code4

#### Explanation

An error occurred during a system call.

#### System Action

Processing stops.

#### User Action

Refer to the User Action relevant to the reason code.

Table 12.24 is20102 Reason Code Explanations

Reason Code1	Reason	Action
1038	The component transaction service may not have been installed, or an error may exist in the installation environment.	Install the component transaction service.
Other	An error occurred during a system call.	Use the <i>iscollectinfo</i> command to collect the information, and then contact your systems engineer.

## 12.9.2 is21010

---

### IS: INFO: is21010: INTERSTAGE Operation Tool started normally

#### Explanation

The Interstage Operation Tool service was started normally.

## 12.9.3 is21011

---

### IS: INFO: is21011: INTERSTAGE Operation Tool stopped normally

#### Explanation

The Interstage Operation Tool service stopped normally.

## 12.9.4 is21012

---

### IS: ERROR: is21012: INTERSTAGE Operation Tool unable to start : CODE=%d1-%d2

#### Variable Information

%d1 = Reason Code1

%d2 = Reason Code2

#### Explanation

The Interstage Operation Tool service failed to start.

#### System Action

Processing stops.

#### User Action

Perform the corrective action indicated for the reason code, as shown in the following table.

Table 12.25 is21012 Reason Codes and Required Action

%d1	%d2	Corrective Measures
1002	-	There is a temporary resource or memory shortage.
1003	-	Execute the process again later. If this message is generated frequently, refer to the Tuning Guide, reestimate the memory required to run Interstage, and check whether there is enough memory.
1004	-	
1005	-	
1006	-	
2001	2	<p>There are not enough system resources. Contact the system administrator.</p> <p>It may be possible that the upper limit for the number of threads in the system has been exceeded. Change the upper limit.</p>
2001	Except 2	<p><b>Windows32/64</b></p> <p>Take the action indicated by the other message output in the event log at the same time.</p> <p><b>Solaris32/64</b> <b>Linux32/64</b></p> <p>Take the action indicated by the other message output in the system log at the same time.</p>
2002	<b>Windows32/64</b>	Make sure that the PATH environment variable contains "C:\Interstage\bin".
	126	
2002	1001	Stop any applications not required and reexecute the command.
2002	1002	The user has no access rights to the installed Interstage Operation Tool.
2002	1003	Reinstall the Interstage Operation Tool.
2002	1004	<p>There is a memory shortage. Execute the process again later. If this message is generated frequently, refer to the Tuning Guide, reestimate the memory required to run Interstage, and check whether there is enough memory.</p> <p>If there is enough memory to run Interstage, there may be inadequate memory to run other applications. Reestimate the amount of memory required for the other applications running on the same machine to determine if there is an appropriate amount of memory.</p> <p>Contact your system administrator if the reestimation indicates that the memory is insufficient. Ask the system administrator to either increase the size of the main memory or to increase the size of the page file.</p>
2002	9999	<p>Use the <i>iscollectinfo</i> command to collect investigation information, and contact your systems engineer.</p> <p><b>Solaris32/64</b> <b>Linux32/64</b></p> <p>Alternatively, if the FJSVisas package has not been installed, install it and reexecute processing.</p>
3001	-	Reinstall the Interstage Operation Tool.
3002	-	
3003	-	
5005	<b>Windows32/64</b>	OD is not installed. Install OD.
	8,11	

%d1	%d2	Corrective Measures
	Solaris32/64 Linux32/64 1	
	Windows32/64 12,14 Solaris32/64 Linux32/64 2	TD is not installed. Install TD.
	Windows32/64 15,18 Solaris32/64 Linux32/64 3	EXTP is not installed. Install EXTP.
	Other	The mandatory Interstage products are not installed. Reinstall Interstage.
Solaris32/64 Linux32/64 5555	-	The IPC key value required for starting the Interstage Operation Tool is duplicated and must be customized. For more information, refer to "Other Customization Items" in the "System Tuning" chapter of the Tuning Guide.
Solaris32/64 Linux32/64 6001	-	Since it is an Admin Server, the Interstage Operation Tool cannot be started. Do not operate it.

## 12.9.5 is21013

### IS: ERROR: is21013: INTERSTAGE Operation Tool unable to stop : CODE=%d1-%d2

#### Variable Information

%d1 = Reason Code1

%d2 = Reason Code2

#### Explanation

The Interstage Operation Tool service failed to stop.

#### System Action

Processing stops.

#### User Action

Perform the corrective action indicated for the reason code, as shown in the following table.

Table 12.26 is21013 Reason Codes and Required Action

%d1	%d2	Corrective Measures
1001	-	Collect diagnostic information using the <i>iscollectinfo</i> command, and then contact your systems engineer.

%d1	%d2	Corrective Measures
1003	-	Collect diagnostic information using the <i>iscollectinfo</i> command, and then contact your systems engineer.
1004	-	Reinstall the Interstage Operation Tool.
1005	-	Collect diagnostic information using the <i>iscollectinfo</i> command, and then contact your systems engineer.
2001	-	<p><b>Windows32/64</b></p> <p>Refer to the message that is output in the event log at the same time.</p> <p><b>Solaris32/64</b> <b>Linux32/64</b></p> <p>Use the <i>iscollectinfo</i> command to collect investigation information. Send the error information to a Systems Engineer.</p>
4001	-	Reexecute processing.
5001	-	There is no need to take any action because Interstage Operation Tool is in the process of being stopped.
6001	-	<p>If x is '28', it may be possible that there are not enough message queues. Contact the system administrator.</p> <p>Ask the system administrator to add the estimates described in the following sections of the Tuning Guide: 'System Tuning', 'System Resources for Operating Interstage Server Function', 'Component Transaction Service System Environment Settings', 'System Parameters', and 'Interstage Operation Tool'.</p> <p>If the problem is still not resolved, use the <i>iscollectinfo</i> command to collect investigation information. Send the error information to a Systems Engineer.</p>
<p><b>Solaris32/64</b> <b>Linux32/64</b></p> <p>6001</p>	-	Since it is an Admin Server, the Interstage Operation Tool cannot be started. Do not operate it.
7001	-	Collect diagnostic information using the <i>iscollectinfo</i> command, and then contact your systems engineer.
8001	-	Collect diagnostic information using the <i>iscollectinfo</i> command, and then contact your systems engineer.
9999	-	<p>There is not enough memory. Wait for a while and reexecute processing. If this message is output frequently, refer to the Tuning Guide, reestimate the memory that is needed to run Interstage, and confirm that there is enough memory.</p> <p>If the memory secured for Interstage is adequate, it may be that there is not enough memory for use by other applications. Estimate the memory used for running other applications on the same machine, and investigate whether the memory is sufficient.</p> <p>If it is confirmed that there is not enough memory as a result of reestimating the memory, contact the system administrator. Ask the administrator to expand the main memory or extend the swap area.</p>

## 12.9.6 is21021

**IS: ERROR: is21021: INTERSTAGE Operation Tool stopped abnormally : CODE=%d1-%d2-%d3**

### Variable Information

%d1 = Reason Code1

%d2 = Reason Code2

%d3: Reason Code3

## Explanation

The Interstage Operation Tool service terminated abnormally.

## System Action

Processing stops.

## User Action

Perform the corrective action indicated for the reason code shown in the following table.

Table 12.27 is21021 Reason Codes and Required Action

%d1	%d2	%d3	Corrective Measures
1004	-	-	<p>There is a memory shortage. Execute the process again later. If this message is generated frequently, refer to the Tuning Guide, reestimate the memory required to run Interstage, and check whether there is enough memory.</p> <p>If there is enough memory to run Interstage, there may be inadequate memory to run other applications. Reestimate the amount of memory required for the other applications running on the same machine to determine if there is an appropriate amount of memory.</p> <p>Contact your system administrator if the reestimation indicates that the memory is insufficient. Ask the system administrator to either increase the size of the main memory or to increase the size of the page file.</p>
2001	0	0	<p>Collect diagnostic information using the <i>iscollectinfo</i> command, and then contact your systems engineer.</p>
	-	-	<p><b>Windows32/64</b></p> <p>Refer to the message that is output in the event log at the same time.</p> <p>If no message is output, collect the files under C:\Interstage\gui\trc\ and the investigation information collected using the <i>iscollectinfo</i> command. Send this information to a Systems Engineer.</p> <p><b>Solaris32/64</b> <b>Linux32/64</b></p> <p>Refer to the message that is output in the system log at the same time.</p> <p>If no message is output, collect the files under /var/opt/FJSVisgui/trc and the investigation information collected using the <i>iscollectinfo</i> command. Send this information to a Systems Engineer.</p> <p><b>Solaris32/64</b></p> <p>If the system in which the error occurred is an extended system, collect the files under /var/opt/FJSVisas/system/system name/FJSVisgui/var/trc and investigation information using the <i>iscollectinfo</i> command. Send this information to a Systems Engineer.</p>
<b>Solaris32/64</b> <b>Linux32/64</b> 5003	2	2	<p>The IPC key value required for starting the Interstage Operation Tool is duplicated and must be customized. For more information, refer to "Other Customization Items" in the "System Tuning" chapter of the Tuning Guide.</p>

## 12.9.7 is21026

**IS: ERROR: is21026: An error occurred in initialization of INTERSTAGE Operation Tool : CODE=%s**

### Variable Information

%s = Reason Code

## Explanation

An error occurred in the initialization of the Interstage Operation Tool service.

## System Action

Processing stops.

## User Action

Perform the corrective action indicated for the reason code in the following table.

The reason codes are indicated in 5001-x-y-z format. Carry out the corrective measures indicated under x, y, or z.

If there is no explanation for the reason code, use the *iscollectinfo* command to collect investigation information. Send this information to a Systems Engineer.

Table 12.28 is21026 Reason Codes and Required Action

x	y	z	Corrective Measures
1	3	x	Collect diagnostic information using the <i>iscollectinfo</i> command, and then contact your systems engineer.
2	3	x	<p><b>Windows32/64</b></p> <p>Required software is not installed. Install the required software.</p> <p><b>Solaris32/64</b> <b>Linux32/64</b> An essential package has not been installed. Install the essential package. If essential packages have been installed, check that they have been installed correctly.</p>
3	1	1	There is a shortage of installation resources. Reinstall the Interstage Operation Tool.
		2	Collect diagnostic information using the <i>iscollectinfo</i> command, and then contact your systems engineer.
		3	The Client timer value is incorrect. Specify a valid value.
		4 to 7	Collect diagnostic information using the <i>iscollectinfo</i> command, and then contact your systems engineer.
		9	There is a shortage of installation resources. Reinstall the Interstage Operation Tool.
		10	Collect diagnostic information using the <i>iscollectinfo</i> command, and then contact your systems engineer.
		11	<p>There is a memory shortage. Execute the process again later. If this message is generated frequently, refer to the Tuning Guide, reestimate the memory required to run Interstage, and check whether there is enough memory.</p> <p>If there is enough memory to run Interstage, there may be inadequate memory to run other applications. Reestimate the amount of memory required for the other applications running on the same machine to determine if there is an appropriate amount of memory.</p> <p>Contact your system administrator if the reestimation indicates that the memory is insufficient. Ask the system administrator to either increase the size of the main memory or to increase the size of the page file.</p>
		12 to 19	Collect diagnostic information using the <i>iscollectinfo</i> command, and then contact your systems engineer.
		20	The value specified in the environment definition file is invalid. Specify a valid value.
		21 to 23	Collect diagnostic information using the <i>iscollectinfo</i> command, and then contact your systems engineer.
		24	Reinstall the Interstage Operation Tool.
25	Collect diagnostic information using the <i>iscollectinfo</i> command, and then contact your systems engineer.

## 12.10 is21100 to is21199

This section details messages numbered between is21100 and is21199.

### 12.10.1 is21100

**IS: ERROR: is21100: The virtual host could not be updated. Allocation destination server or allocation destination Server Group of the virtual host = %s1, virtual host before update = %s2, virtual host after update = %s3**

#### Variable Information

%s1: Name of the allocation destination server or allocation destination Server Group of the virtual host

%s2: Name of the virtual host before update

%s3: Name of the virtual host after update

#### Explanation

The virtual host could not be updated.

#### System Action

Terminates the processing

## User Action

A message indicating the cause of the error is output at the same time. Follow the instructions in the message.

### 12.10.2 is21101

---

**IS: ERROR: is21101: The specified execution class name already exists. IJServer = %s1, execution class = %s2**

#### Variable Information

%s1: IJServer name

%s2: Execution class name

#### Explanation

The execution class could not be added because the specified execution class name already exists.

#### System Action

Terminates the processing

#### User Action

Specify a different execution class name.

### 12.10.3 is21102

---

**IS: ERROR: is21102: The module could not be reactivated. IJServer = %s1, module name = %s2**

#### Variable Information

%s1: IJServer name

%s2: Module name

#### Explanation

The module could not be reactivated to any of the Managed Servers.

#### System Action

Terminates the processing

#### User Action

A message indicating the cause of the error is output at the same time. Follow the instructions in the message.

### 12.10.4 is21103

---

**IS: ERROR: is21103: The common port could not be obtained. IJServer = %s**

#### Variable Information

%s = IJServer name

#### Explanation

Creating a new IJServer or updating the definition for the IJServer has failed because a free common port for Managed Servers could not be obtained.

#### System Action

Terminates the processing

## User Action

Obtain a free common port for Managed Servers, and execute the processing again.

## 12.10.5 is21104

---

**IS: ERROR: is21104: The specified IJServer does not exist. IJServer = %s**

### Variable Information

%s = IJServer name

### Explanation

The processing failed because the specified IJServer does not exist.

### System Action

Terminates the processing

### User Action

- Check the IJServer name and execute the processing again.
- If multiserver management is used, and this message is output during an IJServer operation, the IJServer may not exist for the management target server in which the error occurred.

In this case, in the Admin Server Interstage Management Console click [Application Management] > [Interstage Management Console] > [Interstage Application Server] > [WorkUnit] > [IJServer Name] > [Operate].

In the environment settings error in this window, check whether the creation or deletion of the IJServer failed. If the creation of the IJServer failed, establish the cause, create the IJServer and then reexecute processing.

If the deletion of the IJServer failed, there is no need to take action in the management target server in which this message was output. Since the attempt to delete the IJServer failed in a management target server of another distribution destination, take action in that server.

## 12.10.6 is21105

---

**IS: ERROR: is21105: The specified IJServer already exists IJServer = %s**

### Variable Information

%s = IJServer name

### Explanation

The processing failed because the specified IJServer already exists.

### System Action

Terminates the processing

### User Action

Execute the processing again using a different name.

## 12.10.7 is21106

---

**IS: ERROR: is21106: The specified deployment file does not exist. Specify the correct path for the deployment file. File name = %s**

### Variable Information

%s = File name

## Explanation

The processing failed because the file specified could not be found on the Managed Server.

## System Action

Terminates the processing

## User Action

Specify the correct path for the deployment file and execute the processing again.

A file on the network drive cannot be specified for allocating the deployment file if the Admin Server is selected. Specify a file on the Admin Server instead.

## 12.10.8 is21107

---

**IS: ERROR: is21107: Deployment has failed because none the servers could be terminated. IJServer = %s**

## Variable Information

%s = IJServer name

## Explanation

Deployment failed because termination of IJServer failed on all servers.

## System Action

Terminates the processing

## User Action

A message indicating the cause of the error is output at the same time. Follow the instructions in the message.

## 12.10.9 is21108

---

**IS: ERROR: is21108: Deployment has failed because the file could not be up-loaded to any of the Managed Servers. IJServer = %s1, Module = %s2**

## Variable Information

%s1: IJServer name

%s2: Module name

## Explanation

Deployment has failed because the file could not be up-loaded to any of the Managed Servers.

## System Action

Terminates the processing

## User Action

A message indicating the cause of the error is output at the same time. Follow the instructions in the message.

## 12.10.10 is21109

---

**IS: ERROR: is21109: The client distribution data could not be downloaded. IJServer = %s1, Module = %s2, Server = %s3, Information=%s4**

### Variable Information

%s1: JIIServer name  
%s2: Module name  
%s3: Server name  
%s4: Error information

### Explanation

The EJB client distribution data could not be downloaded.

### System Action

Terminates the processing

### User Action

A message indicating the cause of the error is output at the same time. Follow the instructions in the message.

## 12.10.11 is21110

---

**IS: ERROR: is21110: The deployment file could not be read. File = %s**

### Variable Information

%s = File name

### Explanation

The deployment file could not be read.

### System Action

Terminates the processing

### User Action

The deployment file may have been damaged. Check the deployment file and execute the processing again.

## 12.10.12 is21111

---

**IS: ERROR: is21111: The format of the specified file is invalid. File = %s**

### Variable Information

%s1: File name

### Explanation

The deployment file type could not be obtained.

### System Action

Terminates the processing

### User Action

Check the contents of the deployment file and execute the processing again.

## 12.10.13 is21112

---

---

**IS: ERROR: is21112: Deployment by overwriting failed because some servers failed to deploy. IJServer = %s1, Module = %s2**

**Variable Information**

%s1: IJServer name

%s2: Module name

**Explanation**

Deployment by overwriting failed because some servers had failed to deploy.

**System Action**

Terminates the processing

**User Action**

Remove from the servers the cause of the failure to deploy, and execute the deployment retry operation. Then execute the deployment by overwriting again.

## 12.10.14 is21113

---

**IS: ERROR: is21113: IJServer delete processing has failed in parts. IJServer = %s**

**Variable Information**

%s = IJServer name

**Explanation**

IJServer delete processing failed for some of the Managed Servers.

**System Action**

Terminates the processing

**User Action**

A message indicating the cause of the error is output at the same time. Follow the instructions in the message.

## 12.10.15 is21114

---

**IS: ERROR: is21114: IJServer delete processing has failed. IJServer = %s**

**Variable Information**

%s = IJServer name

**Explanation**

IJServer delete processing failed for all of the Managed Servers.

**System Action**

Terminates the processing

**User Action**

A message indicating the cause of the error is output at the same time. Follow the instructions in the message.

## 12.10.16 is21115

---

**IS: ERROR: is21115: Undeployment processing has failed in parts. IJServer = %s1 Module = %s2**

### Variable Information

%s1: IJServer name

%s2: Module name

### Explanation

Undeployment processing failed for some of the Managed Servers.

### System Action

Terminates the processing

### User Action

A message indicating the cause of the error is output at the same time. Follow the instructions in the message.

## 12.10.17 is21116

---

**IS: ERROR: is21116: Undeployment processing has failed. IJServer = %s1 Module = %s2**

### Variable Information

%s1: IJServer name

%s2: Module name

### Explanation

Undeployment processing failed for all of the Managed Servers.

### System Action

Terminates the processing

### User Action

A message indicating the cause of the error is output at the same time. Follow the instructions in the message.

## 12.10.18 is21117

---

**IS: ERROR: is21117: IJServer activation processing has failed in parts. IJServer = %s1**

### Variable Information

%s1: IJServer name

### Explanation

IJServer activation processing failed for some of the Managed Servers.

### System Action

Terminates the processing

### User Action

A message indicating the cause of the error is output at the same time. Follow the instructions in the message.

## 12.10.19 is21118

---

**IS: ERROR: is21118: IJServer activation processing has failed. IJServer = %s1**

### Variable Information

%s1: IJServer name

### Explanation

IJServer activation processing failed for some of the Managed Servers.

### System Action

Terminates the processing

### User Action

A message indicating the cause of the error is output at the same time. Follow the instructions in the message.

## 12.10.20 is21119

---

**IS: ERROR: is21119: IJServer termination processing has failed in parts. IJServer = %s**

### Variable Information

%s = IJServer name

### Explanation

IJServer termination processing failed for some of the Managed Servers.

### System Action

Terminates the processing

### User Action

A message indicating the cause of the error is output at the same time. Follow the instructions in the message.

## 12.10.21 is21120

---

**IS: ERROR: is21120: IJServer termination processing has failed. IJServer = %s**

### Variable Information

%s = IJServer name

### Explanation

IJServer termination processing failed for all of the Managed Servers.

### System Action

Terminates the processing

### User Action

A message indicating the cause of the error is output at the same time. Follow the instructions in the message.

## 12.10.22 is21121

---

**IS: ERROR: is21121: Message queue closure processing has failed in parts. IJServer = %s**

### Variable Information

%s = IJServer name

### Explanation

Message queue closure processing failed for some of the Managed Servers.

### System Action

Terminates the processing

### User Action

A message indicating the cause of the error is output at the same time. Follow the instructions in the message.

## 12.10.23 is21122

---

**IS: ERROR: is21122: Message queue closure processing has failed. IJServer = %s**

### Variable Information

%s = IJServer name

### Explanation

Message queue closure processing failed for some or all of the Managed Servers.

### System Action

Terminates the processing

### User Action

A message indicating the cause of the error is output at the same time. Follow the instructions in the message.

## 12.10.24 is21123

---

**IS: ERROR: is21123: Message queue closure cancellation processing has failed in parts. IJServer = %s**

### Variable Information

%s = IJServer name

### Explanation

Message queue closure cancellation processing failed for some of the Managed Servers.

### System Action

Terminates the processing

### User Action

A message indicating the cause of the error is output at the same time. Follow the instructions in the message.

## 12.10.25 is21124

---

**IS: ERROR: is21124: Message queue closure cancellation processing has failed. IJServer = %s**

### Variable Information

%s = IJServer name

### Explanation

Message queue closure cancellation processing failed for all of the Managed Servers.

### System Action

Terminates the processing

### User Action

A message indicating the cause of the error is output at the same time. Follow the instructions in the message.

## 12.10.26 is21125

---

**IS: ERROR: is21125: Deployment processing has failed in parts. IJServer = %s1, Module = %s2**

### Variable Information

%s1: IJServer name

%s2: Module name

### Explanation

Deployment processing failed for some of the Managed Servers.

### System Action

Terminates the processing

### User Action

A message indicating the cause of the error is output at the same time. Follow the instructions in the message.

## 12.10.27 is21126

---

**IS: ERROR: is21126: Deployment processing has failed. IJServer = %s1, Module = %s2**

### Variable Information

%s1: IJServer name

%s2: Module name

### Explanation

Deployment processing failed for all of the Managed Servers.

### System Action

Terminates the processing

### User Action

A message indicating the cause of the error is output at the same time. Follow the instructions in the message.

A file on the network drive cannot be specified for allocating the deployment file if the Admin Server is selected. Specify a file on the Admin Server instead.

## 12.10.28 is21127

---

### IS: ERROR: is21127: Creating a new IJServer has failed in parts. IJServer = %s

#### Variable Information

%s = IJServer name

#### Explanation

Creating a new IJServer failed for some of the Managed Servers.

#### System Action

Terminates the processing

#### User Action

A message indicating the cause of the error is output at the same time. Follow the instructions in the message, and set up the environment for the IJServer.

## 12.10.29 is21128

---

### IS: ERROR: is21128: Creating a new IJServer has failed. IJServer = %s

#### Variable Information

%s = IJServer name

#### Explanation

Creating a new IJServer failed for all of the Managed Servers.

#### System Action

Terminates the processing

#### User Action

A message indicating the cause of the error is output at the same time. Follow the instructions in the message, and set up the environment for the IJServer.

## 12.10.30 is21129

---

### IS: ERROR: is21129: IJServer definition could not be updated. IJServer = %s

#### Variable Information

%s = IJServer name

#### Explanation

IJServer definition could not be updated for any of the Managed Servers.

#### System Action

Terminates the processing

## User Action

A message indicating the cause of the error is output at the same time. Follow the instructions in the message.

### 12.10.31 is21130

---

**IS: ERROR: is21130: IJServer definition could not be updated in parts. IJServer = %s**

#### Variable Information

%s = IJServer name

#### Explanation

IJServer definition could not be updated for some of the Managed Servers.

#### System Action

Terminates the processing

#### User Action

A message indicating the cause of the error is output at the same time. Follow the instructions in the message.

### 12.10.32 is21131

---

**IS: ERROR: is21131: The execution class could not be added in parts. IJServer = %s1 Execution class = %s2**

#### Variable Information

%s1: IJServer name

%s2: Execution class name

#### Explanation

The execution class could not be added to some of the Managed Servers.

#### System Action

Terminates the processing

#### User Action

A message indicating the cause of the error is output at the same time. Follow the instructions in the message, and set up the environment for the execution class.

### 12.10.33 is21132

---

**IS: ERROR: is21132: The execution class could not be added. IJServer = %s1 Execution class = %s2**

#### Variable Information

%s1: IJServer name

%s2: Execution class name

#### Explanation

The execution class could not be added to any of the Managed Servers.

## System Action

Terminates the processing

## User Action

A message indicating the cause of the error is output at the same time. Follow the instructions in the message, and set up the environment for the execution class.

## 12.10.34 is21133

---

**IS: ERROR: is21133: The execution class could not be deleted in parts. IJServer = %s1 Execution class = %s2**

## Variable Information

%s1: IJServer name

%s2: Execution class name

## Explanation

The IJServer execution class could not be deleted from some of the Managed Servers.

## System Action

Terminates the processing

## User Action

A message indicating the cause of the error is output at the same time. Follow the instructions in the message.

## 12.10.35 is21134

---

**IS: ERROR: is21134: The execution class could not be deleted. IJServer = %s1 Execution class = %s2**

## Variable Information

%s1: IJServer name

%s2: Execution class name

## Explanation

The IJServer execution class could not be deleted from any of the Managed Servers.

## System Action

Terminates the processing

## User Action

A message indicating the cause of the error is output at the same time. Follow the instructions in the message.

## 12.10.36 is21135

---

**IS: ERROR: is21135: The execution class could not be updated in parts. IJServer = %s1 Execution class = %s2**

## Variable Information

%s1: IJServer name

%s2: Execution class name

#### Explanation

The IIServer execution class could not be updated for some of the Managed Servers.

#### System Action

Terminates the processing

#### User Action

A message indicating the cause of the error is output at the same time. Follow the instructions in the message.

### 12.10.37 is21136

---

**IS: ERROR: is21136: The execution class could not be updated in parts. IIServer = %s1 Execution class = %s2**

#### Variable Information

%s1: IIServer name

%s2: Execution class name

#### Explanation

The IIServer execution class could not be updated for any of the Managed Servers.

#### System Action

Terminates the processing

#### User Action

A message indicating the cause of the error is output at the same time. Follow the instructions in the message.

### 12.10.38 is21137

---

**IS: ERROR: is21137: The name conversion definition could not be updated in parts. IIServer = %s1 Module = %s2**

#### Variable Information

%s1: IIServer name

%s2: Module name

#### Explanation

The name conversion definition could not be updated for some Managed Servers.

#### System Action

Terminates the processing

#### User Action

A message indicating the cause of the error is output at the same time. Follow the instructions in the message.

### 12.10.39 is21138

---

---

**IS: ERROR: is21138: The name conversion definition could not be updated. IJServer = %s1 Module = %s2**

**Variable Information**

%s1: IJServer name

%s2: Module name

**Explanation**

The name conversion definition could not be updated for any of Managed Servers.

**System Action**

Terminates the processing

**User Action**

A message indicating the cause of the error is output at the same time. Follow the instructions in the message.

## 12.10.40 is21139

---

**IS: ERROR: is21139: Environment setup for the EAR module has failed in parts. IJServer = %s1 Module = %s2**

**Variable Information**

%s1: IJServer name

%s2: Module name

**Explanation**

Environment setup for the EAR module failed for some of the Managed Servers.

**System Action**

Terminates the processing

**User Action**

A message indicating the cause of the error is output at the same time. Follow the instructions in the message.

## 12.10.41 is21140

---

**IS: ERROR: is21140: Environment setup for the EAR module has failed. IJServer = %s1 Module = %s2**

**Variable Information**

%s1: IJServer name

%s2: Module name

**Explanation**

Environment setup for the EAR module failed for all of the Managed Servers.

**System Action**

Terminates the processing

**User Action**

A message indicating the cause of the error is output at the same time. Follow the instructions in the message.

## 12.10.42 is21141

---

**IS: ERROR: is21141: Environment setup for the ejb-jar module has failed in parts. IJServer = %s1 Module = %s2**

### Variable Information

%s1: IJServer name

%s2: Module name

### Explanation

Environment setup for the ejb-jar module failed for some of the Managed Servers.

### System Action

Terminates the processing

### User Action

A message indicating the cause of the error is output at the same time. Follow the instructions in the message.

## 12.10.43 is21142

---

**IS: ERROR: is21142: Environment setup for the ejb-jar module has failed. IJServer = %s1 Module = %s2**

### Variable Information

%s1: IJServer name

%s2: Module name

### Explanation

Environment setup for the ejb-jar module failed for all of the Managed Servers.

### System Action

Terminates the processing

### User Action

A message indicating the cause of the error is output at the same time. Follow the instructions in the message.

## 12.10.44 is21143

---

**IS: ERROR: is21143: Environment setup for the Web application has failed in parts. IJServer = %s1 Application = %s2**

### Variable Information

%s1: IJServer name

%s2: Application name

### Explanation

Environment setup for the Web application failed for some of the Managed Servers.

### System Action

Terminates the processing

## User Action

A message indicating the cause of the error is output at the same time. Follow the instructions in the message.

## 12.10.45 is21144

---

**IS: ERROR: is21144: Environment setup for the Web application has failed. IJServer = %s1 Application = %s2**

### Variable Information

%s1: IJServer name

%s2: Application name

### Explanation

Environment setup for the Web application failed for all of the Managed Servers.

### System Action

Terminates the processing

### User Action

A message indicating the cause of the error is output at the same time. Follow the instructions in the message.

## 12.10.46 is21145

---

**IS: ERROR: is21145: The resource adapter definition could not be set in parts. IJServer = %s1 Resource adapter definition = %s2**

### Variable Information

%s1: IJServer name

%s2: Resource adapter definition name

### Explanation

The resource adapter definition could not be set for some of the Managed Servers.

### System Action

Terminates the processing

### User Action

A message indicating the cause of the error is output at the same time. Follow the instructions in the message.

## 12.10.47 is21146

---

**IS: ERROR: is21146: The resource adapter definition could not be set. IJServer = %s1 Resource adapter definition = %s2**

### Variable Information

%s1: IJServer name

%s2: Resource adapter definition name

### Explanation

The resource adapter definition could not be set for any of the Managed Servers.

### System Action

Terminates the processing

### User Action

A message indicating the cause of the error is output at the same time. Follow the instructions in the message.

## 12.10.48 is21147

---

**IS: ERROR: is21147: Environment setup for the EJB application has failed in parts. IJServer = %s1 Application = %s2**

### Variable Information

%s1: IJServer name

%s2: Application name

### Explanation

Environment setup for the EJB application failed for some of the Managed Servers.

### System Action

Terminates the processing

### User Action

A message indicating the cause of the error is output at the same time. Follow the instructions in the message.

## 12.10.49 is21148

---

**IS: ERROR: is21148: Environment setup for the EJB application has failed. IJServer = %s1 Application = %s2**

### Variable Information

%s1: IJServer name

%s2: Application name

### Explanation

Environment setup for the EJB application failed for all of the Managed Servers.

### System Action

Terminates the processing

### User Action

A message indicating the cause of the error is output at the same time. Follow the instructions in the message.

## 12.10.50 is21149

---

**IS: ERROR: is21149: The IJServer log definition could not be updated in parts. IJServer = %s**

#### Variable Information

%s1: IJServer name

#### Explanation

The IJServer log definition could not be updated for some of the Managed Servers.

#### System Action

Terminates the processing

#### User Action

A message indicating the cause of the error is output at the same time. Follow the instructions in the message.

### 12.10.51 is21150

---

**IS: ERROR: is21150: The IJServer log definition could not be updated. IJServer = %s**

#### Variable Information

%s1: IJServer name

#### Explanation

The IJServer log definition could not be updated for any of the Managed Servers.

#### System Action

Terminates the processing

#### User Action

A message indicating the cause of the error is output at the same time. Follow the instructions in the message.

### 12.10.52 is21151

---

**IS: ERROR: is21151: The processing could not be executed because another user was using the same IJServer for their processing. IJServer name = %s**

#### Variable information

%s = IJServer name

#### Explanation

The processing could not be executed because another user was using the same IJServer for processing that could not be executed simultaneously.

#### System Action

Terminates the processing

#### User Action

Execute the processing again after the other user finishes their processing.

### 12.10.53 is21152

---

**IS: ERROR: is21152: An internal conflict has occurred.**

## Explanation

An internal conflict has occurred.

## System Action

Terminates the processing

## User Action

Use the *iscollectinfo* command to collect the error log, and contact the engineer in charge.

## 12.10.54 is21153

---

**IS: ERROR: is21153: IJServer status could not be obtained in some parts. IJServer = %s**

## Variable Information

%s1: IJServer name

## Explanation

IJServer status could not be obtained for some of the Managed Servers.

## System Action

Terminates the processing

## User Action

A message indicating the cause of the error is output at the same time. Follow the instructions in the message.

## 12.10.55 is21154

---

**IS: ERROR: is21154: IJServer status could not be obtained. IJServer = %s**

## Variable Information

%s = IJServer name

## Explanation

IJServer status could not be obtained for any of the Managed Servers.

## System Action

Terminates the processing

## User Action

A message indicating the cause of the error is output at the same time. Follow the instructions in the message.

## 12.10.56 is21155

---

**IS: ERROR: is21155: IJServer has not started IJServer=%s**

## Variable Information

%s = IJServer name

## Explanation

Failed to process because IJServer has not started.

## System Action

Terminates the processing

## User Action

Start the specified IJServer and then reexecute.

## 12.10.57 is21156

---

**IS: ERROR: is21156: IJServer cannot be stopped in any of the specified Managed Servers IJServer=%s**

### Variable Information

%s = IJServer name

### Explanation

The attempt to stop the IJServer failed, these are possible causes:

- The environment settings of all the Managed Servers to which the IJServer (%s) has been deployed failed.
- If the servers allocated to the Servlet container and the EJB container are different in the IJServer (%s), Line type linkage between the containers could not be established.

## System Action

Stops processing.

## User Action

Correct the environment settings of the Managed Servers, and then execute processing again.

If the server allocated to the Servlet container and EJB container are different, make the Server Group serial number in the Servlet container and EJB container the same.

## 12.10.58 is21157

---

**IS: ERROR: is21157: The specified EAR module does not exist. IJServer = %s1, Module = %s2**

### Variable Information

%s1: IJServer name

%s2: Module name

### Explanation

Failed to set the target (EAR module) in the target environment because the deployment of the target (EAR module) specified in all the management target servers failed.

## System Action

Terminates the processing

## User Action

Establish the cause of the deployment failure in the management target server and then retry the deployment.

To retry the deployment, in the Interstage Management Console click [Application Management] > [Interstage Management Console] > [Interstage Application Server] > [WorkUnit] > [IJServer Name].

Click the Application Status/Undeployment tab, select the module in which the error occurred, and then click the [Retry Deployment] button. Following this operation, the application is deployed in the management target server that was not deployed.

## 12.10.59 is21158

---

**IS: ERROR: is21158: The specified ejb-jar module does not exist. IJServer = %s1, Module = %s2**

### Variable Information

%s1: IJServer name

%s2: Module name

### Explanation

Failed to set the target (ejb-jar module) in the target environment because the deployment of the target (ejb-jar module) specified in all the management target servers failed.

### System Action

Terminates the processing

### User Action

Establish the cause of the deployment failure in the management target server and then retry the deployment.

To retry the deployment, in the Interstage Management Console click [Application Management] > [Interstage Management Console] > [Interstage Application Server] > [WorkUnit] > [IJServer Name].

Click the Application Status/Undeployment tab, select the module in which the error occurred, and then click the [Retry Deployment] button. Following this operation, the application is deployed in the management target server that was not deployed.

## 12.10.60 is21159

---

**IS: ERROR: is21159: The specified Web application does not exist. IJServer = %s1, Application = %s2**

### Variable Information

%s1: IJServer name

%s2: Application name

### Explanation

Failed to set the target (Web application) in the target environment because the deployment of the target (Web application) specified in all the management target servers failed.

### System Action

Terminates the processing

### User Action

Establish the cause of the deployment failure in the management target server and then retry the deployment.

To retry the deployment, in the Interstage Management Console click [Application Management] > [Interstage Management Console] > [Interstage Application Server] > [WorkUnit] > [IJServer Name].

Click the Application Status/Undeployment tab, select the module in which the error occurred, and then click the [Retry Deployment] button. Following this operation, the application is deployed in the management target server that was not deployed.

## 12.10.61 is21160

---

**IS: ERROR: is21160: The specified resource adapter definition does not exist. IJServer = %s1 Resource adapter definition = %s2**

## Variable Information

%s1: IJServer name

%s2: Resource adapter definition name

## Explanation

Failed to set the target (resource adapter definition) in the target environment because the deployment of the target (resource adapter definition) specified in all the management target servers failed.

## System Action

Terminates the processing

## User Action

Establish the cause of the deployment failure in the management target server and then retry the deployment.

To retry the deployment, in the Interstage Management Console click [Application Management] > [Interstage Management Console] > [Interstage Application Server] > [WorkUnit] > [IJServer Name].

Click the Application Status/Undeployment tab, select the module in which the error occurred, and then click the [Retry Deployment] button. Following this operation, the application is deployed in the management target server that was not deployed.

## 12.10.62 is21161

---

**IS: ERROR: is21161: The specified EJB application does not exist. IJServer = %s1 Application = %s2**

## Variable Information

%s1: IJServer name

%s2: Application name

## Explanation

The processing failed because the specified EJB application did not exist.

## System Action

Terminates the processing

## User Action

Check the EJB application name and execute the processing again.

## 12.10.63 is21162

---

**IS: ERROR: is21162: The operation is not possible because the process to delete the specified IJServer failed IJServer=%s**

## Variable Information

%s = IJServer name

## Explanation

Failed to process because the process used to delete the specified IJServer has already been executed.

## System Action

Terminates the processing

#### User Action

Check the IJServer name and execute the processing again.

If the IJServer name is correct, delete the IJServer, recreate IJServer and reexecute processing.

### 12.10.64 is21163

---

**IS: ERROR: is21163: The specified IJServer message queue has not been closed. IJServer = %s**

#### Variable Information

%s = IJServer name

#### Explanation

The processing failed because the specified IJServer message queue was not closed.

#### System Action

Terminates the processing

#### User Action

Check the IJServer message queue status and execute the processing again.

### 12.10.65 is21164

---

**IS: ERROR: is21164: The specified IJServer is not in the state for activation. IJServer = %s**

#### Variable Information

%s = IJServer name

#### Explanation

The processing failed because the IJServer was not in the inactive state.

#### System Action

Terminates the processing

#### User Action

Check the specified IJServer status and execute the processing again.

### 12.10.66 is21165

---

**IS: ERROR: is21165: The specified IJServer message queue has already been closed. IJServer = %s**

#### Variable Information

%s = IJServer name

#### Explanation

The processing failed because the specified IJServer message queue had been already closed.

#### System Action

Terminates the processing

## User Action

Check the IJServer message queue status and execute the processing again.

## 12.10.67 is21166

---

**IS: ERROR: is21166: IJServer cannot be started in any of the specified Managed Servers IJServer=%s**

### Variable Information

%s = IJServer name

### Explanation

The attempt to start IJServer (%s) failed. Possible causes are:

- The environment settings in all of the Managed Servers to which IJServer (%s) has been deployed failed.
- If the servers allocated to the Servlet container and EJB container are different in the IJServer (%s), the linkage between the containers could not be established.

### System Action

Terminates the processing

### User Action

Correct the environment settings of the Managed Servers, and then execute processing again.

If the servers allocated to the Servlet container and EJB container are different, make the Server Group serial number in the Servlet container and EJB container the same. For details refer to 'Multiserver Management - 'Server Groups' in the 'Operator's Guide'.

## 12.10.68 is21167

---

**IS: ERROR: is21167: The processing cannot be executed because the specified IJServer could not be created for any of the Managed Servers. IJServer = %s**

### Variable Information

%s = IJServer name

### Explanation

The processing failed because the specified IJServer could not be created for any of the Managed Servers.

### System Action

Terminates the processing

### User Action

Correct the error for the Managed Servers, and execute the processing again.

## 12.10.69 is21168

---

**IS: ERROR: is21168: The message queue cannot be closed for the specified IJServer type. IJServer = %s**

### Variable Information

%s = IJServer name

## Explanation

The message queue could not be closed because message queue closing was not enabled for the type of the specified IJServer.

## System Action

Terminates the processing

## User Action

Check the IJServer type, and execute the processing again.

## 12.10.70 is21169

---

**IS: ERROR: is21169: The processing cannot be executed because the Hot Deploy function is disabled in the IJServer environment setting . IJServer = %s**

## Variable Information

%s = IJServer name

## Explanation

The module could not be activated or deactivated because the Use of Hot Deploy was disabled in the work unit setting.

## System Action

Terminates the processing

## User Action

Check the Use of Hot Deploy specification in the IJServer environment setting. Change the setting if required and execute the processing again.

## 12.10.71 is21170

---

**IS: ERROR: is21170: The activation processing has failed. IJServer = %s1, Module = %s2**

## Variable Information

%s1: IJServer name

%s2: Module name

## Explanation

The activation processing failed for all of the Managed Servers.

## System Action

Terminates the processing

## User Action

A message indicating the cause of the error is output at the same time. Follow the instructions in the message.

## 12.10.72 is21171

---

**IS: ERROR: is21171: The activation processing has failed in some parts. IJServer = %s1, Module = %s2**

## Variable Information

%s1: IJServer name

%s2: Module name

#### Explanation

The activation processing failed for some of the Managed Servers.

#### System Action

Terminates the processing

#### User Action

A message indicating the cause of the error is output at the same time. Follow the instructions in the message.

## 12.10.73 is21172

---

**IS: ERROR: is21172: The deactivation processing has failed. IJServer = %s1, Module = %s2**

#### Variable Information

%s1: IJServer name

%s2: Module name

#### Explanation

The deactivation processing failed for all of the Managed Servers.

#### System Action

Terminates the processing

#### User Action

A message indicating the cause of the error is output at the same time. Follow the instructions in the message.

## 12.10.74 is21173

---

**IS: ERROR: is21173: The deactivation processing has failed in some parts. IJServer = %s1, Module = %s2**

#### Variable Information

%s1: IJServer name

%s2: Module name

#### Explanation

The deactivation processing failed for some of the Managed Servers.

#### System Action

Terminates the processing

#### User Action

A message indicating the cause of the error is output at the same time. Follow the instructions in the message.

## 12.10.75 is21174

---

**IS: ERROR: is21174: Application status could not be obtained. IJServer = %s1, Module = %s2**

#### Variable Information

%s1: IJServer name

%s2: Module name

#### Explanation

Application status could not be obtained for any of the Managed Servers.

#### System Action

Terminates the processing

#### User Action

A message indicating the cause of the error is output at the same time. Follow the instructions in the message.

### 12.10.76 is21175

---

**IS: ERROR: is21175: Application status could not be obtained in some parts. IJServer = %s1, Module = %s2**

#### Variable Information

%s1: IJServer name

%s2: Module name

#### Explanation

Application status could not be obtained for some of the Managed Servers.

#### System Action

Terminates the processing

#### User Action

A message indicating the cause of the error is output at the same time. Follow the instructions in the message.

### 12.10.77 is21176

---

**IS: ERROR: is21176: The Servlet container could not be created because a Web server connector for the line could not be found. IJServer = %s**

#### Variable Information

%s = IJServer name

#### Explanation

The Servlet container could not be created because a Web server connector for the Servlet container line could not be found.

#### System Action

Continues the processing on servers where the error has not been generated.

#### User Action

Use the same number of Servlet containers as Web server connectors, and execute the processing again.

## 12.10.78 is21177

---

**IS: ERROR: is21177: The Web server connector could not be created because a Servlet container for the line could not be found. IJServer = %s**

### Variable Information

%s = IJServer name

### Explanation

The Web server connector could not be created because a Servlet connector for the Web server connector line could not be found.

### System Action

Continues the processing on servers where the error has not been generated.

### User Action

Take one of the following actions:

- Add the Managed Server for the Web server connector line to the Server Group of a Servlet container.
- Delete from the Server Group of the Web server connector the Managed Server which has failed to create the Web server connector.

## 12.10.79 is21178

---

**IS: ERROR: is21178: The IJServer is active. Terminate the IJServer and execute the processing again. IJServer = %s**

### Variable Information

%s = IJServer name

### Explanation

The processing failed because the IJServer was active.

### System Action

Terminates the processing

### User Action

Terminate the IJServer, and execute the processing again.

## 12.10.80 is21179

---

**IS: ERROR: is21179: The specified IJServer is not in the state ready for termination. IJServer = %s**

### Variable Information

%s = IJServer name

### Explanation

The termination processing failed because the IJServer was not in the active state.

### System Action

Terminates the processing

#### User Action

Check the status of the specified IIServer and execute the processing again.

### 12.10.81 is21180

---

**IS: ERROR: is21180: The IIServer cannot be activated because the application has not been deployed. IIServer = %s**

#### Variable Information

%s = IIServer name

#### Explanation

The IIServer could not be activated because the application was not deployed

#### System Action

Terminates the processing

#### User Action

Deploy the application and execute the processing again. If the IIServer type is 1VM, check that the Web application has been deployed.

### 12.10.82 is21181

---

**IS: ERROR: is21181: Deployment of the specified module has been cancelled. IIServer = %s1, Module = %s2**

#### Variable Information

%s1: IIServer name

%s2: Module name

#### Explanation

The processing failed because deployment of the specified module has been cancelled.

#### System Action

Terminates the processing

#### User Action

Check the module name and execute the processing again.

### 12.10.83 is21182

---

**IS: ERROR: is21182: The virtual host name could not be changed because the IIServer using the specified virtual host was still running. Allocation destination server or allocation destination Server Group of the virtual host = %s1, Virtual host = %s2**

#### Variable Information

%s1: Allocation destination server name or allocation destination Server Group name of the virtual host

%s2: Virtual host name

#### Explanation

The virtual host name could not be changed because the IIServer using the specified virtual host name was still running.

#### System Action

Terminates the processing

#### User Action

Terminate the IIServer that is using the specified virtual host and execute the processing again.

## 12.10.84 is21183

---

**IS: INFO: is21183: Detail information of the deployment file could not be obtained for some Managed Servers. IIServer = %s**

#### Variable Information

%s1: IIServer name

#### Explanation

Detailed information of the deployment file could not be obtained for some Managed Servers.

## 12.10.85 is21184

---

**IS: ERROR: is21184: Detail information for the deployment file could not be obtained. IIServer = %s**

#### Variable Information

%s = IIServer name

#### Explanation

Detailed information for the deployment file could not be obtained for any of the Managed Servers.

#### System Action

Terminates the processing

#### User Action

A message indicating the cause of the error is output at the same time. Follow the instructions in the message.

## 12.10.86 is21185

---

**IS: WARNING: is21185: The deployment file could not be deleted. File = %s**

#### Variable Information

%s = File name

#### Explanation

The deployment file stored by the Managed Server could not be deleted.

#### System Action

Terminates the processing

## User Action

Remove the file that could not be deleted.

## 12.10.87 is21186

---

**IS: WARNING: is21186: The deployment file cannot be redeployed because it has been deleted. IJServer = %s1, Module = %s2**

### Variable Information

%s1: IJServer name

%s2: Module name

### Explanation

Failed to redeploy because the deployment file on the Admin Server had already been deleted. Possible causes are shown below.

- Deployment in all Managed Servers was successful.
- 24 hours have elapsed since the initial deployment
- The Interstage JMX service was restarted after the initial deployment
- Files on the Admin Server were illegally deleted.

### System Action

Terminates the processing

### User Action

Undeploy, then deploy again.

## 12.10.88 is21187

---

**IS: ERROR: is21187: The definition has been updated by another user.**

### Explanation

The definition could not be updated because another user had updated it.

### System Action

Terminates the processing

### User Action

The definition information requested to be updated had been updated by another user. Update the latest definition information and execute the processing again.

## 12.10.89 is21188

---

**IS: ERROR: is21188: The IJServer definition could not be extracted when a server was added to the Site. server = %s**

### Variable Information

%s = Server name

## Explanation

The IIServer definition on the server being added could not be extracted when the server was added to the Site.

## System Action

The IIServer definition will not be registered with the Site.

## User Action

Check the state of the server to be added to the site and reexecute.

## 12.10.90 is21189

---

**IS: ERROR: is21189: The IIServer definition is not located on the server to be added to the Server Group. Server Group = %s**

## Variable Information

%s = Server Group name

## Explanation

The server could not be added to the Server Group. The IIServer definition for the Server Group was not located on the server to be added.

## System Action

The allocation destination information in the IIServer definition will not be changed.

## User Action

Backup or restore the Managed Server to be added to the Server Group, and execute the processing again.

## 12.10.91 is21190

---

**IS: ERROR: is21190: Deployment by overwriting has failed because undeployment of some of the servers had failed IIServer = %s1, Module = %s2**

## Variable Information

%s1: IIServer name

%s2: Module name

## Explanation

Deployment by overwriting has failed because undeployment of some of the Managed Servers had failed

## System Action

Terminates the processing

## User Action

Correct the problem preventing the Managed Servers from undeploying. Undeploy, and then deploy again.

## 12.10.92 is21191

---

**IS: ERROR: is21191: The Web server connector log definition could not be updated. Web server connector=%s**

### Variable Information

%s = Web server connector name

### Explanation

The Web server connector log definition could not be updated.

### System Action

Terminates the processing

### User Action

A message indicating the cause of the error is output at the same time. Follow the instructions in the message.

## 12.10.93 is21192

---

**IS: ERROR: is21192: The Web server connector log definition could not be updated in some parts. Web server connector = %s**

### Variable Information

%s = Web server connector name

### Explanation

The Web server connector log definition could not be updated in some parts.

### System Action

Terminates the processing

### User Action

A message indicating the cause of the error is output at the same time. Follow the instructions in the message.

## 12.10.94 is21193

---

**IS: ERROR: is21193: The Web server connector error monitor definition could not be updated. Web server connector = %s**

### Variable Information

%s = Web server connector name

### Explanation

The Web server connector error monitor definition could not be updated.

### System Action

Terminates the processing

### User Action

A message indicating the cause of the error is output at the same time. Follow the instructions in the message.

## 12.10.95 is21194

---

**IS: ERROR: is21194: The Web server connector error monitor definition could not be updated in some parts. Web server connector = %s**

#### Variable Information

%s = Web server connector name

#### Explanation

Some parts of the Web server connector error monitor definition could not be updated.

#### System Action

Terminates the processing

#### User Action

A message indicating the cause of the error is output at the same time. Follow the instructions in the message

### 12.10.96 is21195

---

**IS: ERROR: is21195: The module could not be reactivated in some parts. IJServer = %s1, Module = %s2**

#### Variable Information

%s1: IJServer name

%s2: Module name

#### Explanation

The module could not be reactivated to some of the Managed Servers.

#### System Action

Terminates the processing

#### User Action

A message indicating the cause of the error is output at the same time. Follow the instructions in the message.

### 12.10.97 is21196

---

**IS: ERROR: is21196: The specified Web server connector could not be found. Web server connector = %s**

#### Variable Information

%s = Web server connector name

#### Explanation

The processing failed because the specified Web server connector could not be found.

#### System Action

Terminates the processing

#### User Action

Check the resource name and execute the processing again.

### 12.10.98 is21197

---

**IS: ERROR is21197: The specified IJServer has already been activated. IJServer = %s**

## Variable Information

%s = IJServer name

## Explanation

The specified IJServer has already been activated.

## System Action

Terminates the processing

## User Action

If there is an error in the IJServer name, specify a correct IJServer name and reexecute processing.

## 12.10.99 is21198

---

**IS: ERROR is21198: The specified IJServer has already been terminated. IJServer = %s**

## Variable Information

%s = IJServer name

## Explanation

The specified IJServer has already been terminated.

## System Action

Terminates the processing

## User Action

If there is an error in the IJServer name, specify a correct IJServer name and reexecute processing.

## 12.10.100 is21199

---

**IS: ERROR: is21199: The processing could not be executed because another user is using the same Web server connector for their processing. Web server connector = %s**

## Variable Information

%s = Web server connector name

## Explanation

The processing could not be executed because another user is using the same Web server connector for their processing.

## System Action

Terminates the processing

## User Action

Execute the processing again after the other user finishes their processing.

## 12.11 is21200 to is21299

---

This section details messages numbered between is21200 and is21299.

### 12.11.1 is21200

---

---

**IS: ERROR: is21200: The specified module does not exist. IJServer = %s1, Module = %s2****Variable Information**

%s1: IJServer

%s2: Module

**Explanation**

The module specified for the Managed Server does not exist.

**System Action**

Terminates the processing

**User Action**

Check the module name.

---

**12.11.2 is21201**

---

**IS: ERROR: is21201: IJServer cannot be activated in any of the specified Managed Servers IJServer=%s****Variable Information**

%s = IJServer

**Explanation**

IJServer (%s) cannot be activated, possible causes are:

- The environment settings in all of the Managed Servers to which IJServer (%s) has been deployed failed.
- If the servers allocated to the Servlet container and EJB container in the IJServer (%s) are different, the Line type linkage between the containers could not be established.

**System Action**

Stops processing.

**User Action**

Correct the environment settings in the Managed Servers, and then execute processing again.

If the server allocated to the Servlet container and EJB container is different, make the Server Group serial number in the Servlet container and EJB container the same. For details, refer to 'Multiserver Management' - 'Server Groups' in the 'Operator's Guide'.

---

**12.11.3 is21202**

---

**IS: ERROR: is21202: The Managed Server could not be deleted from the Server Group. Server Group = %s****Variable Information**

%s = Server Group name

**Explanation**

If the Managed Server to be deleted from the Server Group was a Servlet container, it could not be deleted from the Server Group because its IP address could not be deleted from the Web server connector definition.

**System Action**

Terminates the processing

**User Action**

A message indicating the cause of the error is output at the same time. Follow the instructions in the message.

## 12.11.4 is21203

---

**IS: ERROR: is21203: Failed to add to the Site Managed Server because Web server connector and WorkUnit are set up in separated machine**

### Explanation

Failed to add the server to the site because the machine settings are 'Do not operate the Web server and WorkUnit on the same machine'.

### System Action

Terminates the processing

### User Action

Change the Servlet detailed settings of the system environment settings to 'Operate the Web server and WorkUnit on the same machine' and reexecute processing.

## 12.11.5 is21204

---

**IS: ERROR: is21204: Failed to add the Site Managed Server because IJServer version is old version which is V6 IJServer=%s**

### Variable Information

%s = IJServer name

### Explanation
