# Preface

---

## Purpose of this Document

This manual explains the messages output by Interstage Application Server.

The following manuals explain the messages output by the specified Interstage components:

Throughout this manual Interstage Application Server is referred to as Interstage.

## Intended Readers

This manual is intended for users who operate Interstage and users who develop distributed applications with Interstage.

It is assumed that readers of this manual have a basic knowledge of:

- The Internet
- Object-oriented technology
- Distributed object technology (CORBA)
- Relational databases
- AIM on a global server
- Basic knowledge of the OS used

## Structure of This Document

The structure of this manual is as follows:

### Part 1 Messages with Labels

#### Chapter 1 Messages Overview

This chapter explains the output format of the messages.

#### Chapter 2 Messages Beginning with 'DEP'

This chapter explains the messages starting with 'DEP'.

#### Chapter 3 Messages Beginning with 'EJB'

This chapter explains the messages having message numbers that begin with 'EJB'.

#### Chapter 4 Messages Beginning with 'ENABLER'

This chapter explains the messages having message numbers that begin with 'ENABLER'.

#### Chapter 5 Messages Beginning with 'es'

This chapter explains the messages having message numbers that begin with 'es'.

#### Chapter 6 Messages Beginning with 'EXTP'

This chapter explains the messages having message numbers that begin with 'EXTP'.

#### Chapter 7 Messages Beginning with 'ihs'

This chapter explains the messages having message numbers that begin with 'ihs'.

#### Chapter 8 Messages Beginning with 'IJServer1'

This chapter explains the messages having message numbers that begin with 'IJServer1'.

#### Chapter 9 Messages Beginning with 'IJServer2'

This chapter explains the messages having message numbers that begin with 'IJServer2'.

#### Chapter 10 Messages Beginning with 'IJServer3'

This chapter explains the messages having message numbers that begin with 'IJServer3'.

#### [Chapter 11 Messages Beginning with 'irep'](#)

This chapter explains the messages having message numbers that begin with 'irep'.

#### [Chapter 12 Messages Beginning with 'is'](#)

This chapter explains the messages having message numbers that begin with 'is'.

#### [Chapter 13 Messages Beginning with 'isj2ee'](#)

This chapter explains the messages starting with 'isj2ee'.

#### [Chapter 14 Messages Beginning with 'isws'](#)

This chapter explains the messages having message numbers that begin with 'isws'.

#### [Chapter 15 Messages Beginning with 'jms'](#)

This chapter describes the messages displayed by the JMS.

#### [Chapter 16 Messages Beginning with 'JSSR'](#)

This chapter explains the messages having message numbers that begin with 'JSSR'.

#### [Chapter 17 Messages Beginning with 'JSVLT'](#)

This chapter explains the messages starting with 'JSVLT'.

#### [Chapter 18 Messages Beginning with 'od'](#)

This chapter explains the messages having message numbers that begin with 'od'.

#### [Chapter 19 Messages Beginning with 'ots'](#)

This chapter explains the messages having message numbers that begin with 'ots'.

#### [Chapter 20 Messages Beginning with 'scs'](#)

This chapter explains the messages having message numbers that begin with 'scs'.

#### [Chapter 21 Messages Beginning with 'sso'](#)

This chapter explains the messages having message numbers that begin with 'sso'.

#### [Chapter 22 Messages Beginning with 'SSQCARM'](#)

This chapter explains the messages having message numbers that begin with 'SSQCARM'.

#### [Chapter 23 Messages Beginning with 'SvMon'](#)

This chapter explains the messages having message numbers that begin with 'SvMon'.

#### [Chapter 24 Messages Beginning with 'td'](#)

This chapter explains the messages having message numbers that begin with 'td'.

### [Part 2 Messages with No Label](#)

#### [Chapter 25 Messages Output during Resource Access Definition](#)

This chapter explains the messages output by the JNDI operation commands or J2EE Resource Access Definition.

#### [Chapter 26 Messages Output by the Servlet Service of Interstage Management Console](#)

This chapter explains the messages which Servlet Service outputs to the Interstage Management Console.

#### [Chapter 27 Messages Output by Portable-ORB](#)

This chapter explains the messages which Portable-ORB outputs.

#### [Chapter 28 Messages Output by SSL Operation Commands](#)

This chapter explains the messages which SSL Commands outputs.

#### [Chapter 29 Exception Information Minor Codes Reported from the CORBA Service](#)

This chapter describes the exception information and minor codes that can occur during operation of the CORBA service.

### [Chapter 30 Exception Information Reported from Component Transaction Service](#)

This chapter describes the exception information that may occur during the operation of the Component Transaction Service.

### [Chapter 31 Exception Information Reported from the Database Linkage Service](#)

This chapter describes the exception information that may occur during the operation of the Database Linkage Service.

### [Chapter 32 Exception Information Minor Codes Reported from the Event Service](#)

This chapter describes the exception information and minor codes that can occur during operation of the Event Service.

### [Chapter 33 Status Codes Reported from the Web Server](#)

This chapter explains the status codes reported from the Web server.

### [Chapter 34 Messages Output by Single Sign-on](#)

This chapter explains the messages which Single Sign-on outputs.

### [Chapter 35 Messages Output by Interstage Directory Service](#)

This chapter explains the messages which Interstage Directory Service outputs.

### [Chapter 36 Error Codes to be Reported from Interstage Directory Service](#)

This chapter describes error codes reported via Interstage Directory Service (IDS) from the IDS Server to the IDS Client.

## Part 3 Messages Output to a Log File

### [Chapter 37 Messages Output by Interstage HTTP Server](#)

This chapter describes the messages output by Interstage HTTP Server.

### [Chapter 38 Exceptions Output during J2EE Usage](#)

This chapter explains the exceptions output during operation of a J2EE Application.

### [Chapter 39 Messages Output by IJServer WorkUnits](#)

This chapter explains the messages output by IJServers.

### [Chapter 40 Messages Output by the Servlet Service of Interstage Management Console](#)

This chapter explains the messages Servlet Service outputs to the Interstage Management Console.

### [Chapter 41 Messages Output by the J2EE Application Security Function](#)

This chapter explains the messages output by the security function of a J2EE Application.

### [Chapter 42 Messages Output by the Component Transaction Service](#)

This chapter explains the messages which the Component Transaction Service outputs.

### [Chapter 43 Messages Output by the Interstage Management Console](#)

This chapter explains the messages which the Interstage Management Console outputs.

### [Chapter 44 Messages Output by the Event Service](#)

This chapter describes the messages output by the Event Service.

### [Chapter 45 Messages Logged and Output in Single Sign-on](#)

This chapter describes the messages logged and output during Single Sign-on.

## Conventions

### Representation of Platform-specific Information

In the manuals of this product, there are parts containing content that relates to all products that run on the supported platform. In this case, an icon indicating the product platform has been added to these parts if the content varies according to the product. For this reason, refer only to the information that applies to your situation.

	Indicates that this product (32-bit) is running on Windows.
-------------------------------------------------------------------------------------	-------------------------------------------------------------

<b>Windows64</b>	Indicates that this product (64-bit) is running on Windows.
<b>Windows32/64</b>	Indicates that this product (32/64-bit) is running on Windows.
<b>Solaris32</b>	Indicates that this product (32-bit) is running on Solaris.
<b>Solaris64</b>	Indicates that this product (64-bit) is running on Solaris.
<b>Solaris32/64</b>	Indicates that this product (32/64-bit) is running on Solaris.
<b>Linux32</b>	Indicates that this product (32-bit) is running on Linux.
<b>Linux64</b>	Indicates that this product (64-bit) is running on Linux.
<b>Linux32/64</b>	Indicates that this product (32/64-bit) is running on Linux.

## Abbreviations

Read occurrences of the following Components as their corresponding Service.

Service	Component
CORBA Service	ObjectDirector
Component Transaction Service	TransactionDirector

## Export Controls

Exportation/release of this document may require necessary procedures in accordance with the regulations of the Foreign Exchange and Foreign Trade Control Law of Japan and/or US export control laws.

## Trademarks

Trademarks of other companies are used in this documentation only to identify particular products or systems.

Product Trademarks/Registered Trademarks
Microsoft, Active Directory, ActiveX, Excel, Internet Explorer, MS-DOS, MSDN, Visual Basic, Visual C++, Visual Studio, Windows, Windows NT, Windows Server, Win32 are either registered trademarks or trademarks of Microsoft Corporation in the United States and/or other countries.
Oracle and Java are registered trademarks of Oracle and/or its affiliates.

Other company and product names in this documentation are trademarks or registered trademarks of their respective owners.

# Chapter 1 Messages Overview

This chapter explains the output format of the messages.

## 1.1 Output Format

---

The output format of the messages is shown below:

`Windows32/64`

Label: Error type: Message number: Message text

`Solaris32/64` `Linux32/64`

UX: Label: Error type: Message number: Message text

Note: UX appears at the beginning of all messages, but in this manual the UX has been omitted.

### 1.1.1 Label

---

Displays the service that output the message. Labels that can be displayed are shown below. Note that in addition to the labels below, command names may sometimes be displayed as labels.

#### **DEP**

Label output by DEP

#### **EJB**

Label output by EJB service

#### **ENABLER**

Label output by Interstage data store

#### **ES**

Label output by event service

#### **extp**

Label output by EXTP

#### **IJServer, IJServer1, IJServer2, IJServer3**

Label output by IJServer

#### **IHS**

Label output by Interstage HTTP Server

#### **IREP**

Label output by Interstage Directory Service

#### **IS**

Label output by INTERSTAGE

#### **ISJ2EE**

Label output by ISJ2EE service

**JMS**

Label output by JMS service

**JSSR**

Label output by Session Recovery

**JSVLT**

Label output by Servlet Service

**OD**

Label output by CORBA Service (ObjectDirector)

**OTS**

Label output by Database Linkage Service (ObjectTransactionService)

**SSO**

Label output by Interstage Single Sign-on

**SSQCARM**

Label output by Systemwalker Service Quality Coordinator

**SvMon**

Label output by Fault Monitoring function of Web Server connector

**TD**

Label output by Component Transaction Service (TransactionDirector)

## 1.1.2 Error Type

---

Displays the status of the error in the message. The following error types are displayed:

**INFO**

Displays the end status of the processing. No specific countermeasures are required.

**WARNING**

Shows an internal error. Refer to the User Action described in the message.

**ERROR**

Shows a fatal error. Refer to the User Action described in the message.

## 1.1.3 Message Number

---

Each message has its own unique ID number output to the screen or to an external device. Refer to this number to find its explanation in this manual.

## 1.1.4 Message Text

---

The message text describes the system status or error.

## 1.1.5 Before Contacting a Systems Engineer

---

### Collecting data using the Batch Information Collection Tool

If a problem occurs while Interstage is running and it cannot be solved by following the procedure listed in "User Action", collect the necessary data using the *iscollectinfo* command, and then contact your systems engineer. For details on the *iscollectinfo* command, refer to the "Maintenance Commands" chapter of the Reference Manual (Command Edition).

The *iscollectinfo* command is stored in the folder below:

**Windows32/64**

```
C:\Interstage\bin
```

**Solaris32/64** **Linux32/64**

```
/opt/FJSVisas/bin
```

#### Point

FJQSS (Information Collection Tool) collects the same information as the *iscollectinfo* command.

**Windows32/64**

For details on FJQSS, refer to the manual that is displayed from the following menu items:

[Start] > [All Programs] > [FJQSS (Information Collection Tool)] > [FJQSS User's Guide]

**Solaris32/64** **Linux32/64**

For details on FJQSS, refer to the manual stored in the "FJQSS" directory of the Manual package.

#### Note

If multiserver management is used, use the batch information collection tool to collect the data on both the managed server on which the problem occurred, and also on the admin server.

# Chapter 2 Messages Beginning with 'DEP'

This chapter explains the messages beginning with 'DEP'.

## 2.1 DEP1000 to DEP1099

---

These are messages displayed during operation of the Interstage Management Console.

### 2.1.1 DEP1001

---

#### Application %s1 is being deployed

##### Variable Information

%s1 = Application name

##### Explanation

The application is currently being deployed.

### 2.1.2 DEP1003

---

#### No blank identifier or "/" is allowed in a Web application identifier: Details=%s1

##### Variable Information

%s1 = Tag name

##### Explanation

The Web application identifier may not contain a blank character and "/".

##### System Action

Processing stops.

##### User Action

After removing the cause of the error based on the detailed message, re-execute the processing.

### 2.1.3 DEP1004

---

#### An error occurred while saving %s1: Details=%s2

##### Variable Information

%s1 = Name of the application currently being saved

%s2 = Detailed message of the error

##### Explanation

An error occurred while saving the application.

##### System Action

Processing stops.

##### User Action

After removing the cause of the error based on the detailed message, re-execute the processing.

It can also be assumed that the access authority may not be granted to the transfer destination directory or the EAR/WAR file of the input source.

## 2.1.4 DEP1005

---

### An error occurred while creating a temporary file: Details=%s1

#### Variable Information

%s1 = Detailed message of the error

#### Explanation

An error occurred while creating a temporary work file.

#### System Action

Processing stops.

#### User Action

After removing the cause of the error based on the detailed message, re-execute the processing.

## 2.1.5 DEP1009

---

### Deployment failed: Details=%s1: Web application identifier=%s2

#### Variable Information

%s1 = Detailed message of the error

%s2 = Web application identifier

#### Explanation

An error occurred when accessing the environment definition file or name conversion file of the Servlet Service during deployment.

#### System Action

Processing stops.

#### User Action

After removing the cause of the error based on the detailed message, re-execute the processing.

The following causes can be assumed:

- Insufficient system memory
- If another message is displayed in the execution situation window, take action according to both messages.

## 2.1.6 DEP1011

---

### File I/O error: File=%s1: Details=%s2

#### Variable Information

%s1 = File name

%s2 = Detailed message of the error

#### Explanation

An error occurred during input/output of the file.

The following file may have been deleted.

C:\Interstage\J2EE\etc\isj2ee.properties

```
/etc/opt/FJSVj2ee/etc/isj2ee.properties
```

### System Action

Processing stops.

### User Action

The following causes can be assumed. Remove the cause and re-execute the processing.

- Check whether the file exists and the access authority is granted. The error may also occur if the file indicated in the variable information or its directory is referenced by another application.
- A file path included in the deployment destination or in the application file to be deployed (EAR, WAR, ejb-jar, or RAR file) may be too long. Change the path of the deployment destination or in the file to be deployed according to its appropriate length.
- Characters that cannot be identified are used in the storage directory of the web application. Use a text editor to delete definitions of the name conversion file.
- The file system capacity may be too small. Delete unnecessary files, or increase the size of the file system.
- If the isj2ee.properties file has been incorrectly deleted, either reinstall Interstage or recover the environment by restoring the IJServer resource file. For details about backing up and restoring resources, refer to "Maintenance (Resource Backup)" in the "Operator's Guide".

### Windows32/64

The DOS device name may have been used as the specified module name. Change the file name to something suitable.

If the problem cannot be resolved, collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

## 2.1.7 DEP1012

---

### Saving failed: Details=%s1

#### Variable Information

%s1 = Detailed message of the error

#### Explanation

An error occurred while saving the file.

#### System Action

Processing stops.

#### User Action

After removing the cause of the error based on the detailed message, re-execute the processing.

## 2.1.8 DEP1013

---

### An error occurred while canceling deployment: Details=%s1: Web application identifier=%s2

#### Variable Information

%s1 = Detailed message of the error

%s2 = Web application identifier

#### Explanation

An error occurred when accessing the environment definition file or name conversion file of the Servlet Service during undeployment.

## System Action

Processing stops.

## User Action

After removing the cause of the error based on the detailed message, re-execute the processing.

The error may also occur if the deployment destination directory of the Web application is referenced by another process. Because the deployment directory of the Web application may remain, delete it if it remains.

## 2.1.9 DEP1014

---

### Failed to save the selected component or application: Details=%s1

#### Variable Information

%s1 = Detailed message of the error

#### Explanation

Failed to save the application.

#### System Action

Processing stops.

#### User Action

After removing the cause of the error based on the detailed message, re-execute the processing.

## 2.1.10 DEP1017

---

### Deletion failed: Details=%s1

#### Variable Information

%s1 = Detailed message of the error

#### Explanation

Failed to delete a file or a web.xml item from the application.

#### System Action

Processing stops.

#### User Action

After removing the cause of the error based on the detailed message, re-execute the processing.

## 2.1.11 DEP1019

---

### The selected file is not a WAR file: Details=%s1

#### Variable Information

%s1 = Detailed message of the error

#### Explanation

WEB-INF/web.xml is not contained in the WAR file that was attempted to read.

#### System Action

Processing stops.

## User Action

After storing web.xml in the WAR file correctly, re-execute the processing.

### 2.1.12 DEP1025

---

#### Enter a correct application file name

##### Explanation

No application name is entered.

##### System Action

Processing stops.

##### User Action

After entering the application name, re-execute the processing.

### 2.1.13 DEP1026

---

#### A directory name was entered. Enter a file: File name=%s1

##### Variable Information

%s1 = File name

##### Explanation

The entered EAR file name refers to a directory.

##### System Action

Processing stops.

##### User Action

Enter the correct EAR file name.

### 2.1.14 DEP1028

---

#### An error occurred when creating a new application: Details=%s1

##### Variable Information

%s1 = Detailed message of the error

##### Explanation

An error occurred when creating a new application

##### System Action

Processing stops.

##### User Action

After removing the cause of the error based on the detailed message, re-execute the processing.

### 2.1.15 DEP1030

---

#### Enter a value for %s1

##### Variable Information

%s1 = Item name

### Explanation

The value of the required item is not entered.

### System Action

Processing stops.

### User Action

After entering a value, re-execute the processing.

## 2.1.16 DEP1099

---

### Internal error: Details=%s1

#### Variable Information

%s1 = Detailed message of the error

#### Explanation

An error occurred in internal processing.

#### System Action

Processing stops.

#### User Action

After removing the cause of the error based on the detailed message, re-execute the processing.

When this message is output, the system memory (or maximum memory of the JavaVM on which the Interstage JMX service operates) may be insufficient. Stop any unnecessary services or reboot the system. Extend system memory, if required.

## 2.2 DEP1200 to DEP1299

---

These are messages displayed during operation of the Interstage Management Console.

### 2.2.1 DEP1201

---

#### Do you want to cancel the deployment of %s1?

#### Variable Information

%s1 = Application name

#### Explanation

Confirm whether to undeploy the application shown in Variable information.

#### User Action

Select "Yes" if you want to undeploy. Select "No" if you do not want to undeploy.

### 2.2.2 DEP1202

---

#### The %s1 file already exists. Do you want to overwrite it?

#### Variable Information

%s1 = File name

#### Explanation

Confirm whether to overwrite the file shown in Variable information.

#### User Action

Select "Yes" to overwrite. Select "No" not to overwrite.

### 2.2.3 DEP1204

---

#### **%s1 is already opened. Do you want to update it to the latest status?**

##### Variable Information

%s1 = Application name

##### Explanation

Confirm whether to close the application shown in Variable information and reread.

##### User Action

Select "Yes" to reread. Select "No" not to reread.

### 2.2.4 DEP1206

---

#### **Do you want to delete %s1?**

##### Variable Information

%s1 = Definition item value

##### Explanation

Confirm whether to delete the definition item shown in Variable information.

##### User Action

Select "Yes" to delete. Select "No" not to delete.

### 2.2.5 DEP1208

---

#### **Selected application %s1 is opened. Close it before overwriting %s2**

##### Variable Information

%s1 = File name

%s2 = Application name

##### Explanation

Indicates that an attempt was made to overwrite an opened EAR file.

##### System Action

Processing stops.

##### User Action

Overwrite after closing the EAR file or save in a file with a different file name.

### 2.2.6 DEP1213

---

#### **To close an application, select the file menu, and close**

##### Explanation

Indicates that an attempt was made to close the application by selecting "Edit" -> "Delete".

### System Action

Processing stops.

### User Action

Use "File" -> "Close" to close the application.

## 2.2.7 DEP1223

---

### The node cannot be deleted: Node name=%s1

#### Variable Information

%s1 = Node name

#### Explanation

An error occurred when an attempt was made to delete a node from the EAR file or WAR file.

### System Action

Processing stops.

### User Action

Contact your Fujitsu systems engineer.

## 2.2.8 DEP1229

---

### %s1 has been saved: %s2

#### Variable Information

%s1 = Application display name

%s2 = File name

#### Explanation

Notifies that the EAR file has been saved successfully.

## 2.2.9 DEP1230

---

### The servlet is in operation

#### Explanation

Deployment is performed while the Servlet Service is operating.

### System Action

Processing stops.

### User Action

Stop the Servlet Service and then perform re-deployment.

## 2.2.10 DEP1231

---

### An error occurred when setting the environment definition file: File name=%s1: Item name=%s2

#### Variable Information

%s1 = File name

%s2 = Item name

### Explanation

The environment definition file or name conversion file of the Servlet Service is set incorrectly.

### System Action

Processing stops.

### User Action

Check [Item name] in [File name] of the message and then set the correct value.

If the problem cannot be resolved, collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

## 2.2.11 DEP1233

---

### Application %s1 has been deployed

#### Variable Information

%s1 = Application display name

### Explanation

Deployment is completed.

## 2.2.12 DEP1234

---

### The selected directory is not a Web application: Details=%s1

#### Variable Information

%s1 = Web application directory

### Explanation

A directory was selected for deployment, but the directory is not a Web application in the directory configuration of the Interstage Studio development environment.

### System Action

Processing stops.

### User Action

After selecting the correct directory, re-execute the processing.

## 2.2.13 DEP1236

---

### The setting value is incorrect

#### Explanation

The input value is incorrect.

### System Action

Processing stops.

### User Action

Enter the correct value.

## 2.2.14 DEP1237

---

---

**The setting value is incorrect: WAR file name=%s1: Tab name=%s2: Item name=%s3**

**Variable Information**

%s1 = WAR file name

%s2 = Tab name

%s3 = Item name

**Explanation**

The input value is incorrect.

**System Action**

Processing stops.

**User Action**

After setting the value of the item indicated in Variable information correctly, perform re-deployment.

---

## 2.2.15 DEP1238

---

**The setting value is incorrect: JSP name =%s1: Tab name=%s2: Item name=%s3**

**Variable Information**

%s1 = JSP file name

%s2 = Tab name

%s3 = Item name

**Explanation**

The input value is incorrect.

**System Action**

Processing stops.

**User Action**

After setting the value of the item indicated in Variable information correctly, perform re-deployment.

---

## 2.2.16 DEP1239

---

**The setting value is incorrect: Servlet class name=%s1: Tab name=%s2: Item name=%s3**

**Variable Information**

%s1 = Servlet class name

%s2 = Tab name

%s3 = Item name

**Explanation**

The input value is incorrect.

**System Action**

Processing stops.

**User Action**

After setting the value of the item indicated in Variable information correctly, perform re-deployment.

## 2.2.17 DEP1240

---

**The setting value of a web application environment definition file is incorrect: Tag name=%s1**

### Variable Information

%s1 = Tag name

### Explanation

A setup value of item in web.xml is incorrect when deploying the directory.

### System Action

Processing stops.

### User Action

After correcting the value of the item in web.xml to the correct value, perform re-deployment.

## 2.2.18 DEP1241

---

**The setting value is incorrect: Item name =%s1**

### Variable Information

%s1 = Item name

### Explanation

The input value is incorrect.

### System Action

Processing stops.

### User Action

After setting the value of the item indicated in Variable information correctly, perform re-deployment.

When deploying an EAR file containing multiple Web applications, deployment destination information of all Web applications must be set.

## 2.2.19 DEP1242

---

**The specified directory does not exist: Directory=%s1**

### Variable Information

%s1 = Directory name

### Explanation

The input directory does not exist.

### System Action

Processing stops.

### User Action

After entering a directory name that exists, re-execute the processing.

## 2.2.20 DEP1243

---

**The directory already exists**

## Explanation

A directory with the same name as the Web application identifier already exists in the deployment destination directory.

## System Action

Processing stops.

## User Action

The following causes can be assumed if this message is output during deployment:

- A directory with the same name as the Web application identifier may have been set as the transfer destination directory. Specify a directory with a different name and then perform re-deployment.
- A deployed EAR file may have been attempted to deploy. Perform deployment after undeploying all Web applications contained in the EAR file or perform re-deployment. Special care must be taken when deploying an EAR file containing multiple Web applications.

## 2.2.21 DEP1244

---

**You have no write permission on the specified directory: Directory=%s1**

## Variable Information

%s1 = Directory name

## Explanation

A directory to which no write authority is granted is specified.

## System Action

Processing stops.

## User Action

After granting the write authority to the directory, re-execute the processing.

## 2.2.22 DEP1245

---

**This window cannot be closed until the processing ends**

## Explanation

An attempt was made to close the window during deployment.

## System Action

Continues the processing.

## User Action

Do not close the window during deployment.

## 2.2.23 DEP1246

---

**The selected file is not an EAR file: Details=%s1**

## Variable Information

%s1 = Detailed message of the error

## Explanation

META-INF/application.xml is not stored in the EAR file that was attempted to read.

#### System Action

Processing stops.

#### User Action

After storing META-INF/application.xml correctly in the EAR file, re-execute the processing.

## 2.2.24 DEP1247

---

### No container is defined: Details=%s1

#### Explanation

Not a single container is defined.

#### System Action

Processing stops.

#### User Action

After defining a container, re-execute the processing.

## 2.3 DEP1400 to DEP1499

---

These are messages displayed during operation of the Interstage Management Console.

### 2.3.1 DEP1401

---

### A file or directory that violates the EJB rules is specified: Details=%s1

#### Variable Information

%s1 = Detailed message of the error

#### Explanation

An EJB application file or directory that violates the EJB rules is specified.

#### System Action

Stops the processing.

#### User Action

The following cause can be assumed if this message is output:

- No Enterprise Bean name may be set in the deployment descriptor of the EJB application.

### 2.3.2 DEP1404

---

### The log has been saved: File name = %s1

#### Variable Information

%s1 = File name

#### Explanation

The execution status log of the deployment wizard has been saved in a file.

#### System Action

Continues processing.

### 2.3.3 DEP1405

---

#### Specify an EJB application name: EJB display name=%s1: Enterprise Bean name=%s2

##### Variable Information

%s1 = EJB display name

%s2 = Enterprise Bean name

##### Explanation

The EJB application name is blank in the deployment wizard - EJB application - basic operation window.

##### System Action

Processing stops.

##### User Action

Enter an EJB application name.

### 2.3.4 DEP1406

---

#### The creation destination directory is duplicated: Duplicate directory=%s1

##### Variable Information

%s1 = Duplicate directory name

##### Explanation

This message is output if, in the expansion wizard - EJB application - generation destination setting window, the generation destination directory of the server file is the same as that of the client file.

##### System Action

Processing stops.

##### User Action

Ensure that the generation destination directory of the server file is different from that of the client file.

### 2.3.5 DEP1407

---

#### Specify a creation destination directory: Details=%s1

##### Variable Information

%s1 = Detailed message of the error

##### Explanation

No generation destination directory is specified.

##### System Action

Processing stops.

##### User Action

Remove the cause of an error based on a detailed message, and perform processing again.

### 2.3.6 DEP1408

---

#### Enter a creation destination directory using an absolute path: Details=%s1

### Variable Information

%s1 = Detailed message of the error

### Explanation

The path specified as the generation destination directory is not an absolute path.

### System Action

Processing stops.

### User Action

Specify the generation destination directory using an absolute path.

## 2.3.7 DEP1409

---

### The creation destination directory does not exist: Details=%s1

### Variable Information

%s1 = Detailed message of the error

### Explanation

The specified generation destination directory does not exist.

### System Action

Processing stops.

### User Action

Specify a directory that exists as the generation destination directory or create a directory specified as the generation destination directory.

## 2.3.8 DEP1410

---

### Do you want to exit the wizard?

### Explanation

Confirm whether to quit the wizard.

### User Action

Select "Yes" to quit the wizard. Select "No" not to quit the wizard.

## 2.3.9 DEP1411

---

### The specified file has been updated. Do you want to reflect the content of the file?

### Explanation

The same file as that specified last time is specified, but its contents have been updated. Confirm whether to continue processing by having updated contents reflected.

### User Action

Select "Yes" to continue processing by having updated contents reflected. Select "No" to stop processing.

## 2.3.10 DEP1412

---

### The files for the server files already exist. : May I overwrite?

### Variable Information

%s1 = Detailed message

### Explanation

Confirm whether to overwrite the files for the server files which has already existed.

### User Action

Select "Yes" to continue processing after overwriting. Select "No" to stop processing.

## 2.3.11 DEP1414

---

**The specified creation destination is not a directory: Group=%s1: EJB display name=%s2: Directory name=%s3**

### Variable Information

%s1 = Input group

%s2 = EJB display name

%s3 = Directory name

### Explanation

The generation destination shown in Variable information is not a directory.

### System Action

Processing stops.

### User Action

Change the directory name shown in Variable information.

## 2.3.12 DEP1415

---

**No file or directory is specified**

### Explanation

A file or directory is not specified.

### System Action

Stops the processing.

### User Action

Specify a file or directory.

## 2.3.13 DEP1416

---

**A character that cannot be specified for an EJB application name is used: EJB display name=%s1: Enterprise Bean name=%s2**

### Variable Information

%s1 = EJB application name

%s2 = Enterprise Bean name

### Explanation

A character that may not be specified in the EJB application name specified in the Enterprise Bean name shown in Variable information is used.

Specification of the following names in the EJB application name.

- Full-size character (a hiragana, katakana, a Chinese character, an English number, sign)
- Katakana of a half-size character
- Signs other than '-', '/', ':', '!', and '\_'
- Space
- A head or a terminus is the thing of '/'.
- That for which '/' and '/' are used continuously

#### System Action

Processing stops.

#### User Action

Specify the EJB application name correctly.

### 2.3.14 DEP1417

---

#### **Naming context can have up to 32 levels: EJB display name=%s1: Enterprise Bean name=%s2**

##### Variable Information

%s1 = EJB display name

%s2 = Enterprise Bean name

##### Explanation

The number of hierarchical levels of the naming context of the EJB application name specified in the Enterprise Bean name shown in Variable information exceeds 32 ('/' exceeds 32.).

##### System Action

Processing stops.

##### User Action

Specify the EJB application name correctly.

### 2.3.15 DEP1418

---

#### **An EJB application name can have up to 255 characters: EJB display name=%s1: Enterprise Bean name=%s2**

##### Variable Information

%s1 = EJB display name

%s2 = Enterprise Bean name

##### Explanation

The number of characters in the EJB application name specified in the Enterprise Bean name shown in Variable information exceeds 255.

##### System Action

Processing stops.

##### User Action

Specify the EJB application name correctly.

## 2.3.16 DEP1419

---

### Deployment of %s1 has started

#### Variable Information

%s1 = resource name

#### Explanation

Deployment of the resource adapter has started.

## 2.3.17 DEP1420

---

### Deployment of %s1 has ended

#### Variable Information

%s1 = resource name

#### Explanation

Deployment of the resource adapter has finished.

## 2.3.18 DEP1421

---

### Cancellation of deployment is completed

#### Explanation

Undeployment has completed.

## 2.3.19 DEP1424

---

### The EJB application name is duplicated: EJB display name=%s1: EJB application name=%s2

#### Variable Information

%s1 = EJB display name

%s2 = EJB application name

#### Explanation

The EJB application name is duplicated.

#### System Action

Processing stops.

#### User Action

Specify an EJB application name that is not duplicated.

## 2.3.20 DEP1425

---

### This Java version is not supported: Version=%s1

#### Variable Information

%s1 = Java version

#### Explanation

This Java version is not supported.

## System Action

Processing stops.

## User Action

**Windows32/64** **Solaris32/64** **Linux32/64**

Install JDK 6.

## 2.3.21 DEP1426

---

### Failed to open the EAR file: Details=%s1

#### Variable Information

%s1 = Detailed message of the error

#### Explanation

Failed to open the EAR file.

#### System Action

Processing stops.

#### User Action

Check that the file is a normal EAR file.

## 2.3.22 DEP1427

---

### The EAR file includes no component: Details=%s1

#### Variable Information

%s1 = Detailed message of the error

#### Explanation

Not a single component is contained in the EAR file

#### System Action

Processing stops.

#### User Action

Add components to the EAR file or specify an EAR file that contains components.

## 2.3.23 DEP1428

---

### Failed to create a directory in which the jar file should be created: Group=%s1

#### Variable Information

%s1 = Input group

#### Explanation

Failed to create a directory at the jar file generation destination.

#### System Action

Processing stops.

## User Action

If a file with the same name as the directory name at the jar file generation destination exists, move the file.

### 2.3.24 DEP1429

---

#### The resource name includes a character that cannot be used: RAR display name=%s1

##### Variable Information

%s1 = RAR display name

##### Explanation

An invalid character is included the resource name that was specified in the RAR display name in the variable information.

The following names cannot be used for resource names:

- A name including only en-size blank spaces
- A name including an and sign (&), a question mark (?), a double quote ("), angle bracket (< or >), a vertical bar (|), a colon (:), a semicolon (;), an asterisk (\*), or a slash (/)
- If the Windows(R) version is used, a character string including a file delimiter (\) is also invalid.

##### System Action

Processing stops.

##### User Action

Specify a correct resource name.

### 2.3.25 DEP1430

---

#### A resource with the same name already exists. Do you want to overwrite it?

##### Explanation

The same resource name is already present. This message is generated to check whether the resource name can be overwritten.

##### User Action

To overwrite the resource and continue the process, select Yes. To terminate the process, select No.

### 2.3.26 DEP1431

---

#### The property value is incorrect: RAR display name=%s1: Property name=%s2: Property type=%s3

##### Variable Information

%s1 = RAR display name

%s2 = Property name

%s3 = Property type

##### Explanation

The property value is invalid.

##### System Action

Processing stops.

##### User Action

Check the property value and enter the correct value.

## 2.3.27 DEP1432

---

**The EJB application name is duplicated: EJB name 1=%s1: EJB name 2=%s2: EJB application name=%s3**

### Variable Information

%s1 = EJB display name 1

%s2 = EJB display name 2

%s3 = EJB application name 3

### Explanation

The EJB application name is duplicated

### System Action

Processing stops.

### User Action

Change the EJB application name specified either in EJB name 1 or EJB name 2.

## 2.3.28 DEP1433

---

**The EnterpriseBean name is duplicated: EJB name=%s1: EnterpriseBean name=%s2**

### Variable Information

%s1 = EJB display name

%s2 = EnterpriseBean name

### Explanation

The EnterpriseBean name is duplicated

### System Action

Processing stops.

### User Action

Change the EnterpriseBean name of the deployment descriptor so that it is not duplicated.

## 2.3.29 DEP1434

---

**The EnterpriseBean name is duplicated: EJB display name 1=%s1: EJB display name 2=%s2: EnterpriseBean name=%s3**

### Variable Information

%s1 = EJB display name 1

%s2 = EJB display name 2

%3= EnterpriseBean name

### Explanation

The same EnterpriseBean name is specified for EJB name 1 and EJB name 2.

### System Action

Processing stops.

## User Action

Change the EnterpriseBean name specified either for EJB name 1 or EJB name 2.

### 2.3.30 DEP1435

---

#### No resource name is entered: RAR display name=%s1

##### Variable Information

%s1 = RAR display name

##### Explanation

No resource name is entered.

##### System Action

Processing stops.

##### User Action

Enter a resource name.

### 2.3.31 DEP1436

---

#### A resource name can have up to 32 characters: RAR display name=%s1

##### Variable Information

%s1 = RAR display name

##### Explanation

A resource name can have up to 32 characters.

##### System Action

Processing stops.

##### User Action

Specify a resource name with up to 32 characters.

### 2.3.32 DEP1437

---

#### A file or directory that violates the connector specification was specified: Details=%s1

##### Variable Information

%s1 = Detailed message of an error

##### Explanation

A resource adapter file name or directory that violates the connector specification was specified

##### System Action

Processing stops.

##### User Action

Correct the value in rxr.xml and specify the resource adapter application file or directory again.

### 2.3.33 DEP1438

---

---

**A file or directory that violates the web specification was specified: Details=%s1****Variable Information**

%s1 = Detailed message of an error

**Explanation**

A Web application file or directory that violates the web specification was specified

**System Action**

Processing stops.

**User Action**

Correct the value in war.xml and specify the web application file or directory again.

---

**2.3.34 DEP1439**

---

**Failed to acquire definition information: Details=%s1****Variable Information**

%s1 = Detailed message of an error

**Explanation**

Failed to acquire resource definition information

**System Action**

Processing stops.

**User Action**

Refer to the detailed message and remove the cause of the error. Then execute the process again.

---

**2.3.35 DEP1440**

---

**Failed to set a resource definition. : Details=%s1****Variable Information**

%s1 = Detailed message of an error

**Explanation**

Failed to set a resource definition.

**System Action**

Processing stops.

**User Action**

After removing the cause of the error based on the detailed message, re-execute the processing.

---

**2.3.36 DEP1441**

---

**The resource name is duplicated: RAR display name=%s1****Variable Information**

%s1 = RAR display name

#### Explanation

A resource name is duplicated on the resource adapter resource definition screen.

#### System Action

Processing stops.

#### User Action

Specify a resource name that is not duplicated.

### 2.3.37 DEP1442

---

#### **The file name or directory name contains an illegal character:%s1**

#### Variable Information

%s1 = Detailed message of an error

#### Explanation

The file name or directory name contains an illegal character.

#### System Action

Processing stops.

#### User Action

Use characters valid for specifying a file name or a directory name.

### 2.3.38 DEP1443

---

#### **Enter an absolute path: Details=%s1**

#### Variable Information

%s1 = Detailed message of an error

#### Explanation

A file or a directory is specified using a relative path.

#### System Action

Processing stops.

#### User Action

Specify a file or directory using an absolute path.

### 2.3.39 DEP1444

---

#### **The directory name contains an illegal character:%s1**

#### Variable Information

%s1 = Detailed message of an error

#### Explanation

The directory name contains an illegal character.

#### System Action

Processing stops.

#### User Action

Use characters valid for specifying a directory name.

### 2.3.40 DEP1445

---

#### The EJB service is not installed

##### Explanation

The EJB service is not installed.

##### System Action

Processing stops.

##### User Action

Install EJB service, when you deploy EJB application.

### 2.3.41 DEP1446

---

#### The EJB service is not installed: EJB application will not be deployment: Do you want to continue?

##### Explanation

The EJB service is not installed: EJB application will not be deployment: Do you want to continue?

##### System Action

Processing stops.

##### User Action

To continue the process without deploying EJB application, select Yes. To cancel the process, select No.

### 2.3.42 DEP1447

---

#### Enter a host name

##### Explanation

The host name is not inputted.

##### System Action

Processing stops.

##### User Action

Enter a host name.

### 2.3.43 DEP1448

---

#### Enter a port number

##### Explanation

A port number is not inputted.

##### System Action

Processing stops.

##### User Action

Enter a port number.

## 2.3.44 DEP1449

---

### The port number is incorrect

#### Explanation

An invalid port number is entered.

#### System Action

Processing stops.

#### User Action

Enter a correct port number.

## 2.3.45 DEP1450

---

### Enter a transfer destination directory

#### Explanation

A transfer destination directory is not entered.

#### System Action

Processing stops.

#### User Action

Enter a transfer destination directory.

## 2.3.46 DEP1451

---

### Enter a user name

#### Explanation

A user name is not entered.

#### System Action

Processing stops.

#### User Action

Enter a user name.

## 2.3.47 DEP1452

---

### Enter a password

#### Explanation

A password is not entered.

#### System Action

Processing stops.

#### User Action

Enter a password.

## 2.3.48 DEP1454

---

---

**The same web application identifier already exists. Do you want to overwrite it?****Explanation**

The same web application identifier already exists. Do you want to overwrite it?

**User Action**

To overwrite it and continue the process, select Yes. To cancel the process, select No.

---

**2.3.49 DEP1455**

---

**No user name is entered: RAR display name=%s1****Variable Information**

%s1=RAR display name

**Explanation**

No user name is entered

**System Action**

Processing stops.

**User Action**

Specify a user name, or remove the password and then execute the process again.

---

**2.3.50 DEP1456**

---

**Deployment of %s1 has started****Variable Information**

%s1 = EJB display name

**Explanation**

Deployment has started.

---

**2.3.51 DEP1457**

---

**Deployment of %s1 has ended****Variable Information**

%s1 = EJB display name

**Explanation**

Deployment has ended.

---

**2.3.52 DEP1458**

---

**The specified file is deploying****Explanation**

The specified file is deploying.

**System Action**

Processing stops.

#### User Action

Verify that the deployment has ended and then execute the process again.

### 2.3.53 DEP1459

---

#### The specified file is deploying

##### Explanation

The specified file is deploying.

##### System Action

Processing stops.

##### User Action

Verify that the other deployment has ended, then execute the process again.

### 2.3.54 DEP1460

---

#### Can not be continued because other %s1 are while it deploying: Process is stopped

##### Variable Information

%s1 = Detailed message of an error

##### Explanation

Another deployment is being performed.

##### System Action

Processing stops.

##### User Action

Verify that the other deployment has ended and execute the process again.

### 2.3.55 DEP1461

---

#### Can not be continued because other EJB are while it deploying: Process is stopped

##### Explanation

Another deployment is being performed.

##### System Action

Processing stops.

##### User Action

Verify that the other deployment has ended, then execute the process again.

### 2.3.56 DEP1462

---

#### The specified resource name already used: Resource name=%s1

##### Variable Information

%s1 = resource name

##### Explanation

The same resource name already exists.

#### System Action

Processing stops.

#### User Action

Undeploy the specified resource name and deploy it, or re-deploy the resource name.

### 2.3.57 DEP1463

---

**The setting value is incorrect: WAR display name=%s1: Item name=%s2**

#### Variable Information

%s1 = WAR display name

%s2 = Item name

#### Explanation

The input value is incorrect.

#### System Action

Processing stops.

#### User Action

Enter the correct value.

### 2.3.58 DEP1464

---

**The specified directory does not exist: WAR display name=%s1: Directory=%s2**

#### Variable Information

%s1 = WAR display name

%s2 = Director

#### Explanation

The specified directory does not exist.

#### System Action

Processing stops.

#### User Action

Enter the existing directory and execute processing again.

### 2.3.59 DEP1465

---

**There is an unrecognizable directory at the deployment destination: WAR display name=%s1: Web application identifier=%s2**

#### Variable Information

%s1 = WAR display name

%s2 = Web application identifier

#### Explanation

The directory on the server specified for deployment could not be recognized.

### System Action

Processing stops.

### User Action

If the deployment directory is not the web application directory, delete the directory or specify other directory and execute the process again.

If the problem cannot be resolved, collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

## 2.3.60 DEP1466

---

### No container is defined

#### Explanation

No container is defined.

#### System Action

Processing stops.

#### User Action

Define a container and execute processing again.

## 2.3.61 DEP1467

---

### No container is defined: Web application will not be installed: Do you want to continue?

#### Explanation

Verify whether to perform deployment other than the web application deployment.

#### User Action

To perform deployment other than the web application deployment, select Yes. To cancel the process, select No.

## 2.3.62 DEP1468

---

### The web application identifier is duplicated: WAR display name=%s1

#### Explanation

In the Web application screen, the web application identifier is duplicated.

#### System Action

Processing stops.

#### User Action

Specify the web application identifier that is not duplicated.

## 2.3.63 DEP1469

---

### Deployment failed: Details=%s1

#### Variable Information

%s1 = Detailed message of an error

#### Explanation

Failed while deploying and deployment failed.

### System Action

Processing stops.

### User Action

After removing the cause of the error based on the detailed message, re-execute the processing.

The following cause can be considered.

- The amounts of memories of a system are insufficient.

When another message is displayed on an execution situation window, cope with it according to both messages.

## 2.3.64 DEP1470

---

### Failed while canceling deployment: Details=%s1

#### Variable Information

%s1 = Detailed message of an error

#### Explanation

Failed while canceling deployment and deployment failed.

#### System Action

Processing stops.

#### User Action

After removing the cause of the error based on the detailed message, re-execute the processing.

## 2.3.65 DEP1471

---

### A class doesn't exist Class=%s1

#### Variable Information

%s1 = Class name

#### Explanation

A class displayed in Variable Information doesn't exist.

#### System Action

Processing stops.

#### User Action

Check whether the package composition of the class in Variable Information is right.

Check whether the class in Variable Information has broken.

## 2.3.66 DEP1472

---

### The EJB application already exists: Do you want to overwrite it?

#### Explanation

Checks whether to overwrite EJB application that already exists.

#### User Action

Select "Yes" to overwrite. Select "No" not to overwrite.

## 2.3.67 DEP1473

### EJB application deployment failed: Details code=%s1

#### Variable Information

%s1 = Details code

#### Explanation

The error occurred when deploying EJB application, and deployment failed.

#### System Action

Processing stops.

#### User Action

Perform the following management based on a detailed code correspondence table.

Table 2.1 DEP1473 Error Management

Detail code	Meaning	Cause	Action
2	An error exists in an environmental setup.	An error is in the environment variable of "IS_J2EEAPF."  Installation of Interstage is not performed correctly. If the value of an environment variable is set up incorrectly, Interstage cannot operate correctly.	Re-install Interstage.
12	A shortage of memory occurred.	Insufficient memory available.	Perform processing again after a short period of time.  When this message is output frequently, refer to the Tuning Guide and re-estimate the amount of memory which is needed in order to employ EJB service and check whether the memory is fully prepared.  When the memory is fully prepared for the amount of memory which EJB service needs, it is possible that the amount of user memory for other applications is insufficient. Carry out a re-estimate of other applications currently employed on the same machine, and determine whether the amount of memory is suitable.  Contact a system administrator when it is found as a result of the re-estimate that the amount of memory is insufficient. The system administrator needs to perform extension of main memory or extension of the swap domain.
110	An error occurred in ORB.	Because CORBA service has not started, execution of processing cannot be performed.	Perform again after starting CORBA service. For the details about starting of CORBA service, refer to "S99startod" in "CORBA Service Operation Commands" or "isstart" in "Interstage Setup Commands" in the Reference Manual (Command Edition).

Detail code	Meaning	Cause	Action
		Because naming service has not started, execution of processing cannot be performed.	Perform again after starting naming service. For the details about starting of naming service, refer to "CosNaming_s" in "CORBA Service Operation Commands" or "isstart" in "Interstage Setup Commands" in the Reference Manual (Command Edition).
		<p>Connection with CORBA service failed. One of the following will be the cause.</p> <ul style="list-style-type: none"> <li>- Initialization of Interstage is not carried out.</li> <li>- CORBA service is not started.</li> <li>- The resources for CORBA service operating are insufficient.</li> <li>- Naming service is not started.</li> </ul>	<p>Manage as follows.</p> <ul style="list-style-type: none"> <li>- Perform again after checking whether initialization of Interstage is carried out, CORBA service has started, and the resources for CORBA service operation are sufficient.</li> <li>- When initialization of Interstage is not carried out, and initialize Interstage.</li> <li>- When CORBA service is not started, start with reference to "S99startod" in "CORBA Service Operation Commands" or "isstart" in "Interstage Setup Commands" of the Reference Manual (Command Edition).</li> <li>- "When the resources for CORBA service operating are insufficient, secure resources with reference to the Tuning Guide.</li> <li>- When naming service is not started, start with reference to "CosNaming_s" in "CORBA Service Operation Commands" or "isstart" in "Interstage Setup Commands" of the Reference Manual (Command Edition).</li> </ul>
		Registration of implementation Repository ID of CORBA service failed.	<p>Manage the error according to the information contained in the CORBA service event log.</p> <p>If this does not correct the error, collect diagnostic information using the <i>iscollectinfo</i> command, and then contact your systems engineer.</p>
		Implementation Repository ID of CORBA service is already registered.	Check implementation Repository of CORBA service.
		Implementation Repository ID of CORBA service is not registered.	Check registration of implementation Repository ID of CORBA service.
		Deletion of implementation Repository ID of CORBA service cannot be performed.	<p>Manage as follows.</p> <ul style="list-style-type: none"> <li>- When EJB application is processing, perform again after stopping EJB application.</li> <li>- When EJB application is not processing, manage the error according to the information contained in the CORBA service event log.</li> </ul> <p>If this does not correct the error, collect diagnostic information using the <i>iscollectinfo</i> command, and then contact your systems engineer.</p>
		Implementation Repository ID of a same name was registered into CORBA service, and since the application corresponding to the	Perform again after stopping the application corresponding to implementation Repository ID. Check the contents of registration to CORBA service using the <i>odlistns</i> command. Refer to

Detail code	Meaning	Cause	Action
		implementation Repository ID was applying, registration of implementation Repository ID failed.	" <i>odlistns</i> " in "CORBA Service Operation Commands" of the Reference Manual (Command Edition) for the details of the <i>odlistns</i> command.
		Registration of the EJB application name into naming service failed.	Manage the error according to the information contained in the CORBA service event log.  If this does not correct the error, collect diagnostic information using the <i>iscollectinfo</i> command, and then contact your systems engineer.
		The EJB application name is already registered into naming service.	Check naming service. Perform again after using an <i>OD_or_adm</i> command and deleting a load balance object group, in re-installing the EJB application registered as a load balance object group.  If this does not correct the error, collect diagnostic information using the <i>iscollectinfo</i> command, and then contact your systems engineer.
		The EJB application name is not registered into naming service.	The EJB application name is not registered into naming service.
		Deletion of an EJB application name from naming service failed.	Manage the error according to the information contained in the CORBA service event log.  If this does not correct the error, collect diagnostic information using the <i>iscollectinfo</i> command, and then contact your systems engineer.
		Because an EJB application name was in use, deletion of the EJB application name from the naming service failed. The following can be considered as the reason the EJB application name was in use.  - In an environment where the naming service is shared by two or more server machines, and the EJB application is not operating on the server machine which performed the processing.  - When a CORBA application is operating with the same name as an EJB application name.	Perform again after stopping the application which is using the EJB application name.
501	An error is in the environment variable of "IS_J2EEAPF."	There are the following possibilities.  - Installation of Interstage was not performed correctly.  - Because the value of an environment variable is set up incorrectly, Interstage cannot operate correctly.	Re-install Interstage.
502	Abnormalities arose during an exclusive operation.	Because an EJB application is operating or a definition is being updated, processing cannot continue.	Perform the operation again after stopping the EJB application or the definition update operation.

Detail code	Meaning	Cause	Action
		Because an EJB application is deploying or canceling, processing cannot be continued.	Perform again after deployment of the EJB application is completed or canceled.
		Because an EJB application or a definition is operating, processing cannot be continued.	Perform again after stopping the IJServer or definition operation.
		The length of the specified EJB application name is above the limit (256).	Specify the EJB application name with a number of bytes not exceeding restriction (256 or less), and perform again.
		The specified EJB application has been deployed in the EJB container.	Undeploy the specified EJB application in the EJB container, then re-execute.
518	The specified EJB is not deployed.	The specified EJB application is not deployed.	Deploy the specified EJB application.
999	A system error occurred.	Too many EJB applications are deployed.	Reduce the number of deployed EJB applications. Or, remove unnecessary EJB applications from deployment.
		No EJB application is found in the server file generation destination directory. It may have been deleted.	Re-execute after deleting the directory in which the server file was generated.
		An EJB application without an EJB application definition exists in the server file generation destination directory.	Processing will continue, although the EJB application that caused the warning will not be deployed.
		Implementation repository ID of the CORBA service is too long.	<p>The action to be taken by the user depends on the language used in the EJB application.</p> <ul style="list-style-type: none"> <li>- In the case of Java, the implementation repository ID is created by attaching "IDL:" and ":1.0" to a class name of the Home interface including the package name. Thus, the number of bytes of a class name of the Home interface including the package name should be (maximum length of the implementation repository ID) - 8 bytes or less.</li> <li>- In the case of COBOL, the implementation repository ID is created by attaching "IDL:", "/", and ":1.0" to a module name and the Home interface name. Thus, the total number of bytes of the module name and the Home interface name should be (maximum length of the implementation repository ID) - 9 bytes or less.</li> </ul>
		The EJB application name is incorrect.	Check for any invalid character specified in the EJB application name. If an invalid character is specified, change the EJB application name.
		Multiple EJB applications with the same EJB application name exist in the server file expansion source directory. It is not permitted to deploy multiple EJB applications with the same EJB application name.	Re-deploy EJB applications after clearing the work area in which EJB applications are expanded.

Detail code	Meaning	Cause	Action
		An input/output error occurred.	The disk drive may be damaged. If the disk drive is damaged, repair or replace it.
		An input/output error occurred in the current directory.	Repair or replace the disk drive in which the current directory is stored.
		<p>A system error occurred due to an environment problem or for some other reason:</p> <ul style="list-style-type: none"> <li>- An environment variable is set incorrectly.</li> <li>- Memory has been exhausted.</li> <li>- An attempt was made on an EJB application in operation to change its JNDI name and deploy it.</li> </ul>	<p>Take one of the following actions.</p> <ul style="list-style-type: none"> <li>- If the environment variable is set incorrectly, examine the environment variable setting.</li> <li>- If memory has been exhausted, check the memory amount.</li> <li>- If an attempt was made on an EJB application in operation to change its JNDI name and deploy it, stop the relevant EJB application and then carry out deployment.</li> <li>- Otherwise, collect diagnostic information using the <i>iscollectinfo</i> command, and then contact your systems engineer.</li> </ul>

## 2.3.68 DEP1474

---

### Failed while canceling deployment: Details code=%s1

#### Variable Information

%s1 = Detail code

#### Explanation

The error occurred while canceling deployment of the EJB application, and deployment failed.

#### System Action

Processing stops.

#### User Action

Examine the detail code and perform the required action.

In addition, refer to the detailed code table of DEP1473.

## 2.3.69 DEP1475

---

### The EJB application already exists.

#### Explanation

EJB application already exists.

#### System Action

Processing stops.

#### User Action

Cancel deployment of the EJB application that already exists and perform again, or perform again by the replace mode.

## 2.4 DEP1700 to DEP1799

---

The following messages are displayed during operation of the Interstage Management Console.

### 2.4.1 DEP1700

---

#### **An application to be undeployed was not specified.**

##### Explanation

An application to be undeployed was not specified.

##### System Action

Processing stops.

##### User Action

Re-execute the processing after selecting the application you want to undeploy.

### 2.4.2 DEP1702

---

#### **A container name was not specified in the option. Are you sure you want to continue processing?**

##### Explanation

Asks for confirmation to continue deployment even though a container name is not specified in the option.

##### User Action

Select "Yes" to continue processing. Select "No" to cancel.

### 2.4.3 DEP1703

---

#### **An error occurred during acquisition of the latest information.**

##### Explanation

An error occurred during acquisition of the latest information.

##### System Action

Processing stops.

##### User Action

Click the Detail button to display message details. Correct the error, then re-execute processing.

### 2.4.4 DEP1704

---

#### **Do you want to undeploy the selected application?**

##### Explanation

Asks for confirmation to undeploy the selected application.

##### User Action

Select "Yes" to continue processing. Select "No" to cancel.

### 2.4.5 DEP1705

---

#### **An error occurred during acquisition of information about deployed applications.**

#### Explanation

An error occurred during acquisition of information about deployed applications.

#### System Action

Processing stops.

#### User Action

Click the Detail button to display message details. Correct the error, and then re-execute processing.

### 2.4.6 DEP1707

---

**An execution environment for %s1 was not created on the selected IJServer. An execution environment for %s1 was created if the IJServer was changed.**

#### Variable Information

%s1 = Servlet or EJB

#### Explanation

The execution environment of %s1 is not created by the selected IJServer. The execution environment of %s1 can be created by changing IJServer.

### 2.4.7 DEP1708

---

**A IJServer has been added: IJServer name = %s1**

#### Variable Information

%s1 = IJServer name

#### Explanation

An IJServer has been added.

### 2.4.8 DEP1709

---

**Could not add a IJServer: IJServer name = %s1**

#### Variable Information

%s1 = IJServer name

#### Explanation

An error occurred while an IJServer was being added.

#### System Action

Processing stops.

#### User Action

Click the Detail button to display message details. Correct the error, then re-execute processing.

### 2.4.9 DEP1710

---

**Are you sure you want to change the IJServer?: IJServer name = %s1**

#### Variable Information

%s1 = IJServer name

#### Explanation

Asks for confirmation to change the existing IJServer.

#### User Action

Select "Yes" to continue processing. Select "No" to cancel.

### 2.4.10 DEP1711

---

#### IJServer has been changed: IJServer name = %s1

#### Variable Information

%s1 = IJServer name

#### Explanation

The IJServer has been changed.

### 2.4.11 DEP1712

---

#### Could not change the IJServer: IJServer name = %s1

#### Variable Information

%s1 = IJServer name

#### Explanation

An error occurred when the IJServer was changed.

#### System Action

Processing stops.

#### User Action

Click the Detail button to display message details. Correct the error, then re-execute processing.

### 2.4.12 DEP1713

---

#### Are you sure you want to delete the IJServer?: IJServer name = %s1

#### Variable Information

%s1 = IJServer name

#### Explanation

Asks for confirmation to delete the IJServer.

#### User Action

Select "Yes" to continue processing. Select "No" to cancel.

### 2.4.13 DEP1714

---

#### If the IJServer is deleted, deployed applications will also be deleted. Are you sure you want to delete the IJServer?

#### Explanation

Asks for confirmation to delete the IJServer.

#### User Action

Select "Yes" to continue processing. Select "No" to cancel.

### 2.4.14 DEP1715

---

#### **IJServer has been deleted: IJServer name = %s1**

#### Variable Information

%s1 = IJServer name

#### Explanation

The IJServer has been deleted.

### 2.4.15 DEP1716

---

#### **No IJServer exists.**

#### Explanation

An IJServer does not exist.

#### System Action

Processing stops.

#### User Action

Add an IJServer and re-execute deployment.

### 2.4.16 DEP1717

---

#### **No IJServer exists. Web applications will not be deployed. Are you sure you want to continue?**

#### Explanation

Asks for confirmation to continue deployment even though there is no IJServer.

#### User Action

Select "Yes" to continue processing. Select "No" to cancel.

### 2.4.17 DEP1718

---

#### **No IJServer exists. EJB applications will not be deployed. Are you sure you want to continue?**

#### Explanation

Asks for confirmation to continue deployment even though there is no IJServer.

#### User Action

Select "Yes" to continue processing. Select "No" to cancel.

### 2.4.18 DEP1719

---

#### **Could not acquire data about the IJServer.**

#### Explanation

The system could not acquire data about the IJServer.

## System Action

Processing stops.

## User Action

Click the Detail button to display message details. Correct the error, then re-execute processing.

## 2.4.19 DEP1720

---

**Applications that specify the same directory name as the generation destination of the server file cannot be deployed on separate IJServers: display name1 = %s1, display name2 = %s2**

### Variable Information

%s1 = EJB display name1

%s2 = EJB display name2

### Explanation

Applications that specify the same directory name as the generation destination of the server file cannot be deployed on separate IJServers.

## System Action

Processing stops.

## User Action

Specify the same IJServer as the deployment destination, or specify different directory names as the generation destination of the server file.

## 2.4.20 DEP1721

---

**An incorrect value was entered. Enter the correct value.: Tab name=%s1**

### Variable Information

%s1 = Tab name

### Explanation

An incorrect value was entered.

## System Action

Processing stops.

## User Action

Click the Detail button to display message details. Enter the correct value, then re-execute processing.

## 2.4.21 DEP1722

---

**Could not start the Customize Tool.**

### Explanation

Could not activate the Customize Tool because the environment may not be ready.

## System Action

Processing stops.

## User Action

Ready the environment for activation, then re-execute processing.

## 2.4.22 DEP1723

---

### Could not start the J2EE resource access definition.

#### Explanation

Could not activate the J2EE resource access definition because the environment may not be ready.

#### System Action

Processing stops.

#### User Action

Ready the environment for activation, then re-execute processing.

## 2.4.23 DEP1724

---

### The specified IJServer already exists: IJServer name = %s1

#### Variable Information

%s1 = IJServer name

#### Explanation

The IJServer already exists.

#### System Action

Processing stops.

#### User Action

Change the IJServer name, then re-execute processing.

## 2.4.24 DEP1725

---

### An error occurred when the system file was being read.

#### Explanation

The IJServer information file is damaged, or an unsupported file was read.

#### System Action

Processing stops.

#### User Action

Delete the following file, then re-create the IJServer.

**Windows32/64**

C:\Interstage\J2EE\etc\j2eeserver.dat

**Linux32/64**

/opt/FJSVj2ee/etc/j2eeserver.dat

**Solaris32/64**

/opt/FJSVj2ee/etc/j2eeserver.dat

/var/opt/FJSVisas/system/system-name/FJSVj2ee/etc/j2eeserver.dat

(set when an extended system (-M option) is specified at activation)

## 2.4.25 DEP1726

---

### The specified IJServer does not exist: IJServer name = %s1

#### Variable Information

%s1 = IJServer name

#### Explanation

The specified IJServer does not exist because either the information displayed by the J2EE Deployment tool is not current, or the IJServer indicated in the variable information cannot be found.

#### System Action

Processing stops.

#### User Action

If the IJServer indicated in the variable information cannot be found, add the IJServer, then re-execute processing.

## 2.4.26 DEP1727

---

### Could not acquire the port number.

#### Explanation

Could not acquire the port number.

#### System Action

Processing stops.

#### User Action

Click the Detail button to display message details. Correct the error, then re-execute processing.

## 2.4.27 DEP1728

---

### No IJServer name was entered.

#### Explanation

The IJServer name was not entered.

#### System Action

Processing stops.

#### User Action

Enter an IJServer name.

## 2.4.28 DEP1729

---

### The maximum number of characters that can be specified for the IJServer name is 28: IJServer name = %s1

#### Variable Information

%s1 = IJServer name

#### Explanation

The number of characters entered for the IJServer name exceeded the maximum.

#### System Action

Processing stops.

#### User Action

Change the IJServer name using 28 characters or less.

### 2.4.29 DEP1730

---

#### **The IJServer name contains a character that is not allowed: IJServer name = %s1**

#### Variable Information

%s1 = IJServer name

#### Explanation

The IJServer name contains an illegal character

#### System Action

Processing stops.

#### User Action

Specify the IJServer name correctly.

Legal characters for the IJServer name include the following:

- Any en-size alphanumeric character
- Underscore '\_' provided it does not occur at the beginning or end of an IJServer name.

### 2.4.30 DEP1731

---

#### **Could not delete the IJServer: IJServer name = %s1**

#### Variable Information

%s1 = IJServer name

#### Explanation

The IJServer could not be deleted properly.

#### System Action

Processing stops.

#### User Action

Click the Detail button to display message details. Correct the error, then re-execute processing.

### 2.4.31 DEP1732

---

#### **'\_' cannot be used at the start and end of an IJServer name.**

#### Explanation

You cannot use an underscore character '\_' at the beginning or the end of the IJServer name.

#### System Action

Processing stops.

#### User Action

Re-specify the IJServer name correctly.

## 2.4.32 DEP1733

---

**The input value is incorrect. Input the correct value.**

### Explanation

The input value is incorrect.

### System Action

Processing stops.

### User Action

Click the Detail button to display message details. Input the correct value, then re-execute processing.

## 2.4.33 DEP1734

---

**The environment setting file of the Servlet service is inconsistent.**

### Variable Information

The environment setting file of the Servlet service is inconsistent.

### System Action

The system continues processing.

### User Action

Click the Detail button to display message details. Take appropriate action to correct the error.

## 2.4.34 DEP1735

---

**The environment definition of the EJB application is inconsistent.**

### Explanation

The environment definition of the EJB application is inconsistent.

### System Action

The system continues processing.

### User Action

Click the Detail button to display message details. Take appropriate action to correct the error.

## 2.4.35 DEP1736

---

**Deployment descriptor cannot be read due to a definition error.**

### Explanation

The deployment descriptor cannot be read due to a definition error.

### System Action

Processing stops.

### User Action

Click the Detail button to display message details. Correct the error, then re-execute processing.

## 2.4.36 DEP1737

---

---

**Deployment descriptor cannot be read due to a definition error. Do you want to continue the User Action****Explanation**

The deployment descriptor could not be read because of a definition error. Asks for confirmation to skip the file and continue processing.

**User Action**

Click the Detail button to display message details. Select "Yes" to skip and continue. Select "No" to stop.

---

**2.4.37 DEP1738**

---

**Deployment failed.****Explanation**

The Deployment process failed to complete properly.

**System Action**

Processing stops.

**User Action**

Inspect the messages displayed on the execution progress screen to correct the error, then re-execute processing.

---

**2.4.38 DEP1739**

---

**JNDI name cannot be set due to an error in the deployment descriptor definition. Do you want to continue the deployment?****Explanation**

The JNDI name cannot be set because of an error in the deployment descriptor definition. Asks for confirmation to continue the deployment.

**User Action**

Click the Detail button to display message details. Select "Yes" to continue. Select "No" to cancel.

---

**2.4.39 DEP1740**

---

**An error occurred while reading the deployment descriptor: Detail = %s1****Variable Information**

%s1 = Detailed message of the error

**Explanation**

An error occurred while reading the deployment descriptor.

**System Action**

Processing stops.

**User Action**

Refer to the detailed message of the error to correct the error, then re-execute processing.

If a message displays in the detailed message and informs you that the encoding is invalid, take either of the following actions and then re-execute processing.

When the XML parser used is Xerces2 (the IJServer default), refer to "Product Notes" - "Notes on JDK/JRE" - "Notes on Using XML Processing (JAXP)".

- Correct the deployment descriptor

Use encoding supported by the XML parser configured in the IJServer environment settings to describe the deployment descriptor.

- Change the XML parser

In the IJServer environment settings, configure the XML parser that supports the encoding deployment descriptor.

For details about XML parsers used for deployment, refer to "Settings of XML parsers required for deployment" in the "J2EE User's Guide".

If a message displays in the detailed message and informs you that the root tag has not been declared, possible causes are as follows:

- When deploying modules of J2EE version 1.4 or later:

The module may have been deployed to a V8.0 compatible IJServer or to an IJServer created in InterstageV8 or earlier.

Modules of J2EE version 1.4 or later cannot be deployed to V8.0 compatible IJServers or to IJServers created in InterstageV8 or earlier.

The connector1.5 module may also have been deployed as a resource. However, it cannot be deployed as a resource.

Deploy the module to an IJServer of V9.0 or later.

- When deploying modules of J2EE1.3 or earlier:

The deployment descriptor DOCTYPE declaration may be invalid.

Correct the deployment descriptor and re-execute processing.

## 2.4.40 DEP1741

---

### An error occurred while acquiring IJServer data: IJServer name = %s1

#### Variable Information

%s1 = IJServer name

#### Explanation

An error occurred while acquiring IJServer data.

#### System Action

Stops reading data from the applicable IJServer.

#### User Action

Inspect all subsequent message details and correct the error.

## 2.4.41 DEP1742

---

### A web application of the same name is already deployed. Do you want to redeploy it?

#### Explanation

Asks for confirmation to re-deploy the web application.

#### User Action

Select "Yes" to continue re-deployment. Select "No" to cancel re-deployment.

## 2.4.42 DEP1743

---

### An EJB application of the same name is already deployed. Do you want to redeploy it?

#### Explanation

Asks for confirmation to re-deploy the EJB application.

#### User Action

Select "Yes" to continue re-deployment. Select "No" to cancel re-deployment.

### 2.4.43 DEP1744

---

**No EJB execution environment has been created on IJServer at the deployment destination: IJServer name = %s1**

#### Variable Information

%s1 = IJServer name

#### Explanation

An EJB execution environment has not been created on IJServer at the deployment destination.

#### System Action

Processing stops.

#### User Action

Modify the IJServer to provide an EJB execution environment, then re-execute processing.

### 2.4.44 DEP1745

---

**No Servlet execution environment has been created on IJServer at the deployment destination: IJServer name = %s1**

#### Variable Information

%s1 = IJServer name

#### Explanation

The Servlet execution environment has not been created on IJServer at the deployment destination.

#### System Action

Processing stops.

#### User Action

Modify the IJServer as required to provide a Servlet execution environment, then re-execute processing.

### 2.4.45 DEP1746

---

**An error occurred during undeployment: Application name = %s1**

#### Variable Information

%s1 = Application name

#### Explanation

The undeployment process failed to complete properly.

#### System Action

Processing stops.

#### User Action

Click the Detail button to display message details. Correct the error, then re-execute processing.

## 2.4.46 DEP1747

---

**An error occurred during undeployment: Resource name = %s1**

### Variable Information

%s1 = Resource name

### Explanation

The undeployment process failed to complete properly.

### System Action

Processing stops.

### User Action

Click the Detail button to display message details. Correct the error, then re-execute processing.

## 2.4.47 DEP1748

---

**Because no EJB execution environment exists on the specified IJServer, the Customize Tool cannot be activated. Create an EJB execution environment by modifying the IJServer or specify another IJServer and re-execute the processing: IJServer name = %s1**

### Variable Information

%s1 = IJServer name

### Explanation

The Customize Tool cannot be activated because an EJB execution environment does not exist.

### System Action

Processing stops.

### User Action

Modify the IJServer, or specify another IJServer on which an EJB execution environment exists, then re-execute processing.

## 2.4.48 DEP1749

---

**A server file already exists in the specified directory. Are you sure you want to overwrite it?**

### Explanation

Asks for confirmation to overwrite an existing server file.

### User Action

Select "Yes" to overwrite the server file. Select "No" to skip overwriting.

## 2.4.49 DEP1750

---

**Failed to initialize the directory specified as the generation destination of a server file: Directory name = %s1**

### Variable Information

%s1 = Directory name

### Explanation

The specified directory failed to initialize properly.

Possible causes may include:

- The directory may not exist
- Access permissions may need to be re-specified.
- The directory may be locked by another application.

#### System Action

Processing stops.

#### User Action

Correct the error, then re-execute processing.

## 2.4.50 DEP1751

---

**Failed to initialize the directory specified as the generation destination of a client file: Directory name = %s1**

#### Variable Information

%s1 = Directory name

#### Explanation

The specified directory failed to initialize properly.

Possible causes may include:

- The directory may not exist
- Access permissions may need to be re-specified.
- The directory may be locked by another application.

#### System Action

Processing stops.

#### User Action

Correct the error, then re-execute processing.

## 2.4.51 DEP1752

---

**Failed to initialize the directory specified as the generation destination of a SOAP gateway file: Directory name = %s1**

#### Variable Information

%s1 = Directory name

#### Explanation

The specified directory failed to initialize properly.

Possible causes may include:

- The directory may not exist
- Access permissions may need to be re-specified.
- The directory may be locked by another application.

#### System Action

Processing stops.

#### User Action

Correct the error, then re-execute processing.

### 2.4.52 DEP1753

---

**The directory specified during deployment will be initialized. Are you sure to initialize it?**

#### Explanation

Asks for confirmation to initialize the directory.

#### User Action

Select "Yes" to continue with initialization. Select "No" to skip initialization.

### 2.4.53 DEP1754

---

**A web application of the same name is already deployed on another IJServer. Change the web application identifier or undeploy the web application and re-execute the processing: Web application identifier = %s1**

#### Variable Information

%s1 = Web application identifier

#### Explanation

Web applications of the same name cannot be deployed on multiple IJServers.

#### System Action

Processing stops.

#### User Action

Either change the web application identifier, or undeploy the web application, then re-execute processing.

### 2.4.54 DEP1755

---

**A web application of the same name that has been deployed in non-server management mode exists. Change the web application identifier or undeploy the web application and re-execute the processing: Web application identifier = %s1**

#### Variable Information

%s1 = Web application identifier

#### Explanation

The deployment process cannot complete because a web application of the same name is already deployed in non-server management mode.

#### System Action

Processing stops.

#### User Action

Either change the web application identifier, or undeploy the web application, then re-execute processing.

### 2.4.55 DEP1756

---

**Another application is accessing the IJServer information.**

## Explanation

Processing cannot be continued because another application is accessing the IJServer information.

## System Action

Processing stops.

## User Action

Wait a while and re-execute.

If the problem is still not resolved, check whether there are other users performing operations, restart the Interstage JMX service and then re-execute.

The following cause may be investigated if the event persists after re-execution:

1. Backup/restore error

When the environment in which the event was generated had been created by the backup/restore processing, check that no errors were generated when it was backed up or restored. If an error was generated, backup or restore again.

2. Procedural error in the backup/restore processing

When the environment in which the event was generated had been created by the backup/restore processing, check that no procedural errors (i.e. omission to specify an essential resource) were committed when it was backed up or restored. If a procedural error was committed, backup or restore again.

If the event recurs after re-execution and the above cause does not apply to the failure, use the *iscollectinfo* command to collect the error log, and then contact your systems engineer.

If this message is output following a message indicating that the operation ended normally, post operation information may not have been successfully obtained, even though the operation ended normally. If this is the case, obtain the information again. This event may be generated after IJServer is manipulated simultaneously by multiple Interstage management consoles or *isj2eeadmin* command.

## 2.4.56 DEP1757

---

**A character that cannot be specified in an EJB application name has been used: ejb-jar file name=%s1: Tag name=%s2: Value=%s3**

### Variable Information

%s1 = ejb-jar file name (At EAR file deployment, URI is output.)

%s2 = Tag name of the deployment descriptor used as the EJB application name

%s3 = Value that caused the error

## Explanation

An invalid character has been used in an EJB application name. The following characters cannot be used in an EJB application name:

- Em-size characters (hiragana, katakana, kanji, alphanumeric characters, and symbols)
- En-size katakana characters
- Symbols other than hyphen "-", slash "/", colon ":", period ".", and underscore "\_"
- Spaces
- Characters that begin or terminate with slash "/"
- Characters where "/" is used consecutively as double-slash "/"

## System Action

Processing stops.

## User Action

Change the value indicated in the variable information to set the correct EJB application name.

## 2.4.57 DEP1758

---

**The maximum number of hierarchies of naming contexts is 32: ejb-jar file name=%s1: Tag name=%s2: Value=%s3**

### Variable Information

%s1 = ejb-jar file name (At EAR file deployment, URI is output.)

%s2 = Tag name of the deployment descriptor used as the EJB application name

%s3 = Value that caused the error

### Explanation

The number of hierarchies of naming contexts of an EJB application name is greater than 32.

### System Action

Processing stops.

### User Action

Change the value indicated in the variable information to set the correct EJB application name.

## 2.4.58 DEP1759

---

**Up to 255 characters can be specified for EJB application names: ejb-jar file name=%s1: Tag name=%s2: Value=%s3**

### Variable Information

%s1 = ejb-jar file name (At EAR file deployment, URI is output.)

%s2 = Tag name of the deployment descriptor used as the EJB application name

%s3 = Value that caused the error

### Explanation

The value used as the EJB application name has more than 255 characters.

### System Action

Processing stops.

### User Action

Change the value indicated in the variable information to set the correct EJB application name.

## 2.4.59 DEP1760

---

**The EJB application name has been duplicated: ejb-jar file name=%s1: Tag name=%s2: Value=%s3**

### Variable Information

%s1 = ejb-jar file name (At EAR file deployment, URI is output.)

%s2 = Tag name of the deployment descriptor used as the EJB application name

%s3 = Value that caused the error

### Explanation

The value used as the EJB application name has been duplicated

### System Action

Processing stops.

## User Action

Change the value indicated in the variable information so that the EJB application name is not duplicated.

## 2.4.60 DEP1761

---

**A character that cannot be specified in a resource name has been used: RAR file name=%s1: Tag name=%s2: Value=%s3**

### Variable Information

%s1 = RAR file name (At EAR file deployment, URI is output.)

%s2 = Tag name of the deployment descriptor used as the resource name

%s3 = Value that caused the error

### Explanation

An invalid character has been used in a resource name. The following characters cannot be used in resource names:

- En-size spaces only
- Symbols ampersand "&", question "?", double quote "\"", less than "<", greater than ">", vertical bar "|", colon ":", semi-colon ";", asterisk "\*", and slash "/"
- For Windows(R), character strings that include the file delimiter back-slash "\" cannot be specified.

### System Action

Processing stops.

### User Action

Change the value indicated in the variable information to set the correct resource name.

If the information indicated by the tag name of the variable information has been omitted, the value without the extension of the RAR file name will be used as the resource name. Correct the RAR file name.

## 2.4.61 DEP1762

---

**The property value is incorrect: RAR file name=%s1: Property name tag=%s2: Property name=%s3: Property type tag=%s4: Property type=%s5**

### Variable Information

%s1 = RAR file name (At EAR file deployment, URI is output.)

%s2 = Tag name of the deployment descriptor used as the property name

%s3 = Setting value of property name tag

%s4 = Tag name of the deployment descriptor used as the property type

%s5 = Setting value of property type tag

### Explanation

The property value is incorrect.

### System Action

Processing stops.

### User Action

Check the property value indicated in the variable information. Change the value to the correct setting.

## 2.4.62 DEP1763

---

**The EJB application name has been duplicated: ejb-jar file name1=%s1: ejb-jar file name2=%s2: Tag name=%s:3 Value=%s4**

### Variable Information

%s1 = ejb-jar file name1 (URI is output.)

%s2 = ejb-jar file name2 (URI is output.)

%s3 = Tag name of the deployment descriptor used as the EJB application name

%s4 = Value that caused the error

### Explanation

The value used as the EJB application name has been duplicated.

### System Action

Processing stops.

### User Action

Change the value indicated in the variable information so that the EJB application name is not duplicated.

## 2.4.63 DEP1764

---

**The maximum number of characters that can be specified for the resource name is 32: RAR file name = %s1: Tag name = %s2: Value = %s3**

### Variable Information

%s1 = RAR file name (At EAR file deployment, URI is output.)

%s2 = Tag name of the deployment descriptor used as the resource name

%s3 = Value that caused the error

### Explanation

More than 32 characters were entered for the resource name.

### System Action

Processing stops.

### User Action

Change the value indicated in the variable information to set the correct resource name.

If the information indicated by the tag name of the variable information has been omitted, the value without the extension of the RAR file name will be used as the resource name. Correct the RAR file name.

## 2.4.64 DEP1765

---

**The resource name has been duplicated: RAR file name1=%s1: RAR file name2=%s2: Tag name=%s:3 Value=%s4**

### Variable Information

%s1 = RAR file name1 (URI is output.)

%s2 = RAR file name2 (URI is output.)

%s3 = Tag name of the deployment descriptor used as the resource name

%s4 = Value that caused the error

## Explanation

The value used as the resource name has been duplicated

## System Action

Processing stops.

## User Action

Change the value indicated in the variable information so that the resource name is not duplicated.

If the information indicated by the tag name of the variable information has been omitted, the value without the extension of the RAR file name will be used as the resource name. Correct the RAR file name.

## 2.4.65 DEP1766

---

**An invalid character has been used in the directory name: File type=%s1: ejb-jar file name=%s2: Tag name=%s3: Value=%s4**

### Variable Information

%s1 = Type of file to be created

%s2 = ejb-jar file name (At EAR file deployment, URI is output.)

%s3 = Tag name of the deployment descriptor used as the directory name

%s4 = Value that caused the error

## Explanation

An invalid character has been used in a directory name.

## System Action

Processing stops.

## User Action

Change the value indicated in the variable information to set the correct directory name.

If the information indicated by the tag name of the variable information has been omitted, the value without the extension of the ejb-jar file name will be used as the directory name. Correct the ejb-jar file name.

## 2.4.66 DEP1767

---

**The specified resource name has already been used: RAR file name=%s1: Tag name=%s2: Value=%s3**

### Variable Information

%s1 = RAR file name (At EAR file deployment, URI is output.)

%s2 = Tag name of the deployment descriptor used as the resource name

%s3 = Value that caused the error

## Explanation

The specified resource name has already been used.

## System Action

Processing stops.

## User Action

Either release deployment of the resource currently being used, or change the value indicated in the variable information to set a different resource name.

If the information indicated by the tag name of the variable information has been omitted, the value without the extension of the RAR file name will be used as the resource name. Correct the RAR file name.

## 2.4.67 DEP1768

---

### The Web application identifier is incorrect: WAR file name=%s1: Tag name=%s2: Value=%s3

#### Variable Information

%s1 = WAR file name (At EAR file deployment, URI is output.)

%s2 = Tag name of the deployment descriptor used as the Web application identifier

%s3 = Value that caused the error

#### Explanation

The value used as the Web application identifier is incorrect.

The Web application identifier can be a maximum of 64 alphanumeric characters, and/or the any of following characters '+', '-', '.', '\_', '\$'

#### System Action

Processing stops.

#### User Action

Change the value indicated in the variable information to set the correct Web application identifier.

If the information indicated by the tag name of the variable information has been omitted, the value without the extension of the WAR file name will be used as the application identifier. Correct the WAR file name.

## 2.4.68 DEP1769

---

### The Web application identifier has been duplicated: WAR file name1=%s1: WAR file name2=%s2: Tag name=%s3 Value=%s4

#### Variable Information

%s1 = WAR file name1 (URI is output.)

%s2 = WAR file name2 (URI is output.)

%s3 = Tag name of the deployment descriptor used as the Web application identifier

%s4 = Value that caused the error

#### Explanation

The value used as the Web application identifier has been duplicated

#### System Action

Processing stops.

#### User Action

Change the value indicated in the variable information so that the Web application identifier is not duplicated.

If the information indicated by the tag name of the variable information has been omitted, the value without the extension of the WAR file name will be used as the application identifier. Correct the WAR file name.

## 2.4.69 DEP1770

---

---

**A Web application having the same name has already been deployed to another IJServer. Change the Web application identifier or release the deployment of the Web application that uses the same name and re-execute : WAR file name=%s1: Tag name=%s2: Value=%s3**

#### Variable Information

%s1 = WAR file name (At EAR file deployment, URI is output.)

%s2 = Tag name of the deployment descriptor used as the Web application identifier

%s3 = Value that caused the error

#### Explanation

The Web application indicated by the value used as the Web application identifier has already been deployed to another IJServer.

#### System Action

Processing stops.

#### User Action

Either release deployment of the Web application currently being used, or change the value indicated in the variable information to set a different Web application identifier.

If the information indicated by the tag name of the variable information has been omitted, the value without the extension of the WAR file name will be used as the application identifier. Correct the WAR file name.

## 2.4.70 DEP1771

---

**A Web application having the same name has already been deployed in an environment other than in server control mode. Change the Web application identifier or release the deployment of the Web application and re-execute : WAR file name=%s1: Tag name=%s2: Value=%s3**

#### Variable Information

%s1 = WAR file name (At EAR file deployment, URI is output.)

%s2 = Tag name of the deployment descriptor used as the Web application identifier

%s3 = Value that caused the error

#### Explanation

The Web application indicated by the value used as the Web application identifier has already been deployed in an environment using non-server control mode.

#### System Action

Processing stops.

#### User Action

Either change the Web application identifier, or undeploy the Web application, then re-execute processing.

If the information indicated by the tag name of the variable information has been omitted, the value without the extension of the WAR file name will be used as the application identifier. Correct the WAR file name.

## 2.5 DEP1800 to DEP1899

---

These messages are displayed during operation of the Interstage Management Console.

### 2.5.1 DEP1800

---

**An IJServer with the same name that was created in an environment not using the Interstage Management Console already exists. Specify another IJServer name.**

## Explanation

The specified IJServer cannot be created because an IJServer created in an environment not using the Interstage Management Console already exists.

## System Action

Processing stops.

## User Action

Re-execute processing with another IJServer name specified.

## 2.5.2 DEP1801

---

### IJServer is active: Stop IJServer and re-execute processing.

## Explanation

IJServer is active.

## System Action

Processing stops.

## User Action

Stop IJServer and re-execute processing.

## 2.5.3 DEP1802

---

### IJServer definition information may already have been updated.

## Explanation

IJServer definition information may already have been updated by another user.

## System Action

Processing stops.

## User Action

Obtain IJServer definition information again, change the definition, and re-execute update processing.

## 2.5.4 DEP1803

---

### The specified file format is invalid: Detail=%s1

## Variable Information

%s1 = File name

## Explanation

The format of the file indicated in Variable Information is invalid.

## System Action

Processing stops.

## User Action

The format of the file indicated in Variable Information is invalid. Specify a validly formatted file and re-execute processing.

## 2.5.5 DEP1804

---

---

**The specified file contains no component that can be deployed: Detail=%s1****Variable Information**

%s1 = File name

**Explanation**

The specified file contains no component that can be deployed.

It is also possible that the directory specified in the -d option of the *ijdeployment* command does not exist.

**System Action**

Processing stops.

**User Action**

Specify a file that contains a component that can be deployed, then re-execute processing.

If the *ijdeployment* command was used for deployment, check that the directory specified in the -d option exists. If the -d option is specified, 'EJB Applications Only' type IIServers cannot be specified in the -n option.

---

**2.5.6 DEP1805**

---

**The value specified for the minimum number of EJB containers that can be processed concurrently:  
Specified value=%s1****Variable Information**

%s1 = Specified value

**Explanation**

An invalid value was specified.

**System Action**

Processing stops.

**User Action**

Correct the minimum value indicated in Variable Information, then re-execute processing.

---

**2.5.7 DEP1806**

---

**The value specified for the maximum number of EJB containers that can be processed concurrently:  
Specified value=%s1****Variable Information**

%s1 = Specified value

**Explanation**

An invalid value was specified.

**System Action**

Processing stops.

**User Action**

Correct the maximum value indicated in Variable Information, then re-execute processing.

---

**2.5.8 DEP1807**

---

---

**The attribute cannot be changed: Attribute name=%s1**

Variable Information

%s1 = Attribute name

Explanation

An attempt was made to change an attribute that cannot be changed.

System Action

Processing stops.

User Action

Correct the attribute's value indicated in Variable Information, then re-execute processing.

---

## 2.5.9 DEP1808

---

**Interstage is stopped in all forced stop mode: Start Interstage and re-execute processing.**

Explanation

Interstage is stopped in all forced stop mode.

System Action

Processing stops.

User Action

Start Interstage and re-execute processing.

---

## 2.5.10 DEP1809

---

**An error occurred during deletion of IJServer: Delete IJServer: IJServer name=%s1**

Variable Information

%s1 = IJServer name

Explanation

An error occurred during deletion of the IJServer indicated in Variable Information.

System Action

Processing stops.

User Action

Delete the IJServer indicated in Variable Information.

If the "Working Directory" and "Log File Directory" of the WorkUnit are user specified, the directory contents may not be deleted.

If this happens, delete the directory contents manually.

If this message is output following an operation from a Management Console on the Admin Server [Application Management] page, set the IS\_SSV\_DEFOP\_LOCK environment variable in the Managed Sever to "off", and then delete IJServer using the isj2eedadmin command. For details about the commands, refer to the "Reference Manual (Command Edition)".

---

## 2.5.11 DEP1810

---

**The minimum number of EJB contains that can be processed concurrently exceeds the maximum number: Minimum number=%s1: Maximum number=%s2**

## Variable Information

%s1 = Value specified for the minimum value

%s2 = Value specified for the maximum value

## Explanation

The minimum number of EJB contains that can be processed concurrently exceeds the maximum number.

## System Action

Processing stops.

## User Action

Correct the values indicated in Variable Information, and re-execute processing.

## 2.5.12 DEP1811

---

### Access authority is not granted: PATH=%s1

## Variable Information

%s1 = path

## Explanation

The access authority is not granted to the file or directory with the path indicated in Variable Information.

## System Action

Processing stops.

## User Action

Check the access authority to the file or directory at the path indicated in Variable Information.

This error may be generated when other applications are referring to the file and directory whose path is indicated in variable information. If this is case, close down the other applications.

## 2.5.13 DEP1812

---

### Access authority is not granted: PATH1=%s1: PATH2=%s2

## Variable Information

%s1 = path

%s2 = path

## Explanation

The access authority is not granted to the file or directory with the path indicated in Variable Information.

## System Action

Processing stops.

## User Action

Check the access authority to the file or directory at the path indicated in Variable Information.

This error may be generated when other applications are referring to the file and directory whose path is indicated in variable information. If this is case, close down the other applications.

## 2.5.14 DEP1813

---

---

### The disk is short of free space.

#### Explanation

The disk is short of free space.

#### System Action

Processing stops.

#### User Action

The file system capacity is probably too small. Delete unnecessary files, or increase the capacity of the file system.

---

## 2.5.15 DEP1814

---

### An I/O error occurred: PATH=%s1: CODE=%s2

#### Variable Information

%s1 = path

%s2 = error code

#### Explanation

An I/O error occurred.

#### System Action

Processing stops.

#### User Action

Possible causes are listed below. Remove the cause, and re-execute processing.

If the problem cannot be solved, contact your Fujitsu systems engineer.

- The disk unit may be faulty. Check the disk unit for faults.
- The file or directory may be damaged. Delete the file or directory indicated in Variable Information.
- System memory may be short of free space. Terminate unnecessary services, or restart the system.

---

## 2.5.16 DEP1815

---

### An I/O error occurred: PATH1=%s1: PATH2=%s2: CODE=%s3

#### Variable Information

%s1 = path

%s2 = path

%s3 = error code

#### Explanation

An I/O error occurred.

#### System Action

Processing stops.

#### User Action

Possible causes are listed below. Remove the cause and re-execute processing.

If the problem cannot be solved, contact your Fujitsu systems engineer.

- The disk unit may be faulty. Check the disk unit for faults.

- The file or directory may be damaged. Delete the file or directory indicated in Variable Information.
- System memory may be short of free space. Terminate unnecessary services, or restart the system.

## 2.5.17 DEP1818

---

### An IJServer type cannot be changed

#### Explanation

An IJServer type cannot be changed.

#### System Action

Processing stops.

#### User Action

Specify the IJServer type that was specified at the time of the IJServer creation and re-execute processing, or create a new IJServer of the required type.

## 2.5.18 DEP1819

---

### Operation cannot continue because the Servlet service is not installed.

#### Explanation

Operation cannot continue because the Servlet service is not installed.

#### System Action

Processing stops.

#### User Action

Set up the environment necessary for operation, and re-execute processing.

To use a V8.0 compatible IJServer or an IJServer created in InterstageV8 or earlier, "Application Server Compatible Functions" - "Tomcat 4.1-based Servlet" is required.

## 2.5.19 DEP1820

---

### Operation cannot continue because the EJB service is not installed.

#### Explanation

Operation cannot continue because the EJB service is not installed.

#### System Action

Processing stops.

#### User Action

Set up the environment necessary for operation, and re-execute processing.

## 2.5.20 DEP1821

---

### This operation cannot be performed because the IJServer operating environment was changed: Delete the IJServer: IJServer name=%s1

#### Variable Information

%s1 = IJServer name

## Explanation

Operation cannot be performed because the IJServer operating environment was changed after creation of the IJServer.

## System Action

Processing stops.

## User Action

The IJServer indicated in Variable Information cannot be used. Delete it if it is no longer needed.

If the "Working Directory" and "Log File Directory" of the WorkUnit are user specified, the directory contents may not be deleted.

If this happens, delete the directory contents manually.

IJServers created as V8.0-compatible or on V8.0 or earlier cannot be used in this version. If that is the case, create the IJServer again.

## 2.5.21 DEP1822

---

### An invalid Web application name was specified: WAR file name=%s1: Value=%s2

#### Variable Information

%s1 = WAR file name (URI is output when an EAR file is deployed.)

%s2 = Erroneous value

#### Explanation

The specified Web application name is invalid.

Specify a Web application name conforming to the following naming rules:

- A Web application name can be up to 64 characters.
- The following characters can be used: alphanumeric, +, -, ., \_, \$, /
- If "." is used, it must be used with another character.

#### System Action

Processing stops.

#### User Action

Specify a valid Web application name and re-execute processing.

If deployed using commands, the Web application name is resolved in the following order:

1. The value specified in the -c option of the isjdeployment command
2. The value specified in the Web module definition file (interstage-web.xml).

If the Web application name is not specified in either of the above, it is resolved as shown below. In this case, change the EAR or WAR file and re-execute processing.

- EAR file
  - If a value is set in context-root in application.xml, the value is used.
  - If no value is set in context-root in application.xml, the value obtained by removing the extension from the WAR file name is used.

- WAR file

The value obtained by removing the extension from the WAR file name is used.

## 2.5.22 DEP1823

---

### A Web application name is duplicated: WAR file name 1=%s1: WAR file name 2=%s2: Value=%s3

## Variable Information

%s1 = WAR file name 1 (URI is output.)

%s2 = WAR file name 2 (URI is output.)

%s3 = Erroneous value

## Explanation

The specified Web application name already exists.

## System Action

Processing stops.

## User Action

Change the Web application name so that it does not match an existing Web application name, and re-execute processing.

If a command is used for deployment, the Web application name is determined as shown below. Change the EAR file properly and re-execute processing.

- If a value is set in context-root in application.xml, use this value.
- If no value is set in context-root in application.xml, use the value obtained by removing the extension from the WAR file name.

If the Web application name is specified in the Web module definition file (interstage-web.xml), that name is used.

## 2.5.23 DEP1824

---

### The EJB application name includes an unspecifiable character: ejb-jar file name=%s1: Value=%s2

## Variable Information

%s1 = ejb-jar name (URI is output when an EAR file is deployed.)

%s2 = Erroneous value

## Explanation

The value used for the EJB application name includes an invalid character type.

The following characters cannot be used to specify the EJB application name:

- em-size characters (hiragana, katakana, kanji, alphanumeric characters, and symbols)
- en-size katakana
- Symbols other than -, /, ., ,, \_
- Blank
- Leading or trailing slash '/'
- Slashes "/" and "/" used consecutively

## System Action

Processing stops.

## User Action

Correct the value indicated in Variable Information so that a valid EJB application name is set.

If a command is used for deployment, the value that is set in ejb-name of the following tag in ejb-jar.xml is used as an EJB application name. Change the ejb-jar file name properly, and re-execute processing.

- session
- entity

- message-driven

## 2.5.24 DEP1825

---

### Operation cannot continue because a required package is not installed.

#### Explanation

Since the required package is not installed, the operation cannot be continued.

#### System Action

Processing stops.

#### User Action

Install a J2EE package (FJSVj2ee) and perform processing again.

## 2.5.25 DEP1826

---

### Module name is duplicated: Module name = %s1

#### Variable Information

%s1 = Module name

#### Explanation

The operation cannot be continued because another module with the same name exists.

#### System Action

Processing stops.

#### User Action

A module of the same name, but of a different type, has been deployed by overwriting. Either change the module name or undeploy the (already deployed) module of the same name, and re-execute processing.

The message concerned is also output when overwrite deployment is carried out for the module from which the module name is the same as the module that has already been deployed and the classification is different from the currently deployed module. In this case, perform the above-mentioned management.

## 2.5.26 DEP1827

---

### Operations cannot continue because HotDeploy function is invalid.

#### Explanation

The operations cannot continue because the HotDeploy function is no longer valid.

#### System Action

Processing stops.

#### User Action

Possible causes are given below. Remove the cause of the error, then re-execute processing.

- IJServer is started. Stop IJServer.
- The HotDeploy function is not valid. Make the HotDeploy function valid.

## 2.5.27 DEP1828

---

### Operations cannot continue because Fujitsu XML processor is not installed.

### Explanation

The operations cannot continue because the Fujitsu XML processor is not installed.

### System Action

Processing stops.

### User Action

Install the Fujitsu XML processor, or modify the setup of the XML server used by IJServer, then re-execute processing.

## 2.5.28 DEP1829

---

**The setting value is incorrect: Item name = %s1: Value = %s2**

### Variable Information

%s1 = Item name

%s2 = Value

### Explanation

Processing cannot continue because the value of a setting is incorrect.

### System Action

Processing stops.

### User Action

Enter the correct value and re-execute the processing.

## 2.5.29 DEP1830

---

**Environment setup information may already have been modified.**

### Explanation

The environment setup information may already have been modified by another user.

### System Action

Processing stops.

### User Action

Obtain the environment setup information and correct it, then modify the definitions and re-execute the modify processing.

## 2.5.30 DEP1831

---

**Web application with the same name is already deployed: WAR filename=%s1: Web application name=%s2**

### Variable Information

%s1=WAR filename (if EAR file is deployed, URI is posted.)

%s2=Web application name

### Explanation

Operations cannot continue because a Web application with the same name is already deployed.

### System Action

Processing stops.

## User Action

Change the Web application name, or undeploy the module that contains the Web application with the same name that is already deployed, then re-execute processing.

If commands are used to deploy applications, the Web application name is determined as shown below. Therefore, modify the EAR file, then re-execute processing.

- If a value is set in the context-root of application.xml, that value is used.
- If a value is not set in the context-root of application.xml, the WAR filename minus the extension is used as the value.

If the Web application name is specified in the Web module definition file (interstage-web.xml), that name is used.

## 2.5.31 DEP1832

---

### Maximum of 32 characters can be set as a module name: Module-name=%s1

#### Variable Information

%s1=Module name

#### Explanation

The value specified as the module name exceeds 32 characters. Therefore, processing cannot continue.

#### System Action

Processing stops.

#### User Action

Change the module name, then re-execute processing.

## 2.5.32 DEP1833

---

### Module name contains illegal characters: Module-name=%s1

#### Variable Information

%s1=Module name

#### Explanation

The module name includes illegal characters.

The following characters cannot be specified in module names:

- Symbols other than '+', '-', '\_', '.', '\$', and '~' ( '.' cannot be specified after the module name.)
- Blank
- Characters that make the name exceed 32 characters
- Character string "null"
- In Windows, this is the DOS device name

The name of the deployed file is used as the module name default value. If the default value exceeds 32 characters, the first 32 characters are used for the value.

If the Web application to be executed is deployed on any location on the server, however, the Web application storage directory is used as the default value. For example, if the deployment destination is "c:\sample\j2eesample", the default value for the module name is "j2eesample". Spaces cannot be specified in the module name, so if the Web application storage directory contains spaces, specify a module name that does not contain spaces.

Alternatively, when the "EAR" file includes an "ejb-jar/WAR/RAR" file, the path of the storage directory that includes the "ejb-jar/WAR/RAR" filename is used as the module name. The following characters cannot be used to specify the path of this storage directory:

- Symbols other than '+', '-', '\_', '!', '\$', '~', and '/'
- Blank

Note that Solaris and Linux distinguish between upper- and lower-case letters.

#### System Action

Processing stops.

#### User Action

Change the module name according to either of the following methods and re-execute processing.

- Change the module name in the Interstage Management Console Detailed Settings window
- Change the name of the deployed file or the name of the Web application storage directory

### 2.5.33 DEP1834

---

**Specified module does not exist. Module-name=%s1.**

#### Variable Information

%s1=Module name

#### Explanation

Specified module does not exist. Processing cannot continue.

#### System Action

Processing stops.

#### User Action

Check the specified module name and, if required, re-execute processing.

### 2.5.34 DEP1835

---

**The directory specified in the XML server type that is to be used cannot be found: Directory name = %s1**

#### Variable Information

%s1 = Directory name

#### Explanation

The processing cannot be continued because the directory specified in the XML server type to be used cannot be found.

#### System Action

Processing stops.

#### User Action

Set the directory correctly, and re-execute processing.

### 2.5.35 DEP1836

---

**The definition name has not been specified.**

#### Explanation

The processing cannot be continued because the definition name has not been specified.

### System Action

Processing stops.

### User Action

Check that the definition name has been specified, and re-execute processing.

## 2.5.36 DEP1837

---

**The operation cannot be continued because the IJServer is in the activation process.**

### Explanation

The operation cannot be continued because IJServer is in the activation process.

### System Action

Processing stops.

### User Action

The following causes may be considered:

- The IJServer is in the activation process. Terminate the IJServer, or check that the IJServer is in the active status.
- The *isstandbywu* command may have been executed. Execute the *isreleasewu* command.

Remove the cause of the error, and re-execute processing.

## 2.5.37 DEP1839

---

**When the class loaders are not separated, neither EAR, RAR, nor ejb-jar can use the hot deploy function.**

### Explanation

The processing cannot be continued because when the class loaders are not separated, neither EAR, RAR, nor ejb-jar can use the hot deploy function.

### System Action

Processing stops.

### User Action

Change the setting for the class loaders, or terminate the IJServer, then re-execute processing.

## 2.5.38 DEP1840

---

**Resource with the same name is already deployed: RAR filename=%s1: Resource-name=%s2**

### Variable Information

%s1=RAR filename (if EAR file is deployed, URI is posted.)

%s2=Resource name

### Explanation

Processing cannot continue because a resource with the same name is already deployed.

### System Action

Processing stops.

## User Action

Change the resource name, or undeploy the module that contains the resource with the same name that is already deployed, then re-execute processing.

If commands are used to deploy resources, the resource name is the RAR filename minus the extension. Therefore, change the file, then re-execute processing.

## 2.5.39 DEP1841

---

**When the IJServer type is the IJServer (Web + EJB [1VM]) but ejb-jar has been deployed, ejb-jar cannot be called if all the class loaders are separated: MODULE=%s1**

### Variable Information

%s1 = Module name

### Explanation

The processing cannot be continued because when the IJServer type is the IJServer (Web + EJB [1VM]) but ejb-jar has been deployed, ejb-jar cannot be called if all the class loaders are separated.

### System Action

Processing stops.

### User Action

Change the setting for the class loaders, then re-execute processing.

## 2.5.40 DEP1842

---

**When all the class loaders are separated, RAR cannot be called even if it has been deployed: MODULE=%s1**

### Variable Information

%s1 = Module name

### Explanation

The processing cannot be continued because when all the class loaders are separated, RAR cannot be called even if it has been deployed.

### System Action

Processing stops.

### User Action

Change the setting for the class loaders, then re-execute processing.

## 2.5.41 DEP1844

---

**Unless the hot deploy function is to be used, the deploy processing cannot be executed with the active IJServer.**

### Explanation

The processing cannot be continued because the deploy processing cannot be executed with the active IJServer, except when the hot deploy function is to be used.

### System Action

Processing stops.

### User Action

The error may have occurred due to the following:

- The IJServer is active. Terminate it.
- The hot deploy function is not effective. Set the hot deploy function to effective.

Remove the cause, then re-execute processing.

## 2.5.42 DEP1845

---

**Unless the hot deploy function is to be used, the undeploy processing cannot be executed with the active IJServer.**

### Explanation

The processing cannot be continued because the undeploy processing cannot be executed with the active IJServer except when the hot deploy function is to be used.

### System Action

Processing stops.

### User Action

The error may have occurred due to the following:

- The IJServer is active. Terminate it.
- The hot deploy function is not effective. Set the hot deploy function to effective.

Remove the cause, then re-execute processing.

## 2.5.43 DEP1846

---

**Operation cannot be continued because IJServer is performing the termination process.**

### Explanation

Operation cannot be continued because IJServer is performing the termination process.

### System Action

Processing stops.

### User Action

Confirm that IJServer has been terminated, and re-execute processing.

## 2.5.44 DEP1847

---

**A module is being activated. Re-execute the processing after the module activation process has completed.**

### Explanation

Operation cannot be continued because a module is being activated. Re-execute the processing after the module activation processing has completed.

### System Action

Processing stops.

### User Action

Confirm that the module activation process has been terminated and re-execute the processing.

## 2.5.45 DEP1848

---

**Operation cannot be continued because the Systemwalker Service Quality Coordinator Agent has not been installed.**

### Explanation

Operation cannot be continued because the Systemwalker Service Quality Coordinator Agent has not been installed.

### System Action

Processing stops.

### User Action

To use the transaction breakdown analysis function, install the Systemwalker Service Quality Coordinator Agent.

If the transaction breakdown analysis will not be executed, disable the use of the transaction breakdown analysis function in the IJServer environment setting.

## 2.5.46 DEP1849

---

**The value specified as the measuring interval in the transaction breakdown analysis is incorrect: Value=%s1**

### Variable Information

%s1 = Specified value

### Explanation

The value specified as the measuring interval in the transaction breakdown analysis is incorrect.

### System Action

Processing stops.

### User Action

Set the correct measuring interval for the transaction breakdown analysis, and execute the processing again.

## 2.5.47 DEP1850

---

**The manifest file format is incorrect: File name=%s1: Detail=%s2**

### Variable Information

%s1 = File name

%s2 = Detail message of the error

### Explanation

Operation cannot be continued because the manifest file format is incorrect.

### System Action

Processing stops.

### User Action

Set the correct manifest file format, and execute the processing again.

## 2.5.48 DEP1851

---

**The hot deploy function cannot be used when the class loader is not to be split.**

## Explanation

The processing cannot continue because the hot deploy function cannot be used when the class loader is not to be split.

## System Action

Processing stops.

## User Action

Change the setting of the class loader. Alternatively, terminate IJServer. Then, execute the processing again.

## 2.5.49 DEP1852

---

**'All' is specified for the splitting of the class loaders, and so some modules may not be able to be called.**

## Explanation

The following modules cannot be called if the Web application and the EJB application of the IJServer type are run in the same JavaVM operation and 'All' is specified for the splitting of the class loaders:

- ejb-jar
- RAR
- 'EAR' that includes "ejb-jar/RAR" only

Due to the above condition, the IJServer environment setting cannot be updated.

## System Action

Processing stops.

## User Action

Take one of the following required actions:

- Change the setting for the splitting of the class loaders
- If the 'EAR' module that includes either "ejb-jar", "RAR", or only "ejb-jar/RAR" is not required, undeploy it.

## 2.5.50 DEP1853

---

**If the IJServer type is not IJServer(Web+EJB[1VM]), the Web service cannot be enabled.**

## Explanation

The IJServer type must be 'Web Applications and EJB Applications run in same Java VM' for the Web service to be enabled.

## System Action

Processing stops.

## User Action

Change the IJServer type to 'Web Applications and EJB Applications run in same Java VM', or disable the Web service.

## 2.5.51 DEP1854

---

**If the container Web service is enabled, an XML parser that cannot be used was specified. NAME=CRIMSON**

## Explanation

If the Web service is enabled for the container, the specified XML parser cannot be used.

To use the Web service, the Web service deployment descriptor file must be in XML Schema format. To analyze XML files that are in XML Schema format, the XML parser must be supported by JAXP (Java API for XML Processing) 1.2 and later.

Crimson is a JAXP1.1 supported XML parser. Hence, an error occurs if 'Crimson' is specified as the XML parser type when the "container Web Service" configuration option is set to "ON".

#### System Action

Processing stops.

#### User Action

Change the XML parser type to one supported in JAXP1.2 and later (such as Xerces2).

## 2.5.52 DEP1855

---

### The value specified for the class loader search order was invalid: Value=%s1

#### Variable Information

%s1 = Specified value

#### Explanation

The value specified for the class loader search order was invalid.

#### System Action

Processing stops.

#### User Action

Set the class loader search order to a valid value.

## 2.5.53 DEP1856

---

### The directory was not specified.

#### Explanation

[Other] was selected for the XML parser type to use in the IJServer, but the directory was not specified.

#### System Action

Processing stops.

#### User Action

Change the XML parser type used in the IJServer, or specify the directory.

## 2.5.54 DEP1857

---

### If the Java version is 1.3, the Web service cannot be enabled.

#### Explanation

The Web service cannot be enabled when the Java version is 1.3.

#### System Action

Processing stops.

#### User Action

Change the Java version, or disable the Web service.

## 2.5.55 DEP1858

---

### When a module containing the Web service is deployed, the Web service cannot be disabled.

#### Explanation

The Web service cannot be disabled if a module containing the Web service is deployed.

#### System Action

Processing stops.

#### User Action

Undeploy the module containing the Web service, or enable the Web service.

### 2.5.56 DEP1859

---

**The maximum length that can be entered for the option was exceeded: Application-specific library path (maximum value per line: 255 characters, maximum 255 lines)**

#### Explanation

The application-specific library path exceeded the maximum length for this field.

#### System Action

Processing stops.

#### User Action

Set a valid length for the application-specific library path.

### 2.5.57 DEP1860

---

**The application-specific library path was repeated: Value=%s1**

#### Variable Information

%s1 = Repeated value

#### Explanation

The application-specific library path was repeated.

#### System Action

Processing stops.

#### User Action

Set a unique application-specific library path.

### 2.5.58 DEP1861

---

**Characters that cannot be used were contained in the application-specific library path.**

#### Explanation

The application-specific library path contains invalid characters.

#### System Action

Processing stops.

#### User Action

Set a valid path for the application-specific library path.

### 2.5.59 DEP1862

---

---

**An error occurred during recovery processing in the deployed module: Module=%s1****Variable Information**

%s1 = Module name

**Explanation**

An error occurred during recovery processing in the deployed module.

**System Action**

Stops processing and deletes the deployed module (%1).

**User Action**

Refer to the message output at the same time to establish the cause of the deployment failure, and then re-deploy.

---

**2.5.60 DEP1863**

---

**Failed to delete some of the files: Check that no files are being used, and delete them manually if they are: IJServer name=%s1: Module name=%s2: Directory name=%s3****Variable Information**

%s1 = IJServer name

%s2 = Module name

%s3 = Directory name

**Explanation**

Failed to delete part of the module to be undeployed.

**System Action**

Continues processing.

**User Action**

In the module to be undeployed, only the problem shown in the message affects the application. If necessary, stop the IJServer or application, and then delete the directory indicated by the variable information. If the directory cannot be deleted, then restart the Interstage JMX service and try again. If there is more than one directory for which the deletion failed, they are separated with semicolons when listed in the variable information.

Before deleting the directory, it is recommended that you back up IJServer resources.

Additionally, note that only directories output in the variable information should be deleted. If other directories are deleted, subsequent operation cannot be guaranteed. If a directory is deleted by mistake, create the IJServer again, or recover the environment by restoring the IJServer resource file. For details about backing up and restoring resources, refer to "Maintenance (Backing up resources) in the "Operator's Guide".

If a directory was not deleted, one of the problems shown below may have occurred. In these cases, it is recommended that you delete the directory.

- The same module was redeployed
- The disk resources have been depleted by unnecessary resources
- The intended purpose of the resources is unknown after a period of time, or because of a change in the managing personnel

---

**2.5.61 DEP1864**

---

**The Auto Reload function cannot be used if the class loaders are separated.****Explanation**

The Auto Reload function cannot be used if the class loaders are separated.

### System Action

Stops processing.

### User Action

Change the class loader or Auto Reload settings and then re-execute processing.

## 2.5.62 DEP1865

---

**The Auto Reload function cannot be used if the module containing the Web service is deployed.**

### Explanation

The Auto Reload function cannot be used if the module containing the Web service is deployed.

### System Action

Stops processing.

### User Action

Either undeploy the module containing the Web service, or change the Auto Reload settings and then re-execute processing.

## 2.5.63 DEP1866

---

**The value specified as the checking interval for the changing of Auto Reload is invalid: Specify a number from [1] to [2147483647]: Value=%s1**

### Variable Information

%s1 = Value

### Explanation

The value specified as the checking interval for the changing of Auto Reload is invalid: Specify a number from [1] to [2147483647].

### System Action

Stops processing.

### User Action

Specify a number from [1] to [2147483647] as the checking interval for the changing of Auto Reload, and then re-execute processing.

## 2.5.64 DEP1867

---

**The XML parser that was specified cannot be used if applications using J2EE versions 1.4 or later are deployed: XML parser name=%s1**

### Variable Information

%s1 = XML parser name

### Explanation

The XML parser that was specified cannot be used if applications using J2EE versions 1.4 or later are deployed.

### System Action

Stops processing.

### User Action

If applications using J2EE versions 1.4 or later are deployed, specify an XML parser that supports JAXP version 1.2 or later.

## 2.5.65 DEP1868

---

**Processing cannot continue because an unsupported module was specified: File name=%s1: Version=%s2**

### Variable Information

%s1 = File name (if an EAR file is deployed, the URI is output)

%s2 = Version

### Explanation

Processing cannot continue because an unsupported module was specified.

### System Action

Stops processing.

### User Action

Check the module version, change it where necessary, and then re-execute processing.

The modules shown below can only be deployed if the IJServer type is "Run Web applications and EJB applications on the same JavaVM". Check the IJServer type.

- Connector1.5 spec RAR files
- EJB2.1 spec ejb-jar files

## 2.5.66 DEP1869

---

**The XML parser that was specified in the IJServer environment does not support JAXP1.2: XML parser name=%s1**

### Variable Information

%s1 = XML parser name

### Explanation

The XML parser that was specified in the IJServer environment does not support JAXP1.2.

### System Action

Stops processing.

### User Action

Change the XML parser type in the IJServer environment to one that supports JAXP version 1.2 or later if applications using J2EE version 1.4 or later are deployed: XML parser name=%s1

## 2.5.67 DEP1870

---

**The value set for the Compatible mode cannot be changed after the IJServer is created.**

### Explanation

The value set for the Compatible mode cannot be changed after the IJServer is created.

### System Action

Stops processing.

### User Action

Specify the Compatible mode when the IJServer is created and then re-execute processing. Alternatively, create a new IJServer for the specified Compatible mode.

If this message is output when the `isj2eeadmin` command is used, check the `<Isj2eeIjserverDefinition><IJServer><Version>` settings in the `IJServer` definition file.

If you are updating the `IJServer`, if `<Isj2eeIjserverDefinition><IJServer><Version>` is omitted, the value used is the one that was used when the `IJServer` was created.

For details on specifying the Compatible mode, refer to "isj2eeadmin" - "Compatible options" in the "Reference Manual (Command Edition)".

## 2.5.68 DEP1871

---

**The Java version cannot be set as 5.0 or later if the V8.0 Compatible mode is used and the IJServer is V8 or earlier.**

### Explanation

The Java version cannot be set as 5.0 or later if the V8.0 Compatible mode is used and the `IJServer` is V8 or earlier.

### System Action

Stops processing.

### User Action

Change the value set for the V8.0 Compatible mode or the Java version.

If this message is output when the `IJServer` definition is updated, the value that was set for the V8.0 Compatible mode cannot be changed.

To set the Java version as 6, consider switching to an `IJServer` of V9.0 or later.

## 2.5.69 DEP1872

---

**The Java version cannot be set as 1.4 if the V8.0 Compatible mode is not used.**

### Explanation

The Java version cannot be set as 1.4 if the V8.0 Compatible mode is not used.

### System Action

Stops processing.

### User Action

Change the value set for the V8.0 Compatible mode or the Java version.

If this message is output when the `IJServer` definition is updated, the value that was set for the V8.0 Compatible mode cannot be changed.

The Java version cannot be set as 1.4 in the `IJServer` of V9.0 or later, therefore set the Java version as 6.

## 2.5.70 DEP1873

---

**An unknown file exists in the directory that the module was deployed to: Delete the file and then re-execute processing: IJServer name=%s1: Module name=%s2: Directory name=%s3**

### Variable Information

%s1 = `IJServer` name

%s2 = Module name

%s3 = Directory name

### Explanation

An unknown file exists in the directory that the module was deployed to.

## System Action

Stops processing.

## User Action

An unknown file exists in the directory that the module was deployed to. Delete the directory whose name was output in the variable information. If there is more than one unknown file in the directory, there is a semicolon between each file when they are output in the variable information.

The attempt to delete the file when the module is undeployed may have failed because another IJServer or application is referencing the file in the module deployment destination. In this case, stop the IJServer or application, and then either delete the directory indicated by the variable information, or specify a different module name. If the directory cannot be deleted, then restart the Interstage JMX service and try again.

Before deleting the directory, it is recommended that you back up the IJServer resources.

Additionally, note that only directories output in the variable information should be deleted. If other directories are deleted, subsequent operation cannot be guaranteed. If a directory is deleted by mistake, create the IJServer again, or recover the environment by restoring the IJServer resource file. For details about backing up and restoring resources, refer to "Maintenance (Backing up resources)" in the "Operator's Guide".

## 2.5.71 DEP1874

---

### The XML parser that was specified cannot be used: XML parser name=%s1

#### Variable Information

%s1 = XML parser name

#### Explanation

The XML parser that was specified cannot be used.

Crimson cannot be specified as the XML parser.

#### System Action

Stops command processing.

#### User Action

Change the XML parser type to Xerces2.

## 2.5.72 DEP1875

---

### The XML parser that was specified cannot be used if the module containing the Web service is deployed: XML parser name=%s1

#### Variable Information

%s1 = XML parser name

#### Explanation

The XML parser that was specified cannot be used if the module containing the Web service is deployed.

#### System Action

Stops processing.

#### User Action

Change the XML parser type to one that supports JAXP1.2 or more (such as Xerces2), and then re-execute processing.

## 2.5.73 DEP1876

---

**The XML parser that was specified cannot be used if the container Web service function is enabled: XML parser name=%s1**

### Variable Information

%s1 = XML parser name

### Explanation

The XML parser that was specified cannot be used if the container Web service function is enabled.

### System Action

Stops processing.

### User Action

Change the XML parser type to one that supports JAXP1.2 or later (such as Xerces2), and then re-execute processing.

## 2.5.74 DEP1877

---

**There was insufficient memory.**

### Explanation

There was insufficient memory. Possible causes are as follows:

- There was insufficient virtual memory.
- There was insufficient memory when the request was processed on the Interstage JMX service.

### System Action

Stops processing.

### User Action

The steps that should be taken depend on the cause of the problem as described below.

- There was insufficient virtual memory.

[Action]

Check that there is enough virtual memory using the relevant function for the OS. If there is not enough virtual memory, wait for a while and then re-execute processing.

If this message is output frequently, refer to the "Tuning Guide", re-estimate the memory that is required for running Interstage, and then check that enough memory has been reserved.

If enough memory has been reserved, it is possible that not enough memory has been reserved for other applications. Re-estimate the memory that is required for running other applications on the same machine.

If there is not enough memory, contact the system administrator. Ask the system administrator to increase the main memory or extend the page file.

- There was insufficient memory when the request was processed on the Interstage JMX service.

[Action]

Extend the Heap/Perm for the java processes used in the Interstage JMX service.

## 2.5.75 DEP1878

---

**Failed to read the control file.**

## Explanation

Failed to read the control file because it is damaged.

## System Action

Stops processing.

## User Action

Delete the control file according to the following procedure and then re-execute processing.

### Windows32/64

1. Stop the Interstage Operation Tool service.
2. Delete the following files that are stored in the C:\Interstage\J2EE\var\isdeploy directory:
  - j2eeserv6.inf
  - j2eeserv6.lock
3. Start the Interstage Operation Tool service.

### Solaris32/64 Linux32/64

1. Stop the Interstage JMX service using the isjmxstop command.
2. Delete the following files that are stored in the /opt/FJSVj2ee/var/isdeploy directory:
  - j2eeserv6.inf
  - j2eeserv6.lock
3. Start the Interstage JMX service using the isjmxstart command."

## 2.5.76 DEP1879

---

**The root tag 'version' attribute and the DOCTYPE declaration have not been specified in the deployment descriptor: File name=%s1**

## Variable Information

%s1: File name (If an EAR file is deployed, the URI is output)

## Explanation

The root tag 'version' attribute and the DOCTYPE declaration have not been specified in the deployment descriptor.

## System Action

Stops processing.

## User Action

Possible causes are as follows:

- The root tag 'version' attribute and the DOCTYPE declaration have not been defined in the deployment descriptor
- The deployment descriptor DOCTYPE declaration is incorrect.

The root tag 'version' attribute and the DOCTYPE declaration must be specified according to the following J2EE rules:

- When deploying modules of J2EE version 1.4 or later:
  - Specify the root tag 'version' attribute
- When deploying modules of J2EE version 1.3 or earlier:
  - Describe the DOCTYPE declaration according to the rules

Correct the deployment descriptor and re-execute processing.

## 2.5.77 DEP1880

---

**The value that was specified for the root tag 'version' attribute of the deployment descriptor is invalid: File name=%s1: version=%s2**

### Variable Information

%s1: File name (If an EAR file is deployed, the URI is output)

%s2: Value specified for the 'version' attribute

### Explanation

The value that was specified for the root tag 'version' attribute of the deployment descriptor is invalid.

### System Action

Stops processing.

### User Action

Correct the value specified for the root tag 'version' attribute, and then re-execute processing.

If you are deploying a module in J2EE1.3 or earlier, the DOCTYPE declaration must be described in the deployment descriptor according to the rules.

## 2.5.78 DEP1881

---

**Specify a directory containing the jar file of an XML parser that supports JAXP1.1 or later as the selected directory for the XML parser type: Directory name=%s1**

### Variable Information

%s1: Directory name

### Explanation

Specify a directory containing the jar file of an XML parser that supports JAXP1.1 or later as the selected directory for the XML parser type.

### System Action

Stops processing.

### User Action

Either change the XML parser type, or set a directory containing the jar file of an XML parser that supports JAXP1.1 or later and then re-execute processing.

## 2.5.79 DEP1882

---

**An error occurred when reading the definition file: File name=%s1: Details=%s2**

### Variable Information

%s1: Definition file name URI

%s2: Detailed information

### Explanation

An error occurred when reading the definition file %s1.

### System Action

Stops processing.

## User Action

Resolve the error based on the detailed information and re-execute processing.

## 2.5.80 DEP1883

---

**An illegal value was set in the definition file: File name=%s1: Tag name=%s2: Set value=%s3**

### Variable Information

%s1: Definition file name URI

%s2: Name of tag that caused the error

%s3: Set value

### Explanation

An illegal value was set for the definition file tag %s1.

### System Action

Stops processing.

### User Action

Set the definition file tag %s1 to a valid value and re-execute processing.

If nothing is output for %s3 in the variable information, the tag %s2 may have been set to 'null'. To use the default value, omit the tag itself.

## 2.5.81 DEP1884

---

**The number of characters in the set value exceeds the allowable number in the definition file: File name=%s1: Tag name=%s2: Number of characters allowed=%s3**

### Variable Information

%s1: Definition file name URI

%s2: Name of tag that caused the error

%s3: Allowed maximum number of characters

### Explanation

The number of characters set for the definition file tag %s2 exceeded the allowed maximum.

### System Action

Stops processing.

### User Action

Set a value containing the same or fewer characters than the allowed maximum %s3 for the definition file tag %s2 and re-execute processing.

## 2.5.82 DEP1885

---

**There is an error in the deployment descriptor: ejb-jar file name=%s1: ejb-name=%s2: Tag name=%s3**

### Variable Information

%s1 = ejb-jar file name

%s2 = Value of <ejb-name>

%s3 = Name of tag that caused the error

## Explanation

An illegal value was set for the deployment descriptor.

## System Action

Stops processing.

## User Action

Set correct values for the tags that are output in the variable information and re-execute.

## 2.5.83 DEP1886

---

**There is an error in the deployment descriptor: ejb-jar file name=%s1: ejb-name=%s2: message-destination-ref-name=%s3: Tag name=%s4**

### Variable Information

%s1 = ejb-jar file name

%s2 = Value of <ejb-name>

%s3 = Value of <message-destination-ref-name>

%s4 = Name of tag that caused the error

## Explanation

An illegal value was set for the deployment descriptor.

## System Action

Stops processing.

## User Action

Set correct values for the tags that are output in the variable information and re-execute.

## 2.5.84 DEP1887

---

**There is an error in the deployment descriptor: ejb-jar file name=%s1: ejb-name=%s2: activation-config-property-name=%s3: Tag name=%s4**

### Variable Information

%s1 = ejb-jar file name

%s2 = Value of <ejb-name>

%s3 = Value of <activation-config-property-name>

%s4 = Name of tag that caused the error

## Explanation

An illegal value was set for the deployment descriptor.

## System Action

Stops processing.

## User Action

Set correct values for the tags that are output in the variable information and re-execute.

## 2.5.85 DEP1888

---

---

**There is an error in the deployment descriptor: client-jar file name=%s1: message-destination-ref-name=%s2: Tag name=%s3**

**Variable Information**

%s1 = client-jar file name

%s2 = Value of <message-destination-ref-name>

%s3 = Name of tag that caused the error

**Explanation**

An illegal value was set for the deployment descriptor.

**System Action**

Stops processing.

**User Action**

Set correct values for the tags that are output in the variable information and re-execute.

---

## 2.5.86 DEP1889

---

**<home> or <local> has not been defined in the deployment descriptor: ejb-jar file name=%s1: ejb-name=%s2**

**Variable Information**

%s1 = ejb-jar file name

%s2 = Value of <ejb-name>

**Explanation**

<home> or <local-home> has not been defined in the deployment descriptor.

**System Action**

Stops processing.

**User Action**

Check the deployment descriptor of the ejb-jar that is output in the variable information to fix the error and re-execute.

---

## 2.5.87 DEP1890

---

**<remote> has not been defined in the deployment descriptor: ejb-jar file name=%s1: ejb-name=%s2**

**Variable Information**

%s1 = ejb-jar file name

%s2 = Value of <ejb-name>

**Explanation**

<remote> has not been defined in the deployment descriptor.

**System Action**

Stops processing.

**User Action**

Check the deployment descriptor of the ejb-jar that is output in the variable information to fix the error and re-execute.

## 2.5.88 DEP1891

---

**<local> has not been defined in the deployment descriptor: ejb-jar file name=%s1: ejb-name=%s2**

### Variable Information

%s1 = ejb-jar file name

%s2 = Value of <ejb-name>

### Explanation

<local> has not been defined in the deployment descriptor.

### System Action

Stops processing.

### User Action

Check the deployment descriptor of the ejb-jar that is output in the variable information to fix the error and re-execute.

## 2.5.89 DEP1892

---

**<service-endpoint> cannot be defined if <session-type> of the deployment descriptor is 'Stateful': ejb-jar file name=%s1: ejb-name=%s2**

### Variable Information

%s1 = ejb-jar file name

%s2 = Value of <ejb-name>

### Explanation

<service-endpoint> cannot be defined if <session-type> of the deployment descriptor is 'Stateful'.

### System Action

Stops processing.

### User Action

Check the deployment descriptor of the ejb-jar that is output in the variable information to fix the error and re-execute.

## 2.5.90 DEP1893

---

**<ejb-relationship-role-name> has not been defined in the deployment descriptor: ejb-jar file name=%s1: ejb-relation-name=%s2**

### Variable Information

%s1 = ejb-jar file name

%s2 = Value of <ejb-relation-name>

### Explanation

<ejb-relationship-role-name> has not been defined in the deployment descriptor.

### System Action

Stops processing.

### User Action

Check the deployment descriptor of the ejb-jar that is output in the variable information to fix the error and re-execute.

## 2.5.91 DEP1894

---

**The EJB application defined as the Web service end point interface cannot be deployed as ejb-jar: NAME=%s1**

### Variable Information

%s1 = EJB application name

### Explanation

The ejb-jar that contains the STATELESS Session Bean that can be called from the Web service cannot be deployed. It must be deployed in the EAR file.

### System Action

Stops processing.

### User Action

Generate the EAR file and then re-deploy.

## 2.5.92 DEP1895

---

**A file with the same name as the EJB SOAP router exists in the deployment target module: IJServer name=%s1: Module name=%s2: EJB SOAP router file name=%s3**

### Variable Information

%s1 = IJServer name

%s2 = Name of the module used to store the EJB SOAP router

%s3 = EJB SOAP router file name

### Explanation

A file with the same name as the EJB SOAP router exists in the deployment target module.

### System Action

Stops processing.

### User Action

Take one of the following actions and re-execute.

- Change the name of the ejb-jar file that contains the Web service STATELESS Session Bean.
- Change the name of the file with the same name as the EJB SOAP router.

## 2.5.93 DEP1896

---

**A file with the same name as the EJB SOAP router has already been deployed: IJServer name=%s1: Module name=%s2: EJB SOAP router file name=%s3**

### Variable Information

%s1 = IJServer name

%s2 = Name of the module used to store the EJB SOAP router

%s3 = EJB SOAP router file name

### Explanation

A file with the same name as the EJB SOAP router has already been deployed.

## System Action

Stops processing.

## User Action

Take the following action and re-execute.

- Change the name of the ejb-jar file that contains the Web service STATELESS Session Bean.

## 2.5.94 DEP1897

---

**An error exists in <message-destination-name> that is defined in the deployment descriptor: ejb-jar file name=%s1: message-destination-name=%s2**

### Variable Information

%s1 = ejb-jar file name

%s2 = Value of <message-destination-name>

### Explanation

The value of <message-destination-name> in the deployment descriptor cannot be duplicated.

## System Action

Stops processing.

## User Action

Check the deployment descriptor of the ejb-jar that is output in the variable information to fix the error and re-execute.

## 2.5.95 DEP1898

---

**An error exists in <config-property-name> that is defined in the deployment descriptor: RAR file name=%s1: config-property-name=%s2**

### Variable Information

%s1 = RAR file name

%s2 = Value of <config-property-name>

### Explanation

The value of <config-property-name> in the deployment descriptor cannot be duplicated in the following tags:

- <connector><resourceadapter><config-property>
- <connector><resourceadapter><outbound-resourceadapter><connection-definition><config-property>
- <connector><resourceadapter><inbound-resourceadapter><messageadapter><messagelistener><activation-spec><required-config-property>
- <connector><resourceadapter><adminobject><config-property>

## System Action

Stops processing.

## User Action

Check the deployment descriptor of the RAR file that is output in the variable information to fix the error and re-execute.

## 2.5.96 DEP1899

---

**There is an error in the deployment descriptor: RAR file name=%s1: Tag name=%s2: Value=%s3**

### Variable Information

%s1 = RAR file name

%s2 = Name of tag that caused the error

%s3 = Value that caused the error

### Explanation

An illegal value was set for the deployment descriptor.

### System Action

Stops processing.

### User Action

Set correct values for the tags that are output in the variable information and re-execute.

## 2.6 DEP1900 to DEP1999

---

These messages are displayed during operation of the Interstage Management Console.

### 2.6.1 DEP1900

---

**A character that cannot be specified in a resource adapter name has been used: RAR file name=%s1: Value=%s2**

#### Variable Information

%s1 = RAR file name (At EAR file deployment, URI is output.)

%s2 = Value that caused the error

#### Explanation

An invalid character has been used in a resource adapter name. The following characters cannot be used in resource adapter names:

- En-size spaces only
- Symbols ampersand "&", question "?", double quote "\"", less than "<", greater than ">", vertical bar "|", colon ":", semi-colon ";", asterisk "\*", and slash "/"
- For Windows(R), character strings that include the file delimiter back-slash "\" cannot be specified.

#### System Action

Processing stops.

#### User Action

Change the value indicated in the variable information to set the correct resource adapter name.

The value without the extension of the RAR file name will be used as the default resource adapter name. Correct the RAR file name.

### 2.6.2 DEP1901

---

**The maximum number of characters that can be specified for the resource adapter name is 32: RAR file name = %s1: Value = %s2**

#### Variable Information

%s1 = RAR file name (At EAR file deployment, URI is output.)

%s2 = Value that caused the error

## Explanation

More than 32 characters were entered for the resource adapter name.

## System Action

Processing stops.

## User Action

Change the value indicated in the variable information to set the correct resource adapter name.

The value without the extension of the RAR file name will be used as the default resource adapter name. Correct the RAR file name.

## 2.6.3 DEP1902

---

**The resource adapter name has been duplicated: RAR file name1=%s1: RAR file name2=%s2: Value=%s3**

### Variable Information

%s1 = RAR file name1 (URI is output.)

%s2 = RAR file name2 (URI is output.)

%s3 = Value that caused the error

## Explanation

The value used as the resource adapter name has been duplicated

## System Action

Processing stops.

## User Action

Change the value indicated in the variable information so that the resource adapter name is not duplicated.

The value without the extension of the RAR file name will be used as the default resource adapter name. Correct the RAR file name.

## 2.6.4 DEP1903

---

**The resource adapter name has not been specified.**

### Explanation

The processing cannot be continued because the resource adapter name has not been specified.

### System Action

Processing stops.

### User Action

Check that the resource adapter name has been specified, and re-execute processing.

## 2.6.5 DEP1904

---

**The resource name and resource adapter name are duplicated: RAR file name1=%s1: RAR file name2=%s2: Value=%s3**

### Variable Information

%s1 = RAR file name1 (URI is output.)

%s2 = RAR file name2 (URI is output.)

%s3 = Value that caused the error

## Explanation

The value used as the resource name and the resource adapter name is duplicated.

## System Action

Stops processing.

## User Action

Change the value indicated in the variable information so that the resource name and resource adapter name are not duplicated.

The RAR file name, without the extension, will be used as the resource name and resource adapter name default values, so change the RAR file name.

## 2.6.6 DEP1905

---

**<home>, <local-home>, or <service-endpoint> has not been defined in the deployment descriptor: ejb-jar file name=%s1: ejb-name=%s2**

### Variable Information

%s1 = ejb-jar file name

%s2 = Value of <ejb-name>

### Explanation

<home>, <local-home>, or <service-endpoint> has not been defined in the deployment descriptor.

### System Action

Stops processing.

### User Action

Check the deployment descriptor of the ejb-jar that is output in the variable information to fix the error and re-execute.

## 2.6.7 DEP1906

---

**A resource adapter with the same name is already deployed: RAR filename=%s1: Resource-adapter-name=%s2**

### Variable Information

%s1 = RAR file name (At EAR file deployment, URI is output.)

%s2 = Resource adapter name

### Explanation

Processing cannot continue because a resource adapter with the same name is already deployed.

### System Action

Stops processing.

### User Action

Change the resource adapter name, or undeploy the module that contains the resource adapter with the duplicated name and re-execute.

If commands are used to deploy resources, the resource name is the RAR filename without the extension. Therefore, change the file then re-execute.

## 2.6.8 DEP1907

---

**Resource with the same name is already deployed: RAR filename=%s1: Resource-adapter-name=%s2**

## Variable Information

%s1 = RAR file name (At EAR file deployment, URI is output.)

%s2 = Resource adapter name

## Explanation

Processing cannot continue because a resource adapter with the same name is already deployed.

## System Action

Stops processing.

## User Action

Change the resource adapter name, or undeploy the module that contains the resource with the duplicated name then re-execute.

If commands are used to deploy resources, the resource name is the RAR filename without the extension. Therefore, change the file then re-execute.

## 2.6.9 DEP1908

---

### **Resource adapter with the same name is already deployed: RAR filename=%s1: Resource-name=%s2**

## Variable Information

%s1 = RAR file name (At EAR file deployment, URI is output.)

%s2 = Resource name

## Explanation

Processing cannot continue because a resource adapter with the same name is already deployed.

## System Action

Stops processing.

## User Action

Change the resource adapter name, or undeploy the module that contains the resource with the duplicated name then re-execute.

If commands are used to deploy resources, the resource name is the RAR filename without the extension. Therefore, change the file then re-execute.

## 2.6.10 DEP1909

---

### **The resource name and ConnectionFactory definition name have been duplicated: RAR file name=%s1: Resource name=%s2**

## Variable Information

%s1 = RAR file name (At EAR file deployment, URI is output.)

%s2 = Resource name

## Explanation

Processing cannot continue because the ConnectionFactory definition name is the same as the name of the resource adapter that has been deployed.

## System Action

Stops processing.

## User Action

Take one of the following actions and re-execute.

- Change the resource name.
- If commands are used to deploy resources, the resource name is the RAR filename without the extension. Therefore, change the file.
- Change the ConnectionFactory definition name in the ConnectionFactory Environment Settings window.
- Undeploy the module containing the ConnectionFactory definition name.

## 2.6.11 DEP1910

---

**The resource name and managed object definition name have been duplicated: RAR file name=%s1: Resource name=%s2**

### Variable Information

%s1 = RAR file name (At EAR file deployment, URI is output.)

%s2 = Resource name

### Explanation

Processing cannot continue because the managed object definition name is the same as the name of the resource adapter that has been deployed.

### System Action

Stops processing.

### User Action

Take one of the following actions and re-execute.

- Change the resource name.
- If commands are used to deploy resources, the resource name is the RAR filename without the extension. Therefore, change the file then re-execute.
- Change the managed object definition name in the Managed Object Environment Settings window.
- Undeploy the module containing the managed object definition name.

## 2.6.12 DEP1911

---

**A tag with a name space prefix is specified in the deployment descriptor: filename=%s1**

### Variable Information

%s1 = File name

### Explanation

A tag with a namespace prefix is specified in the deployment descriptor

### System Action

Stops processing.

### User Action

If a tag with a name space prefix is specified in the deployment descriptor, delete the prefix from the tag and re-execute.

## 2.6.13 DEP1912

---

**The <role-name> defined in the deployment descriptor contains an error: ejb-jarfilename=%s1: ejb-name=%s2: role-name=%s3**

## Variable Information

%s1 = ejb-jar file name

%s2 = Value of <ejb-name>

%s3 = Value of <role-name>

## Explanation

The <role-name> defined in the deployment descriptor contains an error.

## System Action

Stops processing.

## User Action

Check the following, and then according to the contents that are output in the variable information, define a correct value and re-execute.

### - Session Bean

The values defined for <ejb-jar><enterprise-beans><session><security-identity><run-as><role-name> must be defined for <ejb-jar><enterprise-beans><session><security-role-ref><role-name> in the Enterprise Bean.

### - Entity Bean

The values defined for <ejb-jar><enterprise-beans><entity><security-identity><run-as><role-name> must be defined for <ejb-jar><enterprise-beans><entity><security-identity><run-as><role-name> in the Enterprise Bean.

### - Message-driven Bean

The values defined for <ejb-jar><enterprise-beans><message-driven><security-identity><run-as><role-name> must be defined for <ejb-jar><assembly-descriptor><security-role><role-name>.

## 2.6.14 DEP1913

---

**A character that cannot be specified in a resource name has been used: RAR file name=%s1: Value=%s2**

## Variable Information

%s1 = RAR file name (At EAR file deployment, URI is output.)

%s2 = Value that caused the error

## Explanation

An invalid character has been used in a resource name. The following characters cannot be used in resource names:

### - En-size spaces only

- Symbols "\", ",", "=", ampersand "&", question "?", double quote "\"", less than "<", greater than ">", vertical bar "|", colon ":", semi-colon ";", asterisk "\*", slash "/", and "\$"

## System Action

Stops processing.

## User Action

Change the value indicated in the variable information to set the correct resource name.

The value without the extension of the RAR file name will be used as the default resource name. Correct the RAR file name.

## 2.6.15 DEP1914

---

**The maximum number of characters that can be specified for the resource name is 32: RAR file name = %s1: Value = %s2**

### Variable Information

%s1 = RAR file name (At EAR file deployment, URI is output.)

%s2 = Value that caused the error

### Explanation

The value used as the resource name has exceeded 32 characters.

### System Action

Stops processing.

### User Action

Change the value indicated in the variable information so that the resource name that is set is correct.

The RAR file name, without the extension, will be used as the resource name default value, so change the RAR file name.

## 2.6.16 DEP1915

---

**The resource name has been duplicated: RAR file name1=%s1: RAR file name2=%s2: Value=%s3**

### Variable Information

%s1 = RAR file name1 (URI is output.)

%s2 = RAR file name2 (URI is output.)

%s3 = Value that caused the error

### Explanation

The value used as the resource name is duplicated.

### System Action

Stops processing.

### User Action

Change the value indicated in the variable information so that the resource name is not duplicated.

The RAR file name, without the extension, will be used as the resource name default value, so change the RAR file name.

## 2.6.17 DEP1916

---

**The specified resource name has already been used: RAR file name=%s1: Value=%s2**

### Variable Information

%s1 = RAR file name (At EAR file deployment, URI is output.)

%s2 = Value that caused the error

### Explanation

The resource indicated in the value used as the resource name already exists.

### System Action

Stops processing.

### User Action

Change the resource adapter name, or undeploy the module that contains the resource with the duplicated name, and then re-execute.

The RAR file name, without the extension, will be used as the resource name default value, so change the RAR file name.

## 2.7 DEP2100 to DEP2199

---

These are messages displayed during processing of EJB Deployment.

### 2.7.1 DEP2100

---

#### Information concerning Enterprise Bean implementation class [%s] cannot be acquired

##### Variable Information

%s = Name of the Bean class

##### Explanation

A Bean class could not be loaded.

##### System Action

Processing stops.

##### User Action

Check that the jar file, referential class path, or class path of the EJB application includes the Bean class.

Moreover, check that the class referenced by the Bean class and the jar file, or referential classpath of the EJB application, are set in the classpath.

Additionally, depending on the IJServer "Separate Class Loaders" settings, it may not be possible to refer from one module to another. Refer to "Designing J2EE" - "Separating Class Loaders" in the J2EE User's Guide, and check that the application configuration and class loader separation are correct.

### 2.7.2 DEP2101

---

#### Information concerning remote interface class [%s] cannot be acquired

##### Variable Information

%s = Remote interface name

##### Explanation

A remote interface name could not be loaded.

##### User Action

Processing stops.

##### User Action

Verify that the Remote interface exists in a jar file of the EJB application, reference class path or class path.

Moreover, check that the class referenced by the Bean class and the jar file, or referential classpath of the EJB application, are set in the classpath.

Additionally, depending on the IJServer "Separate Class Loaders" settings it may not be possible to refer from one module to another. Refer to "Designing J2EE" - "Separating Class Loaders" in the J2EE User's Guide, and check that the application configuration and class loader separation are correct.

### 2.7.3 DEP2102

---

#### Information concerning home interface class [%s] cannot be acquired

##### Variable Information

%s = Home interface name

## Explanation

A Home interface name could not be loaded.

## System Action

Processing stops.

## User Action

Check that the jar file, referential class path, or class path of the EJB application includes the Home interface.

Moreover, check that the class referenced by the Bean class and the jar file, or referential classpath of the EJB application, are set in the classpath.

Additionally, depending on the IJServer "Separate Class Loaders" settings, it may not be possible to refer from one module to another. Refer to "Designing J2EE" - "Separating Class Loaders" in the J2EE User's Guide, and check that the application configuration and class loader separation are correct.

## 2.7.4 DEP2103

---

### Information concerning primary key class %s cannot be acquired

#### Variable Information

%s = Primary key class name

#### Explanation

A primary key class could not be loaded.

#### System Action

Processing stops.

#### User Action

Check that the jar file, referential class path, or class path of the EJB application includes the primary key class.

Moreover, check that the class referenced by the Bean class and the jar file, or referential classpath of the EJB application, are set in the classpath.

Additionally, depending on the IJServer "Separate Class Loaders" settings, it may not be possible to refer from one module to another. Refer to "Designing J2EE"- Separating Class Loaders" in the J2EE User's Guide, and check that the application configuration and class loader separation are correct.

## 2.7.5 DEP2104

---

### %s2 is not described in %s1 class

#### Variable Information

%s1 = Name of the class

%s2 = Modifier

#### Explanation

A modifier required by the EJB convention has not been specified in the class.

#### System Action

Processing stops.

#### User Action

Specify the indicated modifier.

## 2.7.6 DEP2105

---

### **%s2 cannot be described in %s1 class**

#### Variable Information

%s1 = Name of the class

%s2 = Modifier

#### Explanation

A modifier required by the EJB convention has not been specified in the class.

#### System Action

Processing stops.

#### User Action

Delete the indicated modifier.

## 2.7.7 DEP2106

---

### **%s is not interface**

#### Variable Information

%s = Name of the class

#### Explanation

An entity to be defined as an interface is defined as a class.

#### System Action

Processing stops.

#### User Action

Define it as an interface.

## 2.7.8 DEP2107

---

### **%s1 does not extend %s2**

#### Variable Information

%s1 = Name of the Interface

%s2 = Name of the Interface

#### Explanation

Inheritance required by the EJB convention has not been implemented.

#### System Action

Processing stops.

#### User Action

Define an interface that inherits the indicated interface.

## 2.7.9 DEP2108

---

### **%s1 does not implement %s2**

### Variable Information

%s1 = Name of the class

%s2 = Name of the Interface

### Explanation

An interface required by the EJB convention is has not been implemented.

### System Action

Processing stops.

### User Action

Define the indicated interface in the class.

## 2.7.10 DEP2109

---

### Stateless Session Bean [%s] cannot implement SessionSynchronization

#### Variable Information

%s = Name of the Bean class

#### Explanation

Stateless Session Bean encapsulates javax.ejb.SessionSynchronization.

#### System Action

The system continues processing.

#### User Action

Delete javax.ejb.SessionSynchronization.

## 2.7.11 DEP2110

---

### %s2 method is not defined in %s1 class

#### Variable Information

%s1 = Name of the class

%s2 = Name of the method

#### Explanation

A method required by the EJB convention has not been defined.

#### System Action

Processing stops.

#### User Action

Add the indicated method.

## 2.7.12 DEP2111

---

### %s3 is defined in %s2 method of %s1 class

#### Variable Information

%s1 = Name of the class

%s2 = Name of the method

%s3 = Modifier

#### Explanation

A modifier prohibited by the EJB convention has been specified in the method.

#### System Action

Processing stops.

#### User Action

Specify the indicated modifier.

## 2.7.13 DEP2112

---

### No %s2 method is described in %s1 class

#### Variable Information

%s1 = Name of the class

%s2 = Name of the method

#### Explanation

Methods required by the EJB convention have not been specified.

#### System Action

Processing stops.

#### User Action

Add the indicated method(s).

## 2.7.14 DEP2113

---

### %s3 is not described in %s2 method of %s1 class

#### Variable Information

%s1 = Name of the class

%s2 = Name of the method

%s3 = Modifier

#### Explanation

A modifier required by the EJB convention has not been specified in the method.

#### System Action

Processing stops.

#### User Action

Specify the indicated modifier.

## 2.7.15 DEP2114

---

### %s3 is described as the return value type of %s2 method of %s1 class. The return value type must be %s4

#### Variable Information

%s1 = Name of the class

%s2 = Name of the method

%s3 = Data type (incorrect type of return value)

%s4 = Data type (type of return value required by the EJB convention)

#### Explanation

The type of return value of the method does not conform to the EJB convention.

#### System Action

Processing stops.

#### User Action

Change the type of return value.

## 2.7.16 DEP2115

---

### **Exception [%s3] is not described in %s2 method of %s1 class**

#### Variable Information

%s1 = Name of the class

%s2 = Name of the method

%s3 = Name of the exception

#### Explanation

An exception required by the EJB convention has not been specified in a method.

#### System Action

Processing stops.

#### User Action

Specify the indicated exception in throws.

## 2.7.17 DEP2116

---

### **%s4 method that cannot be mapped to %s3 method of %s2 class is described in %s1 class**

#### Variable Information

%s1 = Class name

%s2 = Class name

%s3 = Method name

%s4 = Method name

#### Explanation

Methods are mismatching.

#### System Action

Processing stops.

#### User Action

Correct the mismatching of the methods.

## 2.7.18 DEP2117

---

### **%s2 method is defined in %s1 class**

#### Variable Information

%s1 = Class name

%s2 = Method name

#### Explanation

A method prohibited by the EJB convention has been defined.

#### System Action

Processing stops.

#### User Action

Delete the method.

## 2.7.19 DEP2118

---

### **The argument of %s2 method of %s1 class should be one, and the type should be %s3**

#### Variable Information

%s1 = Class name

%s2 = Method name

%s3 = Data type (type of argument required by the EJB convention)

#### Explanation

For an argument of a method, the type of argument or the number of arguments of the type is incorrect: the EJB convention specifies that the argument must be a specific type and the number of arguments must be one.

#### System Action

Processing stops.

#### User Action

Correct the argument(s) of the method.

## 2.7.20 DEP2119

---

### **Cannot describe the finalize method in class %s**

#### Variable Information

%s = Name of the class

#### Explanation

The finalize method has been defined in a class in which the finalize method is prohibited by the EJB convention.

#### System Action

Processing stops.

#### User Action

Delete the finalize method.

## 2.7.21 DEP2120

---

### A public constructor without arguments is not described in %s class

#### Variable Information

%s = Name of the class

#### Explanation

A public constructor without an argument, which is required by the EJB convention, has not been specified.

#### System Action

Processing stops.

#### User Action

Define a public constructor without an argument.

## 2.7.22 DEP2121

---

### java.rmi.RemoteException is described in %s2 method of %s1 class. You are recommended to use javax.ejb.EJBException for system exceptions in EJB1.1

#### Variable Information

%s1 = Name of the class

%s2 = Name of the method

#### Explanation

java.rmi.RemoteException, which is not recommended by the EJB convention, has been specified in a method.

#### System Action

Processing stops.

#### User Action

Specify javax.ejb.EJBException in throws of the method.

## 2.7.23 DEP2122

---

### %s3 is not described in %s2 field of %s1 class

#### Variable Information

%s1 = Name of the class

%s2 = Name of the field

%s3 = modifier

#### Explanation

A modifier required by the EJB convention has not been specified in a field.

#### System Action

Processing stops.

#### User Action

Specify the indicated modifier.

## 2.7.24 DEP2123

---

### The %s3 field that cannot be mapped to field of %s2 class is described in %s1 class

#### Variable Information

%s1 = Name of the class

%s2 = Name of the class

%s3 = Name of the field

#### Explanation

Fields are mismatching.

#### System Action

Processing stops.

#### User Action

Correct the mismatching of the fields.

## 2.7.25 DEP2124

---

### Deployment descriptor file [%s] is not found

#### Variable Information

%s = Name of the file

#### Explanation

A deployment descriptor could not be found. The deployment descriptor file has been deleted or the name of the directory containing the deployment descriptor file is incorrect.

#### System Action

Processing stops.

#### User Action

Check the deployment descriptor file.

## 2.7.26 DEP2125

---

### Deployment descriptor file [%s] cannot be read

#### Variable Information

%s = Name of the file

#### Explanation

A deployment descriptor file could not be read because the format of a deployment descriptor was incorrect.

#### System Action

Processing stops.

#### User Action

Check that the deployment descriptors are coded with the correct format.

## 2.7.27 DEP2126

---

---

### **IOError occurred during reading of deployment descriptor file [%s]**

#### Variable Information

%s = Name of the file

#### Explanation

An error occurred in a read of a deployment descriptor.

#### System Action

Processing stops.

#### User Action

Check the access permission assigned to the temporary directory or jar file of the EJB application.

---

## **2.7.28 DEP2127**

---

### **The form of the deployment descriptor file [%s] is incorrect**

#### Variable Information

%s = Name of the file

#### Explanation

A deployment descriptor is specified with an invalid format.

#### System Action

Processing stops.

#### User Action

Check the format of the deployment descriptors.

---

## **2.7.29 DEP2128**

---

### **The Enterprise Bean class name of %s is not defined in the deployment descriptor**

#### Variable Information

%s = Value of ejb-name of a deployment descriptor

#### Explanation

A deployment descriptor does not contain the name of a class that corresponds to a user-defined Bean.

#### System Action

Processing stops.

#### User Action

Define the Bean class name in the deployment descriptor.

---

## **2.7.30 DEP2129**

---

### **The home interface name of %s is not defined in the deployment descriptor**

#### Variable Information

%s = Value of ejb-name of a deployment descriptor

## Explanation

A deployment descriptor does not contain the name of an interface that corresponds to the user-defined Home.

## System Action

Processing stops.

## User Action

Define the name of the Home interface in the deployment descriptor.

### 2.7.31 DEP2130

---

#### The remote interface name of %s is not defined in the deployment descriptor

## Variable Information

%s = Value of ejb-name of a deployment descriptor

## Explanation

An interface name corresponds to the user definition. Remote does not exist in the deployment descriptor.

## System Action

Processing stops.

## User Action

Define an interface name for Remote in the deployment descriptor.

### 2.7.32 DEP2131

---

#### The primary key class name of %s is not defined in the deployment descriptor

## Variable Information

%s = Value of ejb-name of a deployment descriptor

## Explanation

A deployment descriptor does not contain the name of an class which corresponds to the user-defined Primary Key.

## System Action

Processing stops.

## User Action

Define the name of the Primary Key in the deployment descriptor.

### 2.7.33 DEP2132

---

#### The container-managed field of %s is not defined

## Variable Information

%s = Value of ejb-name of a deployment descriptor

## Explanation

A deployment descriptor does not contain the name of an interface that corresponds to the user-defined Primary Key.

## System Action

Processing stops.

## User Action

Define the container-managed field in the deployment descriptor.

### 2.7.34 DEP2133

---

#### More than one ejbCreate method is defined in Stateless Session Bean [%s]

##### Variable Information

%s = Name of the Bean class

##### Explanation

Multiple ejbCreate methods have been specified in Stateless Session Bean.

##### System Action

Processing stops.

##### User Action

Delete unnecessary ejbCreate methods.

### 2.7.35 DEP2134

---

#### More than one create method is defined in the home interface of Stateless Session Bean [%s]

##### Variable Information

%s = Name of the Home interface

##### Explanation

Multiple create methods have been specified for Stateless Session Bean.

##### System Action

Processing stops.

##### User Action

Delete unnecessary create methods.

### 2.7.36 DEP2135

---

#### The ejbCreate method with arguments is defined in Stateless Session Bean [%s]

##### Variable Information

%s = Name of the Bean class

##### Explanation

The ejbCreate method with arguments appended have been specified in Stateless Session Bean.

##### System Action

Processing stops.

##### User Action

Delete the unnecessary ejbCreate method.

### 2.7.37 DEP2136

---

---

**The create method with arguments is defined in the home interface of Stateless Session Bean [%s]**

Variable Information

%s = Name of the Home interface

Explanation

The create method with arguments appended has been specified for the Home interface of Stateless Session Bean.

System Action

Processing stops.

User Action

Delete the unnecessary create method.

---

### 2.7.38 DEP2137

---

**A field [%s1] defined in the cmp-field of the deployment descriptor is not defined in the class [%s2]**

Variable Information

%s1 = Name of the field

%s2 = Name of the class

Explanation

A field which has been defined in cmp-field of a deployment descriptor according to CMP1.1 has not been defined in a class.

System Action

Processing stops.

User Action

Correct the inconsistency between cmp-field and a field of the class.

---

### 2.7.39 DEP2142

---

**The method [%s1] that is defined in deployment descriptor for transaction is not defined in %s2**

Variable Information

%s1 = Name of the method

%s2 = Name of the class

Explanation

A method which has been defined in container-transaction of a deployment descriptor has not been defined in an interface or Bean class.

System Action

Processing stops.

User Action

Correct the deployment descriptor or Bean class so that the methods are correctly associated.

---

### 2.7.40 DEP2143

---

**The method [%s1] that is defined in deployment descriptor for permission is not defined in %s2**

## Variable Information

%s1 = Name of the method

%s2 = Name of the class

## Explanation

A method, which has been defined in method-permission of a deployment descriptor, has not been defined in an interface or Bean class.

## System Action

Processing stops.

## User Action

Correct the deployment descriptor or Bean class so that the methods are correctly associated.

## 2.7.41 DEP2144

---

### The class used in class [%s] cannot be found

## Variable Information

%s = Name of the class

## Explanation

A class used as a return value or argument of a method could not be referenced.

## System Action

Processing stops.

## User Action

Check that the class to be used is placed in the jar file for the EJB application, reference class path, or class path. Note the following when deploying the EJB application in an EAR file.

- When the jar file (class) that is required for Home/Remote interface compilation is included in the EAR file, specify the reference class path using the following procedure:
  1. Fetch the jar file (class) that is required for compilation from the EAR file and move it to an some suitable directory.
  2. Specify the moved location of the jar file (which was moved to another directory) in the reference class path.

Additionally, depending on the IJServer "Separate Class Loaders" settings, it may not be possible to refer from one module to another. Refer to "Designing J2EE" - "Separating Class Loaders" in the J2EE User's Guide, and check that the application configuration and class loader separation are correct.

## 2.7.42 DEP2145

---

### The class used in [%s2] of class [%s1] cannot be found

## Variable Information

%s1 = Name of the method

%s2 = Name of the class

## Explanation

A class used as a return value or argument of a method could not be referenced.

## System Action

Processing stops.

## User Action

Check that the class to be used is placed in the jar file for the EJB application, reference class path, or class path.

Additionally, depending on the IJServer "Separate Class Loaders" settings, it may not be possible to refer from one module to another. Refer to "Designing J2EE"- Separating Class Loaders" in the J2EE User's Guide, and check that the application configuration and class loader separation are correct.

## 2.7.43 DEP2146

---

### The class [%s] cannot be found

#### Variable Information

%s = Name of the class

#### Explanation

A class could not be referenced.

#### System Action

Processing stops.

#### User Action

Check that the class to be used is placed in the jar file for the EJB application, reference class path, or class path.

## 2.7.44 DEP2147

---

### Application exception(s) [%s3] is described in %s2 method of %s1 class

#### Variable Information

%s1 = Name of the class

%s2 = Name of the method

%s3 = Name of the exception

#### Explanation

An application exception prohibited by the convention is specified in a method.

#### System Action

Processing stops.

#### User Action

Delete the indicated application exception from throws in the method.

## 2.7.45 DEP2150

---

### The accessor method [%s2] for CMP field name [%s1] defined cmp-field in deployment descriptor is not defined in CMP Entity Bean[%s3]

#### Variable Information

%s1 = Name of the field

%s2 = Name of the method

%s3 = Name of the Bean class

#### Explanation

An accessor method which corresponds to the cmp-field of deployment descriptor is not defined in the Bean class.

### System Action

Processing stops.

### User Action

Add the accessor method to the Bean class.

## 2.7.46 DEP2151

---

**The accessor method [%s2] for CMR field name [%s1] defined cmr-field in deployment descriptor is not defined in CMP Entity Bean[%s3]**

### Variable Information

%s1 = Name of the field

%s2 = Name of the method

%s3 = Name of the Bean class

### Explanation

An accessor method which corresponding to the cmr-field of deployment descriptor, is not defined in the Bean class.

### System Action

Processing stops.

### User Action

Add the accessor method to the Bean class.

## 2.7.47 DEP2152

---

**abstract is not described in an accessor method [%s2] of CMP Entity Bean%s1**

### Variable Information

%s1 = Name of the Bean class

%s2 = Name of the method

### Explanation

An abstract is not specified in an accessor method.

### System Action

Processing stops.

### User Action

Specify an abstract for the accessor method.

## 2.7.48 DEP2153

---

**More than one parameter is described in a get accessor method [%s2] of a CMP Entity Bean[%s1]**

### Variable Information

%s1 = Name of the Bean class

%s2 = Name of the method

### Explanation

The parameter is described for the GET accessor method.

#### System Action

Processing stops.

#### User Action

Delete the parameter.

### 2.7.49 DEP2154

---

**No parameter is described in a set accessor method [%s2] of a CMP Entity Bean[%s1]**

#### Variable Information

%s1 = Name of the class

%s2 = Name of the method

#### Explanation

No arguments have been specified for a set accessor method.

#### System Action

Processing stops.

#### User Action

Specify arguments.

### 2.7.50 DEP2160

---

**The field [%s1] defined for cmp-field in deployment descriptor is defined in CMP Entity Bean[%s2]. It cannot be defined in the bean**

#### Variable Information

%s1 = Name of the field

%s2 = Name of the Bean class

#### Explanation

The CMP field defined in cmp-field is also specified in a Bean class.

#### System Action

Processing stops.

#### User Action

Delete the indicated field from the Bean class.

### 2.7.51 DEP2161

---

**The field [%s1] defined for cmr-field in deployment descriptor is defined in CMP Entity Bean[%s2]. It cannot be defined in the bean**

#### Variable Information

%s1 = Name of the field

%s2 = Name of the Bean class

#### Explanation

The CMR field defined in cmr-field is also specified in a Bean class.

## System Action

Processing stops.

## User Action

Delete the indicated field from the Bean class.

## 2.7.52 DEP2162

---

**The CMP field name [%s] defined for cmp-field in deployment descriptor is not begun with a lowercased character**

### Variable Information

%s = Name of the field

### Explanation

The value in cmp-field does not begin with a lowercase.

### System Action

Processing stops.

### User Action

Correct the first character in cmp-field with a lowercase.

## 2.7.53 DEP2163

---

**The CMR field name [%s] defined for cmr-field in deployment descriptor is not begun with a lowercased character**

### Variable Information

%s = Name of the field

### Explanation

The value in cmr-field does not begin with a lowercase.

### System Action

Processing stops.

### User Action

Correct the first character in cmr-field with a lowercase.

## 2.7.54 DEP2164

---

**The %s2 field that cannot be mapped to cmp-field of deployment descriptor is defined in %s1 class**

### Variable Information

%s1 = Name of the class

%s2 = Name of the field

### Explanation

A field, which cannot be associated with a field of a deployment descriptor according to CMP1.1, has been defined in a class.

### System Action

The system continues processing.

## User Action

Correct the deployment descriptor or Bean class so that the fields are correctly associated.

### 2.7.55 DEP2165

---

**The %s2 field that cannot be mapped to container managed field of deployment descriptor is defined in %s1 class**

#### Variable Information

%s1 = Name of the class

%s2 = Name of the field

#### Explanation

A field that cannot be associated with a field of a deployment descriptor according to CMP 2.0 has been defined in a class.

#### System Action

The system continues processing.

#### User Action

Correct the deployment descriptor or Bean class so that the fields are correctly associated.

### 2.7.56 DEP2166

---

**The bean class cannot be described as return type for the method [%s2] of the class [%s1]**

#### Variable Information

%s1 = Name of the class

%s2 = Name of the method

#### Explanation

A Bean class has been specified in a type of return value of a method.

#### System Action

Processing stops.

#### User Action

Change the type of return value.

### 2.7.57 DEP2167

---

**The primkey-field of %s is defined in the deployment descriptor. primkey-field tag can be defined only for CMP Entity Bean**

#### Variable Information

%s = Name of the Bean class

#### Explanation

primkey-field has been defined for a Bean other than CMP Entity Bean.

#### System Action

Processing stops.

## User Action

Delete the primkey-field.

## 2.7.58 DEP2168

---

**The query of %s is defined in the deployment descriptor. The query tag can be defined only for CMP Entity Bean**

### Variable Information

%s = Name of the Bean class

### Explanation

Query is specified for Bean that is not CMP2.0 EntityBean.

### System Action

Processing stops.

### User Action

Delete the query.

## 2.7.59 DEP2169

---

**The method [%s1] defined for query tag in the deployment descriptor is not defined in %s2**

### Variable Information

%s1 = Name of the method

%s2 = Name of the Bean class

### Explanation

The method [%s1] defined for the query tag in the deployment descriptor is not defined in the Bean class [%s2].

### System Action

Processing stops.

### User Action

Modify the deployment descriptor or the Bean class to correspond to the method.

## 2.7.60 DEP2170

---

**The method [%s2] of %s1 is not defined for query tag in the deployment descriptor**

### Variable Information

%s1 = Name of the class

%s2 = Name of the method

### Explanation

The deployment descriptor's query tag does not have a method defined for it.

### System Action

Processing stops.

### User Action

Specify the query tag's method.

## 2.7.61 DEP2171

---

### Local interface [%s] is not found.

#### Variable Information

%s = Local interface name

#### Explanation

The Local interface defined in the deployment descriptor cannot be loaded.

#### System Action

Processing stops.

#### User Action

Check that the ejb-jar, classpath, or extended classpath, contains a user-defined Local interface.

Moreover, check that the class referenced by the Local interface and the jar file, or referential classpath of the EJB application, are set in the classpath.

Additionally, depending on the IJServer "Separate Class Loaders" settings, it may not be possible to refer from one module to another. Refer to "Designing J2EE" - "Separating Class Loaders" in the J2EE User's Guide, and check that the application configuration and class loader separation are correct.

## 2.7.62 DEP2172

---

### LocalHome interface [%s] is not found.

#### Variable Information

%s = LocalHome interface name

#### Explanation

The LocalHome interface defined in the deployment descriptor cannot be loaded.

#### System Action

Processing stops.

#### User Action

Check that the ejb-jar, classpath, or extended classpath, contains a user-defined LocalHome interface.

Moreover, check that the class referenced by the LocalHome interface and the jar file, or referential classpath of the EJB application, are set in the classpath.

Additionally, depending on the IJServer "Separate Class Loaders" settings, it may not be possible to refer from one module to another. Refer to "Designing J2EE" - "Separating Class Loaders" in the J2EE User's Guide, and check that the application configuration and class loader separation are correct.

## 2.7.63 DEP2173

---

### A Local interface name for the Enterprise Bean name [%s] is not defined in the deployment descriptor.

#### Variable Information

%s = value of ejb-name in the deployment descriptor

#### Explanation

A remote interface and the Local interface are not defined in the deployment descriptor.

Alternatively, a Local interface name is defined with null characters.

## System Action

Processing stops.

## User Action

Define a remote interface or Local interface.

## 2.7.64 DEP2174

---

**A LocalHome interface name for the Enterprise Bean name [%s] is not defined in the deployment descriptor.**

### Variable Information

%s = value of ejb-name in the deployment descriptor

### Explanation

A LocalHome interface has not been defined although Local interface is defined in the deployment descriptor. Alternatively, a LocalHome interface name is defined with null characters.

## System Action

Processing stops.

## User Action

Define a LocalHome interface.

## 2.7.65 DEP2175

---

**A Local interface name for the Enterprise Bean name [%s] is defined in the deployment descriptor. The Local interface cannot be used with CMP1.1.**

### Variable Information

%s = value of ejb-name in the deployment descriptor

### Explanation

A Local interface is defined for a CMP1.1 Entity Bean.

## System Action

Processing stops.

## User Action

Delete the Local interface definition.

## 2.7.66 DEP2176

---

**A LocalHome interface name for the Enterprise Bean name [%s] is defined in the deployment descriptor. The LocalHome interface cannot be used with CMP1.1.**

### Variable Information

%s = value of ejb-name in the deployment descriptor

### Explanation

A LocalHome interface is defined for a CMP1.1 Entity Bean.

## System Action

Processing stops.

#### User Action

Delete the LocalHome interface definition.

### 2.7.67 DEP2177

---

**Neither a Remote interface name nor a Local interface name for the Enterprise Bean name [%s] is defined in the deployment descriptor.**

#### Variable Information

%s = value of ejb-name in the deployment descriptor

#### Explanation

Neither a Remote interface name nor a Local interface name is defined.

#### System Action

Processing stops.

#### User Action

Define a Remote interface or Local interface.

### 2.7.68 DEP2178

---

**%s3 cannot be defined in parameters of the method[%s2] in the class[%s1]**

#### Variable Information

%s1 = Name of the Bean class

%s2 = Name of the method

%s3 = Data type

#### Explanation

The model which cannot be specified to be the argument of a method on agreement is specified.

#### System Action

Processing stops.

#### User Action

Please change the argument of a method.

### 2.7.69 DEP2179

---

**%s3 cannot be defined as a return type of the method[%s2] in the class[%s1]**

#### Variable Information

%s1 = Name of the Bean class

%s2 = Name of the method

%s3 = Data type

#### Explanation

The model which cannot be specified to be the return value of a method on agreement is specified.

#### System Action

Processing stops.

#### User Action

Please change the return value of a method.

### 2.7.70 DEP2180

---

**%s3 is described as the return value type of %s2 method of %s1 class, and %s6 is described as the return value type of %s5 method of %s4 class. The return value types must be same**

#### Variable Information

%s1 = Name of the class

%s2 = Name of the method

%s3 = Data type

%s4 = User-defined class interface name

%s5 = Name of the method

%s6 = Data type

#### Explanation

Different types of return value have been specified for associated methods.

#### System Action

Processing stops.

#### User Action

Correct the types of return value so that they are correctly associated.

### 2.7.71 DEP2181

---

**The %s2 interface that is described in %s1 in deployment descriptor is not defined for %s3**

#### Variable Information

%s1 = Name of the tag in the deployment descriptor

%s2 = Interface type

%s3 = Value of ejb-name of the deployment descriptor

#### Explanation

An interface defined in a deployment descriptor is not included in the Bean.

#### System Action

Processing stops.

#### User Action

Correct the deployment descriptor.

### 2.7.72 DEP2182

---

**The interface type [%s2] that is described in %s1 in deployment descriptor is illegal**

#### Variable Information

%s1 = Name of the tag in the deployment descriptor

%s2 = Interface type

## Explanation

An invalid value has been specified in the interface type of a deployment descriptor.

## System Action

Processing stops.

## User Action

Correct the value of the method-intf tag.

## 2.7.73 DEP2183

---

**The java.rmi.RemoteException is described in %s2 method of %s1 class. You cannot use the RemoteException for the method**

## Variable Information

%s1 = Name of the class

%s2 = Name of the method

## Explanation

java.rmi.RemoteException has been specified in throws of a method.

## System Action

Processing stops.

## User Action

Delete java.rmi.RemoteException from throws of the method.

## 2.7.74 DEP2184

---

**%s3 cannot be defined in field[%s2] of class[%s1]**

## Variable Information

%s1 = Name of the class

%s2 = Name of the method

%s3 = Modifier

## Explanation

The modifier forbidden on EJB agreement is described by the field name.

## System Action

Processing stops.

## User Action

Delete the modifier forbidden from the field of a class.

## 2.7.75 DEP2185

---

**%s is not class**

## Variable Information

%s = Name of the class

## Explanation

What should be a class is defined as an interface.

## System Action

Processing stops.

## User Action

Define it as a class.

## 2.7.76 DEP2186

---

### Information concerning service endpoint interface class [%s] cannot be acquired.

#### Variable Information

%s = service endpoint interface name

#### Explanation

The service endpoint interface defined in the deployment descriptor cannot load.

#### System Action

Processing stops.

#### User Action

Check whether the service endpoint interface defined by the user is in the ejb-jar, or the extended class path or class path.

Check whether the class referenced in the service endpoint interface has been set in the EJB application jar file, or the reference class path has been set in the class path.

Depending on the setting for "Separate Class Loader" of the J2EE Application Server, it may not be possible to carry out reference between modules. Refer to "Design of J2EE Application" - "Separation of Class Loaders" in the "J2EE User's Guide", and check that the application structure and class loader separation are correct.

## 2.7.77 DEP2187

---

### The service endpoint interface name of %s is not defined in the deployment descriptor.

#### Variable Information

%s = Value of <ejb-name> of deployment descriptor

#### Explanation

The service endpoint interface is not defined in the deployment descriptor, or the service endpoint interface name has been defined using space characters.

#### System Action

Processing stops.

#### User Action

Define the service endpoint interface.

## 2.7.78 DEP2188

---

### No remote interface name and no local interface name and no service endpoint interface is defined for %s, in deployment descriptor.

### Variable Information

%s = Value of <ejb-name> of deployment descriptor

### Explanation

No Remote interface, Local interface, or service endpoint interface name is defined.

### System Action

Processing stops.

### User Action

Define the Remote interface, Local interface, or service endpoint interface.

## 2.7.79 DEP2189

---

**The service endpoint interface name of %s is defined in the deployment descriptor. The service-endpoint tag can be defined only for STATELESS Session Bean.**

### Variable Information

%s = Value of <ejb-name> of deployment descriptor

### Explanation

The service endpoint interface is defined in Stateful Session Bean.

### System Action

Processing stops.

### User Action

Delete the service endpoint interface.

## 2.7.80 DEP2190

---

**Stateful Session Bean [%s] cannot implement TimedObject.**

### Variable Information

%s = Bean class name

### Explanation

Stateful Session Bean has implemented javax.ejb.TimedObject.

### System Action

Processing continues.

### User Action

Delete the javax.ejb.TimedObject implementation.

## 2.7.81 DEP2191

---

**Information concerning message listener interface class [%s] cannot be acquired.**

### Variable Information

%s = message listner interface name

### Explanation

The message listener interface defined in the deployment descriptor cannot load.

## System Action

Processing stops.

## User Action

Check whether the message listener interface defined by the user is in the ejb-jar, or the extended class path or class path.

Check whether the class referenced in the message listener interface has been set in the EJB application jar file, or the reference class path has been set in the class path.

Depending on the setting for "Separate Class Loader" of the J2EE Server, it may not be possible to carry out reference between modules. Refer to "Design of J2EE Application" - "Separation of Class Loaders" in the "J2EE User's Guide", and check that the application structure and class loader separation are correct.

## 2.7.82 DEP2192

---

**The message listener interface name of %s is not defined in the deployment descriptor.**

### Variable Information

%s = Value of <ejb-name> of deployment descriptor

### Explanation

The message listener interface is not defined in the deployment descriptor, or the message listener interface name has been defined using space characters.

### System Action

Processing stops.

### User Action

Define the message listener interface.

## 2.7.83 DEP2199

---

**An error occurred to check EJB spec.**

### Explanation

An internal error occurred in the EJB rule check.

### System Action

Stops the EJB rule check.

### User Action

Check whether there is a problem with the EJB rules. If, after the problem is found and removed, the error still occurs, use the *iscollectinfo* command to collect diagnostic information. Send the error information to your systems engineer.

## 2.8 DEP2200 to DEP2299

---

These are messages displayed during processing of EJB Deployment.

### 2.8.1 DEP2200

---

**An invalid value was specified for cmp-version of CMP Enterprise Bean [%s] in the deployment descriptor.**

#### Variable Information

%s = Bean class name

## Explanation

cmp-version is not omitted and the value set for it is neither 2.x nor 1.x.

## System Action

Processing stops.

## User Action

Correct the cmp-version value according to the CMP version.

## 2.8.2 DEP2201

---

**An invalid value was specified for the persistence-type of the CMP Enterprise Bean [%s] in the deployment descriptor. The value must be "Bean" or "Container."**

### Variable Information

%s = Bean class name

## Explanation

The value specified for the persistence-type is neither "Bean" nor "Container."

## System Action

Processing stops.

## User Action

Specify "Bean" or "Container" for the persistence-type value.

## 2.8.3 DEP2203

---

**An invalid value was specified for the primkey-field of the CMP Enterprise Bean [%s] in the deployment descriptor. The value must be one of the values in cmp-field.**

### Variable Information

%s = Bean class name

## Explanation

primkey-field is not found in the Bean class cmp-field.

## System Action

Processing stops.

## User Action

Use one of the values in the Bean class cmp-field to specify the value for primkey-field.

## 2.8.4 DEP2204

---

**An invalid value was specified for the prim-key-class of the CMP Enterprise Bean [%s] in the deployment descriptor. A primitive type value cannot be specified.**

### Variable Information

%s = Bean class name

## Explanation

A primitive type value is specified for prim-key-class.

### System Action

Processing stops.

### User Action

Specify a value other than the primitive type for prim-key-class.

## 2.8.5 DEP2205

---

**An invalid value was specified for the result-type-mapping of the CMP Enterprise Bean [%s] in the deployment descriptor. The value must be "Local" or "Remote."**

### Variable Information

%s = Bean class name

### Explanation

The value specified for the result-type-mapping is neither "Local" nor "Remote".

### System Action

Processing stops.

### User Action

Specify "Local" or "Remote" for the result-type-mapping value.

## 2.8.6 DEP2206

---

**No value is defined for the ejb-name of the CMP Enterprise Bean [%s] in the deployment descriptor.**

### Variable Information

%s = Bean class name

### Explanation

Null characters are specified for the ejb-name value.

### System Action

Processing stops.

### User Action

Define a value for ejb-name.

## 2.8.7 DEP2207

---

**A reserved word for EJB-QL was specified for the value of the ejb-name of the CMP Enterprise Bean [%s] in the deployment descriptor.**

### Variable Information

%s = Bean class name

### Explanation

The value of ejb-name is a reserved word for EJB-QL.

### System Action

Processing stops.

## User Action

For ejb-name, specify a value other than a reserved word for EJB-QL.

### 2.8.8 DEP2208

---

**abstract-schema-name is defined for the CMP Enterprise Bean [%s] in the deployment descriptor. abstract-schema-name can be defined only for CMP2.0.**

#### Variable Information

%s = Bean class name

#### Explanation

The abstract-schema-name is defined for a Bean class other than CMP2.0.

#### System Action

Processing stops.

#### User Action

Delete the abstract-schema-name defined for a Bean class other than CMP2.0.

### 2.8.9 DEP2209

---

**No value is defined for the abstract-schema-name of the CMP Enterprise Bean [%s] in the deployment descriptor.**

#### Variable Information

%s = Bean class name

#### Explanation

Null characters are specified for the abstract-schema-name value.

#### System Action

Processing stops.

#### User Action

Define a value for abstract-schema-name.

### 2.8.10 DEP2210

---

**A reserved word for EJB-QL was specified for the value of the abstract-schema-name of the CMP Enterprise Bean [%s] in the deployment descriptor.**

#### Variable Information

%s = Bean class name

#### Explanation

The value of abstract-schema-name is a reserved word for EJB-QL.

#### System Action

Processing stops.

#### User Action

For abstract-schema-name, specify a value other than a reserved word for EJB-QL.

## 2.8.11 DEP2211

---

**The value specified for the abstract-schema-name of the CMP Enterprise Bean [%s] in the deployment descriptor is already used for another Bean. Specify a value that is unique within the EJB-jar.**

### Variable Information

%s = Bean class name

### Explanation

The value specified for abstract-schema-name is not unique within the ejb-jar.

### System Action

Processing stops.

### User Action

For abstract-schema-name, specify a value that is unique within the ejb-jar.

## 2.8.12 DEP2212

---

**result-type-mapping corresponding to the method [%s2] of the CMP Enterprise Bean [%s1] is not defined in the deployment descriptor.**

### Variable Information

%s1 = Bean class name

%s2 = Method name

### Explanation

ejbSelect <-> is EJBObject (or its collection), and result-type-mapping is not defined.

### System Action

Processing stops.

### User Action

Define result-type-mapping.

## 2.8.13 DEP2213

---

**An invalid value was specified for the result-type-mapping corresponding to the method [%s2] of the CMP Enterprise Bean [%s1] in the deployment descriptor. When the method return value is [%s3], "Remote" must be specified.**

### Variable Information

%s1 = Bean class name

%s2 = Method name

%s3 = Return value of method

### Explanation

ejbSelect <-> is EJBObject (or its collection), and result-type-mapping is not "Remote."

### System Action

Processing stops.

## User Action

Specify "Remote" for the value of result-type-mapping.

### 2.8.14 DEP2214

---

**No value is defined for the ejb-name of the relation between the Bean name [%s1] and Bean name [%s2] of the deployment descriptor.**

#### Variable Information

%s1 = Bean class name 1 having a relation

%s2 = Bean class name 2 having a relation

#### Explanation

Null characters are specified for the value of ejb-name.

#### System Action

Processing stops.

#### User Action

Define the value of ejb-name in the relation.

### 2.8.15 DEP2215

---

**The CMP Enterprise Bean corresponding to the ejb-name [%s3] of the relation between the Bean name [%s1] and Bean name [%s2] of the deployment descriptor is not found.**

#### Variable Information

%s1 = Bean class name 1 having a relation

%s2 = Bean class name 2 having a relation

%s3 = Value of ejb-name of deployment descriptor relationships

#### Explanation

A Bean class having a relation is not found.

#### System Action

Processing stops.

#### User Action

Correct the value of ejb-name in the relation, so that it becomes the Bean class name having the relation.

### 2.8.16 DEP2216

---

**The CMR field corresponding to the cmr-field-name [%s3] of the relation between the Bean name [%s1] and Bean name [%s2] of the deployment descriptor is not found in the CMP Enterprise Bean [%s4].**

#### Variable Information

%s1 = Bean class name 1 having a relation

%s2 = Bean class name 2 having a relation

%s3 = Value of ejb-name of deployment descriptor relationships

%s4 = Bean class name

#### Explanation

A CMR field is not found in the Bean.

#### System Action

Processing stops.

#### User Action

Specify a Bean class having a CMR field for the value of ejb-name in the relation.

### 2.8.17 DEP2217

---

**The CMR field corresponding to the cmr-field-name [%s3] of the relation between the Bean name [%s1] and Bean name [%s2] of the deployment descriptor is defined as a CMP field in the CMP Enterprise Bean [%s4].**

#### Variable Information

%s1 = Bean class name 1 having a relation

%s2 = Bean class name 2 having a relation

%s3 = Value of ejb-name of deployment descriptor relationships

%s4 = Bean class name

#### Explanation

A CMR field is defined as a CMP field.

#### System Action

Processing stops.

#### User Action

Correct the settings so that the CMP field and CMR field do not have the same name within the same Bean class.

### 2.8.18 DEP2218

---

**The CMP Enterprise Bean [%s2] defines the CMR field [%s3] for the CMP Enterprise Bean [%s1] in which a local interface is not installed.**

#### Variable Information

%s1 = Bean class name

%s2 = Bean class name having a CMR field

%s3 = CMR field

#### Explanation

Another Bean holds a CMR for a bean without a local interface.

#### System Action

Processing stops.

#### User Action

Delete the cmr-field definition.

### 2.8.19 DEP2219

---

---

**The accessor method of the CMR field [%s2] of the CMP Enterprise Bean [%s1] is defined for the remote interface.**

**Variable Information**

%s1 = Bean class name

%s2 = CMR field

**Explanation**

The accessor method of the CMR field must not be defined for the remote interface.

**System Action**

Processing stops.

**User Action**

Check whether a method having the same name as the CMR field accessor method exists in the remote class. If one exists, delete the relevant method in the remote class.

---

## **2.8.20 DEP2220**

---

**The type of the return value of the get accessor method of the CMR field [%s2] of the CMP Enterprise Bean [%s1] differs from the parameter type of the set accessor method.**

**Variable Information**

%s1 = Bean class name

%s2 = CMR field

**Explanation**

The accessor method types differ between "get" and "set" in the CMR field.

**System Action**

Processing stops.

**User Action**

Match the return value type of the get accessor method with the parameter type of the set accessor method in the CMR field, in the Bean class.

---

## **2.8.21 DEP2221**

---

**The type of the accessor method in the CMR field [%s2] of the CMP Enterprise Bean [%s1] is invalid. When the relation is 1:n or n:n, type "collection" must be specified.**

**Variable Information**

%s1 = Bean class name

%s2 = CMR field

**Explanation**

Although the relation is one-to-many or many-to-many, the type of the accessor method in the CMR field is not "collection."

**System Action**

Processing stops.

**User Action**

Set the return value type of the get accessor method and parameter type of the set accessor method in the CMR field, in the Bean class, to "collection."

## 2.8.22 DEP2222

---

**The accessor method in the CMR field [%s2] of the CMP Enterprise Bean [%s1] is invalid. When the relation is 1:1 or n:1, Local interface must be specified.**

### Variable Information

%s1 = Bean class name

%s2 = CMR field

### Explanation

Although the relation is one-to-one or many-to-one, the type of the accessor method in the CMR field is not Local interface.

### System Action

Processing stops.

### User Action

Set the return value type of the get accessor method and parameter type of the set accessor method in the CMR field, in the Bean class, to Local interface.

## 2.8.23 DEP2224

---

**cmr-field-type is not defined for the relation of the Bean name [%s3] and Bean name [%s4] of the deployment descriptor corresponding to the CMR field [%s2] of the CMP Enterprise Bean [%s1]. cmr-field-type must be specified when the CMR field is "collection."**

### Variable Information

%s1 = Bean class name

%s2 = CMR field

%s3 = Bean class name 1 having a relation

%s4 = Bean class name 2 having a relation

### Explanation

The cmr-field-type is not defined in the CMR field for which "collection" is specified.

### System Action

Processing stops.

### User Action

Define the cmr-field-type.

## 2.8.24 DEP2225

---

**The value of cmr-field-type defined for the relation of the Bean name [%s3] and Bean name [%s4] of the deployment descriptor corresponding to the CMR field [%s2] of the CMP Enterprise Bean [%s1] differ from the type in the CMR field.**

### Variable Information

%s1 = Bean class name

%s2 = CMR field

%s3 = Bean class name 1 having a relation

%s4 = Bean class name 2 having a relation

## Explanation

The content of cmr-field-type differs from the accessor method in the CMR field.

## System Action

Processing stops.

## User Action

Correct the settings so that the value of cmr-field-type matches the type of the accessor method in the CMR field of the Bean class.

## 2.8.25 DEP2226

---

**cmr-field-type is defined for the relation of the Bean name [%s3] and Bean name [%s4] of the deployment descriptor corresponding to the CMR field [%s2] of the CMP Enterprise Bean [%s1]. cmr-field-type can be defined only when the CMR field is "collection."**

### Variable Information

%s1 = Bean class name

%s2 = CMR field

%s3 = Bean class name 1 having a relation

%s4 = Bean class name 2 having a relation

## Explanation

The cmr-field-type is defined for a CMR field that is not "collection."

## System Action

Processing stops.

## User Action

Delete the cmr-field-type definition.

## 2.8.26 DEP2227

---

**The definition of multiplicity for the relation between the Bean name [%s1] and Bean name [%s2] of the deployment descriptor is invalid. Only "One" or "Many" can be defined.**

### Variable Information

%s1 = Bean class name 1 having a relation

%s2 = Bean class name 2 having a relation

## Explanation

The value specified for the <multiplicity> is neither "One" nor "Many".

## System Action

Processing stops.

## User Action

Specify "One" or "Many" for the multiplicity value.

## 2.8.27 DEP2228

---

---

**The definition of cascade-delete for the relation between the Bean name [%s1] and Bean name [%s2] of the deployment descriptor is invalid. cascade-delete can be defined only when the value of multiplicity of the other ejb-relationship-role in the same ejb-relation is "One."**

Variable Information

%s1 = Bean class name 1 having a relation

%s2 = Bean class name 2 having a relation

Explanation

The cascade-delete setting cannot be defined when the value of multiplicity of the other ejb-relationship-role in the same ejb-relation is other than "One."

System Action

Processing stops.

User Action

Delete the cascade-delete definition.

---

## 2.8.28 DEP2229

---

**No value is defined for cmp-field-name of the CMP Enterprise Bean [%s] of the deployment descriptor.**

Variable Information

%s = Bean class name

Explanation

Null characters are specified for the value of cmp-field-name.

System Action

Processing stops.

User Action

Define the value of cmp-field-name.

---

## 2.8.29 DEP2230

---

**No value is defined for cmp-field-name of the relation between Bean name [%s1] and Bean name [%s2] of the deployment descriptor**

Variable Information

%s1 = Bean class name 1 having a relation

%s2 = Bean class name 2 having a relation

Explanation

Null characters are specified for the value of cmr-field-name.

System Action

Processing stops.

User Action

Define the value of cmr-field-name.

---

## 2.8.30 DEP2281

---

**An error occurred during deployment of CMP2.0. Detailed information=%s****Variable Information**

%s = Detailed error message

**Explanation**

The deployment descriptor could not be read.

**System Action**

Processing stops.

**User Action**

Ensure that the values defined in the deployment descriptor file are correct, and then deploy the ejb-jar file again.

---

**2.8.31 DEP2253**

---

**An EJB-jar file cannot be read. Check right to read of the file****Explanation**

The jar file for a specified EJB application could not be read due to lack of access permission or another reason.

**System Action**

Processing stops.

**User Action**

Check the access permission of the jar file for the EJB application, and change it, if necessary.

---

**2.8.32 DEP2254**

---

**An EJB-jar file cannot be read. A format of the file may be incorrect****Explanation**

The jar file for the specified EJB application could not be read due to its invalid format.

**System Action**

Processing stops.

**User Action**

Check that the jar file for the EJB application has been correctly specified.

---

**2.8.33 DEP2255**

---

**An entry cannot be gained from the jar file. Check the jar file****Explanation**

Entries could not be obtained from the jar file for the specified EJB application.

**System Action**

Processing stops.

**User Action**

Check that the jar file for the EJB application has been correctly specified.

## 2.8.34 DEP2256

---

### An information of an entry cannot be gained from the jar file. Check the jar file

#### Explanation

Entries could not be obtained from the jar file for the specified EJB application.

#### System Action

Processing stops.

#### User Action

Check that the jar file for the EJB application has been correctly specified.

## 2.8.35 DEP2261

---

### A deployment descriptor is not found in EJB-jar

#### Explanation

No deployment descriptor has been included in the jar file for an EJB application.

#### System Action

Processing stops.

#### User Action

Check that the deployment descriptor is included in the jar file for the EJB application.

## 2.8.36 DEP2264

---

### A deployment descriptor file cannot be read. A format of the file may be incorrect

#### Explanation

A deployment descriptor is specified with an invalid format, thus the deployment descriptor could not be read.

#### System Action

Processing stops.

#### User Action

Check the format of the deployment descriptor.

## 2.8.37 DEP2265

---

### No bean is defined in a deployment descriptor. The file may not a deployment descriptor

#### Explanation

A deployment descriptor includes no definition of a bean.

#### System Action

Processing stops.

#### User Action

Check the format of the deployment descriptor.

## 2.8.38 DEP2266

---

---

### **It failed to create a temporarily file**

#### Explanation

Generation of a temporary file failed.

#### System Action

Processing stops.

#### User Action

Check the access permission to the temporary directory of the OS, then change it, if necessary.

---

## **2.8.39 DEP2268**

---

### **A mapping definition file for CMP exists as a directory**

#### Explanation

The name of a file specified as a CMP mapping definition file is indicating a directory.

#### System Action

Processing stops.

#### User Action

Check that the CMP mapping definition file is correctly specified.

---

## **2.8.40 DEP2269**

---

### **A mapping definition file for CMP is not read. Check right to read of the file**

#### Explanation

A CMP mapping definition could not be read due to lack of access permission.

#### System Action

Processing stops.

#### User Action

Check the access permission of the CMP mapping definition file.

---

## **2.8.41 DEP2270**

---

### **A mapping definition file for CMP is not read. A format of the file may be incorrect**

#### Explanation

A CMP mapping definition could not be read due to an invalid format of the file.

#### System Action

Processing stops.

#### User Action

Check the format of the CMP mapping definition file.

---

## **2.8.42 DEP2272**

---

### **It failed to load a class : JDK message=%s1**

## Variable Information

%s1=class or interface name for which the error occurred

## Explanation

A load of a class failed.

## System Action

Processing stops.

## User Action

- Check that the class to be used is placed in the jar file for the EJB application, reference class path, or class path.
- The following may be output immediately after this message:

```
(wrong name: %s1): Detail information=02-004-0302
%s1=Class or interface name for which the error occurred
```

This error occurs when the package name starts with uppercase, but a class name (or an I/F name) starts with lowercase.

## Example

```
package user1;
public interface SampleRemote extends java.rmi.Remote
{
    aAA.bbb meth1() throws java.rmi.RemoteException;
    aAa.BBB meth2() throws java.rmi.RemoteException;
}
```

Additionally, depending on the IJServer "Separate Class Loaders" settings, it may not be possible to refer from one module to another. Refer to "Designing J2EE" - "Separating Class Loaders" in the J2EE User's Guide, and check that the application configuration and class loader separation are correct.

## 2.8.43 DEP2273

---

### The same Enterprise Bean name is defined for more than one beans, in a deployment descriptor

## Variable Information

%s = duplicate EJB application name(ejb name)

## Explanation

The value of the same ejb-name is specified to Multiple Beans in a deployment descriptor.

## System Action

Processing stops.

## User Action

Specify an ejb-name that is not duplicated in a deployment descriptor.

## 2.8.44 DEP2299

---

### An error occurred by the check processing of EJB deploying. %s

## Variable Information

%s = JDK message

## Explanation

An error occurred in the check processing of EJB deployment.

### System Action

Stops the EJB deployment processing.

### User Action

Collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

---

## 2.9 DEP2300 to DEP2399

---

These are messages displayed during processing of EJB Deployment.

---

### 2.9.1 DEP2310

---

#### A character that cannot be used in an EJB application name was used

#### Explanation

For an EJB application, an unspecifiable character has been specified in its name.

#### System Action

Processing stops.

#### User Action

Correct the specified EJB application name.

---

### 2.9.2 DEP2311

---

#### Enter an EJB application name

#### Explanation

The name of an EJB application has not been input.

#### System Action

Processing stops.

#### User Action

Input the name of the EJB application.

---

### 2.9.3 DEP2312

---

#### The EJB application name already exists. Specify another name

#### Explanation

In an EJB with multiple Beans included, an EJB application name has been specified twice

#### System Action

Processing stops.

#### User Action

Change either EJB application name.

---

### 2.9.4 DEP2313

---

#### The EJB application name exceeds 255 bytes

## Explanation

The name of an EJB application has been specified with more than 255 bytes.

## System Action

Processing stops.

## User Action

Correct the name of the EJB application.

## 2.9.5 DEP2314

---

### The naming context contains more than 32 layers

## Explanation

An EJB application name has been hierarchically specified beyond 32 levels.

## System Action

Processing stops.

## User Action

Correct the name of the EJB application.

## 2.9.6 DEP2315

---

### An invalid naming text was specified.

## Explanation

The EJB application name has finished it as "/".

## System Action

Processing stops.

## User Action

Check an EJB application name.

## 2.9.7 DEP2320

---

### Enterprise Bean of the same EJB application name exists already

## Explanation

There is another EJB with the same EJB application name.

## System Action

The system stops processing.

## User Action

If an EJB application with the same JNDI name has already been deployed, either correct the application or change the name of the EJB application when it is deployed so that so that the JNDI name is not duplicated. Modules for which the configuration has been changed cannot be deployed by overwriting the previous module. After the module is undeployed, redeploy it.

## 2.9.8 DEP2321

---

### In the same EJB application name, another Enterprise Bean exists already

## Explanation

There is another EJB with the same EJB application name.

## System Action

The existing EJB is overwritten with the new one. The existing Enterprise Bean class file remains undeleted.

## User Action

The EJB application name is changed or if satisfactory, continue as it is.

## 2.9.9 DEP2322

---

**The same Enterprise Bean exists in another EJB application name already. Overwrite is not finished**

## Explanation

There is the same EJB with a different EJB application name.

## System Action

Processing stops.

## User Action

Change the name of the EJB application.

## 2.9.10 DEP2330

---

**The CMP2.0 Entity Bean includes a relationship to a Bean that is not to be processed. Check the relationship of the Bean.**

## Explanation

The relationship of CMP2.0 references another Bean.

## System Action

Processing stops.

## User Action

Check the relationship in the deployment descriptor.

## 2.10 DEP2400 to DEP2499

---

These are messages displayed during processing of EJB Deployment.

### 2.10.1 DEP2401

---

**An internal error occurred during implementation generation.**

## Explanation

An internal error occurred while a class file was being generated.

## System Action

Processing stops.

## User Action

If isj2ee.jar, isj2ee12.jar or isejb.jar is set in a user-specified classpath, the class may fail to be internally loaded.

Do not set isj2ee.jar, isj2ee12.jar or isejb.jar in the classpath.

## 2.10.2 DEP2404

---

**Failed in a note of a source file. Please confirm it whether you have write authority whether a creation point exists whether there is a space on a disk.: File Name=%s1**

### Variable Information

%s1 = File path

### Explanation

The writing of a source file failed.

### System Action

Processing stops.

### User Action

The following causes are assumed:

- The generation destination does not exist, the user has no write permission, or there is insufficient disk space. Take corrective action.
- The path name of the work directory or the source file to be generated at deployment (extraction) may be too long. Change the Interstage installation directory or J2EE common directory by shortening the path, or by shortening the package name or class name of the deployed application.

## 2.10.3 DEP2406

---

**CMP Bean installation failed. Detailed information=%s**

### Variable Information

%s = detailed information

### Explanation

A source for CMP2.0 could not be generated.

### System Action

Processing stops.

### User Action

Ensure that the definition values in the deployment descriptor file are correct, and then deploy the ejb-jar file again.

If there is a message in which the detailed information contains [CMP\*\*\*\*], perform a corrective action according to [User Action] of the IJServer21239 message.

## 2.10.4 DEP2472

---

**Writing to the source file failed. Check whether the generation destination exists, whether write authority is granted, and whether the disk has enough free space.**

### Explanation

An I/O error occurred during writing to the source file.

### System Action

Processing stops.

### User Action

The source generation destination may have one of the following problems.

- The disk does not have enough free space
  - Write authority is not granted
- Remove the cause of the problem.

## 2.11 DEP2500 to DEP2599

---

These are messages displayed during processing of EJB Deployment.

### 2.11.1 DEP2511

---

**A compilation error occurred. Check the java compiler options or user definition class based on the error message.**

#### Explanation

A compilation error occurred in javac.

#### System Action

Processing stops.

#### User Action

After removing the cause of the error according to the compilation error message of Javac, perform processing again.

#### Note

- If a JDK environment is not installed, Javac cannot be executed. Install a JDK environment and perform the previous user action.
- A character string that is unusable as the Java identifier may be used as the Enterprise Bean name. If so, change the Enterprise Bean name to the character string usable as the Java identifier.
- A class or interface name that is the same as the package name may be used. Change the class or interface name.

#### Example

```
Interface name(Complete modification name)=aaa.bbb.bbb  
Interface name(Complete modification name)=bbb.aaa.bbb
```

- java.rmi.RemoteException may not be defined in the exception definition of the business method. Define java.rmi.RemoteException.
- The following message may appear immediately after this message:

```
Code of the try statement is too large.
```

In this case, too many business methods have been defined in one EJB, therefore the generated Tie source exceeds the javac limit (the maximum value of the code in the try section is 64K bytes in the class status). Correct this situation by deleting an unnecessary method, or split the EJB.

### 2.11.2 DEP2513

---

**The Javac command does not exist. Please check whether there is any error in environment.**

#### Explanation

The *javac* command does not exist.

#### System Action

Processing stops.

## User Action

Check the following environment.

- JDK is installed correctly.
- Check whether the contents described in the Java environment settings file are correct

For details about checking the contents described in the Java environment settings file, refer to "Checking the operating environment" in the "J2EE User's Guide".

To use an IJServer that was created in V8 or earlier or a V8.0 Compatible mode IJServer, select 1.4 as the IJServer environment settings Java version.

## 2.11.3 DEP2521

---

### An error occurred in IDL file creation processing.

#### Explanation

An error occurred in IDL file creation processing.

#### System Action

Processing stops.

#### User Action

The following causes can be assumed. After removing the cause of the error, re-execute the processing.

- Insufficient area of the IDL file output destination directory or inadequate access right
- Creation error of the Java application
- There is a difference between the compiled JDK version and the IJServer Java version.

The version of Java used to compile the application and the IJServer Java version may not match. Compile the application again using the same JDK as for the IJServer Java version and re-execute.

Additionally, depending on the IJServer "Separate Class Loaders" settings, it may not be possible to refer from one module to another. Refer to "Designing J2EE" - "Separating Class Loaders" in the J2EE User's Guide, and check that the application configuration and class loader separation are correct.

The following explains the action to be taken when a message of FJJ2IDLxxxx is displayed on the execution status screen. Actual names are displayed in (%n) in messages.

If the following message is output, stop the IDL file generation.

Table 2.2 DEP2521 FJJ2IDLxxxx Messages and Management

<p>FJJ2IDL0001S</p> <p>FJJ2IDL0001S An IDL file output error occurred. ClassName/InterfaceName = (%1) Detail Information = (%2)</p> <p>[Explanation]: An error occurred during output of an IDL file.</p> <ul style="list-style-type: none"><li>- The name of the class or interface in which the error occurred is (%1).</li><li>- Detailed error information is (%2).</li></ul> <p>[User response]: Check the directory to which the IDL file is to be output and the free space at the output destination.</p>
<p>FJJ2IDL0002S</p> <p>FJJ2IDL0002S A security error occurred. ClassName/InterfaceName = (%1) Detail Information = (%2)</p> <p>[Explanation]: A security error occurred during output of an IDL file.</p> <ul style="list-style-type: none"><li>- The name of the class or interface in which the error occurred is (%1).</li><li>- Detailed security information is (%2).</li></ul>

<p>[User response]: Check the security of the IDL file output destination.</p>
<p>FJJ2IDL0003S</p> <p>FJJ2IDL0003S A method with the same name as the name provided by conversion has already been defined. InterfaceName = (%1) MethodName = (%2)</p> <p>[Explanation]: This error occurs when a method with the same name as the name provided by conversion has already been defined.</p> <ul style="list-style-type: none"> <li>- The name of the interface in which the error occurred is (%1).</li> <li>- The name of the method with the same name is (%2).</li> </ul> <p>[User response]: Change the name of the method undergoing name conversion during IDL generation, or change the identical name of the existing method.</p>
<p>FJJ2IDL0005S</p> <p>FJJ2IDL0005S A field with the same name as the name provided by conversion has already been defined. ClassName = (%1) FieldName = (%2)</p> <p>[Explanation]: This error occurs when a field with the same name as the name provided by conversion has already been defined.</p> <ul style="list-style-type: none"> <li>- The name of the class in which the error occurred is (%1).</li> <li>- The name of the field having the same name is (%2).</li> </ul> <p>[User response]: Change the name of the field undergoing name conversion during IDL generation, or change the identical name of the existing field.</p>
<p>FJJ2IDL0015S</p> <p>FJJ2IDL0015S A class or interface was not found. Name = (%1)</p> <p>[Explanation]: This error occurs if a required class or interface is not found.</p> <ul style="list-style-type: none"> <li>- The name of the class or interface that was not found is (%1).</li> </ul> <p>[User response]: Check the classpath to the applicable class or interface.</p>
<p>FJJ2IDL0016S</p> <p>FJJ2IDL0016S A method that is not defined as throwing java.rmi.RemoteException is included. InterfaceName = (%1) MethodName = (%2)</p> <p>[Explanation]: This error occurs if a method that is not defined as throwing java.rmi.RemoteException is included in the abstract method definition for an interface that inherits java.rmi.Remote.</p> <ul style="list-style-type: none"> <li>- The name of the interface in which the error occurred is (%1).</li> <li>- The name of the method that is not defined as throwing java.rmi.RemoteException is (%2).</li> </ul> <p>[User response]: Correct the faulty method so that it throws java.rmi.RemoteException as an exception.</p>
<p>FJJ2IDL0024S</p> <p>FJJ2IDL0024S A remote implementation class is used in a method parameter or return value. Name = (%1)</p> <p>[Explanation]: This error occurs if a class that implements an interface inheriting java.rmi.Remote in a method parameter or return value is included in the definition of the interface that inherits java.rmi.Remote.</p> <ul style="list-style-type: none"> <li>- The defined class name is (%1).</li> </ul> <p>[User response]: Do not define a class that implements an interface inheriting java.rmi.Remote in a method parameter or return value.</p>
<p>FJJ2IDL0025S</p> <p>FJJ2IDL0025S The same method is defined in multiple interfaces to be inherited. InterfaceName = (%1) MethodName = (%2)</p> <p>[Explanation]: This error occurs if the same method is defined in multiple interfaces, to be inherited by an interface.</p> <ul style="list-style-type: none"> <li>- The name of the interface in which the error occurred is (%1).</li> </ul>

- The duplicate method name is (%2).

[User response]: Change the duplicate method name so that the same method name is not used in multiple interfaces to be inherited.

FJJ2IDL0029S

FJJ2IDL0029S A remote implementation class has not implemented a remote interface. ClassName = (%1)

[Explanation]: This error occurs if a class that must implement one or more interfaces that inherit java.rmi.Remote has not implemented such an interface.

- The name of the class in which the error occurred is (%1).

[User response]: Correct the program so that the class in which the error occurred implements an interface that inherits.

FJJ2IDL0030S

FJJ2IDL0030S Class loading failed. Detail Information = (%1)

[Explanation]: This error occurs if a class could not be loaded.

- Detailed information is (%1).

[User response]: Check whether an inheritance class or interface exists for the class defined in the application.

FJJ2IDL0032S

FJJ2IDL0032S An attribute with the same name has already been defined. InterfaceName = (%1) AttributeName = (%2)

[Explanation]: This error occurs if an attribute with the same name has already been defined, when name conversion to an attribute name is performed during IDL generation.

- The name of the interface in which the error occurred is (%1).
- The duplicate attribute is (%2).

[User response]: Change the method name undergoing name conversion to an attribute name during IDL generation.

FJJ2IDL0033S

FJJ2IDL0033S A method with the same name as an attribute name has already been defined. InterfaceName= (%1)  
AttributeName = (%2)

[Explanation]: This error occurs if an existing method name is identical to an attribute name after name conversion during IDL generation.

- The name of the interface in which the error occurred is (%1).
- The duplicate attribute is (%2).

[User response]: Change the method name undergoing name conversion to an attribute name during IDL generation, or change the existing method name that is identical to the attribute name.

FJJ2IDL5001S

FJJ2IDL5001S File output failed.

[Explanation]: This error occurs if file output fails.

[User response]: Check the directory to which the file is to be output and the free space at the output destination. The XML purser class may be contained in the EJB application for deployment , jar file specified to be a reference class path or the directory.

- Remove the jar file or directory in which the XML purser class is contained from a reference class path.
- Delete an XML purser class from the EJB application.

FJJ2IDL9999S

FJJ2IDL9999S An undefined error occurred. InterfaceName/ClassName = (%1) Detail Information = (%2)

[Explanation]: An undefined error occurred in FJJ2IDL.

[User response]: Check whether the following may have occurred. If the following does not apply, refer to JavaDOC in the exception information that is output in "Detail Information" and take action.

If 'java.lang.UnsupportedClassVersionError' is output in "Detail Information", the deployed module may contain a class that cannot be loaded in the Java version specified in IJServer. Either compile using the JDK under the specified Java version and then re-execute, or deploy the module to the IJServer for the compiled version.

## 2.11.4 DEP2532

---

### An error occurred in IDLc compile processing: Detail=%s1

#### Variable Information

%s1 = IDLc command detailed message

#### Explanation

An error exists in the execution environment of the *IDLc* command.

#### System Action

Processing stops.

#### User Action

Follow the detailed message.

## 2.11.5 DEP2533

---

### The IDLc Runtime Environment contains an error.: Detail=%s1

#### Variable Information

%s1 = IDLc command detailed message

#### Explanation

An error exists in the execution environment of the *IDLc* command.

#### System Action

Processing stops.

#### User Action

Check the following environment.

- CORBA service is installed correctly.
- CORBA service development tool is installed correctly.
- Environment variable OD\_HOME and IS\_HOME are defined correctly.

#### Solaris32/64

The following applications are required for executing the *IDLc* command. Ensure that these environment are installed.

- /usr/ccs/lib/cpp

If the above does not exist, set "Developer System Support" or higher as the installation mode during OS installation, then reinstall it.

#### Linux32/64

The following applications are required for executing the *IDLc* command. Ensure that these applications are installed.

- binutils
- cpp

- gcc
- gcc-c++
- libstdc++-devel
- glibc-devel
- kernel-headers

## 2.11.6 DEP2534

---

**A syntax error was detected in IDLc.: Detail=%s1**

### Variable Information

%s1 = IDLc command detailed message

### Explanation

An error exists in the syntax of the *IDLc* command.

### System Action

Processing stops.

### User Action

Follow the detailed message.

## 2.11.7 DEP2535

---

**Nonsupported processing was called in IDLc.: Detail=%s1**

### Variable Information

%s1 = IDLc command detailed message

### Explanation

Non-supported processing was called in IDLc.

### System Action

Processing stops.

### User Action

Follow the detailed message.

## 2.11.8 DEP2536

---

**An error was detected in IDLc.**

### Explanation

The error occurred by the *IDLc* command.

### System Action

Processing stops.

### User Action

Remove the cause of error according to the compile error message of IDLc, and perform processing again.

Following this message, the CORBA service message may be output as shown below:

```
DEPLOY: ERROR: DEP2536: An error was detected in IDLc.
IDLc -roi -info.....(The interior parts omitted).....
OD: ERROR: od51401: IDL:CORBA/StExcep/COMM_FAILURE:1.0 occurred in the
exception information for the
IDLejbparser:CORBA_InterfaceRep_create_repository<PWriteIDL> function.
The minor code is 0x0.
OD: ERROR: od51221: IDLc: IDLejbparser command error. Error code=4
```

If the above case occurs, check the following, then re-execute the processing.

- The Interstage EJB service may not be initialized correctly.  
Specify the EJB option, then execute the *isinit* command.
- Since the LAN environment does not operate normally, IDLc may not be able to access the repository service of the server.  
Check the LAN environment.
- Since the host information file is not set correctly, IDLc may not be able to access the repository service of the server.  
Check the following host information file.  
  
C:\Interstage\ODWIN\etc\inithost  
  
/etc/opt/FSUNod/initial\_hosts
- Any one of the following services of the server may not be started:  
Start Interstage with the *isstart* command, or start the service with its associated *start* command.
  - Repository service
  - Naming service
  - CORBA service

## 2.11.9 DEP2537

**The IDLc command does not exist. Please check whether there is any error in environment.**

### Explanation

The IDLc command does not exist.

### System Action

Processing stops.

### User Action

Check the following environment.

- The CORBA service development tool is installed correctly.
- PATH is set as an *IDLc* command storing directory.

The following message may appear followed by this message:

```
<JDK Message> java.io.IOException: There is no enough area.
```

If the above case occurs, the swap area may be insufficient. Extend the area.

## 2.11.10 DEP2599

**An error occurred by processing of the execution of an external command of EJB deploying.**

## Explanation

An error occurred in the processing to create deployment resources in the EJB deployment.

## System Action

Stops the EJB deployment processing.

## User Action

Collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

## 2.12 DEP2600 to DEP2699

---

These are messages displayed during processing of EJB Deployment.

### 2.12.1 DEP2600

---

#### **A file cannot be gained from the jar file. Check the jar file**

## Explanation

A file could not be obtained from the jar file for an EJB application.

## System Action

Processing stops.

## User Action

Check the jar file of the EJB application.

### 2.12.2 DEP2601

---

#### **A file cannot be copied to a directory from the jar file. Check the directory**

## Explanation

A file could not be saved due to a write prohibition to the file or directory containing it.

## System Action

Processing stops.

## User Action

Check the access permission and other settings of the file or directory.

### 2.12.3 DEP2602

---

#### **File copy to a directory from jar file is failed. Check the directory**

## Explanation

An existing file could not be copied from a jar file of an EJB application due to a write prohibition to the file.

## System Action

Processing stops.

## User Action

Check the access permission and other settings of the file or directory.

## 2.12.4 DEP2610

---

### No installation batch base file (install.base) exists

#### Explanation

The install.base file could not be found in the etc directory.

#### System Action

Processing stops.

#### User Action

Check up the etc directory.

## 2.12.5 DEP2611

---

### An I/O error occurred during the creation of an installation batch file (install.bat)

#### Explanation

An error occurred while the install.bat file was being written into the server file generated directory.

#### System Action

Processing stops.

#### User Action

Check the access permission and other settings of the directory.

## 2.12.6 DEP2612

---

### An I/O error occurred during the creation of an installation shell file (install.sh)

#### Explanation

An error occurred while the install.sh file was being written into the server file generated directory.

#### System Action

Processing stops.

#### User Action

Check the access permission and other settings of the directory.

## 2.12.7 DEP2620

---

### The client file creation destination could not be created. Check the client file creation destination

#### Explanation

A directory for the generated client files could not be generated.

#### System Action

Processing stops.

#### User Action

Check the access permission and other settings of the directory.

## 2.12.8 DEP2621

---

---

**Created resources cannot be copied to the client file creation destination. Check the client file creation destination**

**Explanation**

A file could not be copied into the client file generated directory.

**System Action**

Processing stops.

**User Action**

Check the access permission and other settings of the directory.

---

## **2.12.9 DEP2622**

---

**Copy of generated class files failed. Check the client file storage destination**

**Explanation**

A class file could not be copied into the client file generated directory.

**System Action**

Processing stops.

**User Action**

Check the access permission and other settings of the directory.

---

## **2.12.10 DEP2623**

---

**Created resources cannot be copied to the soap file creation destination. Check the client file creation destination**

**Explanation**

A file could not be copied into the SOAP gateway file generated directory.

**System Action**

Processing stops.

**User Action**

Check the access permission and other settings of the directory.

---

## **2.12.11 DEP2624**

---

**Copy of generated class files failed. Check the soap file storage destination**

**Explanation**

A class file could not be copied into the SOAP gateway file generated directory.

**System Action**

Processing stops.

**User Action**

Check the access permission and other settings of the directory.

---

## **2.12.12 DEP2625**

---

### Copy of generated class files failed. Check the server file storage destination

#### Explanation

A class file could not be copied into the server file generated directory.

#### System Action

Processing stops.

#### User Action

Check the access permission and other settings of the directory.

---

## 2.12.13 DEP2630

---

### Saving of the deployment descriptor file failed. Check the file storage destination

#### Explanation

It is not allowed to save FJDeploymentDescriptor.xml under info\xxxx.

#### System Action

Processing stops.

#### User Action

Check the access permission and other settings of the directory containing the file.

---

## 2.12.14 DEP2631

---

### Saving of the FJebProperties file failed

#### Explanation

It is not allowed to save FJebProperties.xml under info\xxxx.

#### System Action

Processing stops.

#### User Action

Check the access permission and other settings of the directory containing the file.

---

## 2.12.15 DEP2632

---

### Saving of an FJcpDescriptor file failed

#### Explanation

It is not allowed to save the CMP mapping definition file under info\xxxx.

#### System Action

Processing stops.

#### User Action

Check the access permission and other settings of the directory containing the file.

---

## 2.12.16 DEP2633

---

### A directory could not be created in a info directory. Check the info directory

#### Explanation

Directories with serial numbers could not be generated under the info directory.

#### System Action

Processing stops.

#### User Action

Check the access permission and other settings of the info directory.

---

### 2.12.17 DEP2634

---

#### Update of the deployment descriptor file failed

#### Explanation

FJDeploymentDescriptor.xml could not be saved.

#### System Action

Processing stops.

#### User Action

Check the access permission and other settings of the file and directory containing it.

---

### 2.12.18 DEP2635

---

#### Update of the FJebProperties file failed

#### Explanation

FJebProperties.xml could not be saved.

#### System Action

Processing stops.

#### User Action

Check the access permission and other settings of the file and directory containing it.

---

### 2.12.19 DEP2640

---

#### Creation of a file of deployed beans' info failed. Check the file storage destination

#### Explanation

The exist\_eb\_info.ser file could not be generated.

#### System Action

Processing stops.

#### User Action

Check the access permission and other settings of the file and directory containing it.

---

### 2.12.20 DEP2641

---

#### Reading of the serialized file failed. Set the file readable

#### Explanation

A serialized file has been read-disabled.

#### System Action

Processing stops.

#### User Action

Check the access permission and other settings of the file.

### 2.12.21 DEP2642

---

#### **Saving of the serialized file to a directory failed. Set the directory writable**

#### Explanation

The directory into which serialized files are to be stored has been write-disabled.

#### System Action

Processing stops.

#### User Action

Check the access permission and other settings of the file.

### 2.12.22 DEP2643

---

#### **The specified serialized file is not found. Specify the correct name of the parent directory**

#### Explanation

A specified serialized file could not be found.

#### System Action

Processing stops.

#### User Action

Check the directory.

### 2.12.23 DEP2647

---

#### **The work area file is currently busy.It can be removed, if it is unnecessary after the EJB Deployment Tool ended**

#### Explanation

An unnecessary file could not be deleted.

#### System Action

Processing stops.

#### User Action

Delete the file.

### 2.12.24 DEP2653

---

#### **It failed in making client jar file. Please deploy it again after releasing deployment. %s**

#### Variable Information

%s = JDK message

## Explanation

Failed to create the resources for distribution in the EJB deployment processing.

## System Action

Stops the EJB deployment processing.

## User Action

If the target application for deployment has already been deployed, delete the deployment and then re-execute deployment processing.

Alternatively, distribution data jar files for a client that has already been deployed are being referenced by another IJServer or application, therefore the attempt to overwrite the files may have failed. In this case, stop the IJServer or application that is referencing the files, and then re-execute deployment processing. To prevent the other IJServer or application being affected, copy the distribution data jar files for the client and use the copies.

If the problem still occurs after the deployment is deleted, collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

## 2.12.25 DEP2669

---

**Please check whether the right to access is in the specified jar directory, or the specification jar file**

## Explanation

Access to a jar file for an EJB application could not be made.

## System Action

Processing stops.

## User Action

Check the access permission and other settings of the file and directory containing it.

## 2.12.26 DEP2670

---

**The directory does not exist. Check whether the directory exists, then check for drives and check the removable disk**

## Explanation

A directory or disk to be handled could not be found.

## System Action

Processing stops.

## User Action

Check the drive or directory.

## 2.12.27 DEP2671

---

**The directory is not a directory. Specify a correct directory**

## Explanation

The specified name is not of a directory.

## System Action

Processing stops.

## User Action

Check the name of the directory, and use it.

- The specified directory may not be a directory. Check and change the specification of the directory.
- The path of the file included in the deployment destination or the application file to be deployed (ejb -far file) may be too long. Change the path of the deployment destination or in the file to be deployed according to its appropriate length.

## 2.12.28 DEP2672

---

### The process stops because a directory exists as file. Please delete the file

#### Explanation

A file was specified as a directory.

#### System Action

Processing stops.

#### User Action

Delete the file.

## 2.12.29 DEP2699

---

### An error occurred by the making processing of deployment files of EJB deploying. %s

#### Variable Information

%s = JDK message

#### Explanation

An error occurred in the processing of EJB deployment files.

#### System Action

Stops the EJB deployment processing.

#### User Action

Collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

## 2.13 DEP2700 to DEP2799

---

These are messages displayed during processing of EJB Deployment.

### 2.13.1 DEP2704

---

#### not support cmp2.0

#### Variable Information

%s = Name of a jar file for an EJB application

#### Explanation

An EJB application which includes CMP2.0 was specified.

#### System Action

Processing stops.

## User Action

Specify an EJB application which does not include CMP2.0.

### 2.13.2 DEP2706

---

#### not support local interface

#### Variable Information

%s = Name of a jar file for an EJB application

#### Explanation

An EJB application that includes a local interface was specified.

#### System Action

Processing stops.

#### User Action

Specify an EJB application that does not include a local interface.

### 2.13.3 DEP2799

---

#### An error occurred by set processing of the inside information of EJB deploying.

#### Explanation

An error occurred in the set processing of EJB deployment information.

#### System Action

Stops the EJB deployment processing.

#### User Action

Collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

### 2.14 DEP2800 to DEP2899

---

These are messages displayed during processing of EJB Deployment.

#### 2.14.1 DEP2850

---

#### An error occurred by the acquisition processing of deployment information on EJB deploying.

#### Explanation

An error occurred in the acquisition processing of EJB deployment information.

#### System Action

Stops the EJB deployment processing.

#### User Action

Collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

### 2.15 DEP3000 to DEP3999

---

These are messages displayed during processing of connector.

## 2.15.1 DEP3001

---

### Resource adapter archive does not exist: FILE=%s

#### Variable Information

%s = rar file name of resource adapter application

#### Explanation

The specified resource adapter archive does not exist. Specify a RAR file again.

#### System Action

Processing stops.

#### User Action

Execute the deployment process again.

## 2.15.2 DEP3002

---

### Failure in reading resource adapter archive: FILE=%s

#### Variable Information

%s = rar file name of resource adapter application

#### Explanation

Reading of the resource adapter file failed. The file may be damaged. Verify the specified file and execute the deployment process again.

#### System Action

Processing stops.

#### User Action

The rar.xml file does not exist. Store the rsr.xml file and execute the deployment process again.

## 2.15.3 DEP3003

---

### Deployment descriptor in resource adapter archive does not exist: FILE=%s

#### Variable Information

%s = rar file name of resource adapter application

#### Explanation

Deployment descriptor does not exist in the specified resource adapter file. Recreate a resource adapter file and execute the process again.

#### System Action

Processing stops.

#### User Action

Rar.xml does not exist. Store a rar.xml file and perform deployment processing again.

## 2.15.4 DEP3004

---

### Failure in writing to file: INFO=%s

### Variable Information

%s = rar file name of resource adapter application

### Explanation

The specified resource is being deployed or in operation. After the operation of the resource ends, execute the processing again.

### System Action

Processing stops.

### User Action

After the operation of the specified resource has ended, execute the deployment process again.

Cancel the deployment of the specified resource and execute the deployment process again.

**Windows32/64**

The DOS device name may have been specified as the definition name, or the DOS device name file may have been included in the RAR file. Change this so the DOS device name is not used.

## 2.15.5 DEP3005

---

### Unexpected error occurred: EXCEPTION=%s

#### Variable Information

%s = detail of EXCEPTION

#### Explanation

Unexpected error occurred. Install Interstage again

#### System Action

Processing stops.

#### User Action

Because unexpected error occurred, install Interstage again.

## 2.15.6 DEP3006

---

### Incorrect deployment descriptor: INFO=%s

#### Variable Information

%s = detailed message of the error

#### Explanation

Incorrect deployment descriptor.

#### System Action

Processing stops.

#### User Action

Refer to the message that was output to the additional information and correct the deployment descriptor. Then execute the deployment process again.

## 2.15.7 DEP3007

---

### Files remain: INFO=%s

## Variable Information

%s = Remained directory

## Explanation

A file remains in the directory, indicated in INFO, after the deployment was canceled. The deployment may be canceled during the operation.

## System Action

Processing stops.

## User Action

Check the environment and delete the unnecessary file manually.

## 2.15.8 DEP3008

---

### Failure in deleting file: FILE=%s

## Variable Information

%s = File that could not be deleted

## Explanation

The system attempted to delete an unnecessary file in the deployment directory during deployment, but the file indicated in INFO could not be deleted.

## System Action

Processing stops.

## User Action

Check the environment and delete the unnecessary file manually.

## 2.15.9 DEP3009

---

### Memory shortage occurred

## Explanation

Memory shortage occurred

## System Action

Processing stops.

## User Action

Terminate other applications and execute the deployment process again.

## 2.15.10 DEP3010

---

### Failure in finding J2EE common directory

## Explanation

J2EE common directory cannot be acquired.

## System Action

Processing stops.

## User Action

Install Interstage and perform deployment processing again.

## 2.16 DEP4100 to DEP4199

---

Servlet related messages.

### 2.16.1 DEP4100

---

**Invalid number of processes: Specify the number of processes within the range 1 to 255: Specified value=%s1**

#### Variable Information

%s1 = Specified number of processes

#### Explanation

An invalid number of processes has been specified.

#### System Action

Processing stops.

#### User Action

Specify the number of processes within the range 1 to 255.

### 2.16.2 DEP4101

---

**Invalid IP Address: Specify a valid IP Address: Specified value=%s1**

#### Variable Information

%s1 = Specified IP address

#### Explanation

Invalid IP Address.

#### System Action

Processing stops.

#### User Action

Check whether the format (example: 127.0.0.1) used to specify the IP address is correct.

### 2.16.3 DEP4102

---

**Timeout is too large: Specify a smaller timeout value: Specified value= %s1**

#### Variable Information

%s1 = Specified timeout value

#### Explanation

Timeout is too large.

#### System Action

Processing stops.

## User Action

Specify a value from 1 to 2147483 seconds for the timeout value.

### 2.16.4 DEP4103

---

**Invalid port number: Specify the port number within the range 5001 to 65535: Specified value= %s1**

#### Variable Information

%s1 = Specified port number

#### Explanation

Invalid port number.

#### System Action

Processing stops.

#### User Action

Specify the port number within the range 5001 to 65535.

If this message was output in Interstage Java EE and %s1 is null, then follow the steps below:

- If message was output when the HTTP\_LISTENER\_PORT system property was deleted:

Delete the link between the Web server and IJServer, using either the Interstage Java EE Management Console or the *asadmin* command with the *delete-web-server-ref* subcommand.

- If message was output configuring the link between the Web server and IJServer cluster:

The link cannot be established if the HTTP\_LISTENER\_PORT system property has not been set in the IJServer cluster. Set it using either the Interstage Java EE Management Console or the *asadmin* command with the *create-system-properties* subcommand, and re-execute the operation.

### 2.16.5 DEP4104

---

**Two or more identical port numbers have been specified: Please specify different port numbers: Specified value= %s1**

#### Variable Information

%s1 = Specified port number

#### Explanation

Two or more identical port numbers have been specified.

#### System Action

Processing stops.

#### User Action

Specify different port numbers.

### 2.16.6 DEP4105

---

**Invalid maximum number of requests from client per container: Specify the maximum number of requests from client per container within the range 1 to 2048: Specified value= %s1**

#### Variable Information

%s1 = Specified maximum number of requests from client per container

## Explanation

Invalid maximum number of requests from client per container.

## System Action

Processing stops.

## User Action

Specify the maximum number of requests from client per container within the range 1 to 2048.

## 2.16.7 DEP4106

---

### **Servlet container port number was not specified for IP Address: Specified value= %s1**

#### Variable Information

%s1 = Specified IP address

#### Explanation

A servlet container port number was not specified for an IP Address.

#### System Action

Processing stops.

#### User Action

Specify the IP address and port number of the Servlet container in the "ip-address:port-number" format.

## 2.16.8 DEP4107

---

### **Error in IP address of web server: Specified value= %s1**

#### Variable Information

%s1 = Specified IP address of web server

#### Explanation

Error in IP address of web server.

#### System Action

Processing stops.

#### User Action

Check whether the value specified for the IP address of the Web server is correct.

## 2.16.9 DEP4108

---

### **The specified port number is already in use: Specified value= %s1**

#### Variable Information

%s1 = Specified port number

#### Explanation

The specified port number is already in use.

#### System Action

Processing stops.

#### User Action

Specify an unused port number.

### 2.16.10 DEP4109

---

**The specified IP address and port number are already in use in another WorkUnit: Please specify different values: Specified value= %s1**

#### Variable Information

%s1 = Specified IP address and port number

#### Explanation

The specified IP address and port number are already in use in another WorkUnit.

#### System Action

Processing stops.

#### User Action

Specify different values.

### 2.16.11 DEP4110

---

**Deployment file has not been specified**

#### Explanation

Deployment file has not been specified.

#### System Action

Processing stops.

#### User Action

Specify the deployment file.

### 2.16.12 DEP4111

---

**Specified deployment file does not exist: Specified value= %s1**

#### Variable Information

%s1 = Specified deployment file

#### Explanation

Specified deployment file does not exist.

#### System Action

Processing stops.

#### User Action

Specify the correct path of the deployment path.

### 2.16.13 DEP4112

---

**Could not access file: %s1**

## Variable Information

%s1 = Data information

## Explanation

Could not access file.

## System Action

Processing stops.

## User Action

See the messages in the error log for details on the cause of the error, remove or correct the cause, and re-execute processing. If the problem is not solved, collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

Possible causes are as follows:

- The specified file does not exist.

When the file causing the error is in the deployment directory of the application, the deployment directory environment may be destroyed. When adding, deleting, and updating the file in the deployment directory of the application in order to use the auto reload of a class, follow the procedure described in 'Deploying and Setting J2EE Applications' of the J2EE User's Guide. Also use the procedure in this section of the J2EE User's Guide to attempt recovery.

If the file that caused the error is a Web application anywhere on the server, the resources on the deployment destination server are not targets of backup/restore. Copy the application resources from the deployment destination server separately.

- Access authority is not granted to the file.

Access authority of a file may have been changed. Restore the access authority for the file, and re-execute processing.

- The file or directory is referenced by another application.

Stop other applications, and re-execute processing.

- The disk is defective.

A defect on the disk may be preventing files and directories from being accessed. Run a disk check.

- Conflict with another process.

Conflict with another process may make the disk temporarily inaccessible. Re-execute processing.

- If the attempt to read the XML file failed:

Character encoding not supported by the XML parser may have been specified in the XML declaration of the XML file.

Take either of the following actions, and then re-execute processing:

- In the IJServer environment settings, for [Type of XML parser used], specify an XML parser that supports the character encoding specified in the XML declaration of the XML file.
- In the XML declaration of the XML file, specify the character encoding supported by the XML parser specified for [Type of XML parser used] in the IJServer environment settings

- The Interstage system files may be damaged.

Reinstall Interstage, or recover the environment by restoring the IJServer resource files. For details about backing up and restoring the resources, refer to "Maintenance (Backing up resources)" in the "Interstage Application Server Application Guide".

## 2.16.14 DEP4113

---

**A valid port does not exist: Please obtain a port number within the range 5001 to 65535**

## Explanation

A valid port does not exist.

## System Action

Processing stops.

## User Action

Obtain a port number within the range 5001 to 65535.

## 2.16.15 DEP4114

---

### Error in servlet container settings: %s1

#### Variable Information

%s1 = Detail information

#### Explanation

Error in servlet container settings.

#### System Action

Processing stops.

#### User Action

The following cause may be investigated:

- Procedural error in the backup/restore processing

When the environment in which the event was generated had been created by the backup/restore processing, check that no procedural errors (i.e. omission to specify an essential resource) were committed when it was backed up or restored. If a procedural error was committed, backup or restore again.

- Backup/restore error

When the environment in which the event was generated had been created by the backup/restore processing, check that no errors were generated when it was backed up or restored. If an error was generated, backup or restore again.

- The contents error of a definition file.

For the file for which variable information has been opened, check whether the contents for the definition of the item are correct.

If the above cause does not apply to the failure, use the *iscollectinfo* command to collect the error log, and then contact your systems engineer.

## 2.16.16 DEP4115

---

### Web application name has not been specified

#### Explanation

Web application name has not been specified.

#### System Action

Processing stops.

#### User Action

Specify a Web application name.

## 2.16.17 DEP4116

---

### Virtual host name is already in use

#### Explanation

Virtual host name is already in use.

#### System Action

Processing stops.

#### User Action

Specify another virtual host name.

Alternatively, delete the virtual host name that already exists.

### 2.16.18 DEP4117

---

#### Invalid interval: Please re-enter one or more numbers: Specified value= %s1

#### Variable Information

%s1 = Specified check interval

#### Explanation

Invalid interval.

#### System Action

Processing stops.

#### User Action

Specify a value from 1 to 2147483647 for the check interval.

### 2.16.19 DEP4119

---

#### IJServer name was not specified

#### Explanation

IJServer name was not specified.

#### System Action

Processing stops.

#### User Action

Specify an IJServer name.

### 2.16.20 DEP4120

---

#### Root directory of the web application was not specified

#### Explanation

Root directory of the web application was not specified.

#### System Action

Processing stops.

#### User Action

Specify the root directory of the Web application.

## 2.16.21 DEP4121

---

**Selected web application does not exist: It may have been undeployed: Web application name= %s1**

### Variable Information

%s1 = Web application name

### Explanation

Selected web application does not exist.

### System Action

Processing stops.

### User Action

Check the Web application specified for modification.

## 2.16.22 DEP4122

---

**A web application of the same name already exists on another WorkUnit: In order to deploy a web application of the same name, a different virtual host must be selected: Web Application Name= %s1[IJServer =%s2 Module=%s3]**

### Variable Information

%s1 = Name of the Web application that has already been deployed

%s2 = Name of the IJServer in which a Web application with the same name has been deployed

If this message is output when the Web server connector definition is updated in the Interstage Management Console or isj2eeadmin command, the name of the IJServer used to update the definition is also displayed.

%s3 = Name of the module within the IJServer in which a Web application with the same name has been deployed

If this message is output when the Web server connector definition is updated in the Interstage Management Console or isj2eeadmin command, the module name is not displayed.

Since there is no module name in the application developed by IJServer for V6, a blank is displayed on a module name.

### Explanation

A web application of the same name already exists on another WorkUnit.

### System Action

Processing stops.

### User Action

Re-deploy after changing an application name.

When you want to use the same application name, re-deploy after changing the virtual host that IJServer uses.

- When a Web server and a WorkUnit are employed by the same machine, or when a Multi-server management function is used:  
Change the virtual host in the environment setup of IJServer.
- When a Web server and a WorkUnit are not employed by the same machine:  
Change the virtual host in the environment setup of Web server connector.

## 2.16.23 DEP4123

---

**The selected web application does not exist: It may have been undeployed: Check the Web Application: Web application name=%s1**

#### Variable Information

%s1 = Web application name

#### Explanation

The selected web application does not exist or is currently undeployed.

#### System Action

Processing stops.

#### User Action

Ensure that the Web application has been deployed.

### 2.16.24 DEP4124

---

#### Error in log file definition of web server connector: %s1

#### Variable Information

%s1 = Detail information

#### Explanation

Error in log file definition of web server connector.

#### System Action

Processing stops.

#### User Action

Ensure that the definition of the file item indicated in Variable Information is correct, and re-execute processing.

If the problem is not solved, collect check information using the *iscollectinfo* command, and contact your systems engineer.

### 2.16.25 DEP4125

---

#### Invalid timeout value: Specified value= %s1

#### Variable Information

%s1 = Specified timeout value

#### Explanation

An invalid value was specified for the timeout value.

#### System Action

Processing stops.

#### User Action

Specify a value from 1 to 2147483 for the timeout value.

And, specify a value from 1 to 2147483 for the send/receive timeout value.

### 2.16.26 DEP4126

---

#### Specified interval is too large: Specify smaller value: Specified value= %s1

#### Variable Information

%s1 = Specified check interval

#### Explanation

Specified interval is too large.

#### System Action

Processing stops.

#### User Action

Specify a value from 1 to 2147483647 for the check interval.

### 2.16.27 DEP4127

---

**Invalid output level: Choose either ERROR, INFO, or DEBUG: Specified value= %s1**

#### Variable Information

%s1 = Specified output level

#### Explanation

Invalid output level.

#### System Action

Processing stops.

#### User Action

Choose either ERROR, INFO, or DEBUG.

### 2.16.28 DEP4128

---

**Invalid log size: Log size must be in the range 1 to 512: Specified value= %s1**

#### Variable Information

%s1 = Specified log size

#### Explanation

Invalid log size.

#### System Action

Processing stops.

#### User Action

Log size must be in the range 1 to 512.

### 2.16.29 DEP4129

---

**Invalid start time for log rotation: Value must be within the range 0 to 23: Specified value= %s1**

#### Variable Information

%s1 = The rollover start time

#### Explanation

Invalid start time for log rotation.

#### System Action

Processing stops.

#### User Action

Specify a value from 0 to 23 for the start time.

### 2.16.30 DEP4130

---

**Invalid periodic backup time for log rotation: Value must be within the range 1 to 24: Specified value= %s1**

#### Variable Information

%s1 = The rollover repetition time

#### Explanation

Invalid periodic backup time for log rotation.

#### System Action

Processing stops.

#### User Action

Specify a value from 1 to 24 for the repetition time.

### 2.16.31 DEP4131

---

**Invalid number of log files: Value must be within the range 1 to 9: Specified value= %s1**

#### Variable Information

%s1 = Number of log files

#### Explanation

Invalid number of log files.

#### System Action

Processing stops.

#### User Action

Specify a value from 1 to 9 for the number of log files.

### 2.16.32 DEP4132

---

**Web application is currently deployed on the specified Virtual host: Please retry the operation after undeploying the web application: Specified value= %s1**

#### Variable Information

%s1 = Specified virtual host

#### Explanation

Another Web application has already been deployed to the specified virtual host.

#### System Action

Processing stops.

#### User Action

Take either of the following actions:

- Undeploy the Web application from IJServer, and re-execute the processing of virtual host deletion.

- Clear the virtual Host settings in the IIServer settings.

### 2.16.33 DEP4134

---

#### The name of the Startup/Shutdown Class was not specified

##### Explanation

The name of the Startup/Shutdown Class was not specified.

##### System Action

Processing stops.

##### User Action

Specify the name of the Startup/Shutdown Class.

### 2.16.34 DEP4135

---

#### The class name of the Startup/Shutdown Class was not specified

##### Explanation

The class name of the Startup/Shutdown Class was not specified.

##### System Action

Processing stops.

##### User Action

Specify the class name of the Startup/Shutdown Class.

### 2.16.35 DEP4136

---

#### Selected Startup/Shutdown class does not exist: Startup/Shutdown class name= %s1

##### Variable Information

%s1 = Specified Startup/Shutdown class

##### Explanation

Selected Startup/Shutdown class does not exist.

##### System Action

Processing stops.

##### User Action

Change the Startup/Shutdown class to one that exists.

### 2.16.36 DEP4137

---

#### A Startup/Shutdown class of the same name already exists: Please choose a different name for the new Startup/Shutdown class: Startup/Shutdown class name= %s1

##### Variable Information

%s1 = Specified name of Startup/Shutdown class

##### Explanation

A Startup/Shutdown class of the same name already exists.

#### System Action

Processing stops.

#### User Action

Change the name of the Startup/Shutdown class.

### 2.16.37 DEP4138

---

**The value of the Startup/Shutdown Class container type is invalid: Please choose either Web Container, EJB Container or Both Web and EJB: Specified value= %s1**

#### Variable Information

%s1 = Name of the container used to execute the Startup/Shutdown Class

#### Explanation

The value of the Startup/Shutdown Class container type is invalid.

#### System Action

Processing stops.

#### User Action

Choose either Web Container, EJB Container or both Web and EJB Containers.

### 2.16.38 DEP4139

---

**Check level used for encodeURL is not a numerical value: Specified value= %s1**

#### Variable Information

%s1 = Check level

#### Explanation

Check level used for encodeURL is not a numerical value.

#### System Action

Processing stops.

#### User Action

Specify an integer of 0 to 2147483647 for the check level.

### 2.16.39 DEP4140

---

**Selected encoding type is not valid: Specified value= %s1**

#### Variable Information

%s1 = Specified encoding type

#### Explanation

Selected encoding type is not valid.

#### System Action

Processing stops.

#### User Action

Specify a character set that is supported by Java.

## 2.16.40 DEP4141

---

### A Startup/Shutdown Class specified in the execution order does not exist: Specified value= %s1

#### Variable Information

%s1 = The Startup/Shutdown Class specified in the execution order

#### Explanation

A Startup/Shutdown Class specified in the execution order does not exist.

#### System Action

Processing stops.

#### User Action

Check that the Startup/Shutdown Class specified in the execution order, if not replace it with a valid one.

## 2.16.41 DEP4142

---

### Error in SSL configuration name: Specified value= %s1

#### Variable Information

%s1 = SSL configuration name

#### Explanation

Error in SSL configuration name.

#### System Action

Processing stops.

#### User Action

Check whether the SSL configuration name is correct.

Alternatively, the SSL configuration may have been deleted. Check whether it has been deleted.

## 2.16.42 DEP4143

---

### Error in authorization system: Specified value= %s1

#### Variable Information

%s1 = Certification method based on SSL client authentication

#### Explanation

Error in authorization system.

#### System Action

Processing stops.

#### User Action

For the authorization system, specify authenticationOnly, requireMyOwnCert, or requireCertInList.

## 2.16.43 DEP4144

---

### Error in SSL configuration settings: Details= %s1

## Variable Information

%s1 = Detail information

## Explanation

Error in SSL configuration settings.

## System Action

Processing stops.

## User Action

Remove the error cause based on the detailed information in the %s1 variable, then re-execute processing.

Possible causes of errors in the SSL configuration settings may be:

- The protocol version is only SSL2.0.
- For encryption method SSL3.0/TLS1.0, the "40-bit RC4 encryption, MD5 MAC" or "No encryption, or MD5 MAC" check box is not selected.
- The site certificate is in the UTF-8 format.
- The SSL configuration has a problem.

## 2.16.44 DEP4145

---

### Performing log file rotation update...

## Explanation

The roll-over of a log file occurred.

## System Action

Processing stops.

## User Action

Update a log with the newest information via the Interstage Management Console.

## 2.16.45 DEP4146

---

### Selected log file does not exist

## Explanation

Selected log file does not exist.

## System Action

Processing stops.

## User Action

This message is output if the Web server does not start up after the following operations are performed:

- A new Web server is created, or
- The Web server connector log output destination is changed

Refer to the log that is output after the Web server starts up.

## 2.16.46 DEP4147

---

### Could not acquire log file

## Explanation

Could not acquire log file.

## System Action

Processing stops.

## User Action

Update a log with the newest information via the Interstage Management Console.

## 2.16.47 DEP4148

---

### Error in virtual host of the specified web server: Specified value= %s1

#### Variable Information

%s1 = Virtual host of the specified web server

#### Explanation

Error in the virtual host name of the specified web server.

#### System Action

Processing stops.

#### User Action

Check the definition of the Web Server's virtual host name.

## 2.16.48 DEP4149

---

### Two or more identical virtual hosts have been set up on the web server: Specified value= %s1

#### Variable Information

%s1 = virtual host for a Web server

#### Explanation

Two or more identical virtual hosts have been set up on the web server.

#### System Action

Processing stops.

#### User Action

Specify only one virtual host for a Web server.

Alternatively, delete a duplicated virtual host.

## 2.16.49 DEP4150

---

### Error in specified web application name: Specified value= %s1

#### Variable Information

%s1 = Web application name

#### Explanation

Error in specified web application name.

Specify a Web application name according to the following naming rules:

- A Web application name must be specified in up to 64 characters.

- The following characters can be used:  
Alphanumeric characters, +, -, ., \_, \$, /
- If "." is used, it must be used with another character.

If '/' is specified at the beginning of a Web application name, the name excluding '/' is used as the Web application name.

#### System Action

Processing stops.

#### User Action

Check that the Web application name complies with the rules set out above.

## 2.16.50 DEP4151

---

**Two or more identical web application names have been specified: Specified value= %s1**

#### Variable Information

%s1 = Web application name

#### Explanation

Two or more identical web application names have been specified.

#### System Action

Processing stops.

#### User Action

Specify only one Web application name.

## 2.16.51 DEP4152

---

**Two or more identical IP address/port number combinations have been specified in this servlet container: Specified value= %s1**

#### Variable Information

%s1 = IP address and port number

#### Explanation

Two or more identical IP address/port number combinations have been specified in this servlet container.

#### System Action

Processing stops.

#### User Action

Specify only one IP address and port number of a Servlet container.

## 2.16.52 DEP4153

---

**IP address and port number has not been specified for this servlet container**

#### Explanation

IP address and port number has not been specified for this servlet container.

#### System Action

Processing stops.

#### User Action

Specify the IP address and port number of a Servlet container.

### 2.16.53 DEP4154

---

#### Error in configuration of web server connector: %s1

##### Variable Information

%s1 = Web server connector configuration information

##### Explanation

Error in the Web server connector configuration.

##### System Action

Processing stops.

##### User Action

Refer to the variable information, and check the Web server connector configuration.

### 2.16.54 DEP4156

---

#### Two or more identical WorkUnit names have been specified: Specified value= %s1

##### Variable Information

%s1 = workunit name

##### Explanation

The same WorkUnit was specified more than once, or is already registered.

##### System Action

Processing stops.

##### User Action

Take one of the following actions:

- Specify only one WorkUnit name.
- Specify a WorkUnit name that is not already registered.

### 2.16.55 DEP4157

---

#### The settings information has changed since it was last acquired: Please retry the operation after updating the settings information

##### Explanation

The settings information has changed since it was last acquired.

##### System Action

Processing stops.

##### User Action

Retry the operation after updating the settings information.

### 2.16.56 DEP4158

---

---

### Error in certificate configuration: Details= %s1

#### Variable Information

%s1 = Detail information

#### Explanation

Error in certificate configuration.

#### System Action

Processing stops.

#### User Action

Specify a certificate in the "serial-number@CA-DN" format.

---

## 2.16.57 DEP4159

---

### Virtual host cannot be changed because a duplicate web application exists: Specified value= %s1

#### Variable Information

%s1 = virtual host name

#### Explanation

Virtual host cannot be changed because a duplicate web application exists.

#### System Action

Processing stops.

#### User Action

Change the server name or port number of the virtual host.

---

## 2.16.58 DEP4160

---

### The web application to be deployed already exists: Please specify a different web application name: Web application name= %s1

#### Variable Information

%s1 = web application name

#### Explanation

The web application to be deployed already exists.

#### System Action

Processing stops.

#### User Action

Change the Web application name, then re-execute the processing.

If deployed using commands, the Web application name is resolved in the following order:

1. The value specified in the -c option in the isjdeployment command
2. The value specified in the Web module definition file (interstage-web.xml).

If the Web application name is not specified in either of the above, it is resolved as shown below. In this case, change the EAR or WAR file and re-execute processing.

- In the case of an EAR file:
  - The value is used when the value is set as context-root of application.xml.
  - The value excluding the extension from the WAR file name is used when the value is not set as context-root of application.xml.
- In the case of an WAR file:
  - The value excluding the extension from the WAR file name is used.

## 2.16.59 DEP4161

---

**Error in specified directory: Please specify it by the absolute path within %s1 bytes: Specified value=%s2**

### Variable Information

%s1 = The number of bytes which can be inputted

%s2 = Log output place directory

### Explanation

Error in specified directory.

### System Action

Processing stops.

### User Action

Specify the absolute path within the length specified by the existing directory.

The following values may have been specified incorrectly:

- The path more than the specified length
- When a relative path is specified
- When a file is specified
- The directory not existing

## 2.16.60 DEP4163

---

**Some log files could not be deleted: Please delete remaining log files manually: Log output directory=%s1**

### Variable Information

%s1 = log output place directory

### Explanation

Some log files could not be deleted.

### System Action

Processing stops.

### User Action

Check whether some log files remain in the directory displayed on variable information.

Delete the log files which remain by manual operation.

### Note

A log file cannot be deleted when the others are referring to that log file.

## 2.16.61 DEP4164

---

**Log file cannot be deleted while the web server is running. Please stop the web server and try again.**

### Explanation

The Web server must be stopped, before the deletion of a log file can be performed.

### System Action

Processing stops.

### User Action

Perform processing again after stopping a Web server.

## 2.16.62 DEP4165

---

**The value specified for `serverRoot` contains a reserved word. Please specify a different value. The value must be an absolute path and less than %s1 bytes long. Specified value = %s2**

### Variable Information

%s1 = The number of bytes which can be input

%s2 = Log output directory

### Explanation

`serverRoot` cannot be specified because of a reservation word.

### System Action

Processing stops.

### User Action

Specify the existing directory, within the specified length, with an absolute path.

## 2.16.63 DEP4166

---

**Log file cannot be deleted while the WorkUnit is running. Please stop the WorkUnit and try again.**

### Explanation

Since the WorkUnit has not stopped, deletion of a log file cannot be performed.

### System Action

Processing stops.

### User Action

Perform processing again after stopping a WorkUnit.

## 2.16.64 DEP4167

---

**Log file location has changed. Please update the log file's information.**

### Explanation

The output place of a log was changed.

### System Action

Processing stops.

#### User Action

Update the log file's information.

### 2.16.65 DEP4168

---

**Invalid value was specified for web server user. Please set a valid value and try again. Specified value=%s1**

#### Variable Information

%s1 = user of web server

#### Explanation

An invalid value was specified for user of web server.

#### System Action

Processing stops.

#### User Action

Correct a value, then re-execute processing.

### 2.16.66 DEP4169

---

**Invalid value was specified for web server group. Please set a valid value and try again. Specified value=%s1**

#### Variable Information

%s1 = group of web server

#### Explanation

An invalid value was specified for group of Web servers.

#### System Action

Processing stops.

#### User Action

Correct a value, then re-execute processing.

### 2.16.67 DEP4170

---

**Specified directory is not a directory. Please enter a valid directory name. Specified value=%s1**

#### Variable Information

%s1 = log output directory

#### Explanation

The specified directory is not a directory.

#### System Action

Processing stops.

#### User Action

Specify a valid directory.

## 2.16.68 DEP4171

---

### Creation of log output directory has failed. Specified value=%s1

#### Variable Information

%s1 = log output directory

#### Explanation

Creation of a log output directory has failed.

#### System Action

Processing stops.

#### User Action

The following may be why the creation of a log output directory has failed:

- Authority to write in is not granted to the parent directory of a log output directory.
- A defect on the disk may be preventing files and directories from being accessed. Run a disk check.
- Conflict with another process may make the disk temporarily inaccessible. Re-execute processing.

**Windows32/64**

- The network drive may have been specified.  
Specify the path on a local disk to the log output directory.

## 2.16.69 DEP4172

---

### User does not have write permission for specified directory. Specified value=%s1

#### Variable Information

%s1 = log output directory

#### Explanation

There is no authority written in the specified directory.

#### System Action

Processing stops.

#### User Action

Check that write authority has been assigned for the Web server connector log output directory.

**Solaris32/64 Linux32/64**

A directory that satisfies both requirements shown below must be specified in the Web server connector log output directory. If the following requirements are not satisfied, either change the authority for the Web server connector log output directory, or change the value of the Interstage HTTP Server User/Group directives and re-execute processing.

- The owner of the Web server connector log output directory and the value specified for the Interstage HTTP Server User directive are the same, and
- The owner has been assigned write authority.

## 2.16.70 DEP4173

---

### Log settings cannot be updated while the web server is running. Please stop the web server and try again.

## Explanation

Because the web server has not stopped, the log setting cannot be updated.

## System Action

Processing stops.

## User Action

Stop the web server, and execute processing again.

## 2.16.71 DEP4174

---

**The value specified for the log output directory contains an invalid character. Please specify a different value. The value must be an absolute path and less than %s1 bytes long. Specified value=%s2**

## Variable Information

%s1 = The number of bytes which can be inputted

%s2 = log output directory

## Explanation

Invalid character in the specified log directory.

## System Action

Processing stops.

## User Action

The following characters cannot be used for the log output directory.

**Windows32/64**

A hash (#), a double quotation mark ("), comma (,), a slash (/), a semicolon(;), an asterisk (\*), question mark (?), brackets (>,<), and a pipe (|)

A colon (:) is usable only as a delimiter for drives.

**Solaris32/64 Linux32/64**

A sharp (#)

Remove the invalid character, then re-execute processing.

## 2.16.72 DEP4175

---

**Invalid class name. Please enter a valid value and try again. Specified value=%s1**

## Variable Information

%s1 = Class name

## Explanation

Invalid class name.

## System Action

Processing stops.

## User Action

Change the class name to a correct value, then re-execute processing.

## 2.16.73 DEP4177

---

**The value specified for a port number has already been used: Please specify an unused port number: Specified value = %s1**

### Variable Information

%s1 = Specified port number

### Explanation

The specified port number is already in use.

### System Action

Processing stops.

### User Action

Specify an unused port number.

## 2.16.74 DEP4178

---

**The value specified to be a Monitoring Method is invalid. Specified value=%s1**

### Variable Information

%s1 = Specified monitoring method

### Explanation

The value specified as the monitoring method is invalid.

### System Action

Processing stops.

### User Action

Specify a correct value.

## 2.16.75 DEP4179

---

**The value specified to be a Monitoring Interval is invalid. Specified value=%s1**

### Variable Information

%s1 = Specified Fault monitoring interval

### Explanation

The value specified to as the monitoring interval is invalid.

### System Action

Processing stops.

### User Action

Specify an interval value in the range 1 to 99999.

## 2.16.76 DEP4180

---

**The value specified to be a Response Wait Time is invalid. Specified value=%s1**

## Variable Information

%s1 = Specified response wait time

## Explanation

The value specified as the response wait time is invalid.

## System Action

Processing stops.

## User Action

Specify a response wait time in the range 1 to 99.

## 2.16.77 DEP4181

---

**The value specified to be a Retry Count is invalid. Specified value=%s1**

## Variable Information

%s1 = Specified the number of retries at the time of fault

## Explanation

The value specified as the number of retries at the time of the fault is invalid.

## System Action

Processing stops.

## User Action

Specify a value in the range 1 to 99999.

## 2.16.78 DEP4182

---

**The value specified to be a Startup Wait Time is invalid. Specified value=%s1**

## Variable Information

%s1 = Specified startup wait time

## Explanation

The value specified as a startup wait time is invalid.

## System Action

Processing stops.

## User Action

Specify a startup wait time in the range of 1 to 600.

## 2.16.79 DEP4183

---

**The Fault Monitoring of a Web server connector is not installed.**

## Explanation

The Fault monitoring function of a Web server connector is not installed.

## System Action

Processing stops.

## User Action

Install the Web server connector fault monitoring function if the following products are used:

- Interstage Application Server Enterprise Edition
- Interstage Application Server Standard-J Edition
- Web Package bundled with Interstage Application Server Enterprise Edition

The fault monitoring function can only be used with the above products.

## 2.16.80 DEP4184

---

**Cannot add a Managed Server that is not a Reserved Server, or cannot add the Managed Server to the Server Group: Change the Web server connector and WorkUnit settings and re-execute processing.**

### Explanation

The conditions required for adding a Managed Server that is not a Reserved Server to the site, or for adding a Managed Server to the first Server Group, have not been satisfied.

### System Action

Processing stops.

### User Action

The conditions required for adding the server are shown below.

- In the stand-alone server Interstage Management Console, click [System] > [Settings] > [Update System Settings] > [Servlet Service Settings] > [Run Web server and WorkUnit on the same machine?]. If [Yes] has been set for [Run Web server and WorkUnit on the same machine?], the server can be added in the following cases:
  - There is only one "Fjapache" Web server, and
  - All the IJServers are using the Web server (except for cases in which the IJServer type is "EJB Applications Only")
- If [No] has been set for [Run Web server and WorkUnit on the same machine?], the server can be added in the following cases:
  - There is only one "FJapache" Web server, and
  - The Web server and IJServer are run on the same machine, and
  - The Web server connector and IJServer have the same configuration, and
  - The Servlet container IP address has not been specified, and
  - A Web server IP address that allows connection has not been specified (the server can be added if 127.0.0.1 is specified, however).

## 2.16.81 DEP4185

---

**Error in specified servlet container identifier: Specified value=%s1**

### Variable Information

%s1 = Servlet container identifier

### Explanation

An error is in the specified servlet container identifier.

A servlet container identifier needs to specify according to the following naming agreement.

- It is 32 bytes or less.
- Any characters other than the following characters should not be used.

An alphanumeric character, '\_', '\_'.

#### System Action

Processing stops.

#### User Action

Check a servlet container identifier.

### 2.16.82 DEP4186

---

#### **Servlet container identifier of the same name already exists: Specified value=%s1**

#### Variable Information

%s1 = Servlet container identifier

#### Explanation

Two or more same servlet container identifier are specified in the same WorkUnit.

#### System Action

Processing stops.

#### User Action

Specify a different servlet container identifier. When a servlet container identifier is omitted and updated, a servlet container identifier is not changed. Check whether the same servlet container identifier as the servlet container identifier who omitted is specified by other definitions.

### 2.16.83 DEP4187

---

#### **Error in automatic servlet container identifier numbering**

#### Explanation

Since it was over the maximum number which can carry out automatic numbering of the servlet container identifier, automatic numbering failed.

#### System Action

Processing stops.

#### User Action

Specify a servlet container identifier after "IP address of a servlet container: port number".

### 2.16.84 DEP4188

---

#### **The WorkUnit is not specified**

#### Explanation

The WorkUnit name was not specified.

#### System Action

Processing stops.

#### User Action

Specify the WorkUnit name.

### 2.16.85 DEP4189

---

---

**The specified directory could not be deployed: Specified value=%s1: Details= %s2****Variable Information**

%s1 = Specified directory name

%s2 = Detail information

Note: The detail information is not always displayed.

**Explanation**

The specified directory cannot be deployed.

**System Action**

Processing stops.

**User Action**

The specified directory architecture is not valid for Web applications. Note the following points, and re-execute processing:

- The specified directory/WEB-INF must contain web.xml.
- The file name for web.xml must be in lowercase.
- The directory name for WEB-INF must be in uppercase.
- The directory must be specified using its absolute path.
- web.xml must be described in Servlet API 2.2 or 2.3 or 2.4 format. (In a V8.0 Compatible mode IJServer or an IJServer that was created in V8 or earlier, the web.xml cannot be described in Servlet API 2.4 format.)

---

**2.16.86 DEP4190**

---

**The specified directory could not be deployed because the Web service was included: Specified value=%s1****Variable Information**

%s1 = Specified directory name

**Explanation**

The Web service is included, so the specified directory cannot be deployed.

**System Action**

Processing stops.

**User Action**

Create the WAR files and deploy a Web application containing the Web service.

---

**2.16.87 DEP4191**

---

**The value specified for KeepAlive is invalid: Specify the maximum number of requests for KeepAlive, or [0]: Specified value=%s1****Variable Information**

%s1 = Specified value of KeepAlive

**Explanation**

The value specified for is invalid.

**System Action**

Processing stops.

#### User Action

Specify the maximum number of requests for KeepAlive, or [0].

If [0] is specified, the number of requests for KeepAlive is unlimited.

### 2.16.88 DEP4192

---

**When the Web server and the work unit are operated with the same machine, the breakdown monitoring function of the Web server connector cannot be used**

#### Explanation

Web Server connector fault monitoring cannot be used if the Web Server and WorkUnit are run on the same server.

#### System Action

Processing stops.

#### User Action

To use Web Server connector fault monitoring, change the setting for [Run Web server and WorkUnit on the same machine?] to 'No', and then and re-execute processing.

### 2.16.89 DEP4193

---

**When the Web server and the work unit are operated with the same machine, an environmental setting of the Web server connector cannot be changed**

#### Explanation

The Web Server connector environment settings cannot be changed if the Web Server and WorkUnit are run on the same server.

#### System Action

Processing stops.

#### User Action

To change the Web Server connector environment settings, change the settings for running the [Run Web server and WorkUnit on the same machine?] to 'No', and then and re-execute processing.

### 2.16.90 DEP4194

---

**The specified directory does not exist: Specified value=%s1**

#### Variable Information

%s1 = Specified directory name

#### Explanation

The specified directory could not be found.

#### System Action

Processing stops.

#### User Action

Specify the correct directory and re-execute.

### 2.16.91 DEP4195

---

**The value specified for WorkUnit name is invalid: Specified value=%s1**

## Variable Information

%s1 = Specified value

## Explanation

The value specified for the WorkUnit name is invalid.

## System Action

Processing stops.

## User Action

Half-width alphanumerics and ' ' (space) can be specified for the WorkUnit name. A maximum of [28] characters can be specified.

Check the value specified for the WorkUnit name.

## 2.16.92 DEP4196

---

### **When the Web server and the work unit are operated with the same machine, the limit of connector cannot be used**

## Explanation

'Connector Limitation' cannot be set if the Web server and WorkUnit are run on the same machine.

## System Action

Processing stops.

## User Action

To set 'Connector Limitation', change the settings for running the [Run Web server and WorkUnit on the same machine?] to 'No', and then re-execute.

## 2.16.93 DEP4199

---

### **An unexpected error occurred: %s1**

## Variable Information

%s1 = Detail information

## Explanation

An unexpected error occurred.

## System Action

Processing stops.

## User Action

Remove the error cause based on the %s1 variable's detailed information, then re-execute processing.

If the problem is not solved, collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

## 2.17 DEP4200 to DEP4299

---

Servlet related messages.

### 2.17.1 DEP4201

---

#### **The port number specified for the control port is not the same as the one for the WorkUnit process concurrency**

## Explanation

The port number for WorkUnit process concurrency and the port number specified for the control port are not the same.

## System Action

Processing stops.

## User Action

Specify the port number for WorkUnit process concurrency to the same value specified for the control port.

## 2.17.2 DEP4202

---

**The value specified for the control port is invalid: Specify a port number from [5001] to [65535]: Specified value=%s1**

## Variable Information

%1=Specified port number

## Explanation

The value specified for the control port is invalid.

## System Action

Processing stops.

## User Action

Specify a number from [5001] to [65535] for the port number.

## 2.17.3 DEP4203

---

**The value specified for the control port is already being used: Specify a port number that is not being used: Specified value=%s1**

## Variable Information

%1=Specified port number

## Explanation

The value specified for the control port is already in use.

## System Action

Processing stops.

## User Action

Specify a port number that is not already being used.

## 2.17.4 DEP4204

---

**The same port number for the control port was specified more than once: Specify a port number that is not being used: Specified value=%s1**

## Variable Information

%1=Specified port number

## Explanation

The same port number was specified more than once.

## System Action

Processing stops.

## User Action

Specify a port number that is not already being used.

## 2.17.5 DEP4205

---

**The value specified for the IP address that allows connection to the control port is incorrect: Specified value=%s1**

### Variable Information

%1=Specified IP address

### Explanation

The value specified for the IP address is invalid.

### System Action

Processing stops.

### User Action

Check that the format specified for the IP address (for example: 127.0.0.1) is correct.

## 2.17.6 DEP4206

---

**The same port name for the control port was specified more than once: Specify a port name that is not being used: Specified value=%s1**

### Variable Information

%1=Name specified for the control port

### Explanation

The name specified for the control port was specified more than once.

### System Action

Processing stops.

### User Action

Specify a name for the control port that is not already in use.

## 2.18 DEP4300 to DEP4399

---

Servlet related messages.

### 2.18.1 DEP4310

---

**The value specified for session recovery is invalid: Specified value=%s1**

#### Variable Information

%1=Specified value

#### Explanation

The value specified for [Session Recovery] is invalid.

#### System Action

Processing stops.

#### User Action

Check that the value specified for [Session Recovery] is correct.

### 2.18.2 DEP4311

---

#### **The control port was not set: Set the control port.**

#### Explanation

Session recovery cannot be used because the [Control Port] has not been set.

#### System Action

Processing stops.

#### User Action

To use session recovery, set the [Control Port].

### 2.18.3 DEP4312

---

#### **The value specified for the Session Registry Server address is invalid: Specified value=%s1**

#### Variable Information

%1=Specified IP address

#### Explanation

The value specified for the IP address of [Session backup destination Session Registry Server address:Port] is invalid.

#### System Action

Processing stops.

#### User Action

Check that the specified IP address format is correct (for example: 127.0.0.1).

### 2.18.4 DEP4313

---

#### **The Session Registry Server address was not specified**

#### Explanation

The IP address of [Session backup destination Session Registry Server address:Port] was not specified.

#### System Action

Processing stops.

To use session recovery, specify the Session Registry Server IP address.

### 2.18.5 DEP4314

---

#### **The value specified for the Session Registry Server port is invalid: Specified value=%s1**

#### Variable Information

%1=Specified value

#### Explanation

The value specified for the port of [Session backup destination Session Registry Server address:Port] is invalid.

#### System Action

Processing stops.

#### User Action

Check that the value specified for the Session Registry Server port is correct.

## 2.18.6 DEP4315

---

### The Session Registry Server port was not specified.

#### Explanation

The port of [Session backup destination Session Registry Server address:Port] was not specified.

#### System Action

Processing stops.

#### User Action

To use session recovery, specify the Session Registry Server Port.

## 2.18.7 DEP4316

---

### The value specified for the backup mechanism is invalid: Specified value=%s1

#### Variable Information

%1=Specified value

#### Explanation

The value specified for the [Backup Mode] is invalid.

#### System Action

Processing stops.

#### User Action

Check that the value specified for [Backup Mode] is correct.

## 2.18.8 DEP4317

---

### The value specified for the backup interval is invalid: Specified value=%s1

#### Variable Information

%1=Specified value

#### Explanation

The value specified for the backup interval is invalid. Specify a number from [1] to [2147483647] for the backup interval.

#### System Action

Processing stops.

#### User Action

Check that the value specified for the backup interval is correct.

## 2.18.9 DEP4318

---

**The value specified for the response wait time from Session Registry Server is invalid: Specified value=%s1**

### Variable Information

%1=Specified value

### Explanation

The value specified for the [Response waiting time from the Repository server] is invalid.

Specify a number from [1] to [86400] for the [Response waiting time from the Repository server].

### System Action

Processing stops.

### User Action

Check that the value specified for [Response waiting time from the Repository server] is correct.

## 2.18.10 DEP4319

---

**The value specified for the access log is invalid: Specified value=%s1**

### Variable Information

%1=Specified value

### Explanation

The value specified for [Outputs the access log] is invalid.

### System Action

Processing stops.

### User Action

Check that the value specified for [Outputs the access log] is correct.

## 2.18.11 DEP4320

---

**The value specified at the end of the non-session URL is invalid: Specified value=%s1**

### Variable Information

%1=The value specified at the end of the non-session URL

### Explanation

The value specified at the end of the [End of the non-session URL] is invalid.

Only alphanumeric and underscores (\_) can be used for the [End of the non-session URL].

### System Action

Processing stops.

### User Action

Check that the value specified for [End of the non-session URL] is correct.

## 2.18.12 DEP4321

---

---

## A package required for the use of session recovery was not installed.

### Explanation

A package required for the use of session recovery was not installed.

### System Action

Processing stops.

### User Action

Check that the required package was installed.

---

## 2.18.13 DEP4322

---

### Session recovery cannot be used if the Java version is 1.3.

### Explanation

Session recovery cannot be used if the Java version is 1.3.

### System Action

Processing stops.

### User Action

To use session recovery, select Java version 1.4 or later.

---

## 2.19 DEP4400 to DEP4499

Servlet related messages.

---

### 2.19.1 DEP4400

---

#### The Web server does not exist: Web server name=%s1

### Variable Information

%s1 = Web Server name

### Explanation

The Web server displayed in the variable information does not exist.

### Cause

Possible causes are as follows:

- The specified Web server does not exist.
- An attempt was made to create a V8.0 compatible mode IJServer if there was no "Fjapache" Web server.
- An "Fjapache" Web server was deleted when there was a V8.0 compatible mode IJServer.

### System Action

Processing stops.

### User Action

Check whether the Web server exists.

If an "Fjapache" Web server was deleted when there was a V8.0 compatible mode IJServer, take either of the following actions:

- Delete the V8.0 compatible mode IJServer

- Create an "Fjapache" Web server and update the V8.0 compatible mode IIServer environment settings.

## 2.19.2 DEP4401

---

### Error parsing web.xml syntax: Details=%s1

#### Variable Information

%s1 = Detailed information

#### Explanation

An error occurred in web.xml syntax parsing.

#### System Action

Processing stops.

#### User Action

Check the web.xml syntax.

web.xml must be described in Servlet API 2.2, 2.3, or 2.4 format.

If a message informing you that the encoding is illegal is output in the detailed message, take either of the following actions and re-execute processing.

- Correct web.xml

Specify the character encoding supported in the XML parser specified in "Type of XML Parser to use" of the IIServer environment settings in the web.xml XML declaration.

- Change the XML parser that is used

Specify the XML parser that supports the character encoding specified in the web.xml XML declaration in "Type of XML Parser to use" of the IIServer environment settings.

## 2.19.3 DEP4402

---

### The same Web server name was specified more than once: Specify a different Web server name: Specified value=%s1

#### Variable Information

%s1 = Web server name

#### Explanation

The same web server name was specified more than once.

#### System Action

Processing stops.

#### User Action

Specify a Web server name that is not duplicated.

Alternatively, delete the Web duplicated server name.

## 2.19.4 DEP4403

---

### The value specified for send/receive timeouts is invalid: Specify a value from [1] to [2147483647]: Specified value=%s1

#### Variable Information

%s1 = Send/receive timeout

## Explanation

Invalid send and receive timeout.

## System Action

Processing stops.

## User Action

Check whether the send/receive timeout is within the range that can be specified.

## 2.19.5 DEP4404

---

**Value specified for the maximum number of connections to the Servlet container is invalid: Specify a value from [1] to [2048]: Specified value=%s1**

### Variable Information

%s1 = Maximum number of connections to the Servlet container

## Explanation

Invalid maximum connection number to servlet container.

## System Action

Processing stops.

## User Action

Check whether the maximum number of connections to the Servlet container is within the range that can be specified.

## 2.19.6 DEP4405

---

**The value specified for the maximum number of connections (the maximum number of requests that can connect to the Servlet container) is invalid: Specify a value from [1] to [2147483647]: Specified value=%s1**

### Variable Information

%s1 = Maximum number of connections (maximum number of requests that can connect to the Servlet container)

## Explanation

Invalid maximum connection number (maximum number of connectable requests to the servlet container).

## System Action

Processing stops.

## User Action

Check whether the maximum number of connections (the maximum number of requests that can connect to the Servlet container) is within the range that can be specified.

## 2.19.7 DEP4406

---

**The value specified for the number of simultaneous processes (initial value) is invalid: Specify a value from [2] to [2048]: Specified value=%s1**

### Variable Information

%s1 = Number of simultaneous processes (initial value)

## Explanation

Invalid concurrent processing number of requests from client per container (initial value).

## System Action

Processing stops.

## User Action

Check whether the number of simultaneous processes (initial value) is within the range that can be specified.

## 2.19.8 DEP4407

---

**The value specified for the number of simultaneous processes (maximum value) is invalid: Specify a value from [2] to [2048]: Specified value=%s1**

## Variable Information

%s1 = Number of simultaneous processes (maximum value)

## Explanation

Invalid concurrent processing number of requests from client per container (maximum value).

## System Action

Processing stops.

## User Action

Check whether the number of simultaneous processes (maximum value) is within the range that can be specified.

## 2.19.9 DEP4408

---

**The value specified for the number of simultaneous processes (maximum idle value) is invalid: Specify a value from [2] to [2048]: Specified value=%s1**

## Variable Information

%s1 = Number of simultaneous processes (maximum idle value)

## Explanation

Invalid concurrent processing number of requests from client per container (maximum idle value).

## System Action

Processing stops.

## User Action

Check whether the number of simultaneous processes (maximum idle value) is within the range that can be specified.

## 2.19.10 DEP4409

---

**The value specified for request URI encoding is invalid. Characters that can be used for request URI encoding are alphanumeric: hyphens (-), and underscores (\_): Specified value=%s1**

## Variable Information

%s1 = Request URI encoding

## Explanation

Invalid encoding for the request URI.

#### System Action

Processing stops.

#### User Action

Check whether the characters can be used for request URI encoding.

### 2.19.11 DEP4410

---

**The value specified for encoding for dispatch to static resources is invalid: Characters that can be used for encoding for dispatch to static resources are alphanumeric, hyphens (-), and underscores (\_): Specified value=%s1**

#### Variable Information

%s1 = Encoding for dispatch to static resources

#### Explanation

Invalid encoding for dispatching to static resources.

#### System Action

Processing stops.

#### User Action

Check whether the characters can be used for encoding for dispatch to static resources.

### 2.19.12 DEP4411

---

**The value specified for enable/disable JSP reload, and that for the reload mechanism when it is enabled are invalid: Specified value=%s1**

#### Variable Information

%s1 = The value specified for enable/disable JSP reload, and the value for the reload mechanism when it is enabled

#### Explanation

Represents an Invalid JSP reload enable/disable, and the value for the reload mechanism when it is enabled.

#### System Action

Processing stops.

#### User Action

Check whether the value specified for enable/disable JSP reload, and the value for the reload mechanism when it is enabled, are correct.

### 2.19.13 DEP4412

---

**The value specified for the JSP reload monitor interval is invalid: Specify a value from [1] to [2147483647]: Specified value=%s1**

#### Variable Information

%s1 = JSP reload monitor interval

#### Explanation

Invalid JSP reload interval.

#### System Action

Processing stops.

## User Action

Check whether the JSP reload monitor interval is within the range that can be specified.

### 2.19.14 DEP4413

---

**The value specified for the number of simultaneous processes (maximum value) is greater than the maximum number of connections (the maximum number of requests that can connect to the Servlet container): Specify a value for the number of simultaneous processes (maximum value) that does not exceed the maximum number of connections (the maximum number of requests that can connect to the Servlet container): Specified values: Number of simultaneous processes (maximum value)=%s1, Maximum number of connections=%s2**

#### Variable Information

%s1 = Number of simultaneous processes (maximum value)

%s2 = Maximum number of connections

#### Explanation

The value specified for the number of simultaneous processes (maximum value) is greater than the maximum number of connections (the maximum number of requests that can connect to the Servlet container).

#### System Action

Processing stops.

#### User Action

Check the relative value specified for the number of simultaneous processes (maximum value) to the maximum number of connections.

### 2.19.15 DEP4414

---

**The proportionality of the values specified for the number of simultaneous processes is incorrect: Specify values that are proportionately correct: Specified values: Number of simultaneous processes (initial value)=%s1, Number of simultaneous processes (maximum idle value)=%s2, Number of simultaneous processes (maximum value)=%s3**

#### Variable Information

%s1 = Number of simultaneous processes (initial value)

%s2 = Number of simultaneous processes (maximum idle value)

%s3 = Number of simultaneous processes (maximum value)

#### Explanation

The proportionality of the values specified for the number of simultaneous processes is incorrect.

#### System Action

Processing stops.

#### User Action

Check whether the number of simultaneous processes (initial value) is greater than the number of simultaneous processes (maximum idle value), or if the number of simultaneous processes (maximum idle value) is greater than the number of simultaneous processes (maximum value).

### 2.19.16 DEP4415

---

**The XML parser that was selected does not support the XML schema.**

## Explanation

web.xml parsing failed because the XML parser that was selected does not support the XML schema.

## System Action

Processing stops.

## User Action

The XML parser that is selected must support the XML schema to deploy Servlet2.4 Web applications.

Check the IJServer environment settings.

## 2.19.17 DEP4416

---

**The specified log output destination directory has been set for another Web server connector (Web server name=%s1): Specify a different Web server connector log output destination: Specified value=%s2**

### Variable Information

%s1 = Web server name

%s2 = Value specified in the log output destination directory

## Explanation

The specified log output destination directory has been set for another Web server connector.

## System Action

Processing stops.

## User Action

Change the log output destination directory.

## 2.19.18 DEP4417

---

**A web application of the same name already exists on another WorkUnit: web server name=%s1 Web Application Name=%s2[IJServer=%s3 Module=%s4]**

### Variable Information

%s1 = Web Server name

%s2 = Name of the Web application that is already deployed

%s3 = Name of the IJServer used to deploy the Web application of the same name

%s4 = Name of the module in the IJServer used to deploy the Web application of the same name

This will not be output when the name of the IJServer in %3 is IJServer(Java EE).

## Explanation

A Web application of the same name has been deployed to another IJServer.

A Web application of the same name cannot be deployed to separate IJServers in the following cases:

- The same Web server is used, and
- The same virtual host is used, or a virtual host is not used

## System Action

Processing stops.

## User Action

Take either of the following actions:

- Change the Web application name and deploy the Web application again.
- Change the Web server that is used by IJServer, or change the virtual host and redeploy the application.

## 2.19.19 DEP4418

---

**When the Web server and the work unit are operated with the different machine, this function cannot be used: function name=%s1**

### Variable Information

%s1 = Name of the function in which the error occurred

### Explanation

If the Web server and the WorkUnit are not run on the same machine, the function displayed in this function name cannot be used.

### System Action

Processing stops.

### User Action

To use the function displayed in this function name, select "Yes" to run the Web server and the WorkUnit on the same machine and re-execute.

## 2.19.20 DEP4419

---

**If the session is not configured to use cookies, you cannot specify that the session be saved in the Web browser**

### Explanation

It is not possible to specify that the session be saved in the Web browser if the session is not configured to use cookies.

### System Action

Processing stops.

### User Action

To save the session in the Web browser, change the settings so that the session uses cookies.

## 2.19.21 DEP4420

---

**A IJServer(J2EE) and a IJServer cluster with the same name cannot be configured to use the same Web server: IJServer name=%s1 Web server name=%s2**

### Variable Information

%s1 = Name of the IJServer

%s2 = Name of the Web Server

### Explanation

Settings were configured so that an IJServer(J2EE) and an IJServer cluster with the same name used the same Web server.

### System Action

Processing stops.

## User Action

- If this message is displayed when the IJServer is created or the environment settings are updated

Either change the IJServer name and create it again, or configure the environment so that IJServers with the same name use different Web servers.

- If this message is displayed when the system setting [System] > [Environment Settings] > "Run Web server and WorkUnit on the same machine?" is updated

Either delete the IJServer(J2EE), or change the link of the IJServer cluster to the Web server and set this option to "Yes".

## 2.19.22 DEP4499

---

**An unexpected error occurred. Remove the error cause based on the detailed messages: Detailed=%s1**

### Variable Information

%1=Detailed messages

### Explanation

An unexpected error occurred.

### System Action

Processing stops.

### User Action

Rectify the error indicated by the detailed message, then re-execute processing.

## 2.20 DEP4500 to DEP4599

---

The following messages are displayed by IJServer operations, and deploying/undeploying EJB applications.

### 2.20.1 DEP4501

---

**Application storage folder being moved. Re-execute after folder moved.**

#### Explanation

An application storage folder is currently being moved.

#### System Action

Processing stops.

#### User Action

After the application storage folder has been moved, re-execute.

### 2.20.2 DEP4502

---

**EJB application being deployed, undeployed, or run. Re-execute after processing is complete.**

#### Explanation

An EJB application is currently being deployed or undeployed.

#### System Action

Processing stops.

#### User Action

After the EJB application has been deployed or undeployed, re-execute.

## 2.20.3 DEP4503

---

**EJB container being created, updated, or deleted. Re-execute after processing is complete.**

### Explanation

An EJB container is being created, updated, or deleted.

### System Action

Processing stops.

### User Action

After the EJB container has been created, updated, or deleted, re-execute.

## 2.20.4 DEP4504

---

**Name specified as IJServer name already being used as EJB container name. Change the IJServer name: NAME = %s1**

### Variable Information

%s1 = IJServerName

### Explanation

The name specified as an IJServer name is already being used as an EJB container name.

### System Action

Processing stops.

### User Action

Change the IJServer name.

## 2.20.5 DEP4505

---

**Name identical to name of deployed EJB application cannot be specified as an IJServer name. Change the IJServer name: NAME = %s1**

### Variable Information

%s1 = EJB application name

### Explanation

The IJServer name cannot have the same name of a deployed EJB application.

### System Action

Processing stops.

### User Action

Change the IJServer name.

## 2.20.6 DEP4506

---

**Processing cannot continue due to invalid file. Delete the invalid file: FILE = %s1**

### Variable Information

%s1 = File name

## Explanation

A directory cannot be created because the file is invalid.

## System Action

Processing stops.

## User Action

Delete the file indicated in the Variable information section.

## 2.20.7 DEP4507

---

**Permission to access directory denied. Check the access permission: PATH = %s1**

## Variable Information

%s1 = Directory name

## Explanation

Permission to access the directory is denied.

## System Action

Processing stops.

## User Action

Change the access permission for the directory, then re-execute processing. Alternatively, retry processing as a user with the required access permissions.

## 2.20.8 DEP4508

---

**File input/output error occurred. The probable cause is an invalid access permission, insufficient file system size, a damaged file, or a failed disk unit: FILE = %s1**

## Variable Information

%s1 = File name

## Explanation

A file input/output error occurred.

## System Action

Processing stops.

## User Action

- If access permission was denied, change the access permission, then re-execute processing. Alternatively, retry processing as a user with the required access permissions.
- If the file system size is too small, delete unnecessary files or increase the size of the file system.
- If file creation failed because there is no directory, check whether a current directory exists for the file name indicated in the Variable information section exists.
- If the file appears to be damaged, restore the EJB.
- If the disk unit appears to have failed, verify that it is operating normally.
- It may not be possible to read the definition file encoding using the XML parser defined in the IJServer environment settings. Take either of the following actions:

- Correct the definition file

Use encoding supported by the XML parser configured in the IJServer environment settings to describe the definition file.

- Correct the definition file

Use encoding supported by the XML parser configured in the IJServer environment settings to describe the definition file.

- Change the XML parser that is used

In the IJServer environment settings, configure the XML parser that supports the encoding described in the definition file.

## 2.20.9 DEP4509

---

### **Permission to access file denied. Check the access permission: FILE = %s1**

#### Variable Information

%s1 = File name

#### Explanation

Permission to access the file is denied.

#### System Action

Processing stops.

#### User Action

Change the access permission to the file, then re-execute processing. Alternatively, retry processing as a user with the required access permissions.

## 2.20.10 DEP4510

---

### **Failed to delete definition file. Check the access permission: FILE = %s1**

#### Variable Information

%s1 = File name

#### Explanation

The definition file could not be deleted.

#### System Action

Processing stops.

#### User Action

Change the access permission to the file, then re-execute processing. Alternatively, retry processing as a user with the required access permissions.

## 2.20.11 DEP4511

---

### **Connection to the CORBA service failed. Start Interstage. If Interstage is already operating, there may be no more system memory available. Stop unnecessary services or restart the system.**

#### Explanation

Failed to connect to CORBA service.

#### System Action

Processing stops.

## User Action

Ensure that Interstage is operating and that there is sufficient system memory available. Stop all unnecessary services, then restart the system.

## 2.20.12 DEP4512

---

**EJB container of IJServer deleted. Obtain the latest information, and if necessary, re-execute the processing.**

### Explanation

IJServer EJB container deleted

### System Action

Processing stops.

### User Action

Investigate further, then if required, re-execute processing.

## 2.20.13 DEP4513

---

**Failed to register implementation repository ID. Refer to messages in event log: ID = %s1**

### Variable Information

%s1 = Implementation repository ID

### Explanation

The implementation repository ID could not be registered. It may have already have been registered.

### System Action

Processing stops.

### User Action

Inspect the event log message. If the ID is being used by another application, change the IJServer name. If the corresponding implementation repository ID is unnecessary, delete it and re-execute.

## 2.20.14 DEP4514

---

**Failed to delete implementation repository ID. Refer to messages in event log: ID = %s1**

### Variable Information

%s1 = Implementation repository ID

### Explanation

The implementation repository ID could not be deleted.

### System Action

Processing stops.

### User Action

If the EJB application is currently operating, stop the EJB application, then re-execute. If the EJB application is not currently operating, check the event log messages.

## 2.20.15 DEP4515

---

---

**WorkUnit definition could not be registered. Cause may be a syntax error. Check the WorkUnit definition: FILE = %s1**

**Variable Information**

%s1 = WorkUnit definition file path

**Explanation**

A WorkUnit definition could not be registered. The cause may be a syntax error.

**System Action**

Processing stops.

**User Action**

Check the WorkUnit definition. If incorrect, create an IJServer without setting the item that caused the problem. Re-register the WorkUnit definition as indicated below:

**Windows32/64**

```
isaddwundef -o C:\Interstage\ejb\etc\MyServer.def
```

**Solaris32/64 Linux32/64**

```
isaddwundef -o /opt/FJSVejb/etc/MyServer.def
```

---

## 2.20.16 DEP4516

---

**Failed to delete WorkUnit definition. Refer to messages displayed at same time: NAME = %s1**

**Variable Information**

%s1 = WorkUnit definition name

**Explanation**

A WorkUnit definition could not be deleted.

**System Action**

Processing stops.

**User Action**

Refer to any other associated messages.

---

## 2.20.17 DEP4517

---

**Failed to create directory. Check the access permission and check whether the application storage folder exists: PATH = %s1**

**Variable Information**

%s1 = Directory name

**Explanation**

A directory could not be created.

**System Action**

Processing stops.

#### User Action

- If access permission was denied, change the access permission, then re-execute processing. Alternatively, retry processing as a user with the required access permissions.
- If an application storage folder does not exist, create an application storage folder.

### 2.20.18 DEP4518

---

**EJB container definition is being used by other processing. Re-execute the processing after the other processing is complete. If operation in progress, stop it: NAME = %s1**

#### Variable Information

%s1 = JJSERVER name

#### Explanation

The EJB container definition is being used by other processing.

#### System Action

Processing stops.

#### User Action

After processing for the specified EJB container or any other operations are complete or terminated, re-execute processing.

### 2.20.19 DEP4519

---

**EJB container definition file does not exist. Restore the EJB: NAME = %s1**

#### Variable Information

%s: EJB container name

#### Explanation

The EJB container definition file does not exist.

#### System Action

Processing stops.

#### User Action

Restore the EJB.

### 2.20.20 DEP4520

---

**Invalid definition file format. Restore the EJB: FILE = %s1**

#### Variable Information

%s1 = File name

#### Explanation

The definition file format is invalid.

#### System Action

Processing stops.

#### User Action

Restore the EJB.

## 2.20.21 DEP4521

---

**Invalid maximum memory for JavaVM. Specify value within allowed range: RANGE = %s1**

### Variable Information

%s1 = Allowed range

### Explanation

The value specified as the maximum memory for JavaVM is invalid.

### System Action

Processing stops.

### User Action

Specify a value that is within the allowed range.

## 2.20.22 DEP4522

---

**Maximum number of paths specifiable in CLASSPATH exceeded: MAX = %s1**

### Variable Information

%s1 = Maximum number of paths

### Explanation

The maximum number of paths that can be specified in CLASSPATH was exceeded.

### System Action

Processing stops.

### User Action

Reduce the number of paths specified in CLASSPATH to the maximum number or less.

## 2.20.23 DEP4523

---

**Paths specified in CLASSPATH exceed maximum number of bytes: MAX = %s1, PATH = %s2**

### Variable Information

%s1 = Maximum number of bytes

%s2 = Path

### Explanation

Paths specified in CLASSPATH exceeded the maximum number of bytes.

### System Action

Processing stops.

### User Action

Reduce the length of the paths specified in CLASSPATH.

## 2.20.24 DEP4524

---

**Character not allowed in CLASSPATH specified: PATH = %s1**

## Variable Information

%s1 = Path

## Explanation

A character that cannot be specified in CLASSPATH was specified.

## System Action

Processing stops.

## User Action

Specify only valid characters (refer to the Help information in Interstage Management Console).

## 2.20.25 DEP4525

---

### Specify only absolute paths in CLASSPATH: PATH = %s1

## Variable Information

%s1 = Path

## Explanation

A path that is not absolute was specified in CLASSPATH.

## System Action

Processing stops.

## User Action

Specify only absolute paths for CLASSPATH.

## 2.20.26 DEP4526

---

### Maximum number of bytes specifiable in other options exceeded: MAX = %s1

## Variable Information

%s1 = Maximum number of bytes

## Explanation

The maximum number of bytes that can be specified in other options was exceeded.

## System Action

Processing stops.

## User Action

Modify the other options so that the maximum number of bytes is not exceeded.

## 2.20.27 DEP4527

---

### "-classpath" or "-cp" not allowed in other options. Respecify in CLASSPATH.

## Explanation

"-classpath" or "-cp" cannot be specified in the other options.

## System Action

Processing stops.

#### User Action

Re-specify "-classpath" or "-cp" in CLASSPATH.

### 2.20.28 DEP4528

---

**Value specified for concurrent processes invalid. Specify value in the allowed range: RANGE = %s1**

#### Variable Information

%s1 = Allowed range

#### Explanation

The value specified for concurrent processes is invalid.

#### System Action

Processing stops.

#### User Action

Change the value for concurrent processes to a value in the allowed range.

### 2.20.29 DEP4529

---

**Value specified for pre-opened connection is invalid. Specify value in the allowed range: RANGE = %s1**

#### Variable Information

%s1 = Valid range

#### Explanation

The value specified for pre-opened connection is invalid.

#### System Action

Processing stops.

#### User Action

Change the pre-opened connection value in the data source to a value in the allowed range.

### 2.20.30 DEP4530

---

**Specify a data source name**

#### Explanation

You need to specify a data source name.

#### System Action

Processing stops.

#### User Action

Specify a data source name.

### 2.20.31 DEP4531

---

**Insufficient system memory. Stop unnecessary services or restart the system.**

#### Explanation

There is insufficient system memory.

#### System Action

Processing stops.

#### User Action

Stop all unnecessary services or restart the system. If necessary, add system memory.

### 2.20.32 DEP4532

---

#### Insufficient file system space. Delete unnecessary files.

#### Explanation

The file system space is insufficient.

#### System Action

Processing stops.

#### User Action

Delete unnecessary files.

### 2.20.33 DEP4533

---

#### Failed to register WorkUnit definition. Interstage not initialized. Initialize Interstage.

#### Explanation

The WorkUnit definition could not be registered. Interstage has not been initialized.

#### System Action

Processing stops.

#### User Action

Initialize Interstage.

### 2.20.34 DEP4534

---

#### Deployed EJB application already exists: NAME = %s1

#### Variable Information

%s1 = EJB application name

#### Explanation

A deployed EJB application already exists.

#### System Action

Processing stops.

#### User Action

Overwrite the deployed EJB application or respond in the confirmation dialog box.

### 2.20.35 DEP4535

---

#### Deployed EJB application is in non-server management mode or on IJServer different from the specified IJServer name. Change EJB application name or undeploy EJB application, then re-execute: NAME = %s1

## Variable Information

%s1 = JJServer name

## Explanation

A deployed EJB application is in non-server management mode or is on an JJServer that is different from the specified JJServer name.

## System Action

Processing stops.

## User Action

Change the EJB application name or release deployment, then re-execute.

## 2.20.36 DEP4536

---

**EJB application is being deployed, undeployed, or customized. Re-execute processing after current processing complete.**

## Explanation

An EJB application is being deployed, undeployed, or customized.

## System Action

Processing stops.

## User Action

After the current processing is complete, re-execute processing.

## 2.20.37 DEP4537

---

**EJB application name already registered with Naming Service. Change the EJB application name or delete its registration: NAME = %s1**

## Variable Information

%s1 = EJB application name

## Explanation

The EJB application name is already registered with the Naming Service.

## System Action

Processing stops.

## User Action

Change the EJB application name and re-execute. Alternatively, if an unnecessary name is registered in the Naming Service, delete it using the OD\_or\_adm command.

## 2.20.38 DEP4538

---

**EJB application being deployed is being activated. Stop the EJB application, then redeploy it.**

## Explanation

The EJB application that is being deployed is being activated.

## System Action

Processing stops.

#### User Action

Stop the EJB application, then re-deploy it.

### 2.20.39 DEP4539

---

**Specified EJB application has been undeployed. Acquire latest information: NAME = %s1**

#### Variable Information

%s1 = EJB application name

#### Explanation

The specified EJB application has already been undeployed.

#### System Action

Processing stops.

#### User Action

Obtain the latest information.

### 2.20.40 DEP4540

---

**Length of EJB application name exceeds limit: MAX = %s1**

#### Variable Information

%s1 = Maximum number of characters

#### Explanation

The length of the EJB application name exceeds the limit.

#### System Action

Processing stops.

#### User Action

Change the EJB application name.

### 2.20.41 DEP4541

---

**EJB application being activated. Stop EJB application, then re-execute it.**

#### Explanation

The EJB application is being activated.

#### System Action

Processing stops.

#### User Action

If the EJB application has been started, stop the EJB application, then re-execute.

### 2.20.42 DEP4542

---

**Application storage folder does not exist. Create an application storage folder.**

#### Explanation

An application storage folder does not exist.

#### System Action

Processing stops.

#### User Action

Create an application storage folder.

### 2.20.43 DEP4543

---

**"-Xmx" cannot be specified in other options. Respecify it for the maximum memory of JavaVM.**

#### Explanation

"-Xmx" cannot be specified in the other options.

#### System Action

Processing stops.

#### User Action

Respecify it for the maximum memory of JavaVM.

### 2.20.44 DEP4544

---

**EJB application to be deployed cannot be found. Specify an EJB application, then re-execute the processing.**

#### Explanation

An EJB application to be deployed cannot be found.

#### System Action

Processing stops.

#### User Action

Specify an EJB application, then re-execute processing.

### 2.20.45 DEP4545

---

**A name used as EJB container name cannot be specified as EJB application name. Change the EJB application name or delete the EJB container.**

#### Explanation

An EJB container name cannot be specified as an EJB application name.

#### System Action

Processing stops.

#### User Action

Change the EJB application name or delete the EJB container.

### 2.20.46 DEP4562

---

**Information on the IJServer specified in the IJServer list definition is not found. Update the IJServer. NAME=%s1**

#### Variable Information

%s1 = IJServer name

#### Explanation

Information on the IJServer specified in the IJServer list definition is not found.

#### System Action

Processing stops.

#### User Action

Update the named IJServer.

### 2.20.47 DEP4563

---

**The EJB application to be deployed contains an error. Re-execute processing starting with expansion processing. PATH=%s1**

#### Variable Information

%s1 = File name

#### Explanation

The EJB application to be deployed contains an error.

#### System Action

Processing stops.

#### User Action

The indicated file is damaged. Correct the file and then deploy the EJB application again.

### 2.20.48 DEP4564

---

**The IJServer directory or a part of it does not exist. Delete the IJServer and recreate it. PATH=%s1**

#### Variable Information

%s1 = File name

#### Explanation

The IJServer directory or a part of it does not exist.

#### System Action

Processing stops.

#### User Action

Delete the IJServer and recreate it.

### 2.20.49 DEP4567

---

**The IJServer is active. Stop the IJServer and re-execute processing.**

#### Variable Information

%s1 = File name

#### Explanation

The IJServer is active.

### System Action

Processing stops.

### User Action

Stop the IJServer and re-execute processing.

## 2.20.50 DEP4568

---

**The implementation ID of the IJServer was deleted. Update the IJServer. ID=%s1**

### Variable Information

%s1 = Implementation ID

### Explanation

The implementation ID of the IJServer was deleted.

### System Action

Processing stops.

### User Action

Update the IJServer.

## 2.20.51 DEP4569

---

**The specified EJB application has already been deployed to an IJServer other than the specified IJServer. Change the EJB application name or undeploy the application, then re-execute processing. NAME=%s1**

### Variable Information

%s1 = EJB application name

### Explanation

The specified EJB application has already been deployed to an IJServer other than the specified IJServer.

### System Action

Processing stops.

### User Action

Specify another EJB application name or undeploy the existing application from the other IJServer, then re-execute processing.

If the EJB application only has a local interface, an application with the same name can be deployed in the following environments: Web+EJB[same JavaVM], Web+EJB[separate JavaVM], or EJB Only.

If the EJB application has a remote interface, an application with the same name can be deployed, depending on the type of IJServer.

Table 2.3 IJServer Application Deployment

Application to Deploy	Application Deployed		
	Web+EJB [1VM]	Web+EJB[Separate VM]	EJB Only
Web+EJB [1VM]	Yes	Yes (*1)	Yes (*1)
Web+EJB[Separate VM]	Yes	No	No
EJB Only	Yes	No	No

Yes: The same application can be deployed.

No: The same application cannot be deployed.

\*1 Deployed only in the one environment out of Web+EJB[Separate VM], or EJB Only.

If IIOB load balancing is executed when a remote Naming Service is used (and IPCOM is allocated between the remote Naming Service and the EJB application), the EJB application registration process also becomes the target of load balancing.

Accordingly, delete the EJB application object reference using the *OD\_or\_adm* command on all servers that are targets of load balancing and re-execute deployment.

If none of the above is applicable, the application with the same name is already registered in the naming service. Use the *OD\_or\_adm* command to delete the same named of application, and re-execute processing.

For more information, refer to "*OD\_or\_adm*" of "CORBA Service Operation Commands" in the Reference Manual (Command Edition).

## 2.20.52 DEP4570

---

**Failed to check whether there already is an application with the same name: Details=%s1**

### Variable Information

%s1 = Error information

### Explanation

An error occurred while checking if the specified application has already been deployed.

### System Action

Processing stops.

### User Action

A memory shortage may have occurred, increase the size of main memory or restart OS.

If the overwrite-mode deployment function is available, specify the option for the over-write deployment, and execute again.

If the problem is not solved, collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

## 2.20.53 DEP4571

---

**The EJB application has already been deployed: NAME=%s1**

### Variable Information

%s1 = EJB application name (EJB application name, )

### Explanation

The EJB application has already been deployed.

### System Action

Processing stops.

### User Action

Specify the option for over-write deployment, and execute again.

Alternatively, change the duplicate EJB application name and execute again.

## 2.20.54 DEP4572

---

**There is already EJB application of the same name besides specified IJServer. Change the EJB application name, or undeploy it from the other IJServer and then re-execute it: NAME=%s1: IMPLID=%s2: INTFID=%s3: INFO=%s4**

## Variable Information

%s1 = EJB application name

%s2 = Implementation repository ID

%s3 = Interface repository ID

%s4 = Information

## Explanation

An EJB application or CORBA application with the same name as the specified IJServer has already been deployed.

## System Action

Processing stops.

## User Action

- If the variable information implementation repository ID starts with IDL:com.fujitsu.interstage.j2ee.ijserver/

Change the EJB application name, or undeploy it from the other IJServer and then re-execute it.

IDL:com.fujitsu.interstage.j2ee.ijserver/{IJServer name}: Specify the IJServer name from 1.0.

An EJB application that only has a Local interface can deploy applications with the same name in the following environments:

- IJServer type environments in which the Web and EJB applications are operated in the same JavaVM
- IJServer type environments in which the Web and EJB applications are operated in different JavaVMs
- IJServer type environments in which only the EJB application is operated

An EJB application that has a Remote interface can deploy applications with the same name, depending on the IJServer type.

Applications that deploy	Applications that are deployed		
	IJServer(Web + EJB[1VM])	IJServer(Web + EJB[same JavaVM])	Only the EJB application is operated
IJServer(Web + EJB[1VM])	Yes	Yes	Yes
IJServer (Web + EJB [in different VMs])	No	No	No
Only the EJB application is operated	Yes	No	No

Yes: Can deploy with the same application name.

No: Cannot deploy with the same application name.

In environments in which Web and EJB applications are operated in different JavaVMs, only the EJB application is operated, deployment is only possible in one environment.

- Other implementation repository IDs

It means that an application name with the same name as the naming service has already been registered. In this case, use the *OD\_or\_adm* command to delete the application with the same name, and then re-execute.

Refer to "*OD\_or\_adm*" in the "Reference Manual (Command Edition)" for details.

## 2.20.55 DEP4573

**The EJB application you tried to deploy has already been deployed in another module: NAME=%s1: MODULE=%s2: DEPLOYED\_MODULE=%s3**

## Variable Information

%s1 = EJB application name

%s2 = Module name

%s3 = Name of the another module that has already been deployed

## Explanation

An EJB application with the same JNDI name as the EJB application you tried to deploy has already been deployed. Alternatively, the configuration of the module you tried to deploy by overwriting has been changed.

## System Action

Processing stops.

## User Action

If an EJB application with the same JNDI name has already been deployed, correct the application or change the EJB application name when the application is deployed so that the JNDI names do not conflict. If a module configuration is changed, the module cannot be overwritten. First undeploy the module, then redeploy it.

The method of checking for conflicts in EJB application names has changed in V7.0

## 2.20.56 DEP4574

---

**The EJB application that has already been deployed and the EJB application you tried to deploy by overwriting it are different. Undeploy the EJB application and then redeploy it.: NAME=%s1: MODULE=%s2: BEAN\_TYPE1=%s3: BEAN\_TYPE2=%s4**

## Variable Information

%s1 = EJB application name

%s2 = Modure name

%s3 = EJB application type that deploys

%s4 = EJB application type that is deployed

## Explanation

Processing stops.

## System Action

Undeploy the EJB application and then redeploy it.

## 2.21 DEP4700 to DEP4799

---

The following messages are displayed by IJServer operations.

### 2.21.1 DEP4700

---

**An error occurred during writing to the name conversion file. Check whether FJebeProperties.xml exists or whether coding format has errors.**

## Explanation

An error occurred during writing to the name conversion file.

## System Action

Continue processing.

## User Action

- Deploying

Check if FJebeProperties.xml exists, and if the description format is correct. To use the name conversion function, change the configuration in FJebeProperties.xml.

- Undeploying

It is possible that there is still information for the undeployed EJB application in FJebeProperties.xml. Delete unnecessary information.

## 2.22 DEP4800 to DEP4899

---

These messages are displayed on the Interstage Management Console.

### 2.22.1 DEP4800

---

#### An invalid value is defined for the IJServer: %s1

##### Variable Information

%s1 = Error information

##### Explanation

An invalid value is defined for the IJServer.

##### System Action

Processing stops.

##### User Action

Correct the error and rerun the process. Refer to the *isj2eeadmin* command in the Reference Manual (Commands) for definition details.

### 2.22.2 DEP4801

---

#### Cannot process the operation : %s

##### Variable Information

%s1 = Error information

##### Explanation

There is an error in the IJServer definition.

##### System Action

Processing stops.

##### User Action

Correct the error and rerun the process. If the specified data source name does not exist, specify a valid data source name or register the JDBC data source to be used and rerun the process.

Refer to the *isj2eeadmin* command in the Reference Manual (Commands) for definition details.

## 2.23 DEP4900 to DEP4999

---

The following messages are displayed by IJServer operations, and deploying/undeploying EJB applications.

### 2.23.1 DEP4997

---

---

**An unexpected error occurred in the processing of the CORBA service, contact a Systems Engineer.: INFO=%s1**

Variable Information

%s1 = Detail code

Explanation

An unexpected error occurred in the processing of the CORBA service.

System Action

Processing stops.

User Action

It might be the case that the CORBA service is not available for current use. Try to establish the cause of the problem from the details code, and then re-execute processing.

If the problem is not resolved by taking the above action, contact your systems engineer.

---

## 2.23.2 DEP4998

**An abnormality occurred in the system environment. The package has not been installed correctly and then install the package.**

Explanation

An abnormality occurred in the system environment for one of the following reasons:

- The package has not been installed correctly

**Solaris32/64 Linux32/64**

- The dependent package has not been installed

System Action

Processing stops.

User Action

- The package has not been installed correctly

Reinstall the package

**Solaris32/64 Linux32/64**

- The dependent package has not been installed

Refer to "Package Dependency Relationships" in the "Installation Guide", and then install the dependent package.

---

## 2.23.3 DEP4999

**Unexpected error occurred. Contact Fujitsu SE: INFO = %s1**

Variable Information

%s1 = Detail code

Explanation

An unexpected error occurred because:

- The CORBA service may not be available.
- The business system that controls the WorkUnit may not be available.
- A conflict may have occurred among files in the J2EE common directory.

- The EJB application is running or files cannot be handled because system files are being edited.

### System Action

Processing stops.

### User Action

Correct the problem as appropriate, then re-execute.

If the problem is not resolved, delete IJServer, create it again and re-execute.

If the problem is still not resolved, note the information in the message and use the iscollectinfo command to collect diagnostic information. Send the error information to your systems engineer.

## 2.24 DEP5000 to DEP5099

---

These messages are output during execution of the ijsdeployment/ij sundeployment/ij slistapl command.

### 2.24.1 DEP5003

---

**A memory shortage occurred. Memory size = %s1, Function = %s2**

#### Variable Information

%s1 = Memory size

%s2 = Name of the function in which an error occurred

#### Explanation

A memory shortage occurred.

#### System Action

Processing stops.

#### User Action

Increase the size of main memory, add a swap area, or terminate unnecessary applications.

### 2.24.2 DEP5004

---

**Access to a file failed. File name=%s1, Detail=%s2**

#### Variable Information

%s1 = File name

%s2 = Detail code, see explanation below

#### Explanation

Access to a file failed.

#### System Action

Processing stops.

#### User Action

The possible causes according to the detail code are listed below. Remove the cause and re-execute the command.

Detail code	Cause and Action
001	Possible causes are as follows: - An I/O error occurred

Detail code	Cause and Action
	<p>Check the file path name.</p> <ul style="list-style-type: none"> <li>- A wildcard was used for the file path name</li> </ul> <p>Specify a file path name that does not use a wildcard and re-execute.</p>
002	The target file may not exist. Check the file path indicated in Variable Information.
003	<p>Possible causes are as follows:</p> <ul style="list-style-type: none"> <li>- The file shown in the variable information is a directory. Check that the file shown in the variable information is not a directory.</li> <li>- Access authority is not granted to the file. Check the access authority of the file indicated in Variable Information.</li> </ul>
004	It means that there may be insufficient memory. Increase the memory where necessary, and add swap areas or stop unnecessary applications.
005	It means that the maximum value for fileopen may have been reached temporarily. Close unnecessary files and then re-execute.
006	It means that the file path shown in the variable information may be too long. Set a shorter file path and then re-execute.
007	It means that there may be too many symbolic links for resolving the file path shown in the variable information. Reduce the number of symbolic links and then re-execute.
008	It means that the configuration elements in the file path shown in the variable information may contain an element that is not a directory. Check that the configuration elements in the file path only contain elements that are directories.
009	It means that the file shown in the variable information may already exist. Check the file path name shown in the variable information.
010	It means that the disk capacity may be insufficient. Check the disk capacity, and adjust or increase it where necessary.
011	It means that a device contained in the file path name shown in the variable information may not exist. Check the file path name shown in the variable information.
other	<p>Possible causes are as follows:</p> <ul style="list-style-type: none"> <li>- Another user may be accessing the specified file. Re-execute the command later.</li> <li>- The file or directory may be damaged. Check the file or directory of the path indicated in Variable Information.</li> </ul>

### 2.24.3 DEP5005

#### An invalid argument was specified with an option. Option=%s1, Argument=%s2

##### Variable Information

%s1 = Option

%s2 = Argument

##### Explanation

An invalid argument was specified with an option.

##### System Action

Processing stops.

##### User Action

The argument indicated in Variable Information is invalid.

Correct the error and re-execute the command.

## 2.24.4 DEP5006

---

### Two or more same options are specified. Option=%s1

#### Variable Information

%s1 = Option

#### Explanation

The option indicated in the Variable Information was specified more than once.

#### System Action

Processing stops.

#### User Action

Specify the option correctly, and re-execute the command.

## 2.24.5 DEP5010

---

### An invalid option was specified. Option=%s1

#### Variable Information

%s1 = Option

#### Explanation

The specified option indicated in the Variable Information is invalid.

#### System Action

Processing stops.

#### User Action

Specify the option correctly, and re-execute the command.

## 2.24.6 DEP5011

---

### The command usage is invalid.

#### Explanation

The command usage is invalid.

#### System Action

Processing stops.

#### User Action

Specify the command correctly, and re-execute the command.

The format "ijsundeployment -n name -t targetname ..." can be used for a WorkUnit of IIServer created with Interstage Application Server V7 or later.

The format "ijsundeployment -n name -k kind -a application ..." can be used for a WorkUnit of IIServer created with Interstage Application Server V6.

## 2.24.7 DEP5020

---

---

## The user is not authorized to execute the command.

### Explanation

The user who attempted to execute the command lacks necessary authority.

### System Action

Processing stops.

### User Action

Perform following corrective actions:

- A user having the administrator authorization re-executes the command.

---

## 2.24.8 DEP5023

---

### The command execution environment is invalid. Detail=%s1, Function=%s2

#### Variable Information

%s1 = Detail code

%s2 = Name of the function in which an error occurred

#### Explanation

The command execution environment is invalid.

#### System Action

Processing stops.

#### User Action

The possible causes identified in the detail code are:

- When the detail code is 001, possible causes are as follows:
  - An invalid value may be specified for the environment variable CLASSPATH. Check the environment variable.
  - The Java environment in which the command operates cannot be found. Define the Java environment information in the following command environment.
  - Abnormalities may exist in the execution environment of Java.

#### Command Environment Setup File

This environment setup file is used to define information required for following command operations:

- ijsdeployment
- ijsundeployment
- ijslistapl

Basically, the environment setup file need not be modified.

If modification is needed, use an editor to edit the file.

The edited information becomes effective from the next execution.

#### Location of Command Environment Setup File

The location and name of the environment setup file are as follows:

**Windows32/64**

[Interstage installation folder]\J2EE\etc\ijscomprop.conf

Solaris32/64 Linux32/64

/opt/FJSVj2ee/etc/ijscmprop.conf

### Definitions in the Command Environment Setup File

Key	Explanation	Default
java.home	Specifies the path of the JDK/JRE installation directory when changing the JavaVM to be used by the command. The command executes the following command in the specified directory:  Windows32/64  bin\java.exe  Solaris32/64 Linux32/64  bin/java	Windows32/64  Path environment variable  Solaris32/64 Linux32/64  For default value, refer to Checking the Operating Environment in "Operating J2EE Applications" of the J2EE User's Guide.
java.maxMemory	Specifies the maximum size (MB) of memory to be allocated to the JavaVM that is started in an extension of command execution.	It operates by 512.

### Example of Definition in Command Environment Setup File

An example of the definition in the command environment setup file is shown below.

Use the "key=value" format and delimit each statement with a linefeed.

Place "#" at the beginning of a comment line.

When you describe a blank character to a value, bundle with double quotation marks and describe.

If the value of a definition item is invalid, the default is used for operation.

Windows32/64

```
# Interstage J2EE Deployment Command Configuration file
java.home=C:\Interstage\JDK6
          *1 Specify this value properly according to the environment.
java.maxMemory=512
```

Solaris32/64 Linux32/64

```
# Interstage J2EE Deployment Command Configuration file
java.home=/opt/FJSVawjbc/jdk6
          *1 Specify this value properly according to the environment.
java.maxMemory=512
```

- When the detail code is 002, an invalid value may be specified for the environment variable IS\_HOME. Check the environment variable. Correct the cause of the error and re-execute the command.

## 2.24.9 DEP5024

### The Interstage JMX service is not installed.

#### Explanation

The Interstage JMX service is not installed.

Windows32/64

Alternatively, the value specified for the "IS\_HOME" environment variable is invalid.

## System Action

Processing stops.

## User Action

Install the Interstage JMX service.

**Windows32/64**

If the Interstage JMX service is installed, the "IS\_HOME" environment variable setting may be invalid. Check that the Interstage installation directory was specified.

## 2.24.10 DEP5050

---

**Deployment processing has been completed. File name=%s1**

### Variable Information

%s1 = Name of the specified file to be deployed

### Explanation

Application deployment is completed normally.

## 2.24.11 DEP5051

---

**Undeployment processing has been completed.**

### Explanation

Application undeployment is completed normally.

## 2.24.12 DEP5052

---

**The name conversion definition has been updated.**

### Explanation

Name conversion definition updating is completed normally.

## 2.24.13 DEP5053

---

**The specified application has not been deployed. Detail=%s1**

### Variable Information

%s1 = Specified application name

### Explanation

The specified application cannot be undeployed because it has not been deployed.

### System Action

The system continues processing if two or more applications are specified to be undeployed.

### User Action

Re-execute the command with a valid application name specified.

### Note

This message is also displayed if the type of the application to be undeployed is incorrect.

Check whether the type of the application to be undeployed is specified correctly.

## 2.24.14 DEP5054

---

### No IJServer exists.

#### Explanation

No information is available for list output because no IJServer exists.

#### System Action

Processing stops.

#### User Action

Create an IJServer, and re-execute the command.

## 2.24.15 DEP5060

---

### Interstage is stopped in all forced stop mode. Start Interstage and re-execute the command.

#### Explanation

Interstage is stopped in all forced stop mode.

#### System Action

Processing stops.

#### User Action

Start Interstage and re-execute the command.

## 2.24.16 DEP5061

---

### The specified IJServer does not exist. Detail=%s1

#### Variable Information

%s1 = Specified IJServer name

#### Explanation

The specified IJServer does not exist.

#### System Action

Processing stops.

#### User Action

Specify an existing IJServer, and re-execute the command.

## 2.24.17 DEP5062

---

### The specified IJServer is active. Stop the IJServer and re-execute the command. Detail=%s1

#### Variable Information

%s1 = Specified IJServer name

#### Explanation

The specified IJServer is active.

#### System Action

Processing stops.

## User Action

Stop the IJServer and re-execute the command.

## 2.24.18 DEP5063

---

### Access to the specified IJServer failed. Detail=%s1

#### Variable Information

%s1 = Specified IJServer name

#### Explanation

Access to the specified IJServer failed.

#### System Action

Processing stops.

#### User Action

Another user may be accessing the IJServer. Re-execute the command later.

## 2.24.19 DEP5064

---

### Access to the specified file to be deployed failed. Detail=%s1

#### Variable Information

%s1 = Specified file name to be deployed

#### Explanation

An I/O error occurred during access to the specified file to be deployed.

#### System Action

Processing stops.

#### User Action

Possible causes are:

- The file or directory on the path indicated in Variable Information may be incorrect. Check whether the directory or path is specified correctly.
- Another user may be in use of the file indicated in Variable Information. Re-execute the command later.
- Inappropriate access authority may be granted to the file or directory indicated in Variable Information. Check the access authority granted to the file or directory.
- The file given in the variable information may be different from the file to be deployed. Specify the correct file for deployment and rerun the process.

Correct the cause of the error and re-execute the command.

## 2.24.20 DEP5065

---

### No application is deployed to the specified IJServer. Detail=%s1

#### Variable Information

%s1 = Specified IJServer name

#### Explanation

No application is deployed to the specified IJServer.

## System Action

Processing stops.

## User Action

Specify an IJServer to which an application has been deployed, and re-execute the command.

## 2.24.21 DEP5066

---

### An error occurred during internal processing. Detail=%s1

#### Variable Information

%s1 = Detail code

#### Explanation

An error occurred during internal processing.

#### System Action

Processing stops.

#### User Action

The possible causes according to the detail code are:

- For detail codes 001 to 003, the system memory or the maximum memory of JavaVM in which a command runs may be insufficient. Stop unnecessary services, or restart the system. If necessary, increase the size of system memory.

The maximum memory size of JavaVM can be defined with the command environment setting file.

For the command environment definition file, see [User Action] of DEP5023.

- When the detail code is 010 to 011, possible causes are as follows:
  - Another user may be accessing the specified file or IJServer. Re-execute the command later.
  - The specified file or directory may be damaged.

Correct the cause of the error and re-execute the command.

If the problem is not solved, collect log file `"/opt/FJSVj2ee/var/isdeploy/ijscm.log"`, collect diagnostic information using the `iscollectinfo` command, and then contact your systems engineer.

## 2.24.22 DEP5067

---

### This Java version is not supported. Version=%s1

#### Variable Information

%s1 = Java version

#### Explanation

JDK 6 is the required Java environment in which to run commands.

#### System Action

Processing stops.

#### User Action

Define the Java environment in which commands run with the command environment setting file.

For details on changing the command environment definition file, see [User Action] of DEP5023.

## 2.24.23 DEP5068

---

### An error occurred during connection with the Interstage JMX service.

#### Explanation

An error occurred during connection with the Interstage JMX service.

#### System Action

Processing stops.

#### User Action

Check the previous message, then re-execute the command.

This message is also displayed if the Interstage JMX service is not active.

Check whether the Interstage JMX service is active.

## 2.24.24 DEP5069

---

### The name conversion definition could not be updated.

#### Explanation

The name conversion definition could not be updated.

#### System Action

Processing stops.

#### User Action

Possible causes are:

- Another user may be updating the definition of the file to be deployed. Re-execute the command later.
- The name conversion definition may contain an error. Correct the definition by the following Examples.

#### Example(J2EE application client, Web application)

```
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE fujitsu-ebe-definition SYSTEM 'fujitsu-ebe-definition.dtd'>
<fujitsu-ebe-definition>
  <client> or <web>
    <app-name>GetBeans</app-name>
    <ejb-ref-entry>
      <ejb-ref-name>ejb/EntBean</ejb-ref-name>
      <jndi-name>EB1</jndi-name>
    </ejb-ref-entry>
    <res-entry>
      <res-ref-name>jdbc/DataSource</res-ref-name>
      <datasource-name>DS1</datasource-name>
    </res-entry>
    <res-entry>
      <res-ref-name>jms/TopicCF</res-ref-name>
      <datasource-name>CF1</datasource-name>
    </res-entry>
    <res-env-entry>
      <res-env-ref-name>jms/Topic</res-env-ref-name>
      <environment-name>DN1</environment-name>
    </res-env-entry>
  </client> or </web>
</fujitsu-ebe-definition>
```

## Example(EJB Application)

```
<?xml version="1.0"?>
<!DOCTYPE fujitsu-ebe-definition SYSTEM 'fujitsu-ebe-definition.dtd'>
<fujitsu-ebe-definition >
  <ejb>
    <group-name>MyServer</group-name>
    <jndi-name>OperationBean</jndi-name>
    <ejb-ref-entry>
      <ejb-ref-name>ejb/CallBean</ejb-ref-name>
      <jndi-name>AccountBean</jndi-name>
    </ejb-ref-entry>
    <res-entry>
      <res-ref-name>jms/TopicCF</res-ref-name>
      <datasource-name>CatalogCF</datasource-name>
    </res-entry>
  </ejb>
  <ejb>
    <group-name>MyServer</group-name>
    <jndi-name>EmployeeBean</jndi-name>
    <ejb-ref-entry>
      <ejb-ref-name>ejb/CallBean</ejb-ref-name>
      <jndi-name>AccountBean</jndi-name>
    </ejb-ref-entry>
    <res-entry>
      <res-ref-name>jms/TopicCF</res-ref-name>
      <datasource-name>CatalogCF</datasource-name>
    </res-entry>
  </ejb>
</fujitsu-ebe-definition>
```

Correct the cause of the error, and re-execute the command.

## 2.24.25 DEP5070

---

**The undeployment processing has been completed: MODULE=%s1**

### Variable Information

%s1: Module name

### Explanation

The undeployment processing for the module has ended normally.

## 2.24.26 DEP5071

---

**The undeployment processing has failed: MODULE=%s1**

### Variable Information

%s1: Module name

### Explanation

The undeployment processing for the module has failed.

### System Action

Stops processing the module. Undeploys the modules that follow if multiple modules have been selected and undeployed.

### User Action

Take the action indicated in the message output immediately before this message, and execute the command again.

## 2.24.27 DEP5072

---

**The undeployment processing has been completed: Application name=%s1**

### Variable Information

%s1: Application name

### Explanation

The undeployment processing for the application ended normally.

## 2.24.28 DEP5073

---

**The undeployment processing has failed: Application name=%s1**

### Variable Information

%s1: Application name

### Explanation

The undeployment processing for the application has failed.

### System Action

Stops processing the application. Undeploys the applications that follow if multiple applications have been selected and undeployed.

### User Action

Take the action indicated in the message output immediately before this message, and execute the command again.

## 2.24.29 DEP5074

---

**The deactivation processing for the module has been executed: MODULE=%s1**

### Variable Information

%s1: Module name

### Explanation

The deactivation processing for the module has been executed.

## 2.24.30 DEP5075

---

**The deactivation processing for the module has failed: MODULE=%s1**

### Variable Information

%s1: Module name

### Explanation

The deactivation processing for the module has failed.

### System Action

Stops processing the module. Undeploys the modules that follow if the message was output when multiple modules were selected and undeployed.

### User Action

Take the action indicated in the message output immediately before this message, and execute the command again.

## 2.24.31 DEP5076

---

**The activation processing for the module has been executed: MODULE=%s1**

### Variable Information

%s1: Module name

### Explanation

The activation processing for the module has been executed.

## 2.24.32 DEP5077

---

**The activation processing for the module has failed: MODULE=%s1**

### Variable Information

%s1: Module name

### Explanation

The activation processing for the module has failed.

### System Action

Stops processing the module. Undeploys the modules that follow if the message was output when multiple modules were selected and undeployed.

### User Action

Take the action indicated in the message output immediately before this message, and reactivate the module again.

## 2.24.33 DEP5078

---

**The undeployment processing has failed: File name=%s1**

### Variable Information

%s1: File name

### Explanation

The undeployment processing has failed.

### System Action

Processing stops.

### User Action

Take the action indicated in the message output immediately before this one, and execute the command again.

## 2.24.34 DEP5079

---

**The command cannot be executed because Interstage is starting up.**

### Explanation

The command cannot be executed because Interstage is starting up.

### System Action

Stops processing.

#### User Action

Wait for a while and then re-execute the command.

### 2.24.35 DEP5080

---

**The command cannot be executed because Interstage is stopping.**

#### Explanation

The command cannot be executed because Interstage is stopping.

#### System Action

Stops processing.

#### User Action

Re-execute the command after Interstage has started up.

### 2.24.36 DEP5081

---

**The command cannot be executed because Interstage has already been started.**

#### Explanation

The command cannot be executed because Interstage has already been started.

#### System Action

Stops processing.

#### User Action

Re-execute the command after Interstage has started up.

## 2.25 DEP5100 to DEP5199

---

These messages are output during execution of the `ijsdeployment/ijsundeployment/ijslistapl` command.

### 2.25.1 DEP5100

---

**This operation cannot be executed on the managed server that the application operation mode set to the management operation mode.**

#### Explanation

This operation cannot be performed on managed servers or Admin servers where the application operation type is set to batch operation mode.

#### System Action

Processing stops.

#### User Action

Log in to the management server with the Interstage Management Console, and execute the same operation for this server.

### 2.25.2 DEP5101

---

**This operation cannot be executed on the control server.**

#### Explanation

This operation cannot be executed on the control server.

## System Action

Processing stops.

## User Action

Select the appropriate option to execute the operation on the control server, and re-execute the processing.

To execute the operation on a managed server, re-execute the processing on a managed server.

## 2.25.3 DEP5199

---

### An error occurred during internal processing. Detail=%s1

#### Variable Information

%s1 = Detail code

#### Explanation

An error occurred during internal processing.

#### System Action

Processing stops.

#### User Action

**Solaris32/64 Linux32/64**

If the detailed code is "001", the user that executed the command may not have the required authority. For details on the authority required to execute commands, refer to 'Notes on Using Commands' in the "Reference Manual (Command Edition)".

Otherwise, collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

## 2.26 DEP5200 to DEP5299

---

These messages are output during execution of the *isj2eadmin* command.

### 2.26.1 DEP5201

---

#### Memory shortage occurred

#### Explanation

There is insufficient memory.

#### System Action

Processing stops.

#### User Action

Wait a few moments and then rerun the process.

If this message appears frequently, refer to the Tuning Guide to estimate the amount of memory required to run Interstage, and verify that sufficient system memory is available. If there is sufficient memory, the problem may result from a memory shortage in another application. Verify that enough memory is available by estimating the memory requirements of the other applications running on the same machine.

If this investigation reveals a memory shortage, contact the system administrator to have the main memory increased or the swap area expanded.

### 2.26.2 DEP5202

---

---

## Failure execution of command

### Explanation

The process could not be executed because an error occurred during command execution.

### System Action

Processing stops.

### User Action

If the message below was displayed before this message, then take the action below.

#### Message

error occurred during initialization of VM  
couldn't reserve enough space for object HEAP

#### Cause

The attempt to acquire Java heap area failed due to insufficient memory.

#### Action

Customize "java.maxMemory" of the environment configuration file for the isj2eeadmin command, by reducing the value from 512 to 256, for example, in order to reduce the memory used by the command.

- File to be edited

Windows32/64

```
[Interstage installation folder]\J2EE\etc\ijscomprop.conf
```

Solaris32/64 Linux32/64

```
/opt/FJSVj2ee/etc/ijscomprop.conf
```

- Key

java.maxMemory

If the message displayed was other than the one above, then correct the indicated problem.

If there were no other messages, collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

---

## 2.26.3 DEP5299

### system error occurred: CODE=%d

#### Variable Information

%d = System error information

#### Explanation

A system error resulted from a problem such as an environment error.

#### System Action

Processing stops.

#### User Action

Collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

## 2.27 DEP6000 to DEP6099

---

### 2.27.1 DEP6005

---

**The deployed module contains the isws-server-config.wsdd file.**

Explanation

The isws-server-config.wsdd file is in the deployment module.

System Action

Processing stops.

User Action

Remove isws-server-config.wsdd from the deployment module.

### 2.27.2 DEP6009

---

**The module containing the Web service could not be deployed because the container Web service is not enabled.**

Explanation

The module containing the Web service could not be deployed because the container Web service is not enabled.

System Action

Processing stops.

User Action

Enable Web Service function for the container, or delete the Web service contained in the module.

The Web service container can only be enabled when the IJServer type is 'Web and EJB Applications run in the same Java VM'.

### 2.27.3 DEP6010

---

**The module containing the Web service cannot be deployed if the Auto Reload function is used.**

Explanation

The module containing the Web service cannot be deployed if the Auto Reload function is used.

System Action

Stops processing.

User Action

Change the Auto Reload settings and then re-execute processing.

# Chapter 3 Messages Beginning with 'EJB'

This chapter describes the messages displayed by the EJB (Enterprise Java Beans) Service.

## 3.1 EJB Service Message Format

### Message Output Format

The format for messages output by the EJB Service is as follows:

Windows32/64

```
Label : Error Type : Message Number : Message Text
```

Solaris32/64 Linux32/64

```
UX:Label : Error Type : Message Number : Message Text
```

#### Label

Contains the character string EJB or a command name.

- EJB : Indicates an EJB Service message.
- Command name: Displays the name of the submitted command.

#### Error Type

Indicates the type of message:

- INFO: Information message
- ERROR: Error message
- WARNING: Warning message

#### Message Number

Displays the message number.

#### Message Text

Displays the system status or system error.

### Message Output Destination

Any EJB Service message is output to the system log.

Command messages are displayed in the command prompt window in which the command has been entered.

## 3.2 EJB Customize Tool Message Format

### Message Output Format

The format for messages output by the EJB Customize Tool is as follows:

Message Text

```
Label : Message Number : Error Type - Customize Code - Class Number - Method Number
```

#### Message Text

Displays the system status or system error.

#### Label

EJB: EJB Service message

### Message Number

Displays the message number.

### Error Type

Indicates the type of message:

- I: Information message
- S: Error message
- W: Warning message

### Customize Code

Variables: Two-digit numeric value

### Class Number

Variables: Three-digit numeric value.

Because this value is not fixed, it is expressed in 'xxx' format as in [3.20 EJB3000 to EJB3099](#) and [3.26 EJB3800 to EJB3899](#).

### Method Number

Variables: Four-digit numeric value.

Because this value is not fixed, it is expressed in 'xxxx' format as in [3.20 EJB3000 to EJB3099](#) and [3.26 EJB3800 to EJB3899](#).

### Note

The customize code, class number, and method number are internal codes used by your software supplier to determine the status of the EJB Customize Tool.

## 3.3 EJB0100 to EJB0199

---

This section details the messages with message numbers between EJB0100 and EJB0199.

### 3.3.1 EJB0100

---

#### **EJB: ERROR:EJB0100: Insufficient memory**

#### Explanation

There is not enough memory available.

#### System Action

Stops processing.

#### User Action

Wait for a while, then retry processing. If this message appears frequently, refer to the Interstage Application Server Tuning Guide, reestimate the memory required for EJB Service operation, and confirm that there is enough memory.

If there is enough memory for the EJB Service, there may be insufficient memory to run other applications. Reestimate the amount of memory needed for other applications running on the same machine.

If there is not enough memory, contact the system administrator. The system administrator must either increase the size of the main memory or increase the size of the page file.

### 3.3.2 EJB0101

---

#### **EJB: ERROR:EJB0101: I-O error: PATH='%s'**

## Variable Information

%s = File name

## Explanation

An I/O error occurred.

## System Action

Stops processing.

## User Action

Restore the file with the I/O error from the backup.

### 3.3.3 EJB0102

---

Windows32/64

#### **EJB: ERROR:EJB0102: I-O error in current folder**

## Explanation

An I/O error occurred in the current folder.

## System Action

Stops processing.

## User Action

Restore normal operation to the disk drive that contains the current folder.

Solaris32/64 Linux32/64

#### **EJB: ERROR:EJB0102: I-O error in current directory**

## Explanation

An I/O error occurred in the current directory.

## System Action

Stops processing.

## User Action

Restore normal operation to the disk drive that contains the current directory.

### 3.3.4 EJB0103

---

#### **EJB: ERROR:EJB0103: I-O error in Application Folder**

## Explanation

An I/O error occurred in the Application Folder.

## System Action

Stops processing.

## User Action

Restore the Application Folder from the backup.

### 3.3.5 EJB0110

---

#### **EJB: ERROR:EJB0110: Insufficient system resource**

## Explanation

There are not enough System resources available.

## System Action

Stop processing.

## User Action

Wait for a short period of time, then retry processing. If this message appears frequently, refer to the Interstage Application Server Tuning Guide, reestimate the System resources required for EJB Service operation, and confirm that there are enough System resources.

### 3.3.6 EJB0111

---

#### **EJB: ERROR:EJB0111: Acquisition of IPC resources failed**

## Explanation

Could not acquire the IPC resource because a necessary IPC resource was using it.

## System Action

Stops processing.

## User Action

Refer to the Interstage Application Server Tuning Guide, reestimate the System resources required for EJB Service operation, and confirm that there are enough System resources.

### 3.4 EJB0200 to EJB0299

---

This section details the messages with message numbers between EJB0200 and EJB0299.

#### 3.4.1 EJB0200

---

**Windows32/64**

#### **EJB: ERROR:EJB0200: Incorrect file name or folder name : PATH='%s'**

## Variable Information

%s = File or folder name

## Explanation

The file or folder name is incorrect.

## System Action

Stops processing.

## User Action

Specify the correct file or folder name, and then reexecute the command.

**Solaris32/64** **Linux32/64**

#### **EJB: ERROR:EJB0200: Incorrect file name or directory name : PATH='%s'**

## Variable Information

%s = File or directory name

## Explanation

The file or directory name is incorrect.

### System Action

Stops processing.

### User Action

Specify the correct file or directory name, and then reexecute the command.

## 3.4.2 EJB0201

---

**EJB: ERROR:EJB0201: Specified path name length exceeds limit : MAX=%s**

### Variable Information

%s = Maximum length of path name

### Explanation

The specified path name is too long.

### System Action

Stops processing.

### User Action

Specify a path name within the allowed number of bytes, and then reexecute the command.

## 3.4.3 EJB0202

---

**Windows32/64**

**EJB: ERROR:EJB0202: File or folder not exist: PATH='%s'**

### Variable Information

%s = File or folder name

### Explanation

The possible causes are:

- The file or folder does not exist

### System Action

Stops processing.

### User Action

- When a file or folder does not exist.  
Check the path, and then reexecute the command.

**Solaris32/64 Linux32/64**

**EJB: ERROR:EJB0202: File or directory not exist: PATH='%s'**

### Variable Information

%s = File or directory name

### Explanation

The possible causes are:

- The file or directory does not exist
- The XML Library has not been installed.
- The FJSVj2ee package is not installed.

### System Action

Stops processing.

### User Action

- When a file or directory does not exist.  
Check the path, and then reexecute the command.
- When the XML Library has not been installed.  
Install the XML Library.
- When the FJSVj2ee package is not installed  
Install the FJSVj2ee package.

## 3.4.4 EJB0203

---

### EJB: ERROR:EJB0203: File opening failed: FILE='%s'

#### Variable Information

%s = File name

Windows32/64

#### Explanation

The file could not be opened because:

- The file is being used by other applications.
- The entire file or part of the file is locked by other applications.

### System Action

Stops processing.

### User Action

Terminate other applications that are using the file, and then reexecute the command.

Solaris32/64 Linux32/64

#### Explanation

The file could not be opened because:

- The file is being used by other applications.
- The entire file or part of the file is locked by other applications.
- The maximum number of files that can be opened has been exceeded.

### System Action

Stops processing.

### User Action

Terminate other applications that are using the file, and then reexecute the command.

If the maximum number of files that can be opened has been exceeded, use the *ulimit* command to increase the number of file descriptors, and then reexecute the command.

## 3.4.5 EJB0204

---

---

Windows32/64

**EJB: ERROR:EJB0204: Folder deletion failed : PATH='%s'**

Variable Information

%s = Folder name

Explanation

The folder could not be deleted because it contains files.

System Action

Stops processing.

User Action

Check whether the files in the folder can be deleted.

If the files can be deleted, check whether they are being used by other applications. If the files are being used by another application, terminate the application, and then reexecute the command.

If the files cannot be deleted, check whether you have the access permission to delete the files. If not, either change the access permission of the files or change your access permission so that you can delete them. Delete the files, and then reexecute the command.

---

Solaris32/64 Linux32/64

**EJB: ERROR:EJB0204: Directory deletion failed : PATH='%s'**

Variable Information

%s = Directory name

Explanation

The directory could not be deleted because it contains files.

System Action

Stops processing.

User Action

Check whether the files in the directory can be deleted.

If the files can be deleted, check whether they are being used by other applications. If the files are being used by another application, terminate the application, and then reexecute the command.

If the files cannot be deleted, check whether you have the access permission to delete the files. If not, either change the access permission of the files or change your access permission so that you can delete them. Delete the files, and then reexecute the command.

---

### 3.4.6 EJB0205

---

Windows32/64

**EJB: ERROR:EJB0205: Path name not specifying folder : PATH='%s'**

Variable Information

%s = Path name

Explanation

A non-folder name was specified in the path name.

System Action

Stops processing.

User Action

Correct the path name, and then reexecute the command.

---

Solaris32/64 Linux32/64

### **EJB: ERROR:EJB0205: Path name not specifying directory : PATH='%s'**

#### Variable Information

%s = Path name

#### Explanation

A non-directory name was specified in the path name.

#### System Action

Stops processing.

#### User Action

Correct the path name, and then reexecute the command.

---

## 3.4.7 EJB0210

Windows32/64

### **EJB: ERROR:EJB0210: No access permission to file or folder: PATH='%s'**

#### Variable Information

%s = File or folder name

#### Explanation

The access permission set for the specified file (or folder) does not allow it to be accessed.

#### System Action

Stops processing.

#### User Action

Change your access permission so that you can access the file or folder, or have it accessed by a user with the required permission.

---

Solaris32/64 Linux32/64

### **EJB: ERROR:EJB0210: No access permission to file or directory: PATH='%s'**

#### Variable Information

%s = File or directory name

#### Explanation

The access permission set for the specified file (or directory) does not allow it to be accessed.

#### System Action

Stops processing.

#### User Action

Change your access permission so that you can access the file or directory, or have it accessed by a user with the required permission.

---

## 3.4.8 EJB0211

Windows32/64

### **EJB: ERROR:EJB0211: No access permission to current folder**

#### Explanation

The access permission set for the current folder does not allow it to be accessed.

## System Action

Stops processing.

## User Action

Change your access permission so that you can access the current folder, or have it accessed by a user with the required permission.

---

Solaris32/64 Linux32/64

### **EJB: ERROR:EJB0211: No access permission to current directory**

## Explanation

The access permission set for the current directory does not allow it to be accessed.

## System Action

Stops processing.

## User Action

Change your access permission so that you can access the current directory, or have it accessed by a user with the required permission.

## 3.4.9 EJB0212

---

### **EJB: ERROR:EJB0212: No access permission to Application Folder: PATH='%s'**

## Variable Information

%s = Application Folder name

## Explanation

The access permission set for the Application Folder does not allow it to be accessed.

## System Action

Stops processing.

## User Action

Change your access permission so that you can access the Application Folder, or have it accessed by a user with the required permission.

## 3.4.10 EJB0213

---

### **EJB: ERROR:EJB0213: No access permission to definition file: FILE='%s'**

## Variable Information

%s = Definition file name

## Explanation

The access permission set for the EJB service definition file does not allow it to be accessed.

## System Action

Stops processing.

## User Action

Change your access permission so that you can access the EJB Service definition file, or have it accessed by a user with the required permission.

## 3.4.11 EJB0214

---

### **EJB: ERROR:EJB0214: No access permission to EJB application definition: FILE='%s'**

## Variable Information

%s = EJB application definition file name

## Explanation

The access permission set for the EJB application definition file does not allow it to be accessed.

## System Action

Stops processing.

## User Action

Change your access permission so that you can access the EJB application definition file, or have it accessed by a user with the required permission.

## 3.4.12 EJB0220

---

**EJB: ERROR:EJB0220: Insufficient file system size : PATH='%s'**

## Variable Information

%s = File or folder name

## Explanation

The size of the file system including the specified file or folder is insufficient.

## System Action

Stops processing.

## User Action

Ensure sufficient free space in the file system, and then reexecute the process.

## 3.4.13 EJB0221

---

**EJB: ERROR:EJB0221: Insufficient file system size for Application Folder**

## Explanation

The size of the file system in which the Application Folder is stored is insufficient.

## System Action

Stops processing.

## User Action

Ensure sufficient free space in the file system where the Application Folder is stored, and then reexecute the process.

## 3.5 EJB0300 to EJB0399

---

This section details the messages with message numbers between EJB0300 and EJB0399.

### 3.5.1 EJB0300

---

**EJB: ERROR:EJB0300: CORBA Service not activated.**

## Explanation

Processing cannot be executed because the CORBA Service has not been activated.

## System Action

Stops processing.

## User Action

Activate the CORBA Service, and then reexecute the command. For details of the CORBA Service, refer to the *S99startod* command or the *isstart* command in the Interstage Application Server Reference Manual (Command Edition).

### 3.5.2 EJB0301

---

#### **EJB: ERROR:EJB0301: Naming Service not activated**

## Explanation

Processing cannot be executed because the Naming Service has not been activated.

## System Action

Stops processing.

## User Action

Activate the Naming Service, and then reexecute the command. For details of the Naming Service, refer to the *CosNaming\_s* command or the *isstart* command in the Interstage Application Server Reference Manual (Command Edition).

### 3.5.3 EJB0303

---

#### **EJB: ERROR:EJB0303: Connection with CORBA Service failed**

## Explanation

The system failed to access the CORBA Service because:

- Interstage is not initialized.
- The CORBA Service is not started.
- Insufficient resources are available to run the CORBA Service.
- The Naming Service is not initiated.

## System Action

Stops processing.

## User Action

Check that Interstage is initialized, the CORBA Service is started, and sufficient resources are available to run the CORBA Service, and then reexecute the command.

If Interstage is not initialized, initialize it as described in the Operator's Guide.

If the CORBA Service is not started, start it as described in the *S99startod* command or the *isstart* command in the Interstage Application Server Reference Manual (Command Edition).

If insufficient resources are available to run the CORBA Service, secure sufficient resources as described in the Interstage Application Server Tuning Guide.

If the Naming Service is not started, start it as described in the *CosNaming\_s* command or *isstart* command in the Interstage Application Server Reference Manual (Command Edition).

### 3.5.4 EJB0304

---

#### **EJB: WARNING: EJB0304: Failed to delete the resources because couldn't connect with CORBA Service: CODE=%d**

## Variable Information

%s = Detail code

## Explanation

The system failed to connect the CORBA or Naming Service. As a result, it failed to delete the following resources on the IJServer:

- IJServer Implementation Repository ID
- Object Reference of the EJB application deployed on the IJServer

## System Action

The system will continue processing.

The system continues the isinit initialization process even if this message is output.

## User Action

Resources of the CORBA or Naming Service may remain undeleted because the system failed to delete the resources. Take the following action:

- When the detail code is 1 or 2  
Delete the Implementation Repository ID and Object Reference.
- When the detail code is 3 or 4  
Delete the Object Reference.

### Deleting the Implementation Repository ID

Delete the Implementation Repository ID when the IJServer type is either of the following:

- Contains Web Applications and EJB Applications (run in separate Java VMs)
- Contains EJB Applications only

To delete the Implementation Repository ID:

1. Execute the following command:

```
OD_impl_inst -d -r IDL:com.fujitsu.interstage.j2ee.ijserver/[IJServer name]:1.0
```

Note: Specify the name of an IJServer you created for [ijserver-name]

### Deleting the Object Reference

To delete the Object Reference:

1. Display the Object Reference using the *odlistns -l* command.  
The Object Reference information will display.
2. Check the name (Object Reference name) of the EJB application deployed on the IJServer.

Check the Object Reference information in this screen display:

```
*****  
Name(Type)      Object information(detail)  
                Default object information(detail)  
EJBSample  
  (o)  RMI:EJBSample.EJBSampleHome:0000000000000000,  
  (a)  IDL:com.fujitsu.interstage.j2ee.ijserver/WU0001:1.0,  
  (b)  (testhost:8002:1.1:UNICODE(UCS4))  
*****
```

In this display, the contents of the following variables are:

- (a) EJB application name (Object Reference name)
- (b) Implementation Repository name

As described above, the Object Reference having the following Implementation Repository ID indicates the EJB application deployed on the IJServer:

```
IDL:com.fujitsu.interstage.j2ee.ijserver/{IJServer}:1.0
```

Deleting the Object Reference registered to the Naming Service

Execute the following command to delete the Object Reference:

```
OD_or_adm -d -n [EJB application name]
```

- If you use type3 (Naming Service on a remote host) of Interstage, execute the above command on the server on which the Naming Service runs.
- Perform deletion immediately after execution of the *isinit* command.
- If you perform deletion after creating an IJServer and deploying an EJB application on that IJServer, required resources may be deleted.

### 3.5.5 EJB0310

---

#### **EJB: ERROR:EJB0310: Implementation Repository ID registration failed: NAME=%s**

##### Variable Information

%s = EJB application name

##### Explanation

The Implementation Repository ID for the CORBA Service could not be registered.

##### System Action

Stops processing.

##### User Action

EJB service operation commands cannot be used in the Interstage Application Server Web Package. Use the following products for applications that use EJB service operation commands:

- Interstage Application Server Enterprise Edition
- Interstage Application Server Standard-J Edition

Take corrective action according to the system log information output by the CORBA Service. If you cannot resolve the problem, select the forced install option, and then reexecute the command.

If the error recurs, use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer.

### 3.5.6 EJB0311

---

#### **EJB: ERROR:EJB0311: Implementation Repository ID already registered: NAME=%s**

##### Variable Information

%s = EJB application name

##### Explanation

The Implementation Repository ID for the CORBA Service has already been registered.

##### System Action

Stops processing.

## User Action

Check the Implementation Repository for the CORBA Service. If registration is not required, select the forced install option, and then reexecute the command.

## 3.5.7 EJB0312

---

### **EJB: WARNING:EJB0312: Implementation Repository ID not registered: NAME=%s**

#### Variable Information

%s = EJB application name

#### Explanation

The Implementation Repository ID for the CORBA Service is not registered.

#### System Action

Continues processing.

## 3.5.8 EJB0313

---

### **EJB: ERROR:EJB0313: Implementation Repository ID deletion failed: NAME=%s**

#### Variable Information

%s = EJB application name

#### Explanation

The Implementation Repository ID for the CORBA Service could not be deleted.

#### System Action

Stops processing.

#### User Action

- When the EJB application is in operation:

After terminating the EJB application, reexecute the command.

- In cases other than the above:

Take corrective action according to the system log information output by the CORBA Service. To delete the EJB application, select the forced install option, and then reexecute the command.

If the error recurs, use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer.

## 3.5.9 EJB0314

---

### **EJB: ERROR:EJB0314: Implementation Repository ID registration failed: NAME=%s1 ID=%s2**

#### Variable Information

%s1 = EJB application name

%s2 = Implementation Repository ID

#### Explanation

The Implementation Repository ID could not be registered. The registration failed because an Implementation Repository ID with the same name has been registered in the CORBA Service and the application that corresponds to the Implementation Repository ID is running.

## System Action

Stops processing.

## User Action

Stop the application that corresponds to the Implementation Repository ID, and then reexecute the command.

Use the *odlistns* command to confirm the information to be registered in the CORBA Service. Refer to the *odlistns* command in the Interstage Application Server Reference Manual (Command Edition) for details.

## 3.5.10 EJB0320

---

**EJB: ERROR:EJB0320: EJB application name registration in Naming Service failed : NAME=%s**

### Variable Information

%s = EJB application name

### Explanation

The EJB application name could not be registered in the Naming Service.

### System Action

Stops processing.

### User Action

Take corrective action according to the system log information output by the CORBA Service. If you cannot resolve the problem, select the forced install option, and then reexecute the command.

If the error recurs, use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer.

## 3.5.11 EJB0321

---

**EJB: ERROR:EJB0321: EJB application name already registered in Naming Service : NAME=%s**

### Variable Information

%s = EJB application name

### Explanation

The EJB application name has already been registered in the Naming Service.

### System Action

Stops processing.

### User Action

Check the Naming Service. If registration is not required, select the forced install option, and then reexecute the command.

If the EJB application registered as a Load Balancing object group is to be reinstalled, delete the Load Balancing object group using the *OD\_or\_adm* command, and then reexecute the command.

## 3.5.12 EJB0322

---

**EJB: WARNING:EJB0322: EJB application name not registered in Naming Service : NAME=%s**

### Variable Information

%s = EJB application name

### Explanation

The EJB application name is not registered in the Naming Service.

## System Action

Continues processing.

### 3.5.13 EJB0323

---

**EJB: ERROR:EJB0323: EJB application name deletion from Naming Service failed : NAME=%s**

#### Variable Information

%s = EJB application name

#### Explanation

The EJB application name could not be deleted from the Naming Service.

#### System Action

Stops processing.

#### User Action

Take corrective action according to the system log information output by the CORBA Service. To delete the EJB application, select the forced install option, and then reexecute the command.

If the error recurs, use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer.

### 3.5.14 EJB0324

---

**EJB: ERROR: EJB0324: EJB application name deletion from Naming Service failed because EJB application name is being used: NAME=%s**

#### Variable Information

%s = EJB application name

#### Explanation

Because the EJB application name is being used, it could not be deleted from the Naming Service. Possible reasons why the EJB application name is being used are:

- In an environment where the Naming Service is being shared by multiple server machines, the EJB application is running on a server machine other than the one that executed this command.
- A CORBA application with the same name as the EJB application is running.

#### System Action

Stops processing.

#### User Action

Stop the application that has the same name as the EJB application, and then reexecute the command.

### 3.5.15 EJB0325

---

**EJB: ERROR:EJB0325: EJB application name deletion from Naming Service failed: NAME=%s1 ID=%s2**

#### Variable Information

%s1 = EJB application name

%s2 = Implementation Repository ID

#### Explanation

The EJB application name could not be deleted from the Naming Service. Possible causes are as follows:

- The EJB application is running on a server machine that did not execute this command (in an environment where the Naming Service is shared by multiple server machines).
- A CORBA application with the same name as the EJB application is running.
- The Implementation Repository ID that corresponds to the EJB application name is also registered in another EJB application that is currently running.

#### System Action

Stops processing.

#### User Action

- When the EJB application is running on a server machine that did not execute this command (in an environment where the Naming Service is shared by multiple server machines).  
Stop the application that is using the EJB application name, and then reexecute the command.
- When a CORBA application with the same name as the EJB application is running.  
Stop the application that is using the EJB application name, and then reexecute the command.
- When the Implementation Repository ID that corresponds to the EJB application name is associated with another EJB application that is currently running.  
Stop the application associated with the Implementation Repository ID, and then reexecute the command.

Use the *odlistns* command to confirm the information to be registered in the CORBA Service. Refer to the *odlistns* command in the Interstage Application Server Reference Manual (Command Edition) for details.

### 3.5.16 EJB0332

---

#### **EJB: ERROR:EJB0332: Interface information registration failed: NAME=%s**

##### Variable Information

%s = EJB application name

##### Explanation

Registration of EJB application interface information failed because the IDL compiler terminated abnormally.

##### System Action

Stops processing

##### User Action

Take corrective action according to the IDL compiler output results displayed in the console window. For details on the IDL compiler, refer to the *IDLc* command in the Interstage Application Server Reference Manual (Command Edition).

### 3.5.17 EJB0335

---

#### **EJB: ERROR:EJB0335: Interface information deletion failed : NAME=%s**

##### Variable Information

%s = EJB application name

##### Explanation

The EJB application interface information could not be deleted because the IDL compiler terminated abnormally.

##### System Action

Stops processing.

## User Action

Take corrective action according to the IDL compiler output results displayed in the console window.

For details on the IDL compiler, refer to the *IDLc* command in the Interstage Application Server Reference Manual (Command Edition).

### 3.5.18 EJB0336

---

#### **EJB: ERROR:EJB0336: IDL compiler execution failed**

##### Explanation

The IDL compiler that registers or deletes EJB application interface information could not be executed.

##### System Action

Stops processing.

##### User Action

Ensure that:

- The environment variable PATH points to the folder that stores the IDL compiler (IDLc.exe).
- You have permission to execute the IDL compiler (IDLc.exe).

### 3.5.19 EJB0337

---

#### **EJB: WARNING:EJB0337: IDL file not exist : NAME=%s1 FILE='%s2'**

##### Variable Information

%s1 = EJB application name

%s2 = IDL file name

##### Explanation

Although the interface registration option was specified, interface information will not be registered because the IDL file does not exist in the corresponding EJB application.

##### System Action

Does not register the EJB application interface information.

## 3.6 EJB0400 to EJB0499

---

This section details the messages with message numbers between EJB0400 and EJB0499.

### 3.6.1 EJB0400

---

#### **EJB: ERROR:EJB0400: Invalid option specified : OPTION=%s**

##### Variable Information

%s = Option

##### Explanation

An invalid option was specified.

##### System Action

Stops processing.

## User Action

Specify a correct option, and then reexecute the command.

### 3.6.2 EJB0401

---

#### **EJB: ERROR:EJB0401: Incorrect option: OPTION=%s**

##### Variable Information

%s = Option

##### Explanation

The specified option is not correct. This message is displayed when:

- A duplicate option is specified.
- The combination of options and arguments is incorrect.
- Option arguments other than those described in the manual are specified.

##### System Action

Stops processing.

##### User Action

Refer to information on EJB Service operation commands in the Interstage Application Server Reference Manual (Command Edition), and then reexecute the command.

### 3.6.3 EJB0402

---

#### **EJB: ERROR:EJB0402: Incorrect argument**

##### Explanation

The specified argument is incorrect.

##### System Action

Stops processing.

##### User Action

Refer to information on EJB Service operation commands in the Interstage Application Server Reference Manual (Command Edition), and then reexecute the command.

### 3.6.4 EJB0404

---

#### **EJB: ERROR:EJB0404: Incorrect environment variable: ENV=%s**

##### Variable Information

%s = Environment variable name

##### Explanation

An error exists in the value defined in an environment variable.

##### System Action

Stops processing.

##### User Action

Redefine a correct environment variable, and then reexecute the command.

## 3.6.5 EJB0410

---

### **EJB: ERROR:EJB0410: Other process being executed**

#### Explanation

While the Application Folder creation command was being executed, an attempt was made to execute another process that cannot be executed at the same time.

The following processing items cannot be executed while the Application Folder creation command is being executed.

- Installing an EJB application
- Uninstalling an EJB application
- Manipulating the EJB Customize Tool
- Operating an EJB application
- Creating an Application Folder
- Setting encryption communication using the EJB application SSL
- Canceling encryption information using the EJB application SSL

#### System Action

Stops processing.

#### User Action

Reexecute the command after the process that cannot be executed at the same time has completed.

## 3.6.6 EJB0411

---

### **EJB: ERROR:EJB0411: EJB application being operated or customized: NAME=%s**

#### Variable Information

%s = EJB application name

#### Explanation

The processing cannot continue because an EJB application is running or being customized.

#### System Action

Stops processing.

#### User Action

Reexecute the command once the EJB application stops or is customized.

## 3.6.7 EJB0412

---

### **EJB: ERROR:EJB0412: Application Folder being created, or customized**

#### Explanation

The processing cannot continue because an Application Folder is being created or customized.

#### System Action

Stops processing.

#### User Action

Reexecute the command once the Application Folder is created or customized.

## 3.6.8 EJB0413

---

### **EJB: ERROR:EJB0413: EJB application being installed or uninstalled**

#### Explanation

Processing cannot continue because an EJB application is being installed or uninstalled.

#### System Action

Stops processing.

#### User Action

Reexecute the command after installing or uninstalling the EJB application.

## 3.6.9 EJB0414

---

### **EJB: ERROR:EJB0414: EJB application being operated, customized, or operation command being executed: NAME=%s**

#### Variable Information

%s = EJB application name

#### Explanation

Processing cannot continue because an EJB application is running or being customized, or the EJB Service operation command is being executed for the EJB application.

#### System Action

Stops processing.

#### User Action

Reexecute the command after the EJB application has stopped; the EJB application customization has terminated; or the EJB Service operation command for the EJB application has terminated.

## 3.6.10 EJB0420

---

### **EJB: ERROR:EJB0420: Application Folder not created**

#### Explanation

The Application Folder does not exist.

#### System Action

Stops processing.

#### User Action

Reexecute the command after creating the Application Folder.

## 3.6.11 EJB0430

---

### **EJB: ERROR:EJB0430: EJB application name length exceeds limit : MAX=%s**

#### Variable Information

%s = Maximum length of EJB application name

#### Explanation

The EJB application name is too long.

### System Action

Stops processing.

### User Action

Specify an EJB application name within the maximum bytes limit, and then reexecute the command.

## 3.6.12 EJB0440

---

### **EJB: ERROR:EJB0440: Application Folder not specified**

#### Explanation

No Application Folder has been specified in the argument of the Application Folder creation command.

### System Action

Stops processing.

### User Action

Specify an Application Folder, and then reexecute the command.

## 3.6.13 EJB0441

---

### **EJB: ERROR:EJB0441: EJB application name not specified**

#### Explanation

No EJB application name is specified in the argument of the command.

### System Action

Stops processing.

### User Action

Specify an EJB application name, and then reexecute the command.

## 3.6.14 EJB0450

---

### **EJB: ERROR:EJB0450: The environment variable setting is invalid: ENV='%s1' CODE='%s2'**

#### Variable Information

%s1 = Environment variable name

%s2 = Error code

1: The environment variable is not set.

2: The value of the environment variable is not set.

#### Explanation

In case the environment variable is 'IS\_J2EEAPF', one of the following reasons:

- Interstage is not installed correctly.
- Interstage cannot be run correctly because the environment variable or the value of the environment variables is wrong.

An environment variable of "CommonProgramFiles" may cause a Windows(R) environment error. If this occurs, it may not be possible to run the Windows(R) environment.

### System Action

Stops processing.

## User Action

If the environment variable is 'IS\_J2EEAPP', reinstall Interstage.

If the environment variable is "CommonProgramFiles", check the Windows(R) environment.

### 3.6.15 EJB0470

---

#### **EJB: ERROR: EJB0470: Specified EJB Container not exist: NAME=%s1**

##### Variable Information

%s1 = EJB container name

##### Explanation

The specified EJB container does not exist.

##### System Action

Stops processing.

##### User Action

Specify the correct EJB container name, and then reexecute the command.

### 3.6.16 EJB0471

---

#### **EJB: ERROR: EJB0471: Specified EJB Container name length exceeds limit: MAX=%d**

##### Variable Information

Maximum length of the EJB container name

##### Explanation

The length of the specified EJB container name exceeds the limit

##### System Action

Stops processing.

##### User Action

Limit the EJB container name to no more than 28 bytes, and then reexecute the command.

### 3.6.17 EJB0472

---

#### **EJB: ERROR: EJB0472 EJB Container being operated: NAME=%s CODE=%d**

##### Variable Information

%s = EJB container name

%d = Error code

The following lists the detail codes:

1. An operation that uses the *ejbstarteb* command is in progress.
2. An operation that uses a WorkUnit is in progress

##### Explanation

Processing cannot continue because the EJB container is currently being used.

##### System Action

Stops processing.

#### User Action

Stop the EJB container, and then reexecute the command.

### 3.6.18 EJB0473

---

**EJB: ERROR: EJB0473 EJB Container being customized, or operation command being executed: NAME=%s**

#### Variable Information

%s = EJB container name

#### Explanation

Processing cannot continue because either the EJB container is being customized, or an EJB service management command is being executed for an EJB application.

#### System Action

Stops processing.

#### User Action

After completion of EJB container customization, or execution of the EJB service management command, reexecute the command.

### 3.6.19 EJB0474

---

**EJB: ERROR: EJB0474: Application Folder being created, or operation command being executed**

#### Explanation

Processing cannot continue because either an application storage folder is being created, or an EJB service operation command is being executed.

#### System Action

Stops processing.

#### User Action

After completion of the created application storage folder or execution of the EJB service operation command, reexecute the command.

### 3.6.20 EJB0480

---

**EJB: ERROR: EJB0480:J2EE properties are being updated**

#### Explanation

The process could not continue because the J2EE properties were being updated.

#### System Action

Stops processing.

#### User Action

Rerun the process when the J2EE property update is complete.

### 3.6.21 EJB0481

---

**EJB: ERROR: EJB0481:This function cannot be used because the specified EJB application or LightEJB Container is not supported: NAME=%s1**

## Variable Information

%s = EJB application name or LightEJB container name

## Explanation

An unsupported function was used for the EJB application or LightEJB container.

## System Action

Stops processing.

## User Action

Switch to an application that uses IJServer.

## 3.7 EJB0500 to EJB0599

---

This section details the messages with message numbers between EJB0500 and EJB0599.

### 3.7.1 EJB0500

---

#### **EJB: INFO:EJB0500: Application Folder creation completed**

## Explanation

Application Folder creation is complete.

### 3.7.2 EJB0501

---

#### **EJB: ERROR:EJB0501: Application Folder creation failed**

## Explanation

The Application Folder could not be created.

## System Action

Stops processing.

## User Action

Remove the cause of the failure by referring to any other error messages or to the system log, and then reexecute the command.

### 3.7.3 EJB0502

---

#### **EJB: ERROR:EJB0502: Specify in full path name**

## Explanation

The full path format for the Application Folder is required.

## System Action

Stops processing.

## User Action

Specify the full path format for the Application Folder in the argument of the Application Folder creation command.

### 3.7.4 EJB0503

---

#### **EJB: ERROR:EJB0503: Specify hard disk drive in local system: PATH='%s'**

## Variable Information

%s = Path name

## Explanation

The hard disk drive of the local system for the Application Folder has not been specified.

## System Action

Stops processing.

## User Action

Specify the hard disk drive of the local system in the argument of the Application Folder creation command.

### 3.7.5 EJB0504

---

Windows32/64

**EJB: ERROR:EJB0504: Specify empty folder as Application Folder: PATH='%s'**

## Variable Information

%s = Application Folder

## Explanation

The specified Application Folder contains a file or folder.

## System Action

Stops processing.

## User Action

Specify a new or unused folder as the Application Folder.

Solaris32/64 Linux32/64

**EJB: ERROR:EJB0504: Specify empty directory as Application Folder: PATH='%s'**

## Variable Information

%s = Application Folder

## Explanation

The specified Application Folder contains a file or directory.

## System Action

Stops processing.

## User Action

Specify a new or unused directory as the Application Folder.

### 3.7.6 EJB0510

---

**EJB: INFO:EJB0510: EJB application information deletion started**

## Explanation

The registered EJB application information is deleted before an Application Folder is created.

### 3.7.7 EJB0511

---

**EJB: ERROR:EJB0511: EJB application information deletion failed: NAME='%s'**

### Variable Information

%s = EJB application name

### Explanation

The deletion of EJB application information failed.

### System Action

Stops processing.

### User Action

Reexecute the command after all of the EJB applications are stopped or customized.

If this message continues to appear after performing the above action, uninstall all of the EJB applications by selecting the forced uninstall option before executing the Application Folder creation command.

## 3.7.8 EJB0512

---

**EJB: INFO:EJB0512: EJB application information deletion completed: NAME=%s**

### Variable Information

%s = EJB application name

### Explanation

The EJB application information has been deleted.

## 3.7.9 EJB0530

---

**EJB: INFO:EJB0530: EJB application installation completed**

### Explanation

The EJB application installation is complete.

## 3.7.10 EJB0531

---

**EJB: ERROR:EJB0531: EJB application installation failed**

### Explanation

Installation of the EJB application failed.

### System Action

Stops processing.

### User Action

Remove the cause of the failure by referring to any other error messages or to the system log, and then reexecute the command.

## 3.7.11 EJB0532

---

**EJB: INFO:EJB0532: EJB application installation canceled**

### Explanation

Installation of the EJB application has been suspended due to user operation.

### System Action

Stops processing.

### 3.7.12 EJB0533

---

**EJB: INFO:EJB0533: EJB application information deletion started because reinstalling**

#### Explanation

Information has been deleted because the EJB application is being reinstalled.

### 3.7.13 EJB0534

---

**EJB: INFO:EJB0534: EJB application information deletion started: NAME=%s**

#### Variable Information

%s = EJB application name

#### Explanation

EJB application information has been deleted.

### 3.7.14 EJB0535

---

**EJB: INFO:EJB0535: EJB application information deletion completed: NAME=%s**

#### Variable Information

%s = EJB application name

#### Explanation

The deletion of EJB application information is complete.

### 3.7.15 EJB0536

---

**EJB: INFO:EJB0536: EJB application installation started**

#### Explanation

The system is starting to install the EJB application.

### 3.7.16 EJB0537

---

**EJB: INFO:EJB0537: EJB application information registration started: NAME=%s**

#### Variable Information

%s = EJB application name

#### Explanation

The EJB application information has been registered.

### 3.7.17 EJB0538

---

**EJB: INFO:EJB0538: EJB application information registration completed: NAME=%s**

#### Variable Information

%s = EJB application name

#### Explanation

Registration of EJB application information is complete.

### 3.7.18 EJB0539

---

#### **EJB: INFO:EJB0539: EJB application file copy started to Application Folder**

##### Explanation

The EJB application file is being copied to the Application Folder.

### 3.7.19 EJB0540

---

#### **EJB: INFO:EJB0540: EJB application file copy completed to Application Folder**

##### Explanation

The EJB application file has been copied to the Application Folder.

### 3.7.20 EJB0541

---

#### **EJB: INFO:EJB0541: EJB application installation check started**

##### Explanation

The EJB application to be installed is being checked.

### 3.7.21 EJB0550

---

#### **EJB: ERROR:EJB0550: The number of EJB applications can not exceed limit: MAX=%s**

##### Variable Information

%s = Number of EJB applications that can be installed

##### Explanation

Too many EJB applications are being installed.

##### System Action

Stops processing.

##### User Action

Reduce the number of EJB applications to be installed, or uninstall unnecessary EJB applications.

### 3.7.22 EJB0551

---

#### **EJB: WARNING:EJB0551: EJB application to install not exist**

##### Explanation

The EJB application to be installed was not found in its source location.

##### System Action

Stops processing.

##### User Action

When executing the *ejbinstalleb* command, check that the path for the argument is linked to the work area to which EJB applications were extracted by the Deployment Tool.

### 3.7.23 EJB0552

---

#### **EJB: WARNING:EJB0552: EJB application definition not exist**

## Explanation

An EJB application in the source area does not have an EJB application definition.

## System Action

Continues processing. The EJB application for which the warning was issued is not installed.

### 3.7.24 EJB0553

---

#### **EJB: ERROR:EJB0553: Not specify Application Folder: PATH='%s'**

## Variable Information

%s = Application Folder name

## Explanation

Installation was stopped because an Application Folder was specified in the argument.

## System Action

Stops processing.

## User Action

Specify a folder other than the Application Folder in the argument, and then reexecute the command.

### 3.7.25 EJB0554

---

#### **EJB: ERROR:EJB0554: Implementation Repository ID length exceeds limit: NAME=%s1 MAX=%s2**

## Variable Information

%s1 = EJB application name

%s2 = Implementation Repository ID name maximum length

## Explanation

The Implementation Repository ID of the CORBA Service is too long.

## System Action

Stops processing.

## User Action

The Implementation Repository ID is created by adding 'IDL:' and ':1.0' to the class name of the Home interface including the package name. Therefore, the class name of the Home interface including the package name should have bytes equal to, or less than:

(Implementation Repository ID name maximum length) - 8

### 3.7.26 EJB0555

---

#### **EJB: ERROR: EJB0555: Interface Repository ID length exceeds limit: NAME=%s1 MAX=%s2**

## Variable Information

%s1 = EJB application name

%s2 = Maximum length of the Interface Repository ID name

## Explanation

The Interface Repository ID for the CORBA service is too long.

## System Action

Stops processing.

## User Action

The user action to be taken depends on the language used in the EJB application.

- Java

This message is not displayed.

- COBOL

The Interface Repository ID is created by adding 'IDL:', '/' and ':1.0' to the module name and Remote Interface name. For this reason, set the total number of characters for the module name and Remote Interface name as follows:

(Maximum length of the Interface Repository ID name) - 9

## 3.7.27 EJB0556

---

### **EJB: ERROR:EJB0556: Incorrect EJB application name: NAME=%s**

#### Variable Information

%s = EJB application name

#### Explanation

The EJB application name contains an error.

#### System Action

Stops processing.

#### User Action

Check whether invalid characters have been specified in the EJB application name. If so, change the EJB application name.

## 3.7.28 EJB0557

---

### **EJB: ERROR: EJB0557: Specified EJB application can not be installed**

#### Explanation

Processing was stopped because the specified EJB application was not an Enterprise Bean, or because the JDK version was not appropriate.

#### System Action

Stops processing.

#### User Action

Check the following:

- Check whether something other than an Enterprise Bean is included in the EJB application
- Confirm that the JDK version is correct

## 3.7.29 EJB0558

---

 Windows32/64

### **EJB: ERROR:EJB0558: EJB application of the same name exists in install-source-folder: NAME=%s**

#### Variable Information

%s = EJB application name

## Explanation

Multiple EJB applications in the install-source-folder have the same name. Only one EJB application can be installed with a particular name.

## System Action

Stops processing.

## User Action

Clear the work area in which the EJB application was deployed by the Deployment tool, then redeploy the EJB application. Once this has been done, reexecute the command.

---

**Solaris32/64** **Linux32/64**

**EJB: ERROR:EJB0558: EJB application of the same name exists in install-source-folder: NAME=%s**

## Variable Information

%s = EJB application name

## Explanation

Multiple EJB applications in the install-source-folder have the same name. Only one EJB application can be installed with a particular name.

## System Action

Stops processing.

## User Action

Clear the work area in which the EJB application was deployed by the Deployment tool, then redeploy the EJB application.

Note that the directory previously copied may have existed when the EJB application was copied to the server machine after deployment. Delete the copied directory, and make another copy.

Once this has been done, reexecute the command.

## 3.7.30 EJB0560

---

**EJB: ERROR:EJB0558: Host name length exceeds the limit: NAME=%s**

## Variable Information

%s = Maximum length of host name

## Explanation

The specified host name is too long.

## System Action

Stops processing.

## User Action

Specify a host name not longer than the allowed number of bytes, and then reexecute the command.

## 3.7.31 EJB0570

---

**EJB: INFO:EJB0570: EJB application uninstallation completed**

## Explanation

Uninstallation of the EJB application is complete.

### 3.7.32 EJB0571

---

#### **EJB: ERROR:EJB0571: EJB application uninstallation failed**

##### Explanation

An attempt to uninstall the EJB application failed.

##### System Action

Stops processing.

##### User Action

Remove the cause of the failure by referring to any other error messages or to the system log, and then reexecute the command.

### 3.7.33 EJB0572

---

#### **EJB: INFO:EJB0572: EJB application uninstallation canceled**

##### Explanation

The user stopped uninstalling the EJB application.

##### System Action

Stops processing.

### 3.7.34 EJB0580

---

#### **EJB: INFO:EJB0580: EJB application not exist**

##### Explanation

The EJB application to be uninstalled was not found in the Application Folder.

### 3.7.35 EJB0581

---

#### **EJB: ERROR:EJB0581: Specified EJB application not exist: NAME=%s**

##### Variable Information

%s = EJB application name

##### Explanation

The specified EJB application does not exist.

##### System Action

Stops processing.

##### User Action

Specify the correct EJB application, and then reexecute the command.

### 3.7.36 EJB0582

---

#### **EJB: WARNING:EJB0582: Forcibly uninstallation started because EJB application status abnormal: NAME=%s**

##### Variable Information

%s = EJB application name

## Explanation

The system has forcibly uninstalled the EJB application due to an abnormal status.

If an EJB application terminates abnormally while it is being installed or uninstalled, its status becomes abnormal.

## System Action

Continues processing.

### 3.7.37 EJB0583

---

#### **EJB: ERROR:EJB0583: EJB application definition not exist**

## Explanation

There is no EJB application definition.

## System Action

Stops processing.

## User Action

Specify the forced uninstall option, and then reexecute the command. In this situation, unnecessary information may remain in the CORBA Service.

### 3.8 EJB0600 to EJB0699

---

This section details the messages with message numbers between EJB0600 and EJB0699.

#### 3.8.1 EJB0600

---

##### **EJB: INFO: EJB0600: Setup of communication with SSL completed: NAME=%s**

## Variable Information

%s = EJB application name

## Explanation

The SSL encryption communication settings were completed.

#### 3.8.2 EJB0601

---

##### **EJB: INFO: EJB0601: Cancel of communication with SSL completed: NAME=%s**

## Variable Information

%s = EJB application name

## Explanation

The cancellation of SSL encryption communication was completed.

#### 3.8.3 EJB0602

---

##### **EJB: ERROR: EJB0602: Setup of communication with SSL failed: NAME=%s**

## Variable Information

%s = EJB application name

#### Explanation

The SSL encryption communication settings failed.

#### System Action

Stops processing.

#### User Action

Refer to other error messages and system logs to establish the cause, and then reexecute the command.

### 3.8.4 EJB0603

---

#### **EJB: ERROR: EJB0603: Cancel of communication with SSL failed: NAME=%s**

#### Variable Information

%s = EJB application name

#### Explanation

The cancellation of SSL encryption communication failed.

#### System Action

Stops processing.

#### User Action

Refer to other error messages and system logs to establish the cause, and then reexecute the command.

### 3.8.5 EJB0650

---

#### **EJB: ERROR:EJB0650: Improper Java Execution environment**

#### Explanation

Processing failed because of an error in the Java execution environment.

#### System Action

Stops processing.

#### User Action

Check the following:

- The environment (environment variables, etc.) does not contain an error.
- A correct JDK/JRE version is used.
- JDK/JRE is correctly installed.
- **Windows32/64**  
jre.exe does not exist in a Windows(R) folder or Windows(R) folder\system32.
- No memory shortage has occurred.
- The information specified in the Java environment file is correct.
- Has JDK/JRE, which is required by the application, been described in the installation and Java environment settings files?

If EJB applications are to be executed in a WorkUnit, also check the following items.

- Information was set in the Java environment setup file when the *isstart* command was executed.

Reexecute the command after removing the cause of the error.

## 3.8.6 EJB0651

---

### EJB: ERROR:EJB0651: Improper Java Development environment

#### Explanation

Processing failed because the Java development environment is incorrect, or because JDK is not installed.

#### System Action

Stops processing.

**Windows32/64**

#### User Action

Check the following Java environment items:

- The environment (environment variables, etc) is correct.
- The JDK version that is currently used is correct.
- JDK has been correctly installed.

Reexecute the processing after removing the cause of the error.

**Solaris32/64** **Linux32/64**

#### User Action

Check the following Java environment items:

- The environment (for example, environment variables LD\_LIBRARY\_PATH, etc) is correct.
- The JDK version that is currently used is correct.
- JDK has been correctly installed.

Reexecute the processing after removing the cause of the error.

## 3.8.7 EJB0652

---

### EJB: ERROR:EJB0652: Abnormal event occurred in Java Execution environment

#### Explanation

Processing was suspended because an abnormal event occurred in the Java runtime environment.

#### System Action

Stops processing.

#### User Action

If this message is output frequently, refer to the 'Tuning Guide'. Estimate the amount of memory required for operating the EJB service, and then check that sufficient memory has been reserved.

If there is enough memory for the EJB Service, there may be insufficient memory to run other applications. Reestimate the amount of memory needed for other applications running on the same machine and confirm that an appropriate amount of memory is available.

If there is not enough memory, contact the system administrator. The system administrator should increase the size of the main memory or increase the size of the page file.

**Solaris32/64** **Linux32/64**

If there is on problem with system tuning, it might mean that there is an abnormal event in the Java runtime environment. Note the following information and the corresponding message, and send this information to a Systems Engineer.

core files under /var/opt/FJSVisas/system/default/FJSVextp/td001/tmp/is/

/opt/FJSVejb/var/java\_console.log

## 3.8.8 EJB0655

---

**EJB: ERROR: EJB0655: Java environment file not exist: PATH='%s'**

### Variable Information

%s = File name

### Explanation

The Java environment file does not exist.

### System Action

Stops processing.

### User Action

Create a Java environment file, and then reexecute the command.

## 3.8.9 EJB0656

---

**EJB: ERROR: EJB0656: No access permission to Java environment file: PATH='%s'**

### Variable Information

%s = File name

### Explanation

Access permission to the Java environment file has not been set.

### System Action

Stops processing.

### User Action

Check and modify the access permissions for the Java environment file, or get a user with access permission to perform the processing.

## 3.8.10 EJB0657

---

**EJB: ERROR: EJB0657: Incorrect Java environment file: PATH='%s'**

### Variable Information

%s = File name

### Explanation

The Java environment file contains incorrect settings.

### System Action

Stops processing.

### User Action

Enter the correct information in the Java environment file, and then reexecute the command.

## 3.8.11 EJB0658

---

**EJB: ERROR: EJB0658: Fujitsu XML Processor not exist**

### Explanation

Command execution failed because the Fujitsu XML processor was not installed.

### System Action

Stops processing.

### User Action

Install the Fujitsu XML processor, and then reexecute the command.

## 3.8.12 EJB0659

---

### **EJB: ERROR: EJB0659: No access permission to Fujitsu XML Processor**

#### Explanation

Access permission to the Fujitsu XML processor is not granted.

#### System Action

Stops processing.

#### User Action

Ensure that access permission to the Fujitsu XML processor is granted, or reexecute processing as a user with access permission.

## 3.8.13 EJB0670

---

Windows32/64

### **EJB: ERROR:EJB0670: File or folder not exist: NAME=%s1 PATH='%s2'**

#### Variable Information

%s1 = EJB application name

%s2 = File or folder name

#### Explanation

The EJB application cannot run because the file or folder does not exist.

#### System Action

Stops operation.

#### User Action

Reinstall the EJB application.

Solaris32/64 Linux32/64

### **EJB: ERROR:EJB0670: File or directory not exist: NAME=%s1 PATH='%s2'**

#### Variable Information

%s1 = EJB application name

%s2 = File or directory name

#### Explanation

The EJB application cannot run because the file or directory does not exist.

#### System Action

Stops operation.

#### User Action

Reinstall the EJB application.

### 3.8.14 EJB0671

---

Windows32/64

**EJB: ERROR:EJB0671: No access permission to file or folder: NAME=%s1 PATH='%s2'**

#### Variable Information

%s1 = EJB application name

%s2 = File or folder name

#### Explanation

The access permission set for the EJB application operation file does not allow it to be accessed.

#### System Action

Stops operation.

#### User Action

Change your access permission so that you can access the file or folder, or have it accessed by a user with the required permission.

Solaris32/64 Linux32/64

**EJB: ERROR:EJB0671: No access permission to file or directory: NAME=%s1 PATH='%s2'**

#### Variable Information

%s1 = EJB application name

%s2 = File or directory name

#### Explanation

The access permission set for the EJB application operation file does not allow it to be accessed.

#### System Action

Stops operation.

#### User Action

Change your access permission so that you can access the file or directory, or have it accessed by a user with the required permission.

### 3.8.15 EJB0672

---

**EJB: ERROR:EJB0672: EJB application definition not exist: NAME=%s**

#### Variable Information

%s = EJB application name

#### Explanation

EJB application operation failed because there is no EJB application definition.

#### System Action

Stops operation.

#### User Action

Reinstall the EJB application.

### 3.8.16 EJB0673

---

**EJB: ERROR:EJB0673: No access permission to EJB application definition: NAME=%s1 FILE='%s2'**

### Variable Information

%s1 = EJB application name

%s2 = EJB application definition file name

### Explanation

The access permission set for the EJB application definition file does not allow the operation to be performed.

### System Action

Stops operation.

### User Action

Change your access permission so that you can access the EJB application definition, or have it accessed by a user with the required permission.

## 3.8.17 EJB0674

---

**EJB: ERROR:EJB0674: Incorrect EJB application definition: NAME=%s1 CODE=%s2**

### Variable Information

%s1 = EJB application name

%s2 = Identification code

### Explanation

EJB application operation failed because the EJB application definition contains an error.

### System Action

Stops operation.

### User Action

Reinstall the EJB application.

## 3.8.18 EJB0677

---

**EJB: ERROR:EJB0677: Rapid Invoked Bean not exist: NAME1=%s1 NAME2=%s2**

### Variable Information

%s1 = Rapid Invoking Bean

%s2 = Rapid Invoked Bean

### Explanation

Command execution failed because the Rapid Invoked Bean is not installed.

### System Action

Stops executing the command.

### User Action

Reexecute the command after installing the Rapid Invoked Bean.

## 3.8.19 EJB0678

---

**EJB: ERROR:EJB0678: EJB application execution file not exist: NAME=%s1 FILE='%s2'**

## Variable Information

%s1 = EJB application name

%s2 = EJB application execution file

## Explanation

Activation of the EJB application failed because the EJB application execution file does not exist.

## System Action

Stops processing.

## User Action

Reinstall the EJB application.

## 3.8.20 EJB0679

---

**EJB: ERROR:EJB0679: No access permission to EJB application execution file: NAME=%s1 FILE='%s2'**

## Variable Information

%s1 = EJB application name

%s2 = EJB application execution file name

## Explanation

The EJB application failed to start because there is no access permission for the EJB application execution file.

## System Action

Stops the startup.

## User Action

Check the access permission for the EJB application execution file or have a user with appropriate access permission perform the processing.

## 3.8.21 EJB0680

---

Windows32/64

**EJB: ERROR:EJB0680: Incorrect current folder: NAME=%s1 PATH='%s2'**

## Variable Information

%s1 = EJB application name

%s2 = Current folder name

## Explanation

An abnormality was detected in the current folder for one of the following reasons:

- The current folder was deleted by mistake.
- The current folder has new access permission.

## System Action

Stops processing.

## User Action

- If the current folder was deleted:  
Reexecute the command after creating a current folder.

- If the current folder has new access permission:

Reexecute the command after changing the access permission of the current folder.

---

Solaris32/64 Linux32/64

**EJB: ERROR:EJB0680: Incorrect current directory: NAME=%s1 PATH='%s2'**

#### Variable Information

%s1 = EJB application name

%s2 = Current directory name

#### Explanation

An abnormality was detected in the current directory for one of the following reasons:

- The current directory was deleted by mistake.
- The current directory has new access permission.

#### System Action

Stops processing.

#### User Action

- If the current directory was deleted:  
Reexecute the command after creating a current directory.
- If the current directory has new access permission:  
Reexecute the command after changing the access permission of the current directory.

## 3.8.22 EJB0681

---

**EJB: WARNING:EJB0681: Standard output acquisition to file failed: NAME=%s1 FILE='%s2' CODE=%s3**

#### Variable Information

%s1 = EJB application name

%s2 = Name of file to be obtained

%s3 = Detail code

#### Explanation

A failure occurred sending the standard output to a file. Refer to the detail codes below for an explanation of the cause.

2: No folder found

5: I/O error occurred

12: Memory shortage occurred

13: No access permission for file or folder

22: Invalid file name or a path name that is too long

28: Insufficient free space in file system

101: File used by another process

102: File used by another process

#### System Action

Does not send standard output to a file, but allows the EJB application to continue running.

## User Action

To ensure that standard output is sent to a file, stop the EJB application, remove the cause of the error, and restart the EJB application.

### 3.8.23 EJB0682

---

**EJB: WARNING:EJB0682: Standard error output acquisition to file failed: NAME=%s1 FILE='%s2' CODE=%s3**

#### Variable Information

%s1 = EJB application name

%s2 = Name of file to be acquired

%s3 = Detail code

#### Explanation

A failure occurred outputting standard error output to a file. Refer to the detail codes below for an explanation of the cause.

2: No folder found

5: I/O error occurred

12: Memory shortage occurred

13: No access permission for file or folder

22: Invalid file name or a path name that is too long

28: Insufficient free space in file system

101: File used by another process

102: File used by another process

#### System Action

Does not send standard output to a file, but allows the EJB application to continue running.

#### User Action

To ensure that standard output is sent to a file, stop the EJB application, remove the cause of the error, and restart the EJB application.

### 3.8.24 EJB0683

---

**EJB: ERROR: EJB0683: Incorrect contents of EJB application definition file: FILE='%s' CODE=%d**

#### Variable Information

%s = EJB application definition file name

%d = detail codes

#### Explanation

The EJB application definition file contains an error.

For details on the failure cause, refer to the detail code. The detail codes are listed below.

1: CMP-version tag value is invalid.

#### System Action

Stops the process.

#### User Action

Review the cmp-version tag value of the EJB application definition file name, remove the cause, and then reexecute the command.

## 3.9 EJB0700 to EJB0799

---

This section details the messages with message numbers between EJB0700 and EJB0799.

### 3.9.1 EJB0704

---

**EJB: INFO:EJB0704: EJB application activation request accepted : NAME=%s**

Variable Information

%s = EJB application name

Explanation

An EJB application activation request has been accepted.

### 3.9.2 EJB0705

---

**EJB: ERROR:EJB0705: EJB application activation failed: NAME=%s**

Variable Information

%s = EJB application name

Explanation

The EJB application activation request was unsuccessful.

System Action

Stops activating the EJB application.

User Action

Remove the cause of the failure by referring to any other error messages or to the system log, and then reexecute the command.

### 3.9.3 EJB0706

---

**EJB: INFO:EJB0706: EJB application deactivation request accepted : NAME=%s**

Variable Information

%s = EJB application name

Explanation

A request to deactivate an EJB application was accepted.

### 3.9.4 EJB0707

---

**EJB: ERROR:EJB0707: EJB application deactivation failed: NAME=%s**

Variable Information

%s = EJB application name

Explanation

A request to stop an EJB application failed.

System Action

Stops deactivating the EJB application.

## User Action

Remove the cause of the failure by referring to any other error messages or to the system log, and then reexecute the command.

### 3.9.5 EJB0708

---

Windows32/64

**EJB: INFO:EJB0708: Confirm EJB application activation result by the event log**

#### Explanation

Refer to the system log to confirm the EJB application activation result.

Solaris32/64 Linux32/64

**EJB: INFO:EJB0708: Confirm EJB application activation result by the console or the system log**

#### Explanation

Refer to the console or the system log to confirm the EJB application activation result.

### 3.9.6 EJB0709

---

Windows32/64

**EJB: INFO:EJB0709: Confirm EJB application deactivation result by the event log**

#### Explanation

Refer to the system log to confirm the EJB application deactivation result.

Solaris32/64 Linux32/64

**EJB: INFO:EJB0709: Confirm EJB application deactivation result by the console or the system log**

#### Explanation

Refer to the console or the system log to confirm the EJB application deactivation result.

### 3.9.7 EJB0710

---

**EJB: ERROR:EJB0710: Specified EJB application not exist: NAME=%s1**

#### Variable Information

%s1 = EJB application name

#### Explanation

The command could not be executed because the specified EJB application had not been installed.

#### System Action

Stops command execution.

#### User Action

Specify the name of the installed EJB application, and then reexecute the command.

### 3.9.8 EJB0714

---

**EJB: ERROR:EJB0714: EJB application can not be executed: NAME=%s1**

#### Variable Information

%s1 = EJB application name

## Explanation

The specified EJB application is of a type that cannot be started.

## System Action

Stops the startup of the EJB application.

## User Action

Change the application based on the EJB1.0 specification to one that is based on EJB1.1 or later.

---

### 3.9.9 EJB0715

---

**EJB: ERROR:EJB0715: EJB application activation failed because being installed, uninstalled, or customized: NAME=%s1**

## Variable Information

%s1 = EJB application name

## Explanation

Startup or stop failed because the specified EJB application is being installed, uninstalled, or customized.

## System Action

Stops processing.

## User Action

If you are installing or customizing the EJB application, reexecute the command after you finish doing so. If you are uninstalling the EJB application, the EJB application cannot be started after it has been successfully uninstalled. Even if the uninstallation task fails, you may not be able to start the EJB application because the EJB application definition may be incomplete.

---

### 3.9.10 EJB0719

---

**EJB: ERROR:EJB0719: Invalid operation of specified EJB application: NAME=%s1**

## Variable Information

%s1 = EJB application name

## Explanation

Invalid operation of the specified EJB application. The possible cause is either of the following:

- This application cannot be started or stopped because it is not possible to start the specified EJB application.
- Setting or canceling of encryption communication using SSL is invalid for the specified EJB application.
- The specified EJB application is an EJB application installed in the EJB container. It is not possible to start or stop an EJB application installed in the EJB container.

## System Action

Stops operation of the EJB application.

---

### 3.9.11 EJB0780

---

**EJB: ERROR: EJB0780: EJB application being operated by other service: NAME=%s**

## Variable Information

%s = EJB application name

## Explanation

Processing cannot be continued because the EJB application is being used by another Service. This can happen in the following circumstances.

- When the *ejbdstarteb* or *ejbdstopeb* command is being executed.  
The EJB application is being used by the *isstartwu* command.
- When the *isstartwu* command is being executed.  
The EJB application is being used by the *ejbdstarteb* command.

## System Action

Stops processing.

## User Action

Take the following action:

- When the *ejbdstarteb* command is being executed.  
Use the *isstopwu* command to stop the EJB application, and then reexecute the command.
- When the *ejbdstopeb* command is being executed.  
Use the *isstopwu* command to stop the EJB application.
- When the *isstartwu* command is being executed.  
Use the *ejbdstopeb* command to stop the EJB application, and then reexecute the command.

## 3.9.12 EJB0781

---

### **EJB: ERROR: EJB0781: EJB application information acquisition failed: NAME=%s**

#### Variable Information

%s = EJB application name

#### Explanation

Processing could not continue because EJB application status information was not collected. This error may have been caused by:

- Other application processes overloading the system CPU.
- Too high processing load of the EJB application to be stopped.

#### System Action

Stops processing.

#### User Action

Either wait a moment, or:

- Stop any other application processes that are overloading the CPU.
- Stop processing of the EJB application to be stopped.

Then, reexecute processing.

To stop the EJB application immediately, use the *isstopwu* command to forcibly stop the WorkUnit.

Refer to the *isstopwu* command in the Interstage Application Server Reference Manual (Command Edition) for details.

## 3.10 EJB0800 to EJB0899

---

This section details the messages with message numbers between EJB0800 and EJB0899.

### 3.10.1 EJB0801

---

#### **EJB: ERROR: EJB0801: Registration of extended system resource failed**

##### Explanation

Failed to generate an extended system resource.

##### System Action

Stops processing.

##### User Action

Remove the cause of the failure by referring to any other error messages or to the system log, and then reexecute the command.

### 3.10.2 EJB0806

---

#### **EJB: ERROR: EJB0806: Deletion of extended system resource failed**

##### Explanation

Failed to delete the extended system resource.

##### System Action

Stops processing.

##### User Action

Remove the cause of the failure by referring to any other error messages or to the system log, and then reexecute the command.

### 3.10.3 EJB0807

---

#### **EJB: ERROR: EJB0807: EJB service being operated**

##### Explanation

EJB Service is in operation.

##### System Action

Stops processing.

##### User Action

Stop EJB Service operation, and then reexecute the command.

### 3.10.4 EJB0810

---

#### **EJB: ERROR: EJB0810: Incorrect system name**

##### Explanation

System name is incorrect.

##### System Action

Stops processing.

##### User Action

Specify the correct system name, and then reexecute the command.

### 3.10.5 EJB0811

---

---

**EJB: ERROR: EJB0811: Specified system name length exceeds limit: MAX=%s****Variable Information**

%s = Maximum value of system name

**Explanation**

Length of the specified system name exceeds the maximum value.

**System Action**

Stops processing.

**User Action**

Specify the system name with the bytes not exceeding the limit, and then reexecute the command.

---

**3.10.6 EJB0812**

---

**EJB: ERROR: EJB0812: Specified system not exist****Explanation**

Specified system does not exist.

**System Action**

Stops processing.

**User Action**

Specify the system name that has been generated, and then reexecute the command.

---

**3.10.7 EJB0850**

---

**EJB: ERROR: EJB0850: Improper XML Processor Execution environment****Explanation**

Selected XML Processor Execution environment in use is incorrect.

**System Action**

Stops processing.

**User Action**

When JDK1.2.2 is used, use the Fujitsu XML Processor.

**Windows32/64**

Edit 'C:\INTERSTAGE\J2EE\etc\isj2ee.properties' file to 'xml\_parser=FUJITSU', and then reexecute processing.

**Solaris32/64** **Linux32/64**

Edit '/opt/FJSVj2ee/etc/isj2ee.properties' file to 'xml\_parser=FUJITSU', and then reexecute processing.

---

**3.11 EJB0900 to EJB0999**

---

**3.11.1 EJB0900**

---

**EJB: INFO: EJB0900 EJB Container creation completed:**

## Explanation

The EJB container was created successfully.

### 3.11.2 EJB0901

---

#### **EJB: ERROR: EJB0901 EJB Container creation failed**

## Explanation

An EJB container could not be created.

## System Action

Stops processing.

## User Action

Examine any other related error messages and the system log, then correct the error. Reexecute the command.

### 3.11.3 EJB0902

---

#### **EJB: INFO: EJB0902 EJB Container creation canceled**

## Explanation

Creation of the EJB container was cancelled by the user.

## System Action

Stops processing.

### 3.11.4 EJB0903

---

#### **EJB: INFO: EJB0903 EJB Container deletion completed**

## Explanation

The EJB container was deleted successfully.

### 3.11.5 EJB0904

---

#### **EJB: ERROR: EJB0904 EJB Container deletion failed**

## Explanation

The EJB container could not be created.

## System Action

Stops processing.

## User Action

Examine any other related error messages and the system log, then correct the error. Reexecute the command.

### 3.11.6 EJB0905

---

#### **EJB: INFO: EJB0905 EJB Container deletion canceled**

## Explanation

Deletion of the EJB container was cancelled by the user.

## System Action

Stops processing.

### 3.11.7 EJB0906

---

**EJB: INFO: EJB0906 Rapid Invocation definition registration to EJB Container completed: NAME=%s CONTAINER=%s**

#### Variable Information

%s = EJB application name

%s2 = EJB container name

#### Explanation

Registration of the rapid invocation definition in the EJB container was completed.

### 3.11.8 EJB0907

---

**EJB: INFO: EJB0907 Rapid Invocation definition registration to EJB Container failed: NAME=%s CONTAINER=%s**

#### Variable Information

%s = EJB application name

%s2 = EJB container name

#### Explanation

The rapid invocation definition could not be registered in the EJB container.

#### System Action

Stops processing.

#### User Action

Examine any other related error messages and the system log, then correct the error. Reexecute the command.

### 3.11.9 EJB0908

---

**EJB: INFO: EJB0908 Rapid Invocation definition unregistration to EJB Container completed: NAME=%s CONTAINER=%s**

#### Variable Information

%s = EJB application name

%s2 = EJB container name

#### Explanation

Unregistration of the rapid invocation definition from the EJB container was completed.

### 3.11.10 EJB0909

---

**EJB: ERROR: EJB0909 Rapid Invocation definition unregistration to EJB Container failed: NAME=%s1 CONTAINER=%s2**

#### Variable Information

%s1 = EJB application name

%s2 = EJB container name

## Explanation

The rapid invocation definition could not be unregistered from the EJB container.

## System Action

Stops processing.

## User Action

Examine any other related error messages and the system log, then correct the error. Reexecute the command.

### 3.11.11 EJB0910

---

**EJB: ERROR: EJB0910 Specified EJB application can not be installed in EJB Container: NAME=%s**

#### Variable Information

%s = EJB application name

## Explanation

The specified EJB application cannot be installed in the EJB container.

There are two possible causes. Either:

- (a) The deployed EJB application has a version number earlier than Interstage V5.0, or
- (b) An overwrite installation was attempted using the *ejbinstalleb* command, in which '-s container-name' was specified for an EJB application that was not installed in the EJB container.

## System Action

Stops installation of the EJB application.

## User Action

Do the following, as necessary:

If (a) above, redeploy the EJB application.

If (b) above, uninstall the installed EJB application, and then reexecute the deployment with '-s container-name' specified.

### 3.11.12 EJB0911

---

**EJB: ERROR: EJB0911 Specified EJB application already installed in different EJB Container: NAME=%s CONTAINER1=%s CONTAINER2=%s**

#### Variable Information

%s = EJB application name

%s2 = EJB container name specified as an option

%s3 = Name of the installed EJB container

## Explanation

The specified EJB application is installed in another EJB container.

## System Action

Stops processing.

## User Action

Do the following:

- Uninstall the installed EJB application, then reinstall it.

- Ensure that the container name specified as an option matches the name of the installed container for installation.

### 3.11.13 EJB0912

---

**EJB: ERROR: EJB0912 EJB application and EJB container of the same name can not be installed: NAME=%s**

#### Variable Information

%s = EJB container name

#### Explanation

An EJB application that has the same name as the EJB container cannot be installed.

#### System Action

Stops processing.

#### User Action

After changing the name of the EJB application so that it does not duplicate the EJB container name, reinstall it.

### 3.11.14 EJB0913

---

**EJB: ERROR: EJB0913 Specified EJB application already installed in EJB Container: NAME=%s1 CONTAINER=%s2**

#### Variable Information

%s1 = EJB application name

%s2 = EJB container name

#### Explanation

The specified EJB application is already installed in the EJB container.

There are two possible causes. Either:

- Overwrite installation was performed for an EJB application installed in the EJB container without '-s container-name' being specified, or
- Overwrite installation of an EJB application defined for rapid invocation in the EJB container was attempted with -r specified.

#### System Action

Stops processing.

#### User Action

Do the following, as necessary:

If (a) above, specify '-s container-name' when performing overwrite installation for an EJB application installed in the EJB container.

If (b) above, specify '-s container-name' to perform overwrite installation for an EJB application installed in the EJB container. However, for installation in the same container as the backup source of the application storage folder specified by -r, unregister the rapid invocation definition from the EJB container, then respecify -r for the installation.

### 3.11.15 EJB0914

---

**EJB: ERROR: EJB0914 Specified EJB application not exist in EJB Container: NAME=%s1 CONTAINER=%s2**

#### Variable Information

%s1 = EJB application name

%s2 = EJB container name

### Explanation

The specified EJB application does not exist in the EJB container.

### System Action

Stops processing.

### User Action

Do the following:

- Uninstall, specify the correct EJB container name, and then reexecute processing.
- For EJB applications installed in other than an EJB container, however, you cannot specify the -s option to install the EJB applications by overwriting the EJB container. Therefore, uninstall the EJB application, then install the EJB application specifying the -s option. If the -r option has been specified, uninstall the EJB application, then install the EJB application specifying the -r option.

## 3.11.16 EJB0915

---

**EJB: ERROR: EJB0915 Specified EJB application is registered to EJB Container as Rapid Invocation definition: NAME=%s1 CONTAINER=%s2**

### Variable Information

%s1 = EJB container name

%s2 = Container

### Explanation

The specified EJB application is registered in the EJB container as a rapid invocation definition.

There are two possible causes, either:

- (a) Overwrite installation has been performed for an EJB application registered in the EJB container as a rapid invocation definition, without specifying '-s container-name'.
- (b) Overwrite installation of an EJB application defined for rapid invocation in the EJB container was attempted with -r specified.

### System Action

Stops processing.

### User Action

Do the following, as necessary:

If (a) above, specify '-s container-name' when performing overwrite installation for an EJB application installed in the EJB container.

If (b) above, specify '-s container-name' to perform overwrite installation for an EJB application installed in the EJB container. However, for installation in the same container as the backup source of the application storage folder specified by -r, unregister the rapid invocation definition from the EJB container, then respecify -r for the installation.

## 3.11.17 EJB0916

---

**EJB: ERROR: EJB0916 Specified EJB application is registered to different EJB Container as Rapid Invocation definition: NAME=%s1 CONTAINER=%s2 CONTAINER=%s3**

### Variable Information

%s1 = EJB application name

%s2 = EJB container name specified as an option

%s3 = Name of the installed EJB container

### Explanation

The specified EJB application is registered in another EJB container as a rapid invocation definition.

### System Action

Stops processing.

### User Action

Unregister the rapid invocation definition, and then reexecute processing.

## 3.11.18 EJB0917

---

**EJB: ERROR: EJB0917 Specified EJB application is not registered to EJB Container as Rapid Invocation definition: NAME=%s1 CONTAINER=%s2**

### Variable Information

%s1 = EJB application name

%s2 = EJB container name specified as an option

### Explanation

The specified EJB application is registered in another EJB container as a rapid invocation definition.

### System Action

Stops processing.

### User Action

Specify the correct EJB application name and EJB container name, and then reexecute processing.

## 3.11.19 EJB0918

---

**EJB: ERROR: EJB0918 container and EJB application of the same name can not be created: NAME=%s**

### Variable Information

%s = EJB container name

### Explanation

An EJB container that has the same name as an EJB application name cannot be created.

### System Action

Stops processing.

### User Action

Specify an EJB container name that is not the same as any of the existing names of installed EJB applications, and then reexecute processing.

## 3.11.20 EJB0919

---

**EJB: ERROR: EJB0919: EJB container that no EJB applications is installed cannot be activated: NAME=%s**

### Variable Information

%s = EJB container name

## Explanation

The EJB container cannot be started because the EJB application has not been installed in the specified EJB container.

## System Action

Stops processing.

## User Action

Install the EJB application in the specified EJB container, and then reexecute the command.

### 3.11.21 EJB0930

---

**EJB: ERROR: EJB0930 EJB Container definition not exist: PATH=%s**

#### Variable Information

%s = File name of the EJB container definition

## Explanation

The container definition file does not exist.

## System Action

Stops processing.

## User Action

Specify an existing container definition file, and then reexecute processing.

### 3.11.22 EJB0931

---

**EJB: ERROR: EJB0931 Incorrect EJB Container definition: PATH=%s CODE=%d**

#### Variable Information

%s = File name of the EJB container definition file

%d = Tag name

1: rep-id

## Explanation

The EJB container definition file is incorrect.

## System Action

Stops processing.

## User Action

Amend the definitions, and then reexecute processing.

### 3.11.23 EJB0932

---

**EJB: ERROR: EJB0932 Incorrect EJB Container definition: LINE=%d PATH=%s**

#### Variable Information

%d = Line number

%s = EJB container name

## Explanation

The EJB container definition file is incorrect.

### System Action

Stops processing.

### User Action

Amend the definition at the line number indicated, and then reexecute processing.

## 3.11.24 EJB0933

---

### **EJB: ERROR: EJB0933: EJB container name not specified**

#### Explanation

There are two possible causes. Either:

- For *ejbmakecontainer* commands, an EJB container name was not specified for the name of the [Common] section in the EJB container definition file.
- For other commands, an EJB container name was not specified for the command option.

### System Action

Stops processing.

### User Action

Take the following action:

- For *ejbmakecontainer* commands, specify an EJB container name for name of the [Common] section in the EJB container definition file, and then reexecute the command.
- For other commands, specify an EJB container name for the command option, and then reexecute the command.

## 3.11.25 EJB0938

---

### **EJB: ERROR: EJB0938 Failure in reading a file of EJB Container list definition**

#### Explanation

The EJB container list definition could not be read.

### System Action

Stops processing.

### User Action

Correct the following errors as indicated below, and then reexecute processing.

**Windows32/64**

- C:\Interstage\EJB\etc\FJContainerListProperties.xml does not exist.
- Access permission for C:\Interstage\EJB\etc\FJContainerListProperties.xml is denied.
- C:\Interstage\EJB\etc\FJContainerListProperties.xml is incorrect.

## 3.11.26 EJB0939

---

### **EJB: WARNING: EJB0939 Failure in reading a file of name convert definition**

#### Explanation

The name conversion file could not be read.

## System Action

Stops processing.

## User Action

The possible cause may be.

- The name conversion file could not be read.
- Access permission for the name conversion file was denied.
- The name conversion file is incorrect.

Rectify as necessary, and then reexecute processing.

## 3.11.27 EJB0950

---

**EJB: ERROR: EJB0950 WorkUnit definition registration failed: NAME=%s**

### Variable Information

%s = EJB container name

### Explanation

The WorkUnit definition could not be registered.

### System Action

Stops processing.

### User Action

Examine any other error messages generated and the system log, correct the error, and then reexecute the command.

## 3.11.28 EJB0951

---

**EJB: ERROR: EJB0951 WorkUnit definition deletion failed: NAME=%s**

### Variable Information

%s = EJB container name

### Explanation

The WorkUnit definition could not be registered.

### System Action

Stops processing.

### User Action

Examine any other error messages generated and the system log, correct the error, and then reexecute the command.

## 3.12 EJB1000 to EJB1099

---

This section details the messages with message numbers between EJB1000 and EJB1099.

### 3.12.1 EJB1001

---

**EJB: INFO:EJB1001: EJB application activated : NAME=%s1**

#### Variable Information

%s1 = EJB application name

### Explanation

The EJB application has been activated successfully.

### System Action

Activates the EJB application.

## 3.12.2 EJB1002

---

**EJB: INFO:EJB1002: EJB application deactivated : NAME=%s1**

### Variable Information

%s1 = EJB application name

### Explanation

The EJB application has been deactivated successfully.

### System Action

Deactivates the EJB application.

## 3.12.3 EJB1004

---

**EJB: ERROR:EJB1004: Failure in reading a definition file: NAME=%s1 FILE='%s2'**

### Variable Information

%s1 = EJB application name

%s2 = File name

### Explanation

Failed to read a definition file.

### System Action

Stops starting up the EJB application.

### User Action

The possible causes are:

- No file with the specified file name exists in the folder.
- No access permission exists for the file or folder.
- A system environment abnormality such as a memory shortage occurred.

Check whether a definition with the specified file name exists. Check the access permission for the file, the system environment, and so on.

## 3.12.4 EJB1005

---

**EJB: ERROR:EJB1005: Activation of EJB application failed : NAME=%s1**

### Variable Information

%s1 = EJB application name

### Explanation

The EJB application could not be activated.

## System Action

Stops activating the EJB application.

## User Action

Remove the cause of the failure according to the system log, then reactivate the EJB application.

This error also occurs when you try to activate multiple EJB application processes, which use distributed transactions, under the following conditions. In these cases, activate only one process.

- When an Entity Bean is specified as a Rapid invoking Bean.
- When a STATELESS Session Bean is specified as a Rapid invoking Bean, and sharing the EJB object of Performance Option is selected in Customize Tool.
- When EJB application that Deployment is done before Interstage V4.1 is specified.

## 3.12.5 EJB1008

---

**EJB: WARNING:EJB1008: Failed to write snap file : NAME=%s1 FILE=%s2**

### Variable Information

%s1 = EJB application name

%s2 = File name

### Explanation

An error occurred writing the information file, but processing is continued.

### System Action

Continues processing.

### User Action

Check the system environment. Possible causes are as follows:

- There is no access permission for the file or folder.
- A disk I/O error occurred.
- A memory shortage occurred.
- A disk capacity shortage occurred.

## 3.12.6 EJB1010

---

**EJB: ERROR:EJB1010: No access right to EJB application : NAME=%s1 CLASS=%s2**

### Variable Information

%s1 = EJB application name

%s2 = Class name

### Explanation

An instance of the EJB application class could not be activated.

### System Action

Stops activating the EJB application.

### User Action

The access qualifier of the class whose instance could not be activated is not public. Change the qualifier to public.

## 3.12.7 EJB1011

---

**EJB: ERROR:EJB1011: EJB application being deactivated : NAME=%s1**

### Variable Information

%s1 = EJB application name

### Explanation

The method cannot be executed via the client application because the EJB application is being deactivated.

### System Action

Stops executing the method via the client application.

### User Action

Reactivate the EJB application, then retry the method.

## 3.12.8 EJB1012

---

**EJB: ERROR:EJB1012: STATELESS Session Bean not available for Rapid Invocation: NAME=%s1**

### Variable Information

%s1 = EJB application name

### Explanation

The EJB application could not be activated because a STATELESS Session Bean was included in the Rapid Invocation.

### System Action

Stops activation of the EJB application.

### User Action

Either delete the STATELESS Session Bean from the Rapid Invocation definition; or convert the interaction status management model to STATEFUL, then redeploy and reactivate the EJB application.

## 3.12.9 EJB1013

---

**EJB: ERROR:EJB1013: Generation of EJB application class instance failed: NAME=%s1 CLASS=%s2**

### Variable Information

%s1 = EJB application name

%s2 = Class name

### Explanation

An EJB application class instance could not be generated because the EJB application class was defined as an interface.

### System Action

Stops activating the EJB application.

### User Action

Take the following action:

- Make sure the EJB application class for which you attempt to generate an instance is not defined as an interface. When a constructor is defined in the EJB application class, check whether an exception has occurred in the constructor.
- Confirm whether or not lookup processing is executed in the Entity Bean constructor. If it is executed, correct the EJB application so that lookup processing is executed in the setEntityContext method.

## 3.12.10 EJB1014

---

**EJB: ERROR:EJB1014: SessionContext setting failed: NAME=%s1**

### Variable Information

%s1 = EJB application name

### Explanation

An Exception occurred during execution of the setSessionContext method implemented in the Session Bean.

### System Action

When the interaction status management model is STATEFUL, an exception is returned to the client application and execution of the create method is stopped via the client application.

When the interaction status management model is STATELESS, the EJB application is stopped. In this situation, no exception is returned to the client application.

### User Action

Examine the setSessionContext method implemented in the Session Bean of the EJB application to determine the required action. Otherwise, contact the EJB application Session Bean developer.

## 3.12.11 EJB1015

---

**EJB: ERROR:EJB1015: EJB application class not found: NAME=%s1 CLASS=%s2**

### Variable Information

%s1 = EJB application name

%s2 = Class name

### Explanation

The EJB application class was not found.

### System Action

Stops the startup of the EJB application.

### User Action

Check whether a required EJB application class file exists in the Application Folder.

Also check that:

- The Primary Key class name defined in the deployment descriptor file matches the PrimaryKey class name (including the package name)
- The Enterprise Bean class name defined in the deployment descriptor file matches the Enterprise Bean class name (including the package name)
- The Home interface name defined in the deployment descriptor file matches the Home interface class name (including the package name)
- The Remote interface name defined in the deployment descriptor file matches the Remote interface class name (including the package name)

If a correct class file exists, deploy the EJB application again and start the EJB application.

## 3.12.12 EJB1016

---

**EJB: ERROR:EJB1016: Method not found: NAME=%s1 METHOD=%s2**

### Variable Information

%s1 = EJB application name

%s2 = Method name or constructor

### Explanation

The EJB application class cannot be found.

### System Action

Stops executing the EJB application method.

### User Action

The probable causes are:

- The method does not exist in the EJB application class or there is an error in the method interface.
- The method of the EJB application class is not public.

Confirm that the method exists in the EJB application class and that there is no error in the method interface. Correct the error if the method of the EJB application class is not public.

## 3.12.13 EJB1017

---

**EJB: ERROR:EJB1017: Unable to access method: NAME=%s1 METHOD=%s2**

### Variable Information

%s1 = EJB application name

%s2 = Method name or constructor

### Explanation

A security violation occurred during execution of the EJB application method.

### System Action

Stops executing the EJB application method.

### User Action

Examine the cause of the security violation.

## 3.12.14 EJB1018

---

**EJB: ERROR:EJB1018: Argument error: NAME=%s1 METHOD=%s2**

### Variable Information

%s1 = EJB application name

%s2 = Method name or constructor

### Explanation

The argument passed to the EJB application method is incorrect.

### System Action

Stops executing the EJB application method.

### User Action

Check and correct the relevant argument.

## 3.12.15 EJB1019

---

**EJB: WARNING:EJB1019: Failed to create snap file : NAME=%s1 FILE=%s2**

### Variable Information

%s1 = EJB application name

%s2 = File name

### Explanation

A snap file could not be generated. EJB application start processing continues, but data output to the snap file is not performed.

### System Action

Continues EJB application start processing.

### User Action

The possible causes are as follows:

- There is no access permission for the installation folder\var.
- A disk I/O error occurred.

When the output to a snap file function is used, check the system environment, then reset snap acquisition and start the EJB application.

## 3.12.16 EJB1020

---

**EJB: ERROR:EJB1020: Method execution failed: NAME=%s1 METHOD=%s2**

### Variable Information

%s1 = EJB application name

%s2 = Method name

### Explanation

A user exception occurred in the method specified with %s2 in the EJB application specified with %s1.

### System Action

Stops executing the EJB application method.

### User Action

Follow the procedure below to determine why the exception occurred, then remove the cause, and then reexecute the application:

1. Check the details of the exception in the following log file:

**Windows32/64**

C:\Interstage\EJB\var\FJEJBconsole

**Solaris32/64 Linux32/64**

/opt/FJSVejb/var/FJEJBconsole

2. Check the stack trace to determine why the exception occurred. For details of the causes of common exceptions, see 'Exception Information Output When You Use J2EE.'

If you still cannot resolve the problem, collect the following data and contact a Fujitsu service engineer:

- Console file

**Windows32/64**

C:\Interstage\EJB\var\FJEJBconsole

**Solaris32/64 Linux32/64**

/opt/FJSVejb/var/FJEJBconsole

- System log

### 3.12.17 EJB1021

---

**EJB: WARNING:EJB1021: Generation of standard output or standard error output file failed: NAME=%s1 FILE=%s2'**

#### Variable Information

%s1 = EJB application name

%s2 = File name

#### Explanation

A standard output or standard error output file could not be generated. The EJB application activation procedure continues but there is no output to these files.

#### System Action

Activates the EJB application.

#### User Action

The probable causes are:

- The destination for standard output or standard errors has not been specified.
- The destination for standard output or standard errors is wrong.
- You do not have the correct access permissions to access standard output or the folder specified as the output destination for standard errors.
- A disk input/output error occurred.

When using standard output or using the function to output data to standard error output files, confirm related definitions and file environments, then reactivate the EJB application.

### 3.12.18 EJB1022

---

**EJB: ERROR:EJB1022: Attempted function not supported: NAME=%s1**

#### Variable Information

%s1 = EJB application name

#### Explanation

An attempt was made to use an unsupported function.

#### System Action

Stops activating the EJB application or stops executing the method via the client application.

#### User Action

Refer to the EJB application interface in the Interstage Application Server Reference Manual (API Edition) for details of unsupported functions.

### 3.12.19 EJB1023

---

**EJB: ERROR:EJB1023: Reached upper connection limit: NAME=%s1**

#### Variable Information

%s1 = EJB application name

## Explanation

The create method was aborted because the number of times the create method was executed via the client application reached the upper limit (1024).

## System Action

Outputs the following exception information to the console file, then stops execution of the EJB application method.

FJTooManyObjectsException

## User Action

Check the following items and take appropriate action:

- The EJB object of a Session Bean, generated using the create method, needs to be deleted using the remove method at the termination of processing.

If the remove method is not executed, correct the client application, then restart the EJB application, and then reexecute the client application.

- If a client application is forcibly terminated before the remove method is executed, the EJB object remains undeleted. In this case, you can use the session timeout function to reduce the number of occurrences of this symptom to some extent.

Check the session timeout period specified for the EJB application name output as variable information. If the period is short, specify a longer period. Then, restart the EJB application, and then reexecute the client application.

## 3.12.20 EJB1024

---

**EJB: ERROR:EJB1024: EJB object not exist: NAME=%s1**

### Variable Information

%s1 = EJB application name

### Explanation

The message appears during the processing of a method aborted because of a nonexistent EJB object from a client application.

This can occur where an EJB object has been deleted due to one of the following causes:

1. If, immediately before this message (EJB1024), the message EJB1001 or EJB1057 is output, the EJB application may have been stopped during the execution of the client application, then restarted.
2. If, immediately before this message (EJB1024), the message EJB1033 is output for the same EJB application, the EJB application may have terminated during the execution of the client application because memory on the Java VM has become insufficient.  
After the termination, the EJB application may have been restarted. Alternatively, a process abnormally terminated by a WorkUnit function may automatically have been restarted.
3. If, immediately before this message (EJB1024), the message EXTP4657 is output for the WorkUnit running the EJB application which caused the error, the EJB application may have terminated because the maximum application processing time for the WorkUnit has elapsed during the execution of the client application.  
After the termination, the EJB application may have been restarted. Alternatively, a process abnormally terminated by a WorkUnit function may automatically have been restarted.
4. If, before this message (EJB1024), the message EJB1029 is output for the same EJB application, a timeout may have been caused by the session timeout function, and an EJB object may automatically have been deleted.
5. If, before this message (EJB1024), the message EJB1096 is output for the same EJB application, a system exception may have occurred during the execution of a method of the EJB application, and an EJB object may automatically have been deleted.
6. An EJB object has already been deleted by executing the EJB Home.remove method in the client application.
7. An EJB object has already been deleted by executing the EJB Object.remove method in the client application.

## System Action

Returns java.rmi.NoSuchObjectException to the client application and continues processing.

## User Action

The actions to be taken for each error cause are given below.

- For 1, 2, and 3 above, take the following action:
  - If the system returns java.rmi.NoSuchObjectException to the client application, to continue processing recreate the EJB object by executing the create method in the client application.  
  
If processing has been performed as above, you need to take no action. If processing has not been performed as above, correct, and then reexecute the client application.
- For 4, above, take either of the following actions:
  - Check the session timeout period specified for the EJB application name output as variable information. If the period is short, specify a longer period. Then, restart the EJB application, and then reexecute the client application.
  - If this error occurs and the system returns java.rmi.NoSuchObjectException to the client application, to continue processing the EJB object must be recreated.  
  
Execute the create method in the client application to recreate the EJB object. If processing has not been performed as above, correct, and then reexecute the client application.
- For 5, above, take the following action:
  - EJB container deleted the EJB object because it determined that processing could not be continued due to the occurrence of a system exception in preprocessing in which an error had occurred. Remove the cause of the system exception, and then reexecute the client application.
  - Check whether an invalid remove method is executed in the client application. If an invalid remove method is executed, correct, and then reexecute the client application.
  - If an application always executes the remove method so that no EJB object remains undeleted after postprocessing for an error, the remove method may be issued twice. In this case, the error causes no problem. Continue processing.

### 3.12.21 EJB1025

---

**EJB: ERROR:EJB1025: Exception accepted from EJB application : NAME=%s1**

#### Variable Information

%s1 = EJB application name

#### Explanation

An Exception not defined in the interface was accepted from the EJB application method.

#### System Action

Stops executing the EJB application method.

#### User Action

See if the EJB application has thrown an exception that is not defined in the interface. Otherwise, contact the EJB application Session Bean developer.

### 3.12.22 EJB1026

---

**EJB: ERROR:EJB1026: Transaction timeout: NAME=%s1**

#### Variable Information

%s1 = EJB application name

## Explanation

A transaction timeout occurred.

## System Action

Invalidates transaction processing.

## User Action

Determine why processing from the UserTransaction.begin method up to the UserTransaction.commit method has not completed within the time specified for transaction timeout. Check whether transaction timeout is correctly specified.

### 3.12.23 EJB1027

---

#### **EJB: ERROR: EJB1027: Communication error occurred**

## Explanation

A communications error has occurred.

## System Action

Stops the EJB application.

## User Action

The probable causes are:

- A network error has occurred.
- There is insufficient memory.

Check the network and system environments.

### 3.12.24 EJB1029

---

#### **EJB: ERROR:EJB1029: Session timeout: NAME=%s1**

## Variable Information

%s1 = EJB application name

## Explanation

A session timeout occurred while a connection was being established from a client application.

## System Action

Invalidates the connection from the client application.

## User Action

Determine why processing (from the create method to the remove method being issued from a client application) did not end within the time set for session timeout. Check whether the time setting for session timeout is appropriate.

### 3.12.25 EJB1030

---

#### **EJB: ERROR: EJB1030: No right to access method : NAME=%s1 METHOD=%s2**

## Variable Information

%s1 = EJB application name

%s2 = Method name

## Explanation

There is no access permission the method now being called.

## System Action

Stops executing the EJB application method.

## User Action

Execute with the security roll which has the authorization of method access, or add the security roll to the corresponding method. For information about setting the security roll, contact the EJB application Bean administrator.

It is also possible that there is an error when producing the authentication process of the user ID and the password. Check whether the security management environment definition file is set correctly.

## 3.12.26 EJB1031

---

### **EJB: WARNING:EJB1031: Failure in writing to console file**

## Explanation

An error occurred writing console information to a file.

## System Action

Continues processing.

## User Action

The possible causes are:

- No access permission exists for the console information file or folder.
- A disk input/output error occurred.
- A memory shortage occurred.
- A disk capacity shortage occurred.

Check the system environment.

## 3.12.27 EJB1032

---

### **EJB: ERROR:EJB1032: Error in class file created through Deployment: NAME=%s1**

## Variable Information

%s1 = EJB application name

## Explanation

A class file created through the Deployment Tool cannot be found or is corrupt.

## System Action

Stops the startup of the EJB application or stops the execution of an EJB application method.

## User Action

Check whether the required class file exists in the Application Folder.

Also check that:

- The Home interface name defined in the deployment descriptor file matches the Home interface class name (including the package name)
- The Remote interface name defined in the deployment descriptor file matches the Remote interface class name (including the package name)

If a correct class file exists, deploy the EJB application again and start the EJB application.

## 3.12.28 EJB1033

---

### EJB: ERROR:EJB1033: Memory shortage occurred on JavaVM: NAME=%s1

#### Variable Information

%s1 = EJB application name

#### Explanation

java.lang.OutOfMemoryError occurred. The possible causes are:

- Java VM heap memory is insufficient.
- Virtual memory is insufficient.

#### System Action

Terminates the EJB application.

#### User Action

Take action according to each cause as follows:

- Where Java VM heap memory is insufficient, check whether the maximum heap size is small compared with the amount of memory used by the application as follows.

**Windows32/64 Solaris32/64 Linux32/64**

1. Check method using the performance monitor. For details, see the following commands in the Reference Manual (Command Edition) and related performance monitor manuals:

- ispmakeenv
- ispstart
- ispreport

Information which can be collected:

- Maximum memory usage on the Java VM
- Average memory usage on the Java VM

**Solaris32/64 Linux32/64**

2. Check method using verbose:gc

[Collecting information]

Set -verbose:gc for Java Command Option in the WU definition.

[Application Program]

Java Command Option=-verbose:gc

The information is output to the following file:

/opt/FJSVejb/var/FJEJBVMstderrXXX

[Example]

[GC 1217K->722K(2048K), 0.0040460 secs]

The value in parentheses indicates the heap size for the Java VM.

- If the previous steps confirm that the amount of memory on the Java VM is small, increase the number of concurrent EJB applications, or change the amount of memory on the Java VM:

- Increase the number of concurrent EJB applications

Change the value for Concurrency in the [Application Program] section in the WorkUnit definition.

Example) Concurrency: 2

- Change the amount of memory on the Java VM

Set Java option `-Xmx` as a value of Java Command Option in the [Application Program] section in the WorkUnit definition.

Example) Java Command Option: `-Xmx64m`

If none of the above applies, check the following items:

- The remove method was issued while a Session Bean was invoked
- An EJB application did not illegally acquire memory
- An unnecessarily large number is not set as the initial instance count of an Entity Bean

If one of the above applies, take the following action:

- Modify the client application or the EJB application
- Modify the EJB application definition information

And then restart the EJB application.

- Where Virtual memory is insufficient, use an OS function to confirm whether virtual memory is insufficient. If the memory is insufficient, wait for a while, and then reexecute the processing. If this message is frequently output, see 'Tuning Guide,' reestimate the amount of memory required for running Interstage, and verify that enough memory is available.

If enough memory is available compared with the amount of memory required for Interstage, the amount of memory used by other applications may be insufficient. Reestimate the amount of memory required for other applications running on the same machine and check whether the amount of memory is appropriate.

If the amount of memory is checked to be insufficient as the result of reestimation, contact the system administrator. The system administrator must increase the size of the main memory or expand the page file.

For details of action to be taken if `java.lang.OutOfMemoryError` occurs, refer to "JDK/JRE Tuning" in the "Tuning Guide".

### 3.12.29 EJB1034

---

**EJB: ERROR:EJB1034: No access right to application folder: PATH='%s1'**

#### Variable Information

%s1 = Application Folder name

#### Explanation

The access permission set for the Application Folder does not allow it to be accessed.

#### System Action

Stops activating the EJB application.

#### User Action

Change your access permission so that you can access the Application Folder, or have it accessed by a user with the required permission.

### 3.12.30 EJB1035

---

**EJB: ERROR:EJB1035: Error in accessing CORBA service**

#### Explanation

An abnormality occurred while accessing the CORBA Service.

The possible causes are:

- The CORBA Service is not running normally.
- The startup count of the EJB application exceeded 255, the maximum value for process multiplicity.

- The system memory volume is insufficient.

### System Action

Stops the EJB application or the execution of a method of the EJB application.

#### Windows32/64

### User Action

- Check the CORBA Service operation status.
  - Limit the startup count of the EJB application to 255 or less.
  - Increase real memory and swap area.
  - Check to make sure the Java VM initial heap memory volume is not excessively high.
  - Check to make sure that the max\_IIOp\_req\_per\_con value set in the following file is not excessively high.
    - Interstage install directory \ODWin\etc\config
- For information about the estimated values, refer to 'CORBA service operation environment file' in the Tuning Guide.
- Reestimate the memory volume required to operate Interstage, referring to the Tuning Guide, and check whether memory is sufficiently prepared.

#### Solaris32/64 Linux32/64

### User Action

- Check the CORBA Service operation status.
- Limit the startup count of the EJB application to 255 or less.
- Increase real memory and swap area.
- There may have been an error when the EJB application was transferred. Check the following items and then transfer the EJB application again.
  - The transfer mode must be binary mode.
  - The upper and lower cases of file names must not be changed.
- Check to make sure that the Java VM initial heap memory volume is not excessively high.
- Check to make sure that the max\_IIOp\_req\_per\_con value set in the following file is not excessively high.

#### Solaris32/64

/opt/FSUNod/etc/config

#### Linux32/64

/opt/FJSVod/etc/config

- For information about the estimated values, refer to 'CORBA service operation environment file' in the Tuning Guide.
- Reestimate the memory volume required to operate Interstage, referring to the Tuning Guide and check whether memory is sufficiently prepared.

## 3.12.31 EJB1036

---

**EJB: ERROR:EJB1036: Error in EJB Service operating environment: NAME=%s1**

### Variable Information

%s1 = EJB application name

### Explanation

There is an error in the system files created at EJB Service installation.

### System Action

Stops activating the EJB application.

### User Action

Reinstall the EJB Service, then activate the EJB application.

## 3.12.32 EJB1037

---

### **EJB: ERROR:EJB1037: Error in EJB application operating environment: NAME=%s1**

#### Variable Information

%s1 = EJB application name

#### Explanation

The file storing the EJB application may be corrupt.

#### System Action

Stops activating the EJB application.

#### User Action

Deploy the EJB application again, then activate it.

## 3.12.33 EJB1038

---

### **EJB: ERROR:EJB1038: Error in transaction attribute specification: NAME=%s1**

#### Variable Information

%s1 = EJB application name

#### Explanation

The transaction attribute specification is incorrect.

#### System Action

Stops activating the EJB application.

#### User Action

Check the transaction attribute.

Confirm the transaction attribute of Rapid Invoking Bean and Rapid Invoked Bean when using Rapid Invocation.

## 3.12.34 EJB1039

---

### **EJB: ERROR:EJB1039: EJB application does not exist: NAME=%s1**

#### Variable Information

%s1 = EJB application name

#### Explanation

The EJB application may have already been deleted.

#### System Action

Stops activating the EJB application.

## User Action

Redeploy the EJB application, then activate it.

### 3.12.35 EJB1040

---

**EJB: ERROR: EJB1040: Activation of EJB application failed for being installed, uninstalled, or customized: NAME=%s1**

#### Variable Information

%s1 = EJB application name

#### Explanation

Startup failed because the specified EJB application was being installed, uninstalled, or customized.

#### System Action

Stops startup of the EJB application.

#### User Action

If the specified EJB application was being installed or customized, finish this task and then restart the EJB application.

If the specified EJB application was being uninstalled, it cannot be started if the uninstallation is successful. Additionally, the EJB application may not be able to be started if the installation fails, because the application definition may be incomplete.

### 3.12.36 EJB1041

---

**EJB: ERROR: EJB1041: No access permission to file: NAME=%s1 FILE='%s2'**

#### Variable Information

%s1 = EJB application name

%s2 = File name

#### Explanation

The EJB application failed to start up because there was no permission to access the file.

#### System Action

Stops startup of the EJB application.

#### User Action

Check the file's access permission, and assign appropriate permission if necessary. Alternatively, restart the EJB application as a user with permission.

### 3.12.37 EJB1042

---

**EJB: ERROR: EJB1042: Error in runtime environment: NAME=%s1**

#### Variable Information

%s1 = EJB application name

#### Explanation

Processing failed because of an error in the runtime environment.

#### System Action

Stops the startup of the EJB application.

## User Action

Check that:

- An error does not exist in the environment variable (CLASSPATH, PATH, etc.).
- The correct version of JDK is used.

After removing the cause of the problem, reexecute the processing.

## 3.12.38 EJB1043

---

### EJB: ERROR:EJB1043:Failure in loading class file: NAME=%s1

#### Variable Information

%s1 = EJB application name

#### Explanation

A class file required by the EJB application cannot be found or is corrupt.

#### System Action

Stops the startup of the EJB application, or stops the execution of a method of the EJB application.

#### Windows32/64

#### User Action

Check the following items:

- Check the EJB application runtime environment (CLASSPATH, etc.) for errors.
- Check whether the required EJB application class file exists in the Application Folder.
- Check whether the PrimaryKey class name defined in the deployment descriptor file matches the PrimaryKey class name (including the package name).
- Check whether the Enterprise Bean class name defined in the deployment descriptor file matches the Enterprise Bean class name (including the package name).
- Check whether the Home interface name defined in the deployment descriptor file matches the Home interface class name (including the package name).
- Check whether the Remote interface name defined in the deployment descriptor file matches the Remote interface class name (including the package name).

If a correct class file exists, reexecute deployment of the EJB application, then restart the EJB application.

Alternatively, contact the EJB application Bean developer.

#### Solaris32/64 Linux32/64

#### User Action

Carry out the following actions:

- Check the EJB application runtime environment (CLASSPATH, etc.) for errors.
- Check whether the required EJB application class file exists in the Application Folder.
- Check whether the PrimaryKey class name defined in the deployment descriptor file matches the PrimaryKey class name (including the package name).
- Check whether the Enterprise Bean class name defined in the deployment descriptor file matches the Enterprise Bean class name (including the package name).
- Check whether the Home interface name defined in the deployment descriptor file matches the Home interface class name (including the package name).

- Check whether the Remote interface name defined in the deployment descriptor file matches the Remote interface class name (including the package name).
- There may have been an error when the EJB application was transferred. Check the following items and then transfer the EJB application again.
  - The transfer mode must be binary mode.
  - The upper and lower cases of file names must not be changed.

If a correct class file exists, reexecute deployment of the EJB application, then restart the EJB application.

Alternatively, contact the EJB application Bean developer.

### 3.12.39 EJB1044

---

**EJB: ERROR: EJB1044: The transaction is not completed in this method : NAME=%s1 METHOD =%s2**

#### Variable Information

%s1 = EJB application name

%s2 = Method name

#### Explanation

The transaction is not complete in the STATELESS Session Bean method.

#### System Action

Invalidates the transaction processing. When the transaction is being started, stops the start processing or throws a RemoteException.

#### User Action

Check the method implemented in the STATELESS Session Bean of the EJB application and correct the EJB application so that the transaction is complete in the method. Alternatively, contact the Session Bean developer of the EJB application.

### 3.12.40 EJB1045

---

**EJB: ERROR: EJB1045: Method not available: METHOD =%s1**

#### Variable Information

%s1 = Method name

#### Explanation

The method specified with %s1 cannot be used from the following EJB application methods:

- setSessionContext
- ejbCreate
- ejbRemove
- setEntityContext

#### System Action

When the EJB application is being started, stops the EJB application.

#### User Action

Check the EJB application in which the method specified with %s1 is being used from the following methods, then correct the EJB application so that it does not use the method.

- setSessionContext
- ejbCreate

- ejbRemove
- setEntityContext

### 3.12.41 EJB1046

---

**EJB: ERROR: EJB1046: Status of the transaction is not active : NAME=%s1 METHOD =%s2**

#### Variable Information

- %s1 = EJB application name
- %s2 = Method name

#### Explanation

The transaction had not been started when the EJB application method was executed.

#### System Action

Stops execution of the EJB application method.

#### User Action

Correct the EJB application so that the EJB application method is executed when the transaction has been started (when executing an EJB application method with MANDATORY specified in the transaction attribute).

### 3.12.42 EJB1047

---

**EJB: WARNING: EJB1047: Status of the transaction is marked rollback : NAME=%s1 METHOD =%s2**

#### Variable Information

- %s1 = EJB application name
- %s2 = Method name

#### Explanation

Rollback had already been specified for the transaction when the EJB application method was executed.

#### System Action

Stops execution of the EJB application method.

#### User Action

If rollback has been specified for the transaction, perform the following processing to rollback the transaction:

- If transaction type is Bean
  - Execute the rollback method of the UserTransaction interface.
- If transaction type is Container
  - Terminate the method.

### 3.12.43 EJB1048

---

**EJB: WARNING: EJB1048: Error in snap level: NAME=%s1**

#### Variable Information

- %s1 = EJB application name

#### Explanation

The snap output level is specified incorrectly. EJB application start processing continues, but data output to the snap file is not performed.

### System Action

Continues EJB application start processing.

### User Action

Specify the correct snap output level to obtain a snap, then restart the EJB application.

## 3.12.44 EJB1052

---

**EJB: ERROR: EJB1052: Unable to execute method in Session Bean: NAME=%s1**

### Variable Information

%s1 = EJB application name

### Explanation

The following methods can not be used in Session Bean.

- getPrimaryKey()
- remove(PrimaryKey pk)
- getHomeHandle()

### System Action

- When the getPrimaryKey() is used  
RemoteException will be thrown.
- When remove(PrimaryKey pk) is used  
RemoveException will be thrown.
- When getHomeHandle() is used  
RemoteException will be thrown.

### User Action

In Session Bean, do not use the following methods.

- getPrimaryKey()
- remove(PrimaryKey pk)
- getHomeHandle()

## 3.12.45 EJB1053

---

**EJB: ERROR: EJB1053: Reentrant not available : NAME=%s1**

### Variable Information

%s1 = EJB application name

### Explanation

Reentrant calling can not be made.

### System Action

Stops executing the EJB application method.

## User Action

- In case of Session Bean

Correct the EJB application method so that it will not make a reentrant calling.

- In case of Entity Bean

Correct the EJB application method so that it will not make a reentrant calling when Nonreentrant is specified to the reentrant kind of the deployment descriptor.

Specify reentrant to the reentrant kind of the deployment descriptor when reentrant calling is to be made in the EJB application method.

### 3.12.46 EJB1054

---

**EJB: INFO: EJB1054: The transaction is rolledback: NAME=%s1 METHOD =%s2**

#### Variable Information

%s1 = EJB application name

%s2 = Method name

#### Explanation

The transaction which is started has been rolledback.

### 3.12.47 EJB1055

---

**EJB: ERROR: EJB1055: Internal error occurred in transaction executed: NAME=%s1 CODE =%s2**

#### Variable Information

%s1 = EJB application name

%s2 = System code

#### Explanation

An internal error occurred due to some reason while the transaction was being executed.

#### System Action

Stops executing the EJB application method.

#### User Action

Notify your software supplier of the message information and the following information.

When the distributed transaction is used, use *otstranlist* of the OTS command to roll back pending transactions.

- When the distributed transaction is used
  - Whether or not the transaction timeout occurred.
  - Whether or not the OTS system worked wrong.
- When the distributed transaction is not used
  - Whether or not the transaction timeout occurred.

### 3.12.48 EJB1056

---

**EJB: ERROR: EJB1056: The transaction attribute in this method is not specified: NAME=%s1 METHOD =%s2**

### Variable Information

%s1 = EJB application name

%s2 = System code

### Explanation

The transaction attribute is not specified in the EJB application method which was to be executed.

### System Action

Stops executing the EJB application method.

### User Action

Specify the transaction attribute to the method and execute the method of the EJB application.

## 3.12.49 EJB1057

---

**EJB: INFO: EJB1057: EJBContainer activated : NAME=%s1**

### Variable Information

%s1 = EJB container name

### Explanation

The EJB container was activated successfully.

### System Action

Activates the EJB container.

### User Action

No action necessary.

## 3.12.50 EJB1058

---

**EJB: INFO: EJB1058: EJBContainer deactivated : NAME=%s1**

### Variable Information

%s1 = EJB container name

### Explanation

The EJB container was started successfully.

### System Action

Stops the EJB container.

### User Action

No action necessary.

## 3.12.51 EJB1059

---

**EJB: ERROR: EJB1059: Activation of EJBContainer failed : NAME=%s1**

### Variable Information

%s1 = EJB container name

### Explanation

The EJB container could not be activated.

### System Action

Stops activation of the EJB container.

### User Action

Examine the system log, correct the error, and then reactivate the EJB container. The error may also occur when multiple processes and distributed transactions are activated. If so, activate only one process.

## 3.12.52 EJB1060

---

**EJB: ERROR: EJB1060: Rapid Invocation Light mode is not available with Global Transaction: NAME=%s1**

### Variable Information

%s1 = EJB application name

### Explanation

The rapid invocation Light mode and the distributed transaction cannot be used concurrently.

### System Action

Stops activating the EJB application.

### User Action

When using rapid invocation Light mode, do not use the distributed transaction.

## 3.12.53 EJB1061

---

**EJB: ERROR: EJB1061: Status of the transaction is active: NAME=%s1 METHOD=%s2**

### Variable Information

%s1 = EJB application name

%s2 = Method name

### Explanation

The transaction is already started when the method of the corresponding EJB application is executed.

### System Action

Stops executing the EJB application method.

### User Action

The probable causes are:

- An attempt was made to execute a method of an EJB application in which Never is specified as the transaction attribute after transactions were started.
- An attempt was made to execute the ejbRemove method of a STATEFUL Session Bean in which Container is specified as the transaction type after transactions were started.

Be sure to start either of the above methods in a state in which no transaction is started.

## 3.12.54 EJB1062

---

---

**EJB: ERROR: EJB1062: The STATEFUL Session Bean instance is already in transaction: NAME=%s1 METHOD =%s2****Variable Information**

%s1 = EJB application name

%s2 = Method name

**Explanation**

The instance has already joined the transaction when the STATEFUL Session Bean method is executed.

**System Action**

Stops executing the EJB application method.

**User Action**

When the method of the STATEFUL Session Bean with NotSupported or RequiresNew specified in the transaction attribute is to be executed, correct the EJB application so that the STATEFUL Session Bean is executed when the instance has not joined the transaction.

---

**3.12.55 EJB1063**

---

**EJB: INFO: EJB1063: Status of the transaction marked rollback : NAME=%s1 METHOD =%s2****Variable Information**

%s1 = EJB application name

%s2 = Method name

**Explanation**

Rollback was specified to the transaction which is already started.

---

**3.12.56 EJB1065**

---

**EJB: WARNING: EJB1065: Environmental property name duplicated in Rapid Invocation: NAME=%s1 %s2****Variable Information**

%s1 = EJB application name

%s2 = Environment property name=environment property value

**Explanation**

Environment property names are duplicated in the rapid invocation group.

**System Action**

Activation processing is continued. For the environment property whose name is duplicated, the value indicated in the system log is adopted.

**User Action**

Refer to the system log to check the value corresponding to the environment property name.

---

**3.12.57 EJB1066**

---

**EJB: WARNING: EJB1066: Registration of this Resource failed: RESOURCE=%s1 REASON =%s2****Variable Information**

%s1 = Resource name

%s2 = Reason code

#### Explanation

The resource specified in resource access definition cannot be used.

#### System Action

Continues processing.

#### User Action

The probable causes are:

- The JDBC driver is not properly installed.
- The JDBC driver environment settings are incorrect.
- The JDBC environment CLASSPATH setup is incorrect.

If the relevant resource is being used, correct the error, then restart the EJB application or EJB container. When the EJB application does not use the corresponding resource, there is no effect to the operation.

### 3.12.58 EJB1067

---

**EJB: WARNING: EJB1067: Registration of JMSConnectionFactory failed: RESOURCE=%s1 REASON = %s2**

#### Variable Information

%s1 = JMS connection factory name

%s2 = Detailed message

#### Explanation

The specified JMS connection factory cannot be used.

#### System Action

Continues processing.

#### User Action

The probable causes are:

- JMS is not installed correctly.
- The naming service of JMS is not activated.
- The JMS connection factory name is specified incorrectly.

To use the JMS connection factory, remove the relevant cause, then reactivate the EJB application.

### 3.12.59 EJB1068

---

**EJB: ERROR: EJB1068: Error in security information specification: NAME=%s1 RESOURCE =%s2**

#### Variable Information

%s1 = EJB application name

%s2 = Resource name

#### Explanation

No security information is transferred from the client application.

## System Action

Resource connection processing is stopped.

## User Action

If 'Application' is specified as the resource connector, be sure to make corrections so that security information is transferred from the client application.

### 3.12.60 EJB1069

---

**EJB: WARNING: EJB1069: Registration of MAIL Session failed: RESOURCE=%s1 REASON =%s2**

#### Variable Information

%s1 = MAIL Session name

%s2 = Detailed message

#### Explanation

The specified MAIL Session cannot be used.

#### System Action

Continues processing.

#### User Action

The probable causes are:

- The mail server is not active.
- The MAIL Session name is incorrectly specified.

To use the MAIL Session, remove the relevant cause, then reactivate the EJB application.

### 3.12.61 EJB1070

---

**EJB: WARNING: EJB1070: Registration of Resource Adaptor failed: RESOURCE=%s1 REASON=%s2 CODE=%s3**

#### Variable Information

%s1 = Name of Resource adaptor that could not be used

%s2 = Detailed message

%s3 = Internal code

#### Explanation

Resource adaptor cannot be used.

#### System Action

Continues processing.

#### User Action

Remove the cause of the error as outlined in the detailed messages.

Probable causes are:

Environment setup

- Resource adaptor was not deployed.
- Resource name to lookup in the application is incorrect.
- CLASSPATH not set correctly to use resource adaptor.

Resource adaptor

- Failed to create instance of ManagedConnectionFactory (Exception occurred in constructor).
- Failed to call createConnectionFactory method of ManagedConnectionFactory.
- Setter method for config-property does not exist in the ManagedConnectionFactory.
- Type information of config-property and the value of config-property do not match.

### 3.12.62 EJB1071

---

**EJB: WARNING: EJB1071: Registration of URL failed: RESOURCE=%s1 REASON =%s2**

Variable Information

%s1 = URL name

%s2 = Detailed message

Explanation

The specified URL cannot be used.

System Action

Continues processing.

User Action

The probable cause is: Contents of the resource access definition are incorrect.

To use the URL, remove the relevant cause, then reactivate the EJB application.

### 3.12.63 EJB1072

---

**EJB: WARNING: EJB1072: Failure in reading a file of name convert definition: NAME=%s1**

Variable Information

%s1 = EJB application name

Explanation

Failed to read the name conversion file.

The name conversion of EJB cannot be used in the specified EJB application.

System Action

Activation processing is continued.

User Action

Check whether the name conversion file is set correctly.

### 3.12.64 EJB1073

---

**EJB: ERROR: EJB1073: Rapid invocation for Entity Bean is not defined: NAME=%s1**

Variable Information

%s1 = EJB application name

Explanation

Rapid invocation is not defined in Rapid invoking Entity Bean.

## System Action

Continues the startup processing.

## User Action

When an Entity Bean is used as a Rapid invoking Bean, define Rapid Invocation.

### 3.12.65 EJB1074

---

#### **EJB: ERROR: EJB1074: Error in accessing OTS Service**

#### Explanation

An error occurred when the OTS Service is accessed.

#### System Action

Stops the startup processing.

#### User Action

- Check that the OTS Service or resource control program is running.
- When using the distributed transaction linkage, check the OTS Service operating environment.
- The following environment variable, which is required for the distributed transaction linkage, may not have been set:

`LD_LIBRARY_PATH=/opt/FJSVots/lib`

Check whether the following settings are made:

- When a WorkUnit is used:

The environment is set as an environment variable at the startup of Interstage, or in Library for Application in the WorkUnit definition.

- When the *ejbstarteb* command is used:

The environment variable is set as an environment variable at the execution of the *ejbstarteb* command.

### 3.12.66 EJB1075

---

#### **EJB: WARNING: EJB1075: JDBC log file name is invalid: Value=%s1**

#### Variable Information

%s1 = Specified JDBC log file name

#### Explanation

JDBC log file name (`JDBC_log_file`) specified in the `FJEJBconfig.properties` file is invalid.

#### System Action

Continue processing. No output of JDBC log.

#### User Action

Check the following for the value of JDBC log file name (`JDBC_log_file`) specified in the `FJEJBconfig.properties` file.

- Check if there is an appropriate access right.
- Check if the specified directory exists.
- Check if the directory is specified.
- Check if the specified directory has enough free space.
- Check if it is specified with single-byte characters (double-byte characters are not allowed)

## 3.12.67 EJB1076

---

**EJB: WARNING: EJB1076: FJEJBconsole file size(FJEJBconsole\_file\_size) is invalid. Value=%s1**

### Variable Information

%s1 = Specified value

### Explanation

FJEJBconsole file size (FJEJBconsole\_file\_size) specified in the FJEJBconfig.properties file is invalid.

### System Action

FJEJBconsole file with default size (100Kbyte) is created.

### User Action

Set the FJEJBconsole file size (FJEJBconsole\_file\_size) specified in the FJEJBconfig.properties file to a value in the range of 20 - 30 Kbytes.

## 3.12.68 EJB1077

---

**EJB: WARNING: EJB1077: System File does not exist: FILE=%s1**

### Variable Information

%s1 = File name

### Explanation

System file does not exist.

Therefore, the following function cannot be used.

**Windows32/64**

C:\Interstage\EJB\etc\FJlogging.properties

**Solaris32/64** **Linux32/64**

/opt/FJSVejb/etc/FJlogging.properties

Debug information of the EJB application cannot be output to the snap file.

The processing of the EJB application will continue and snap information other than debug information of EJB application goes to the snap file normally.

### System Action

Continues the startup processing the EJB application.

### User Action

Reinstall the EJB Service.

## 3.12.69 EJB1078

---

**EJB: WARNING: EJB1078: The value of userID , password which is closely geared to securityrole specified in securityidentity is invalid. : NAME=%s1 ROLENAME=%s2**

### Variable Information

%s1 = EJB application name

%s2 = Value for the securityrole name specified in securityidentity

## Explanation

The values of userID and password in Directory Service that correspond to securityrole name of securityidentity are not set properly, or userID and password are not set in the Customize Tool.

## System Action

Stops activation of EJB applications.

## User Action

There are two possible causes for this error. Either:

- The user ID or password was not specified in the definition information (2) tag of the customization tool, or
- The user ID or password specified in the definition information (2) tag of the customization tool was not set in Directory Service, or the security role set in the security identity tag was not assigned.

To ensure correct operation of the security function, also do the following, then reactivate the EJB application:

- If the user ID or password is not specified in the definition information (2) tag of the customization tool  
Specify the user ID/password assigned to the security role of the security identity in the definition information (2) tag of the customization tool.
- If the user ID and password are specified in the definition information (2) tag of the customization tool, the specified user ID or password may be incorrect.

Check the settings in Directory Service to make sure that the user ID, password, and security role are set correctly. For information about security role settings, contact the Bean administrator.

## 3.12.70 EJB1079

---

**EJB: ERROR: EJB1079: Unable to access InfoDirectory. : NAME=%s1**

### Variable Information

%s1 = EJB application name

### Explanation

Failed to access the Directory Service.

### System Action

Stops activation of the EJB application.

### User Action

If the security function is used by the called EJB application, make sure that Directory Service has been activated correctly, then reactivate the EJB application

## 3.12.71 EJB1081

---

**EJB: ERROR: EJB1081: Reached upper limit of create-method numbers for SessionBean : NAME=%s1**

### Variable Information

%s1 = EJB application name

### Explanation

The create method was aborted because the number of times the create method was executed via the client application reached the upper limit.

### System Action

Outputs the following exception information to the console file then stops execution of the EJB application method.

FJTooManyObjectsException

#### User Action

Check if remove method for create method in the Client application is invoked correctly.

Alternatively, after the execution of remove method from other Client application, execute create method again, or restart again after activation of the EJB application.

Using the session timeout function can limit the occurrence of this symptom to some extent. For information on the session timeout function, refer to the relevant previous version manual.

### 3.12.72 EJB1082

---

**EJB: WARNING: EJB1082: JDBC Driver is not supporting batch updates : Name=%s1**

#### Variable Information

%s1 = EJB application name

#### Explanation

Used JDBC driver does not supporting batch updates.

#### System Action

Executes the update process for each item, as opposed to a batch update.

#### User Action

Check whether a JDBC driver that supports the batch update is provided. If provided, change the JDBC driver being used.

If the JDBC driver has not been provided, continue the process, ignoring this message (update process for each item is executed).

### 3.12.73 EJB1083

---

**EJB: WARNING: EJB1083: Initial processing of the performance monitoring function of EJB went wrong: NAME=%s1**

#### Variable Information

%s1 = EJB application name

#### Explanation

Failed initial processing of the performance monitoring function of EJB.

#### System Action

Continues processing. The performance monitoring function of EJB cannot be used.

#### User Action

Notify your software supplier of the message information.

### 3.12.74 EJB1084

---

**EJB: WARNING: EJB1084: The notice of the performance surveillance information on EJB went wrong: NAME=%s1 METHOD=%s2**

#### Variable Information

%s1 = EJB application name

%s2 = Method name

#### Explanation

Failed initial processing of the performance monitoring function of EJB.

#### System Action

Continue processing. Do not notify method (%s2) performance.

#### User Action

Notify your software supplier of the message information.

### 3.12.75 EJB1085

---

**EJB: WARNING: EJB1085: The performance monitoring function of EJB cannot be used : NAME=%s1**

#### Variable Information

%s1 = EJB application name

#### Explanation

An EJB application that is deployed in Interstage V3 or Interstage V4 cannot use the performance monitoring function of EJB.

#### System Action

Continue processing. The performance monitoring function of EJB cannot be used.

#### User Action

To use the performance monitoring function of EJB, use an EJB application that is deployed in Interstage V5 or later.

### 3.12.76 EJB1087

---

**EJB: ERROR: EJB1087: Abnormalities occurred with CORBA service :NAME=%s1 REASON=%s2**

#### Variable Information

%s1 = EJB application name

%s2 = Reason code

#### Explanation

An abnormality occurred in the CORBA Service as shown in the reason code (%s2).

#### System Action

Stops the EJB application.

#### User Action

According to the reason code (%s2), do as follows.

- In case of code 1, reactivate the EJB application.
- In case of code 2, reactivate Interstage and reactivate the EJB application.

### 3.12.77 EJB1088

---

**EJB: ERROR: EJB1088:An error is in specification of the number of threads of EJB application at the time of distributed transaction use :NAME=%s1**

#### Variable Information

%s1 = EJB application name

## Explanation

The number of threads for the EJB application is 1. In case distributed transaction is used, the number of threads should be set to two or higher.

## System Action

Stops the startup processing of the EJB application.

## User Action

Set the number of threads to two or higher by using *ejbinstalleb* command '-t' option, then reinstall the EJB application.

## 3.12.78 EJB1089

---

**EJB:WARNING: EJB1089: Registration of JMS Destination failed: RESOURCE=%s1 REASON =%s2**

### Variable Information

%s1 = JMS connection factory name

%s2 = Detailed message

### Explanation

The specified Destination cannot be used.

### System Action

Continues the processing.

### User Action

This error may have been caused by:

- JMS not installed correctly.
- The JMS Naming Service not been activated.
- The JMSDestination name specified incorrectly

Rectify as necessary, then reactivate the EJB application.

## 3.12.79 EJB1091

---

**EJB: WARNING: EJB1091: When Global Transaction mode, Registration of this ResourceAdapter for Local Transaction failed: RESOURCE=%s1 CODE=%s2 %s3**

### Variable Information

%s1 = Name of a resource adapter which cannot be used

%s2 = Detailed information1

%s3 = Detailed information2

### Explanation

When a distributed transaction mode is employed, a resource adapter for a local transaction cannot be used. An EJB application running with a distributed transaction cannot also use a resource adapter for local transactions.

### System Action

Continues processing.

### User Action

Use an EJB application which does not use the distributed transaction linkage.

Alternatively, deploy and use a resource adapter for a distributed transaction when one is available.

## 3.12.80 EJB1092

---

**EJB: ERROR: EJB1092: created EJB object is deleted: NAME=%s1 CODE=%s2**

### Variable Information

%s1 = EJB application name

%s2 = EJBObject identifier

### Explanation

Processing is interrupted because the created EJB object of the Session Bean has been deleted.

### System Action

Stops execution of the EJB application method.

### User Action

This error may have been caused by:

- An EJB application being stopped during execution of a client application, then the stopped EJB application immediately reactivated.
- The EJB application being terminated because of insufficient memory for the JavaVM during execution of a client application. The terminated EJB application was then reactivated immediately.

In turn, check whether:

- the EJB Home.remove method was issued twice by the client application
- the EJB object.remove method is issued twice by the client application
- the EJB object was deleted because of a session timeout. In this case, check whether message EJB 1094 was generated immediately before the current one. If it was, check whether the EJB object identifier output as [Variable information] in the relevant message and that output as [Variable information] in message EJB1094 match.
- the EJB object was deleted because of a system exception that occurred during execution of the EJB application method. In this case, check whether any EJB 1096 message was generated immediately before the current one. If it was, check whether the EJB object identifier output as [Variable information] of the relevant message and that output as [Variable information] of the EJB1096 message match.

## 3.12.81 EJB1093

---

**EJB: ERROR: EJB1093: EJB object(Entity Bean) is deleted : NAME=%s1**

### Variable Information

%s1 = EJB application name

### Explanation

The EJB object generated in the create or finder method is already deleted.

### System Action

Stops execution of the EJB application method.

### User Action

Consider the following, then rectify as necessary:

- EJB Home.remove method issued twice for a client application
- EJB object.remove method issued twice for a client application
- Appropriate value specified in the EJB object timeout parameter of Entity Bean

## 3.12.82 EJB1094

---

**EJB: ERROR: EJB1094: Session timeout is occurred: NAME=%s1 CODE=%s2**

### Variable Information

%s1 = EJB application name

%s2 = EJBObject identifier

### Explanation

The session timed out while a connection was being made from the client application.

### System Action

Disables connection from the client application.

### User Action

Determine why the processing, starting with the create method issued by the client application and ending with the remove method, was not completed within the session timeout period. Also check whether an appropriate value is set for the session timeout period.

## 3.12.83 EJB1095

---

**EJB: ERROR: EJB1095: Error in transaction attribute specification: NAME=%1 TRANSACTION=%2 REASON=%3**

### Variable Information

%1 = EJB application name

%2 = Transaction attribute

%3 = Detailed message

### Explanation

The transaction attribute was specified incorrectly.

### System Action

Stops activation of the EJB application.

### User Action

Examine any detail messages, then correct the error. Do the following for each detail message:

- Detail message:01

#### **Explanation**

Transaction attributes are not specified for the Session Bean, Message-driven Bean, and Entity Bean when 'Container' has been specified as the transaction management type.

#### **User Action**

If 'Container' has been specified as the transaction management type, you must specify transaction attributes for the Session Bean, Message-driven Bean, and Entity Bean.

- Detail message:02

#### **Explanation**

An incorrect transaction attribute was specified for the Message-driven Bean when 'Container' has been specified as the transaction management type.

#### **User Action**

If 'Container' has been specified as the transaction management type, you can only specify one of the following transaction attributes for the Message-driven Bean.

- Required
- NotSupported
- Detail message:03

**Explanation**

'Mandatory' was specified as the transaction attribute of a method that rapidly invokes a Bean when the distributed transaction function is not used.

**User Action**

If the distributed transaction function is not used, specify a transaction attribute other than 'Mandatory' for the method that rapidly invokes a Bean.

- Detail message:04

**Explanation**

Different transaction attributes were specified for each method of the EJB application that uses the Light mode of the rapid invocation function.

**User Action**

If using the Light mode of the rapid invocation function, specify the same transaction attribute to all EJB application methods.

- Detail message:05

**Explanation**

An unsupported transaction attribute was specified.

**User Action**

- Ensure that all transaction attributes are correctly specified
- If the distributed transaction function is used, ensure that 'NotSupported,' 'Supports,' or 'Never' were specified as the transaction attribute of the Entity Bean method.

- Detail message:06

**Explanation**

- Either, a transaction attribute was specified that is not supported in Light mode of the rapid invocation function, or
- An incorrect combination of transaction attributes were specified for the rapidly invoking Bean and the rapidly invoked Bean.

**User Action**

- Ensure that all transaction attributes are correctly specified
- Ensure that all transaction attributes of the rapidly invoking Bean and the rapidly invoked Bean are correct.

- Detail message:07

**Explanation**

If an EJB application created by Interstage V3 or the processing mode of an EJB application was specified for Interstage V3 operation, a transaction attribute was specified incorrectly.

**User Action**

- Ensure that 'Mandatory' was specified for the transaction attribute of the rapidly invoking Bean
- Ensure that a transaction attribute other than 'Mandatory' was specified for the Entity Bean
- Ensure that a transaction attribute not supported in Interstage V3.1 was specified
- Ensure that the transaction attribute is validly specified.

- Detail message:08

**Explanation**

'NoCache' has been specified for the Entity Bean instance control mode, but an unsupported transaction attribute has been specified.

#### User Action

Ensure that 'NotSupported', 'Supports', or 'Never' has been specified for the transaction attribute.

### 3.12.84 EJB1096

---

**EJB: ERROR: EJB1096: System Exception is occurred during business method called: NAME=%1 METHOD=%2 CODE=%3**

#### Variable Information

%1 = EJB application name

%2 = Method name

%3 = EJB object identifier (For EJB applications that share EJB objects, null is displayed.)

#### Explanation

A system exception was received during processing of a business method of the EJB application.

#### System Action

Stops execution of the EJB application method to delete the EJB object.

#### User Action

Investigate likely causes. Consider contacting the developer of the Session Bean for the EJB application.

### 3.12.85 EJB1097

---

**EJB: ERROR: EJB1097: Unable to execute EJB application in Light EJB Container: NAME=%s1**

#### Variable Information

%s1 = EJB application name

#### Explanation

EJB applications created prior to Interstage V5.0 cannot be used in the EJB container.

#### System Action

Stops activation of the EJB container.

#### User Action

Deploy the EJB application in a V5.1 environment, then activate the EJB container.

### 3.12.86 EJB1099

---

**EJB: ERROR: EJB1099: Failure in reading a Container definition file: NAME=%s1 REASON=%s2**

#### Variable Information

%s1 = EJB container name

%s2 = Detailed message

#### Explanation

The container definition file could not be read.

#### System Action

Stops activation of the EJB container.

## User Action

Inspect the detail messages to correct the error. Do the following for each detail message:

- Detail message:01

### Explanation

An invalid value was specified for a container definition item, or a required item was omitted.

### User Action

Specify the correct values for the container definition items.

- Detail message:02

### Explanation

Either an alphanumeric string item has been specified by a value other than an alphanumeric string, or a value outside the range of int has been specified (-2147483648 to 2147483647).

### User Action

Specify a correct alphanumeric string.

- Detail message:03

### Explanation

An XML file could not be read.

### User Action

Delete the relevant EJB container then recreate an EJB container.

## 3.13 EJB1100 to EJB1199

---

### 3.13.1 EJB1100

---

**EJB: ERROR: EJB1100: CLASSPATH required at the time of operation of EJB application is insufficient: NAME=%s1 CLASS=%s2**

#### Variable Information

%s1 = EJB application name

%s2 = Remote interface class name

#### Explanation

A class developed by the EJB application developer that is referenced by the EJB application was not specified in CLASSPATH.

#### System Action

Stops execution of the EJB application method.

#### User Action

Ensure that the relevant classes of the EJB application are specified in CLASSPATH.

### 3.13.2 EJB1101

---

**EJB: ERROR: EJB1101: The same Home interface name or the Remote interface name is used with two or more EJB applications: NAME=%s**

#### Variable Information

%s1 = Home interface name or Remote interface name

## Explanation

Two or more EJB applications having the same Home interface or Remote interface name were placed in the same EJB container.

## System Action

Stops activation of the EJB container.

## User Action

If the associated EJB applications are invoked only from EJB applications deployed in the same EJB container, specify 'Yes' for 'Local invocation' in the definition information (2) tag of the customization tool, then reactivate the EJB container.

### 3.13.3 EJB1102

---

**EJB: ERROR: EJB1102: CMP20 Bean is not supporting NoCache instance management mode: NAME=%s1**

#### Variable Information

%s1 = EJB application name

#### Explanation

An invalid instance management mode is specified for the CMP2.0 EJB application.

#### System Action

Stops execution of the EJB application method.

#### User Action

For the CMP2.0 EJB application, specify an instance management mode other than NoCache.

### 3.13.4 EJB1103

---

**EJB: ERROR: EJB1103: EJB application can not use because there implements both Local I/F and Remote I/F: NAME=%s1**

#### Variable Information

%s1 = EJB application name

#### Explanation

The Local interface and Remote instance are mounted in the EJB application.

#### System Action

Stops execution of the EJB application method.

#### User Action

Generate EJB applications separately for the Local interface and Remote instance - one for the Local interface, the other for the Remote instance.

### 3.13.5 EJB1105

---

**EJB: WARNING: EJB1105: Not correct a file name of convert definition Environment properties designated: FILE=%s1**

#### Variable Information

%s1 = Nonexistent file name

## Explanation

The name conversion file specified in an environment variable could not be found.

## System Action

Continues start processing.

## User Action

Check whether an existing name conversion file is correctly set up in an environment variable. If not, set up a valid name conversion file correctly and restart the EJB application.

If a correctly set up name conversion file already exists, check the access permission for the specified name conversion file. If no access permission is granted, grant access permission and restart the EJB application, or restart the EJB application as a user with access permission.

## 3.14 EJB1200 to EJB1299

---

This section details the messages with message numbers between EJB1200 and EJB1299.

### 3.14.1 EJB1201

---

#### **EJB: ERROR:EJB1201: Creation of initial context failed**

## Explanation

A system error occurred.

## System Action

Stops activating the EJB application.

## User Action

Check whether the product is properly installed.

### 3.14.2 EJB1202

---

#### **EJB: WARNING: EJB1202: Registration of all Datasources failed**

## Explanation

None of the Datasources defined can be used.

## System Action

Continues processing.

## User Action

The probable causes are:

- The Customize Tool has been started.
- The JDBC driver is not properly installed.
- The JDBC driver environment settings are incorrect.

If the Datasources are to be used, eliminate the cause of the error then restart the EJB application.

### 3.14.3 EJB1203

---

#### **EJB: WARNING: EJB1203: Registration of some Datasources failed: DATASOURCES=%s1**

## Variable Information

%s1 = Datasource name that could not be used

## Explanation

Some Datasources defined cannot be used.

## System Action

Continues processing.

## User Action

The probable causes are:

- The Customize Tool has been started.
- The JDBC driver is not properly installed.
- The JDBC driver environment settings are incorrect.

If you are using these Datasources, eliminate the cause of the error then restart the EJB application.

## 3.14.4 EJB1204

---

**EJB: ERROR: EJB1204: Attempted connection not available: METHOD=%s1**

## Variable Information

%s1 = Method name

## Explanation

An attempt was made to use a Connection class method for an already closed connection. Or, if the distributed transaction function is used, the value specified in the JTS resource definition file of the database linkage service is incorrect.

## System Action

Throws SQLException.

## User Action

The probable causes are:

- A connection that had issued Connection.close was used to issue a Connection class method.
- A UserTransaction.rollback or UserTransaction.commit was issued before a Connection class method was issued.

Issue a Connection class method while the connection is open.

If the distributed transaction function is used, the following causes are also probable.

- The JTS resource definition file of the database linkage service may be incorrect in the following points:
  - Incorrect lookupName
  - Incorrect InitialContextFactory
  - Incorrect ProviderURL
- The resource definition file of the datasource used by the EJB application for the database linkage service has not been registered.

If necessary, contact the EJB application Bean developer.

## 3.14.5 EJB1205

---

**EJB: ERROR:EJB1205: Inappropriate transaction instruction executed: METHOD=%s1**

## Variable Information

%s1 = Method name

## Explanation

The commit or rollback method of the JDBC Connection class cannot be used after UserTransaction.begin has been issued.

## System Action

Throws SQLException.

## User Action

Issue the JDBC commit or rollback method without UserTransaction.begin being issued.

If necessary, contact the EJB application Bean developer.

## 3.14.6 EJB1206

---

### **EJB: ERROR:EJB1206: setAutoCommit method not available**

## Explanation

The setAutoCommit method of the JDBC Connection class cannot be used after UserTransaction.begin has been issued.

## System Action

Throws SQLException.

## User Action

Issue the setAutoCommit method of the JDBC Connection class without UserTransaction.begin being issued.

If necessary, contact the EJB application Bean developer.

## 3.14.7 EJB1207

---

### **EJB: ERROR:EJB1207: setReadOnly method not available**

## Explanation

The setReadOnly method of the JDBC Connection class cannot be used after UserTransaction.begin has been issued.

## System Action

Throws SQLException.

## User Action

Issue the setReadOnly method of the JDBC Connection class without UserTransaction.begin being issued.

If necessary, contact the EJB application Bean developer.

## 3.14.8 EJB1208

---

### **EJB: ERROR: EJB1208: setTransactionIsolation method not available**

## Explanation

The setTransactionIsolation method of the JDBC Connection class cannot be used after UserTransaction.begin has been issued.

## System Action

Throws SQLException.

## User Action

Issue the setTransactionIsolation method of the JDBC Connection class without UserTransaction.begin being issued.

If necessary, contact the EJB application Bean developer.

### 3.14.9 EJB1209

---

#### **EJB: WARNING: EJB1209: Closing of a connection failed**

##### Explanation

The database connection could not be closed.

##### System Action

Throws SQLException.

##### User Action

The probable causes are:

- The connection has already been disconnected.
- Network failure.
- DBMS is not active.

Remove the cause of the failure, then retry processing.

### 3.14.10 EJB1210

---

#### **EJB: ERROR:EJB1210: Acquiring a connection failed**

##### Explanation

The execution of a getConnection method failed while UserTransaction was being used.

##### System Action

Throws SQLException.

##### User Action

The probable causes are:

- JDBC driver is not properly installed.
- JDBC driver environment settings are incorrect.
- DBMS is not active.
- The maximum number of JDBC driver connections has been exceeded.
- The user ID or password specified in the getConnection argument is incorrect.
- There is a network error.
- There is an error in the DBMS operating environment.

Remove the cause of the failure, then retry processing.

### 3.14.11 EJB1211

---

#### **EJB: ERROR:EJB1211: Error in unsetEntityContext method: NAME=%s1 METHOD=%s2**

##### Variable Information

%s1 = EJB application name

%s2 = Method name

## Explanation

An EJB application processing error occurred during unsetEntityContext method processing.

## System Action

Deactivates the EJB application.

## User Action

Check if an exception occurred during the EJB application processing specified in the unsetEntityContext method.

If necessary, contact the EJB application Bean developer.

## 3.14.12 EJB1212

---

### **EJB: ERROR:EJB1212: Generation of an instance failed: NAME=%s1**

#### Variable Information

%s1 = EJB application name

#### Explanation

An insufficient number of Entity Bean instances has been provided.

#### System Action

Throws RemoteException.

#### User Action

Increase the number of Entity Bean instances defined using the Customize Tool.

## 3.14.13 EJB1214

---

### **EJB: ERROR: EJB1214: EJB object associated with EntityContext not found: NAME=%s1**

#### Variable Information

%s1 = EJB application name

#### Explanation

The EntityContext method could not be used because it was invoked incorrectly.

#### System Action

Throws IllegalStateException.

#### User Action

The EntityContext method can be called using the following methods.

- When the getEJBObject method is used:
  - ejbActivate method
  - ejbPassivate method
  - ejbPostCreate method
  - ejbRemove method
  - ejbLoad method
  - ejbStore method
  - Business method

- When the `getPrimaryKey` method is used:
  - `ejbActivate` method
  - `ejbPassivate` method
  - `ejbPostCreate` method
  - `ejbRemove` method
  - `ejbLoad` method
  - `ejbStore` method
  - Business method

Make corrections so that the `EntityContext` method is invoked correctly. If necessary, contact the EJB application Bean developer.

### 3.14.14 EJB1215

---

#### **EJB: ERROR: EJB1215: Transaction postprocessing failed: NAME=%s1 METHOD=%s2**

##### Variable Information

%s1 = EJB application name

%s2 = Method name

##### Explanation

Postprocessing of a transaction failed.

##### System Action

Rolls back the database transaction.

##### User Action

The probable causes are:

- Database updating failed because an error occurred in the database.
- There is an error in `ejbPassivate` method processing.

Confirm that there is no error in the database and check `ejbPassivate` method processing.

If necessary, contact the EJB application Bean developer.

### 3.14.15 EJB1216

---

#### **EJB: ERROR: EJB1216: Error in create method: NAME=%s1**

##### Variable Information

%s1 = EJB application name

##### Explanation

A create method processing error has occurred.

##### System Action

Throws Exception.

##### User Action

Refer to the messages output before and after the create method processing, and remove the cause of the error.

If necessary, contact the EJB application Bean developer.

## 3.14.16 EJB1217

---

### **EJB: ERROR: EJB1217: Error in findByPrimaryKey method: NAME=%s1**

#### Variable Information

%s1 = EJB application name

#### Explanation

An error occurred in the findByPrimaryKey method.

#### System Action

Throws Exception.

#### User Action

Refer to the messages output before and after the findByPrimaryKey method processing, and remove the cause of the error.

If necessary, contact the EJB application Bean developer.

## 3.14.17 EJB1218

---

### **EJB: ERROR: EJB1218: Acquiring Primary Key failed: NAME=%s1 METHOD=%s2**

#### Variable Information

%s1 = EJB application name

%s2 = Method name

#### Explanation

The creation of the PrimaryKey object failed.

#### System Action

Throws Exception.

#### User Action

Refer to the messages output before and after the PrimaryKey object and remove the cause of the error.

If necessary, contact the EJB application Bean developer.

## 3.14.18 EJB1219

---

### **EJB: ERROR: EJB1219: Database update operation failed: NAME=%s1**

#### Variable Information

%s1 = EJB application name

#### Explanation

The database update operation failed.

#### System Action

Throws Exception.

#### User Action

Refer to the messages output before and after the database update error, and remove the cause of the error.

If necessary, contact the EJB application Bean developer.

### 3.14.19 EJB1220

---

**EJB: ERROR: EJB1220: Error in remove method: NAME=%s1**

#### Variable Information

%s1 = EJB application name

#### Explanation

An error occurred in the remove method.

#### System Action

Throws Exception.

#### User Action

Refer to the messages output before and after the remove method error, and remove the cause of the error.

If necessary, contact the EJB application Bean developer.

### 3.14.20 EJB1221

---

**EJB: ERROR: EJB1221: Specified EJB object already deleted: NAME=%s1**

#### Variable Information

%s1 = EJB application name

#### Explanation

The EJB object that executed the remove method cannot be used.

#### System Action

Throws NoSuchObject Exception.

#### User Action

Check if an EJB object that has executed the EJBHome.remove or EJBObject.remove method was used.

If necessary, contact the EJB application Bean developer.

### 3.14.21 EJB1222

---

**EJB: ERROR: EJB1222: Activation of EJB application failed: NAME=%s1**

#### Variable Information

%s1 = EJB application name

#### Explanation

The EJB application instance could not be associated with EJB object due to an inappropriate primary key value or incorrectly created EJB object.

#### System Action

Throws SQLException.

#### User Action

The probable cause is that an attempt was made to invoke an EJB object business method that was created using a primary key that does not exist in the database.

Check whether the primary key value is set correctly. Also check whether EJB object is created correctly after the findByPrimaryKey and finder methods are executed.

Refer to the messages output before and after this error, and remove the cause of the error. If necessary, contact the EJB application Bean developer.

### 3.14.22 EJB1223

---

**EJB: ERROR: EJB1223: getUserTransaction method not available: NAME=%s1 METHOD=%s2**

#### Variable Information

%s1 = EJB application name

%s2 = Method name

#### Explanation

The EntityContext.getUserTransaction method cannot be used in the Entity Bean.

#### System Action

Throws IllegalStateException.

#### User Action

Check that the EntityContext.getUserTransaction method is not used in the Entity Bean. If it is, contact the EJB application Bean developer.

### 3.14.23 EJB1224

---

**EJB: ERROR: EJB1224: Required object not initialized properly: NAME=%s1 METHOD=%s2**

#### Variable Information

%s1 = EJB application name

%s2 = Method name

#### Explanation

Processing was aborted because the required object had an incorrect value, or EntityContext or EJBObject methods were called when they could not be used.

#### System Action

Stops executing the method with the method name shown in the error message.

#### User Action

The probable causes are as follows:

- The reference value of the object (which is passed as an argument) is incorrect or null.
- An EntityContext or EJBObject method that cannot be used in the method was called.

An EntityContext or EJBObject method can be called in the following methods:

- ejbActivate method
- ejbPassivate method
- ejbPostCreate method
- ejbRemove method
- ejbLoad method
- ejbStore method
- Business method

Check whether the value of the object (which is passed as an argument) has been set correctly, or the calling of the method was correct.

### 3.14.24 EJB1225

---

**EJB: ERROR: EJB1225: Value returned from ejbFinder method is null: NAME=%s1 METHOD=%s2**

#### Variable Information

%s1 = EJB application name

%s2 = Method name

#### Explanation

The value of the primary key returned from the ejbFind<METHOD> method is null.

#### System Action

Throws RemoteException.

#### User Action

Check if the value of the primary key returned from the ejbFind<METHOD> method is null.

If necessary, contact the EJB application Bean developer.

### 3.14.25 EJB1226

---

**EJB: ERROR: EJB1226: Value returned from ejbCreate method is null: NAME=%s1**

#### Variable Information

%s1 = EJB application name

#### Explanation

The value of the primary key returned from the ejbCreate method is null.

#### System Action

Throws RemoteException.

#### User Action

Check if the value of the primary key returned from the ejbCreate method is null.

If necessary, contact the EJB application Bean developer.

### 3.14.26 EJB1227

---

**EJB: ERROR: EJB1227: Primary key value is null: NAME=%s1 METHOD=%s2**

#### Variable Information

%s1 = EJB application name

%s2 = Method name

#### Explanation

The value of the primary key passed as an argument of the method is null.

#### System Action

Throws RemoteException.

#### User Action

Check if the argument value of the findByPrimaryKey, EJBHome.remove or EJBObject.isIdentical method is null.

If necessary, contact the EJB application Bean developer.

## 3.14.27 EJB1228

---

**EJB: ERROR: EJB1228: EJB object generation failed: NAME=%s1 REASON=%s2 CODE=%s3**

### Variable Information

%s1 = EJB application name

%s2 = Detailed message

%s3 = System code

### Explanation

Creation of the EJB object failed.

### System Action

Throws Exception.

### User Action

Check that the combination of data types between the CMF and DBMS is correct.

## 3.14.28 EJB1229

---

**EJB: WARNING: EJB1229: STATUS\_ROLLEDBACK returned from commit method of UserTransaction: NAME=%s1**

### Variable Information

%s1 = EJB application name

### Explanation

An error occurred in the UserTransaction commit method and the transaction was rolled back. The possible causes are:

- An error occurred in one of the following methods executed by the commit method:
  - Entity Bean ejbStore method
  - Entity Bean ejbPassivate method
  - DBMS UPDATE processing executed by the EJB container when an Entity Bean (CMP) is used
  - Session Bean beforeCompletion
- The EJB container set the transaction status to STATUS\_MARKED\_ROLLBACK because a system exception occurred in the EJB application during a transaction. For this reason, the transaction was rolled back at the execution of the commit method.
- The UserTransaction setRollbackOnly method was executed in the application. For this reason, the transaction was rolled back at the execution of the commit method.

### System Action

The transaction rolls back and the system throws HeuristicRollbackException to the client application.

### User Action

User response will depend on the cause:

- Where an error occurred in one of the following methods executed by the commit method:
  - Entity Bean ejbStore method
  - Entity Bean ejbPassivate method
  - DBMS UPDATE processing executed by the EJB container when an Entity Bean (CMP) is used
  - Session Bean beforeCompletion

User determines why the exception occurred, following the procedure below:

1. Refer to the log file to analyze the exception which occurred.

**Windows32/64**

C:\Interstage\EJB\var\FJEJBconsole

**Solaris32/64 Linux32/64**

/opt/FJSVejb/var/FJEJBconsole

2. Check the stack trace to examine why the exception occurred. For details of the causes of exceptions which frequently occur, see 'Exception Information Output When You Use J2EE.'

If this procedure does not resolve the problem, contact a Fujitsu service engineer.

- Where the EJB container has set the transaction status to STATUS\_MARKED\_ROLLBACK. A system exception occurred in the EJB application during a transaction and the transaction was rolled back at the execution of the commit method, the user should examine why the error related to message EJB1096 occurred, take action, and then rerun.
- Where the UserTransaction setRollbackOnly method was executed in the application and the transaction was rolled back at the execution of the commit method, the user should check the cause of the execution of the setRollbackOnly method, examine why the setRollbackOnly method was executed, take action, and then rerun.

### 3.14.29 EJB1231

---

**EJB: ERROR: EJB1231: Error in setEntityContext method: NAME=%s1 REASON=%s2**

#### Variable Information

%s1 = EJB application name

%s2 = Detailed message

#### Explanation

An EJB application processing error occurred during setEntityContext method processing.

#### System Action

Stops EJB application startup.

#### User Action

The probable causes and required actions are:

- Confirm whether lookup processing is executed in the Entity Bean constructor. If it is executed, correct the EJB application so that lookup processing is executed in the setEntityContext method.
- The Datasource specified in the Datasource lookup processing is not defined.
- The Datasource specified in the Datasource lookup processing cannot be used.  
Check the messages before and after the error to see if the Datasource specified in the Datasource lookup processing can be used. If it cannot be used, remove the cause of the error according to these messages.
- The deployment descriptor reference resource that corresponds to the Datasource specified in the Datasource lookup processing is not specified correctly.

Refer to the messages output before and after the error, and remove the cause of the error.

If necessary, contact the EJB application Bean developer.

### 3.14.30 EJB1233

---

**EJB: ERROR: EJB1233: Error in ejbLoad method: NAME=%s1 REASON=%s2**

### Variable Information

%s1 = EJB application name

%s2 = Detailed message

### Explanation

An EJB application processing error occurred during ejbLoad method processing.

### System Action

Throws RemoteException or ApplicationException.

### User Action

Check if an exception occurred during processing of the EJB application specified in the ejbLoad method.

If necessary, contact the EJB application Bean developer.

## 3.14.31 EJB1234

---

**EJB: ERROR: EJB1234: Error in ejbStore method: NAME=%s1 REASON=%s2**

### Variable Information

%s1 = EJB application name

%s2 = Detailed message

### Explanation

An EJB application processing error occurred during ejbStore method processing.

### System Action

Throws RemoteException or ApplicationException.

### User Action

Check if an exception occurred during processing of the EJB application specified in the ejbStore method.

If necessary, contact the EJB application Bean developer.

## 3.14.32 EJB1235

---

**EJB: ERROR: EJB1235: Error in ejbRemove method: NAME=%s1 REASON=%s2**

### Variable Information

%s1 = EJB application name

%s2 = Detailed message

### Explanation

An EJB application processing error occurred during ejbRemove method processing.

### System Action

Throws RemoteException or ApplicationException.

### User Action

Check if an exception occurred during processing of the EJB application specified in the ejbRemove method.

If necessary, contact the EJB application Bean developer.

### 3.14.33 EJB1236

---

**EJB: ERROR: EJB1236: Initialization of connection failed: REASON=%s1**

#### Variable Information

%s1 = Detailed message

#### Explanation

An error occurred while initializing a connection.

#### System Action

Throws SQLException.

#### User Action

The possible causes are as follows:

- An attempt was made to set a transaction isolation level that is not supported by the JDBC driver.

Use the JDBC Customize Tool to set the isolation level specified in the rapid invocation definition to an isolation level supported by the JDBC driver.

- An exception was returned from the database.

If an exception was returned from the database, remove the error cause according to the detailed message from the JDBC driver.

Possible actions are as follows:

- Check the database status.
- Check the network for errors.

Remove the cause of the database connection setup failure, and then reexecute processing.

### 3.14.34 EJB1238

---

**EJB: ERROR: EJB1238: Error in finder: NAME=%s1 METHOD=%s2**

#### Variable Information

%s1 = EJB application name

%s2 = Method name

#### Explanation

An error occurred in the finder method.

#### System Action

Throws Exception.

#### User Action

Check the messages before and after the finder method processing error and remove the cause of the error.

If necessary, contact the EJB application Bean developer.

### 3.14.35 EJB1239

---

**EJB: ERROR: EJB1239: Exception from CMP Support: NAME=%s1 REASON=%s2**

#### Variable Information

%s1 = EJB application name

%s2 = Detailed message

Note

When CMP2.0 is used, the EJB application name of changeable information [UNKNOWN] might be displayed.

### Explanation

A CMP processing error occurred.

### System Action

Stops the EJB application startup according to the detailed messages, or throws Exception.

### User Action

Remove the cause of the error as outlined in the detailed messages. The action required for each detailed message is outlined below.

- If you are using CMP1.1, refer to [CMP1.1 Detailed Messages](#), if you are using CMP2.0, refer to [CMP2.0 Detailed Messages](#) if you refer to the detailed messages, but cannot take appropriate action, take the following action:

1. Refer to the following log file to check the exception which occurred.

**Windows32/64**

C:\Interstage\EJB\var\FJEJBconsole

**Solaris32/64 Linux32/64**

/opt/FJSVejb/var/FJEJBconsole

2. Check the stack trace to examine why the exception occurred. For details of the causes of exceptions which frequently occur, see 'Exception Information Output When You Use J2EE.'

If you take the above action, but cannot resolve the problem, notify a Fujitsu service engineer of information about this message and other data.

## CMP1.1 Detailed Messages

- [CMP1] Internal Error. MESSAGE='%s1'.

### Variable Information

%s1 = JDBC driver detailed message

### Explanation

An invalid error occurred in the JDBC driver.

### System Action

Throws RemoteException to the Client application.

### User Action

Check whether the DBMS is running. If the DBMS is not running, start it, then rerun.

When the DBMS is running, remove the cause of the JDBC driver error according to the detailed message in the %s1 variable, see above.

- [CMP101] Bean '%s1' is not currently deployed.

### Variable Information

%s1 = EJB application name

### Explanation

A system error has occurred.

### System Action

Throws RemoteException.

### User Action

Notify your software supplier of the message information.

- [CMP102] Container Managed Persistence is not currently supported for the requested Data Source.

**Explanation**

A system error has occurred.

**System Action**

Throws RemoteException.

**User Action**

Notify your software supplier of the message information.

- [CMP1001] Internal Error. Finder '%s1' not found.

**Variable Information**

%s1 = finder method name

**Explanation**

Unable to locate the Finder definition for the finder method used.

**System Action**

Throws RemoteException.

**User Action**

The finder method definition for the Home interface and the finder definition do not match. Change the finder definition so that it matches the finder method definition.

- [CMP1002] The requested operation is not allowed. The bean is Read-Only.

**Explanation**

A method has been executed that cannot be used when the instance management mode is ReadOnly.

**System Action**

Throws RemoteException.

**User Action**

Determine whether the instance management mode is set to ReadOnly and one of the following methods has been invoked.

- EJBHome.create
- EJBHome.remove
- EJBObject.remove

- [CMP1003] Internal Error. Data get/set failed because of a type mismatch.

**Explanation**

The specified CMF data type and the DBMS column data type cannot be converted.

**System Action**

Throws RemoteException.

**User Action**

Change the CMF data type and the DBMS column data type.

- [CMP1004] Internal Error. Data get/set failed because the type '%s1' is not supported.

**Variable Information**

%s1 = Data type

**Explanation**

The specified data type is not supported.

**System Action**

Throws RemoteException.

**User Action**

Change the data type to a type that is supported. Refer to any messages output before or after the error, and remove the cause of the error.

- [CMP1005] Failed to create the required DB-access command. MESSAGE='%s1'.

**Variable Information**

%s1 = JDBC driver detailed message

**Explanation**

An error occurred in the JDBC driver Connection.PrepareStatement.

**System Action**

Throws RemoteException.

**User Action**

Refer to the detailed message and remove the cause of the error in the JDBC driver Connection.PrepareStatement.

The probable causes of the error are:

- An incorrect CMF definition Datasource name.
  - An incorrect CMF definition schema name.
  - An incorrect CMF definition table name.
  - An incorrect column name in the DBMS corresponding to the CMF.
  - An incorrect CMF data type.
  - An incorrect column data type in the DBMS corresponding to the CMF.
  - An error in the finder definition search conditions.
  - An error in the J2EE resource access definition.
  - one column name of DBMS is mapped to multiple CMFs.
  - An error in the JDBC driver.
- [CMP1006] An error related to DB-access command parameter substitution occurred.

**Explanation**

An error has occurred in the setting processing for the dynamic parameters of the JDBC driver PrepareStatement.

**System Action**

Throws RemoteException.

**User Action**

The probable causes of the error are:

- An incorrect CMF data type.
  - An incorrect DBMS column data type for the CMF.
  - one column name of DBMS is mapped to multiple CMFs.
  - An error in the JDBC driver.
  - Refer to any messages output before or after the error, and remove the cause of the error.
- [CMP1007] Failed to obtain the Finder result-set. MESSAGE='%s1'.

**Variable Information**

%s1 = JDBC driver detailed message

**Explanation**

An error has occurred in the JDBC driver PreparedStatement.executeQuery method or the ResultSet.next method.

**System Action**

Throws RemoteException.

**User Action**

Refer to the detailed message and remove the cause of the error in the JDBC driver PreparedStatement.executeQuery or ResultSet.next method.

The probable causes of the error are:

- An incorrect CMF definition Datasource name.
  - An incorrect CMF definition schema name.
  - An incorrect CMF definition table name.
  - An incorrect column name in the DBMS corresponding to the CMF.
  - An incorrect CMF data type.
  - An incorrect column data type in the DBMS corresponding to the CMF.
  - An error in the finder definition search conditions.
  - An error in the J2EE resource access definition.
  - one column name of DBMS is mapped to multiple CMFs.
  - An error in the JDBC driver.
- [CMP1008] Failed during execution of the required DB-access command. MESSAGE='%s1'.

**Variable Information**

%s1 = JDBC driver detailed message

**Explanation**

An error has occurred in the JDBC driver PreparedStatement.executeUpdate method.

**System Action**

Throws RemoteException.

**User Action**

Refer to the detailed message and remove the cause of the error in the JDBC driver PreparedStatement.executeUpdate method.

The probable causes of the error are:

- An incorrect CMF definition Datasource name.
  - An incorrect CMF definition schema name.
  - An incorrect CMF definition table name.
  - An incorrect column name in the DBMS corresponding to the CMF.
  - An incorrect CMF data type.
  - An incorrect column data type in the DBMS corresponding to the CMF.
  - An error in the J2EE resource access definition.
  - one column name of DBMS is mapped to multiple CMFs.
  - An error in the JDBC driver.
- [CMP1009] Unable to set Container Managed Fields in bean.

**Explanation**

Values cannot be set for the CMF.

**System Action**

Throws RemoteException.

**User Action**

The probable causes of the error are:

- A CMF data type for which null cannot be set is used.
- A CMF data type that truncates character strings is used.
- An incorrect CMF data type.
- one column name of DBMS is mapped to multiple CMFs.
- An incorrect column data type in the DBMS corresponding to the CMF.
- An error in the JDBC driver.

Refer to any other messages output before or after the error, and remove the cause of the error.

- [CMP1010] Failed to instantiate the Primary Key '%s1'.

**Variable Information**

%s1 = Primary Key class name

**Explanation**

Primary Key object creation failed.

**System Action**

Throws RemoteException.

**User Action**

Check if an exception has occurred in the Primary Key class constructor.

- [CMP1011] Unable to assign a Database NULL value to primitive CMF '%s1' in the Bean.

**Variable Information**

%s1 = CMF field name.

**Explanation**

A database null value cannot be set for CMF.

**System Action**

Throws RemoteException.

**User Action**

Change the CMF data type to one for which database null values can be set.

- [CMP1012] The Field-type '%s1' was not recognized so cannot be mapped.

**Variable Information**

%s1 = CMF data type

**Explanation**

The data type specified in the CMF definition is not supported.

**System Action**

Stops EJB application startup.

**User Action**

Change the CMF data type to a supported data type.

- [CMP1013] The Finder Argument-type '%s1' was not recognized so cannot be mapped.

**Variable Information**

%s1 = Argument data type for finder method

**Explanation**

The data type specified in the finder method argument is not supported.

**System Action**

Stops EJB application startup.

**User Action**

The probable causes are:

- The data types that can be specified in the finder method arguments are the same as the data types that can be used for CMF.  
Change the data type to a data type that can be specified in finder method arguments.
- Specify the data type package name in the finder method argument if it has been omitted.

- [CMP1014] DataSource '%s1' not found (it may not be registered in JNDI).

**Variable Information**

%s1 = Datasource name

**Explanation**

Datasource cannot be used.

**System Action**

Throws RemoteException.

**User Action**

The probable cause is that the Datasource name in the CMF definition is incorrect. The specified Datasource cannot be used or an EJB1243 message has been output. If the Datasource cannot be used, refer to the EJB1243 message output and remove the cause of the error.

- [CMP1015] Duplicate Key. MESSAGE='%s1'.

**Variable Information**

%s1 = JDBC detailed message

**Explanation**

A unique constraint error has occurred in the JDBC driver.

**System Action**

Throws DuplicateKeyException.

**User Action**

Refer to the detailed message and remove the cause of the unique constraint error in the JDBC driver.

The probable cause is that a row with the same key value already exists in the database table.

- [CMP1016] Failed to instantiate the Primary Key '%s1' for <primkey-field> '%s2'.

**Variable Information**

%s1 = Primary Key class name

%s2 = primkey-field name

**Explanation**

A system error has occurred.

**System Action**

Throws RemoteException.

**User Action**

Notify your software supplier of the message information.

- [CMP1017] Data truncated for CMF '%s1'.

**Variable Information**

%s1 = CMF field name

**Explanation**

Character strings have been truncated.

**System Action**

Throws RemoteException.

**User Action**

Check whether the CMF obtains the char or java.lang.Character data type of more than one character.

- [CMP1018] Field '%s1' is not a supported type for <primkey-field>.

**Variable Information**

%s1 = CMF field name

**Explanation**

A CMF of a data type that cannot be specified in the Primary Key field has been specified.

**System Action**

Throws RemoteException.

**User Action**

Specify a CMF of one of the following data types in the Primary Key field.

- java.lang.Boolean
  - java.lang.Byte
  - java.lang.Character
  - java.lang.Short
  - java.lang.Integer
  - java.lang.Long
  - java.lang.Float
  - java.lang.Double
  - java.math.BigDecimal
  - java.sql.Date
  - java.sql.Time
  - java.sql.Timestamp
  - java.lang.String
- [CMP1019] Error in finder: %s1. Unexpectedly found > 1 rows.

**Variable Information**

%s1 = finder method name

**Explanation**

The finder method that returns a single search result has returned more than one search result.

**System Action**

Throws FinderException.

**User Action**

Check whether the finder method that returns a single search result has returned more than one search result.

- [CMP1020] Failed to serialize CMF object: '%s1'

**Variable Information**

%s1 = find CMF field name

**Explanation**

The object specified in the CMF could not be serialized.

**System Action**

Throws RemoteException.

**User Action**

Check whether a data type that cannot be serialized is specified in the CMF.

- [CMP1021] Failed to serialize the Finder argument object '%s1'.

**Variable Information**

%s1 = Argument data type for finder method

**Explanation**

The object specified in the argument of the finder method could not be serialized.

**System Action**

Throws RemoteException.

**User Action**

Check whether a data type that cannot be serialized is specified in the argument of the finder method.

- [CMP10001] There are no more elements in this Enumeration.

**Explanation**

All elements have already been fetched from Enumeration or Collection.

**System Action**

Throws RemoteException.

**User Action**

Check that the Enumeration.nextElement method or the Iterator.next method is not being used after true has been returned in the Enumeration.hasMoreElements method or Iterator.hasNext method.

- [CMP20003] Class not found - '%s1'.

**Variable Information**

%s1 = Class name

**Explanation**

Cannot read the class file.

**System Action**

Stops EJB application startup.

**User Action**

Check that the class file has been stored in the CLASSPATH.

- [CMP20007] Table name not specified.

**Explanation**

The table name has not been specified in the CMF definitions.

**System Action**

Stops EJB application startup.

**User Action**

Check whether a table name is specified in the CMF definitions.

- [CMP20009] No fields were specified.

**Explanation**

No field name is specified in the CMF definitions.

**System Action**

Stops EJB application startup.

**User Action**

Check whether a field name is specified in the CMF definitions.

- [CMP20010] Field '%s1' not a member of '%s2' class.

**Variable Information**

%s1 = CMF field name

%s2 = Entity Bean class name

**Explanation**

The Entity Bean class field corresponding to the CMF cannot be located.

**System Action**

Stops EJB application startup.

**User Action**

Possible actions are:

- Check if the Entity Bean class field corresponding to the CMF has been defined.
- Check if public is specified in the Entity Bean class field corresponding to the CMF.

- [CMP20012] Column name mapping not specified for field '%s1'.

**Variable Information**

%s1 = CMF field name

**Explanation**

The CMF specified in the finder definition search conditions is not defined in the CMF definitions, or the CMF definitions contain an error.

**System Action**

Stops EJB application startup.

**User Action**

The probable causes are:

- The CMF specified in the finder definition search conditions is not defined in the CMF definitions.
- The CMF specified in the finder definition search conditions does not correspond to the correct DB column name.

- [CMP20013] Invalid finder name specification: '%s1'.

**Variable Information**

%s1 = finder method name

**Explanation**

An incorrect method name is specified in the finder definition.

**System Action**

Stops EJB application startup.

**User Action**

Check if the method name specified in the finder definition is correct.

- [CMP20014] Invalid finder parameter marker.

**Explanation**

Incorrect parameters are specified in the finder definition search conditions.

**System Action**

Stops EJB application startup.

**User Action**

Check whether the parameters specified in the finder definition search conditions are in the following format:

- ?paramN? (N is a natural number)
- N is 1 or more and does not exceed the finder method parameter value.

- [CMP20017] The field name was not specified.

**Explanation**

No field name is specified in the CMF definitions.

**System Action**

Stops EJB application startup.

**User Action**

Check if the field name is specified in the CMF definitions.

- [CMP20019] Error loading CMP meta-data from FJCMF file '%s1'. Exception = '%s2'.

**Variable Information**

%s1 = CMF definition file name

%s2 = Detailed message

**Explanation**

The CMF definition file could not be read.

**System Action**

Stops EJB application startup.

**User Action**

The environment setting might be incorrect. Check the files in the Application Folder.

- [CMP20020] Invalid finder query string. Finder = '%s1'. Query string = '%s2'.

**Variable Information**

%s1 = finder method name

%s2 = finder definition search conditions

**Explanation**

The finder definition search conditions contain an error.

**System Action**

Stops EJB application startup

**User Action**

The probable causes are:

- There are invalid parameter specifications in the finder definition search conditions.
- The CMF specified in the finder definition search conditions has not been defined in the CMF definitions.

Refer to any messages output before or after the error, and remove the cause of the error.

- [CMP20021] Datasource name not specified.

**Explanation**

No Datasource name is specified in the CMF definitions.

**System Action**

Stops EJB application startup.

**User Action**

Check if a Datasource name is specified in the CMF definitions.

- [CMP20022] No primary key field was found for this bean.

**Explanation**

Cannot find a Primary Key class field that corresponds to the CMF Primary Key.

**System Action**

Stops EJB application startup.

**User Action**

Possible actions are:

- Check if the Primary Key, CMF, has been defined.
- Check if a CMF with the same name as the Primary Key class field has been specified in the CMF definitions.
- Check if public is specified in the Primary Key class field with the same name as the Primary Key, CMF.

- [CMP20025] Failed in the execution of the snap '%s1'.

**Variable Information**

%s1 = error code

**Explanation**

The snap function could not be executed.

**System Action**

Throws RemoteException.

**User Action**

Check the system environment. Possible causes are as follows:

- Access permission is not granted to the subdirectory C:\Interstage\EJB\var.
- A disk I/O error occurred.
- A memory shortage occurred.
- A disk space shortage occurred.

If the snap file output function is used, check the system environment, redefine snap acquisition, and run the EJB application.

## **CMP2.0 Detailed Messages**

- [CMP2.x-0001] Could not find home class %s1.

### **Variable Information**

%s1 = Home interface Name

### **Explanation**

The Home interface or LocalHome interface is not found.

### **System Action**

ClassNotFoundException occurred, which stops deployment.

### **User Action**

This error may have been caused by

- An invalid Home interface name defined in the deployment descriptor file.
- The Home interface not included in the ejb-jar file.
- Class path not specified for a class referenced by the Home interface.

Rectify as necessary, and then reexecute deployment.

- [CMP2.x-0002] Bean class %s1 not found.

### **Variable Information**

%s1 = EJB application

### **Explanation**

The Enterprise Bean class is not found.

### **System Action**

ClassNotFoundException occurred, which stops deployment.

### **User Action**

This error may have been caused by:

- An invalid Home interface name defined in the deployment descriptor file.
- The Home interface not included in the ejb-jar file.
- Class path is not specified for a class referenced by the Home interface.

Rectify as necessary, and then reexecute deployment.

- [CMP2.x-0003] Wrong arity.

### **Explanation**

EJB QL analysis has failed.

### **System Action**

Stops activating the EJB application.

### **User Action**

Ensure that binary operator of EJB QL is expressed correctly.

- [CMP2.x-0004] Wrong expression type.

### **Explanation**

EJB QL analysis has failed.

### **System Action**

Stops activating the EJB application.

**User Action**

Ensure that binary operator of EJB QL is expressed correctly.

- [CMP2.x-0005] The finder query SELECT clause must have a return type matching the Local or Remote interface of the EJB for which it is defined.

**Explanation**

The type of the return value of the finder method, in which the SELECT clause is defined, does not match a local or remote interface.

**System Action**

Stops activating the EJB application.

**User Action**

This error may have been caused by:

- Invalid finder method definition.
- Incorrect EJB QL definition.
- The abstraction schema name is not defined in EJB QL.

Rectify as necessary, then restart the EJB application.

- [CMP2.x-0006] Query returning local ejbs must have local interface defined.

**Explanation**

When the query result type (result-type-mapping) is Local, the EJB application must have the Local interface.

**System Action**

Throws EJBException.

**User Action**

This error may have been caused by:

- Invalid result type (result-type-mapping) specified in the deployment descriptor file.
- The Local interface is defined in the EJB application..

Rectify as necessary, and then reexecute deployment.

- [CMP2.x-0007] Query returning remote ejbs must have remote interface defined.

**Explanation**

When the query result type (result-type-mapping) is Local, the EJB application must have the Local interface.

**System Action**

Throws EJBException.

**User Action**

This error may have been caused by:

- Invalid result type (result-type-mapping) specified in the deployment descriptor file.
- The Remote interface is defined in the EJB application.

Rectify as necessary, and then reexecute deployment.

- [CMP2.x-0008] Wrong expression type.

**Explanation**

EJB QL analysis has failed.

**System Action**

Stops activating the EJB application.

**User Action**

Ensure that the EJB QL operator type is expressed correctly.

- [CMP2.x-0009] Wrong arity.

**Explanation**

EJB QL analysis has failed.

**System Action**

Stops activating the EJB application.

**User Action**

Ensure that EJB QL is expressed correctly.

- [CMP2.x-0010] Wrong expression type.

**Explanation**

EJB QL analysis has failed.

**System Action**

Stops activating the EJB application.

**User Action**

Ensure that EJB QL is expressed correctly.

- [CMP2.x-0011] The finder query SELECT clause must have a return type matching the Local or Remote interface of the ejb for which it is defined.

**Explanation**

An invalid abstraction schema name is specified or a return type that matches the Local or Remote interface of the EJB application (for which the finder method is defined) must be specified for the SELECT clause of the query.

**System Action**

Stops activating the EJB application.

**User Action**

Ensure that the abstraction schema name is correct and the interface (Remote or Home) of the EJB application for which the finder method is defined, is specified for the SELECT clause of query.

- [CMP2.x-0012] The SELECT clause has a return type that does not match the return type of the select query for which it is defined.

**Explanation**

The type returned from EJB QL, in which the SELECT clause is defined, does not match the type of the return value of the query method.

**System Action**

Stops activating the EJB application.

**User Action**

This error may have been caused by:

- incorrect EJB QL definition.
- Incorrect return value of the select method.
- incorrect return value of the finder method.
- return value of the finder method is java.util.Enumeration. Bear in mind that CMP2.0 can be used only for java.util.Collection.

Rectify as necessary, and then reexecute deployment.

- [CMP2.x-0013] Can't find CMP field: %s1

**Variable Information**

%s1 = CMP Field name

**Explanation**

The CMP field associated with the abstract method is not found.

**System Action**

Stops activating the EJB application.

**User Action**

Define the CMP field associated with the abstract method defined in the Enterprise Bean class on the Deployment descriptor file.

- [CMP2.x-0014] Missing local and remote interface for %s1

**Variable Information**

%s1 = EJB application name

**Explanation**

The finder method is not found in the Home and LocalHome interfaces.

**System Action**

Stops activating the EJB application.

**User Action**

Define the finder method in the Home and LocalHome interfaces.

- [CMP2.x-0015] %s1 does not have a parameter corresponding to input parameter ?%s2

**Variable Information**

%s1 = Query method name

%s2 = Parameter number

**Explanation**

There are no parameters for the numbers corresponding to the parameters (?1, ?2, ?3, ---) specified in EJB QL.

**System Action**

Stops activating the EJB application.

**User Action**

This error may have been caused by:

- Invalid EJB QL parameter specified.
- Insufficient parameters for the query method.

Rectify as necessary, then restart the EJB application.

- [CMP2.x-0016] Identification variable %s1 cannot have the same name as an ejb name or abstract schema name.

**Variable Information**

%s1 = Identifier

**Explanation**

The identifier must not be the same as the EJB application name or abstract schema name.

**System Action**

Stops activating the EJB application.

**User Action**

If the specified identifier is the same as the EJB application name or abstract schema name, change the identifier.

- [CMP2.x-0017] Illegal use of navigation operator %s1

**Variable Information**

%s1 = The navigation operator is not used correctly

**Explanation**

Use of the navigation operator (.) is incorrect.

**System Action**

Stops activating the EJB application.

**User Action**

Ensure that the navigation operator (.) is correctly used in EJB QL.

- [CMP2.x-0018] The collection designated in an IS EMPTY expression must not appear in the FROM clause %s1

**Variable Information**

%s1 = Wrong expression

**Explanation**

Collection (used by the IS EMPTY operator of the WHERE clause) cannot be used in the FROM clause.

**System Action**

Stops activating the EJB application.

**User Action**

Corrects EJB QL, then restart the EJB application.

- [CMP2.x-0019] Invalid type for expression %s1

**Variable Information**

%1 = Wrong expression

**Explanation**

An invalid type is specified in the EJB QL operator.

**System Action**

Stops activating the EJB application.

**User Action**

Corrects EJB QL, then restart the EJB application.

- [CMP2.x-0020] Invalid or missing FROM clause.

**Explanation**

An invalid FROM clause is specified or the FROM clause is not found for EJB QL.

**System Action**

Stops activating the EJB application.

**User Action**

Rectify as necessary, then restart the EJB application.

**System Action**

Stops activating the EJB application.

**User Action**

Remove the cause of the error, then restart the EJB application.

- [CMP2.x-0021] EJB QL query must start with a SELECT clause.

**Explanation**

EJB QL must begin with the SELECT clause.

**System Action**

Stops activating the EJB application.

**User Action**

Correct EJB QL.

- [CMP2.x-0023] Cannot add roles when the descriptor is not part of a bundle.

**Explanation**

If the descriptor is not a part of a bundle, a role cannot be added (Internal error)

**System Action**

Stops activating the EJB application.

**User Action**

Contact a Fujitsu SE.

- [CMP2.x-0024] Cannot set type on an entity bean.

**Explanation**

Any type cannot be specified on Entity Bean Internal error)

**System Action**

Stops activating the EJB application.

**User Action**

Contact a Fujitsu SE.

- [CMP2.x-0025] This application has no beans of name %s1

**Variable Information**

%s1 = EJB application name

**Explanation**

The EJB application name is not found (Internal error)

**System Action**

Stops activating the EJB application.

**User Action**

Contact a Fujitsu SE.

- [CMP2.x-0026] Unknown ContainerTransaction type: %s1

**Variable Information**

%s1 = Transaction attribute

**Explanation**

An invalid transaction attribute has been specified.

**System Action**

Stops activating the EJB application.

**User Action**

Some value other than one listed below has been specified for the transaction attribute. Provide the correct transaction attribute.

Mandatory

Required

Supports

RequiresNew

NotSupported

Never

- [CMP2.x-0027] Referencing error: this bundle has no bean of name: %s1

**Variable Information**

%s1 = EJB application name

**Explanation**

The EJB application name is not found (Internal error)

**System Action**

Stops activating the EJB application.

**User Action**

Contact a Fujitsu SE.

- [CMP2.x-0028] Error loading the ejb class %s1 in getFields on EjbDescriptor %s2

**Variable Information**

%s1 = Enterprise Bean class

%s2 = Detailed message

**Explanation**

An error occurred when the Enterprise Bean class was being loaded.

**System Action**

Stops activating the EJB application.

**User Action**

This error may have been caused by:

- Enterprise Bean class does not exist in the disposed ejb-jar file.
- The class passing is not set to the class referred to by the Enterprise Bean class.

Rectify as necessary, then restart the EJB application.

- [CMP2.x-0029] Error loading class %s1

**Variable Information**

%s1 = Class name

**Explanation**

An error occurred when the class was being loaded.

**System Action**

Stops activating the EJB application.

**User Action**

This error may have been caused by:

- Enterprise Bean class does not exist in the disposed ejb-jar file.
- The class passing is not set to the class referred to by the Enterprise Bean class.

Rectify as necessary, then restart the EJB application.

- [CMP2.x-0030] Entity beans can only have Container transaction type. The type was being set to %s1

**Variable Information**

%s1 = Transaction type

**Explanation**

A value other than Container is specified for the Transaction management type of Entity Bean.

**System Action**

Stops activating the EJB application.

**User Action**

Specify Container for the management type of the deployment descriptor file, then restart the EJB application.

- [CMP2.x-0031] %s1 is not a legal value for entity reentrancy.

**Variable Information**

%s1 = EJB application name

**Explanation**

An invalid value is specified in reentrancy of the EJB application.

**System Action**

Stops activating the EJB application.

**User Action**

Specify a valid value in reentrancy of the EJB application.

- [CMP2.x-0032] %s1 is not an allowed persistence type.

**Variable Information**

%s1 = Persistence type

**Explanation**

An invalid value is specified in persistence type.

**System Action**

Stops activating the EJB application.

**User Action**

Only Container (CMP) and Bean (BMP) can be specified for the Persistence type of the deployment descriptor. Correct the deployment descriptor, then restart the EJB application.

- [CMP2.x-0033] %s1 not found in %s2

**Variable Information**

%s1 = Method object ID

%s2 = EjbDescriptor Method object ID

**Explanation**

The method is not found in the EJB application.

**System Action**

Stops activating the EJB application.

**User Action**

Contact a Fujitsu SE.

- [CMP2.x-0034] Error building allSqlStatementedMethods %s1

**Variable Information**

%s1 = Internal message

**Explanation**

An error occurred during configuration of allSqlStatemented Methods.

**System Action**

Stops activating the EJB application.

**User Action**

Contact a Fujitsu SE.

- [CMP2.x-0035] Field name %s1 exceeds the maximum length (%s2) allowed.1

**Variable Information**

%s1 = Field name

%s2 = Maximum number of characters

**Explanation**

The number of characters specified in the column name exceeds the maximum number.

**System Action**

Stops activating the EJB application.

**User Action**

Correct the specified column name, then restart the EJB application.

- [CMP2.x-0036] EJB in runtime info not known: %s1

**Variable Information**

%s1 = Enterprise Bean name

**Explanation**

The EJB application name is not found in the Runtime file (FJCMF\_XXX\_Runtime.xml) of the application storage folder.

**System Action**

Stops activating the EJB application.

**User Action**

Delete the corresponding Runtime file (FJCMF\_XXX\_Runtime.xml) in the application folder, and then reexecute the EJB application. If necessary, contact a Fujitsu SE.

- [CMP2.x-0037] Join object in runtime info not known: %s1

**Variable Information**

%s1 = Join Object name

**Explanation**

The EJB application name is not found in the Runtime file (FJCMF\_XXX\_Runtime.xml) of the application storage folder.

**System Action**

Stops activating the EJB application.

**User Action**

Delete the corresponding Runtime file (FJCMF\_XXX\_Runtime.xml) in the application folder, and then reexecute the EJB application. If necessary, contact a Fujitsu SE.

- [CMP2.x-0038] CMP20Info for EJB not found: %s1

**Variable Information**

%s1 = EJB application name

**Explanation**

CMP20Info is not found in the EJB application (Internal error)

**System Action**

Stops activating the EJB application.

**User Action**

Contact a Fujitsu SE.

- [CMP2.x-0039] DataSource for %s1 is not specified.

**Variable Information**

%s1 = EJB application name

**Explanation**

A data source name is not specified.

**System Action**

Stops activating the EJB application.

**User Action**

Specify a data source name with the Customize Tool, then restart the EJB application.

- [CMP2.x-0040] Invalid XML : Bean %s1 does not define a local home or home interface.

**Variable Information**

%s1 = EJB application name

**Explanation**

The LocalHome or Home interface is not defined in the deployment descriptor file.

**System Action**

Stops activating the EJB application.

**User Action**

Define the LocalHome or Home interface in the deployment descriptor file, then redeploy the EJB application.

- [CMP2.x-0041] ERROR: Cascade-delete can only be specified if the other role has a multiplicity of ONE.

**Explanation**

Cascade-delete can be specified only if the multiplicity of another role is ONE.

**System Action**

Stops activating the EJB application.

**User Action**

Correct the deployment descriptor file, then redeploy the EJB application.

- [CMP2.x-0042] All CMP20 beans in the group must have the same datasource.

**Explanation**

For all CMP2.0 EJB applications in the same group, use the same data source.

**System Action**

Stops activating the EJB application.

**User Action**

Change the data source, then restart the EJB application.

- [CMP2.x-0043] ERROR! This is wrapper implementation for CMP 2.x

**Explanation**

This is a wrapper for CMP 2.x.

**System Action**

Stops activating the EJB application.

**User Action**

Contact a Fujitsu SE.

- [CMP2.x-0044] ERROR! This is wrapper implementation for CMP 2.x

**Explanation**

This is wrapper implementation for CMP 2.x. (Internal error)

**System Action**

Stops deployment or activating the EJB application.

**User Action**

Contact a Fujitsu SE.

- [CMP2.x-0045] Bad primitive class.

**Explanation**

An invalid primitive class is specified (Internal error)

**System Action**

Stops deployment or activating the EJB application.

**User Action**

Contact a Fujitsu SE.

- [CMP2.x-0046] Can't find cmr field: %s1

**Variable Information**

%s1 = CMR field name

**Explanation**

The CMR field is not found.

**System Action**

Stops activating the EJB application.

**User Action**

Define the CMR field, then redeploy the EJB application.

- [CMP2.x-0047] EJB QL query not initialized.

**Explanation**

EJB-QL is not initialized or, SELECT clause is null (Internal error)

**System Action**

Stops activating the EJB application.

**User Action**

Contact a Fujitsu SE.

- [CMP2.x-0048] getLiteral not applicable.

**Explanation**

getLiteral cannot be executed (Internal error)

**System Action**

Stops activating the EJB application.

**User Action**

Contact a Fujitsu SE.

- [CMP2.x-0049] Abstract schema not defined for nav. exprs ending in cmp field.

**Explanation**

No abstract schema name is defined in a navigator that ends with the CMP field of EJB QL.

**System Action**

Stops activating the EJB application.

**User Action**

Correct the expression of the navigation in a navigator that ends with the CMP field of EJB QL, then redeploy the EJB application.

- [CMP2.x-0050] Invalid join table field = %s1 : %s2

**Variable Information**

%s1 = Table name

%s2 = Column name

**Explanation**

An invalid Join table field is specified (Internal error)

**System Action**

Stops activating the EJB application.

**User Action**

Contact a Fujitsu SE.

- [CMP2.x-0051] No join table for %s1

**Variable Information**

%s1 = CMR Field name

**Explanation**

The Join table associated with CMR is not found (Internal error)

**System Action**

Stops activating the EJB application.

**User Action**

Contact a Fujitsu SE.

- [CMP2.x-0052] Only applicable for select queries returning ejbs.

**Explanation**

Only select method can return the Local interface.

**System Action**

Stops activating the EJB application.

**User Action**

Either change the return value of the finder method to the Remote interface, or change the method to the select method. If necessary, contact a Fujitsu SE.

- [CMP2.x-0053] Warning -- pkey class pkey fields not available for %s1

**Variable Information**

%s1 = EJB application name

**Explanation**

The primary key class is not defined in the deployment descriptor file.

**System Action**

Continues processing.

**User Action**

No action necessary.

- [CMP2.x-0054] CMP 2.x Entity EJB %s1 has an empty abstract schema name.

**Variable Information**

%s1 = EJB application name

**Explanation**

The abstract schema name of COMP2.x Entity Bean is not specified.

**System Action**

Stops activating the EJB application.

**User Action**

Define the abstract schema name, then redeploy the EJB application.

- [CMP2.x-0055] Invalid escape character at line %s1, column %s2.

**Variable Information**

%s1 = Line number

**Explanation**

An invalid escape character is specified.

**System Action**

Stops activating the EJB application.

**User Action**

Correct the escape character, then restart the EJB application.

- [CMP2.x-0056] Illegal cmr field = %s1

**Variable Information**

%s1 = CMR Field name

**Explanation**

An invalid CMR field is specified in Enterprise Bean other than CMP2.x.

**System Action**

Stops activating the EJB application.

**User Action**

Ensure the version of Enterprise Bean (for which the CMR field is specified) is CMP2.x.

- [CMP2.x-0057] Missing return statement in function.

**Variable Information**

%s1 = CMR Field name

**Explanation**

There is no return statement (Internal error)

**System Action**

Stops activating the EJB application.

**User Action**

Contact a Fujitsu SE.

- [CMP2.x-0058] cmr-field-type is %s1, must be java.util.Collection or java.util.Set

**Variable Information**

%s1 = CMR Field name

**Explanation**

The type of the CMR field must be java.util.Collection or java.util.Set.

**System Action**

Stops activating the EJB application.

**User Action**

Correct the CLR field, then redeploy the EJB application.

- [CMP2.x-0059] Illegal ejb version: %s1

**Variable Information**

%s1 = EJB Version

**Explanation**

An illegal EJB version is specified.

**System Action**

Stops activating the EJB application.

**User Action**

Ensure that the supported version is correct.

- [CMP2.x-0060] ejb-jar doesn't have a finder table base name.

**Variable Information**

%s1 = EJB Version

**Explanation**

The table name is not found.

**System Action**

Stops activating the EJB application.

**User Action**

Define the table name, then restart the EJB application.

- [CMP2.x-0061] Invalid CMP version: %s1

**Variable Information**

%s1 = CMP Version

**Explanation**

An invalid CMP version is defined in the deployment descriptor.

**System Action**

Stops activating the EJB application.

**User Action**

Only 2.x and 1.x are available in the CMP version. Ensure that the deployment descriptor file and EJB application are defined appropriately.

- [CMP2.x-0062] Cannot set use-caller-identity for Message Driven beans.

**Explanation**

Use-caller-identity cannot be specified in a Message-driven Bean.

**System Action**

Stops activating the EJB application.

**User Action**

Contact a Fujitsu SE.

- [CMP2.x-0063] Cannot add roles when the bundle does not have them.

**Explanation**

A role not defined in the method permission has been specified.

**System Action**

Stops activating the EJB application.

**User Action**

Correct the role in the deployment descriptor file, then restart the EJB application.

- [CMP2.x-0064] Cannot add roles when the descriptor is not part of a bundle.

**Explanation**

No role can be added for an undefined EJC application.

**System Action**

Stops activating the EJB application.

**User Action**

Contact a Fujitsu SE.

- [CMP2.x-0066] cmp-field or cmr-field name cannot be empty strings.

**Explanation**

An empty String value cannot be specified in the CMF or CMR field.

**System Action**

Stops activating the EJB application.

**User Action**

Ensure that the CMF or CMR field is specified correctly for the deployment descriptor.

- [CMP2.x-0067] cmp-field or cmr-field %s1 must begin with a letter.

**Variable Information**

%s1 = CMF or CMR field name

**Explanation**

The CMF or CMR field must begin with a character.

**System Action**

Stops activating the EJB application.

**User Action**

Ensure that the CMF or CMR field begins with a character for the deployment descriptor.

- [CMP2.x-0068] cmp-field or cmr-field %s1 must begin with a lowercase letter.

**Variable Information**

%s1 = CMF or CMR field name

**Explanation**

The CMF or CMR field must begin with a lowercase character.

**System Action**

Stops activating the EJB application.

**User Action**

Ensure that the CMF or CMR field begins with a lowercase character for the deployment descriptor.

- [CMP2.x-0069] Method %s1 is not on any EJB interface.

**Variable Information**

%s1 = Method name

**Explanation**

The specified method is found in an interface of the EJB application.

**System Action**

Stops activating the EJB application.

**User Action**

This error may have been caused by:

- The method does not exist in the EJB application class.
- An invalid interface is registered in the method.

- [CMP2.x-0070] CMRFieldInfo not found for field %s1

**Variable Information**

%s1 = Field name

**Explanation**

Information on the CMR field is not found.

**System Action**

Stops activating the EJB application.

**User Action**

Ensure that the CMR field is specified.

- [CMP2.x-0071] No local interface for target bean of CMR field.

**Explanation**

The Local interface is not found in the EJB application defined as the CMR field.

**System Action**

Stops activating the EJB application.

**User Action**

Ensure that the EJB application defined a correct CMF in EJB QL.

- [CMP2.x-0072] PersistentFieldInfo not found for field %s1

**Variable Information**

%s1 = CMF name

**Explanation**

Information on the CMF definition for CMF is not found.

**System Action**

Stops activating the EJB application.

**User Action**

Ensure that CMF is defined.

- [CMP2.x-0073] PersistentFieldInfo not found for pkey field %s1

**Variable Information**

%s1 = Primary key Field name

**Explanation**

Information on the CMF definition for a primary key class field is not found (Internal error)

**System Action**

Stops activating the EJB application.

**User Action**

Contact a Fujitsu SE.

- [CMP2.x-0074] Primary Key field name %s1 is not a known cmp-field.

**Variable Information**

%s1 = Primary key Field name

**Explanation**

CMF is not specified for the primary key class field name.

**System Action**

Stops activating the EJB application.

**User Action**

This error may have been caused by:

- CMF not specified for the primary key.
- CMF not having the same name as the primary key class field specified in the CMF definition.

- [CMP2.x-0075] Cannot find accessor %s1 for CMP field %s2

**Variable Information**

%s1 = Abstract accessor method name

%s2 = CMF

**Explanation**

The abstract accessor method for CMF is not found.

**System Action**

Stops activating the EJB application.

**User Action**

Ensure that the abstract accessor method for CMF is defined in the Enterprise Bean class. (The abstract accessor method should be a method name that starts with 'set/get' + CMF. The first character of CMF must be a capital letter.

- [CMP2.x-0076] Can't find CMP field %s1 in class %s2

**Variable Information**

%s1 = Class name

%s2 = CMF

**Explanation**

Class on the CMF is not found (Internal error)

**System Action**

Stops activating the EJB application.

**User Action**

Ensure that the CMF is defined in the specified class and redeploy the EJB application. If this error persists, contact a Fujitsu SE.

- [CMP2.x-0077] Can't find CMP field %s1 in class %s2

**Explanation**

A system error has occurred.

**System Action**

Stops activating the EJB application.

**User Action**

Contact a Fujitsu SE.

- [CMP2.x-0078] Error: Ignoring invalid lexical state: %s1. State unchanged.

**Variable Information**

%s1 = State

**Explanation**

A system error has occurred.

**System Action**

Stops activating the EJB application.

**User Action**

Contact a Fujitsu SE.

- [CMP2.x-0079] Unable to serialize container-managed field. Exception: %s1

**Variable Information**

%s1 = JDBC driver's detailed message

**Explanation**

The system failed to serialize CMF.

**System Action**

Throws RemoteException or EJBException.

**User Action**

Ensure that a serialization disabled data type is specified for CMF.

- [CMP2.x-0080] Unsupported JDBC type: %s1

**Variable Information**

%1s = Type of unsupported JDBC.

**Explanation**

The type of JDBC is not supported.

**System Action**

Throws RemoteException or EJBException.

**User Action**

Provide the correct JDBC driver, as indicated by the detail message.

- [CMP2.x-0081] Field not accessible. Exception: %s1

**Variable Information**

%s1 = Detailed message

**Explanation**

Cannot access CMF.

**System Action**

Throws RemoteException or EJBException.

**User Action**

This error may have been caused by an incorrect CMF definition and accessor method from a detailed message. Rectify as necessary.

- [CMP2.x-0082] Unable to deserialize field. Exception: %s1

**Variable Information**

%s1 = Exception

**Explanation**

Deserializing field is not correctly associated with CMF.

**System Action**

Throws RemoteException or EJBException.

**User Action**

Byte data of the column may not correspond with the CMF type about to be loaded in the database. Ensure that a deserialization disabled data type is specified in CMF.

- [CMP2.x-0083] Unable to deserialize object. Exception: %s1

**Variable Information**

%s1 = Exception

**Explanation**

Deserializing object is not correctly associated with CMF.

**System Action**

Throws RemoteException or EJBException.

**User Action**

Byte data of the column may not correspond with the object about to be loaded in the database. Ensure that a deserialization disabled data type is specified in CMF.

- [CMP2.x-0084] Object has been deleted.

**Explanation**

The object has been deleted.

**System Action**

Throws RemoteException or EJBException.

**User Action**

Ensure that the object that has already been deleted or the object that does not exist is specified.

- [CMP2.x-0085] Primary key field must not be set after ejbCreate.

**Explanation**

A primary key cannot be set after ejbCreate.

**System Action**

Throws RemoteException or EJBException.

**User Action**

Ensure that a deserialization disabled data type is specified in CMF.

- [CMP2.x-0086] Entity object is already removed.

**Explanation**

The EJB object has already been deleted in the same transaction.

**System Action**

Throws NoSuchObjectException or EJBException.

**User Action**

Ensure that an EJB object is used that EJBHome.remove or EJBObject.remove is executed.

- [CMP2.x-0087] Primary key fields of bean not initialized.

**Explanation**

The primary key is not specified in the invoked ejbCreate method.

**System Action**

Throws RemoteException or EJBException.

**User Action**

Ensure that the primary key is correctly specified in the ejbCreate method.

- [CMP2.x-0088] Duplicate primary key.

**Explanation**

A uniqueness restriction error occurred.

**System Action**

Throws Javax.ejb.DuplicateKeyException.

**User Action**

A record having the same primary key already exists. Ensure that the primary key is correctly specified.

- [CMP2.x-0089] No database row for primary key.

**Explanation**

The record of the specified primary key does not exist.

**System Action**

Javax.ejb.ObjectNotFoundException was generated.

**User Action**

Investigate whether an undefined record is searched or invalid primary key is specified. Rectify as necessary.

- [CMP2.x-0090] ERROR initializing EJB field %s1

**Explanation**

An error occurred during initialization of CMF (Internal error)

**System Action**

Stops activating the EJB application.

**User Action**

Ensure that the CMF definition is correct. If this error persists, contact a Fujitsu SE.

- [CMP2.x-0091] ERROR in SQL SELECT: No database row for EJB.

**Explanation**

The record of the correspondence does not exist in the database.

**System Action**

Throws NoSuchEntityException or NoSuchObjectLocalException.

**User Action**

Investigate whether an undefined record is searched. Rectify as necessary.

- [CMP2.x-0092] ERROR in removeRow!! resultCount = %s1

**Variable Information**

%s1 = resultCount

**Explanation**

An error occurred at removal of a line (Internal error)

**System Action**

Throws RemoteException.

**User Action**

The error occurred while deleting a line of the database. Contact the development engineer of the associated EJB Bean application.

- [CMP2.x-0093] Internal Error:.ejbStore called for deleted bean.

**Explanation**

An internal error..ejbStore has been called for a deleted EJB application.

**System Action**

Throws RemoteException or EJBException.

**User Action**

Ensure that the EJB application described in the.ejbStore method has already been deleted, or contact a Fujitsu SE.

- [CMP2.x-0094] ERROR in storeRow!! resultCount = %s1

**Variable Information**

%s1 = resultCount

**Explanation**

An error occurred during update of a line.

**System Action**

Throws RemoteException or EJBException.

**User Action**

The error occurred in updating a line of the database. The deletion and updating processes may occur at the same time. Contact the development engineer of the associated EJB Bean application.

- [CMP2.x-0095] Unable to get JDBC DataSource for CMP EntityBean state.

**Explanation**

The data source cannot be acquired.

**System Action**

Throws RemoteException or EJBException.

**User Action**

This error may have been caused by:

- An invalid or incorrectly expressed data source name in the CMF definition.
- Incorrect data source usage. Ensure that the specified data source is correct from the subsequent message output. Define a correct data source name with the Customize Tool, and then reexecute the EJB application.

- [CMP2.x-0096] ERROR in createRow!! resultCount = %s1

**Variable Information**

%s1 = resultCount

**Explanation**

An error occurred while creating a database row.

**System Action**

Throws RemoteException or EJBException.

**User Action**

The error occurred in creating a line of the database. Contact the development engineer of the associated EJB Bean application.

- [CMP2.x-0097] Unable to get JDBC DataSource for CMP EntityBean state.

**Explanation**

The specified data source cannot be acquired.

**System Action**

Throws RemoteException or EJBException.

**User Action**

This error may have been caused by:

- An invalid or incorrectly expressed data source name in the CMF definition.
- Incorrect data source use. Ensure that the specified data source is correct from the subsequent message output. Define a correct data source name with the Customize Tool, and then reexecute the EJB application.

- [CMP2.x-0098] Error creating table. Table may already exist. SQL: %s1

**Variable Information**

%s1 = SQL exception

**Explanation**

The system failed to create a table. The table may already exist.

**System Action**

Stops activating the EJB application.

**User Action**

Use an already created table to restart the IJServer.

- [CMP2.x-0099] Error dropping table. Table may not exist. SQL: %s1

**Variable Information**

%s1 = SQL exception

**Explanation**

An error occurred during deletion of a table. A table already exists.

**System Action**

Continues processing because the table has already been deleted.

**User Action**

No action necessary.

- [CMP2.x-0100] Internal Error: Instance is null.

**Explanation**

An internal error. The instance is null.

**System Action**

Throws EJBException

**User Action**

Contact your Fujitsu system engineer.

- [CMP2.x-0101] ReplaceObject: Not implemented!

**Explanation**

A system error has occurred.

**System Action**

Throws EJBException

**User Action**

Contact your Fujitsu system engineer.

- [CMP2.x-0102] No database specified for CMP EntityBeans' persistent state.

**Explanation**

The database is not specified for CMF (Internal error)

**System Action**

Stops activating the EJB application.

**User Action**

Contact your Fujitsu system engineer.

- [CMP2.x-0103] No SQL type found for Class %s1

**Variable Information**

%s1 = Class name

**Explanation**

SQL type to the class is not found (Internal error)

**System Action**

Stops activating the EJB application.

**User Action**

Contact your Fujitsu system engineer.

- [CMP2.x-0104] Generating SQL for database: %s1

**Variable Information**

%s1 = SQL

**Explanation**

SQL of the database is generated.

**System Action**

Generates an SQL statement fitting to a database.

**User Action**

No action necessary.

- [CMP2.x-0105] Error connecting to database. Exception: %s1

**Variable Information**

%s1 = Message

**Explanation**

A database connectivity error occurred.

**System Action**

Start processing is discontinued.

**User Action**

This error may have been caused by:

- Undefined data source specified in the customization tool.
- Incorrect J2EE resource access definition.
- JDBC driver not correctly installed.

- Incorrect JDBC driver environment setup.
- DBMS not started.
- Exceeding the maximum number of connections available for the JDBC driver.
- Invalid user ID or password specified in the getConnection argument.
- A network error occurred.
- Incorrect DBMS operating environment.

Rectify as necessary, and then reexecute.

- [CMP2.x-0106] No SQL statement for method %s1

**Variable Information**

%s1 = Finder or select method name

**Explanation**

There is no SQL sentence of the method.

**System Action**

Throws RemoteException or EJBException.

**User Action**

Ensure that the EJB QL is defined correctly in the deployment descriptor. Delete the corresponding Runtime file (FJCOMP\_XXX\_Runtime.xml) in the application folder, and then reexecute the EJB application. Contact a Fujitsu SE.

- [CMP2.x-0107] Bad SQL query for method %s1

**Variable Information**

%s1 = Method name

**Explanation**

SQL query to the method is wrong.

**System Action**

Throws RemoteException.

**User Action**

Ensure that EJB QL is correctly defined in the query definition. If this error persists, contact the development engineer of the associated EJB Bean application.

- [CMP2.x-0108] Bad parameter number %s1 in SQL query for method %s2

**Variable Information**

%s1 = Argument number

%s2 = Method name

**Explanation**

An invalid argument is specified in the SQL query of the method.

**System Action**

Throws RemoteException.

**User Action**

Ensure that EJB QL is correctly defined in the query definition. If this error persists, contact the development engineer of the associated EJB Bean application.

- [CMP2.x-0109] No database row found for finder %s1

**Variable Information**

%s1 = Finder method name

**Explanation**

A database row was not found for the finder method.

**System Action**

Throws FinderObjectNotFound Exception.

**User Action**

Ensure there is a row in the database corresponding to the finder method.

- [CMP2.x-0110] More than one row returned by SQL query for single-object finder %s1

**Variable Information**

%s1 = Finder method name

**Explanation**

More than one result was returned using the finder method for a single SQL search.

**System Action**

Throws FinderException.

**User Action**

Ensure that more than one result is not returned using the finder method for a single SQL search.

- [CMP2.x-0111] Invalid return type for finder %s1

**Variable Information**

%s1 = Finder method name

**Explanation**

The type of the return value of the finder method is invalid.

**System Action**

Throws FinderException.

**User Action**

Ensure that the type of the return value of the finder method is either the Remove interface type or java.util.Collection interface of Enterprise Bean.

- [CMP2.x-0112] No EJB QL defined for %s1

**Variable Information**

%s1 = EJB application name

**Explanation**

EJB QL is not defined in the EJB application.

**System Action**

Throws RemoteException or EJBException.

**User Action**

Ensure that EJB QL is correctly defined in the query definition.

- [CMP2.x-0113] java.util.Set is not an allowed return type for finder method %s1

**Variable Information**

%s1 = finder Method name

**Explanation**

java.util.Set cannot be returned as a return value of the finder method.

**System Action**

Throws RuntimeException(Finder) Exception.

**User Action**

Ensure that java.util.Set is defined in the type of the return value of the finder method.

- [CMP2.x-0114] More than one row returned by EJB-QL query for single-object finder %s1

**Variable Information**

%s1 = finder Method name

**Explanation**

More than one result was returned using the finder method for a single EJB QL.

**System Action**

Throws FinderException.

**User Action**

Ensure that more than one result is not returned using the finder method for a single EJB QL.

- [CMP2.x-0115] %s1 has a single-valued return type but results of query contained %s2

**Variable Information**

%s1 = Method name

%s2 = Retrieval result rows

**Explanation**

More than one result was returned using the finder method for a single search result.

**System Action**

Throws ObjectNotFoundException.

**User Action**

Ensure that more than one result was not returned using the finder method for a single search result.

- [CMP2.x-0116] Could not get primary key for input parameter %s1 : %s2

**Variable Information**

%s1 = Value of input argument

%s2 = Class of argument

**Explanation**

A primary key to the input argument was not able to be acquired.

**System Action**

Stops activating the EJB application.

**User Action**

This error may have been caused by:

- Incorrect input argument return type, which should be EJBObject or EJBLocalObject.
- Undefined Primary Key or CMF.
- CMF with the same name as the Primary Key class field not specified in the CMF definitions.

- [CMP2.x-0117] Unknown param type = %s1

**Variable Information**

%s1 = Type of input argument

**Explanation**

Unknown argument type.

**System Action**

Throws EJBException.

**User Action**

Ensure that EJB QL is correctly defined in the query definition.

- [CMP2.x-0118] Argument must be a local object type.

**Explanation**

The argument should be a local object type.

**System Action**

Throws EJBException.

**User Action**

Specify a local object type in the argument of the search method, and then reexecute the command.

- [CMP2.x-0119] Object has been deleted.

**Explanation**

The object has been deleted.

**System Action**

Throws RemoteException or EJBException.

**User Action**

Ensure a deleted object is specified.

- [CMP2.x-0120] Argument to Collection-valued set must not be null.

**Explanation**

If there is Bean having the Many relation, you must define the Collection field in CMR.

**System Action**

Throws RemoteException or EJBException.

**User Action**

Ensure that the definition of the Collection field for CMR is not null.

- [CMP2.x-0121] Argument to Collection-valued set must be a java.util.Collection type.

**Explanation**

The argument of the Collection value must be set java.util.Collection.

**System Action**

Throws RemoteException or EJBException.

**User Action**

Ensure that the only value set for a Collection value argument is of type java.util.Collection.

- [CMP2.x-0122] Bad argument type for collection add.

**Explanation**

An invalid argument type was specified for an added Collection.

The type of an unjustified argument was specified for the addition of Collection.

**System Action**

Throws RemoteException or EJBException.

**User Action**

Ensure that the specified argument type (for the set method of relation add) is other than the EJBLocal object.

- [CMP2.x-0123] Error: Join Table has more than 1 row for many-1 relationship.

**Explanation**

The Join Table has more than one row for a many-to-one relationship.

**System Action**

Throws RemoteException or EJBException.

**User Action**

A Join table is specified that does not correspond with the relation definition. Reevaluate the table configuration, and then reexecute the command.

If this error persists, contact a Fujitsu SE.

- [CMP2.x-0124] Collection may have been accessed after transaction completion.

**Explanation**

A system error occurred.

**System Action**

Throws InvalidStateException.

**User Action**

Please report this message to the system administrator.

- [CMP2.x-0125] Cannot add null to a relationship.

**Explanation**

Null cannot be added to the relationship.

**System Action**

Throws RemoteException or EJBException.

**User Action**

Ensure that the Null value is not added to the CMR field in the relation definition.

Otherwise, contact the development engineer of the relevant EJB Bean application, or a Fujitsu SE.

- [CMP2.x-0126] Collection modified or transaction completed.

**Explanation**

Either the Collection has been modified or the transaction has completed.

**System Action**

Throws Exception.

**User Action**

Contact your Fujitsu system engineer.

- [CMP2.x-0128] Illegal null argument to ObjectInputStreamWithLoader.

**Explanation**

A system error has occurred.

**System Action**

Throws Exception.

**User Action**

Contact your Fujitsu system engineer.

- [CMP2.x-0129] Encountered "%s1" at line %s2, column %s3.Was expecting:%s4

**Variable Information**

%s1 = Invalid character string

%s2 = Line number

%s3 = Position of character string (from the beginning) containing the error.

%s4 = Correct mark

**Explanation**

Stops activating the EJB application.

**System Action**

Throws RemoteException.

**User Action**

Ensure the specified character string is valid.

- [CMP2.x-0130] Encountered "%s1" at line %s2, column %s3.Was expecting one of:%s4

**Variable Information**

%s1 = Invalid character string

%s2 = Line number

%s3 = Position of character string (from the beginning) containing the error.

%s4 = List of correct mark

**Explanation**

The EJB QL definition is incorrect.

**System Action**

Stops activating the EJB application.

**User Action**

Ensure the specified character string is valid.

- [CMP2.x-0131] Lexical error at line %s1, column %s2. Encountered %s3 after %s4

**Variable Information**

%s1 = Invalid character string

%s2 = Line number

%s3 = Position of character string (from the beginning) containing the error.

%s4 = After character strings

**Explanation**

The EJB QL definition is incorrect.

**System Action**

Stops activating the EJB application.

**User Action**

Ensure the specified character string is valid.

- [CMP2.x-0132] Unknown class: %s1

**Variable Information**

%s1 = Class name

**Explanation**

The class is not found.

**System Action**

Stops the deployment process.

**User Action**

Contact your Fujitsu system engineer.

- [CMP2.x-0133] Table name %s1 exceeds the maximum length (%s2) allowed.

**Variable Information**

%s1 = Table name

%s2 = Maximum length

**Explanation**

The table name exceeded the maximum length of the identifier name of DBMS.

**System Action**

Stops activating the EJB application.

**User Action**

Correct the table name using the customization tool, then restart the EJB application.

- [CMP2.x-0134] The parameter class %s1 listed for the ejb selector or ejb finder method %s2 could not be found.

**Variable Information**

%s1 = Class name

%s2 = Fine Method name

**Explanation**

The class of the parameter of the select method or the finder method is not found.

**System Action**

Stops activating the EJB application.

**User Action**

The CLASSPATH is not set to the class of the parameter of the select method or the finder method.

- [CMP2.x-0135] The ejb selector method %s1 was not found in the bean class %s2.

**Variable Information**

%s1 = EJBSselect Method

%s2 = EJB application Class name

**Explanation**

The EJB selector method was not found in the EJB application class.

**System Action**

Stops the startup processing.

**User Action**

Check whether the selector method is defined in the Enterprise Bean class, and deactivate the EJB application again.

- [CMP2.x-0136] The ejb finder method %s1 was not found in the home interface class(es) for this ejb.

**Variable Information**

%s1 = Finder Method

%s2 = Home interface for EJB application

**Explanation**

The finder method is not found in the Home interface or LocalHome interface for EJB application.

**System Action**

Stops activating the EJB application.

**User Action**

Define the finder method in the Home interface or LocalHome interface.

- [CMP2.x-0137] Unknown def type.

**Explanation**

The definition type is not found.

**System Action**

Stops the startup processing.

**User Action**

Contact your Fujitsu system engineer.

- [CMP2.x-0138] No information is available for bean deployed under the name %s1.

**Variable Information**

%s1 = EJB application name

**Explanation**

Internal error.

**System Action**

Throw does Exception with customization tool.

**User Action**

Record relevant message details, then contact a Fujitsu SE.

- [CMP2.x-0139] Invalid deployment descriptor detected for %s1. %s2.

**Variable Information**

%s1 = EJB application name

%s2 = Unjustified tag in deployment descriptor

**Explanation**

Exception occurred while analyzing selected deployment descriptor.

**System Action**

Throw does Exception with customization tool.

**User Action**

Correct deployment descriptor according to the error message.

- [CMP2.x-0140] Schema name %s1 exceeds the maximum length (%s2) allowed..

**Variable Information**

%s1 = Schema name

%s2 = Maximum length of schema name supported with DBMS

**Explanation**

The schema name exceeded the maximum length allowed by the data source.

**System Action**

Stops activating the EJB application.

**User Action**

Correct the schema name to not exceed the maximum length.

- [CMP2.x-0141] Invalid deployment descriptors detected for the following related beans:%s2.

**Variable Information**

%s1 = List of EJB applications that have an invalid definition among the related EJB application

**Explanation**

Some of the listed beans have deployment descriptors that are invalid.

**System Action**

Customization Tool Exception.

**User Action**

Correct the deployment descriptors for the listed beans and reactivate the Customize Tool.

- [CMP2.x-0142] %s1 is not a CMP2.X bean.

**Variable Information**

%s1 = EJB application name

**Explanation**

Internal error.

**System Action**

Customization Tool Exception.

**User Action**

Record the relevant message details, then contact a Fujitsu SE.

- [CMP2.x-0143] SQL database exception encountered: %s1.

**Variable Information**

%s1 = Detailed message of SQLException

**Explanation**

An SQL exception occurred while accessing the underlying datasource

**System Action**

Stops application startup, or throws a RemoteException or EJBException during application runtime.

**User Action**

Rectify as necessary, according to the detailed SQLException message.

- [CMP2.x-0144] EJBException caused by: %s1.

**Variable Information**

%s1 = Detailed message of exception

**Explanation**

An exception occurred (internal error)

**System Action**

Throws a RemoteException or EJBException during application runtime

**User Action**

Rectify as necessary, according to the detailed exception message. If the exception appears to have been caused by an internal error, contact a Fujitsu SE.

- [CMP2.x-0145] Unable to get database connection. Exception = %s1.

**Variable Information**

%s1 = Detailed message of SQLException

**Explanation**

An SQLException occurred while attempting to connect to the database

**System Action**

Stops application startup, or throws a RemoteException or EJBException during application runtime.

**User Action**

Rectify as necessary, according to the detailed exception message.

- [CMP2.x-0146] Unable to load database row for entity. Exception = %s1.

**Variable Information**

%s1 = Detailed message of exception

**Explanation**

An exception occurred while attempting to load a row from the database

**System Action**

Throws a RemoteException or EJBException.

**User Action**

Rectify as necessary, according to the detailed exception message. If required, contact a Fujitsu SE.

- [CMP2.x-0147] Unable to check primary key for entity. Exception = %s1.

**Variable Information**

%s1 = Detailed message of exception

**Explanation**

An exception occurred while attempting to check the database for the existence of the primary key.

**System Action**

Throws a RemoteException or EJBException.

**User Action**

Rectify as necessary, according to the detailed exception message

- [CMP2.x-0148] Unable to load database relationship data for entity. Exception = %s1.

**Variable Information**

%s1 = Detailed message of exception

**Explanation**

An exception occurred while attempting to update join table data (for 1:N or N:N relationships)

**System Action**

Throws an EJBException.

**User Action**

Rectify as necessary, according to the detailed exception message.

- [CMP2.x-0149] Unable to load database relationship data for entity. Exception = %s1.

**Variable Information**

%s1 = Detailed message of exception

**Explanation**

An exception occurred while attempting to INSERT a row into the database.

**System Action**

Throws a RemoteException or EJBException.

**User Action**

Rectify as necessary, according to the detailed exception message.

- [CMP2.x-0150] Unable to remove database row for entity. Exception = %s1.

**Variable Information**

%s1 = Detailed message of exception

**Explanation**

An exception occurred while attempting to DELETE a row from the database.

**System Action**

Throws a RemoteException or EJBException.

**User Action**

Rectify as necessary, according to the detailed exception message.

- [CMP2.x-0151] Unable to update database row for entity. Exception = %s1.

**Variable Information**

%s1 = Detailed message of exception

**Explanation**

An exception occurred while attempting to UPDATE a row in the database.

**System Action**

Throws a RemoteException or EJBException.

**User Action**

Rectify as necessary, according to the detailed exception message.

### 3.14.36 EJB1240

---

**EJB: ERROR: EJB1240: Error in remove method: NAME=%s1**

Variable Information

%s1 = EJB application name

Explanation

An error has occurred in the EJBHome.remove method.

System Action

Throws Exception.

User Action

Check if an error has occurred in the ejbFindByPrimaryKey method invoked from the EJBHome.remove method.

Refer to any messages output before or after the error, and remove the cause of the error.

If necessary, contact the EJB application Bean developer.

### 3.14.37 EJB1241

---

**EJB: WARNING: EJB1241: EJB object was not found: NAME=%s1**

Variable Information

%s1 = EJB application name

### Explanation

The EJB object that corresponds to the Primary Key specified in the EJBHome.remove method argument was not found.

### System Action

Returns RemoveException.

### User Action

Determine whether the Primary Key value in the EJBHome.remove method argument is correct.

If necessary, contact the EJB application Bean developer.

## 3.14.38 EJB1242

---

**EJB: ERROR: EJB1242: Unable to execute method in specified instance managed mode : NAME=%s1 METHOD=%s2**

### Variable Information

%s1 = EJB application name

%s2 = Method name

### Explanation

A method that cannot be used in the specified instance management mode has been executed.

### System Action

Stops execution of the method named in the error message.

### User Action

Check for the following probable causes:

- One of the following methods is invoked with ReadOnly specified in the instance management mode.
  - EJBHome.create
  - EJBHome.remove
  - EJBObject.remove
- The following method is invoked with NoCache specified in the instance management mode.
  - A finder method that returns java.util.Collection as a return value.

## 3.14.39 EJB1243

---

**EJB: WARNING: EJB1243: Registration of Datasource failed: DATASOURCE=%s1 REASON=%s2**

### Variable Information

%s1 = Unusable Datasource name

%s2 = Detailed message

### Explanation

The Datasource specified in the Resource Access Definition cannot be used.

### System Action

Continues processing.

### User Action

Remove the cause of the error in accordance with the detailed messages. The probable causes are:

- A Customize Tool has been activated.
- The JDBC driver has not been properly installed.
- The JDBC driver environment settings are incorrect.
- If the JDBC driver class path is not set (for details on the environment setting where JDBC is used, refer to 'Environment setting where JDBC is viewed' in the J2EE User's Guide.)
- Datasource is not registered in JDBC.
- A registered data source definition contains an error.
- When a JDBC2.X data source is used, but the JDBC driver Naming Service is not activated

If the Datasource is to be used, remove the cause of the error and restart the EJB application.

When the EJB application does not use the Datasource, normal operation is assumed.

### 3.14.40 EJB1244

---

**EJB: ERROR: EJB1244: Method parameter is null: NAME=%s1 METHOD=%s2**

#### Variable Information

%s1 = EJB application name

%s2 = Method name

#### Explanation

The value passed to the method parameters is null.

#### System Action

Throws RemoteException.

#### User Action

Check if the argument value in the findByPrimaryKey, EJBHome.remove, or EJBObject.isIdentical method is null.

If necessary, contact the EJB application Bean developer.

### 3.14.41 EJB1245

---

**EJB: ERROR: EJB1245: Error in instance management mode specification: NAME=%s1**

#### Variable Information

%s1 = EJB application name

#### Explanation

Instance management mode specification is incorrect.

#### System Action

Stops the startup processing.

#### User Action

Ensure that Sequential is specified in the instance management mode of the following EJB applications.

- An Entity Bean called directly from a client
- An Entity Bean deployed in the Light EJB container, for which 'Not done' is specified in 'local calling' at customization.

### 3.14.42 EJB1247

---

---

**EJB: ERROR: EJB1247: Cannot use connection-class which is already closed: METHOD=%1 RESOURCE=%2****Variable Information**

%s1 = Method name

%s2 = Data source name

**Explanation**

A method of the Connection class was used for a closed connection.

**System Action**

Throws an SQLException.

**User Action**

This error may have been caused by:

- A method of the Connection class was issued because a connection that issued Connection.close was used.
- A method of the Connection class was issued after UserTransaction.rollback, or UserTransaction.commit was issued.

To resolve, issue a method of the Connection class in an open state.

---

**3.14.43 EJB1248**

---

**EJB: ERROR: EJB1248: Cannot issue getConnection method because Transaction is non-active: METHOD=%1 RESOURCE=%****Variable Information**

%s1 = Method name

%s2 = Data source name

**Explanation**

An attempt was made to issue the getConnection method when no transactions were active.

**System Action**

Throws an SQLException.

**User Action**

If using distributed transaction processing, issue the getConnection method only if a transaction is active and is not marked rollback.

This message is output if the EJB application type is CMP2.0 and distributed transaction processing is being used. Distributed transaction processing cannot be used in CMP2.0.

---

**3.14.44 EJB1249**

---

**EJB: ERROR: EJB1249: JTS Exception is occurred when you get JDBCConnection: METHOD=%1 RESOURCE=%****Variable Information**

%s1 = Method name

%s2 = Data source name

**Explanation**

If using distributed transaction processing, an exception occurred during acquisition of a JDBC connection.

## System Action

Throws an SQL Exception.

## User Action

Ensure that the resource definition file of the database used by the EJB application is registered with the database linkage service. If it is registered, check for definition errors in the resource definition file such as the following:

- lookupName is incorrect.
- InitialContextFactory is incorrect.
- ProviderURL is incorrect.

## 3.15 EJB1300 to EJB1399

---

This section details the messages with message numbers between EJB1300 and EJB1399.

### 3.15.1 EJB1350

---

**EJB: ERROR: EJB1350: Customize tool is active: NAME = %s1**

#### Variable Information

%s1 = EJB application name

#### Explanation

The Customize Tool is active.

#### System Action

Stops the startup of the EJB application.

#### User Action

Close the Customize Tool and restart the EJB application.

### 3.15.2 EJB1351

---

**EJB: ERROR: EJB1351: Reading of DB access environment definition file failed: NAME=%s1**

#### Variable Information

%s1 = EJB application name

#### Explanation

Reading of the DB Access Environment Definition file failed.

#### System Action

Stops the startup of the EJB application.

#### User Action

The environment setting might be incorrect. Reinstall Interstage.

### 3.15.3 EJB1352

---

**EJB: ERROR: EJB1352: Acquiring a connection failed: NAME=%s1 DATASOURCE=%s2 REASON=%s3**

#### Variable Information

%s1 = EJB application name

%s2 = Datasource name

%s3 = JDBC driver detailed message

### Explanation

Acquisition of preopened connection failed.

### System Action

Stops the startup of the EJB application.

### User Action

Remove the cause of the database connection error in accordance with the JDBC driver detailed message and rerun the job.

The probable causes are:

- The Datasource specifying the preopened connection count cannot be used. Refer to the messages output before or after the error and remove the cause of the error.
- The deployment descriptor reference resource of the EJB application uses either a data source set in the preopened connection or the data source described in the CMP EntityBean CMF mapping definition data source. It may not be set correctly. These data source settings need to be checked to ensure they are correct.
- The JDBC driver is not properly installed.
- The JDBC driver environment settings are incorrect.
- DBMS has not been activated.
- The specified preopened connection count exceeds the maximum number of connections allowed for the JDBC driver.
- There is a network error.

There is an error in the DBMS operating environment.

## 3.15.4 EJB1353

---

**EJB: WARNING: EJB1353: Datasource specified by previous connection is failed: NAME=%s1 DATASOURCE=%s2 REASON=%s**

### Variable Information

%s1 = Name of rapid invoking EJB application

%s2 = Datasource name

%s3 = JDBC driver detailed message

### Explanation

The preopened connection for the specified datasource failed.

### System Action

Continues start processing.

### User Action

A possible cause is as follows:

- The datasource specified for the preopened connection is not included in the resource access definition.

If the above cause does not apply, refer to the messages output before and after this message.

If the relevant datasource is not to be used, cancel the preopened connection setting.

## 3.16 EJB1400 to EJB1499

---

This section details the messages with message numbers between EJB1400 and EJB1499.

### 3.16.1 EJB1401

---

**EJB: ERROR: EJB1401: JMS initialization failed: NAME=%s1 CODE=%s2**

#### Variable Information

%s1 = EJB application name

%s2 = Internal code

#### Explanation

An error occurred while initializing JMS.

#### System Action

Stops the startup of the EJB application.

#### User Action

The possible causes are:

- JMS is not properly installed.
- An error occurred in JMS.
- An error occurred in the EJB application.
- Memory shortage occurred.

If one of these apply, do the following:

- JMS is not properly installed.
- Check if JMS is installed.
- An error occurred in JMS.
- If JMS message is outputted before/after this message, execute it in accordance with JMS message.
- An error occurred in the EJB application.
- If EJB message is outputted before/after this message, execute it in accordance with EJB message.
- Memory shortage occurred.
- Confirm that there is enough memory.

If none of the above causes apply, notify your software supplier of the message information.

### 3.16.2 EJB1403

---

**EJB: ERROR: EJB1403: Exception from JMS provider: NAME=%s1 REASON=%s2 CODE=%s3**

#### Variable Information

%s1 = EJB application name

%s2 = Detailed message

%s3 = Internal code

#### Explanation

An error occurred in JMS API.

#### System Action

Stops execution of the method.

#### User Action

Take corrective action according to the message.

### 3.16.3 EJB1404

---

**EJB: ERROR: EJB1404: Failed to start JMS message receive thread: NAME=%s1 CODE=%s2**

#### Variable Information

%s1 = EJB application name

%s2 = Internal code

#### Explanation

Failed to start thread.

#### System Action

Stops the EJB application.

#### User Action

Notify your software supplier.

### 3.16.4 EJB1406

---

**EJB: ERROR: EJB1406: Failed to re-start thread: NAME=%s1 CODE=%s2**

#### Variable Information

%s1 = EJB application name

%s2 = Internal code

#### Explanation

Failed to start thread.

#### System Action

Stops the EJB application.

#### User Action

Notify your software supplier.

### 3.16.5 EJB1407

---

**EJB: ERROR: EJB1407: Failed to wait JMS receive thread: NAME=%s1 CODE=%s2**

#### Variable Information

%s1 = EJB application name

%s2 = Internal code

#### Explanation

Failed to wait receiving JMS message.

#### System Action

Stops the EJB application.

## User Action

Notify your software supplier.

### 3.16.6 EJB1410

---

**EJB: ERROR: EJB1410: Failed backup to file: NAME=%s1 FILE=%s2 REASON=%s3 CODE=%s4**

#### Variable Information

%s1 = EJB application name

%s2 = File name for backup

%s3 = Detailed message

%s4 = Internal code

#### Explanation

Although a system error occurred in the onMessage method of the EJB application with 'Required' transaction attribute, failed to make backup to the file.

#### System Action

Stops the EJB application.

#### User Action

Remove the cause of the system error occurred in the EJB application, and restart the EJB application.

Also confirm that there is enough disk space in the following place.

**Windows32/64**

C:\Interstage\EJB\var

**Solaris32/64** **Linux32/64**

/opt/FJSVejb/var

### 3.16.7 EJB1411

---

**EJB: ERROR: EJB1411: JMS Message not serializable: NAME=%s1 CODE=%s2**

#### Variable Information

%s1 = EJB application name

%s2 = Internal code

#### Explanation

Although a system error occurred in the onMessage method of the EJB application with 'Required' transaction attribute, failed to make backup to file because it is not serializable.

#### System Action

Stops the EJB application.

#### User Action

Remove the cause of the system error occurred in the EJB application, and restart the EJB application.

### 3.16.8 EJB1412

---

**EJB: WARNING: EJB1412: JMS Message backup failed: NAME=%s1 CODE=%s2**

## Variable Information

%s1 = EJB application name

%s2 = File name for backup

%s3 = Detailed message

%s4 = Internal code

## Explanation

Although a system error occurred in the onMessage method of the EJB application with 'Required' transaction attribute, failed to make a backup to file for some reason.

## System Action

Stops the EJB application.

## User Action

Take corrective action according to the message that is outputted before this error message.

## 3.16.9 EJB1413

---

**EJB: ERROR: EJB1413: JMS Destination type is invalid: NAME=%s1 CODE=%s2**

## Variable Information

%s1 = EJB application name

%s2 = Internal code

## Explanation

JMS Destination type of the deployment descriptor is invalid.

## System Action

Stops the startup of the EJB application.

## User Action

Specify either the following JMS Destination type of the deployment descriptor. After the modification of its Destination type, restart the EJB application.

- javax.jms.Topic
- javax.jms.Queue

## 3.16.10 EJB1415

---

**EJB: ERROR: EJB1415: Subscription durability is Invalid: NAME=%s1 CODE=%s2**

## Variable Information

%s1 = EJB application name

%s2 = Internal code

## Explanation

The value of subscription durability of the deployment descriptor is invalid.

## System Action

Stops the startup of the EJB application.

## User Action

Specify either the following subscription durability of the deployment descriptor. After the modification of its subscription durability, restart the EJB application.

- Durable
- NonDurable

## 3.16.11 EJB1416

---

**EJB: ERROR: EJB1416: Transaction attribute is Invalid: NAME=%s1 CODE=%s2**

### Variable Information

%s1 = EJB application name

%s2 = Internal code

### Explanation

Transaction type of the deployment descriptor is invalid.

### System Action

Stops the startup of the EJB application.

### User Action

For Message-driven Bean, specify either the following transaction type of the deployment descriptor. After the modification of its transaction type, restart the EJB application.

- Required
- NotSupported

## 3.16.12 EJB1418

---

**EJB: ERROR: EJB1418: Acknowledge mode is invalid: NAME=%s1 CODE=%s2**

### Variable Information

%s1 = EJB application name

%s2 = Internal code

### Explanation

Acknowledge mode of the deployment descriptor is invalid.

### System Action

Stops the startup of the EJB application.

### User Action

Specify either of the following acknowledge modes of the deployment descriptor. After changing the acknowledge mode, restart the EJB application.

- Auto-acknowledge
- Dups-ok-acknowledge

## 3.16.13 EJB1419

---

**EJB: ERROR: EJB1419: The JMS ConnectionFactory for Global transaction mode must be used: NAME=%s1 CODE=%s2**

### Variable Information

%s1 = EJB application name

%s2 = Internal code

### Explanation

Although the distributed transaction use is specified in the Customize Tool, the JMS ConnectionFactory is not set for distributed transaction.

### System Action

Stops the startup of the EJB application.

### User Action

- In case of distributed transaction  
Set the JMS ConnectionFactory for the distributed transaction, and restart the EJB application.
- Otherwise  
Specify not to use the distributed transaction in Customize Tool, and activate the EJB application again.

## 3.16.14 EJB1421

---

**EJB: ERROR: EJB1421 Message-driven Bean is already started: NAME=%s1 CODE=%s2**

### Variable Information

%s1 = EJB application name

%s2 = Internal code

### Explanation

Message-driven Bean is already activated, or two or more concurrencies were specified in the WorkUnit definition of Message-driven bean. Multiple Message-driven Bean processes cannot be activated.

### System Action

Stops the startup of the EJB application.

### User Action

In case that the concurrency of the WorkUnit definition is set to two or more, change it to one again.

## 3.16.15 EJB1422

---

**EJB: ERROR: EJB1422 Cannot release exclusive lock: NAME=%s1 FILE=%s2 CODE=%s3**

### Variable Information

%s1 = EJB application name

%s2 = Exclusive file

%s3 = Internal code

### Explanation

Exclusive lock cannot be released for some reason.

### System Action

Stops the EJB application.

## User Action

There is no problem for the operation.

### 3.16.16 EJB1423

---

**EJB: WARNING: EJB1423: The backup JMS ConnectionFactory for Global transaction mode cannot be used: NAME=%s1 CONNECTIONFACTORY=%s2 CODE=%s3**

#### Variable Information

%s1 = EJB application name

%s2 = ConnectionFactory name

%s3 = Internal code

#### Explanation

For the backup JMS ConnectionFactory, the backup JMS ConnectionFactory for distributed transaction mode cannot be used.

#### System Action

Continues the startup of the EJB application.

#### User Action

Change the backup JMS ConnectionFactory not to use distributed transaction, and activate the EJB application again.

### 3.16.17 EJB1424

---

**EJB: ERROR: EJB1424 Exception occurred in Message-driven Bean: NAME=%s1 EXCEPTION=%s2 METHOD=%s3 CODE=%s4**

#### Variable Information

%s1 = EJB application name

%s2 = Detailed message

%s3 = Method name

%s4 = Internal code

#### Explanation

Message-driven Bean throws a system exception that was caught by Container. This applies not only to the onMessage method but to all methods.

#### System Action

Continues the startup of the EJB application.

#### User Action

Exception occurred in Message-driven Bean. Modify the EJB application then execute it again.

### 3.16.18 EJB1428

---

**EJB: WARNING: EJB1428: Specified backup JMS ConnectionFactory name or backup JMS Destination name is invalid: NAME=%s1 CODE=%s2**

#### Variable Information

%s1 = EJB application name

%s2 = Internal code

## Explanation

Specified backup JMS ConnectionFactory name or backup JMS Destination name in Customize Tool is invalid.

## System Action

Continues the startup of the EJB application. Messages are not backed up to the backup JMS Destination.

## User Action

Modify the backup JMS ConnectionFactory name or the backup JMS Destination name, and activates the EJB application again.

## 3.16.19 EJB1431

---

**EJB: ERROR: EJB1431 Acquiring JMS ConnectionFactory failed: NAME=%s1 REASON=%s2 CONNECTIONFACTORY=%s3 CODE=%s4**

### Variable Information

%s1 = EJB application name

%s2 = Detailed message

%s3 = JMS ConnectionFactory name

%s4 = Internal code

### Explanation

Failed to acquire the JMS ConnectionFactory object.

### System Action

Continues the startup of the EJB application.

### User Action

Exception occurred in Message-driven Bean. Modify the EJB application then execute it again.

## 3.16.20 EJB1432

---

**EJB: ERROR: EJB1432 Acquiring JMS Destination object failed: NAME=%s1 REASON=%s2 DESTINATION=%s3 CODE=%s4**

### Variable Information

%s1 = EJB application name

%s2 = Detailed message

%s3 = JMS Destination name

%s4 = Internal code

### Explanation

Failed to acquire the JMS Destination object.

### System Action

Stops the startup of the EJB application.

### User Action

Confirm the following.

- Check if the JMS Destination definition is registered.
- Check if the Destination name in Customize Tool is set correctly.

## 3.16.21 EJB1433

---

**EJB: ERROR: EJB1433 Specified JMS Destination type is incompatible with the Acquired JMS ConnectionFactory type: NAME=%s1 CODE=%s2**

### Variable Information

%s1 = EJB application name

%s2 = Internal code

### Explanation

Although the JMS Destination type is defined as `javax.jms.Topic` in Customize Tool, the type of the JMS ConnectionFactory object is `javax.jms.QueueConnectionFactory`. Or, although the JMS Destination type is defined as `javax.jms.Queue` in Customize Tool, the type of the JMS ConnectionFactory object is `javax.jms.TopicConnectionFactory`.

### System Action

Stops the startup of the EJB application.

### User Action

Possible reasons are as follows.

- The type of JMS Destination is invalid.
- The JMS ConnectionFactory name in Customize Tool is invalid.
- The JMS ConnectionFactory definition is invalid.

Remove the cause of the error, and activate the EJB application again.

## 3.16.22 EJB1434

---

**EJB: ERROR: EJB1434 Specified JMS Destination type is incompatible with the Acquired JMS Destination type: NAME=%s1 CODE=%s2**

### Variable Information

%s1 = EJB application name

%s2 = Internal code

### Explanation

Although the JMS Destination type is defined as `javax.jms.Topic` in Customize Tool, the type of the JMS Destination object is `javax.jms.Queue`. Or, although the JMS Destination type is defined as `javax.jms.Queue` in Customize Tool, the type of the JMS Destination object is `javax.jms.Topic`.

### System Action

Stops the startup of the EJB application.

### User Action

Possible reasons are as follows.

- The type of JMS Destination is invalid.
- The JMS Destination name in Customize Tool is invalid.
- The JMS Destination definition is invalid.

Remove the cause of the error, and activate the EJB application again.

## 3.16.23 EJB1435

---

---

**EJB: ERROR: EJB1435 The JMS ConnectionFactory for Global transaction mode cannot be used for Bean Managed Transaction: NAME=%s1 CODE=%s2**

**Variable Information**

%s1 = EJB application name

%s2 = Internal code

**Explanation**

In case the transaction type is Bean, the JMS ConnectionFactory for distributed transaction cannot be used.

**System Action**

Stops the startup of the EJB application.

**User Action**

Specify the JMS ConnectionFactory not to use the distributed transaction in Customize Tool, and activate the EJB application again.

---

### 3.16.24 EJB1436

---

**EJB: ERROR: EJB1436 The JMS ConnectionFactory for Global transaction mode cannot be used for NotSupported Transaction Attribute: NAME=%s1 CODE=%s2**

**Variable Information**

%s1 = EJB application name

%s2 = Internal code

**Explanation**

In case of the transaction attribute is NotSupported, the JMS ConnectionFactory for distributed transaction cannot be used.

**System Action**

Stops the startup of the EJB application.

**User Action**

Specify the JMS ConnectionFactory not to use the distributed transaction in Customize Tool, and activate the EJB application again.

---

### 3.16.25 EJB1437

---

**EJB: ERROR: EJB1437 The ConnectionFactory for Global transaction mode cannot be used: NAME=%s1 CODE=%s2**

**Variable Information**

%s1 = EJB application name

%s2 = Internal code

**Explanation**

The JMS ConnectionFactory for distributed transaction cannot be used because the distributed transaction is not set.

**System Action**

Stops the startup of the EJB application.

**User Action**

Define the EJB application to use the distributed transaction in Customize Tool, or specify the JMS ConnectionFactory not to use the distributed transaction, and activate the EJB application again.

### 3.16.26 EJB1438

---

**EJB: ERROR: EJB1438 Failed to create JMS Subscriber or JMS Receiver: NAME=%s1 REASON=%s2 CODE=%s3**

#### Variable Information

%s1 = EJB application name

%s2 = Detailed message

%s3 = Internal code

#### Explanation

Failed to create JMS Subscriber or JMS Receiver.

#### System Action

Stops the startup of the EJB application.

#### User Action

Take the required action according to the error message, and activate the EJB application again.

### 3.16.27 EJB1439

---

**EJB: ERROR: EJB1439 Error in Message-driven Bean. EJB application deactivated: NAME=%s1 CODE=%s2**

#### Variable Information

%s1 = EJB application name

%s2 = Internal code

#### Explanation

Stops the EJB application because some error had occurred in Message-driven Bean

#### System Action

Stops the startup of the EJB application.

#### User Action

Take the required action according to the message of JMS or Event Service that is outputted before/after this message.

### 3.16.28 EJB1440

---

**EJB: ERROR: EJB1440 Failed to complete receiving JMS message: NAME=%s1 REASON=%s2 CODE=%s3**

#### Variable Information

%s1 = EJB application name

%s2 = Detailed message

%s3 = Internal code

#### Explanation

Tried to commit or rollback the JMS message, but an error has occurred.

#### System Action

Stops processing of the EJB application.

## User Action

An error has occurred in JMS. Take the required action according to the exception message, and activate the EJB application again.

### 3.16.29 EJB1441

---

**EJB: ERROR: EJB1441 Failed to start JMS connection: NAME=%s1 REASON=%s2 CODE=%s3**

#### Variable Information

%s1 = EJB application name

%s2 = Detailed message

%s3 = Internal code

#### Explanation

Tried to start connection receiving the JMS message, but an error has occurred in JMS.

#### System Action

Stops the startup of the EJB application.

#### User Action

An error has occurred in JMS. Take the required action according to the exception message, and activate the EJB application again.

### 3.16.30 EJB1442

---

**EJB: WARNING: EJB1442 Failed to release JMS Subscriber or JMS Receiver: NAME=%s1 REASON=%s2 CODE=%s3**

#### Variable Information

%s1 = EJB application name

%s2 = Detailed message

%s3 = Internal code

#### Explanation

JMS failed to close Consumer because of some JMS error.

#### System Action

Continues stop processing of the EJB application.

#### User Action

An error has occurred in JMS. Take the required action according to the exception message, and activate the EJB application again.

### 3.16.31 EJB1443

---

**EJB: WARNING: EJB1443 Failed to release JMS connection: NAME=%s1 REASON=%s2 CODE=%s3**

#### Variable Information

%s1 = EJB application name

%s2 = Detailed message

%s3 = Internal code

#### Explanation

Tried to release JMS connection, but JMS failed to close connection.

## System Action

Continues stop processing of the EJB application.

## User Action

An error has occurred in JMS. Take the required action according to the exception message, and activate the EJB application again.

### 3.16.32 EJB1444

---

**EJB: WARNING: EJB1444 Failed to cleanup JMS: NAME=%s1 REASON=%s2 CODE=%s3**

#### Variable Information

%s1 = EJB application name

%s2 = Detailed message

%s3 = Internal code

#### Explanation

JMS cleanup was executed but an error has occurred for some reason.

## System Action

Continues stop processing of the EJB application.

## User Action

An error has occurred in JMS. Take the required action according to the exception message, and activate the EJB application again.

### 3.16.33 EJB1445

---

**EJB: WARNING: EJB1445 Acquiring backup JMS ConnectionFactory failed: NAME=%s1 REASON=%s2 CONNECTIONFACTORY=%s3 CODE=%s4**

#### Variable Information

%s1 = EJB application name

%s2 = Detailed message

%s3 = ConnectionFactory name

%s4 = Internal code

#### Explanation

Failed to acquire the backup JMS ConnectionFactory object.

## System Action

Continues startup processing of the EJB application. Does not make a backup of the JMS message to the backup JMS Destination.

## User Action

Confirm the following.

- Check if the JMS ConnectionFactory definition is registered.
- Check if the JMS ConnectionFactory name in Customize Tool is set correctly.

### 3.16.34 EJB1446

---

**EJB: WARNING: EJB1446 Acquiring backup JMS Destination object failed: NAME=%s1 REASON=%s2 DESTINATION=%s3 CODE=%s4**

### Variable Information

%s1 = EJB application name

%s2 = Detailed message

%s3 = Destination name

%s4 = Internal code

### Explanation

Failed to acquire the backup JMS Destination object.

### System Action

Continues startup processing of the EJB application.

### User Action

Confirm the following.

- Check if the JMS Destination definition is registered.
- Check if the Destination name in Customize Tool is set correctly.

## 3.16.35 EJB1447

---

**EJB: WARNING: EJB1447 Backup JMS ConnectionFactory type is invalid: NAME=%s1 CONNECTIONFACTORY=%s2 CODE=%s3**

### Variable Information

%s1 = EJB application name

%s2 = ConnectionFactory name

%s3 = Internal code

### Explanation

The type of the backup JMS ConnectionFactory object is invalid.

### System Action

Continues startup processing of the EJB application

### User Action

Confirm that the JMS ConnectionFactory is defined correctly.

## 3.16.36 EJB1448

---

**EJB: WARNING: EJB1448 Failed backup specified JMS Destination: NAME=%s1 REASON=%s2 CODE=%s3**

### Variable Information

%s1 = EJB application name

%s2 = Detailed message

%s3 = Internal code

### Explanation

Although a system error occurred in the EJB application with 'Required' transaction attribute, failed to backup to the backup JMS Destination.

#### System Action

Backup is made to the file.

#### User Action

An error has occurred in JMS. Take the required action according to the exception message, and activate the EJB application again.

### 3.16.37 EJB1449

---

**EJB: WARNING: EJB1449 JMS ConnectionFactory name is not specified: NAME=%s1 CODE=%s2**

#### Variable Information

%s1 = EJB application name

%s2 = Internal code

#### Explanation

The JMS ConnectionFactory name is not specified in Customize Tool.

#### System Action

Stops the startup of the EJB application.

#### User Action

Specify the JMS ConnectionFactory name in Customize Tool and activate the EJB application again.

### 3.16.38 EJB1450

---

**EJB: ERROR: EJB1450 JMS Destination object name is not specified: NAME=%s1 CODE=%s2**

#### Variable Information

%s1 = EJB application name

%s2 = Internal code

#### Explanation

The Destination name is not specified in Customize Tool.

#### System Action

Stops the startup of the EJB application.

#### User Action

Specify the Destination name in Customize Tool and activate the EJB application again.

### 3.16.39 EJB1451

---

**EJB: WARNING: EJB1451 Backup JMS Message to specified backup JMS Destination: NAME=%s1 CODE=%s2**

#### Variable Information

%s1 = EJB application name

%s2 = Internal code

#### Explanation

Backup is done for the JMS message to the backup JMS Destination that is specified in Customize Tool.

## System Action

Continues the startup of the EJB application. The message is backed up to the backup JMS Destination.

## User Action

Message backup is done because the exception has occurred in the method of Message-driven Bean. Remove the cause of the error, and execute it again.

Also, because of the message that an error has occurred had been backed up to the backup JMS Destination, receive and process it again.

## 3.16.40 EJB1452

---

**EJB: WARNING: EJB1452 Backup JMS Message to specified backup file: NAME=%s1 CODE=%s2**

### Variable Information

%s1 = EJB application name

%s2 = Internal code

### Explanation

An exception occurred in the method of Message-driven Bean. Backup of the JMS message is made to the backup file.

## System Action

Continues the startup of the EJB application. The message is serialized and backed up to the following backup file.

**Windows32/64**

C:\Interstage\EJB\var

**Solaris32/64** **Linux32/64**

/opt/FJSVejb/var

## User Action

Modify the cause of the error.

Because of the message that an error has occurred had been backed up to the backup JMS Destination, deserialize the message then process it again.

## 3.16.41 EJB1453

---

**EJB: WARNING: EJB1453 Backup JMS Destination object type is invalid: NAME=%s1 DESTINATION=%s2 CODE=%s3**

### Variable Information

%s1 = EJB application name

%s2 = JMS Destination name

%s3 = Internal code

### Explanation

Specified type of the JMS Destination object in Customize Tool is invalid.

## System Action

Continues the startup of the EJB application. The message that an exception has occurred is backed up to the backup file, not to the backup JMS Destination.

## User Action

JNDI other than the JMS Destination may be specified for the JMS Destination name.

Check if specified backup JMS Destination name is correct.

## 3.16.42 EJB1454

---

**EJB: WARNING: EJB1454 Backup JMS ConnectionFactory type is incompatible with backup JMS Destination type: NAME=%s1 CODE=%s2**

### Variable Information

%s1 = EJB application name

%s2 = JMS Destination name

### Explanation

The type of backup JMS ConnectionFactory is incompatible with the type of the backup JMS Destination.

### System Action

Continues the startup of the EJB application. The message that an exception has occurred is backed up to the backup file, not to the backup JMS Destination.

### User Action

The probable causes follow. Check if specified backup JMS ConnectionFactory name or the backup JMS Destination name is correct.

- Topic for the JMS Destination, and QueueConnectionFactory for the JMS ConnectionFactory are specified.
- Queue for the JMS Destination, and TopicConnectionFactory for the JMS ConnectionFactory are specified.

## 3.17 EJB1900 to EJB1999

---

This section details the messages with message numbers between EJB1900 and EJB1999.

### 3.17.1 EJB1999

---

**EJB: ERROR: EJB1999: System error occurred: NAME=%s1 CODE=%s2**

### Variable Information

%s1 = EJB application name

%s2 = System code

### Explanation

A system error occurred due to an environment abnormality or for some other reason.

### System Action

Stops the EJB application.

### User Action

The possible causes are:

- The environment variable setting is incorrect.
- ISMVIDL was not executed in JDK/JRE1.2.2.
- The product was not installed correctly.
- The JDBC driver library was not specified.

 Windows32/64

- Lookup processing is being executed in the Entity Bean constructor.

If one of the above causes applies, do the following:

- If the environment variable setting is incorrect, change the environment variable setting.
- If ISMVIDL was not executed in JDK/JRE1.2.2, execute ISMVIDL in JDK/JRE1.2.2.
- If the product was not correctly installed, install it correctly.
- If the JDBC driver library was not specified, specify the required JDBC driver library in the Library for Application of the WorkUnit definition, then restart the EJB application.
- If lookup processing is executed in the Entity Bean constructor, correct the EJB application so that lookup processing is executed in the setEntityContext method.

If none of the above causes applies, notify your software supplier of the message information.

**Solaris32/64** **Linux32/64**

#### User Action

The possible causes are:

- The access permission to the Application Folder and its subordinate directories or files has been changed.
- The upper and lower cases of the file name were changed when the EJB application was being copied to the server machine after deployment.
- The environment variable setting is incorrect.
- ISMVIDL was not executed in JDK/JRE1.2.2.
- The product was not installed correctly.
- The JDBC driver library was not specified.
- Lookup processing is being executed in the Entity Bean constructor.

If one of the above causes applies, do the following:

- If the access permission to the Application Folder and its subordinate directories or files has been changed, check the access permission.
- If the upper and lower cases of the file name were changed when the EJB application was being copied to the server machine after deployment, check the file name after the EJB application was copied to the server machine.
- If the environment variable setting is incorrect, change the environment variable setting.
- If ISMVIDL was not executed in JDK/JRE1.2.2, execute ISMVIDL in JDK/JRE1.2.2.
- If the product was not correctly installed, install it correctly.
- If the JDBC driver library was not specified, specify the required JDBC driver library in the Library for Application of the WorkUnit definition, then restart the EJB application.
- If lookup processing is executed in the Entity Bean constructor, correct the EJB application so that lookup processing is executed in the setEntityContext method.

If none of the above causes applies, notify your software supplier of the message information.

## 3.18 EJB2000 to EJB2099

---

This section details the messages with message numbers between EJB2000 and EJB2099.

### 3.18.1 EJB2000

---

**EJB: INFO: EJB2000: EJB application started: NAME=%s1**

## Variable Information

%s1 = EJB application name

## Explanation

The EJB application started up successfully.

### 3.18.2 EJB2001

---

**EJB: INFO: EJB2001: EJB application stopped: NAME=%s1**

## Variable Information

%s1 = EJB application name

## Explanation

The EJB application stopped successfully.

### 3.18.3 EJB2003

---

**EJB: ERROR: EJB2003: Failure in starting the EJB application: NAME=%s1**

## Variable Information

%s1 = EJB application name

## Explanation

The EJB application failed to start up.

## System Action

Stops startup of the EJB application.

## User Action

Check the operating environment, and then reexecute the command. Additionally, refer to any messages output before or after this message.

### 3.18.4 EJB2004

---

**EJB: ERROR: EJB2004: Failure in initializing CORBA service: NAME=%s1 ID=%s2**

## Variable Information

%s1 = EJB application name

%s2 = ORB error ID

## Explanation

ORB initializing failed when the EJB application started up.

## System Action

Stops startup of the EJB application.

## User Action

Check the operating environment, and then reexecute the command. Additionally, refer to any messages output before or after this message. For details of CORBA service error messages, refer to [Chapter 18 Messages Beginning with 'od'](#).

### 3.18.5 EJB2005

---

---

**EJB: ERROR: EJB2005: Failure in reading definition file: NAME=%s1 FILE='%s2'****Variable Information**

%s1 = EJB application name

%s2 = File name

**Explanation**

Failed to read the definition file.

**System Action**

Stops startup of the EJB application.

**User Action**

The EJB application may not have been installed correctly. Check that products created using the J2EE Deployment Tool were installed correctly.

Check the following:

- If products created using the J2EE Deployment Tool were copied to another machine, check that they were copied correctly
- If products created using the J2EE Deployment Tool were transferred to another machine using ftp, check that they were transferred correctly
- Check whether or not files created using the J2EE Deployment Tool that were changed have been deleted.

---

**3.18.6 EJB2008**

---

**EJB: ERROR: EJB2008: Memory shortage occurred: NAME=%s1****Variable Information**

%s1 = EJB application name

**Explanation**

Memory shortage occurred

**System Action**

Stops processing, and stops the EJB application.

**User Action**

Wait for a short period, and then reexecute processing. If this message is output frequently, refer to the Tuning Guide, reestimate the memory that is needed to run the EJB service, and confirm that there is enough.

If sufficient memory has been reserved to run the EJB service, there may not be enough memory to run other applications. Reestimate the memory required to run other applications in the same machine, and investigate the amount of memory that is appropriate.

If, as a result of reestimating the memory, it is confirmed that there is not enough, contact the system administrator in order to increase the main memory or extend the swap area.

---

**3.18.7 EJB2009**

---

**EJB: ERROR: EJB2009: Failure in creating Bean: INTF=%s1 ID=%s2****Variable Information**

%s1 = Interface Ripogitoly ID

%s1 = CORBA Service Error ID

**Explanation**

The attempt to create the Bean failed.

### System Action

Stops startup of the Bean.

### User Action

There may be an abnormality in the CORBA service. Check whether any messages are output in the system log. If a message is output, refer to the message. If there are no abnormalities in the CORBA service, it may be that Deployment was not executed normally. In this case, reexecute it. For details of CORBA service error messages, refer to [Chapter 18 Messages Beginning with 'od'](#).

---

## 3.18.8 EJB2012

---

**EJB: ERROR: EJB2012: Timeout occurred: NAME=%s1**

### Variable Information

%s1 = EJB application name

### Explanation

There was a connection timeout from the client application because the session timeout period was exceeded.

### System Action

Destroys the created Bean, and then disconnects the connection from the client application.

### User Action

Change the value set for the session timeout period. Alternatively, change the execution period for client applications, and then complete processing inside the session timeout period.

---

## 3.18.9 EJB2013

---

**EJB: ERROR: EJB2013: Too many clients to be connected at the same time: NAME=%s1**

### Variable Information

%s1 = EJB application name

### Explanation

Processing of the create\_component method was disconnected because the maximum number of connections that can be processed (execution of the create\_component method from the client application) was exceeded.

### System Action

Stops execution of the method from the client application.

### User Action

Wait until other connections finish execution of the business method, and then reexecute the method.

---

## 3.18.10 EJB2014

---

**EJB: ERROR: EJB2014: Too many clients to be connected: NAME=%s1**

### Variable Information

%s1 = EJB application name

### Explanation

Requests from the client application could not be processed because the maximum number of connections that can be processed (issue of the create\_component method from the client application) was exceeded.

### System Action

Stops execution of the method from the client application.

### User Action

Wait until other connections close (execution of the destroy method from the client application), and then execute the create\_component method, or restart the EJB application and then execute the create\_component method.

## 3.18.11 EJB2015

---

**EJB: ERROR: EJB2015: Communication error occurred: NAME=%s1**

### Variable Information

%s1 = EJB application name

### Explanation

A communication error occurred.

### System Action

Stops the EJB application.

### User Action

Possible causes are as follows:

- A network abnormality occurred
- There was not enough memory

Check the network and system environments.

## 3.18.12 EJB2017

---

**EJB: ERROR: EJB2017: ContainerError sent by Bean: NAME=%s1 REASON=%s2**

### Variable Information

%s1 = EJB application name

%s2 = Exception detail information

### Explanation

ContainerError was detected as being sent by the Bean. The contents of the message sent by the Bean are REASON.

### System Action

Stops the EJB application.

### User Action

Investigate the cause of the ContainerError sent by the Bean, and then correct the Bean if necessary.

## 3.18.13 EJB2099

---

**EJB: ERROR: EJB2099: System error occurred: NAME=%s1 CODE=%s2**

### Variable Information

%s1 = EJB application name

%s2 = Detail error code

## Explanation

A system error occurred.

## System Action

Stops the EJB application.

## User Action

Check whether any messages are output in the system log. If a message is output, refer to the message. If the cause cannot be identified from the message, contact a Systems Engineer.

## 3.19 EJB2100 to EJB2199

---

This section details the messages with message numbers between EJB2100 and EJB2199.

### 3.19.1 EJB2112

---

#### **EJB: ERROR: EJB2112: Failure in reading EJB application: NAME=%s1 FILE='%s2'**

#### Variable Information

%s1 = EJB application name

%s2 = EJB application Library name

#### Explanation

Failed to read the EJB application.

#### System Action

Stops startup of the EJB application.

#### User Action

The EJB application may not have been installed correctly. Check that products created using the EJB Deployment Tool were installed correctly.

Check the following:

- If products created using the J2EE Deployment Tool were copied to another machine, check that they were copied correctly
- If products created using the J2EE Deployment Tool were transferred to another machine using ftp, check that they were transferred correctly
- Check whether or not files created using the J2EE Deployment Tool that were changed were deleted.

## 3.20 EJB3000 to EJB3099

---

#### Note

Variables such as %1, described in the following messages, contain actual file names.

Each error message number displays:

'Label : Message Number : Error type - Customize code number - Class number - Method number' (excluding the message text).

**Windows32/64**

[Installation folder] refers to the EJB folder under the Interstage Install folder.

**Solaris32/64** **Linux32/64**

[Installation directory] refers to the FJSVejb directory under the Interstage Install directory.

## 3.20.1 EJB3001

---

**EJB Application Runtime Environment Definition has been changed. Do you want to save the changes and exit the Customize Tool?**  
**EJB3001W-20-xxx-xxxx**

### Explanation

The EJB Application Runtime Environment Definition has been changed. You must indicate whether or not you want to save the changes.

### System Action

If [Yes] is selected, changes to the EJB Application Runtime Environment Definition are saved and the Customize Tool is closed.

If [No] is selected, the Customize Tool is closed and changes to the EJB Application Runtime Environment Definition are not saved.

If [Cancel] is selected, the dialog is closed without taking any action.

### User Action

Decide whether or not to save the changes.

## 3.20.2 EJB3003

---

**JavaVM in the supported version is needed for executing the Customize Tool.**  
**EJB3003S-20-xxx-xxxx**

### Explanation

An unsupported JDK version is being used.

### System Action

Stops Customize processing.

### User Action

Use JDK version 1.2.2 or later.

## 3.20.3 EJB3006

---

**Windows32/64**

**The (%1) file cannot be found. Check whether the (%1) file exists under the etc folder in the installation folder.**

**EJB3006S-20-xxx-xxxx**

### Explanation

The (variable information) file could not be found.

### System Action

Stops Customize processing.

### User Action

Check if the file exists in the etc folder under the installation folder. If it exists, check whether access permission has been set for the file.

**Solaris32/64** **Linux32/64**

**The (%1) file cannot be found. Check whether the (%1) file exists under the etc directory in the installation directory.**

**EJB3006S-20-xxx-xxxx**

#### Explanation

The (variable information) file could not be found.

#### System Action

Stops Customize processing.

#### User Action

Check if the file exists in the etc directory under the installation directory. If it exists, check whether access permission has been set for the file.

### 3.20.4 EJB3007

---

**Security violation occurred while accessing (%1) file. Check whether the read/write permission is set to (%1) file.**

**EJB3007S-20-xxx-xxxx**

#### Explanation

A security violation occurred while accessing the file.

#### System Action

Stops Customize processing.

#### User Action

Check whether read/write permission is set for the file.

### 3.20.5 EJB3008

---

**An I/O error occurred while accessing (%1) file. Check the attribute of (%1) file.**

**EJB3008S-20-xxx-xxxx**

#### Explanation

An I/O error occurred while accessing the file.

#### System Action

Stops Customize processing.

#### User Action

Check the file attributeEJB3010

---

**Windows32/64**

**The (%1) file cannot be found. Check whether the (%1) file exists under the info folder in the Application Folder.**

**EJB3010W-20-xxx-xxxx**

#### Explanation

The specified file cannot be found.

#### System Action

Stops Customize processing.

#### User Action

Check if the file exists in the info folder under the Application Folder.

---

**Solaris32/64 Linux32/64**

**The (%1) file cannot be found. Check whether the (%1) file exists under the info directory in the Application**

**Folder.**  
**EJB3010W-20-xxx-xxxx**

**Explanation**

The specified file cannot be found.

**System Action**

Stops Customize processing.

**User Action**

Check if the file exists in the info directory under the Application Folder.

---

### 3.20.6 EJB3010

---

Windows32/64

**The (%1) file cannot be found. Check whether the (%1) file exists under the info folder in the Application Folder.**

**EJB3010W-20-xxx-xxxx**

**Explanation**

File cannot be found.

**System Action**

Stops Customize processing.

**User Action**

Check that the (variable information) file exists in \info of the application storage folder.

Solaris32/64 Linux32/64

**The (%1) file cannot be found. Check whether the (%1) file exists under the info folder in the Application Folder.**

**EJB3010W-20-xxx-xxxx**

**Explanation**

File cannot be found.

**System Action**

Stops Customize processing.

**User Action**

Check that the (variable information) file exists in /info of the application storage folder.

---

### 3.20.7 EJB3011

---

**Maximum number (128) for Rapid Invoked Bean is already specified. No more Rapid Invoked Beans can be added.**

**EJB3011I-20-xxx-xxxx**

**Explanation**

The maximum number (128) that can be set for Rapid Invoked Beans has already been reached. No more Rapid Invoked Beans can be added.

---

### 3.20.8 EJB3014

---

---

**Import of a window icon was aborted.**  
**EJB3014S-20-xxx-xxxx**

**Explanation**

The importing of a window icon was aborted.

**System Action**

Stops Customize processing.

**User Action**

An interrupt may have been generated during the importing of a window icon.

Restart the EJB Customize Tool.

---

### 3.20.9 EJB3015

---

**Failed to import a window icon.**  
**EJB3015S-20-xxx-xxxx**

**Explanation**

A window icon could not be imported.

**System Action**

Stops Customize processing.

**User Action**

An error may have been generated during the importing of a window icon.

Restart the Customize Tool.

---

### 3.20.10 EJB3017

---

**Could not get the Name for naming services of EJB application.**  
**EJB3017S-20-xxx-xxxx**

**Explanation**

The registration name for the Naming Service of the EJB application could not be acquired.

**System Action**

Stops customize processing.

**User Action**

The specified EJB application may not exist.

Reselect the EJB application from the EJB application list.

---

### 3.20.11 EJB3020

---

**EJB Application Runtime Environment Definition was successfully saved.**  
**EJB3020I-20-xxx-xxxx**

**Explanation**

The EJB Application Runtime Environment Definition was successfully saved.

---

### 3.20.12 EJB3021

---

**FJserverProperties.ser file is being used by other application. Retry after the other application has terminated.**

**EJB3021I-20-xxx-xxxx**

**Explanation**

The FJserverProperties.ser file is being used by another application so the Application Folder could not be obtained. The FJserverProperties.ser file is a definition file that specifies the path to the Application Folder.

**System Action**

Stops Customize processing.

**User Action**

If the Application Folder is being used by another process, complete that process, then retry Customize processing.

---

### **3.20.13 EJB3022**

---

**EJB application definition is being used by other application. EJB application may be running or may be customizing. Retry after the other application has terminated.**

**EJB3022I-20-xxx-xxxx**

**Explanation**

The EJB application definition is being used by other applications.

**System Action**

Stops Customize processing.

**User Action**

If the EJB application is being activated, deactivate it, then retry Customize processing.

If the EJB application is being customized by another operation, complete that operation, then retry Customize processing.

---

### **3.20.14 EJB3023**

---

**Rapid Invocation information was specified.**

**EJB3023I-20-xxx-xxxx**

**Explanation**

Rapid Invocation information has been specified.

---

### **3.20.15 EJB3024**

---

**Rapid Invocation information has been changed. Do you want to discard the changes?**

**EJB3024W-20-xxx-xxxx**

**Explanation**

Rapid Invocation information has been changed.

**System Action**

If [Yes] is selected, displays the changes to the Rapid Invoking Bean and displays the newly selected Bean.

If [No] is selected, closes the dialog without taking any action.

**User Action**

Decide whether or not to discard the changes.

## 3.20.16 EJB3025

---

**I cannot select this EJB Application as Rapid invoking Bean.  
EJB3025S-20-xxx-xxxx**

### Explanation

A method that does not exist in the Home interface and Remote interface is specified in method permission information. Save it as it is.

## 3.20.17 EJB3031

---

**EJB Application Runtime Environment Definition has been changed. Do you want to save the changes and activate the Rapid Invocation Definition?  
EJB3031W-20-xxx-xxxx**

### Explanation

The runtime environment definition of an EJB application has been changed.

### System Action

If [Yes] is selected, saves the changes made to the EJB Application Runtime Environment Definition, and activates the Rapid Invocation definition.

If [No] is selected, closes the dialog without taking any action.

### User Action

Decide whether or not to save the changes.

## 3.20.18 EJB3032

---

**The selected EJB application does not exist in the Application Folder. Re-open the EJB Application Runtime Environment Definition.  
EJB3032W-20-xxx-xxxx**

### Explanation

The selected EJB application does not exist in the Application Folder.

The EJB application was uninstalled.

### System Action

Stops selecting the EJB Application Runtime Environment Definition.

### User Action

Reopen the runtime environment definition of the EJB application to select the runtime environment definition.

## 3.20.19 EJB3033

---

**The selected EJB application does not exist in the Application Folder. Re-open the Rapid Invocation Definition.  
EJB3033W-20-xxx-xxxx**

### Explanation

The selected EJB application does not exist in the Application Folder.

The EJB application was uninstalled.

### System Action

Stops selecting the Rapid Invoking Bean.

#### User Action

Terminate and then reopen the Rapid Invocation definition to select the Rapid Invoking Bean.

### 3.20.20 EJB3035

---

**Selected Bean is not Invoking Bean of a RMI over IIOP. Invoking Bean can select only Invoking Bean of a RMI over IIOP.**

**EJB3035W-20-xxx-xxxx**

#### Explanation

Only an Invoking Bean of a RMI over IIOP can be selected for the Invoking Bean.

#### System Action

Stops Customize processing.

#### User Action

Specify an Invoking Bean of a RMI over IIOP for the Invoking Bean.

### 3.20.21 EJB3040

---

**The specified EJB application cannot be customized.**

**EJB3040S-20-xxx-xxxx**

**EJB3040S-20- xxx-xxxx**

#### Explanation

The specified EJB application cannot be customized.

#### System Action

Stops Customize processing.

#### User Action

None.

### 3.20.22 EJB3041

---

**The specified EJB application is an EB that this Customize Tool cannot customize. Execute the Customize Tool by other command and customize again.**

**EJB3041S-20-xxx-xxxx**

#### Explanation

The specified EJB application cannot be customized with this Customize Tool.

#### System Action

Stops Customize processing.

#### User Action

Terminate the Customize Tool and restart the Customize Tool with another command (ejbcustx.exe or ejbcust.exe).

### 3.20.23 EJB3043

---

**The specified EJB application is Enterprise COBOL Bean. This Customize Tool cannot customize it. Execute the Customize Tool by using ejbcust command and customize again.**

**EJB3043S-20-xxx-xxxx**

#### Explanation

The Enterprise COBOL Bean that was specified cannot currently be customized using the Customize Tool.

#### System Action

Stops Customize processing.

#### User Action

Exit the Customize Tool, and then use the *ejbcust* command to restart the Customize Tool.

### 3.20.24 EJB3044

---

**The class referred in the specified EJB application cannot be found. Check the operating environment. class=(%1)**

**EJB3044S-20-xxx-xxxx**

#### Explanation

The required class for the specified EJB application cannot be found.

#### System Action

Stops Customize processing.

#### User Action

Check the operating environment. In particular, check if the required class has been specified in CLASSPATH.

### 3.20.25 EJB3045

---

**The Query is not specified in the finder Method Definition. The finder method that the Query is not specified has the Query of searching all.**

**EJB3045W-20-xxx-xxxx**

#### Explanation

The search conditions have not been specified in the finder method definition.

#### System Action

Saves the finder method with unspecified search conditions as 'search all'.

#### User Action

Set search conditions if 'search all' is not suitable.

### 3.20.26 EJB3046

---

**The value is not specified at least one item in Datasource name, or Table name of CMF Mapping Definition. These values are required to specify.**

**EJB3046W-20-xxx-xxxx**

#### Explanation

No value is set for at least one of the following in the CMF mapping definitions:

- Datasource name
- Table name

#### System Action

Cannot save customized information.

## User Action

Set values for any unspecified Datasource name or table name.

### 3.20.27 EJB3047

---

**Deployment descriptor and CMF Mapping Definition are discordance. The system is disabling the field name does not exist in deployment descriptor.**  
**EJB3047W-20-xxx-xxxx**

#### Explanation

The deployment descriptor field name and the CMF mapping definition field name do not match.

#### System Action

Disables the field name not in the deployment descriptor.

#### User Action

Create definitions for the specified field name.

### 3.20.28 EJB3048

---

**EJB application class is inconsistent with the deployment descriptor. The Field name that does not exist in the deployment descriptor is invalid.**  
**EJB3048W-20-xxx-xxxx**

#### Explanation

The deployment descriptor field name and the EJB application class field name do not match.

#### System Action

Disables the field name not in the deployment descriptor.

#### User Action

Create definitions for the displayed field name.

### 3.20.29 EJB3049

---

Windows32/64

**An I/O error occurred in exclusion processing of the FJserverProperties.ser file. Check whether the [installation folder]etc\lock file is broken, or whether the access permission is set to it.**  
**EJB3049S-20-xxx-xxxx**

#### Explanation

An I/O error occurred in the exclusive control processing for reading the FJserverProperties.ser file. The FJserverProperties.ser file is the definition file that specifies the path to the Application Folder.

#### System Action

Stops Customize processing.

#### User Action

Check if the installation folder\etc\lock file is corrupted or if access permission has been assigned to it.

Solaris32/64 Linux32/64

**An I/O error occurred in exclusion processing of the FJserverProperties.ser file. Check whether the [installation directory]etc/.lock file is broken, or whether the access permission is set to it.**  
**EJB3049S-20-xxx-xxxx**

## Explanation

An I/O error occurred in the exclusive control processing for reading the FJserverProperties.ser file. The FJserverProperties.ser file is the definition file that specifies the path to the Application Folder.

## System Action

Stops Customize processing.

## User Action

Check if the installation directory /etc/.lock file is corrupted or if access permission has been assigned to it.

### 3.20.30 EJB3050

---

Windows32/64

**An exclusion file of FJserverProperties.ser does not exist. Check whether the .lock file exists in the [installation folder]etc folder.  
EJB3050S-20-xxx-xxxx**

## Explanation

An attempt was made to execute exclusive control processing for reading the FJserverProperties.ser file, but an exclusion file does not exist. The FJserverProperties.ser file is the definition file that specifies the path to the Application Folder.

## System Action

Stops Customize processing.

## User Action

Check if the installation folder\etc\lock file exists.

Solaris32/64 Linux32/64

**An exclusion file of FJserverProperties.ser does not exist. Check whether the .lock file exists in the [installation directory]etc directory.  
EJB3050S-20-xxx-xxxx**

## Explanation

An attempt was made to execute exclusive control processing for reading the FJserverProperties.ser file, but an exclusion file does not exist. The FJserverProperties.ser file is the definition file that specifies the path to the Application Folder.

## System Action

Stops Customize processing.

## User Action

Check if the installation directory /etc/.lock file exists.

### 3.20.31 EJB3051

---

Windows32/64

**An I/O error occurred in exclusion processing of the EJB application definition. Check whether the .lock file under the \info(%1) folder in the Application Folder is broken, or whether the access permission is set to it.  
EJB3051S-20-xxx-xxxx**

## Explanation

An I/O error occurred during exclusive control processing for reading EJB application definitions.

## System Action

Stops Customize processing.

#### User Action

Check if the Application Folder\info\lock file is corrupted or if access permission has been assigned to it.

---

Solaris32/64 Linux32/64

**An I/O error occurred in exclusion processing of the EJB application definition. Check whether the .lock file under /info/(%1) directory in the Application Folder is broken, or whether the access permission is set to it.**

**EJB3051S-20-xxx-xxxx**

#### Explanation

An I/O error occurred during exclusive control processing for reading EJB application definitions.

#### System Action

Stops Customize processing.

#### User Action

Check if the Application Folder /info/(variable information)/.lock file is corrupted or if access permission has been assigned to it.

### 3.20.32 EJB3052

---

Windows32/64

**An exclusion file of the EJB application definition does not exist. Check whether the .lock file exists under \info(%1) folder in the Application Folder.**

**EJB3052S-20-xxx-xxxx**

#### Explanation

Exclusive control processing was attempted to read EJB application definitions, but an exclusion file does not exist.

#### System Action

Stops customize processing.

#### User Action

Check if the .lock file exists in the \info\ (variable information) folder in the Application Folder.

---

Solaris32/64 Linux32/64

**An exclusion file of the EJB application definition does not exist. Check whether the .lock file exists under /info/(%1) directory in the Application Folder.**

**EJB3052S-20-xxx-xxxx**

#### Explanation

Exclusive control processing was attempted to read EJB application definitions, but an exclusion file does not exist.

#### System Action

Stops customize processing.

#### User Action

Check if the .lock file exists in the /info/ (variable information) directory in the Application Folder.

### 3.20.33 EJB3053

---

**The Transaction attribute specified for the transaction information is not supported or used for each method. The system is saving it as it is.**

**EJB3053I-20-xxx-xxxx**

## Explanation

The transaction attribute specified for the transaction information is not supported or is used for each method. The system is saving it as it is.

### 3.20.34 EJB3054

---

**Failed to write (%1). Check whether the access permission is set to it, or whether the disk has free space. EJB3054S-20-xxx-xxxx**

#### Explanation

An attempt to write to the (%1) file failed.

#### System Action

Stops customize processing.

#### User Action

Check that the correct access permission (write permission) is set for the (variable information) file, and that the disk has enough free space to create and update the (variable information) file.

**Solaris32/64 Linux32/64**

If the user does not have access rights, he or she may not be a user specified by the application file protection level. Refer to "J2EE application deployment and setup" in the J2EE User's Guide and take the appropriate action.

If the disk has insufficient space, increase the available space, and then reexecute the processing.

The full pathname of the backup file is displayed as variable information. Check this information to determine the drive and backup file storage location.

### 3.20.35 EJB3055

---

**Failed to write (%1). Check whether the access permission is set to it, or whether the disk has free space. If the disk is full, the file may be broken. Restore by using a backup file. EJB3055S-20-xxx-xxxx**

#### Variable Information

%1 = File name

#### Explanation

Failed to write %1 file.

#### System Action

Stops customize processing.

#### User Action

Check whether the correct access permission (write permission) is set for the specified file, and if the disk has enough free space.

**Solaris32/64 Linux32/64**

If the user does not have access rights, he or she may not be a user specified by the application file protection level. Refer to "J2EE application deployment and setup" in the J2EE User's Guide and take the appropriate action.

If the disk is full, the specified file may be corrupt. Restore it using a backup file. Once the file is restored, increase the amount of free disk space, and then reexecute processing.

The full path name of the definition file is displayed in %1. Check this information to determine the drive and definition file storage location.

### 3.20.36 EJB3056

---

**Failed to delete a backup file (%1). Check whether the access permission is set to it, or whether the disk has free space.**

**EJB3056S-20-xxx-xxxx**

#### Explanation

An attempt to delete the (%1) backup file failed.

#### System Action

Stops customize processing.

#### User Action

Check if access permission is set for the backup file (%1) and if the disk has enough free space.

**Solaris32/64 Linux32/64**

If the user does not have access rights, he or she may not be a user specified by the application file protection level. Refer to "J2EE application deployment and setup" in the J2EE User's Guide and take the appropriate action.

If there is insufficient disk space, increase the amount of free disk space, and then reexecute processing.

The full pathname of the backup file is displayed in %1. Check this information to determine the drive and backup file storage location.

### 3.20.37 EJB3057

---

**The transaction information (Method name and Transaction attribute) exists, but the Transaction type is Bean. So you cannot specify it.**

**EJB3057S-20-xxx-xxxx**

#### Explanation

The transaction information (method name and transaction attribute) exists, but the transaction management type is Bean so it cannot be saved.

#### System Action

Stops customize processing.

#### User Action

Delete the transaction information or change the transaction management type to Container.

### 3.20.38 EJB3058

---

**Bean is specified as the Transaction type in Stateless Session Bean. The system is saving it as it is.**

**EJB3058I-20-xxx-xxxx**

#### Explanation

Bean is specified as transaction management type in the Stateless Session Bean. The system is saving it as it is.

### 3.20.39 EJB3059

---

**An error occurred while reading the Runtime environment definition information.**

**FILE=(%1)**

**MSG=(%2)**

**LINENUMBER=(%3)**

**EJB3059S-20-xxx-xxxx**

#### Explanation

An error occurred while reading the runtime environment definition information.

### System Action

Stops customize processing.

### User Action

Take the required action for the file according to the message. Please reactivate the customization tool after it responds.

It may not be possible to read the encoding of the definition file. Use an encoding type that is supported in the XML parser used for this command and then define the definition file.

## 3.20.40 EJB3060

---

**An error occurred while writing the Runtime environment definition information.**

**FILE=(%1)**

**MSG =(%2)**

**LINENUMBER=(%3)**

**EJB3060S-20-xxx-xxxx**

### Explanation

An error occurred while the runtime environment definition information was being written to the file.

### System Action

Stops customize processing.

### User Action

Take the required action for the file according to the message.

## 3.20.41 EJB3061

---

**An error occurred in the Java Runtime environment.**

**MSG =(%1)**

**EJB3061S-20-xxx-xxxx**

### Explanation

An error occurred in the Java runtime environment

### System Action

Stops customize processing.

### User Action

Refer to the exception and additional information and take the appropriate action. If the following information appears in the exception and additional information, take the action described below:

- MSG=Unable to create a suitable default GraphicsConfiguration. Try changing your Display Settings.  
If the message above is displayed, the number of display colors set may be 16. Set the number larger than 256.
- MSG=java.lang.NoSuchMethodError.java.awt.Component:method enableInputMethods(Z)V not found.

The JDK/JRE version and the version corresponding to J Business Kit library may not match. Review the environment.

## 3.20.42 EJB3062

---

**The value is not specified at least one item in DB Column name of CMF Mapping Definition. Do you want to save it?**

**EJB3062W-20-xxx-xxxx**

#### Explanation

At least one item is not specified for the DB column name in the CMF mapping definition.

#### System Action

Select 'Yes' to store the CMF in which the DB column name is not entered without mapping it to the DB column and terminate.

Select 'No' to redisplay the CMF mapping definition screen without doing anything.

#### User Action

Specify whether to store the CMF.

To map the CMF to the DB column, specify the name of the DB column that corresponds to the CMF.

### 3.20.43 EJB3063

---

**Subscription Name or Connection Factory Name or Destination Name is not specified in Expansion Information.  
EJB3063S-20-xxx-xxxx**

#### Explanation

Subscription name, ConnectionFactory name, or Destination name is not specified in Expansion information.

#### System Action

Stops customize processing.

#### User Action

Confirm that all Subscription name, ConnectionFactory name, and Destination name are specified.

### 3.20.44 EJB3064

---

**The security role name specified for the method permission is not defined. The system is saving it as it is.  
EJB3064I-20-xxx-xxxx**

#### Explanation

The security role name specified for the method permission is not defined. The system is saving it as it is.

### 3.20.45 EJB3065

---

**The Method specified for the method permission does not exist in Home interface or Remote interface. The system is saving it as it is.  
EJB3065I-20-xxx-xxxx**

#### Explanation

A method that does not exist in the Home interface and Remote interface is specified in method permission information. Save it as it is.

### 3.20.46 EJB3066

---

**The Method specified for the transaction information cannot specify a transaction attribute. Or the Method specified for the method permission does not exist in Home interface or Remote interface. The system is saving it as it is.  
EJB3066I-20-xxx-xxxx**

#### Explanation

The Method specified does not exist.

### System Action

Save processing is stopped.

### User Action

A method for which no transaction attribute can be specified is specified in transaction information. Or a method that does not exist in the Home interface and Remote interface is specified. Save it as it is.

## 3.20.47 EJB3070

---

### The EJB Application of the import target can't specify Rapid Invocation definition for Entity Bean. EJB3070S-20-xxx-xxxx

#### Explanation

Bean of the import target can't specify Rapid Invocation definition for Entity Bean.

#### System Action

Stops Customize processing.

#### User Action

Check whether the definition file of the EJB application was deployed before V3.0. Also, check whether the import target EJB application is an Entity Bean.

## 3.20.48 EJB3071

---

### '%s2' specified in the <%s1> tag is specified in the plural. EJB3071S-20-xxx-xxxx

#### Variable Information

%s1 = Tag name

%s2 = Value

#### Explanation

Multiple values are specified in the (variable information) tag.

#### System Action

Stops Customize processing.

#### User Action

Check whether the same value is specified multiple times in the (variable information) tag of the definition file.

## 3.20.49 EJB3072

---

### Value isn't specified in the <%s1> tag. EJB3072S-20-xxx-xxxx

#### Variable Information

%s1 = Tag name

#### Explanation

No value is specified in the (variable information) tag.

#### System Action

Stops Customize processing.

## User Action

Check whether any value is specified in the (variable information) tag of the definition file.

### 3.20.50 EJB3073

---

**An unsupported transaction attribute is specified in the transaction information settings.  
EJB3073S-20-xxx-xxxx**

#### Explanation

An unsupported transaction attribute is specified in transaction information.

#### System Action

Stops Customize processing.

#### User Action

Check whether any unsupported transaction attribute is specified in transaction information or check for any spelling error.

### 3.20.51 EJB3075

---

**The method '%s2' specified in the <%s1> tag doesn't exist in the Home interface and the Remote interface.  
Or, it is the method which can not be specified.  
EJB3075S-20-xxx-xxxx**

#### Variable Information

%s1 = Tag name

%s2 = Method name

#### Explanation

A method specified in the (variable information) tag exists neither in the Home interface nor Remote interface. Or, it is an unspecifiable method.

#### System Action

Stops Customize processing.

#### User Action

Check whether any method name that does not exist in the EJB application to be edited is defined or an unspecifiable method name is defined in the (variable information) tag of the definition file.

### 3.20.52 EJB3076

---

**A <%s1> tag can't be specified with EJB Application that Deployment is done before V3.0.  
EJB3076S-20-xxx-xxxx**

#### Variable Information

%s1 = Tag name

#### Explanation

No (variable information) tag can be set in EJB applications deployed before V3.0.

#### System Action

Stops Customize processing.

#### User Action

Check whether the EJB application to be edited was deployed before V3.0.

## 3.20.53 EJB3077

---

**A <%s1> tag can be specified only at the time of only %s2 Bean.  
EJB3077S-20-xxx-xxxx**

### Variable Information

%s1 = Tag name

%s2 = Bean type

### Explanation

This tag can only be specified for the Bean type shown in the variable information.

### System Action

Stops Customize processing.

### User Action

Check the Bean type of the EJB application to be edited. Do not specify the tag shown in the variable information of the definition file.

## 3.20.54 EJB3078

---

**An un-definition security roll name '%s2' is defined in the <%s1> tag.  
EJB3078S-20-xxx-xxxx**

### Variable Information

%s1 = Tag name

%s2 = Roll name

### Explanation

An undefined security role name is specified in the (variable information) tag.

### System Action

Stops Customize processing.

### User Action

Check whether any security role name not defined in the <security role> tag is defined in the (variable information) tag of the definition file.

## 3.20.55 EJB3079

---

**The <%s1> tag cannot be specified for EJB applications based on %s2 specification.  
EJB3079S-20-xxx-xxxx**

### Variable Information

%s1 = Tag name

%s2 = EJB spec version

### Explanation

The specified tag cannot be used in EJB spec-compliant EJB applications of the version shown in the variable information.

### System Action

Stops Customize processing.

## User Action

Check the EJB spec version that the EJB application to be edited is based on. Do not specify the tag that is shown in the variable information in the definition file.

## 3.21 EJB3100 to EJB3199

---

This section details the messages with message numbers between EJB3100 and EJB3199.

### 3.21.1 EJB3101

---

**Environment setting was saved.  
EJB3101I-20-xxx-xxxx**

#### Explanation

The environment setting of the Customize Tool has been saved.

### 3.21.2 EJB3103

---

**Windows32/64**

**Failed to save the property file. Check whether the property file exists under the etc folder in the installation folder.  
EJB3103W-20-xxx-xxxx**

#### Explanation

Failed to save the property file (FJcustmize.properties).

#### System Action

Stops Customize processing.

#### User Action

Check if the property file (FJcustmize.properties) exists in the etc folder under the installation folder.

**Solaris32/64 Linux32/64**

**Failed to save the property file. Check whether the property file exists under the etc directory in the installation directory.  
EJB3103W-20-xxx-xxxx**

#### Explanation

Failed to save the property file (FJcustmize.properties).

#### System Action

Stops Customize processing.

#### User Action

Check if the property file (FJcustmize.properties) exists in the etc directory under the installation directory.

### 3.21.3 EJB3111

---

**An error occurred while reading the Runtime environment definition information.  
MSG =( %1)  
EJB3111S-20-xxx-xxxx**

#### Explanation

An error occurred while reading execution environment definition information from a file.

## System Action

Stops Customize processing.

## User Action

Refer to action in message [EJB1239](#). Please reactivate customization tool after it corresponds.

## 3.22 EJB3200 to EJB3299

---

This section details the messages with message numbers between EJB3200 and EJB3299.

### 3.22.1 EJB3201

---

#### **EJB Application Runtime Environment Definition has been changed. Do you want to save the changes? EJB3201W-20-xxx-xxxx**

#### Explanation

An attempt was made to open another runtime environment definition. The current runtime environment definition has been changed but not saved.

#### System Action

If [Yes] is selected, the system saves the changes to the runtime environment definition of the current EJB application, and displays the Open EJB Application Runtime Environment Definition dialog box.

If [No] is selected, the system displays the Open EJB Application Runtime Environment Definition dialog box without saving the changes made to the EJB Application Runtime Environment Definition of the current EJB application.

If [Cancel] is selected, the system closes the dialog without taking any action.

#### User Action

Decide whether or not to save the changes.

### 3.22.2 EJB3202

---

#### **WWW browser is not specified. Specify the WWW browser from the [WWW Browser Path Setup] menu. EJB3202W-20-xxx-xxxx**

#### Explanation

The relevant Web browser was not specified when looking up Help.

#### System Action

Aborts the Help reference.

#### User Action

Specify the required Web browser from the [WWW Browser Path Setup] menu.

### 3.22.3 EJB3203

---

#### **Failed to execute the WWW browser. EJB3203S-20-xxx-xxxx**

#### Explanation

The Web browser could not be executed.

#### System Action

Aborts the Help reference.

#### User Action

From the [WWW browser path setting] menu, check that the path to the Web browser is correct.

### 3.22.4 EJB3204

---

#### **Nonexistent Help file (%1) to be displayed on the WWW browser. EJB3204S-20-xxx-xxxx**

##### Explanation

The specified Help file is not registered in the Customize Tool.

##### System Action

Aborts the Help reference.

##### User Action

**Windows32/64**

Check if the help file (%1) exists in \etc\help under the installation folder.

**Solaris32/64** **Linux32/64**

Check if the help file (%1) exists in /etc/help under the installation directory.

### 3.22.5 EJB3211

---

#### **Failed to read DB Access Environment Definition file. The Datasource cannot be defined in the Rapid Invocation Definition. EJB3211W-20-xxx-xxxx**

##### Explanation

Importing of the DB Access Environment Definition file failed.

##### System Action

Cannot define Datasource in the Rapid Invocation Definition.

##### User Action

Check whether the DB Access Environment Definition file exists, whether the correct access permission (write permission) is set for it, or whether it is corrupted.

### 3.22.6 EJB3212

---

#### **The DB access definition is being used by other application. The DB Access Environment Definition may be running. The Datasource cannot be defined in the Rapid Invocation Definition. If you want to define the Datasource, retry after the other application has terminated. EJB3212I-20-xxx-xxxx**

##### Explanation

The DB access definition is being used by another application.

In this message, the definition information that provides the environment settings required for database access is referred to as 'DB access definition'.

##### System Action

Cannot define Datasource in the Rapid Invocation Definition.

## User Action

To define the Datasource in the Rapid Invocation Definition, close other applications, and then reexecute the customize process. If the DB Access Environment Definition is active, terminate it, and then reexecute the customize process.

### 3.22.7 EJB3213

---

Windows32/64

**An I/O error occurred in the exclusion processing of the DB access definition. Check whether the [installation folder]\etc\dsdeflock file is broken, or whether the access permission is set to it.  
EJB3213S-20-xxx-xxxx**

#### Explanation

Exclusive control processing was attempted to read the DB access definition, but an I/O error occurred.

In this message, the definition information that provides the environment settings required for database access is referred to as 'DB access definition'.

#### System Action

Stops customize processing.

#### User Action

Check to see if the \etc\dsdeflock file under the installation folder is corrupt or if access permission is set for it.

Solaris32/64 Linux32/64

**An I/O error occurred in the exclusion processing of the DB access definition. Check whether the [installation directory]/etc/.dsdeflock file is broken, or whether the access permission is set to it.  
EJB3213S-20-xxx-xxxx**

#### Explanation

Exclusive control processing was attempted to read the DB access definition, but an I/O error occurred.

In this message, the definition information that provides the environment settings required for database access is referred to as 'DB access definition'.

#### System Action

Stops customize processing.

#### User Action

Check to see if the /etc/.dsdeflock file under the installation directory is corrupt or if access permission is set for it.

### 3.22.8 EJB3214

---

Windows32/64

**An exclusion file of the DB access definition does not exist. Check whether the .dsdeflock file exists in the [installation folder]\etc folder.  
EJB3214S-20-xxx-xxxx**

#### Explanation

Exclusive control processing was attempted to read the DB access definition, but an exclusion file did not exist.

In this message, the definition information that provides the environment settings required for database access is referred to as 'DB access definition'.

#### System Action

Stops customize processing.

## User Action

Check to see if the \etc\dsdeflock file under the installation folder exists.

**Solaris32/64** **Linux32/64**

**An exclusion file of the DB access definition dose not exist. Check whether the .dsdeflock file exists in the [installation directory]/etc directory.**

**EJB3214S-20-xxx-xxxx**

## Explanation

Exclusive control processing was attempted to read the DB access definition, but an exclusion file did not exist.

In this message, the definition information that provides the environment settings required for database access is referred to as 'DB access definition'.

## System Action

Stops customize processing.

## User Action

Check to see if the /etc/.dsdeflock file under the installation directory exists.

## 3.23 EJB3300 to EJB3399

---

This section details the messages with message numbers between EJB3300 and EJB3399.

### 3.23.1 EJB3304

---

**EJB application to be customized does not exist in the Application Folder.**

**EJB3304S-20-xxx-xxxx**

## Explanation

There are no EJB applications to be customized in the specified IJServer.

## 3.24 EJB3400 to EJB3499

---

This section details the messages with message numbers between EJB3400 and EJB3499.

### 3.24.1 EJB3400

---

**An attribute (%1) specified for the default Transaction attribute of the Enterprise Bean is not supported. The system is changing it to TX\_NOT\_SUPPORTED.**

**EJB3400I-20-xxx-xxxx**

## Variable Information

%1 = Attribute name

## Explanation

The attribute %1 specified for the default transaction attribute of the Enterprise Bean is not supported. The system is changing the transaction attribute to TX\_NOT\_SUPPORTED.

### 3.24.2 EJB3401

---

**Unable to read resource (%1). Check whether (%1) exists. If found, check whether the file can be read.**

**EJB3401S-20-xxx-xxxx**

#### Explanation

The specified resource cannot be read.

#### System Action

Stops Customize processing.

#### User Action

Check whether the specified resource exists. If the file exists, check whether it can be read.

### 3.24.3 EJB3402

---

**System error occurred. Collect an error message number and then contact an engineer.  
EJB3402S-20-xxx-xxxx**

#### Explanation

A system error occurred.

#### System Action

Stops Customize processing.

#### User Action

The probable cause is that the Application Folder has been deleted. In this case, restore the Application Folder.

If the Application Folder has not been deleted, notify your software supplier of the message information.

### 3.24.4 EJB3406

---

**The Application Folder cannot be found. Create the Application Folder correctly, then retry.  
EJB3406S-20-xxx-xxxx**

#### Explanation

The Application Folder cannot be found.

#### System Action

Stops Customize processing.

#### User Action

Create an Application Folder correctly, then retry the operation that was attempted just before the error message was output. For example, reselect the Open EJB Application Runtime Environment | Rapid Invocation Definition menu option to perform the operation again.

### 3.24.5 EJB3410

---

**Unable to activate JavaVM. Check environment.  
EJB3410S-20-xxx-xxxx**

#### Explanation

JavaVM could not be activated.

#### System Action

Stops Customize processing.

#### User Action

Take the following action. For details of how to set the environment variable, refer to "Checking the operating environment" in the 'J2EE User's Guide'.

Windows32/64

Check whether the JavaVM activation environment setting is correct.

Solaris32/64 Linux32/64

The environment required for activating JavaVM may not have been set up correctly.

Check whether the required environment (LD\_LIBRARY\_PATH) is correctly set for the JDK/JRE version specified in java\_config.txt. Or, the JDK/JRE version specified in java\_config.txt may not match the JDK/JRE version specified in the environment (LD\_LIBRARY\_PATH). Check the environment.

## 3.24.6 EJB3411

---

**Unable to get the Application Folder. If other procedure is using the Application Folder, retry after the other procedure has terminated.**

**EJB3411S-20-xxx-xxxx**

### Explanation

Cannot retrieve the Application Folder.

### System Action

Stops Customize processing.

### User Action

Windows32/64

If another procedure is using the Application Folder, repeat execution once the other procedure has released the Application Folder. Check whether access permission is set for the FJserverProperties.ser file or the .lock file in the \etc folder.

Solaris32/64 Linux32/64

If another procedure is using the Application Folder, repeat execution once the other procedure has released the Application Folder. Check whether access permission is set for the FJserverProperties.ser file or the .lock file in the /etc directory.

## 3.24.7 EJB3412

---

Windows32/64

**fjejbtool.exe file cannot be found. Check whether the file exists under \bin in the installation folder.**

**EJB3412S-20-xxx-xxxx**

### Explanation

The fjejbtool.exe file was not found.

### System Action

Stops Customize processing.

### User Action

Check whether the fjejbtool.exe file exists under \bin in the installation folder.

Solaris32/64 Linux32/64

**fjejbtool.exe file cannot be found. Check whether the file exists under /bin directory in the installation directory.**

**EJB3412S-20-xxx-xxxx**

### Explanation

The fjejbtool.exe file was not found.

### System Action

Stops Customize processing.

### User Action

Check whether the fjejbtool file exists under /bin in the installation directory.

## 3.24.8 EJB3413

---

**The library to be used for the Customize Tool cannot be found. Check the operating environment.  
EJB3413S-20-xxx-xxxx**

### Explanation

**Windows32/64**

The library to be used was not found.

**Solaris32/64** **Linux32/64**

The library to be used was not found, or there is no read authority.

### System Action

Stops Customize processing.

### User Action

If the common J2EE resources or Interstage EJB service are not installed, install them.

If the problem is still not resolved, Interstage cannot be operated. Reinstall Interstage.

## 3.24.9 EJB3414

---

**Windows32/64**

**Failed to get the installation folder. Reinstall the system.  
EJB3414S-20-xxx-xxxx**

### Explanation

Acquisition of an installation folder failed.

### System Action

Stops Customize processing.

### User Action

The registration information contains an error. Reinstall the system.

**Solaris32/64** **Linux32/64**

**Failed to get the installation directory. Reinstall the system.  
EJB3414S-20-xxx-xxxx**

### Explanation

Acquisition of an installation directory failed.

### System Action

Stops Customize processing.

### User Action

Reinstall the system.

### 3.24.10 EJB3416

---

Windows32/64

**java\_config.txt file cannot be found. Check whether the file exists under \etc in the installation folder.  
EJB3416S-20-xxx-xxxx**

#### Explanation

The java\_config.txt file could not be found.

#### System Action

Stops customize processing.

#### User Action

Check if the file exists in \etc under the installation folder.

Solaris32/64 Linux32/64

**java\_config.txt file cannot be found. Check whether the file exists under /etc directory in the installation directory.  
EJB3416S-20-xxx-xxxx**

#### Explanation

The java\_config.txt file could not be found.

#### System Action

Stops customize processing.

#### User Action

Check if the file exists in /etc under the installation directory.

### 3.24.11 EJB3417

---

**Incorrect Java environment file.  
PATH='Interstage install directory\EJB\etc\java\_config.txt'  
EJB3417S-20-xxx-xxxx**

#### Explanation

The Java environment settings file is incorrect.

#### System Action

Stops processing.

#### User Action

Correct the errors in the Java environment settings file, and then reexecute the command.

### 3.24.12 EJB3418

---

Windows32/64

**FJcustomize.properties file cannot be found. Check whether the file exists under \etc folder in the installation folder.  
EJB3418S-20-xxx-xxxx**

#### Explanation

The FJcustomize.properties file could not be found.

### System Action

Stops customize processing.

### User Action

Check if the file exists in \etc under the installation folder.

---

Solaris32/64 Linux32/64

**FJcustomize.properties file cannot be found. Check whether the file exists under /etc directory in the installation directory.**  
**EJB3418S-20-xxx-xxxx**

### Explanation

The FJcustomize.properties file could not be found.

### System Action

Stops customize processing.

### User Action

Check if the file exists in /etc under the installation directory.

---

## 3.24.13 EJB3419

---

**There is not enough memory available. Get sufficient memory and retry.**  
**EJB3419S-20-xxx-xxxx**

### Explanation

There is not enough memory available.

### System Action

Stops customize processing.

### User Action

Close other applications, take action such as increasing virtual memory size, then rerun the job.

---

## 3.24.14 EJB3420

---

**As for specified IJServer, EJB application is not arranged.**  
**EJB3420S-20-xxx-xxxx**

### Explanation

There is no EJB application that can be a customization target in the specified IJServer.

### System Action

Stops customize processing.

---

## 3.24.15 EJB3423

---

**This operation cannot be executed on the managed server.**

### Explanation

This operation cannot be executed on the managed server and management server.

### System Action

Stops processing of the command.

## User Action

Log in to the management server with the Interstage Management Console, and execute the same operation for this server.

### 3.24.16 EJB3424

---

**This operation cannot be executed on the managed server that the application operation mode set to the management operation mode.**

**EJB3424S-20-xxx-xxxx**

#### Explanation

This operation cannot be executed on Admin Servers or Managed Servers whose application operation mode is set to the Management Operation Mode.

#### System Action

Stops processing of the command.

#### User Action

Log in to the management server with the Interstage Management Console, and execute the same operation for this server.

### 3.25 EJB3500 to EJB3599

---

This section details the messages with message numbers between EJB3500 and EJB3599.

#### 3.25.1 EJB3503

---

**I stopped processing.**

**EJB3503I-20-xxx-xxxx**

#### Explanation

Customization was stopped.

#### 3.25.2 EJB3504

---

**An error occurred during reading of definition file (%s1).**

**EJB3504S-20-xxx-xxxx**

#### Variable Information

%s1 = File name

#### Explanation

An error occurred when reading the definition file (variable information).

#### System Action

Stops Customize processing.

#### User Action

Check whether the definition file (variable information) exists. If it exists, check whether the definition file (variable information) is damaged or the access authority is granted.

It may not be possible to read the encoding of the definition file. Use an encoding type that is supported in the XML parser used for this command and then define the definition file.

An XML parser class that cannot be used by the EJB service may also be included in the EJB application. Remove the relevant XML parser class.

### 3.25.3 EJB3505

---

**An error occurred during writing of definition file (%s1).**  
**EJB3505S-20-xxx-xxxx**

#### Variable Information

%s1 = File name

#### Explanation

An error occurred when writing to the definition file (variable information).

#### System Action

Stops Customize processing.

#### User Action

Check whether the definition file (variable information) exists. If it exists, check whether the definition file (variable information) is damaged or the access authority is granted.

### 3.25.4 EJB3506

---

Solaris32/64

**Extended system name is long.**  
**EJB3506S-20-xxx-xxxx**

#### Explanation

The character string of the system name specified in -M or IS\_SYSTEM contains more than eight characters.

#### System Action

Stops Customize processing.

#### User Action

Specify the system name with eight characters or less.

### 3.25.5 EJB3507

---

Solaris32/64

**Extended system name is illegal.**  
**SYSTEM=(%s1)**  
**EJB3507S-20-xxx-xxxx**

#### Variable Information

%s1 = System name

#### Explanation

The system name specified in -M or IS\_SYSTEM is incorrect.

#### System Action

Stops Customize processing.

#### User Action

Specify the system name that begins with an alphabetic character and consists of eight alphanumeric characters or less.

### 3.25.6 EJB3508

---

**There is not such a system.**  
**SYSTEM=(%s1)**  
**EJB3508S-20-xxx-xxxx**

Variable Information

%s1 = System name

Explanation

The system name specified in -M or IS\_SYSTEM does not exist.

System Action

Stops Customize processing.

User Action

Please specify the existing system name.

---

### 3.25.7 EJB3509

**(%s2) is too long that is specified in (%s1).**  
**EJB3509S-20-xxx-xxxx**  
**Variable Information**

%s1 = -i/-s

%s2 = IJServer name/EJB container name

Explanation

IJServer name/EJB container name specified by the option has more than 28 characters.

System Action

Stops the customization.

User Action

Ensure the IJServer name/EJB container name has 28 characters or less.

---

### 3.25.8 EJB3510

**(%s2) name is illegal.**  
**CONTAINER=(%s1)**  
**EJB3510S-20-xxx-xxxx**  
**Variable Information**

%s1 = -i/-s

%s2 = IJServer name/EJB container name

Explanation

The IJServer name/EJB container name specified by the option is incorrect.

System Action

Stops the customization.

User Action

Ensure the IJServer name/EJB container name string has no more than 28 alphanumeric characters. Although it may contain the underscore ( \_ ) character, an underscore must not occur as the first character.

## 3.25.9 EJB3511

---

**There is not such a EJB container.**  
**CONTAINER=(%s1)**  
**EJB3511S-20-xxx-xxxx**  
**Variable Information**

%s1 = EJB container name

### Explanation

The EJB container name specified by -s does not exist.

### System Action

Stops the customization.

### User Action

Specify an existing EJB container name.

## 3.25.10 EJB3512

---

**There is not such a IJServer.**  
**IJServer=(%s1)**  
**EJB3512S-20-xxx-xxxx**

### Variable Information

%s1 = IJServer name

### Explanation

The IJServer specified by -i could not be found.

### System Action

Stops the customization.

### User Action

Specify an existing IJServer name.

## 3.25.11 EJB3516

---

**Windows32/64**  
**A folder (%s2) does not exist under pass (%s1). Please appoint an option justly.**  
**EJB3516S-20-xxx-xxxx**

### Variable Information

%s1 = Path name

%s2 = Folder name

### Explanation

No folder (variable information) exists under the path (variable information).

### System Action

Stops Customize processing.

### User Action

Specify the command option correctly, and then reexecute the command.

**A directory (%s2) does not exist under pass (%s1). Please appoint an option justly.  
EJB3516S-20-xxx-xxxx**

#### Variable Information

%s1 = Path name

%s2 = Directory name

#### Explanation

No directory (variable information) exists under the path (variable information).

#### System Action

Stops Customize processing.

#### User Action

Specify the command option correctly, and then reexecute the command.

---

### 3.25.12 EJB3517

**I was not able to get a pass. It is not made the Application Folder or an option is not appointed justly.  
Please execute it again after having made the Application Folder justly or please appoint an option justly.  
EJB3517S-20-xxx-xxxx**

#### Explanation

No path could be obtained.

#### System Action

Stops Customize processing.

#### User Action

If no application folder has been created, create an application folder. Otherwise, specify the command options correctly, then reexecute.

---

### 3.25.13 EJB3518

**Definition file (%s1) does not exist.  
EJB3518S-20-xxx-xxxx**

#### Variable Information

%s1 = File name

#### Explanation

No definition file (variable information) exists.

#### System Action

Stops Customize processing.

#### User Action

Specify the command option correctly, then reexecute.

---

### 3.25.14 EJB3519

**An error occurred during reading of definition file (%s1). Check whether the definition file (%s1) is broken,  
or whether the access permission is set to it.  
EJB3519S-20-xxx-xxxx**

#### Variable Information

%s1 = File name

#### Explanation

The definition file (variable information) could not be read.

#### System Action

Stops Customize processing.

#### User Action

Check whether the definition file (variable information) is damaged or the access authority is granted.

### 3.25.15 EJB3521

---

**Argument contains an error. How to use:  
EJB3521S-20-xxx-xxxx**

#### Explanation

A command argument is invalid.

#### System Action

Stops Customize processing.

#### User Action

Specify the command option correctly, then reexecute.

### 3.25.16 EJB3522

---

**Argument contains an error. How to use:  
EJB3522S-20-xxx-xxxx**

#### Explanation

A command argument is invalid.

#### System Action

Stops Customize processing.

#### User Action

Specify the command option correctly, then reexecute.

### 3.25.17 EJB3523

---

**Argument contains an error. An argument (%s1) was appointed a plural number time.  
EJB3523S-20-xxx-xxxx**

#### Variable Information

%s1 = Argument

#### Explanation

A command argument is invalid.

#### System Action

Stops Customize processing.

## User Action

Command options (variable information) cannot be specified multiple times. Reexecute the command without specifying command options multiple times.

### 3.25.18 EJB3524

---

**Argument contains an error. An EJB application name (%s1) which I appointed does not exist.  
EJB3524S-20-xxx-xxxx**

#### Variable Information

%s1 = EJB application name

#### Explanation

Possible causes are shown below:

- A command argument is invalid.
- The -i (or -s) option may not have been specified.

#### System Action

Stops Customize processing.

#### User Action

Take the appropriate action according to the following:

- Specify a registered EJB application, then reexecute.
- If the -i option has not been specified, specify the IJServer name for this option.

### 3.25.19 EJB3525

---

**Argument contains an error. A DB definition file (%s1) does not exist.  
EJB3525S-20-xxx-xxxx**

#### Variable Information

%s1 = File name

#### Explanation

A command argument is invalid.

#### System Action

Stops Customize processing.

#### User Action

Check whether the specified DB definition file exists. Or specify an existing DB definition file, then reexecute.

### 3.25.20 EJB3527

---

**Argument contains an error. Optional (%s1) is a required item.  
EJB3527S-20-xxx-xxxx**

#### Variable Information

%s1 = Option name

#### Explanation

A command argument is invalid.

### System Action

Stops Customize processing.

### User Action

The command option (variable information) is a required item. Specify the command option (variable information), then reexecute.

## 3.25.21 EJB3528

---

**Argument contains an error.Optional (%s1) cannot appoint a value.  
EJB3528S-20-xxx-xxxx**

### Variable Information

%s1 = Option name

### Explanation

A command argument is invalid.

### System Action

Stops Customize processing.

### User Action

No value can be set to the command option (variable information). Reexecute the command without specifying any value.

## 3.25.22 EJB3529

---

**Argument contains an error. I have to appoint a value in optional (%s1).  
EJB3529S-20-xxx-xxxx**

### Variable Information

%s1 = Option name

### Explanation

A command argument is invalid.

### System Action

Stops Customize processing.

### User Action

A value must be set to the command option (variable information). Reexecute the command after specifying a value.

## 3.25.23 EJB3530

---

**Argument contains an error. Optional (%s1) cannot appoint more than one value.  
EJB3530S-20-xxx-xxxx**

### Variable Information

%s1 = Option name

### Explanation

A command argument is invalid.

### System Action

Stops Customize processing.

## User Action

No multiple values can be set to the command option (variable information). Reexecute the command without specifying multiple values.

### 3.25.24 EJB3531

---

**Argument contains an error. Pass (%s2) which I appointed with optional (%s1) does not exist.  
EJB3531S-20-xxx-xxxx**

#### Variable Information

%s1 = Option name

%s2 = Path name

#### Explanation

A command argument is invalid.

#### System Action

Stops Customize processing.

#### User Action

Specify a file path that exists in the command options (variable information), then reexecute.

### 3.25.25 EJB3532

---

Windows32/64

**Argument contains an error.The folder (%s2) which I appointed with optional (%s1) does not exist.  
EJB3532S-20-xxx-xxxx**

#### Variable Information

%s1 = Option name

%s2 = Folder name

#### Explanation

A command argument is invalid.

#### System Action

Stops Customize processing.

#### User Action

Specify a folder that exists in the command options (variable information), then reexecute.

Solaris32/64 Linux32/64

**Argument contains an error.The directory (%s2) which I appointed with optional (%s1) does not exist.  
EJB3532S-20-xxx-xxxx**

#### Variable Information

%s1 = Option name

%s2 = Directory name

#### Explanation

A command argument is invalid.

### System Action

Stops Customize processing.

### User Action

Specify a directory that exists in the command options (variable information), then reexecute.

## 3.25.26 EJB3534

---

**Optional (%s1) includes an error. (%s3) combines (%s2) and cannot appoint it. EJB3534S-20-xxx-xxxx**

### Variable Information

%s1 = Option name

%s2 = Option name

%s3 = Option name

### Explanation

The command option (variable information) value is invalid.

### System Action

Stops Customize processing.

### User Action

A value that cannot be specified by combining the command options (variable information) is specified. Delete either of the values or reexecute the command by specifying a different value.

## 3.25.27 EJB3535

---

**Optional (-encode) includes an error. A value except UTF-8 / SJIS / EUC was appointed in optional (-encode). <Error code>:(%s1) EJB3535S-20-xxx-xxxx**

### Variable Information

%s1 = Argument

### Explanation

The command option (-encode) value is invalid.

### System Action

Stops Customize processing.

### User Action

An incorrect value is indicated in (variable information). Delete the incorrect value, specify one of UTF8/SJIS/EUC, and then reexecute.

## 3.25.28 EJB3536

---

**Optional (-comment) includes an error. A value except editable / all / none was appointed in optional (-comment). <Error output mode>:(%s1) EJB3536S-20-xxx-xxxx**

### Variable Information

%s1 = Argument

### Explanation

The command option (-comment) value is invalid.

### System Action

Stops Customize processing.

### User Action

An incorrect value is indicated in (variable information). Delete the incorrect value, specify one of editable/all/none, and then reexecute.

## 3.25.29 EJB3537

---

**Optional (%s1) includes an error. Optional (%s1) cannot appoint more than one (%s2).  
EJB3537S-20-xxx-xxxx**

### Variable Information

%s1 = Option name

%s2 = Option name

### Explanation

The command option (variable information) value is invalid.

### System Action

Stops Customize processing.

### User Action

The same value cannot be specified multiple times in the command options (variable information). Reexecute the command without specifying the same value multiple times.

## 3.25.30 EJB3538

---

**The pass which I appointed includes the character which I cannot use. Or the pass which I appointed is too long. Path=(%s1)  
EJB3538S-20-xxx-xxxx**

### Variable Information

%s1 = Path name

### Explanation

The specified path contains an unusable character or the specified path is too long.

### System Action

Stops Customize processing.

### User Action

Check whether the path contains an unusable character or the path is too long.

## 3.25.31 EJB3539

---

Windows32/64

**Argument contains an error.Pass (%s2) which I appointed with optional (%s1) is a folder.  
EJB3539S-20-xxx-xxxx**

### Variable Information

%s1 = Option name

%s2 = Path name

#### Explanation

A command argument is invalid.

#### System Action

Stops Customize processing.

#### User Action

Check whether any folder is specified in the command options (variable information).

---

**Solaris32/64** **Linux32/64**

**Argument contains an error.Pass (%s2) which I appointed with optional (%s1) is a directory.  
EJB3539S-20-xxx-xxxx**

#### Variable Information

%s1 = Option name

%s2 = Path name

#### Explanation

A command argument is invalid.

#### System Action

Stops Customize processing.

#### User Action

Check whether any directory is specified in the command options (variable information).

### 3.25.32 EJB3541

---

**The value of the child element <%s2> tag of the <%s1> tag is different with the definition file and the Enterprise Bean definition information.  
EJB3541S-20-xxx-xxxx**

#### Variable Information

%s1 = Tag name

%s2 = Tag name

#### Explanation

The tag value in the definition file and that in the Enterprise Bean definition information are different.

#### System Action

Stops Customize processing.

#### User Action

Check whether the tag value in the definition file and that in the Enterprise Bean definition information are different.

### 3.25.33 EJB3542

---

**<session> and <entity> are defined in the plural in the child element of the <enterprise-beans> tag.  
EJB3542S-20-xxx-xxxx**

#### Explanation

The <session> tag or <entity> tag is defined multiple times as a child element of the <enterprise beans> tag.

## System Action

Stops Customize processing.

## User Action

The <session> tag or <entity> tag cannot be defined multiple times as a child element of the <enterprise beans> tag. Correct the definition file so that the <session> tag or <entity> tag is not defined multiple times.

### 3.25.34 EJB3543

---

**'%s2' was specified in the <%s1> tag. Specify '%s3' in the <%s1> tag.  
EJB3543S-20-xxx-xxxx**

#### Variable Information

%s1 = Tag name

%s2 = Value

%s3 = Value

#### Explanation

An invalid (variable information) tag value is specified.

#### System Action

Stops Customize processing.

#### User Action

Set the correct (variable information) tag value.

### 3.25.35 EJB3544

---

**'%s2' isn't defined by a definition file though '%s2' is defined in the <%s1> tag of the Enterprise Bean definition information.  
EJB3544S-20-xxx-xxxx**

#### Variable Information

%s1 = Tag name

%s2 = Value

#### Explanation

A value defined in the (variable information) tag of the Enterprise Bean definition information is not defined in the definition file.

#### System Action

Stops Customize processing.

#### User Action

The value of the (variable information) tag cannot be changed. Specify the same value in the definition file as that in the Enterprise Bean definition information.

### 3.25.36 EJB3545

---

**The value '%s2' which can't be specified is specified in <%s1> tag of the definition file.  
EJB3545S-20-xxx-xxxx**

#### Variable Information

%s1 = Tag name

%s2 = Value

#### Explanation

A value that cannot be specified in the (variable information) tag of the definition file is specified.

#### System Action

Stops Customize processing.

#### User Action

Specify the correct value in the (variable information) tag of the definition file.

### 3.25.37 EJB3546

---

**The transaction attribute of the method unit is specified.  
EJB3546S-20-xxx-xxxx**

#### Explanation

The method unit is specified as the transaction attribute.

#### System Action

Stops Customize processing.

#### User Action

The transaction attribute of the method unit cannot be specified for EJB applications deployed before V3.0. Check whether the transaction attribute of the method unit is specified.

### 3.25.38 EJB3547

---

**The number which a <%s1> tag is defined as is different with the definition file and the Enterprise Bean definition information.  
EJB3547S-20-xxx-xxxx**

#### Variable Information

%s1 = Tag name

#### Explanation

The number of (variable information) tags defined in the definition file and that defined in the Enterprise Bean definition information are different.

#### System Action

Stops Customize processing.

#### User Action

The (variable information) tag cannot be added or deleted. If the (variable information) tag has been added or deleted, make the number of tags equal to that in the Enterprise Bean definition information.

### 3.25.39 EJB3548

---

**Enterprise Bean definition information doesn't define though a <%s1> tag is defined by a definition file.  
EJB3548S-20-xxx-xxxx**

#### Variable Information

%s1 = Tag name

#### Explanation

A (variable information) tag whose value cannot be changed is defined in the definition file, but it is not defined in the Enterprise Bean definition information.

#### System Action

Stops Customize processing.

#### User Action

Delete the (variable information) tag from the definition file.

### 3.25.40 EJB3549

---

**The EJB application of the import point couldn't be specified because a <component-name> tag wasn't defined by a definition file.  
EJB3549S-20-xxx-xxxx**

#### Explanation

Because no <component name> tag is defined in the definition file, the EJB application at the import destination could not be determined.

#### System Action

Stops Customize processing.

#### User Action

Define the <component name> tag in the definition file or specify an EJB application name in the command line options.

### 3.25.41 EJB3550

---

**The EJB Application (Rapid invoking Bean) of the import object can't be specified in Rapid invoked Bean.  
EJB3550S-20-xxx-xxxx**

#### Explanation

Bean (Rapid invoking Bean) of the import object can't be specified in Rapid invoked Bean.

#### System Action

Stops Customize processing.

#### User Action

Check whether an EJB application (rapid invoking Bean) name to be imported is specified as a rapidly invoked Bean name.

### 3.25.42 EJB3551

---

**There is a mistake in the argument. How to use:  
EJB3551S-20-xxx-xxxx**

#### Explanation

A command argument is invalid.

#### System Action

Stops Customize processing.

#### User Action

Specify the command option correctly, then reexecute.

### 3.25.43 EJB3552

---

**There is a mistake in the argument. How to use:  
EJB3552S-20-xxx-xxxx**

#### Explanation

A command argument is invalid.

#### System Action

Stops Customize processing.

#### User Action

Specify the command option correctly, then reexecute.

### 3.25.44 EJB3560

---

**Acquisition of the attribute value of the specified IJServer name(%s1) went wrong.  
EJB3560S-20- xxx-xxxx**

#### Explanation

The acquisition of the attribute value for the specified IJServer failed.

#### System Action

Stops Customize processing.

#### User Action

Contact the technician.

### 3.25.45 EJB3574

---

**The value of the <(%2)> tag of datasource name '(%1)' isn't specified.  
EJB3574S-20-xxx-xxxx**

#### Variable Information

%s1 = Datasource name

%s2 = Tag name

#### Explanation

The value of the (Variable Information) tag of datasource name '(Variable Information)' isn't specified.

#### System Action

Stops Customize processing.

#### User Action

Check whether any value is defined for the <datasource-entry> (variable information) tag where <registration-name> (variable information) </registration-name> is defined in the definition file.

### 3.25.46 EJB3575

---

**The EJB application '%s2' specified in the <%s1> tag doesn't exist.  
EJB3575S-20-xxx-xxxx**

#### Variable Information

%s1 = Tag name

%s2 = EJB application name

#### Explanation

The EJB application specified in the (variable information) tag does not exist.

#### System Action

Stops Customize processing.

#### User Action

Specify a registered EJB application name in the (variable information) tag of the definition file.

### 3.25.47 EJB3576

---

**The EJB application '%s2 ' specified in the <%s1> tag is Session Bean. Value can't be specified in <%s3> tag.**

**EJB3576S-20-xxx-xxxx**

#### Variable Information

%s1 = Tag name

%s2 = EJB application name

%s3 = Tag name

#### Explanation

The specified EJB application is a Session Bean. No value can be set in the (variable information) tag.

#### System Action

Stops Customize processing.

#### User Action

Check whether any value is set in the (variable information) tag of the definition file.

### 3.25.48 EJB3577

---

**The EJB application '%s2' specified in the <%s1> tag is Entity Bean. Specify value in <%s3> tag.**

**EJB3577S-20-xxx-xxxx**

#### Variable Information

%s1 = Tag name

%s2 = EJB application name

%s3 = Tag name

#### Explanation

The specified EJB application is a Entity Bean. No value can be set in the (variable information) tag.

#### System Action

Stops Customize processing.

#### User Action

Check whether any value is set in the (variable information) tag of the definition file.

### 3.25.49 EJB3578

---

---

**Datasource '%s2' specified in the <%s1> tag doesn't exist.  
EJB3578S-20-xxx-xxxx**

**Variable Information**

%s1 = Tag name

%s2 = Datasource name

**Explanation**

The data source specified in the (variable information) tag does not exist.

**System Action**

Stops Customize processing.

**User Action**

Specify a data source name registered in the DB definition information in the (variable information) tag of the definition file.

---

### 3.25.50 EJB3579

---

**The EJB application '%s2' specified in the <%s1> tag is Entity Bean. Specify '%s4' in <%s3> tag.  
EJB3579S-20-xxx-xxxx**

**Variable Information**

%s1 = Tag name

%s2 = EJB application name

%s3 = Tag name

%s4 = Value

**Explanation**

The specified EJB application is an Entity Bean. Set a value (variable information) to the (variable information) tag.

**System Action**

Stops Customize processing.

**User Action**

Set the correct value to the (variable information) tag of the definition file.

---

### 3.25.51 EJB3580

---

**A transaction attribute is defined in the plural, or a transaction attribute is defined by the method of the plural.  
EJB3580S-20-xxx-xxxx**

**Explanation**

A transaction attribute is defined multiple times or a transaction attribute is defined in multiple methods.

**System Action**

Stops Customize processing.

**User Action**

For EJB applications deployed before V3.0, only the transaction attribute of the Bean unit can be defined. Check whether a transaction attribute is defined multiple times or a transaction attribute is defined in multiple methods.

## 3.25.52 EJB3588

---

Windows32/64 Linux32/64

**Invalid argument. Usage:**  
**ejbcustx [-ejbdb]**  
**EJB3588S-20-xxx-xxxx**

### Explanation

Argument of the command is invalid.

### System Action

Stops Customize processing.

### User Action

Specify the correct command option, and execute again.

---

Solaris32/64

**Invalid argument. Usage:**  
**ejbcustx [-M extended system] [-ejbdb]**  
**EJB3588S-20-xxx-xxxx**

### Explanation

Argument of the command is invalid.

### System Action

Stops Customize processing.

### User Action

Specify the correct command option, and execute again.

---

## 3.25.53 EJB3589

---

**Invalid argument.**  
**Usage: ejbcust**  
**EJB3551S-20-xxx-xxxx**

### Explanation

Argument of the command is invalid.

### System Action

Stops Customize processing.

### User Action

Specify the correct command option, and execute again.

---

## 3.25.54 EJB3590

---

**The type of '%s2' field specified for <(%s1)> tag is specified '%s3'.  
It is defined in the class of Bean as '%s4'.**

EJB3590S-20-xxx-xxxx

### Variable Information

%s1 = Tag name

%s2 = Field name

%s3 = Type name

%s4 = Type name

#### Explanation

The type of the field specified in the definition file is different from that defined by the Bean.

#### System Action

Stops Customize processing.

#### User Action

Set the correct type name value in the definition file.

### 3.25.55 EJB3591

---

**The '%s2' field specified for <(%s1)> tag does not exist.  
EJB3591S-20-xxx-xxxx**

#### Variable Information

%s1 = Tag name

%s2 = Field name

#### Explanation

A field specified in the definition file does not exist in the Bean.

#### System Action

Stops Customize processing.

#### User Action

Verify the field name in the definition file.

### 3.25.56 EJB3592

---

**The '%s2' field specified for <(%s1)> tag is not defined as deployment descriptor.  
EJB3592S-20-xxx-xxxx**

#### Variable Information

%s1 = Tag name

%s2 = Field name

#### Explanation

A field specified in the definition file is not defined in the deployment descriptor.

#### System Action

Stops Customize processing.

#### User Action

Verify the field name in the definition file.

### 3.25.57 EJB3593

---

**The EJB application of the import target can't specify a <(%2)> tag for (%1) Entity Bean.  
EJB3593S-20-xxx-xxxx**

### Variable Information

%1 = Cmp version

%2 = Tag name

### Explanation

An invalid (variable information %2) tag is specified in the definition file for an EJB application to be imported.

### System Action

Stops Customize processing.

### User Action

Delete the (variable information %2) tag from the definition file.

## 3.25.58 EJB3594

---

**A disposition module(%s1) does not exist in a path(%s2)  
EJB3594W-20- xxx-xxxx**

### Variable Information

%s1 = Deployment module name

%s2 = Path

### Explanation

The deployment module that is defined in the IJServer definition is not found in the location specified with the path.

### System Action

Continues the customization processing.

## 3.25.59 EJB3595

---

**The EJB application of the import target(%s1) does not exist in a J2EE module definition.  
EJB3595S-20- xxx-xxxx**

### Variable Information

%s1 = EJB application name

### Explanation

The EJB application that is the import target is not found in the J2EE module definition.

### System Action

Stops Customize processing.

### User Action

Redeploy the EJB application..

## 3.25.60 EJB3596

---

**The EJB application of the import target(%s1) does not exist in a deployment descriptor.  
EJB3596S-20- xxx-xxxx**

### Variable Information

%s1 = EJB application name

#### Explanation

The EJB application that is the import target is not found in the deployment descriptor definition.

#### System Action

Stops Customize processing.

#### User Action

Deploy the EJB application again.

### 3.25.61 EJB3597

---

#### **JMX service has not started. EJB3597S-20- xxx-xxxx**

#### Explanation

JMX service has not started.

#### System Action

Stops Customize processing.

#### User Action

Start the JMX service.

### 3.25.62 EJB3598

---

#### **Abnormalities occurred in JMX service. EJB3598S-20- xxx-xxxx**

#### Explanation

Abnormalities occurred in JMX service.

#### System Action

Stops Customize processing.

#### User Action

Contact the technician.

### 3.25.63 EJB3599

---

#### **Acquisition of CLASSPATH went wrong.MSG=%s1 EJB3599S-20- xxx-xxxx**

#### Variable Information

%s1 = Detailed error information

#### Explanation

The acquisition for the CLASSPATH failed.

#### System Action

Stops Customize processing.

#### User Action

Refer to the detailed error information and remove the cause of the error. If this action cannot be taken, contact the technician.

## 3.26 EJB3800 to EJB3899

---

This section details the messages with message numbers between EJB3800 and EJB3899.

### 3.26.1 EJB3800

---

**EJB application is active, or DB access environment definition is already activated.**  
**EJB3800I-00-000-0000**

#### Explanation

Either the EJB application is being started, or the DB access environment definition has already been activated.

#### System Action

Stops processing the DB Access Environment Definition.

#### User Action

If the EJB application is being started, wait until the application has been started, then reexecute.

Determine whether the DB Access Environment Definition has already been activated.

### 3.26.2 EJB3801

---

**Reading of DB access environment definition file failed.**  
**EJB3801S-00-000-0000**

#### Explanation

The DB Access Environment Definition file could not be read.

#### System Action

Stops the DB Access Environment Definition.

#### User Action

**Windows32/64**

Check if the DB Access Environment Definition file (FJJDSEdefs.xml, FJDPSWs.ser, or FJJDSEdefs.ser) exists under the installation folder\etc. If located, check if access permission has been set for the file.

If the cause of the error cannot be determined, notify your software supplier of the message information.

**Solaris32/64** **Linux32/64**

Check if the DB Access Environment Definition file (FJJDSEdefs.xml, FJDPSWs.ser, or FJJDSEdefs.ser) exists under the installation directory/etc. If located, check if access permission has been set for the file.

If the cause of the error cannot be determined, notify your software supplier of the message information.

### 3.26.3 EJB3802

---

**DB access environment definition file does not exist.**  
**EJB3802S-00-000-0000**

#### Explanation

The file used for saving the DB Access Environment Definition does not exist.

#### System Action

Stops the DB Access Environment Definition.

## User Action

**Windows32/64**

Check if the DB Access Environment Definition file (FJJDSDefs.ser) exists under the [Install Folder]\ etc.

If the cause of the error cannot be determined, notify your software supplier of the message information.

**Solaris32/64** **Linux32/64**

Check if the DB Access Environment Definition file (FJJDSDefs.ser) exists under the [Install Directory] /etc.

If the cause of the error cannot be determined, notify your software supplier of the message information.

## 3.26.4 EJB3803

---

### Writing to DB access environment definition file failed. EJB3803S-00-000-0000

#### Explanation

Data could not be written to the DB Access Environment Definition file.

#### System Action

Stops the DB Access Environment Definition.

#### User Action

**Windows32/64**

Check if the DB Access Environment Definition file (FJJDSDefs.xml, FJDPSWs.ser, or FJJDSDefs.ser) exists under the installation folder/etc. If located, check if access permission has been set for the file and if the disk has enough free space.

The added, updated, or deleted definition information has not been reflected in the DB Access Environment Definition file. Remove the cause of the error and specify the definitions again.

If the cause of the error cannot be determined, notify your software supplier of the message information.

**Solaris32/64** **Linux32/64**

Check if the DB Access Environment Definition file (FJJDSDefs.xml, FJDPSWs.ser, or FJJDSDefs.ser) exists under the installation directory/etc. If located, check if access permission has been set for the file and if the disk has enough free space.

The added, updated, or deleted definition information has not been reflected in the DB Access Environment Definition file. Remove the cause of the error and specify the definitions again.

If the cause of the error cannot be determined, notify your software supplier of the message information.

## 3.26.5 EJB3804

---

### System error. EJB3804S-00-000-0000

#### Explanation

A system error occurred.

#### System Action

Deactivates the DB Access Environment Definition.

#### User Action

Notify your software supplier of the error information.

## 3.26.6 EJB3805

---

---

**System error.**  
**EJB3805S-00-000-0000**

Explanation

A system error occurred.

System Action

Stops the DB Access Environment Definition.

User Action

Notify your software supplier of the error information.

---

### 3.26.7 EJB3810

---

**Datasource name not entered.**  
**EJB3810I-00-000-0000**

Explanation

The EJB Datasource name has not been entered. Be sure to enter the Datasource name.

System Action

Returns to the detailed settings window without taking any action.

User Action

Enter the Datasource name.

---

### 3.26.8 EJB3811

---

**Driver name not entered.**  
**EJB3811I-00-000-0000**

Explanation

The driver name has not been entered.

The driver name must be entered when the JDBC1.X version is used.

System Action

Returns to the detailed settings window without making any additions or changes.

User Action

Enter the driver name.

---

### 3.26.9 EJB3812

---

**URL not entered.**  
**EJB3812I-00-000-0000**

Explanation

The URL has not been entered.

The URL must be entered when the JDBC1.X version is used.

System Action

Returns to the detailed settings window without making any additions or changes.

#### User Action

Enter the URL.

### 3.26.10 EJB3813

---

#### **User ID not entered. EJB3813I-00-000-0000**

#### Explanation

The user ID has not been entered.

The user ID must be entered when the JDBC1.X version is used.

When the JDBC2.X version is used, always enter the user ID when the password is entered.

#### System Action

Returns to the detailed settings window without making any additions or changes.

#### User Action

Enter the user ID.

### 3.26.11 EJB3814

---

#### **Password not entered. EJB3814I-00-000-0000**

#### Explanation

A password has not been entered.

The password must be entered when the JDBC1.X version is used.

When the JDBC2.X version is used, always enter the password when the user ID is entered.

#### System Action

Returns to the detailed settings window without making any additions or changes.

#### User Action

Enter the password.

### 3.26.12 EJB3815

---

#### **Identical Datasource name already registered. EJB3815I-00-000-0000**

#### Explanation

An attempt was made to add a Datasource name that already exists.

#### System Action

Returns to the detailed settings window without making any additions.

#### User Action

Either change the Datasource name and register a new name, or use the registered Datasource if available.

### 3.26.13 EJB3816

---

---

**Datasource name not entered.**  
**EJB3816I-00-000-0000**

**Explanation**

The JDBC2.X Datasource name has not been entered.

When using the JDBC2.X version, the JDBC2.X Datasource name must be entered.

**System Action**

Returns to the detailed settings window without making any additions.

**User Action**

Enter the Datasource name.

---

### 3.26.14 EJB3817

---

**INITIAL CONTEXT FACTORY not entered.**  
**EJB3817I-00-000-0000**

**Explanation**

The INITIAL CONTEXT FACTORY was not entered.

When using the JDBC2.X version, the JDBC2.X INITIAL CONTEXT FACTORY must be entered.

**System Action**

Returns to the detailed settings window without making any additions.

**User Action**

Enter the INITIAL CONTEXT FACTORY.

---

### 3.26.15 EJB3818

---

**PROVIDER URL not entered.**  
**EJB3818I-00-000-0000**

**Explanation**

The PROVIDER URL was not entered.

When using the JDBC2.X version, the JDBC2.X PROVIDER URL must be entered.

**System Action**

Returns to the detailed settings window without making any additions or changes.

**User Action**

Enter the PROVIDER URL

---

### 3.26.16 EJB3819

---

**Reading of DB access environment definition file failed. message = %s1 column name=%s2 error line = %s3 error no %s4**  
**EJB3819S-00-000-0000**

**Variable Information**

%s1 = Detailed message

%s2 = Definition item name

%s3 = Error line

%s4 = Error number

#### Explanation

Reading of the DB Access Environment Definition file failed.

#### System Action

Stops processing the DB Access Environment Definition.

#### User Action

Refer to the detailed message and remove the cause of the error.

If the cause of the error cannot be determined, notify your software supplier of the message information.

### 3.26.17 EJB3820

---

**Writing to DB access environment definition file failed. message=%s1 column name=%s2 error line=%s3 error no=%s4  
EJB3820S-00-000-0000**

#### Variable Information

%s1 = Detailed message

%s2 = Definition item name

%s3 = Error line

%s4 = Error number

#### Explanation

Writing of the DB Access Environment Definition file failed.

#### System Action

Stops processing the DB Access Environment Definition.

#### User Action

Refer to the detailed message and remove the cause of the error.

If the cause of the error cannot be determined, notify your software supplier of the message information.

### 3.26.18 EJB3821

---

**Backup of DB access environment definition file failed.  
EJB3821S-00-000-0000**

#### Explanation

Creation of the backup file for the DB Access Environment Definition file failed.

#### System Action

Stops processing the DB Access Environment Definition.

#### User Action

**Windows32/64**

Check if the DB Access Environment Definition file (FJJDSDefs.xml or FJDPSWs.ser) exists under the installation folder\etc. If located, check if access permission has been set for the file and if the disk has enough free space.

The added, updated, or deleted definition information has not been reflected in the DB Access Environment Definition file. Remove the cause of the error and specify the definitions again. If the cause of the error cannot be determined, notify your software supplier of the message information.

**Solaris32/64** **Linux32/64**

Check if the DB Access Environment Definition file (FJJDSDefs.xml or FJDPSWs.ser) exists under the installation directory/etc. If located, check if access permission has been set for the file and if the disk containing the installation directory/etc has enough free space.

The added, updated, or deleted definition information has not been reflected in the DB Access Environment Definition file. Remove the cause of the error and specify the definitions again.

If the cause of the error cannot be determined, notify your software supplier of the message information.

## 3.26.19 EJB3822

---

### Restoration of DB access environment definition file failed. EJB3822S-00-000-0000

#### Explanation

Restoration of the DB Access Environment Definition file failed.

#### System Action

Stops processing the DB Access Environment Definition.

#### User Action

**Windows32/64**

Check the following items.

- Check if access permission has been set for the DB Access Environment Definition file (FJJDSDefs.xml or FJDPSWs.ser) under the installation folder\etc.
- Check if access permission has been set for the backup file (FJJDSDefs.xml\_FUJITSU\_BACKUP\_ or FJDPSWs.ser\_FUJITSU\_BACKUP\_) of the DB Access Environment Definition file under the installation folder\etc.
- Check if there is enough free space on the disk where installation folder\etc is located.

If the disk is full, the DB Access Environment Definition file may be corrupt. Restore it using a backup file.

The added, updated, or deleted definition information has not been reflected in the DB Access Environment Definition file. Remove the cause of the error and specify the definitions again.

If the cause of the error cannot be determined, notify your software supplier of the message information.

**Solaris32/64** **Linux32/64**

Check the following items.

- Check if access permission has been set for the DB Access Environment Definition file (FJJDSDefs.xml or FJDPSWs.ser) under the installation directory/etc.
- Check if access permission has been set for the backup file (FJJDSDefs.xml\_FUJITSU\_BACKUP\_ or FJDPSWs.ser\_FUJITSU\_BACKUP\_) of the DB Access Environment Definition file under the installation directory/etc.
- Check if there is enough free space on the disk where installation directory/etc is located.

If the disk is full, the DB Access Environment Definition file may be corrupt. Restore it using a backup file.

The added, updated, or deleted definition information has not been reflected in the DB Access Environment Definition file. Remove the cause of the error and specify the definitions again.

If the cause of the error cannot be determined, notify your software supplier of the message information.

## 3.27 EJB4000 to EJB4099

---

This section details the messages with message numbers between EJB4000 and EJB4099.

### 3.27.1 EJB4001

---

#### **EJB: ERROR: EJB4001: Insufficient memory**

##### Explanation

A memory shortage occurred.

##### System Action

Setup processing of Interstage is stopped.

##### User Action

Reexecute after a short period of time. If this message is output frequently, refer to the Interstage Application Server Tuning Guide and reestimate the amount of memory required for operating the EJB Service to check whether sufficient memory is provided.

If a sufficient amount of memory required for the EJB Service is provided, memory for other applications may be insufficient. Reestimate the amount of memory of other applications running on the same machine to examine whether the amount of memory is appropriate.

If, as a result of reestimation, insufficient memory is verified, contact your system administrator. The system administrator should add main memory modules or increase the swap area.

### 3.27.2 EJB4002

---

#### **EJB: ERROR: EJB4002: Error operating environment**

##### Explanation

The operating environment is abnormal.

##### System Action

Setup processing of Interstage is stopped.

##### User Action

The probable causes are:

- No access authority to files or folders under the installation folder: \sample\ejb is granted.
- No access authority to files or folders under the installation folder: \ejb is granted.
- No access authority to files or folders under Interstage Studio installation folder is granted.
- A FJserverProperties.ser file does not exist under installation folder: \sample\ejb
- A Cart.def file does not exist under Installation folder: \sample\ejb\wu.
- A java\_config.txt file does not exist under installation folder: \ejb\etc.
- An orb.properties file does not exist under installation folder: \ejb\etc.
- An ejb-app file exists under the installation folder: \EJB\var.
- Installation folder: \td\bin is not set to the path.
- Installation folder: \ejb\bin is not set to the path.

Remove the above causes and set up Interstage again.

If the cause is unknown, report the relevant messages to your system administrator.

The probable causes are:

- No access authority to files or directories under the /opt/FJSVisas/sample/ejbsetup/ejb is granted.
- No access authority to files or directories under the Interstage Java execution environment server package is granted.
- /opt/FJSVisas/sample/ejbsetup/ejb/FJserverProperties.ser file does not exist.
- /opt/FJSVisas/sample/ejbsetup/ejb/wu/Cart.def file does not exist.
- /opt/FJSVejb/etc/java\_config.txt file does not exist.
- /opt/FJSVejb/etc/orb.properties file does not exist.
- An ejb-app file exists under the /opt/FJSVejb/var.

Remove the above causes and set up Interstage again.

If the cause is unknown, report the relevant messages to your system administrator.

### 3.27.3 EJB4003

---

**EJB: ERROR: EJB4003: An error was detected during a system call: CODE=%s1**

#### Variable Information

%s1 = System call error information

#### Explanation

An error was detected in the system call.

#### System Action

Setup processing of Interstage is stopped.

#### User Action

Report the relevant messages to your system administrator.

### 3.27.4 EJB4004

---

**EJB: ERROR: EJB4004: INTERSTAGE installation don't finish: CODE=%s1 PATH=%s2**

#### Variable Information

%s1 = Error information

1: File does not exist.

2: File has no access rights.

3: Folder does not exist.

4: File attribute is invalid.

5: Directory is invalid.

6: File is invalid.

7: Java environment is invalid.

%s2 = The file or PATH setting that caused the error

#### Explanation

Because the product is not installed properly, failed to set up the EJB environment.

### System Action

Setup processing of Interstage is stopped.

### User Action

Install the product.

## 3.27.5 EJB4005

---

**EJB: ERROR: EJB4005: An error was detected during a system call: FUNC=%s1 PARAM=%s2 CODE=%s3**

### Variable Information

%s1 = System function information

%s2 = Parameter information

%s3 = System call error information

### Explanation

An error was detected in a system call.

### System Action

Setup processing of Interstage is stopped.

### User Action

After restarting OS, reinstall the product.

## 3.27.6 EJB4006

---

**EJB: ERROR: EJB4006: Error occurred while setting up INTERSTAGE: MSG=%s1**

### Variable Information

%s1 = Error message

### Explanation

An error occurred during Interstage setup.

### System Action

Setup processing of Interstage is stopped.

### User Action

Remove the cause of the error.

## 3.27.7 EJB4007

---

**EJB: ERROR: EJB4007: Automatic setup for INTERSTAGE failed: CODE=%s1**

### Variable Information

%s1 = Error code

1: Failed to register the EJB sample application (OD\_impl\_inst).

2: Failed to create the Object Reference of the EJB sample application (OD\_or\_adm).

3: Failed to register the WorkUnit definition of the EJB sample application (isaddwundef).

### Explanation

An error occurred during Interstage setup.

### System Action

Setup processing of Interstage is stopped.

### User Action

Remove the cause of the error.

## 3.28 EJB5000 to EJB5999

---

This section details the messages with message numbers between EJB5000 and EJB5999.

### 3.28.1 EJB5001

---

**EJB: ERROR: EJB5001: Unable to read the definition files: They are in use by another operation: IJServer name=%s = EJB application name=%s2**

#### Variable Information

%s = IJServer name

%s2 = EJB application name

#### Explanation

The definition could not be read as it was being used by another type of operation.

#### System Action

Stops processing.

#### User Action

Reexecute processing later.

### 3.28.2 EJB5002

---

**EJB: ERROR: EJB5002: Unable to update the definition files: They are in use by another operation: IJServer name=%s = EJB application name=%s2**

#### Variable Information

%s = IJServer name

%s2 = EJB application name

#### Explanation

The definition could not be written to as it was being used by another type of operation.

#### System Action

Stops processing.

#### User Action

Reexecute processing later.

### 3.28.3 EJB5003

---

**EJB: ERROR: EJB5003: Unable to release the lock on the definition files: Details=%s1**

### Variable Information

%s1 = Detailed error information

### Explanation

The lock could not be released.

### System Action

Stops processing.

### User Action

Remove the error cause by referring to the detailed error information. If the error is not resolved, use the iscollectinfo command to collect investigation information, then contact a Fujitsu service engineer.

## 3.28.4 EJB5004

---

**EJB: ERROR: EJB5004: Unable to read definition file: IJServer name=%s = EJB application name=%s2 =File name=%s3 =Details=%s4**

### Variable Information

%s = IJServer name

%s2 = EJB application name

%s3 = File name

%s4 = Detailed error information

### Explanation

The definition file could not be read.

### System Action

Stops processing.

### User Action

Access permission may not have been granted for the definition file, or the definition file may have been changed to a definition for which this operation is disabled. Check the access permission or definition file. If no action can be taken, redeploy or restore the definition file.

## 3.28.5 EJB5005

---

**EJB: ERROR: EJB5005: Unable to update definition file: IJServer name=%s = EJB application name=%s2 =File name=%s3 =Details=%s4**

### Variable Information

%s = IJServer name

%s2 = EJB application name

%s3 = File name

%s4 = Detailed error information

### Explanation

The definition file could not be written to.

### System Action

Stops processing.

## User Action

Access permission may not have been granted for the definition file, the amount of free disk space may be too small, or the definition file may have been changed to a definition for which this operation is disabled. Check the access permission, the amount of free disk space, or the definition file. If no action can be taken, redeploy or restore the definition file.

### 3.28.6 EJB5006

---

**EJB: ERROR: EJB5006: Unable to load class: Class name=%s1**

#### Variable Information

%s1 = Class name

#### Explanation

The class name could not be found.

#### System Action

Stops processing.

#### User Action

Possible causes are as follows:

- The class does not exist in the ejb-jar file.
- The class is included in another jar file and is not included in the classpath.

Check whether the class exists in the ejb-jar class. If necessary, record the relevant message information, use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer.

If the class is included in another jar file, set it in 'Classpath' of [WorkUnit Setting], which can be displayed by selecting [WorkUnit] | [IIServer Name] | [Environment Setup] on the Interstage management console. Once this has been done, reexecute processing.

Additionally, depending on the IIServer 'Separate Class Loaders' settings, it may not be possible to refer from one module to another. Refer to 'Designing J2EE'-'Separating Class Loaders' in the J2EE User's Guide, and check that the application configuration and class loader separation are correct.

### 3.28.7 EJB5007

---

**EJB: ERROR: EJB5007: Unable to update the definition files: They have been modified by another operation: EJB application name=%s1**

#### Variable Information

%s1 = EJB application name

#### Explanation

Writing to the definition file failed. The definition was being updated by another type of operation.

#### System Action

Stops processing.

#### User Action

The definition was being updated by another type of operation. Obtain the environment setup information for the EJB application, then update the definition.

### 3.28.8 EJB5008

---

**EJB: ERROR: EJB5008: Specified value is out of bounds: Attribute=%s1 Minimum=%s2 =Maximum=%s3**

### Variable Information

%s1 = Item name

%s2 = Minimum value for item name

%s3 = Maximum value for item name

### Explanation

The value range specified for the item name is invalid.

### System Action

Stops processing. The item name values are not changed.

### User Action

Specify a valid range of values, and then reexecute processing.

## 3.28.9 EJB5009

---

**EJB: ERROR: EJB5009: Specified value is out of bounds: Attribute=%s1**

### Variable Information

%s1 = Item name

### Explanation

The value specified for the item name is invalid.

### System Action

Stops processing. The item name values are not changed.

### User Action

Specify a valid range of values, and then reexecute processing.

## 3.28.10 EJB5010

---

**EJB: ERROR: EJB5010: Unable to register the MBean: Details=%s1**

### Variable Information

%s1 = Detailed error information

### Explanation

Access to Interstage JMX Service failed.

### System Action

Stops processing.

### User Action

Remove the error cause by referring to the detailed error information.

If the error is not resolved, use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer.

## 3.28.11 EJB5011

---

**EJB: ERROR: EJB5011: Unable to remove the registration of the MBean: Details=%s1**

### Variable Information

%s1 = Detailed error information

### Explanation

Access to Interstage JMX Service failed.

### System Action

Stops processing.

### User Action

Remove the error cause by referring to the detailed error information.

If the error is not resolved, use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer.

## 3.28.12 EJB5012

---

### **EJB: ERROR: EJB5012: %s1 does not apply to the %s2 type**

#### Variable Information

%s1 = Method name

%s2 = Bean type

### Explanation

Method invocation failed.

### System Action

Stops processing.

### User Action

The indicated method cannot be invoked for the target bean type. Correct the program so that the relevant method is not invoked.

## 3.28.13 EJB5013

---

### **EJB: ERROR: EJB5013: %s1 cannot be used for EJB applications developed conforming to the EJB1.1 specification**

#### Variable Information

%s1 = Method name

### Explanation

The indicated method cannot be used for EJB applications created according to the EJB1.1 specification.

### System Action

Stops processing.

### User Action

The indicated method cannot be invoked for EJB applications created according to the EJB1.1 specification. Correct the program so that the relevant method is not invoked. Alternatively, use an EJB application created according to the EJB2.0 specification or a later specification.

## 3.28.14 EJB5015

---

### **EJB: ERROR: EJB5015: Local invocation cannot be set for EJB applications without a remote interface**

### Explanation

Local invocation can only be specified for EJB applications with a remote interface.

### System Action

Stops processing.

### User Action

Do not specify local invocation because the local invocation setting is not required.

## 3.28.15 EJB5017

---

**EJB: ERROR: EJB5017: Specified value for environment property %s1 is out of bounds: Type=%s2 =Minimum=%s3 =Maximum=%s4**

### Variable Information

%s1 = Environment property name

%s2 = Type of environment property value

%s3 = Minimum value for the type

%s4 = Maximum value for the type

### Explanation

The value range specified for the environment property is invalid.

### System Action

Stops processing. The environment property values are not changed.

### User Action

The maximum and minimum values for the environment property vary depending on the type.

Set the appropriate values for the respective types by referring to the following table.

Table 3.1 Environment Property Minimum and Maximum Values

Type	Minimum value	Maximum value
java.lang.Byte	-128	127
java.lang.Character	0	65535
java.lang.Short	-32768	32767
java.lang.Integer	-2147483648	2147483647
java.lang.Long	-9223372036854775808	9223372036854775807
java.lang.Float	-3.4028234663852886E38	3.4028234663852886E38
java.lang.Double	-1.7976931348623157E308	1.7976931348623157E308

## 3.28.16 EJB5018

---

**EJB: ERROR: EJB5018: Unable to read the definition files: They are in use by another operation: IJServer name=%s1**

### Variable Information

%s1 = IJServer name

### Explanation

The definition file could not be read because it was being used by another type of operation.

### System Action

Stops processing.

#### User Action

Reexecute processing later.

### 3.28.17 EJB5019

---

**EJB: ERROR: EJB5019: Unable to read definition file: JServer name=%s = File name=%s2 =Details=%s3**

#### Variable Information

%s = JServer name

%s2= File name

%s3= Detailed error information

#### Explanation

The definition file could not be read.

#### System Action

Stops processing.

#### User Action

Access permission may not have been granted for the definition file, or the definition file may have been changed to a definition for which this operation is disabled. Check the access permission or definition file. If no action can be taken, redeploy or restore the definition file.

### 3.28.18 EJB5020

---

**EJB: ERROR: EJB5020: <ejb-class> is not defined in the deployment descriptor: JServer name=%s = EJB application name=%s2**

#### Variable Information

%s = JServer name

%s2 = EJB application name

#### Explanation

<ejb-class> is not specified in the deployment descriptor.

#### System Action

Stops processing.

#### User Action

Specify <ejb-class> in the deployment descriptor and redeploy the descriptor.

### 3.28.19 EJB5021

---

**EJB: ERROR: EJB5021: Attribute 'configuration' cannot be set to null**

#### Explanation

Null cannot be set for the attribute 'configuration'.

#### System Action

Stops processing.

#### User Action

Specify a valid object.

## 3.28.20 EJB5022

---

**EJB: ERROR: EJB5022: Error occurred while processing a CMP2.x Entity Bean: Details=%s1**

### Variable Information

%s1 = Detailed error information

### Explanation

An error occurred during CMP2.x Entity Bean processing.

### System Action

Stops processing.

### User Action

Check the detailed error information. Take the appropriate action by referring to [CMP2.0 Detailed Messages](#) in Message EJB1239.

## 3.28.21 EJB5023

---

**EJB: ERROR: EJB5023: Subscription name is not specified**

### Explanation

The subscriber identifier was not specified.

### System Action

Stops processing.

### User Action

Specify the subscriber identifier when the destination type is 'javax.jms.Topic' and the subscriber durability is 'Durable.'

## 3.28.22 EJB5024

---

**EJB: ERROR: EJB5024: Unable to read the definition file: JJSERVER name=%s1: MODULE name=%s2: FILE name=%s3: DETAILS=%s4**

### Variable Information

%s1 = JJSERVER name

%s2 = MODULE name

%s3 = FILE name

%s4 = Detailed error information

### Explanation

The read processing for the definition failed.

### System Action

Stops processing.

### User Action

Establish the cause of the error based on the error information, and then reexecute processing. Possible causes are shown below. If there is still no improvement, use the *iscollectinfo* command to collect diagnostic information. Send the error information to a Systems Engineer.

- The file does not exist.

If the file that caused the error is under the directory to which application deployment was attempted, the environment may be corrupt. Before adding/deleting/changing files under this directory so that class autoloading can be used, attempt recovery of the file using the procedure described in 'Deploying and Setting J2EE Applications' in the J2EE User's Guide.

- There is no file access authority.

The file access authority may have been changed. Return the file access authority to its previous status, and then reexecute processing.

- Other applications, files, or directories are being referenced.

Close other applications, and then reexecute processing.

- The encoding is illegal

It may not be possible to read the definition file encoding in the XML parser defined in the IJServer environment settings. Take either of the following actions:

- Correct the definition file

Use an encoding type that is supported in the XML parser defined in the IJServer environment settings, and then define the definition file.

- Change the XML parser that is used

In the IJServer environment settings, set an XML parser that supports the encoding type defined in the definition file.

If these measures cannot be completed, perform the deployment again or perform a restoration.

### 3.28.23 EJB5025

---

**EJB: ERROR: EJB5025: Unable to write the definition file: IJServer name=%s1: Module name=%s2: File name=%s3: Details=%s4**

#### Variable Information

%s1 = IJServer name

%s2 = Module name

%s3 = File name

%s4 = Detailed error information

#### Explanation

The write processing for the definition failed.

#### System Action

Stops processing.

#### User Action

The file may not have access permission, the disk volume may be insufficient, or the change made in the definition file may have made the operation impossible. Review the access permission, disk volume, or the definition file. If these measures cannot be taken, perform the deployment again or perform a restore.

### 3.28.24 EJB5026

---

**EJB: ERROR: EJB5026: Unable to update the definition file: It is being updated by another operation: IJServer name=%s1: Module name=%s2**

#### Variable Information

%s1 = IJServer name

%s2 = Module name

### Explanation

The write processing of the definition failed.

### System Action

Stops processing.

### User Action

Since the definition has been modified by another operation, obtain the latest information, and perform the operation again.

## 3.28.25 EJB5027

---

**EJB: ERROR: EJB5027: Unable to read the definition file: It is in use by another operation: IJServer name=%s1: Module name=%s2**

### Variable Information

%s1 = IJServer name

%s2 = Module name

### Explanation

The write processing of the definition failed.

### System Action

Stops processing.

### User Action

Wait for a few moments and then perform the operation again.

## 3.28.26 EJB5028

---

**EJB: ERROR: EJB5028: Unable to write the definition file: It is in use by another operation: IJServer name=%s1: Module name=%s2**

### Variable Information

%s1 = IJServer name

%s2 = Module name

### Explanation

The write processing of the definition failed.

### System Action

Stops processing.

### User Action

Wait for a few moments and then perform the operation again.

## 3.28.27 EJB5029

---

**EJB: ERROR: EJB5029: Unable to directly update the managed server's definition file because the system is deployed in multi-server management mode**

### Explanation

The Update of the definition failed.

#### System Action

Stops processing.

#### User Action

Check the configuration of the multiserver management, and update the definition on the management server side.

### 3.28.28 EJB5030

---

**EJB: ERROR: EJB5030: Unable to find the client-distributed materials: IJServer name=%s1: File name=%s2**

#### Explanation

Client distribution data that is to be downloaded was not found.

#### System Action

Stops processing.

#### User Action

The client distribution data may have been deleted. Redeploy the target EJB application.

### 3.28.29 EJB5031

---

**EJB: ERROR: EJB5031: In case of an IJServer of type One VM the local mode setting becomes invalid**

#### Explanation

In case of an IJServer of type One VM the local mode setting becomes invalid.

#### System Action

Stops processing.

#### User Action

The local mode setting is not needed if IJServers are operated in the same JavaVM, so do not configure this setting.

### 3.28.30 EJB5032

---

**EJB: ERROR: EJB5032: One of the following mandatory items have not been specified: DataSource name, table name**

#### Explanation

One of the following mandatory items have not been specified: DataSource name, table name.

#### System Action

Stops processing.

#### User Action

Enter the item that has been omitted from DataSource name or table name and then reexecute.

### 3.28.31 EJB5033

---

**EJB: ERROR: EJB5033: One of the following mandatory items have not been specified: DataSource name, table name, column name, foreign key**

#### Explanation

One of the following mandatory items have not been specified: DataSource name, table name, column name, foreign key.

### System Action

Stops processing.

### User Action

Enter the item that has been omitted from DataSource name, table name, column name, or foreign key and then reexecute.

## 3.28.32 EJB5999

---

### **EJB: ERROR: EJB5999: System error occurred: Details=%s1**

#### Variable Information

%s1 = System error information

#### Explanation

A system error occurred.

#### System Action

Stops processing.

#### User Action

Possible causes are as follows:

- The XML file created by Interstage Studio that is stored in ejb-jar has been edited.
- An invalid environment variable was set.
- A CMP2.x bean related to the relevant EJB application has not been deployed.

If one of the above causes applies, perform the following:

- Edit the XML file created by Interstage Studio

Deploy the environment settings, then use the Interstage Management Console to edit the XML using the preedit module.

If it is necessary to edit the XML before deploying the environment settings, edit the XML in Interstage Studio.

- If an invalid environment variable was set, check the environment variable settings.
- If a CMP2.x bean related to the relevant EJB application has not been deployed, deploy the CMP2.x bean concerned then run the application.

If the above causes do not apply, use the information that is displayed in the message and the *iscollectinfo* command to collect diagnostic information. Send the error information to a Systems Engineer.

## 3.29 EJB6000 to EJB6999

---

This section details the messages with message numbers between EJB6000 and EJB6999.

### 3.29.1 EJB6001

---

#### **EJB: ERROR: EJB6001: The specified option is incorrect: OPTION=%s1**

#### Variable Information

%s1 = Option name

#### Explanation

The specified option is incorrect.

#### System Action

Stops processing.

#### User Action

Correct the specified option, and then reexecute the command.

### 3.29.2 EJB6002

---

**EJB: ERROR: EJB6002: The command does not exist: COMMAND=%s1**

#### Variable Information

%s1 = Command name

#### Explanation

Processing to change the security mode failed because the command shown in the variable information does not exist.

#### System Action

Stops processing.

#### User Action

Confirm that the command shown in the path in the variable information exists.

### 3.29.3 EJB6003

---

**EJB: ERROR: EJB6003: Failed to get the system information.**

#### Explanation

Failed to get the system information.

#### System Action

Stops processing.

#### User Action

Check that a system environment error has not occurred due to, for example, a memory shortage.

### 3.29.4 EJB6004

---

**EJB: ERROR: EJB6004: The target file does not exist: NAME=%s1**

#### Variable Information

%s1 = File name

#### Explanation

The target file does not exist.

#### System Action

Stops processing.

#### User Action

Verify that the file or directory shown in the variable information exists.

### 3.29.5 EJB6005

---

---

**EJB: ERROR: EJB6005: Failed to change the group ownership: GROUP=%s1 FILE=%s2 CODE=%s3****Variable Information**

%s1 = Group name

%s2 = File name

%s3 = Detail code

**Explanation**

Failed to change the group ownership.

**System Action**

Stops processing.

**User Action**

Verify that:

- The group shown in the variable information exists
- The file or directory shown in the variable information exists

Check for system environment errors that may have occurred due to, for example, a memory shortage.

---

**3.29.6 EJB6006**

---

**EJB: ERROR: EJB6006: Failed to change the access authority: NAME=%s1 CODE=%s2****Variable Information**

%s1 = File name

%s2 = Detail code

**Explanation**

Failed to change the access authority.

**System Action**

Stops processing.

**User Action**

Verify that:

- The file or directory shown in the variable information does not exist

Check for system environment errors that may have occurred due to, for example, a memory shortage.

---

**3.30 EJB9000 to EJB9999**

This section details the messages with message numbers between EJB9000 and EJB9999.

---

**3.30.1 EJB9999**

---

**EJB: ERROR: EJB9999: system error occurred: NAME=%s1 CODE=%s2****Variable Information**

%s1 = System error information 1

%s2 = System error information 2

### Explanation

An environment abnormality or system error occurred for some reason

### System Action

Stops processing

### User Action

Refer to "IIServer29999".

# Chapter 4 Messages Beginning with 'ENABLER'

This chapter describes messages with message numbers beginning with 'ENABLER'.

## 4.1 ENABLER9000 to ENABLER9999

This section details messages numbered between ENABLER9000 and ENABLER9999.

### 4.1.1 ENABLER9222

Windows32/64

**ENABLER: ERROR: ENABLER9222: Datastore: %s1 : %s2**

Solaris32/64 Linux32/64

**ENABLER: ERROR: ENABLER9222: Interstage\_Application\_Server: Datastore: %s1 : %s2**

INFO

Solaris32/64 Linux32/64

Interstage\_Application\_Server = This indicates that the message was output from this product. If 'Interstage\_Application\_Server' does not appear in the message, then it might have been output from another product.

#### Variable Information

%s1 = Repository name

%s2 = Detailed information 1

#### Explanation

An error occurred in Interstage data store.

#### System Action

Stops the repository.

Note that if 'Info' or 'Warning' is at the beginning of 'Detailed information 1', the repository has not stopped.

#### User Action

Take appropriate action according to detailed information 1.

Detailed information 1	Explanation and required action
Available space of datastore kernel files became too small, datastore is stopped	%s3 is detailed information 2. Fragmentation occurred in the disk area specified as the database storage area of the repository. This created unusable areas and may have resulted in insufficient disk
Database out of space, file_count=%s3!	Optimize the repository to extend the free space of the disk. For details about optimizing the repository, refer to "Optimizing the Repository" in the Directory Service Operator's Guide. If the above action does not remove the error, check that the size of each repository's data does not exceed the maximum allowable size for Interstage Directory Service. For details about Interstage Directory Service maximum size refer to "Restrictions of Interstage Directory Service" to "Limitations of Capacity" in the Product Notes.
Create of cache failed, %s4	%s4 is detailed information 2. The memory capacity required for the Interstage Directory Service operation is insufficient.
Could not get configuration	Terminate any unnecessary programs to ensure the memory area required for Interstage Directory Service Operation is sufficient, and then restart Interstage Directory Service.

Detailed information 1	Explanation and required action
parameter from broker: error=9358 ! (see %s4 for details).	<p><b>Windows32/64</b></p> <p>If the memory area is still insufficient after terminating unnecessary programs, add more memory or extend the virtual memory.</p>
Malloc of multi lock table failed: %s4	<p><b>Solaris32/64 Linux32/64</b></p>
OS fork failed, %s4	<p>If the memory area is still insufficient after terminating unnecessary programs, add more memory or extend the swap area.</p> <p>For the amount of memory area required for Interstage Directory Service operation, refer to "Memory Requirements" in the Tuning Guide.</p>
CheckLogSpace did not succeed: %s5	<p>%s5 is detailed information 2.</p> <p>The disk capacity required for the Interstage Directory Service operation is insufficient.</p> <p>After ensuring the necessary disk capacity, restart Interstage Directory Service.</p> <p>For the amount of disk area required for the Interstage Directory Service operation, refer to "Disk Space Requirements" in the Tuning Guide.</p>
Couldn't listen() on port number %s6! (see %s7 for details).	<p>%s6 is detailed information 2. %s7 is detailed information 3.</p> <p>The port number assigned to the repository is already used.</p> <p>Change the port number (see detail information 2) for the application currently using it.</p> <p>Alternatively, assign a new port number to the repository, using the omschangeport command below.</p> <p><b>Windows32/64</b></p> <p>%IS_HOME%\Enabler\server\bin\omschangeport.exe "Repository name" -pn "new port number"</p> <p><b>Solaris32/64</b></p> <p>Specify "C" in the LANG environment variable.</p> <p>/opt/FJSVena/server/bin/omschangeport "Repository name" -pn "new port number"</p> <p><b>Linux32/64</b></p> <p>Specify "C" in the LANG environment variable.</p> <p>/opt/FJSVena/Enabler/server/bin/omschangeport "Repository name" -pn "new port number"</p>
Enabler Service: listen() failed on port: %s8.	<p>%s8 is detailed information 2.</p> <p>The port number which the Interstage data store service tried to use is already in use. Change the port number (see detail information 2) for the application currently using it.</p> <p>Alternatively, change the port number used by the Interstage data store service according to the following descriptions:</p> <p><b>Windows32/64</b></p> <p>%IS_HOME%\Enabler\server\bin\omschangeport.exe -u "New port number"</p> <p><b>Solaris32/64</b></p> <p>Set "C" in the LANG environment variable and change the port number in the following command:</p> <p>/opt/FJSVena/server/bin/omschangeport -u "New port number"</p> <p><b>Linux32/64</b></p> <p>Set "C" in the LANG environment variable and change the port number in the following command:</p>

Detailed information 1	Explanation and required action
	<p>/opt/FJSVena/Enabler/server/bin/omschangeport -u "New port number"</p> <p>The procedure to change the port number used by the Interstage data store service is as follows:</p> <ol style="list-style-type: none"> <li>1. Stop other applications that are using the port number displayed in detail information 2.</li> <li>2. Start the Interstage data store service.</li> <li>3. Execute the omschangeport command.</li> </ol>
<p>Datastore: %s9: Size of file %s10 [index:1] is %s11; it must be a multiple of 4096 ! (see %s12 for details).</p>	<p>%s9 is detail information 2, %s10 is detail information 3, %s11 is detail information 4, and %s12 is detail information 5.</p> <p>The repository database file may be corrupt. The repository cannot be started.</p> <p>Refer to the manuals below according to the operation mode, then create the repository again.</p> <ul style="list-style-type: none"> <li>- If the error occurred during an application in stand-alone mode: "Directory Service Operator's Guide", section "Operating and Maintaining Repositories" &gt; "Recovering Repositories" &gt; "Standalone Operation" &gt; "Environment Has been Destroyed"</li> <li>- If the error occurred in a master server repository in replication mode: "Directory Service Operator's Guide", section "Creating a Load Distribution Environment (Replication Mode)" &gt; "Operation Monitoring in Replication Mode and Recovering Repositories" &gt; "Restoring the Master Repository in Replication Mode"</li> <li>- If the error occurred in a slave server repository in replication mode: "Directory Service Operator's Guide", section "Creating a Load Distribution Environment (Replication Mode)" &gt; "Operation Monitoring in Replication Mode and Recovering Repositories" &gt; "Restoring the Slave Repository in Replication Mode"</li> </ul>
<p>Stop datastore because of lack of space</p>	<p>There is not enough disk space for running the repository. Secure the required disk space and restart the repository.</p>
<p>Warning: disc space becomes too small</p>	<p>Disk space stored for the repository is less than 100MB. Secure disk space.</p>
<p>Info: disc space becomes too small</p>	<p>Disk space stored for the repository is less than 1GB. Secure disk space.</p>
<p>Stop datastore because of segment size check</p>	<p>There is not enough datastore space. Optimize the repository and secure datastore space.</p>
<p>Warning message from segment size check</p>	<p>Datastore space is less than 100MB. Optimize the repository and secure datastore space.</p>
<p>Info message from segment size check</p>	<p>Datastore space is less than 1GB. Optimize the repository and secure datastore space.</p>

If the above actions do not remove the error (or if detailed information 1 is other than that shown above), use the iscollectinfo command to collect diagnostic information then contact your service engineer.

# Chapter 5 Messages Beginning with 'es'

This chapter describes the messages sent by the Event Service.

## Note

In Messages Beginning with 'es', ttttt of Message Text shows the maintenance code.

## 5.1 es10000 to es10099

This section details messages numbered between es10000 and es10099.

### 5.1.1 es10010

**ES: INFO: es10010: [ttttt] EventService is not running.**

#### Explanation

Event Service has not been launched.

#### User Action

After launching Event Service, run the process.

### 5.1.2 es10011

**ES: INFO: es10011: [ttttt] EventService is running.**

#### Explanation

Event Service is running.

#### Solaris32/64

#### User Action

If this command is output during the execution of the *isdeletesys* command, execute 'esstop -o off -M system-name' and stop the Event Service.

### 5.1.3 es10012

**ES: ERROR: es10012: [ttttt] Failed to start EventService.**

#### Explanation

Event Service startup failed.

#### System Action

Event Service startup is cancelled.

#### User Action

Refer to the message that was output immediately before this error message to determine the cause of the error. Correct the problem and restart.

Ensure that the user has all the required permissions to access the directories and files under the Interstage installation directory.

#### Windows32/64

If you are not already doing so, execute it with the administrator authority.

### 5.1.4 es10013

---

**ES: ERROR: es10013: [ttttt] Failed to start EventService.: EXCEPTION=%s1, minor=%s2****Variable Information**

%s1 = Exception handling notification from CORBA Service

%s2 = Minor code notified from CORBA Service

**Explanation**

Failed to start Event Service

**System Action**

Event Service startup is cancelled.

**User Action**

Refer to exception information and minor code, eliminate cause of startup failure, and restart.

If this message continues to be displayed after the Event Service was started again, collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

---

**5.1.5 es10014**

---

**ES: ERROR: es10014: [ttttt] Failed to activate EventService.: EXCEPTION=%s1, minor=%s2, pid=%s3****Variable Information**

%s1 = Exception handling notification from CORBA Service

%s2 = Minor code notified from CORBA Service

%s3 = Number of process that failed in activation

**Explanation**

The system failed to activate the Event Service, Event Factory, or Event Channel.

**System Action**

Stops the Event Service, Event Factory, or Event Channel start processing.

**User Action**

Take one of the following actions:

- If the exception information (%s1) is 'NO\_RESOURCES' and the minor code (%s2) is '0x464a0073' when the Event Service is activated, `max_exec_instance` in the config file of the CORBA service (ObjectDirector) may be insufficient. Review the `max_exec_instance` value and restart Interstage with Interstage Management Console.

You can check the `max_exec_instance` consumption with the `odprtcurparam` command. For details about this command, refer to "odprtcurparam" in the "Maintenance Commands" chapter of the Reference Manual (Command Edition).

- If the exception information (%s1) is 'NO\_RESOURCES' and the minor code (%s2) is '0x464a0073' when the Event Channel is activated, `max_exec_instance` in the config file of the CORBA service (ObjectDirector) may be insufficient. Review the `max_exec_instance` value, restart Interstage with Interstage Management Console, and reactivate the event channel with the `esstartchnl` command or Interstage Management Console.

You can check the `max_exec_instance` consumption with the `odprtcurparam` command. For details about this command, refer to "odprtcurparam" in the "Maintenance Commands" chapter of the Reference Manual (Command Edition).

Note: If the value `max_exec_instance` value is insufficient when the Event Channel is activated, the number of Event Channels to be activated simultaneously may exceed the estimated number of Event Channels because there are Event Channels waiting to be stopped in inhibited stop mode. For stop in inhibited stop mode, the Event Channels stop after the event data accumulated in the Event Channels has been acquired or all data has been deleted because the event data survival time elapsed. Check the number of Event Channels activated simultaneously with the `esmonitor` command or Interstage Management Console and re-estimate the `max_exec_instance` value or stop the Event Channels in forced stop mode.

- If the exception information (%s1) is 'NO\_RESOURCES' and the minor code (%s2) is '0x464a0073' when the Event Factory is activated, review the following information and take the appropriate action, as described:

- max\_exec\_instance in the config file of the CORBA service (ObjectDirector) may be insufficient. Review the value set for max\_exec\_instance and restart Interstage using the Interstage Management Console.

You can check the max\_exec\_instance consumption with the *odprtcurparam* command. For details about this command, refer to "odprtcurparam" in the "Maintenance Commands" chapter of the Reference Manual (Command Edition).

- Event Factory stop processing is not completed, and is restarted. A contradiction may occur in the internal information. In this case, since neither start nor stop of Event Factory can be executed, Interstage should be restarted.

To prevent the occurrence of this problem, verify that Event Factory has stopped, and then start it.

1. Verify the status of Event Factory. If it is stopped, there is no problem.

**Windows32/64**

Verify the list of processes in Task Manager. If the "esfactory.exe" process is listed under [Image Name], it means Event Factory is starting.

**Solaris32/64** **Linux32/64**

Execute the *ps* command as shown below. If the "esfactory" process is listed, Event Factory is starting.

```
ps -afe | grep esfactory
```

2. If Event Factory is starting in step 1 above, stop it using the *esstopfctry* command.

```
esstopfctry -o off
```

3. Verify the status of Event Factory again.

If this message continues to be displayed after the Event Service was started again, collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

## 5.1.6 es10015

---

**ES: ERROR: es10015: [ttttt] EventService is not set up.**

### Explanation

Event Service is not set up.

### System Action

The processing stops.

### User Action

Set up the Event Service using one of the methods below.

- Execute the *isinit* command to initialize Interstage.
- Execute the *ismodifyservice* command to add Event Service to the Interstage operating environment.
- Use the Interstage management console to set "Event Service" to "Enable".
- Execute the *essetup* command to set up Event Service.

## 5.1.7 es10016

---

**ES: INFO: es10016: [ttttt] Starting EventService succeeded.: pid=%s1**

### Variable Information

%s1 = Event Service process number

## Explanation

Event Service started up.

### 5.1.8 es10017

---

**ES: INFO: es10017: [ttttt] EventService is being started.**

## Explanation

Event Service is currently being started.

## System Action

Cancels processing of the executed command, and continues Event Service startup processing.

## User Action

After Event Service startup processing is completed, rerun the process.

### 5.1.9 es10018

---

**ES: INFO: es10018: [ttttt] Termination of EventService succeeded.: pid=%s1**

## Variable Information

%s1 = Event Service process number

## Explanation

Event Service is terminated.

### 5.1.10 es10019

---

**ES: INFO: es10019: [ttttt] EventService is being stopped.**

## Explanation

Event Service is currently terminating.

## System Action

Cancels processing of the executed command, and continues Event Service stop processing.

## User Action

After Event Service processing is completed, rerun the process.

**Windows32/64**

A var directory may not exist under the Event Service install directory. If the var directory does not exist, create it and restart the Event Service.

For persistent channel operation, create a dmp directory, mqd directory, and trace directory in the var directory and then restart Event Service.

### 5.1.11 es10020

---

**ES: ERROR: es10020: [ttttt] Failed to stop EventService.: EXCEPTION=%s1 , minor=%s2**

## Variable Information

%s1 = Exception handling notification from CORBA Service

%s2 = Minor code notified from CORBA Service

## Explanation

Event Service stoppage failed.

## System Action

Stops the Event Service stop processing.

## User Action

Take one of the following actions:

- Refer to the message that was output immediately before this error message to determine the cause of the error. Correct the problem and stop the Event Service again.
- If the information message "od10003" was output before this message, the CORBA Service was stopped before the Event Service. The Event Service must be stopped before the CORBA Service.
- If the exception information (%s1) is 'COMM\_FAILURE' and the minor code (%s2) is '0x464a0101', the system may be overloaded. Stop the Event Service again with the *esstop* command or by stopping Interstage forcibly.
- If the exception information (%s1) is 'IDL:CORBA/StExcep/COMM\_FAILURE:1.0' and the minor code (%s2) '0x464a0109' is output with the error message od10918, the value for max\_IIOp\_resp\_con in the CORBA Service environment definition file (config) may be insufficient. Review the max\_IIOp\_resp\_con and correct the problem (The application where the connection is held is stopped, etc.).

Stop the Event Service or the CORBA Service according to the procedure outlined below. The Event Service can be stopped by stopping the CORBA Service.

### Windows32/64

Using the Control Panel service, stop the 'ObjectDirector' service of the CORBA Service.

### Solaris32/64 Linux32/64

Execute the procedure below with system administrator privileges.

1. Set the IS\_CMD\_LOCK environment variable to 'off'.

For bone shell

```
IS_CMD_LOCK=off
export IS_CMD_LOCK
```

2. Stop the CORBA Service.

```
OD_stop
```

3. If you have executed the *isstop -f* command, execute it again.

```
isstop -f
```

4. Clear the IS\_CMD\_LOCK environment variable.

For bone shell

```
unset IS_CMD_LOCK
```

- In other cases, correct the cause of the unsuccessful Event Service stop by referencing the exception information (%s1) and the minor code (%s2) and stop Event Service again.

If this message continues to be displayed despite the above operation, and Event Service cannot be stopped, collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

Restart the system before restarting the Event Service.

## 5.1.12 es10021

---

---

**ES: INFO: es10021: [ttttt] EventChannelGroup(%s1) is being started.**

Variable Information

%s1 = Event Channel Group name

Explanation

After Event Channel Group(%s1 = Event Channel Group name) startup processing is completed, rerun the process.

System Action

Cancels processing of the executed command, and continues Event Channel startup processing.

---

### 5.1.13 es10023

---

**ES: INFO: es10023: [ttttt] Starting EventChannelGroup(%s1) succeeded.: pid=%s2**

Variable Information

%s1 = Event Channel Group name

%s2 = Event Channel Group process number

Explanation

Event Channel Group (%s1 = Event Channel Group name) started up.

---

### 5.1.14 es10024

---

**ES: INFO: es10024: [ttttt] EventChannelGroup(%s1) is not running.**

Variable Information

%s1 = Event Channel Group name

Explanation

After Event Channel Group (%s1 = Event Channel Group name) startup, rerun the process.

---

### 5.1.15 es10025

---

**ES: INFO: es10025: [ttttt] EventChannelGroup(%s1) is running.**

Variable Information

%s1 = Event Channel Group name

Explanation

Event Channel Group (%s1 = Event Channel Group name) is running.

---

### 5.1.16 es10026

---

**ES: ERROR: es10026: [ttttt] Failed to start EventChannel.**

Explanation

Event Channel startup failed.

System Action

Event Channel startup processing will be cancelled.

User Action

Take one of the following actions:

- If this message is output after the event service resources are imported to another server, specify the `-host` option and `-port` option for the import target event service resources when the `esmchnl` command is executed and check that the Event Channel that was created still exists. If it does, delete the Event Channel with the `esrmchnl` command and then re-create it with the `esmchnl` command.
- The directories or files shown below may not exist:
  - A storage directory (`trandir`, `sysdir`, `userdir`) specified in the settings information of the unit that was newly created in the Interstage Management Console, or a file (`estranfile`, `essysmsgfile`, `essysqfile`, `esmsgfile0`, `esuserqfile`) in that directory
  - A storage directory (`trandir`, `sysdir`, `userdir`) specified in the unit definition file when the `esmknunit` command was executed, or a file (`estranfile`, `essysmsgfile`, `essysqfile`, `esmsgfile0`, `esuserqfile`) in that directory

Check whether the above directories and files exist. If they do not all exist, reinstall the Event Service.
- In other cases, refer to the message that was output immediately before this error message to determine the cause of the error. Correct the problem and restart Event Channel.

## 5.1.17 es10027

---

**ES: ERROR: es10027: [ttttt] Failed to start EventChannel.: EXCEPTION=%s1, minor=%s2**

### Variable Information

- %s1 = Exception handling notification from CORBA Service
- %s2 = Minor code notified from CORBA Service

### Explanation

Event Channel startup failed.

### System Action

Stops the Event Channel start processing.

### User Action

Take one of the following actions:

- If the exception information (%s1) is 'COMM\_FAILURE' and the minor code (%s2) is '0x464a0101', the system may be overloaded. Restart the Event Channel with the `esstartchnl` command or Interstage Management Console.
- If the exception information (%s1) is 'IDL:CosNaming/NamingContext/NotFound:1.0', the Event Channel information has been deleted from the Naming Service.

This message is displayed if the Event Channel is started with the `esstartchnl` command or Interstage Management Console after Interstage has been initialized without deleting the Event Channel with the `esrmchnl` command or Interstage Management Console. In this case, delete the Event Channel with the `esrmchnl` command or Interstage Management Console, and recreate it with the `esmchnl` command or Interstage Management Console.

- If the exception information (%s1) is 'IDL:FJ/NameDoesntExist:1.0', the Event Channel information has been deleted from the Implementation Repository.

This message is displayed if the Event Channel is started with the `esstartchnl` command or Interstage Management Console after Interstage has been initialized without deleting the Event Channel with the `esrmchnl` command or Interstage Management Console. In this case, delete the Event Channel with the `esrmchnl` command or Interstage Management Console, and recreate it with the `esmchnl` command or Interstage Management Console.

- If this message is output after the event service resources are imported to another server, specify the `-host` option and `-port` option for the import target event service resources when the `esmchnl` command is executed and check that the Event Channel that was created still exists. If it does, delete the Event Channel with the `esrmchnl` command and then re-create it with the `esmchnl` command.
- In other cases, refer to the message displayed immediately before this message to confirm the cause of the failure, and restart the Event Channel.

- If no first message is displayed, refer to the exception information and the minor code, eliminate the reason for the startup failure, and restart the Event Channel.

If this message continues to be displayed despite the above operation, and the Event Channel cannot be started, collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

## 5.1.18 es10028

---

**ES: INFO: es10028: [ttttt] Termination of EventChannelGroup(%s1) succeeded.:pid=%s2**

### Variable Information

%s1 = Event Channel name

%s2 = Event Channel Group process number

### Explanation

Event Channel Group (%s1 = Event Channel Group name) termination is completed.

### User Action

If this message is displayed without the Event Channel stop command being executed, it could mean that the Event Channel was stopped using the *odctlque* command. Start the Event Channel with the Event Channel start command.

## 5.1.19 es10029

---

**ES: INFO: es10029: [ttttt] EventChannel(%s1) is being stopped.**

### Variable Information

%s1 = Event Channel name

### Explanation

Event Channel (%s1) is now terminating.

### System Action

Cancels processing of the executed command, and continues Event Channel stop processing.

### User Action

The event channel (%s1) may have stopped in the inhibited stop mode. This occurred when the *esstopchnl* command was executed. The event channel contained the event data when this message was output.

Event channels in inhibited stop mode will not stop while they still contain event data. Use the *esstopchnl* command to immediately stop the event channel specifying the forced mode.

In other cases, after Event Channel (%s1 = Event Channel name) termination processing is completed, rerun the process.

## 5.1.20 es10032

---

**ES: ERROR: es10032: [ttttt] EventChannel is not registered.**

### Explanation

Since the Event Channel is not registered, this process cannot be run.

### System Action

The processing stops.

### User Action

Create an Event Channel with the *esmkchnl* command or Interstage Management Console.

If the es10027 message is output as well as this message when the *esstartchnl* command is executed, refer to "5.1.17 es10027".

## 5.1.21 es10033

---

**ES: ERROR: es10033: [ttttt] EventChannel ended abnormally.: CODE=%s1, GROUP=%s2, pid=%s3**

### Variable Information

%s1 = Cause code

%s2 = Group name

%s3 = Event Channel process number

### Explanation

The Event Channel stopped abnormally.

If Cause code (%s1) is "9", possible causes are as follows:

- The EventChannel process may have been stopped forcibly by an external source using the *kill* command.
- The EventChannel may have been forcibly stopped immediately after the persistent channel had been normally stopped.
- The Event Service may have been forcibly stopped immediately after the persistent channel had been normally stopped.

### System Action

The Event channel ends abnormally.

If the Event Channel that ended abnormally is a statically generated channel, the group (%s2) also ends abnormally.

If the Event Channel that ended abnormally is a dynamically generated channel, the Event Channel contained in the process of the Event Channel that ended abnormally also ends abnormally.

### User Action

Take one of the following actions:

- If the EventChannel process was forcibly stopped, then restart the EventChannel.
- If the EventChannel was forcibly stopped immediately after the persistent channel has been normally stopped, then restart the EventChannel.
- If the Event Service was forcibly stopped immediately after the persistent channel has been normally stopped, then restart the Event Service and EventChannel.

In all other cases, collect the following data and diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

#### Windows32/64

- Watson log (output availability and output destination depend on the system environment.)
- User dump (output availability and output destination depend on the system environment.)

#### Solaris32/64

- core file
  - For Default system: in the directory `/var/opt/FJSVes`
  - For Extended system: in the directory `/var/opt/FJSVisas/system/(system name)/FJSVes/var`

#### Linux32/64

- core file (in the directory `/var/opt/FJSVes`)

To restart the job, perform the following:

If the Event Channel that ended abnormally is a statically generated channel, restart it with the *esstartchnl* command or by using the Interstage Management Console.

If the Event Channel that ended abnormally is a dynamically generated channel, restart the application that creates Event Channels (e.g., `EventFactory_create_channel`).

---

## 5.1.22 es10034

---

**ES: ERROR: es10034: [ttttt] The number of EventChannel started exceeded the upper bound.**

### Explanation

Since the number of Event Channel startups has exceeded the upper limit, this Event Channel startup cannot be done.

### System Action

Event Channel startup processing is cancelled.

### User Action

Increase the maximum number of Event Channels that can be started in configuration information or stop unnecessary Event Channels with the `esstopchnl` command or Interstage Management Console. Refer to "essetcnf" or "essetcnfchnl" in the "Event Service Operation Commands" chapter of the Reference Manual (Command Edition) for details on how to set the maximum number of Event Channels that can be started.

You can check the number of Event Channels started simultaneously with the `esmonitor` command or Interstage Management Console.

---

## 5.1.23 es10035

---

**ES: INFO: es10035: [ttttt] Starting EventFactory succeeded.:pid=%s1**

### Variable Information

%s1 = Event Factory process number

### Explanation

Event Factory startup was successful.

---

## 5.1.24 es10036

---

**ES: INFO: es10036: [ttttt] Termination of EventFactory succeeded.:pid=%s1**

### Variable Information

%s1 = Event Factory process number

### Explanation

Event Factory termination is completed.

---

## 5.1.25 es10037

---

**ES: INFO: es10037: [ttttt] EventFactory is running.**

### Explanation

Event Factory is running.

---

## 5.1.26 es10038

---

**ES: INFO: es10038: [ttttt] EventFactory is not running.**

### Explanation

Event Factory is not running.

## User Action

After starting Event Factory, run the process.

## 5.1.27 es10040

---

**ES: ERROR: es10040: [ttttt] EventFactory ended abnormally.: CODE=%s1, pid=%s2**

### Variable Information

%s1 = Cause code

%s2 = Event Factory process number

### Explanation

The Event Factory ended abnormally.

### System Action

The Event Factory ends abnormally.

### User Action

Restart the Event Factory with the *esstartfctry* command or Interstage Management Console.

If this message continues to be displayed and the Event Factory cannot be started even after an attempt has been made to restart the Event Factory, collect the following data and diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

#### Windows32/64

- Watson log (output availability and output destination depend on the system environment.)
- User dump (output availability and output destination depend on the system environment.)

#### Solaris32/64

- core file
  - For Default system: in the directory `/var/opt/FJSVes`
  - For Extended system: in the directory `/var/opt/FJSVisas/system/(system name)/FJSVes/var`

#### Linux32/64

- core file (in the directory `/var/opt/FJSVes`)

## 5.1.28 es10041

---

**ES: ERROR: es10041: [ttttt] Failed to start EventFactory.**

### Explanation

Event Factory startup failed.

### System Action

Event Factory startup processing is cancelled.

### User Action

Confirm the cause of the failure referring to the message output before this message. Eliminate cause of startup failure and restart.

#### Windows32/64

If you are not already doing so, execute it with the administrator authority.

## 5.1.29 es10042

---

**ES: ERROR: es10042: [ttttt] Failed to start EventFactory.: EXCEPTION=%s1**

### Variable Information

%s1 = Exception handling notification from CORBA Service

### Explanation

Event Factory startup failed.

### System Action

Event Factory startup processing is cancelled.

### User Action

Refer to exception information, eliminate cause of startup failure, and restart.

If this message continues to be displayed, and the Event Factory cannot be started even after an attempt has been made to restart the Event Factory, collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

## 5.1.30 es10043

---

**ES: ERROR: es10043: [ttttt] Failed to stop EventFactory.: EXCEPTION=%s1, minor=%s2**

### Variable Information

%s1 = Exception handling notification from CORBA Service

%s2 = Minor code notified from CORBA Service

### Explanation

Failed to stop the Event Factory.

### System Action

Event Factory stop processing is cancelled.

### User Action

Refer to the exception information (%s1) reported from CORBA Service and the minor code (%s2), remove the cause of failure, and stop the Event Factory again.

If this message is still output after re-attempting the stop, collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

## 5.1.31 es10044

---

**ES: ERROR: es10044: [ttttt] EventFactory is not set up.**

### Explanation

Event Factory is not set up.

### System Action

The processing stops.

### User Action

Set up the Event Factory using one of the following methods below.

- Execute the *isinit* command to initialize Interstage.
- Execute the *ismodifyservice* command to add Event Service to the Interstage operating environment.

- Use the Interstage management console to set "Event Service" to "Enable."
- Execute the *essetup* command with the -f option to set up Event Factory.

If the *essetup* command has already been used to set up Event Service, perform one of the actions below.

- If using the Interstage management console, use the *esunsetup* command to delete the Event Service from the system once. After this, use the Interstage management console to set "Event Service" to "Enable."
- If using the *ismodifyservice* command, use the *esunsetup* command to delete the Event Service from the system once. After this, use the *ismodifyservice* command to add Event Service to the Interstage operating environment.
- If using the *essetup* command, execute the *essetup* command with the -f option to set up Event Factory.

### 5.1.32 es10045

---

**ES: ERROR: es10045: [ttttt] EventService is already set up.**

#### Explanation

Event Service is already set up.

#### System Action

The processing stops.

#### User Action

Take one of the following actions:

- If this message is displayed when the *isinit* command is executed, use the following procedure:
  1. Start the CORBA service.
  2. First execute the *esunsetup* command to delete the Event Service from the system.
  3. Stop the CORBA service.
  4. Execute the *isinit* command again.
- If this message is displayed when the *ismodifyservice* command is executed, use the following procedure:
  1. Start the CORBA service.
  2. First execute the *esunsetup* command to delete the Event Service from the system.
  3. Stop the CORBA service.
  4. Execute the *ismodifyservice* command again.
- If this message is displayed when the *essetup* command is executed, the Event Service is already set up, so you need not execute the *essetup* command.

### 5.1.33 es10046

---

**ES: ERROR: es10046: [ttttt] EventFactory is already set up.**

#### Explanation

Event Factory is already set up.

This error could have been caused by one of the following:

- If this message is displayed when the *isinit* command is executed, the Event Service may have already been set up by the *essetup* command.
- If this message is displayed when the *ismodifyservice* command is executed, the Event Service may have already been set up by the *essetup* command.
- If this message is displayed when the Interstage management console is being used to set "Event Service" to "Enable", the Event Service may have already been set up by the *essetup* command.

- If this message is displayed when the *essetup* command is executed, the Event Factory is already set up.

### System Action

The processing stops.

### User Action

Take one of the following actions:

- If this message is displayed when the *isinit* command is executed, follow the procedure shown below. Use the *esstartfctry* command to check whether the Event Factory has already been set up.
  1. Start the CORBA service.
  2. Execute the *esunsetup* command to delete the Event Service from the system.
  3. Stop the CORBA service.
  4. Execute the *isinit* command again.
- If this message is displayed when the *ismodifyservice* command is executed, follow the procedure shown below. Use the *esstartfctry* command to check whether the Event Factory has already been set up.
  1. Start the CORBA service.
  2. Execute the *esunsetup* command to delete the Event Service from the system.
  3. Stop the CORBA service.
  4. Execute the *isinit* command.
  5. Execute the *ismodifyservice* command to set up the Event Service.
- If this message is displayed when the Interstage management console is used to set "Event Service" to "Enable", follow the procedure shown below. Use the *esstartfctry* command to check whether the Event Factory has already been set up.
  1. Start the CORBA service.
  2. Execute the *esunsetup* command to delete the Event Service from the system.
  3. Stop the CORBA service.
  4. Execute the *isinit* command.
  5. Use the Interstage management console to set "Event Service" to "Enable", to set up the Event Service
- If this message is displayed when the *essetup* command is executed, do not execute the *essetup* command. To change the Event Factory settings, follow the procedure shown below.
  1. Delete the Event Factory using the *esunsetup* command with the -f option.
  2. Then execute the *essetup* command with the -f option again, to set up the Event Factory and make your changes.

## 5.1.34 es10047

---

**ES: INFO: es10047: [ttttt]: Termination of EventService setup succeeded.**

### Explanation

Event Service setup was successful.

## 5.1.35 es10048

---

**ES: INFO: es10048: [ttttt] EventService setup information was deleted.**

### Explanation

Event Service setup information was deleted.

### 5.1.36 es10050

---

**ES: ERROR: es10050: [ttttt] Environmental definition of the EventService, the limit was exceeded.(%s1)**

#### Variable Information

%s1 = Parameter name

#### Explanation

Upper limit of Event Service environment definitions has been exceeded.

#### System Action

Does not execute the requests from the client and server. The processing stops.

#### User Action

Increase the value of (%s1 = parameter name) in the Event Service environment information. Refer to the Reference Manual (Command Edition) for details on how to set Event Service environment information.

### 5.1.37 es10051

---

**ES: INFO: es10051: [ttttt] Termination processing of EventService began.**

#### Explanation

Event Service termination processing has been started.

### 5.1.38 es10052

---

**ES: INFO: es10052: [ttttt] Termination processing of EventChannelGroup(%s1) began.**

#### Variable Information

%s1 = Event Channel Group name

#### Explanation

Event Channel Group (%s1 = Event Channel Group name) termination processing has been started.

### 5.1.39 es10053

---

**ES: INFO: es10053: [ttttt] Termination processing of EventFactory began.**

#### Explanation

Event Factory termination processing has been started.

### 5.1.40 es10054

---

**ES: INFO: es10054: [ttttt] EventFactory is being stopped.**

#### Explanation

Event Factory is being stopped.

#### System Action

Cancels processing of the executed command, and continues Event Factory stop processing.

#### User Action

After Event Factory termination processing is completed, re-run the process.

## 5.1.41 es10055

---

**ES: ERROR: es10055: [ttttt] Upper bounds of number of the data which was able to be stored with EventChannel (%s1::%s2) were exceeded.**

### Variable Information

%s1 = Event Channel group name

%s2 = Event Channel name

### Explanation

The upper limit of the number of data items that the Event Channel (%s2) of the Event Channel group name (%s1) is capable of storing has been exceeded.

### System Action

Does not execute processing for requests from the supplier.

### User Action

Take the following actions:

- There is a user who is not pulling the event data. Therefore, the event data is stored in the event channel and the upper limit of the number of data items that the Event Channel is capable of storing may have been exceeded. Check whether there is a consumer who is not pulling the event data in the application.
- The interval during which the supplier pushes event data is longer than the interval during which a consumer pulls event data. Therefore, the event data is stored in the event channel, and the upper limit of the number of data items that the Event Channel is capable of storing may have been exceeded. In the application, check whether the consumer's processing is correct after the event data has been pulled.
- If this message was output after the connection information is recovered using the *esmonitorchnl* command, recover the connection information again using the *esmonitorchnl* command.

In other cases, reset the Event Channel environment using the following procedure.

- Increase the maximum number of data items that can be stored on the Event Channel. Refer to the Reference Manual (Command Edition) for details on how to set the maximum number of data items that can be stored with Event Channel using *essetcnf* command or *essetcnfchnl* command.
- Use the Event Channel block function to stop the event data reserve processing.

Set the Event Channel block function using the following procedure.

#### Using the Event Service operation command

1. Check that the block function can be used in the Event Channel.

The block function can be used with the Event Channel if 'EventChannel blockade function' displays as 'available' when 'essetcnfchnl -d -g (Event Channel group name)' is executed.

The 'available' display means the Event Channel was generated by specifying the following at the time of static generation of the Event Channel (at *esmkchnl* execution).

- -notify (Notification service / JMS)
- -tran (To run the local transaction operation) or -ots (The global transaction operation)
- -ptp (Messaging model: Point-To-Point model)

If the block function cannot be used with the Event Channel, regenerate the Event Channel as follows:

- 1) Stop the Event Channel using the *esstopchnl* command.
- 2) Delete the Event Channel using the *esrmchnl* command.
- 3) Create an Event Channel using the *esmkchnl* command.

Note: The '-notify -tran -ptp' option or the '-notify -ots -persist all -ptp' option must be specified.

4) Set the Event Channel configuration information using the *esetcnfchnl* command.

Note: The '- blockade' (Using the Event Channel block function) option must be specified.

5) Activate the Event Channel using the *esstartchnl* command.

2. If the block function is set to be unavailable for the Event Channel, use the *esetcnf/esetcnfchnl* command to reset the Event Service configuration information. When the *esetcnf/esetcnfchnl* command is executed, the '-threshold' option, '-safety' option, '-blockade' option, and '-unblock' option must be specified.

3. Restart the Event Channel.

```
esstopchnl -g %s1
```

```
esstartchnl -g %s1
```

4. Block the Event Channel according to the following procedure:

```
eschgblock -g EventChannelGroupName -c EventChannelName -b on
```

Unblock according to the following procedure:

```
eschgblock -g EventChannelGroupName -c EventChannelName -b off
```

For more information about the *eschgblock* command, refer to "eschgblock" in the "Event Service Operation Commands" chapter of the Reference Manual (Command Edition).

### Using the Interstage Management Console

1. Check that the block function can be used in the Event Channel.

In the JMS and the Event Service Event Channel Status View page, check that the [Block]/[Unblock] button is displayed in [Control].

If the button is displayed, it means that the following are specified to create the Event Channel when a static generation operating the Event Channel is created.

- [Notification Service]: 'Enable'

- [Local Transactions]: 'Enable'

Or [Global Transactions]: 'Enable'

- [Model]: 'Point-To-Point'

If the block function cannot be used in the Event Channel, re-create the Event Channel according to the following procedure:

1) Click the [Stop] button to stop the Event Channel.

2) Click the [Delete] button to delete the Event Channel.

3) In the [Create a New EventChannel] tab, click Detailed Settings [Show], configure the following settings, and then click the [Create] button

- [Notification Service]: 'Enable'

- [Local Transactions]: 'Enable'

Or [Global Transactions]: 'Enable'

- [Model]: 'Point-To-Point'

4) In the Event Channel Environment Settings page, configure the following settings and then click the [Update] button.

- [Block Operation Mode]: 'Enable the block operation by operation, and disable the automatic block operation.' or 'Enable the operation and the automatic block operation.'

5) In the Event Channel Status View page, click the [Start] button to start the Event Channel.

2. Restart the Event Channel.

In the Event Channel Status View page, click the [Stop] button, and then click the [Start] button.

### 3. Block the Event Channel.

In the JMS and the Event Service Event Channel Status View page, click the [Control] > [Block] buttons.

To unblock the Event Channel, click the [Unblock] button.

#### **Note** Solaris32/64 Linux32/64

If the event data is continuously sent in a state in which the upper limit for data which can be stored was exceeded and this message is output to the Console in large numbers, the Event Channel processing may lag. Change the system message settings (/etc/syslog.conf) so that the error messages are not output to the Console (for details on the system message settings, refer to the operating system manual).

---

## 5.1.42 es10056

---

**ES: INFO: es10056: [ttttt] Termination of EventFactory setup succeeded.**

#### Explanation

Event Factory setup succeeded.

---

## 5.1.43 es10057

---

**ES: INFO: es10057: [ttttt] Setup information of EventFactory was deleted.**

#### Explanation

Event Factory setup information was deleted.

---

## 5.1.44 es10062

---

**ES: INFO: es10062: [ttttt] Termination processing of EventChannel(%s1) began.**

#### Variable Information

%s1 = Event Channel name

#### Explanation

Event Channel (%s1 = Event Channel name) termination processing has started.

---

## 5.1.45 es10063

---

**ES: INFO: es10063: [ttttt] Termination of EventChannel(%s1) succeeded.: pid=%s2**

#### Variable Information

%s1 = Event Channel name

%s2 = Event Channel process number

#### Explanation

Event Channel (%s1 = Event Channel name) termination succeeded.

This message is output when EventChannel (%1) is stopped. If the Event Service application is running, the message is output when the 'destroy' method is called.

---

## 5.1.46 es10064

---

**ES: INFO: es10064: [ttttt] EventChannel(%s1) is not running.**

#### Variable Information

%s1 = Event Channel name

## Explanation

Event Channel (%s1 = Event Channel name) is not running.

## User Action

After Event Channel (%s1 = Event Channel name) startup, rerun the process.

If this message was output after the *eschgblock* command was executed, the Event Channel may not exist. Using the *essrtcfnchnl* command or the Interstage Management Console, verify that the Event Channel exists.

## 5.1.47 es10065

---

**ES: ERROR: es10065: [ttttt] Failed to stop EventService.**

## Explanation

Stopping of the Event Service failed.

## System Action

Event Service stop processing is cancelled.

## User Action

Refer to the message that was output immediately before this error message to determine the cause of the error. Correct the problem then stop the Event Service again.

## 5.1.48 es10066

---

**ES: ERROR: es10066: [ttttt] Failed to stop EventFactory.: CODE=%s1**

## Variable Information

%s1 = Cause code

## Explanation

Stopping of the Event Factory failed.

## System Action

Event Factory stop processing is cancelled.

## User Action

Refer to the message that was output immediately before this error message to determine the cause of the error. Correct the problem then stop the Event Factory again.

If this message continues to occur, collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

## 5.1.49 es10067

---

**ES: ERROR: es10067: [ttttt] Esmonitorchnl is already running.**

## Explanation

The *esmonitorchnl* command cannot be executed because it is already running.

## System Action

Cancels processing of the new *esmonitorchnl* command, and continues processing of the *esmonitorchnl* command currently being executed.

## User Action

After the other *esmonitorchnl* command processing is complete, re-start the command.

### 5.1.50 es10068

---

**ES: ERROR: es10068: [ttttt] Connection information can not be obtained.: EXCEPTION=%s1**

#### Variable Information

%s1 = Exception handling notification from CORBA Service

#### Explanation

Connection information failed to be obtained.

#### System Action

The processing stops.

#### User Action

Refer to the exception information, eliminate the cause of the error, and re-execute the command.

### 5.1.51 es10069

---

**ES: ERROR: es10069: [ttttt] Connection information can not be retrieved.: EXCEPTION=%s1**

#### Variable Information

%s1 = Exception handling notification from CORBA Service

#### Explanation

Connection information failed to be retrieved.

#### System Action

The processing stops.

#### User Action

Refer to the exception information, eliminate the cause of the error, and re-execute the command.

### 5.1.52 es10070

---

**ES: INFO: es10070: [ttttt] Specified connection information is already retrieved.**

#### Explanation

The specified connection information has already been retrieved.

#### User Action

Re-display the connection information and check the current connection information.

### 5.1.53 es10071

---

**ES: INFO: es10071: [ttttt] Disconnection of specified connection succeeded.**

#### Explanation

The specified connection has been disconnected.

### 5.1.54 es10072

---

---

**ES: INFO: es10072: [ttttt] Disconnection of all connections succeeded.**

Explanation

All connections have been disconnected.

### 5.1.55 es10073

---

**ES: INFO: es10073: [ttttt] There is no connection disconnected.**

Explanation

There is no connection disconnected.

### 5.1.56 es10074

---

**ES: INFO: es10074: [ttttt] There is no connection displayed.**

Explanation

There is no connection information to be displayed.

The causes by which this message is output are shown below:

- Either a consumer or a supplier is not connected to the specified Event Channel.
- The specified Event Channel is not activated.
- The specified Event Channel does not exist.

User Action

Check the Event Service status with the Display Event Service Status command (*esmonitor*) or Interstage Management Console.

### 5.1.57 es10075

---

**ES: ERROR: es10075: [ttttt] Unable to retrieve the connection with this command because specified EventChannel is in automatic retrieval mode.**

Explanation

The connection information failed to be retrieved by this command because the specified Event Channel is in automatic retrieval mode.

System Action

The processing stops.

### 5.1.58 es10076

---

**ES: INFO: es10076: [ttttt] Creating EventChannel(%s1) succeeded.: pid=%s2**

Variable Information

%s1 = Event Channel name

%s2 = Event Channel process number

Explanation

Event Channel (%s1) was generated.

### 5.1.59 es10077

---

**ES: INFO: es10077: [ttttt] Start processing of EventService began.**

## Explanation

The start processing of the Event Service commenced.

### 5.1.60 es10078

---

**ES: INFO: es10078: [ttttt] Start processing of EventFactory began.**

## Explanation

The start processing of the Event Factory commenced.

### 5.1.61 es10079

---

**ES: INFO: es10079: [ttttt] Start processing of EventChannelGroup(%s1) began.**

## Variable Information

%s1 = Event Channel Group name

## Explanation

The start processing of the Event Channel Group (%s1) commenced.

### 5.1.62 es10080

---

**ES: ERROR: es10080: [ttttt] Failed to stop processing EventService.: CODE=%s1**

## Variable Information

%s1 = Cause code

## Explanation

Failed to stop Event Service.

## System Action

Event Service stop processing is cancelled.

## User Action

If this message is still output after re-attempting to stop, collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

### 5.1.63 es10085

---

**ES: ERROR: es10085: [ttttt] Failed to stop processing EventChannel(%s1).: EXCEPTION=%s2, minor=%s3**

## Variable Information

%s1 = Event Channel name

%s2 = Exception handling notification from CORBA Service

%s3 = Minor code notified from CORBA Service

## Explanation

Failed to stop the Event Channel.

## System Action

Event Channel stop processing is cancelled.

## User Action

Refer to the exception information (%s2) reported from CORBA Service and the minor code (%s3), remove the cause of failure, and stop the Event Channel again.

If this message is still output after re-attempting to stop, collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

## 5.1.64 es10086

---

**ES: ERROR: es10086: [ttttt] Failed to stop processing EventChannel(%s1).: CODE=%s2**

### Variable Information

%s1 = Cause code

%s2 = Exception handling notification from CORBA Service

### Explanation

Failed to stop the Event Channel.

### System Action

Event Channel stop processing is cancelled.

### User Action

If this message is still output after re-attempting to stop the Event Channel, collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

## 5.1.65 es10087

---

**ES: ERROR: es10087: [ttttt] Failed to stop processing EventChannelGroup(%s1).: EXCEPTION=%s2, minor=%s3**

### Variable Information

%s1 = Event Channel group name

%s2 = Exception handling notification from CORBA Service

%s3 = Minor code notified from CORBA Service

### Explanation

Failed to stop the Event Channel group.

### System Action

Event Channel stop processing is cancelled.

### User Action

Refer to the exception information (%s2) reported from CORBA Service and the minor code (%s3), remove the cause of failure, and stop the Event Channel group again.

If this message is still output after re-attempting to stop, collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

## 5.1.66 es10088

---

**ES: ERROR: es10088: [ttttt] Failed to stop processing EventChannelGroup(%s1).: CODE=%s2**

### Variable Information

%s1 = Event Channel group name

%s2 = Cause code

### Explanation

Failed to stop the Event Channel group.

### System Action

Event Channel stop processing is cancelled.

### User Action

If this message is still output after re-attempting the stop, collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

## 5.2 es10200 to es10299

---

This section details messages numbered between es10200 and es10299.

### 5.2.1 es10201

---

**ES: ERROR: es10201: [ttttt] Failed to start Object Request Broker.: CODE=%s1, EXCEPTION=%s2, minor=%s3, pid=%s4**

#### Variable Information

%s1 = Cause code

%s2 = Exception handling notification from CORBA Service

%s3 = Minor code notified from CORBA Service

%s4 = Number of process that failed in startup.

#### Explanation

Event Service, Event Factory, and Event Channel could not be started.

#### System Action

Stops the Event Service, Event Factory, and Event Channel start processing.

#### User Action

Take one of the following actions:

- If the exception information (%s2) is 'UNKNOWN' and the minor code (%s3) is '0x464a000b', max\_processes of the CORBA Service (ObjectDirectory) config file may be insufficient.

Review the max\_processes value and restart Interstage with Interstage Management Console. If this message is displayed, start the Event Channel that could not be started with the *esstartchnl* command or Interstage Management Console. You can check the config file parameter consumption with the *odprtcurparam* command. For more information about this command, refer to "odprtcurparam" in the "Maintenance Commands" chapter of the Reference Manual (Command Edition).

#### Windows32/64

- If the exception information (%s2) is 'UNKNOWN' and the minor code (%s3) is '0x464a0035' the CORBA service may have not been started. Check the CORBA service status with Interstage Management Console and restart Interstage with Interstage Management Console.

#### Solaris32/64 Linux32/64

- If the exception information (%s2) is 'UNKNOWN' and the minor code (%s3) is '0x464a0016' the CORBA service may have not been started. Check the CORBA service status with Interstage Management Console and restart Interstage with Interstage Management Console.

In other cases, correct the cause of the unsuccessful CORBA start by referencing the CORBA service message displayed before this message, and restart the CORBA service.

If the CORBA service is restarted, but this message continues to be displayed, collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

## 5.3 es10300 to es10399

---

This section details messages numbered between es10300 and es10399.

### 5.3.1 es10301

---

**ES: ERROR: es10301: [ttttt] Environment variable(%s1) does not exist or is invalid.**

#### Variable Information

%s1 = Environment variable

#### Explanation

Environment variable (%s1) is not set or is invalid.

#### System Action

The processing stops.

#### User Action

**Windows32/64**

Set the package directory name correctly in environment variable (%s1).

In the unlikely event that the installation of the product failed, re-install the product.

**Solaris32/64** **Linux32/64**

Set the package directory name correctly in environment variable (%s1).

### 5.3.2 es10302

---

**ES: ERROR: es10302: [ttttt] Group information file(%s1) is destroyed.**

#### Variable Information

%s1 = Group information file name

#### Explanation

The group information file (%s1) has been corrupted. A system error may have occurred.

#### System Action

The processing stops.

#### User Action

Collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

To restore, reconstruct Group information using the *esmkchnl* command after deleting (old) Group information with the *esrmchnl* command. Alternatively, restore the Group information that was saved prior to crashing with the *esrestoresys* command.

### 5.3.3 es10303

---

**ES: ERROR: es10303: [ttttt] Configuration information file(%s1) is destroyed.**

## Variable Information

%s1 = Configuration information file name

## Explanation

The configuration information file has been corrupted. A system error may have occurred.

## System Action

The processing stops.

## User Action

Collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

In order to restore configuration information you should re-define it after resetting it with the -r option of the *esetcnf* command. Otherwise use the *esrestoresys* command to restore the configuration information that was backed up before the file was destroyed.

## 5.3.4 es10304

---

**ES: ERROR: es10304: [ttttt] Unable to access the Configuration information file.: errno=%s1**

## Variable Information

**Windows32/64**

%s1 = Error number of Windows® API

**Solaris32/64 Linux32/64**

%s1 = Error number of system call

## Explanation

Unable to process because configuration information cannot be accessed.

## System Action

The processing stops.

## User Action

Ensure that the user has all the required permissions to access the directories and files under the Interstage installation directory.

In other cases, collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

## 5.3.5 es10305

---

**ES: ERROR: es10305: [ttttt] Failed to access of the file(%s1).: errno=%s2**

## Variable Information

%s1 = File name

**Windows32/64**

%s2 = Error number of Windows® API

**Solaris32/64 Linux32/64**

%s2 = Error number of system call

## Explanation

Cannot process due to failure in accessing the file.

## System Action

The processing stops.

## User Action

When file name (%s1) is 'daemon.bin' and error number (%s2) is '2,' the Event Service may have been stopped again after it was closed. If no other messages appear with this message, there is no problem because the Event Service ended successfully.

Ensure that the user has all the required permissions to access the directories and files under the Interstage installation directory.

In Windows(R), check that the specified unit definition file item (unitid) is not the DOS device name.

In other cases, collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

## 5.3.6 es10306

---

**ES: ERROR: es10306: [ttttt] Failed to access of the group management file.: errno=%s1**

### Variable Information

**Windows32/64**

%s1 = Error number of Windows® API

**Solaris32/64** **Linux32/64**

%s1 = Error number of system call

### Explanation

Processing cannot be performed because the Event Channel group management file (esmnggrp.db) could not be accessed.

### System Action

The processing stops.

### User Action

Take one of the following actions:

- If this message is displayed when the error number (%s1) is '13', the authority of directories and files in the Interstage install directory may have been changed from administrator authority to general user authority. Check if administrator authority is set.
- If this message is displayed when error number (%s1) is '2', the Event Channel group management file may not exist because it was intentionally deleted.

Check if the Event Channel group management file exists. The Event Channel group management file is stored in the following directory.

**Windows32/64**

C:\Interstage\ESWIN\etc\group\esmnggrp.db

**Solaris32/64** **Linux32/64**

/etc/opt/FJSVes/group/esmnggrp.db

If the Event Channel group management file does not exist, take the following action:

- If the Event Service resource is already saved by the *esbackupsys* command, stop the Event Service and manually copy the Event Channel group management file in the saved Event Service resource to the Interstage install directory.
- If this message is displayed when the error number (%s1) is '28', there may be insufficient disk space.

**Windows32/64**

Check whether there is sufficient disk space for the Interstage installation directory.

**Solaris32/64** **Linux32/64**

Check whether there is sufficient disk space for the partition allocated in /etc/opt/FJSVes.

- The permissions required to access the directories and files under the Interstage installation directory may not be set. In this case, set the required permissions.

In other cases, collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

### 5.3.7 es10307

---

**ES: ERROR: es10307: [ttttt] Group management file(%s1) is destroyed.**

#### Variable Information

%s1 = Group management file name

#### Explanation

Group management file (%s1) has been destroyed.

#### System Action

The processing stops.

#### User Action

A system error may have occurred. Collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

### 5.3.8 es10309

---

**ES: INFO: es10309: [ttttt] In this product, NotificationService function can not be used.**

#### Explanation

The Notification Service function cannot be used with this product.

### 5.3.9 es10310

---

**ES: ERROR: es10310: [ttttt] Unit definition binary file(%s1) is destroyed.**

#### Variable Information

%s1 = The unit definition binary file

#### Explanation

The unit definition binary file (%s1) is corrupt.

#### System Action

The processing stops.

#### User Action

Collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

### 5.3.10 es10311

---

**ES: INFO: es10311: [ttttt] The specified function cannot be used in Interstage Application Server.**

#### Explanation

The specified option cannot be used in the Interstage Application Server.

#### System Action

The processing stops.

## User Action

Use an option that is supported in the Interstage Application Server. For details, refer to the Reference Manual (Command Edition).

Before this function can be used, it is necessary to install a product that this function can be specified in. For details about the command options supported in the Interstage Application Server, and the products that this function can be specified in, refer to the Reference Manual (Command Edition).

## 5.3.11 es10312

---

**ES: ERROR: es10312: [ttttt] A system call error occurred during the initialization processing of trace information.: filename=%s1, errno=%s2, process id=%s3**

### Variable Information

%s1 = File name

%s2 = Error number of system call

%s3 = Process ID

### Explanation

Error number (%s2) occurred during the initialization processing of trace information.

### System Action

The processing stops.

### User Action

Take either of the following actions:

- If error number (%s2) is '28', there is a possibility that the disk capacity for /etc/opt/FJSVes is insufficient. Check that there is enough disk capacity for the partition mapped for /etc/opt/FJSVes.
- If error number (%s2) is '5', there is a possibility that an I/O error has occurred in the disk. Check whether a hardware error may have occurred in the disk.

In all other cases, collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

## 5.3.12 es10313

---

**ES: ERROR: es10313: [ttttt] A system call error occurred while processing trace information.: filename=%s1, errno=%s2, process id=%s3**

### Variable Information

%s1 = File name

%s2 = Error number of system call

%s3 = Process ID

### Explanation

Error number (%s2) occurred while processing trace information.

### System Action

The processing stops.

### User Action

Take either of the following actions:

- If error number (%s2) is "28", there is a possibility that the disk capacity for /var/opt is insufficient. Check that there is enough disk capacity for the partition mapped for /var/opt.

- If error number (%s2) is "5", there is a possibility that an I/O error has occurred in the disk. Check whether a hardware error may have occurred in the disk.

In all other cases, collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

### 5.3.13 es10314

---

**ES: ERROR: es10314: [ttttt] The specified function cannot be used in dynamic channel.**

#### Explanation

The specified option cannot be used in dynamic channel.

#### System Action

The processing stops.

#### User Action

Create the Event Channel using *esmchnl* command or the Interstage Management Console, and re-execute the processing.

## 5.4 es10400 to es10499

---

This section details messages numbered between es10400 and es10499.

### 5.4.1 es10402

---

**ES: ERROR: es10402: [ttttt] Shared memory shortage occurred.**

#### Explanation

**Windows32/64**

A memory shortage has occurred.

**Solaris32/64** **Linux32/64**

A shared memory shortage has occurred.

#### System Action

The processing stops.

#### User Action

Close any unnecessary programs, then determine whether sufficient memory space is reserved for Event Service operation.

### 5.4.2 es10403

---

**ES: ERROR: es10403: [ttttt] Enough memory is not available.**

#### Explanation

There is insufficient memory.

#### System Action

The processing stops.

#### User Action

Close any programs that are not being used.

### 5.4.3 es10404

---

---

**ES: ERROR: es10404: [tttttt] Enough memory is not available.: errno=%s1**

Variable Information

%s1 = Cause code

Explanation

Memory shortage has occurred.

System Action

The processing stops.

User Action

Close any programs that are not being used.

## 5.4.4 es10405

---

**ES: ERROR: es10405: [tttttt] Semaphore resource shortage occurred.: CODE=%s1**

Variable Information

%s1 = Cause code

Explanation

A semaphore resource shortage has occurred.

System Action

The processing stops.

User Action

Check that the number of semaphores specified by the system parameter is sufficient.

## 5.4.5 es10406

---

**ES: ERROR: es10406: [tttttt] File system shortage occurred.**

Explanation

There is no free space in the file system.

System Action

The processing stops.

User Action

Delete any unnecessary files to increase free disk space in the file system. Also, determine whether there is sufficient disk space for Event Service operation.

## 5.4.6 es10407

---

**ES: ERROR: es10407: [tttttt] Shared memory is destroyed.**

Explanation

**Windows32/64**

Processing has been interrupted because destruction of data in memory has been detected during access to memory.

**Solaris32/64 Linux32/64**

Processing has been interrupted because destruction of data in shared memory has been detected during access to shared memory.

#### System Action

The processing stops.

#### User Action

Restart the Event Service.

### 5.4.7 es10409

---

**ES: ERROR: es10409: [ttttt] Memory shortage occurred.**

#### Explanation

There is insufficient memory available.

#### System Action

The processing stops.

#### User Action

Close any unnecessary programs, then determine whether sufficient memory space is reserved for Event Service operation.

### 5.4.8 es10410

---

**ES: ERROR: es10410: [ttttt] System resources shortage occurred.: CODE=%s1**

#### Variable Information

%s1 = Detail information

#### Explanation

The system resources are insufficient.

#### System Action

The processing stops.

#### User Action

Re-examine the system resource estimation.

## 5.5 es10500 to es10599

---

This section details messages numbered between es10500 and es10599.

### 5.5.1 es10501

---

**ES: INFO: es10501: [ttttt] Signal was received.: SIGNAL NUMBER=%s1**

#### Variable Information

%s1 = Signal number of received signal.

#### Explanation

Signal has been received.

### 5.5.2 es10502

---

**ES: INFO: es10502: [ttttt] End signal was disregarded.**

## Explanation

Received end signal was disregarded, because the current processing does not allow forced ending.

## 5.6 es10600 to es10699

---

This section details messages numbered between es10600 and es10699.

### 5.6.1 es10601

---

**ES: ERROR: es10601: [ttttt] Failed to register to ImplementationRepository.: EXCEPTION=%s1**

#### Variable Information

%s1 = Error or exception information notified from CORBA Service

#### Explanation

Failed to register in Implementation Repository.

#### System Action

The processing stops.

#### User Action

Take one of the following actions:

- If the error or exception information notified from CORBA Service (%s1) is 'Error:FJ\_ImplementationRep\_create\_impl\_def', information having the same name has already been registered. Refer to "OD\_impl\_inst" in the "CORBA Service Operation Commands" chapter of the Reference Manual (Command Edition) for details of the error notified from CORBA Service.
- If this error occurs while the *esmkchnl* command is being executed, execute the following command to delete the group information registered in the Implementation Repository, then re-execute the *esmkchnl* command.

- For Event Channel in an Event Service

```
OD_impl_inst -d -r "IDL:group name:1.0"
```

- For Event Channel in a Notification Service

```
OD_impl_inst -d -r "IDL:FJNotify/group name:1.0"
```

- If this error occurs while the *isinit*, *ismodify* or *essetup* command is being executed, or when using the Interstage management console to set "Event Service" to "Enable", execute the following commands to delete the information registered in the Implementation Repository:

```
OD_impl_inst -d -r IDL:EventDaemon:1.0
OD_impl_inst -d -r IDL:EventFactory:1.0
OD_impl_inst -d -r IDL:CosEventChannelAdmin/EventChanneln:1.0
(Specify a number in "n" in "EventChanneln:1.0".)
```

Re-execute this process.

- Ensure that the user has all the required permissions to access the directories and files under the Interstage installation directory.
- In other cases, correct the cause of the unsuccessful registration by referencing the error notified from the CORBA Service or the exception information (%s1) and rerun the process.

### 5.6.2 es10602

---

**ES: ERROR: es10602: [ttttt] Failed to register to NamingService.: EXCEPTION=%s1**

## Variable Information

%s1 = Error or exception information notified from CORBA Service

## Explanation

Failed to register in the Naming Service when creating the Event Channel.

## System Action

Event Channel creation processing is cancelled.

## User Action

If the error or exception information notified from CORBA Service (%s1) is 'Error:CosNaming/NamingContext/AlreadyBound:1.0', take one of the following actions:

- The *esmkchnl* command was executed without specifying *-w* option. This causes this message to be outputted while creating the Event Channel using the *esmkchnl* command after registering the Event Channel object reference in the Naming Service using the *essetchnlior* command on the standby node server, while operating of the Cluster Service function. For details of an environmental setting of the cluster service, refer to the High Availability System Guide.
- When this message is output while using the *esmkchnl* command excluding the operation of the Cluster Service function, refer to the contents registered for the displayed Naming Service. Check the object reference detail information registered in the Naming Service in the "EventChannel Group %s1:: EventChannel %s2" binding, and then check whether the registered object reference is required. In EventChannel object references, the interface repository name is registered as "IDL:CosNotifyChannelAdmin/EventChannel:1.0" or "IDL:CosEventChannelAdmin/EventChannel:1.0".

```
odlistns -l
```

If the registered object reference is not required, execute the following command to delete the object reference from the Naming Service and then re-execute the *essetchnlior* command.

```
OD_or_adm -d -n "EventChannel Group:: EventChannel"
```

For details about the *odlistns* and *OD\_or\_adm* commands, refer to "odlistns" and "OD\_or\_adm" in the "CORBA Service Operation Commands" chapter of the Reference Manual (Command Edition).

In other cases, correct the cause of the unsuccessful registration by referencing the error notified from the CORBA Service or the exception information (%s1), and rerun the process.

## 5.6.3 es10603

---

**ES: ERROR: es10603: [ttttt] Failed to delete from ImplementationRepository.: EXCEPTION=%s1**

## Variable Information

%s1 = Error or exception information notified from CORBA Service

## Explanation

Failed to delete from the Implementation Repository.

## System Action

The processing stops.

## User Action

Take one of the following actions:

- Ensure that the user has all the required permissions to access the directories and files under the Interstage installation directory.

- If this message is output while the *esrmchnl* command is being executed and the error or exception information notified from CORBA Service (%s1) is 'Error:RepositoryID delete fails', Event Channel group information may still remain in the Implementation Repository.

After the group with the same name has completely stopped, re-execute the *esrmchnl* command. Refer to "OD\_impl\_inst" in the "CORBA Service Operation Commands" chapter of the Reference Manual (Command Edition) for details of the error notified from CORBA Service.

- If this message is displayed when the Event Channel set enclosed by double quotation marks (") is deleted with the *esrmchnl* command and the error or exception information (%s1) notified from the CORBA service is 'OD: Error: od15009: Implementation Repository ID is not registered.', delete group information from the Implementation Repository by executing the following command:

- For Event Channel in an Event Service

```
OD_impl_inst -d -r "IDL:group name:1.0"
```

- For Event Channel in a Notification Service

```
OD_impl_inst -d -r "IDL:FJNotify/group name:1.0"
```

- In other cases, correct the cause of the unsuccessful registration by referencing the error notified from the CORBA Service or the exception information (%s1) and rerun the process.

## 5.6.4 es10604

---

**ES: ERROR: es10604: [ttttt] Failed to delete from NamingService.: EXCEPTION=%s1, minor=%s2**

### Variable Information

%s1 = Exception handling notification from CORBA Service

%s2 = Minor code notified from CORBA Service

### Explanation

The Event Channel registration name could not be deleted from the Naming Service when the event channel was deleted.

### System Action

Stops the Event Channel deletion processing.

### User Action

Take either of the following measures:

- If exception information (%s1) is 'COMM\_FAILURE', communication with the Naming Service may have failed. Check whether the host name of the Naming Service is correct by executing the *OD\_or\_adm -l* command to display the object reference and to check the host name set in the hosts file.
- In cases other than those described above, refer to exception information (%s1) and minor code (%s2), remove the cause of the failure, and restart processing.

## 5.6.5 es10606

---

**ES: ERROR: es10606: [ttttt] Naming Service is not running.**

### Explanation

Naming Service has not been started.

### System Action

The processing stops.

## User Action

Start the Naming Service.

### 5.6.6 es10607

---

**ES: ERROR: es10607: [ttttt] Failed register to InitialService.**

#### Explanation

Failed to register in initial services.

#### System Action

Processing to set up the Event Service is cancelled.

#### User Action

Take one of the following actions:

- If this message is output while the *essetup* command is being executed, delete Event Factory from *initial\_services* using the *esunsetup* command with the *-f* option and then re-execute the *essetup* command.
- If this message is output while the *isinit* command is being executed, re-execute the *isinit* command.
- If this message is output while the *ismodifyservice* command is being executed, re-execute the *ismodifyservice* command.
- If this message is output while the Interstage management console is being used to set "Event Service" to "Enable", once again use the Interstage management console to re-set "Event Service" to "Enable".

If the *essetup* or *isinit* command was re-executed, and this message continues to display, collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

### 5.6.7 es10608

---

**ES: ERROR: es10608: [ttttt] Failed to delete from InitialService.**

#### Explanation

Failed to delete from *initial\_services* (*init\_svc*).

#### System Action

Processing to delete the Event Service is cancelled.

#### User Action

If this message is output while the *essetup* command is being executed, Event Factory information may still remain in *initial\_services*. Delete Event Factory from *initial\_services* using the *esunsetup -f* command and then re-execute the *essetup* command.

If this message is output while the *isinit* command is being executed, re-execute the *isinit* command.

## 5.7 es10700 to es10799

---

This section details messages numbered between es10700 and es10799.

### 5.7.1 es10701

---

**ES: ERROR: es10701: [ttttt] There is invalid description in parameter(%s1).**

#### Variable Information

%s1 = Parameter name

## Explanation

There is an error in the parameter name or in the corresponding option.

## System Action

Processing of the executed command is cancelled.

## User Action

Specify the parameter and option correctly, and re-execute the command.

Check the option when this message is output following execution of the *esmkchnl* command. The *-persist*, *-unit*, *-tran*, *-ots*, and *-ptp* options have a dependent or exclusive relationship to other options. For details, refer to the Reference Manual (Command Edition).

## 5.7.2 es10702

---

**ES: ERROR: es10702: [ttttt] The parameter(%s1) was doubly specified.**

## Variable Information

%s1 = Parameter name

## Explanation

Parameter has been specified twice.

## System Action

Processing of the executed command is cancelled.

## User Action

Specify the parameter (%s1) just once.

## 5.7.3 es10703

---

**ES: ERROR: es10703: [ttttt] Too many parameters are specified.**

## Explanation

Too many parameters have been specified.

## System Action

Processing of the executed command is cancelled.

## User Action

Do not specify unnecessary parameters.

## 5.7.4 es10704

---

**ES: ERROR: es10704: [ttttt] Indispensable parameters are not specified.**

## Explanation

Parameters have not been specified.

## System Action

Processing of the executed command is cancelled.

## User Action

Specify mandatory parameters.

## 5.7.5 es10705

---

**ES: ERROR: es10705: [ttttt] Parameter(%s1) is insufficient.**

### Variable Information

%s1 = Parameter name

### Explanation

Parameter is insufficient.

### System Action

Processing of the executed command is cancelled.

### User Action

Specify the insufficient parameter (%s1 = parameter name).

Check the option when this message is output following execution of the *esmkchnl* command. The *-persist*, *-unit*, *-tran*, *-ots*, and *-ptp* options have a dependent or exclusive relationship to other options. For details, refer to the Reference Manual (Command Edition).

## 5.7.6 es10706

---

**ES: ERROR: es10706: [ttttt] %s1 option is insufficient.**

### Variable Information

%s1 = Parameter name

### Explanation

The parameter's option is insufficient.

### System Action

Processing of the executed command is cancelled.

### User Action

Specify the option for the parameter (%s1 : parameter name).

## 5.7.7 es10707

---

**ES: ERROR: es10707: [ttttt] Failed to access specified directory(%s1):. errno=%s2**

### Variable Information

%s1 = Folder name

 Windows32/64

%s2 = Error number of Windows® API

 Solaris32/64  Linux32/64

%s2 = Error number of system call

### Explanation

Failed to access the specified folder.

### System Action

The processing stops.

## User Action

Check whether authority has been set for the user that performs operations which require access to the specified directory. If access authority has not been set, set it.

If none of the above items applies, collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

## 5.7.8 es10708

---

**ES: ERROR: es10708: [ttttt] Specified group name does not exist.(%s1)**

### Variable Information

%s1 = Event Channel group name

### Explanation

Specified Event Channel group does not exist.

### System Action

The processing stops.

### User Action

Take one of the following actions:

- If this message is displayed after the Event Channel was deleted using the Interstage Management Console, it is possible that the specified group was deleted by another user or the Interstage JMX service was restarted. In this case, you must recollect Event Channel information. If the specified Event Channel is found as a result of recollecting Event Channel information with Interstage Management Console, rerun the process.
- The Event Channel is not created as an output while starting or deleting the Event Channel, after you register the Event Channel object reference in the Naming Service using the *esetchnl* command. Create the Event Channel using the *esmkchnl* command. For details of an environmental setting of the cluster service, refer to the High Availability System Guide.

In cases other than that described above, check that the specified Event Channel group name is correct.

If the specified Event Channel group does not exist, create it with the *esmkchnl* command or Interstage Management Console.

## 5.7.9 es10709

---

**ES: ERROR: es10709: [ttttt] Specified EventChannel name does not exist.(%s1)**

### Variable Information

%s1 = Event Channel name

### Explanation

Specified Event Channel does not exist in the Event Channel group.

### System Action

The processing stops.

### User Action

Check that the Event Channel name is correct. If you want to include the Event Channel in an Event Channel group, you should use the *esmkchnl* command or Interstage Management Console to re-create an Event Channel group.

## 5.7.10 es10710

---

**ES: ERROR: es10710: [ttttt] Unable to process because specified path name is more than 1024 byte.**

## Explanation

Unable to process because specified path name is more than 1024 bytes.

## System Action

The processing stops.

## User Action

Set the path name to a length of less than 1024 bytes.

## 5.7.11 es10711

---

**ES: ERROR: es10711: [ttttt] Specified parameter is more than the maximum length (%s1)byte.(%s2)**

### Variable Information

%s1 = Maximum length of option for specified parameter.

%s2 = Option for specified parameter.

### Explanation

Option (%s2) for specified parameter is more than the maximum length (%s1) in bytes.

### System Action

Processing of the executed command is cancelled.

### User Action

Verify the maximum length of the option for the parameter, and then specify a value within that range. For further information, refer to the "Event Service Operation Commands" chapter of the Reference Manual (Command Edition).

## 5.7.12 es10712

---

**ES: ERROR: es10712: [ttttt] Specified parameter is more than the maximum value(%s1).( %s2)**

### Variable Information

%s1 = Maximum value of option for specified parameter

%s2 = Option for specified parameter

### Explanation

The option (%s2) for the specified parameter is more than the maximum value (%s1).

### System Action

Processing of the executed command is cancelled.

### User Action

Verify the maximum value of the option for the parameter, and then specify a value within that range. For further information, refer to the "Event Service Operation Commands" chapter of the Reference Manual (Command Edition).

## 5.7.13 es10713

---

**ES: ERROR: es10713: [ttttt] Specified parameter is less than the minimum value(%s1).( %s2)**

### Variable Information

%s1 = Minimum value of option for specified parameter

%s2 = Option for specified parameter

## Explanation

The option (%s2) for the specified parameter is less than the maximum value (%s1).

## System Action

Processing of the executed command is cancelled.

## User Action

Check the minimum value of the option for the parameter, and specify a value within that range. For further information, refer to the "Event Service Operation Commands" chapter of the Reference Manual (Command Edition).

## 5.7.14 es10714

---

**ES: ERROR: es10714: [ttttt] Number(%s1) of arguments is insufficient.**

### Variable Information

%s1 = Number of arguments

### Explanation

Number (%s1) of arguments is insufficient.

### System Action

Processing of the executed command is cancelled.

### User Action

Specify correctly the arguments of the specified command. For further information, refer to the "Event Service Operation Commands" chapter of the Reference Manual (Command Edition).

## 5.7.15 es10715

---

**ES: ERROR: es10715: [ttttt] EventChannel name(%s1) is doubly specified.**

### Variable Information

%s1 = Event Channel name

### Explanation

Event Channel name has been specified twice (%s1)

### System Action

Processing of the executed command is cancelled.

### User Action

Do not specify another Event Channel with the same name within the one group.

## 5.7.16 es10716

---

**ES: ERROR: es10716: [ttttt] Specified group name already registered.(%s1)**

### Variable Information

%s1 = Event Channel group name

### Explanation

Tried to create an Event Channel group with a group name that has already been created.

## System Action

Processing of the executed command is cancelled.

## User Action

Check that the Event Channel group name is correct. If you want to re-create the group, you should delete it first before re-creating it.

## 5.7.17 es10717

---

**ES: ERROR: es10717: [ttttt] Specified EventChannel name already registered.: EventChannel=%s1::%s2**

### Variable Information

%s1 = Event Channel group name

%s2 = Event Channel name

### Explanation

Tried to register the Event Channel object reference of the Event Channel group that has already been created in the Naming Service.

## System Action

Processing of the executed command is cancelled.

## User Action

When you register the Event Channel object reference in the Naming Service using the *esetchnl* command, execute the following commands, and check whether you already registered an object reference of the same name in the Naming Service.

*odlistns -l*

For details on the *odlistns* command, refer to the Reference Manual (Command Edition).

## 5.7.18 es10718

---

**ES: INFO: es10718: [ttttt] There is no group information displayed.**

### Explanation

The specified Event Channel group name does not exist, or else there are no existing Event Channel groups.

## 5.7.19 es10719

---

**ES: INFO: es10719: [ttttt] There is no channel information displayed.**

### Explanation

The specified Event Channel name does not exist, or else there are no existing Event Channels.

The causes by which this message is output are shown below:

- The Event Channel being activated does not exist.
- The specified Event Channel is not activated.
- The specified Event Channel does not exist.

## User Action

Start the Event Channel with the *esstartchnl* command or Interstage Management Console.

Check if the specified Event Channel exists with the *esetchnl* command with the *-d* option or Interstage Management Console.

## 5.7.20 es10720

---

---

**ES: ERROR: es10720: [ttttt] There is no information restored to the specified directory.**

**Explanation**

Tried to restore the environment using the *esrestoresys* command, but there is no information restored to the specified directory.

**System Action**

The *esrestoresys* command processing is cancelled.

**User Action**

Check that the directory name specified in the -d option of the *esrestoresys* command is correct.

---

## 5.7.21 es10721

---

**ES: ERROR: es10721: [ttttt] Specified parameter(%s1) is more than the value specified at(%s2).:value(%s3)**

**Variable Information**

%s1 = Name of parameter that sets initial value

%s2 = Name of parameter that sets maximum value

%s3 = Maximum value set by parameter (%s2)

**Explanation**

Tried to specify a value for parameter (%s1 = parameter that sets initial value) that is more than the value (%s3) of parameter (%s2 = parameter that sets maximum value).

**System Action**

The processing stops.

**User Action**

Reset the initial value in parameter (%s1) so that it is not more than the maximum value (%s3) set by parameter (%s2).

---

## 5.7.22 es10722

---

**ES: ERROR: es10722: [ttttt] Specified parameter(%s1) is less than the value specified at(%s2).:value(%s3)**

**Variable Information**

%s1 = Parameter that sets maximum value.

%s2 = Parameter that sets initial value

%s3 = Initial value set by parameter (%s2)

**Explanation**

Tried to specify a value for parameter (%s1 = parameter that sets maximum value) that is less than the value (%s3) of parameter (%s2 = parameter that sets maximum value).

**System Action**

The processing stops.

**User Action**

Reset the maximum value in parameter (%s1) so that it is more than the initial value (%s3) set by parameter (%s2).

---

## 5.7.23 es10723

---

**ES: INFO: es10723: [ttttt] The parameters that have been set will be valid after the event service is reactivated. Parameters (%s1)**

Variable Information

%s1 = List of parameters that have been set and will be valid after the Event Service is reactivated.

Explanation

Of all the parameters that have been set, the parameters (%s1) will become valid after the Event Service is reactivated.

System Action

Continues the processing.

User Action

Validate the parameters (%s1), and reactivate the Event Service.

---

## 5.7.24 es10724

---

**ES: ERROR: es10724: [ttttt] A value specified in the parameter (%s1) has exceeded or is equal to the value specified in parameter (%s2).:value(%s3)**

Variable Information

%s1 = Parameter name

%s2 = Parameter name

%s3 = Value specified in parameter (%s2)

Explanation

A value larger than the value (%s3) specified in parameter (%s2) was specified for parameter (%s1).

System Action

The processing stops.

User Action

Specify a value smaller than the value specified in parameter (%s2) for parameter (%s1).

---

## 5.7.25 es10730

---

**ES: INFO: es10730: [ttttt] Backup process is starting.**

Explanation

Backup processing of the Event Service started.

---

## 5.7.26 es10731

---

**ES: INFO: es10731: [ttttt] Backup process ended normally.**

Explanation

Backup processing of the Event Service ended normally.

---

## 5.7.27 es10732

---

**ES: ERROR: es10732: [ttttt] Backup terminated abnormally.**

Explanation

Backup processing of the Event Service ended abnormally.

#### System Action

Backup processing is cancelled.

#### User Action

Refer to the error message output simultaneously, remove the error cause, and re-execute the command.

Ensure that the user has all the required permissions to access the directories and files under the Interstage installation directory.

---

### 5.7.28 es10733

---

**ES: INFO: es10733: [ttttt] Restore process is starting.**

#### Explanation

Restore the processing of backup resources for the Event Service started.

---

### 5.7.29 es10734

---

**ES: INFO: es10734: [ttttt] Restore process ended normally.**

#### Explanation

Restore processing of backup resources for the Event Service ended normally.

---

### 5.7.30 es10735

---

**ES: ERROR: es10735: [ttttt] Restore terminated abnormally.**

#### Explanation

Restore processing of backup resources for the Event Service ended abnormally.

#### System Action

Restore processing is cancelled.

#### User Action

Take one of the following actions:

- Ensure that the user has all the required permissions to access the directories and files under the Interstage installation directory.
- If error message es11139 was output at the same time as this message, take action according to [5.11.38 es11139](#) and then re-execute the command. If another message was output, take action according to the message and then re-execute the command.

---

### 5.7.31 es10736

---

**ES: ERROR: es10736: [ttttt] The backup directory does not exist. (PATH=%s1)**

#### Variable Information

%s1 = The backup directory

#### Explanation

The backup directory specified in the command options does not exist.

#### System Action

The processing stops.

#### User Action

Specify the correct backup directory in the command options, then re-execute the command.

## 5.7.32 es10737

---

**ES: ERROR: es10737: [ttttt] The backup resource already exists in the specified directory.**

### Explanation

Because backup resources already exist in the backup directory specified by the command, processing was stopped.

### System Action

The processing stops.

### User Action

It is not permitted to make backup copies to the same directory more than once. Specify the correct backup directory in the command options, then re-execute the command.

## 5.8 es10800 to es10899

---

This section details messages numbered between es10800 and es10899.

### 5.8.1 es10801

---

**ES: ERROR: es10801: [ttttt] System function call error occurred.: Function=%s1, errno=%s2**

#### Variable Information

**Windows32/64**

%s1 = Name of function in which error occurred (Windows® API)

%s2 = Error number of Windows® API

**Solaris32/64 Linux32/64**

%s1 = Name of function in which error occurred (system call name)

%s2 = Error number of system call

#### Explanation

System error has occurred.

#### System Action

The processing stops.

#### User Action

**Windows32/64**

Take one of the following actions:

- If this message is displayed when the command is executed, re-execute the immediately preceding command. If the immediately preceding command was executed, but this message continues to be displayed, restart the Event Service.
- If this message is displayed when Interstage Management Console is used, rerun the immediately preceding process. If the immediately preceding command was executed, but this message continues to be displayed, restart Interstage.
- If the Event Service failed to restart, or this message is output even after the Event Service is restarted, restart the operating system.

If this message is displayed again despite the above operations, collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

**Solaris32/64 Linux32/64**

Refer to the table below and take action for function (%s1) and error number (%s2), and re-execute the command.

Function (%s1)	Error number (%s2)	Meaning	Required Action
fork1	12	The swap area may be insufficient.	Expand the swap area or about one minute and rerun the command.
getnameinfo	-2	There is a possibility that the host name cannot be resolved from IP address.	Check the content of the hosts file.
getaddrinfo/ getnameinfo	-	The network environment settings may be invalid.	Check the network environment, and remove the error cause.
mkstemp	30	<b>Linux32/64</b>  There might not be authority written in the directory which executes the command.	<b>Linux32/64</b>
msgctl	-	If the information message es10924 (Event Service Information( %s1): "msgget return 0") is output immediately before, IPC resources which cannot be re-used still remain, and therefore the Event Service did not run.	If the information message es10924 (Event Service Information (%s1): "msgget return 0") is output immediately before, restart the operating system.
open/shmat	13	The authority of the modules or directories in the Event Service install directory, and the authority of the owner and group, may have been changed from administrator authority to general user authority.	Check if administrator authority is set.
pthread_create	12	<b>Linux32/64</b>  There may be insufficient memory.	<b>Linux32/64</b>  Close unnecessary programs, check whether sufficient memory has been reserved for Event Service operations, and extend the memory if necessary. If there is no problem with the memory, wait for a while then re-execute.
semctl	-	If the information message es10924 (Event Service Information (%s1): "semget return 0") is output immediately before, IPC resources which cannot be re-used still remains, and therefore the Event Service did not run.	If the information message es10924 (Event Service Information (%s1): "semget return 0") is output immediately before, restart the operating system.
shmctl	-	If the information message es10924 (Event Service Information (%s1): "shmget return 0") is output immediately before, IPC resources which cannot be re-used still remains, and therefore the Event Service did not run.	If the information message es10924 (Event Service Information (%s1): "shmget return 0") is output immediately before, restart the operating system.
shmget	22	<b>Solaris32/64</b>  The system parameter shared-memory may be insufficient or '1' is not set as	<b>Solaris32/64</b>  Set the system resources correctly and reboot the system. Refer to the "System Tuning" chapter of the Tuning Guide for system resource details.

Function (%s1)	Error number (%s2)	Meaning	Required Action
		the Minimum segment size of shared memory (shmmin).	
		<b>Linux32/64</b> The system parameter shared-memory may be insufficient.	<b>Linux32/64</b> Set the system resources correctly, and execute 'sysctl -p /etc/sysctl.conf' or reboot the system. Refer to the "System Tuning" chapter of the Tuning Guide for system resource details.
All other numbers		-	If this message is displayed when the command is executed, re-execute the immediately preceding command. If the immediately preceding command is executed, but this message continues to be displayed, restart the Event Service.  If this message is displayed when Interstage Management Console is used, rerun the immediately preceding process. If the immediately preceding command is executed, but this message continues to be displayed, restart Interstage.

If this message is displayed again despite the above operations, collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

## 5.8.2 es10802

**ES: ERROR: es10802: [ttttt] Communication error occurred.: EXCEPTION=%s1, minor=%s2**

### Variable Information

%s1 = Exception handling notification from CORBA Service

%s2 = Minor code notified from CORBA Service

### Explanation

An exception occurred during CORBA communication.

### System Action

The processing stops.

### User Action

Take one of the following actions:

- If the system failed to start the Event Channel, this message may be displayed with exception information (%s1) of 'NO\_IMPLEMENT' and a minor code (%s2) of '0x464a0880' because CORBA Service communication is used to confirm that the Event Channel is started. By removing the cause of the Event Channel start failure, the output of this message is suppressed. Take action corresponding to the Event Service error message displayed immediately after this message.

- Take the following actions if the (%s1) variable displays 'COMM\_FAILURE' and the minor code variable (%s2) displays '0x464a09ec' is the code that indicates that the dynamic event channel failed to start:
  - If the event channel communication path is set with multiple IP addresses, the port number may be incorrect. One of the following, which is the CORBA service port number, should be specified in the port number.
    - When SSL communication is invalid:
      - 'Corba Port Number' in the Interstage operating environment definition file
      - 'IIOP\_port' in the CORBA Service config file
    - When SSL communication is effective:
      - 'SSL Port Number' in the Interstage operating environment definition file
      - 'UNO\_IIOP\_ssl\_port' in the CORBA Service config file
  - If a local host name has been specified in the hosts file, the content of the hosts file may be incorrect. Check that the content defined in the hosts file is correct. For details on entering information in the hosts file, refer to "Entering Information in the Hosts File" in the "Common Notes for Interstage" chapter of the Product Notes.
  - If a normal stop was performed for the Event Channel immediately before this message was output, stop processing for the Event Channel may not have completed. Change the Event Channel stop method to forced stop. Alternatively, start the Event Channel after the es10028 INFO message is output in the event log.
  - In Solaris and Linux, restart the system if the *OD\_kill* or *odrmipc* commands were executed while Interstage was running.
  - In all other cases, refer to the exception information (%s1) and the minor code (%s2) to correct the cause of the communication error and rerun the command.

If this message is displayed again despite the above operations, collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

### 5.8.3 es10803

**ES: ERROR: es10803: [ttttt] System error occurred.: CODE=%s1, EXCEPTION=%s2**

#### Variable Information

%s1 = Cause code

%s2 = Internal API error information

#### Explanation

An internal API call error occurred.

#### System Action

The processing stops.

#### User Action

Take one of the following actions:

- If the cause code (%s1) is '2' and the internal API error information (%s2) is 'log' or 'open log', the var directory may not exist under the Event Service install directory. If the var directory does not exist, create it and then restart the Event Service, or restart Interstage with Interstage Management Console.
 

For persistent channel operation, create a dmp directory, mqd directory, and trace directory in the created var directory and then restart Event Service with the *esstart* command, or restart Interstage with Interstage Management Console.
- In cases other than that described above, collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

If the error recurs, record the cause code (%s1) and exception information (%s2) and contact the System Administrator.

**Solaris32/64** **Linux32/64**

Take one of the following actions:

- If cause code (%s1) is '157' and the internal API error information (%s2) is 'log' or 'open log', a system resource (IPC) may be insufficient. Specify the correct system resources, reboot the system, and then restart the Event Service. For more information about system resources, refer to the Tuning Guide.
- If cause code (%s1) is '90' and the internal API error information (%s2) is 'log' or 'open log', the var directory may not exist under the Event Service install directory. If the var directory does not exist, create it and then restart the Event Service or restart Interstage with Interstage Management Console.

For persistent channel operation, create a dmp directory, mqd directory, and trace directory in the created var directory and then restart Event Service with the *esstart* command or restart Interstage with Interstage Management Console.

- In cases other than that described above, collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

## 5.8.4 es10804

---

**ES: ERROR: es10804: [ttttt] Internal error(%s1) occurred.: CODE=%s2**

### Variable Information

%s1 = Function name

%s2 = Cause code

### Explanation

Internal conflict has occurred.

### System Action

The processing stops.

### User Action

Take the following actions:

- When a persistent channel operation event channel is started, the es10055 error message is output before this message. The function name (%s1) is 'es\_ecc\_htable\_add', and the cause code (%s2) is '27'. This may occur if the number is changed for the data stored for the persistent channel operation event channel.

- **Windows32/64**

When a persistent channel operation event channel/event service is started, this message is output. The function name (%s1) is 'QM program error' and the cause code (%s2) is '12', or the function name (%s1) is 'es\_ecc\_htable\_add' and the cause code (%s2) is '4'. This may occur if the unit is made again though existed for the unit the event channel. Delete and recreate the persistent channel operation event channel.

- **Solaris32/64** **Linux32/64**

If the function name (%s1) is 'es\_ecc\_dequeue' and the cause code (%s2) is '4', a system resource (IPC) may be insufficient. Specify the correct system resources, reboot the system, and then re-execute. For more information about system resources, refer to the Tuning Guide.

- When a persistent event channel is transmitted, and this message is output with function name (%s1) set to 'ProxyConnectChk' or "es\_ecc\_obtain", and cause code (%s2) set to '40', check the settings of the unit used in the Interstage Management Console or the definition values in the unit definition file specified when the *esmunit* command was executed. Use the procedure described below for the latter.

Note that if the definition values are valid, the problem may result from residual unnecessary consumer/supplier connection information. In this case, use the *esmonitor* command or the Interstage Management Console to check that the application's reception processes are not blocked. From the Interstage Management Console, on the [EventChannels : View Status] page check

[No. of Messages in Topic or Queue], [No. of Producer Connections], and [No. of Consumer Connections]. If connection information remains that is not required, delete it using the *esmonitorchnl* command.

#### When using the Event Service operation command

1. While the Event Service is running, execute the *esmonitor -unit* command and check the use rate of the unit's persistent files displayed under 'Use Rate (sys)'.
2. If the use rate of all persistent files checked in step 1 is 90% or more, check the *sysize* settings in the unit definition file that were specified using the *esmkunit* command. If these estimates are not appropriate, revise them. For details on making estimates, refer to "esmkunit" in the "Event Service Operation Commands" chapter of the Reference Manual (Command Edition).

Note that it is possible to monitor the use rate of persistent files using *syswarning* in the unit definition file. For more details, refer to "esmkunit" in the "Event Service Operation Commands" chapter of the Reference Manual (Command Edition).

3. Using the *esstopchnl* command, temporarily stop all Event Channels that are assigned to the unit.

Note that, Event Channels that are assigned to the unit are those Event Channels whose unit name is output in the item *unitid* when *esstcfnchnl -d* is executed.

4. Using the *esrmchnl* command, temporarily delete all Event Channels that are assigned to the unit.
5. Using the *esrmunit* command, delete the unit.
6. Using the *esmkunit* command, recreate the unit.
7. Using the *esmkchnl* command, recreate all of the Event Channels deleted in step 4.

#### When using Interstage Management Console

1. While the Event Service is running, check [System Usage(%)] in Unit Info(Monitoring) of the Stores(Unit) page.
2. If [System Usage(%)] checked in step 1 is 90% or more, the value of [Size of System (for Unit Control) File] displayed in the Unit Info page may not be sufficient.

Note that, if the unit was created from Interstage Management Console, [System Usage(%)] is monitored with a safety value of 70% and a warning value of 90%. If the use rate reaches or exceeds 90%, WARNING message es20003 is output and the status of the persistent file is set to Warning. If the use rate of the message storage area subsequently drops to 70% or less, INFO message es20004 is output and the Warning status is cancelled.

3. From the JMS or the Event Service View Status of EventChannels page, forcibly stop all Event Channels that are using the unit.
4. From the JMS or the Event Service View Status of EventChannels page, delete all Event Channels that are using the unit.
5. Delete the Stores (Unit).
6. Recreate the Stores (Unit). Specify the values calculated in step 2 for [Size of System (for Unit Control) File].
7. Recreate all of the event channels deleted in step 4.

In cases other than that described above, collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

## 5.8.5 es10805

---

**ES: INFO: es10805: [tttttt] Logging file was made.**

#### Explanation

Log file was created.

For an explanation of messages output to the log file, the log file location, and what to do following an error, refer to "Log Messages of the Event Service" in the "Messages Output by the Event Service" chapter.

## 5.8.6 es10806

---

---

**ES: WARNING: es10806: [ttttt] The EventChannel (%s1::%s2) AliveTime was not updated. : pid=%s3, count=%s4**

#### Variable Information

%s1 = Event Channel group name

%s2 = Event Channel name

%s3 = Process number of the Event Channel

%s4 = Retry Count

#### Explanation

The EventChannel AliveTime was not updated.

If 'AliveTime' is updated, there is a possibility that processing was delayed because of the system load. Check the system environment settings if necessary.

#### System Action

The processing continues.

#### User Action

Take the following actions:

- After this message is outputted, execute the *esmonitor* command when the time set for 'Error detection interval' (-dtime option of the *esetcnf* command (Default: 5 seconds)) time is exceeded, and check whether 'AliveTime' is updated.
- If necessary, check the system environment settings.

### 5.8.7 es10807

---

**ES: ERROR: es10807: [ttttt] The EventChannel (%s1::%s2) AliveTime was not updated. Use the batch information collection tool (the "iscollectinfo" command) to collect resources for investigation. Send the resources to a Systems Engineer. : pid=%s3**

#### Variable Information

%s1 = Event Channel group name

%s2 = Event Channel name

%s3 = Process number of the Event Channel

#### Explanation

The EventChannel AliveTime was not updated.

#### System Action

The processing continues.

#### User Action

After this message is outputted, execute the *esmonitor* command when the time set for 'Error detection interval' (-dtime option of the *esetcnf* command (Default: 5 seconds)) time is exceeded, and check whether 'AliveTime' is updated.

If 'AliveTime' is updated, there is a possibility that processing was delayed because of the system load. Check the system environment settings if necessary.

If 'AliveTime' is not updated, collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

### 5.8.8 es10810

---

**ES:ERROR:es10810: [ttttt] Could not get IPC resource due to duplicated key.(key=%s1, path=%s2)**

## Variable Information

%s1 = Key value

%s2 = Pathname

## Explanation

Because the IPC resource required for command execution was in use, it could not be acquired.

If the Event Service ends abnormally, and this message is output after the Event Service was restarted and the maintenance code [ttttt] is [602240], it does not mean that there is a problem because the IPC resources which were being used have been reacquired anyway.

## System Action

One of the following processing types will be performed:

- If maintenance code [ttttt] is [602240], processing is continued.
- In cases other than that described above, processing of the executed command is cancelled.

## User Action

Take the following actions:

- If the Event Service ends abnormally, and this message is output after the Event Service was restarted and the maintenance code [ttttt] is [602240], there is no need to take any action.
- In cases other than that described above, because the IPC key values for acquiring IPC resources are duplicated, they need to be customized. For details, refer to the Tuning Guide.

If this problem is not resolved by customizing the IPC key value, the Event Service IPC resources may still remain - recover the remaining Event Service IPC resources by using the *esrmipc* command (for details, refer to the Reference Manual (Command Edition)).

## 5.8.9 es10811

---

**ES: ERROR: es10811: [ttttt] Value in ipc\_key files overlaps.**

### Explanation

The value of the Interstage common definition file (*ipc\_key*) set for the default system and that set for the extended system are duplicated.

### System Action

Processing of the executed command is cancelled.

### User Action

The value of the Interstage common definition file (*ipc\_key*) set for the default system and that set for the extended system must be different. For details of the Interstage common definition file (*ipc\_key*), refer to the Tuning Guide.

## 5.8.10 es10812

---

**ES:INFO:es10812: [ttttt] The IPC resources obtained by the EventService have already been recovered.**

### Explanation

The IPC resources obtained by the Event Service have already been recovered.

### User Action

If the error message 'es010810' is displayed after reactivating the Event Service, customize the IPC key values because the IPC key values are duplicated in other applications or non-Interstage products. For details on IPC key values, refer to the Tuning Guide.

## 5.8.11 es10813

---

**ES:INFO:es10813: [ttttt] Collection of the IPC resources obtained by the EventService has been completed. Alternatively, the IPC resources obtained by the EventService have already been collected.**

### Explanation

Collection of the IPC resources obtained by the Event Service has been completed. Alternatively, the IPC resources obtained by the Event Service have already been collected.

### User Action

If the error message 'es010810' is displayed after reactivating the Event Service, customize the IPC key values because the IPC key values are duplicated in other applications or non-Interstage products. For details on IPC key values, refer to the Tuning Guide.

## 5.9 es10900 to es10999

---

This section details messages numbered between es10900 and es10999.

### 5.9.1 es10901

---

**ES: ERROR: es10901: [ttttt] The service is already registered.: ServiceName=%s1**

#### Variable Information

%s1 = Name of service that you tried to register

#### Explanation

Service has already been registered.

#### System Action

The processing stops.

#### User Action

Take one of the following actions:

- If this message is output while the *essetup* command is being executed, execute the *esunsetup* command, and then re-execute the *essetup* command.
- If this message is output while the *isinit* command is being executed, re-execute the *isinit* command.
- If this message is output while the *ismodifyservice* command is being executed, re-execute the *ismodifyservice* command.
- If this message is output while the Interstage management console is being used to set "Event Service" to "Enable", use the Interstage management console to re-set "Event Service" to "Enable".

### 5.9.2 es10902

---

**ES: ERROR: es10902: [ttttt] The service is not registered.: ServiceName=%s1**

#### Variable Information

%s1 = Name of service you tried to delete

#### Explanation

Service has not been registered.

#### System Action

The processing stops.

## User Action

Take one of the following actions:

- If this message is output while the *esunsetup* command is being executed, take the following actions:
  - If the service name is 'EventFactory', execute the *essetup* command with the -f option, and then delete EventFactory using the *esunsetup* command with the -f option again.
  - If the service name is 'EventService', execute the *essetup* command, and then delete EventService using the *esunsetup* command.
- If the Event Service was set up using the *essetup* command, and this message is output while the *isinit* command is being executed, take the following actions:
  - If the service name is 'EventFactory', execute the *essetup* command with the -f option, and then re-execute the *isinit* command.
  - If the service name is 'EventService', execute the *essetup* command, and then re-execute the *isinit* command.
- If the Event Service was set up using a method other than the *essetup* command, and this message is output while the *isinit* command is being executed, do the following. Execute the *ismodifyservice* command with the -a ES option once, this will add the Event Service to the Interstage operating environment, and then, execute the *ismodifyservice* command with the -d ES option to delete the Event Service from the Interstage operating environment.
- If this message is output while the *ismodifyservice* command is being executed, execute the *ismodifyservice* command with the -a ES option once, this will add the Event Service to the Interstage operating environment, and then, execute the *ismodifyservice* command with the -d ES option, to delete the Event Service from the Interstage operating environment.
- If this message is output while the Interstage management console is being used to set "Event Service" to "Disable", use the Interstage management console to set "Event Service" to "Enable", and then, use the Interstage management console again to re-set "Event Service" to "Disable."

### 5.9.3 es10903

---

**ES: ERROR: es10903: [ttttt] Unable to delete because EventService is being started.**

#### Explanation

Cannot delete because Event Service is being started.

#### System Action

The processing stops.

#### User Action

Repeat processing after terminating Event Service.

### 5.9.4 es10904

---

**ES: ERROR: es10904: [ttttt] Unable to delete because EventFactory is being started.**

#### Explanation

Cannot delete because Event Factory is being started.

#### System Action

The processing stops.

#### User Action

Repeat processing after terminating Event Factory

### 5.9.5 es10905

---

---

**ES: ERROR: es10905: [ttttt] There is no permission to access.**

**Explanation**

There are no access rights.

**System Action**

The processing stops.

**User Action**

Repeat processing with a user account that has administrator's access rights.

---

## 5.9.6 es10924

---

**ES: INFO: es10924: [ttttt] Information message of ObjectDirector EventService.: %s1, pid=%s2**

**Variable Information**

%s1 = Event Service information

%s2 = Process number of the Event Service

**Explanation**

An Event Service information message was output during execution of process number (%s2).

**User Action**

Take the following actions:

- If 'es\_ecq\_qmerr\_set() qm\_code=27' is output in the Event Service information (%s1), check the settings of the unit used from the Interstage Management Console or the definition values of the unit definition file specified when the *esmkunit* command was executed. Use the procedure described below for the latter.

Note that if the definition values are valid, the problem may result from residual unnecessary event data or consumer/supplier connection information. In this case, use the *esmonitor* command or the Interstage Management Console to check that the application's reception processes are not blocked. From the Interstage Management Console [EventChannels : View Status] page check [No. of Messages in Topic or Queue], [No. of Producer Connections], and [No. of Consumer Connections]. If connection information remains that is not required, delete it using the *esmonitorchnl* command.

**When using the Event Service Operation Command**

1. While the Event Service is running, execute the *esmonitor -unit* command and check the use rate of the unit's persistent files displayed in 'Use Rate (sys/user)'.  
2. If the use rate of all of the persistent files checked in step 1 is 90% or more, check the *sysize* and *userqsize* settings in the unit definition file specified that were specified using the *esmkunit* command. If these estimates are inappropriate, revise them. For details on making estimates, refer to "esmkunit" in the "Event Service Operation Commands" chapter of the Reference Manual (Command Edition).

Note that it is possible to monitor the use rate of persistent files using *syswarning* and *userwarning* in the unit definition file. For more details, refer to "esmkunit" in the "Event Service Operation Commands" chapter of the Reference Manual (Command Edition).

3. Using the *esstopchnl* command, temporarily stop all Event Channels that are assigned to the unit.

Note that Event Channels that are assigned to the unit are those Event Channels whose unit name is output in the item *unitid* when *esetcnfchnl -d* is executed.

4. Using the *esrmchnl* command, temporarily delete all Event Channels that are assigned to the unit.
5. Using the *esrmunit* command, delete the unit.
6. Using the *esmkunit* command, recreate the unit.
7. Using the *esmkchnl* command, recreate all of the Event Channels deleted in step 4.

**When using Interstage Management Console**

1. While the Event Service is running, check [System Usage(%)] and [Event Data Usage(%)] in the Unit Info(Monitoring) of the Stores(Unit) page.

2. If [System Usage(%)] is 90% or more, the value of [Size of System (for Unit Control) File] displayed in the Unit Info page may not be sufficient.

If [Event Data Usage(%)] is 90% or more, the value of [Size of Event Data File] displayed in the View Status of EventChannels page may not be sufficient.

Note that if the unit was created from the Interstage Management Console, [System Usage(%)] and [Event Data Usage(%)] are monitored with a safety value of 70% and a warning value of 90%. If the use rate reaches or exceeds 90%, WARNING message es20003 is output and the status of the persistent file is set to Warning. If the use rate of the message storage area subsequently drops to 70% or less, INFO message es20004 is output and the Warning status is rescinded.

3. From the JMS or the Event Service View Status of EventChannels page, forcibly stop all Event Channels that are using the unit.

4. From the JMS or the Event Service View Status of EventChannels page, delete all Event Channels that are using the unit.

5. Delete the Stores (Unit).

6. Recreate the Stores (Unit). Specify the values calculated in step 2 for [Size of System (for Unit Control) File] and [Size of Event Data File].

7. Recreate all of the event channels deleted in step 4.

- If 'es\_ecq\_qmerr\_set() qm\_code=74' is output in the Event Service information (%s1), the number of messages that have been operated in one transaction might have exceeded the upper limit (8192).

- Check whether large amounts of event data have been sent/received in one transaction.

- If 'es\_ecq\_qmerr\_set() qm\_code=75' is output in the Event Service information (%s1), then the message size operated in a transaction may have exceeded the definition value of the maximum message size.

**Windows32/64**

Check whether to send and receive event data of a large size or a large amount of number of event data in a transaction.

**Solaris32/64 Linux32/64**

Check whether to send and receive event data of a large size or a large amount of number of event data in a transaction. Or, increase the maximum message size according to the following procedures.

#### **When using the Event Service operation command**

Check the tranunitmax settings in the unit configuration file specified in the *esmkunit* command, and change them if necessary. For details, refer to "esmkunit" in the "Event Service Operation Commands" chapter of the Reference Manual (Command Edition).

To change the value of tranunitmax, follow the procedure below:

1. Use *esstopchnl* to temporarily stop all Event Channels assigned to the unit (the ones which unit names are displayed by 'esetcnfchnl -d' in the item unitid).
2. Use *esrmchnl* to temporarily delete all Event Channels assigned to the unit.
3. Use *esrmunit* to delete the unit.
4. Use *esmkunit* to recreate the unit.
5. Use *esmkchnl* to recreate all the Event Channels deleted by *esrmchnl*.

#### **When using Interstage Management Console**

Check the value of [Maximum Message Size per Transaction] displayed in the Unit Info page.

To change the value of [Maximum Message Size per Transaction], follow the procedure below:

1. From the JMS or the Event Service View Status of EventChannels page, forcibly stop all Event Channels using the unit.
2. From the JMS or the Event Service View Status of EventChannels page, delete all Event Channels using the unit.
3. Delete the Stores (Unit).

4. Recreate the Stores (Unit). Specify the values calculated in step 2 for [Size of System (for Unit Control) File] and [Size of Event Data File].

5. Recreate all event channels deleted in step 3.

- If 'es\_ecq\_ots\_prepare() esn\_mon\_2pc\_tableSet err=13' is output in the Event Service information (%s1), communication may have been attempted for a number of global transactions exceeding the Event Service's limit for simultaneous execution. Using the *esetcnf* command or from the Interstage Management Console, check the 'Number of global transactions that can be concurrently executed' and, if necessary, increase the value. For details on using the *esetcnf* command, refer to "esetcnf" in the "Event Service operation Commands" chapter of the Reference Manual (Command Edition).
- If 'rw\_tryrdlock() rtn = 16' is output in the Event Service information (%s1), Event Service processing may be slow due to high system load. Check the system status.

If this message is output, the following problems may occur:

- An increase in the 'pull' method data wait time
- An increase in the transaction timeout
- An increase in deletion of timed out event data
- If 'WriteFile(pipe) error %d' or 'User log write error %d' is output in the Event Service information (%s1), it could mean that the system load was high and therefore the process to output Event Service log messages might have failed. If the following log messages were output in succession to the Event Service log file, then take action according to each log message:
  - Event data not queuing (consumer not connected)
  - Event data not queuing (queuing maxvalue over)
- If 'Err/The communication to esstart went wrong. CODE=22' is output in the Event Service information (%s1), the event channel group object reference might not have been registered in the naming service. Use the *odlistns* command (for details, refer to the Reference Manual (Command Edition)) to check it, and register the object reference if necessary. In cluster systems, import/export the event channel object reference and register the object reference in the naming service:

```
odlistns -l
```

- If 'func=start code=51' or 'qm double start' is output in the Event Service information (%s1), the Event Service resources might remain because of a server abnormality. During the cluster switchover following the server abnormality, collect the remaining resources by stopping and restarting the server machine, and then execute the integration of the standby node.

#### Windows32/64

If 'Shared memory not exist. key =C:/Interstage/eswin/etc/group/essystem.cfg0xFFFFFFFF'(see note) or 'Shared memory not exist. key=C:/Interstage/eswin/etc/group/essystem.cfg0x0000005'(see note) is output in the Event Service information (%s1), the *iscollectinfo* or *eslogdump* command was executed while the Event Service was not running.

If this message is output when the *iscollectinfo* command is executed, there is no need to take action.

If this message is output when the *eslogdump* command is executed, start the Event Service and then re-execute the *eslogdump* command.

Note: The installation path (C:/Interstage) is the default.

## 5.10 es11000 to es11099

---

This section details messages numbered between es11000 and es11099.

### 5.10.1 es11000

---

**ES: INFO: es11000: [ttttt] Initialization of the global transaction is being started.**

Explanation

Initialization of the global transaction is being started.

## 5.10.2 es11001

---

**ES: ERROR: es11001: [ttttt] Failed to start initialization of the global transaction.**

### Explanation

Failed to initialize the global transaction.

### System Action

The processing stops.

### User Action

A memory or system resource shortage may have occurred. Terminate unnecessary programs, and restart.

## 5.10.3 es11002

---

**ES: INFO: es11002: [ttttt] The initialization of the global transaction is succeeded.**

### Explanation

Global transaction was initialized successfully.

## 5.10.4 es11003

---

**ES: ERROR: es11003: [ttttt] Failed to initialize ObjectDirector.: CODE=%s1, EXCEPTION=%s2, minor=%s3**

### Variable Information

%s1 = Cause code

%s2 = Exception handling notification from CORBA Service

%s3 = Minor code notified from CORBA Service

### Explanation

ORB initialization (ORB\_init) failed.

### System Action

The processing stops.

### User Action

Rectify the cause of the CORBA service initialization failure by referencing the exception information (%s2) and the minor code (%s3) and execute the stop processing again.

If this error continues to occur, there may be insufficient memory or system resources available. Terminate any unnecessary programs then restart.

Otherwise, collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

## 5.10.5 es11004

---

**ES: ERROR: es11004: [ttttt] Invalid environment setting of OTS.**

### Explanation

Environment setting of the global transaction is incorrect.

### System Action

The processing stops.

## User Action

The global transaction has not been set up. Set up the global transaction.

## 5.10.6 es11005

---

**ES: ERROR: es11005: [ttttt] An error was received from ObjectDirector.: CODE=%s1, EXCEPTION=%s2, minor=%s3**

### Variable Information

%s1 = Cause code

%s2 = Exception handling notification from CORBA Service

%s3 = Minor code notified from CORBA Service

### Explanation

An error was reported from the CORBA Service (ObjectDirector).

### System Action

The processing stops.

### User Action

Correct the cause of the error by referencing the exception information (%s2), and the minor code (%s3). Then re-execute processing.

If Exception (%s2) is 'BAD\_OPERATION', and Minor code (%s3) is '0x464a0811', it is possible that registration of the server application failed. In Push models, the server application must be a Consumer application, and in Pull models it must be a Supplier application. If the server application was created as a library, check that the absolute path is specified for the 'intfID' item in the *OD\_impl\_inst* command definition file. If this is not registered correctly, register the application again. For details on the *OD\_impl\_inst* command, refer to the Reference Manual (Command Edition).

If this error continues to occur, there may be insufficient memory or system resources available. Terminate any unnecessary programs then restart.

If the message continues to be displayed, collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

## 5.10.7 es11006

---

**ES: ERROR: es11006: [ttttt] An internal error occurred.: CODE=%s1**

### Variable Information

%s1 = Cause code

### Explanation

An internal error was detected.

### System Action

The processing stops.

### User Action

Collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

## 5.10.8 es11007

---

**ES: ERROR: es11007: [ttttt] An error occurred when access to database.: CODE=%s1**

### Variable Information

%s1 = Cause code

## Explanation

An error occurred when accessing the internal database.

## System Action

The processing stops.

## User Action

Collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

## 5.10.9 es11008

---

**ES: ERROR: es11008: [ttttt] An error occurred when preparing of global transaction.: CODE=%s1**

### Variable Information

%s1 = Cause code

## Explanation

An error occurred when preparing a global transaction.

## System Action

The processing stops.

## User Action

**Windows32/64**

Take the following actions:

- If a message is output before this message, refer to the first message to determine the cause of the transaction failure, and re-execute the processing.
- A memory or system resource shortage may have occurred. Terminate unnecessary programs, and re-execute the processing.

If this message continues to be displayed, collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

**Solaris32/64 Linux32/64**

Take the following actions:

- If a message is output before this message, refer to the first message to determine the cause of the transaction failure, and re-execute the processing.
- A memory or system resource shortage may have occurred. Terminate unnecessary programs, and re-execute the processing.

There may be insufficient memory or system resources. Terminate any unnecessary programs and restart. If this error continues to occur, there may be insufficient system resources. Correctly specify system resources, reboot the system, and then restart. For details about system resources, refer to the Tuning Guide.

If this message continues to be displayed, collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

## 5.10.10 es11009

---

**ES: ERROR: es11009: [ttttt] A fatal error occurred in accessing Database.: CODE=%s1**

### Variable Information

%s1 = Cause code

## Explanation

A fatal error occurred when accessing the internal database.

## System Action

The processing stops.

## User Action

Collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

## 5.10.11 es11010

---

**ES: ERROR: es11010: [ttttt] A heuristic error occurred in rollback operation.: CODE=%s1**

## Variable Information

%s1 = Cause code

## Explanation

A heuristic error was detected in rollback processing of the internal database.

A fatal error occurred during rollback processing of the internal database.

## System Action

The processing stops.

## User Action

Collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

## 5.10.12 es11011

---

**ES: ERROR: es11011: [ttttt] A heuristic error occurred in commit operation.: CODE=%s1**

## Variable Information

%s1 = Cause code

## Explanation

A heuristic error was detected in commit processing.

A fatal error occurred during commit processing of the internal database.

## System Action

The processing stops.

## User Action

Collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

## 5.10.13 es11012

---

**ES: ERROR: es11012: [ttttt] An error occurred in terminating a transaction.: CODE=%s1**

## Variable Information

%s1 = Cause code

## Explanation

An error occurred when terminating a transaction. There may be insufficient memory, system resources or file resources when a local transaction is used.

## System Action

The processing stops.

## User Action

Take the following actions when a local transaction is used:

- If the cause code (%s1) is "44", change the maximum message size (the *tranunitmax* value specified in the unit definition file when the unit is created using the *esmunit* command) that can be sent or received by a transaction so that it is not exceeded. Alternatively, calculate the maximum message size that can be sent or received by a transaction, and then create the unit and event channel again.
- If the cause code (%s1) is not "44", stop the Event Channel temporarily, stop any unnecessary programs, and restart the Event Channel.

If the above-mentioned actions have not succeeded, collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

Collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer when a global transaction is used.

---

## 5.10.14 es11013

---

**ES: INFO: es11013: [ttttt] Recovery process is started.: COUNT=%s1**

### Variable Information

%s1 = Number of pending transactions

### Explanation

Recovery processing will be started.

---

## 5.10.15 es11014

---

**ES: INFO: es11014: [ttttt] Recovery process has finished.: CODE=%s1**

### Variable Information

%s1 = Information code

### Explanation

Recovery processing has completed.

---

## 5.10.16 es11015

---

**ES: ERROR: es11015: [ttttt] An error occurred in recovery processing.: CODE=%s1**

### Variable Information

%s1 = Cause code

### Explanation

An error occurred during recovery processing.

## System Action

The processing stops.

## User Action

Collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

## 5.10.17 es11016

---

**ES: INFO: es11016: [ttttt] Pending transaction was solved.**

### Explanation

A pending transaction was solved.

## 5.10.18 es11017

---

**ES: ERROR: es11017: [ttttt] Although pending transaction exists, recovery process is stopped.: COUNT=%s1**

### Variable Information

%s1 = Number of pending transactions

### Explanation

Though pending transactions exist, recovery processing is stopped.

### System Action

Recovery processing is cancelled.

### User Action

A system or network error in the global transaction may have occurred. Check for any error, then reactivate the channel.

## 5.10.19 es11018

---

**ES: ERROR: es11018: [ttttt] An error occurred in rollback operation.: CODE=%s1**

### Variable Information

%s1 = Cause code

### Explanation

An error was detected in rollback processing.

### System Action

The processing stops.

### User Action

Collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

## 5.10.20 es11019

---

**ES: INFO: es11019: [ttttt] This is pending transactionID. : TID=%s1**

### Variable Information

%s1 = Transaction ID

### Explanation

Transaction ID of the pending transaction.

## 5.10.21 es11030

---

**ES: INFO: es11030: [ttttt] Register of global transaction is started.**

## Explanation

Registration of the global transaction is started.

### 5.10.22 es11031

---

**ES: INFO: es11031: [ttttt] Register of global transaction is finished.**

## Explanation

Registration of the global transaction has completed.

### 5.10.23 es11035

---

**ES: ERROR: es11035: [ttttt] Failed to register the transaction to OTS system.: CODE=%s1, EXCEPTION=%s2, minor=%s3**

## Variable Information

%s1 = Cause code

%s2 = Exception handling notification from CORBA Service

%s3 = Minor code notified from CORBA Service

## Explanation

Failed to register the transaction with the database linkage service system.

## System Action

The processing stops.

## User Action

Take either of the following measures:

- If the exception information reported from CORBA Service (%s2) is "COMM\_FAILURE", review the network environment, and then re-execute.
- If the exception information reported from CORBA Service (%s2) is "NO\_IMPLEMENT", start the global transaction system, then re-execute.
- If the exception information reported from CORBA Service (%s2) is "NO\_MEMORY" or "NO\_RESOURCES", then the number of EventChannels that join 1 global transaction may have exceeded "maximum number of resources that join 1 transaction" in the global transaction. Make sure that this limit is not exceeded in the global transaction.

Check the following values for "maximum number of resources that join 1 transaction":

- If the Database Linkage Service operating environment was set using the Interstage setup command (*isinit*) "OTS Participate" of an Interstage operation environment definition
- If the Database Linkage Service operating environment was set using the *otssetup* command "PARTICIPATE" of a setup information definition file

If this message continues to be displayed, collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

### 5.10.24 es11040

---

**ES: INFO: es11040: [ttttt] Information of queue control.: func=%s1, errno=%s2**

## Variable Information

%s1 = Function name

%s2 = Error code

## Explanation

Information message for queue control.

### 5.10.25 es11050

---

**ES: INFO: es11050: [ttttt] 2PC timeout occurred in static channel(%s1::%s2).**

#### Variable Information

%s1 = Event channel group name

%s2 = Event Channel name

#### Explanation

A 2-phase commit timeout occurred in a static channel.

Restart the Event Channel with the *esstartchnl* command or Interstage Management Console.

### 5.10.26 es11051

---

**ES: INFO: es11051: [ttttt] 2PC timeout occurred in dynamic channel(%s1).**

#### Variable Information

%s1 = Event Channel ID

#### Explanation

A 2-phase commit timeout occurred in a dynamic channel.

### 5.10.27 es11052

---

**ES: ERROR: es11052: [ttttt] Recovery process failed.: CODE=%s1, pid=%s2**

#### Variable Information

%s1 = Cause code

%s2 = Process number

#### Explanation

Recovery processing failed.

#### System Action

The processing stops.

#### User Action

Failed to generate a thread for recovery that uses the database linkage service. Probable causes include inactive database linkage service, disconnection of line to the database linkage service, and a memory or system resource shortage. Use the *esstartchnl* command (with the *-r* option) to force the activation.

If this message continues to be displayed, collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

### 5.10.28 es11053

---

**ES: ERROR: es11053: [ttttt] Environmental definition of the EventService,the limit was exceeded, in persistent mode EventChannel restarted.**

## Explanation

The upper limit in the environment definition of the Event Service was exceeded when restarting the Event Channel for persistent channel operation.

A value set as environment information of the Event Service may have been changed during operation of the Event Channel for persistent channel operation.

## System Action

Event Channel startup processing is cancelled.

## User Action

Review the settings of environment information for the Event Service of the Event Channel for persistent channel operation.

For the settings of environment information for the Event Service, refer to "esstcnf" or "esstcnfchnl" in the "Event Service Operation Commands" chapter of the Reference Manual (Command Edition).

# 5.11 es11100 to es11199

---

This section details messages numbered between es11100 and es11199.

## 5.11.1 es11101

---

**ES: ERROR: es11101: [ttttt] Unit(%s1) is not setup.**

### Variable Information

%s1 = Unit name

### Explanation

The unit (%s1) has not been set up.

### System Action

The processing stops.

### User Action

Take one of the following actions:

- The error message es11113 (displayed when a unit is created by the *esmkunit* command or deleted by the *esrmunit* command) indicates that the unit may have not been created when the *esmkunit* command was executed because a new unit will not be created in the directory (trandir, sysdir, userdir) if another unit already exists in the directory.

Check which directory is specified in the unit definition file, and then check if another unit exists in that directory.

If the directory is duplicated, change the unit definition directory and recreate the new unit in a different directory with the *esmkunit* command.

Alternatively, empty the directories and recreate the unit with the *esmkunit* command.

- In other cases, set up the unit (%s1) with the *esmkunit* command or Interstage Management Console.

## 5.11.2 es11102

---

**ES: ERROR: es11102: [ttttt] Unit(%s1) is not running.**

### Variable Information

%s1 = Unit name

### Explanation

The unit (%s1) has not been started.

### System Action

The processing stops.

### User Action

The specified unit (%s1) has not been started. Start the unit (%s1) with the *esstartunit* command or Interstage Management Console.

## 5.11.3 es11103

---

**ES: ERROR: es11103: [ttttt] Unit(%s1) is already running.**

### Variable Information

%s1 = Unit name

### Explanation

The unit (%s1) is already running.

### System Action

The processing stops.

### User Action

The specified unit (%s1) is already running.

## 5.11.4 es11104

---

**ES: ERROR: es11104: [ttttt] Failed to start Unit(%s1).: EXCEPTION=%s2, minor=%s3**

### Variable Information

%s1 = Unit name

%s2 = Exception handling notification from CORBA Service

%s3 = Minor code notified from CORBA Service

### Explanation

Failed to start the unit (%s1).

### System Action

Unit startup processing is cancelled.

### User Action

Refer to exception information (%s2) and minor code (%s3), remove the cause of the start failure, and use the Interstage Management Console to restart the Event Channel or execute the *esstartunit* command.

If this message is still output after the restart, collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

## 5.11.5 es11105

---

**ES: ERROR: es11105: [ttttt] Failed to start Unit(%s1).: CODE=%s2**

### Variable Information

%s1 = Unit name

%s2 = Cause code

## Explanation

Failed to start the unit (%s1).

## System Action

Unit startup processing is cancelled.

## User Action

Take one of the following actions:

- During operation of a persistent channel, if the cause code (%s2) '10012' is displayed and the Unit fails to start, the directories or files shown below may not exist:
  - A storage directory (trandir, sysdir, userdir) specified in the settings information of the unit that was newly created in the Interstage Management Console, or a file (estranfile, essysmsgfile, essysqfile, esmsgfile0, esuserqfile) in that directory
  - A storage directory (trandir, sysdir, userdir) specified in the unit definition file when the *esmkunit* command was executed, or a file (estranfile, essysmsgfile, essysqfile, esmsgfile0, esuserqfile) in that directory

Check whether the above directories and files exist. If they do not all exist, reinstall the Event Service.

- During operation of a persistent channel, if the cause code (%s2) '10018' is displayed and the Unit fails to start, it may not always be possible to reference the directories shown below because of a hardware error, for example. Check that the storage directory hard disk is running normally.
  - A storage directory (trandir, sysdir, userdir) specified in the settings information of the unit that was newly created in the Interstage Management Console
  - A storage directory (trandir, sysdir, userdir) specified in the unit definition file when the *esmkunit* command was executed
- If starting unit with CODE=12 failed during restoration processing, the definition file of this unit may not exist in the backup resources. Store the unit definition file of the unit, which failed to start under the backup storage directory, and re-execute the *esrestoresys* command.
- If cause code (%s2) is 10051, and the unit failed to start when the cluster was switched, then processes on the server or IPC resources (Solaris/Linux) may still be running. Stop or restart the server machine and collect resources, then integrate the standby node.

**Solaris32/64** **Linux32/64**

- If cause code (%s2) is 10011, and the unit failed to start when the Event Channel or unit was started during operation of the persistent channel, a system resource (IPC) may be insufficient. Set system resources correctly, reboot the system, and then restart the Event Channel with Interstage Management Console, or restart the unit with the *esstartunit* command.

For details of the system resources, refer to the "System Tuning" chapter of the Tuning Guide.

In cases other than those described above, collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

## 5.11.6 es11106

---

**ES: ERROR: es11106: [ttttt] Failed to stop Unit(%s1).: EXCEPTION=%s2, minor=%s3**

### Variable Information

%s1 = Unit name

%s2 = Exception handling notification from CORBA Service

%s3 = Minor code notified from CORBA Service

## Explanation

Failed to stop the unit (%s1).

## System Action

Unit stop processing is cancelled.

## User Action

Correct the cause of the unsuccessful unit stop by referencing exception information (%s2) and minor code (%s3) and stop the Event Channel with Interstage Management Console or stop the unit with the *esstopunit* command.

If this message continues to display after the unit is stopped again, collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

## 5.11.7 es11107

---

**ES: ERROR: es11107: [ttttt] Failed to stop Unit(%s1).: CODE=%s2**

### Variable Information

%s1 = Unit name

%s2 = Cause code

### Explanation

Failed to stop the unit (%s1).

### System Action

Unit stop processing is cancelled.

### User Action

Take one of the following actions:

- If Cause code (%s2) is "18" or "10018", the directories or files shown below may not exist:
  - A storage directory (trandir, sysdir, userdir) specified in the settings information of the unit that was newly created in the Interstage Management Console, or a file (estranfile, essysmsgfile, essysqfile, esmsgfile0, esuserqfile) in that directory
  - A storage directory (trandir, sysdir, userdir) specified in the unit definition file when the *esmunit* command was executed, or a file (estranfile, essysmsgfile, essysqfile, esmsgfile0, esuserqfile) in that directory

Check whether the above directories and files exist. If they do not all exist, reinstall the Event Service.

- In cases other than those described above, stop the unit again. If this message continues to display after the unit is stopped again, collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

## 5.11.8 es11108

---

**ES: INFO: es11108: [ttttt] Unit(%s1) is started.: pid=%s2**

### Variable Information

%s1 = Unit name

%s2 = Process number

### Explanation

The unit (%s1) is started.

## 5.11.9 es11109

---

**ES: INFO: es11109: [ttttt] Unit(%s1) is stopped.**

### Variable Information

%s1 = Unit name

### Explanation

The unit (%s1) is stopped.

## 5.11.10 es11111

---

**ES: ERROR: es11111: [ttttt] Wrong description in unit define file(%s1).**

### Variable Information

%s1 = Unit definition file name

### Explanation

The unit definition file (%s1) is incorrect.

### System Action

The processing stops.

### User Action

Review the setting information of the unit to be created on the Interstage Management Console or the contents of unit definition file (%s1) specified during execution of the *esmunit* command. When you specify the path which uses the environment variable for the storage directory (trmdir, sysdir, userdir), specify the full path without the environment variable.

## 5.11.11 es11112

---

**ES: INFO: es11112: [ttttt] The setup of unit(%s1) was finished.**

### Variable Information

%s1 = Unit name

### Explanation

The setup of the unit (%s1) has completed.

## 5.11.12 es11113

---

**ES: ERROR: es11113: [ttttt] Unit(%s1) is already setup.**

### Variable Information

%s1 = Unit name

### Explanation

The unit (%s1) has already been set up.

### System Action

The processing stops.

### User Action

Take any of the following actions:

- Check if the specified unit ID (%s1) is the same as a unit ID in a unit definition previously set, if you are creating the unit from the Interstage Management Console.
- If you are creating a unit using the *esmunit* command, check that the unit ID (%s1) specified in the unit definition file is not the same as a unit ID in an existing unit definition.

If you are using the *esmunit* command without the *-uf* option, and two or more unit definition files exist in the directories below (default installation path), check all unit definition files,

 Windows32/64

C:\Interstage\eswin\etc\def

 Solaris32/64  Linux32/64

```
/opt/FJSVes/etc/def
```

- If you reinstall Interstage without deleting the unit, the created unit may exist. In this case, the directory whose name is the same as 'unit ID' (for the extended system, 'extended system name' + '\_' + 'unit ID') exists in the mqd directory of the Event Service install directory. First delete the unit with the *esrmunit* command and then recreate it with the *esmkunit* command.

### 5.11.13 es11114

**ES: ERROR: es11114: [ttttt] Failed to setup unit(%s1): CODE=%s2**

#### Variable Information

%s1 = Unit name

%s2 = Cause code

#### Explanation

Failed to set up the unit (%s1).

#### System Action

Unit setup processing is cancelled.

#### User Action

Use the *esrmunit* command or the Interstage Management Console to delete the unit (%s1).

Also, refer to the information on cause code (%s2) in the table below and take the appropriate user action.

Cause Code (%s2)	Explanation	User Action
10	Paths of persistent files used by other units may be the same.	Ensure that the settings of any other unit created from the Interstage Management Console and the contents of the unit definition file specified during execution of the <i>esmkunit</i> command are not the same.
12	There may be an error in the directory specification in the unit definition file.	Check that the directory specification in the unit definition file is valid.
-1	The Unit could not be created.	Refer to the previous message, and take the appropriate user action.

If problem cannot be resolved using the above user actions, check that the user has the authorization required to access the directories and files under the Interstage installation directory.

Note that if the *esmkunit* command is executed without a -uf option, the unit definition files below are used.

**Windows32/64**

(Default installation path)

C:\Interstage\eswin\etc\def\esunit01.def

**Solaris32/64 Linux32/64**

(Default installation path)

/opt/FJSVes/etc/def/esunit01.def

### 5.11.14 es11115

**ES: ERROR: es11115: [ttttt] Standard unit cannot be setup more than two.**

#### Explanation

Standard units cannot be set up more than once.

## System Action

Unit setup processing is cancelled.

## User Action

Only one standard unit can be set up. Take any of the following actions:

- Delete the standard unit originally created, then recreate the standard unit.
- Create the extended unit using one of the following procedures:
  - Create the extended unit specifying 'Extended Mode' in 'Unit Mode', when creating the unit from the Interstage Management Console.
  - Create the extended unit specifying 'ext' in the item 'unitmode' of the unit definition file, when creating the unit using the *esmunit* command. If using the *esmunit* command without specifying the -uf option when two or more unit definition files exist under the directories below (default installation path), check the extended unit specified by 'ext' in the item 'unitmode' of all unit definition files.

Windows32/64

C:\Interstage\eswin\etc\def

Solaris32/64 Linux32/64

/opt/FJSVes/etc/def

## 5.11.15 es11116

---

**ES: ERROR: es11116: [ttttt] Standard unit is not setup.**

### Explanation

The standard unit has not been set up.

### System Action

The processing stops.

### User Action

Set up the standard unit with the *esmunit* command or Interstage Management Console.

## 5.11.16 es11117

---

**ES: INFO: es11117: [ttttt] The unit(%s1) was deleted.**

### Variable Information

%s1 = Unit name

### Explanation

The unit (%s1) was deleted.

## 5.11.17 es11118

---

**ES: INFO: es11118: [ttttt] No unit information to indicate.**

### Explanation

No unit information to be indicated exists.

## 5.11.18 es11119

---

---

**ES: ERROR: es11119: [ttttt] The value for keyword(%s1) is smaller than minimum value(%s2).**

Variable Information

%s1 = Keyword

%s2 = Minimum value

Explanation

The value for the keyword (%s1) is smaller than the minimum value (%s2).

System Action

The processing stops.

User Action

Check the setting information of the unit to be newly created on the Interstage Management Console and the definition value of the unit definition file specified during execution of the *esmkunit* command.

---

### 5.11.19 es11120

---

**ES: ERROR: es11120: [ttttt] The setup is not for Persistent.**

Explanation

The setup has not been performed for persistent channel operation.

System Action

Event Channel processing for persistent channel operation is cancelled..

User Action

Set up the unit with the *esmkunit* command or Interstage Management Console.

---

### 5.11.20 es11121

---

**ES: ERROR: es11121: [ttttt] A number of event channel exceeded a number that can be made in unit(%s1).**

Variable Information

%s1 = Unit name

Explanation

An attempt was made to create an Event Channel beyond the number set for the unit when it was created with Interstage Management Console, or beyond the number of event data storage areas (queues) specified in the *esmkunit* command unit definition file.

System Action

Event Channel creation processing is cancelled.

User Action

Take any of the following actions:

- Create an Event Channel in a unit other than the unit (%s1) specified in the error message with the *esmkchnl* command or Interstage Management Console. Check the unit list by executing 'esmonitor -unit' or with Interstage Management Console.  
If no other unit exists other than the unit (%s1), create a new unit with the *esmkunit* command or Interstage Management Console.
- If an unnecessary Event Channel exists in the unit (%s1), delete it with the *esrmchnl* command or Interstage Management Console and then create an Event Channel with the *esmkchnl* command or Interstage Management Console.  
Event Channels whose unitid items in the 'esstcnfchnl -d' output result are %s1 are to be allocated to the unit (%s1).

- Review the number of Event Channels that can be created in the unit, recreate the unit, and then the Event Channels. Take the following action:

The above creation procedure causes the data to be deleted in the persistent memory for all the Event Channels in the unit. Therefore, if a necessary data is contained in the persistent memory, first receive the necessary event data from the persistent memory, and then take the above creation procedure.

#### When using an Event Service Operation command

1. With the Event Service started, execute 'esmonitor -unit' to check 'Use Rate' and 'Region Count' of the unit (%s1) and review the estimates of sysqnum and userqnum on the unit definition file.
2. First stop all the Event Channels allocated to unit (%s1) forcibly with the *esstopchnl* command. Event Channels whose unitid items in the 'esetcnfchnl -d' output result are (%s1) are to be allocated to the unit (%s1).
3. First delete all the Event Channels allocated to %s1 with the *esrmchnl* command.
4. Delete the unit (%s1) with the *esrmunit* command.
5. Create a unit with the *esmkunit* command.
6. Create all the Event Channels deleted in 3. with the *esmkchnl* command.
7. Create the Event Channel that could not be created for the reason indicated by this message with the *esmkchnl* command.

#### When using Interstage Management Console

1. With the Event Service started, check the utilization and number of areas of the unit (%s1) with Interstage Management Console, and review the settings of file capacity and the number of data storage areas.
2. Stop all the Event Channels that use the unit (%s1) forcibly in Event Channel status display of JMS and Event Service.
3. Delete all the Event Channels that use the unit (%s1) in Event Channel status display of JMS and Event Service.
4. Delete the storage destination (unit %s1).
5. Create the storage destination (unit %s1).
6. Create all the Event Channels deleted in 3.
7. Create the Event Channel that could not be created for the reason indicated by this message.

## 5.11.21 es11122

---

**ES: ERROR: es11122: [ttttt] The value for keyword(%s1) is wrong.**

#### Variable Information

%s1 = Keyword of the unit definition file

#### Explanation

The value for the keyword (%s1) is incorrect.

#### System Action

The processing stops.

#### User Action

Check the setting information of the unit to be newly created on the Interstage Management Console and the definition value of the unit definition file specified during execution of the *esmkunit* command.

## 5.11.22 es11123

---

**ES: ERROR: es11123: [ttttt] Failed to delete event channel.: CODE=%s1**

## Variable Information

%s1 = Cause code

## Explanation

Failed to delete Event Channels.

## System Action

Event Channel deletion processing is cancelled.

## User Action

If cause code (%s1) is '10', start the Event Service and use the Interstage Management Console again to delete the Event Channels or execute the *esrmchnl* command. If the cause code (%s1) is '77', channel deletion failed due to failure recovery. Start the Event Channel, stop it, and delete it with the *esrmchnl* command or Interstage Management Console again.

## 5.11.23 es11124

---

**ES: ERROR: es11124: [ttttt] The data domain for unit(%s1) is destroyed.: CODE=%s2**

## Variable Information

%s1 = Unit name

%s2 = Cause code

## Explanation

The data storage area of the unit (%s1) is damaged. If the Event Channel is started or the *esstartchnl* command is executed on the Interstage Management Console and cause code (%s2) is '12', the unit is deleted after the channel is created.

## System Action

The processing stops.

## User Action

Use the following procedure:

### When using an Event Service operation command

1. First delete all the Event Channels allocated to the unit (%s1) with the *esrmchnl* command.  
Event Channels whose unitid items in the 'esstetcnfchnl -d' output result are %s1 are to be allocated to the unit (%s1).
2. Delete the unit (%s1) with the *esrmunit* command.
3. Recreate the unit with the *esmkunit* command.
4. Create all the Event Channels deleted in 1. with the *esmkchnl* command.

### When using Interstage Management Console

1. First delete all the Event Channels that use the unit (%s1) in Event Channel status display of JMS and Event Service.
2. Delete the storage destination (unit %s1).
3. Create the storage destination (unit %s1).
4. Create all the Event Channels deleted in 1.

## 5.11.24 es11125

---

**ES: ERROR: es11125: [ttttt] I/O error occurred. Unit ID(%s1)**

## Variable Information

%s1 = Unit name

## Explanation

An I/O error occurred.

## System Action

The processing stops.

## User Action

Take one of the following actions:

- Check whether there is an abnormality in the disk device on which the following directories exist:
  - A storage directory (trandir, sysdir, userdir) specified in the settings information of the unit that was newly created in the Interstage Management Console
  - A storage directory (trandir, sysdir, userdir) specified in the unit definition file when the *esmunit* command was executed
- The directories or files shown below may not exist:
  - A storage directory (trandir, sysdir, userdir) specified in the settings information of the unit that was newly created in the Interstage Management Console, or a file (estranfile, essysmsgfile, essysqfile, esmsgfile0, esuserqfile) in that directory
  - A storage directory (trandir, sysdir, userdir) specified in the unit definition file when the *esmunit* command was executed, or a file (estranfile, essysmsgfile, essysqfile, esmsgfile0, esuserqfile) in that directory

Check whether the above directories and files exist. If they do not all exist, reinstall the Event Service.

## 5.11.25 es11126

---

**ES: ERROR: es11126: [ttttt] Failed to allocate domain for data.: CODE=%s1**

## Variable Information

%s1 = Cause code

## Explanation

Failed to create a data storage area for the specified unit when creating an Event Channel.

## System Action

Event Channel creation processing is cancelled

## User Action

Take any of the following actions:

### When using an Event Service operation command

1. First delete all the Event Channels allocated to the unit (%s1) with the *esmchnl* command.  
Event Channels whose unitid items in the 'esstcfnchnl -d' output result are %s1 are to be allocated to the unit (%s1).
2. Delete the unit (%s1) with the *esmunit* command.
3. Create a unit with the *esmunit* command.
4. Create all the Event Channels deleted in 1. with the *esmchnl* command.
5. Create the Event Channel that could not be created for the reason indicated by this message with the *esmchnl* command.

### When using Interstage Management Console

1. First delete all the Event Channels that use the unit (%s1) in Event Channel status display of JMS and Event Service.
2. Delete the storage destination (unit %s1).
3. Create the storage destination (unit %s1)
4. Create all the Event Channels deleted in 1.

5. Create the Event Channel that could not be created for the reason indicated by this message.

## 5.11.26 es11127

---

**ES: ERROR: es11127: [ttttt] (%s1) is described twice.**

### Variable Information

%s1 = Keyword

### Explanation

The keyword (%s1) in the unit definition file is duplicated.

### System Action

The processing stops.

### User Action

Review the settings of the new unit to be created with Interstage Management Console, or review the values defined in the unit definition file specified when the *esmkunit* command was executed.

## 5.11.27 es11128

---

**ES: ERROR: es11128: [ttttt] The value for keyword(%s1) is exceeded maximum value(%s2).**

### Variable Information

%s1 = Keyword

%s2 = Maximum value

### Explanation

The value for the keyword (%s1) exceeded the maximum value (%s2).

### System Action

The processing stops.

### User Action

Check the setting information of the unit to be newly created on the Interstage Management Console and the definition value of the unit definition file specified during execution of the *esmkunit* command.

## 5.11.28 es11129

---

**ES: ERROR: es11129: [ttttt] The value for keyword(%s1) is not set.**

### Variable Information

%s1 = Keyword

### Explanation

No value is set for the keyword (%s1).

### System Action

The processing stops.

### User Action

Check the setting information of the unit to be newly created on the Interstage Management Console and the definition value of the unit definition file specified during execution of the *esmkunit* command.

## 5.11.29 es11130

---

**ES: ERROR: es11130: [ttttt] Unit(%s1) ended abnormally.: CODE=%s2, pid=%s3**

### Variable Information

%s1 = Unit name

%s2 = Cause code

%s3 = Process number

### Explanation

The unit (%s1) ended abnormally.

### System Action

The unit ends abnormally.

### User Action

Collect the following data and diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

#### Windows32/64

- Watson log (output availability and output destination depend on the system environment.)
- User dump (output availability and output destination depend on the system environment.)

#### Solaris32/64

- core file
  - For Default system: in the directory /var/opt/FJSVes
  - For Extended system: in the directory /var/opt/FJSVisas/system/(system name)/FJSVes/var

#### Linux32/64

- core file (in the directory /var/opt/FJSVes)

## 5.11.30 es11131

---

**ES: ERROR: es11131: [ttttt] The file system is invalid.: Unit ID(%s1)**

### Variable Information

%s1 = Unit name

### Explanation

The file system is incorrect.

### System Action

The processing stops.

### User Action

Take any of the following actions:

- Persistent files for the unit need to be created on the NTFS file system. Check the setting information of the unit to be newly created on the Interstage Management Console and the definition value of the unit definition file specified during execution of the *esmkunit* command.

#### Windows32/64

- If you are using the *esmkunit* command, check that the specified unit definition file item (trmdir, sysdir, userdir) is not the DOS device name.
- If you are using the Interstage Management Console, check the specified storage directory name is not the DOS device name.

## 5.11.31 es11132

---

**ES: ERROR: es11132: [ttttt] Failed to delete unit(%s1).: CODE=%s2**

### Variable Information

%s1 = Unit name

%s2 = Cause code

### Explanation

Failed to delete the unit (%s1).

### System Action

Unit deletion processing is cancelled.

### User Action

Delete the unit by specifying the unit ID in the *esrmunit* command ('esrmunit-unit command ID').

If the unit cannot be deleted although the unit ID was specified, collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

## 5.11.32 es11133

---

**ES: ERROR: es11133: [ttttt] This command cannot run because data in domain exist.: Unit ID(%s1)**

### Variable Information

%s1 = Unit name

### Explanation

Because data exists in the data storage area, processing cannot be performed.

### System Action

Unit deletion processing is cancelled.

### User Action

Take any of the following actions:

#### When using an Event Service operation command

1. First stop all the Event Channels allocated to unit (%s1) forcibly with the *esstopchnl* command.  
Event Channels whose unitid items in the 'esstetcfchnl -d' output result are %s1 are to be allocated to the unit (%s1).
2. Delete all the Event Channels allocated to %s1 with the *esrmchnl* command.
3. Delete the unit (%s1) with the *esrmunit* command.

#### When using Interstage Management Console

1. With the Event Service started, check the utilization and number of areas of the unit (%s1) with Interstage Management Console and review the settings of file capacity and the number of data storage areas.
2. Stop all the Event Channels that use the unit (%s1) forcibly in Event Channel status display of JMS and Event Service.
3. Delete all the Event Channels that use the unit (%s1) in Event Channel status display of JMS and Event Service.

### 5.11.33 es11134

---

**ES: INFO: es11134: [ttttt] The unit(%s1) is being started.**

#### Variable Information

%s1 = Unit name

#### Explanation

The unit (%s1) is being started.

### 5.11.34 es11135

---

**ES: INFO: es11135: [ttttt] The unit(%s1) is being stopped.**

#### Variable Information

%s1 = Unit name

#### Explanation

The unit (%s1) is being stopped.

#### User Action

The unit may have stopped in the inhibited stop mode while the event channel assigned to the unit (%s1) contained the event data. This occurred when time was required to terminate the unit.

In inhibited stop mode, the event channel assigned to the unit will not stop while it contains event data. Therefore, the unit cannot be stopped. Use the *esstopchnl* command to immediately stop the event channel specifying the forced mode.

### 5.11.35 es11136

---

**ES: ERROR: es11136: [ttttt] Plural event channel with OTS mode cannot be made in same unit(%s1).**

#### Variable Information

%s1 = Unit name

#### Explanation

Multiple Event Channels in global transaction mode cannot be created within the same unit.

#### System Action

Event Channel creation processing is cancelled.

#### User Action

Create Event Channels so that they are allocated to other extended units.

### 5.11.36 es11137

---

**ES: ERROR: es11137: [ttttt] A event channel with OTS mode cannot be made in standard unit(%s1).**

#### Variable Information

%s1 = Unit name

#### Explanation

No Event Channel in global transaction mode can be created in the standard unit.

#### System Action

Event Channel creation processing is cancelled.

#### User Action

Allocate Event Channels in global transaction mode to extended units.

### 5.11.37 es11138

---

**ES: ERROR: es11138: [ttttt] This command cannot run because units exist.**

#### Explanation

Because units exist, processing cannot be continued.

#### System Action

The processing stops.

#### User Action

Delete all the units with the *esrmunit* command or Interstage Management Console, and then rerun the command that caused the output of this message.

### 5.11.38 es11139

---

**ES: ERROR: es11139: [ttttt] The processing cannot be performed because a file from another unit is located in the specified directory. Unit ID (%s1)**

#### Variable Information

%s1 = Unit name

#### Explanation

The processing cannot be performed because a file that belongs to another unit is located in the specified directory.

#### System Action

Terminates the unit creation process.

#### User Action

Check that neither the directory path of a new unit (created from the Interstage Management Console), nor the path defined in the unit definition file (specified at the time of the *esmkunit* command execution), is duplicated in another unit definition. If the unit ID, or path, was not duplicated, check that the directory specified by the path is empty.

If Interstage was re-installed without deleting the unit first, a pre-created unit can sometimes be located. In this instance, a directory with the same name as the 'unit ID' (in an extended system, 'extended system name' + '\_' + 'unit ID') will be found under the mqd directory of the event service installation directory. Delete the unit using the *esrmunit* command, then re-create the unit using the *esmkunit* command.

### 5.11.39 es11140

---

**ES: ERROR: es11140: [ttttt] This command cannot be executed because EventChannel exist. Unit ID(%s1)**

#### Variable Information

%s1 = Unit name

#### Explanation

This command cannot be executed because EventChannel exist.

#### System Action

The processing stops.

## User Action

Delete all the Event Channels which exist in the unit with the *esrmchnl* command or the Interstage Management Console, and then re-execute the command where this message is output.

### 5.11.40 es11150

---

**ES: ERROR: es11150: [ttttt] The command cannot be executed.**

#### Explanation

If this message is output during execution of the *essetup* command, the Event Service has already been set up so the *essetup* command cannot be executed.

Because this environment has been set up by the Interstage Management Console, the *esunsetup* command cannot be executed.

#### System Action

The processing stops.

#### User Action

If this message is output during execution of the *essetup* command, the Event Service has already been set up so no action need be taken.

If this message is output during execution of the *esunsetup* command, use the Interstage integration command, Interstage Management Console to perform the necessary operation.

### 5.11.41 es11152

---

**ES: ERROR: es11152: [ttttt] Required component is not installed. Error Information=%s1**

#### Variable Information

%s1 = Package name

#### Explanation

Necessary package (%s1) is not installed. Or, the environment is destroyed so that modules necessary for operation of the Event Service cannot be read.

#### System Action

The processing stops.

#### User Action

Check the Interstage installation environment, and re-install package (%s1).

**Solaris32/64**

If package (%s1) is 'FSUNtd', also verify that the FSUNextp and FJSVisas packages are installed.

**Linux32/64**

If package (%s1) is 'FJSVtd', also verify that the FJSVextp and FJSVisas packages are installed.

## 5.12 es11200 to es11299

---

This section details messages numbered between es11200 and es11299.

### 5.12.1 es11201

---

**ES: ERROR: es11201: [ttttt] System name is too long.**

### Explanation

The system name is too long.

### System Action

The processing stops.

### User Action

Specify a correct system name with up to 8 characters.

## 5.12.2 es11202

---

**ES: ERROR: es11202: [ttttt] System name is invalid. SYSTEM=%s1**

### Variable Information

%s1 = Specified system name

### Explanation

There is an error in the system name or this is a reserved word.

### System Action

The processing stops.

### User Action

Specify a correct system name with up to 8 alphanumeric characters (beginning with alphabetic characters).

The following system names cannot be specified because they are reserved words.

- td001
- ec001

## 5.12.3 es11203

---

**ES: ERROR: es11203: [ttttt] Failed to access the file or the directory.: filename=%s1, errno=%s2, process id=%s3**

### Variable Information

%s1 = File name

%s2 = Error code

%s3 = Process ID

### Explanation

Failed to access the file or the directory.

### System Action

The processing stops.

### User Action

Confirm that the file shown by the file name or the directory exists.

Re-examine the installation environment.

## 5.12.4 es11204

---

---

**ES: ERROR: es11204: [ttttt] Failed to get the key of the shared memory.: key file=%s1, details=%s2, process id=%s3**

#### Variable Information

%s1 = Key file  
%s2 = Detail information  
%s3 = Process ID

#### Explanation

The processing has been terminated because the key competition with other process occurred while trying to get the shared memory.

#### System Action

The processing stops.

#### User Action

If the execution of a command of Event Service has caused to output this message, wait until the execution of another command is completed, then re-execute this command.

If this message is output again after re-execution, edit the file specified with the key file in the following procedure, and re-execute the command.

1. Take a copy of the key file (%s1) and rename it by the *cp* command.
2. Delete the key file (%s1) by the *rm* command.
3. Change the file name of the file copied in item 1 back to the original key file name (%s1) by the *mv* command.

## 5.12.5 es11205

---

**ES: ERROR: es11205: [ttttt] Failed to initialize the process.: details=%s1, %s2, process id=%s3**

#### Variable Information

%s1 = Detail information1  
%s2 = Detail information2  
%s3 = Process ID

#### Explanation

Failed to initialize the process.

#### System Action

Processing of the executed command is cancelled.

#### User Action

It is possible that initialization failed due to insufficient memory.  
Re-execute the corresponding command after confirming the system status.

## 5.12.6 es11206

---

**ES: ERROR: es11206: [ttttt] There is not such a system.**

#### Explanation

The specified system does not exist.

#### System Action

The processing stops.

## User Action

Specify the correct system name that is registered.

### 5.12.7 es11207

---

**ES: ERROR: es11207: [ttttt] The entry of the library is not found. It may be destroyed.: library name=%s1, function name=%s2**

#### Variable Information

%s1 = Library name

%s2 = Function name

#### Explanation

The entry of the function (%s2) cannot be found from the library (%s1).

#### System Action

The processing stops.

#### User Action

Re-examine the install environment. Check also if the version and level numbers of the installed component are correct.

### 5.12.8 es11208

---

**ES: ERROR: es11208: [ttttt] Only a super user can perform this function.**

#### Explanation

The specified function can be executed by only a super user.

#### System Action

The processing stops.

#### User Action

Re-execute as a super user.

### 5.12.9 es11209

---

**ES: INFO: es11209: [ttttt] Trace file was made.**

#### Explanation

The Event Service trace information was collected.

#### User Action

If a message is output before or after this message, refer to the message to determine the cause of the failure.

If no message is output, no action is required.

This message is output when the Event Channel linkage service starts, but requires no action.

### 5.12.10 es11210

---

**ES: ERROR: es11210: [ttttt] This operation cannot be executed on the managed server.**

#### Explanation

This operation cannot be executed on the managed server and the admin server.

## System Action

The command processing stops.

## User Action

Log in to the Admin Server with Interstage Management Console, and execute the same operation for this server.

## 5.12.11 es11211

---

**ES: ERROR: es11211: [ttttt] Only a administrator can perform this command.**

### Explanation

Only a user with administrator authority can execute this command.

### System Action

The command processing stops.

### User Action

Execute this command as a user with administrator authority.

## 5.13 es11300 to es11399

---

This section details messages numbered between es11300 and es11399.

### 5.13.1 es11300

---

**ES: INFO: es11300: [ttttt] The EventChannel (%s1::%s2) was blocked successfully.**

#### Variable Information

%s1 = Event channel group name

%s2 = Event channel name

#### Explanation

The Event Channel (%s2) of the Event Channel group (%s1) was blocked successfully.

#### System Action

The event data was not reserved because the Event Channel was blocked.

#### User Action

Unblock the Event Channel according to the following procedure:

##### Using the Event Service operation command

###### Windows32/64

```
C:\Interstage\bin\eschgblock -g %s1 -c %s2 -b off
```

###### Solaris32/64

- For the default system:

```
/opt/FJSVes/bin/eschgblock -g %s1 -c %s2 -b off
```

- For the extended system:

```
/opt/FJSVes/bin/eschgblock -g %s1 -c %s2 -b off -M SystemName
```

###### Linux32/64

/opt/FJSVes/bin/eschblock -g %s1 -c %s2 -b off

### Using the Interstage Management Console

In the JMS and the Event Service Event Channel Status View page, click the [Control] > [Unblock] buttons.

## 5.13.2 es11301

---

**ES: INFO: es11301: [ttttt] Blocking of EventChannel (%s1::%s2) was successfully cancelled.**

### Variable Information

%s1 = Event channel group name

%s2 = Event channel name

### Explanation

Blocking of Event Channel (%s2) of the Event Channel group (%s1) was successfully cancelled.

### System Action

Cancels the Event Channel block, and begins receiving event data reception requests.

## 5.13.3 es11302

---

**ES: INFO: es11302: [ttttt] The EventChannel (%s1::%s2) has already been blocked.**

### Variable Information

%s1 = Event channel group name

%s2 = Event channel name

### Explanation

The Event Channel (%s2) of the Event Channel group (%s1) has already been blocked.

### System Action

The processing stops.

## 5.13.4 es11303

---

**ES: INFO: es11303: [ttttt] Blocking of EventChannel (%s1::%s2) has already been cancelled.**

### Variable Information

%s1 = Event channel group name

%s2 = Event channel name

### Explanation

Blocking of Event Channel (%s2) of Event Channel group (%s1) has already been cancelled.

## 5.13.5 es11304

---

**ES: ERROR: es11304: [ttttt] The block function cannot be used for the specified EventChannel (%s1::%s2). Alternatively, blocking cannot be placed or cancelled because the block function is set to unavailable.**

### Variable Information

%s1 = Event channel group name

%s2 = Event channel name

## Explanation

The block function of Event Channel (%s2) of the specified Event Channel group (%s1) cannot be used. Alternatively, blocking cannot be placed or cancelled for that channel because the block function is set to unavailable.

## System Action

The processing stops.

## User Action

Event channel (%s2) of the event channel group (%s1) cannot be blocked or unblocked because it contains one of the following settings:

- When using the Event Service operation command
  - The block function cannot be used for this event channel.
  - The block function can be used for this event channel, but is set to unavailable.
- When using the Interstage Management Console
  - The block function can be used for this event channel, but is set to unavailable.

Check the Event Channel environment using the following procedure:

### Using the Event Service operation command

1. Check that the block function can be used in the Event Channel.

The block function can be used with the Event Channel if 'EventChannel blockade function' displays as 'available' when 'esetcnfchnl -d -g %s1' is executed. The 'available' display means the Event Channel was generated by specifying the following at the time of static generation of the Event Channel (at esmkchnl execution).

- Notification service / JMS(-notify)
- To run the local transaction operation (-tran) or the global transaction operation (-ots)
- Messaging model: Point-To-Point model (-ptp)

If the blockade function cannot be used with the Event Channel, regenerate the Event Channel as follows:

- 1) Stop the Event Channel (esstopchnl).
- 2) Delete the Event Channel (esrmchnl).
- 3) Create an Event Channel (esmkchnl).

Note: The '-notify -tran -ptp' option or the '-notify -ots -persist all -ptp' option must be specified.

- 4) Set the Event Channel configuration information (esetcnfchnl).

Note: The '-threshold' (monitor repository data ratio) option, the '-safety' (monitor restart repository data ratio) option, the '-block' (using the Event Channel block function) option, and the '-unblock' (automatic unblock ratio) option must be specified.

- 5) Activate the Event Channel (esstartchnl).

2. Check that the block function is set to be available for the Event Channel.

The block function is set to be available if '1' or '2' is displayed in the 'EventChannel block level' by executing 'esetcnfchnl -d -g %s1'.

Alternatively, if 'default' is displayed, execute 'esetcnf -d'. The block function is set to be available if '1' or '2' is displayed in the 'EventChannel block level'.

If the block function is set to be unavailable for the Event Channel, use the *esetcnf* command to reset the Event Service configuration information. When the *esetcnf* command is executed, the '-threshold' option, '-safety' option, and '-blockade' option must be specified.

3. Restart the Event Channel.

Execute *esstopchnl -g %s1* and *esstartchnl -g %s1* to restart the Event Channel.

4. Block the Event Channel according to the following procedure:

#### Windows32/64

```
C:\Interstage\bin\eschgblock -g EventChannelGroupName -c EventChannelName -b on
```

#### Solaris32/64

- For the default system  

```
/opt/FJSVes/bin/eschgblock -g EventChannelGroupName -c EventChannelName -b on
```
- For the extended system  

```
/opt/FJSVes/bin/eschgblock -g EventChannelGroupName -c EventChannelName -b on -M SystemName
```

#### Linux32/64

```
/opt/FJSVes/bin/eschgblock -g EventChannelGroupName -c EventChannelName -b on
```

Unblock according to the following procedure:

#### Windows32/64

```
C:\Interstage\bin\eschgblock -g EventChannelGroupName -c EventChannelName -b off
```

#### Solaris32/64

- For the default system  

```
/opt/FJSVes/bin/eschgblock -g EventChannelGroupName -c EventChannelName -b off
```
- For the extended system  

```
/opt/FJSVes/bin/eschgblock -g EventChannelGroupName -c EventChannelName -b off -M SystemName
```

#### Linux32/64

```
/opt/FJSVes/bin/eschgblock -g EventChannelGroupName -c EventChannelName -b off
```

For more information about the *eschgblock* command, refer to "eschgblock" in the "Event Service Operation Commands" chapter of the Reference Manual (Command Edition).

### Using the Interstage Management Console

1. Check that the event channel is set to use the block function.

In the JMS and the Event Service Event Channel Status View page, check that the [Block]/[Unblock] button is displayed in [Control].

In the EventChannel Configuration Settings page, ensure that [Block Operation Mode] is set to either 'Enable blocking and disable automatic blocking' or 'Enable blocking and automatic blocking'.

If [Block Operation Mode] is set to 'Disable blocking', change it to one of the above.

2. Restart the Event Channel.

In the Event Channel Status View page, click the [Stop] button, and then click the [Start] button.

3. Block the Event Channel.

In the JMS and the Event Service Event Channel Status View page, click the [Control] > [Block] buttons.

To unblock the Event Channel, click the [Unblock] button.

## 5.13.6 es11305

---

**ES: INFO: es11305: [ttttt] The size of the repository data for the EventChannel (%s1::%s2) has exceeded the monitor repository data size (threshold value).**

### Variable Information

%s1 = Event channel group name

%s2 = Event channel name

## Explanation

The number of the repository data for Event Channel (%s2) of Event Channel group (%s1) has exceeded the number of the monitor repository data (threshold value).

## System Action

Retains the event data.

## User Action

Since there is a consumer that did not receive event data, it may be that event data is being reserved in the Event Channel, causing the monitor repository data size (the threshold value) in the Event Channel to have been exceeded. Correct the problem preventing the processing of received event data in the application, and then check that the es11306 information message is output.

If this message is output frequently, modify the allowed repository data size or the monitoring repository data ratio (threshold ratio) in the Event Channel.

## 5.13.7 es11306

---

**ES: INFO: es11306: [ttttt] The size of the repository data for EventChannel (%s1::%s2) has recovered to the size of monitor re-open repository data.**

## Variable Information

%s1 = Event channel group name

%s2 = Event channel name

## Explanation

After event data reception processing, the number of the repository data for Event Channel (%s2) of Event Channel group (%s1) has reached the number of the monitor restart repository data.

## System Action

Re-opens monitoring of repository data size.

## 5.13.8 es11307

---

**ES: INFO: es11307: [ttttt] The EventChannel (%s1::%s2) was blocked automatically.**

## Variable Information

%s1 = Event channel group name

%s2 = Event channel name

## Explanation

Event Channel (%s2) of Event Channel group (%s1) was blocked automatically because the upper limit of the number of the Event Channel repository data was reached.

## System Action

Retains no event data because the Event Channel was blocked automatically.

## User Action

Since there is a consumer that did not receive event data, it may be that event data is being reserved in the Event Channel, causing the monitor repository data size (the threshold value) in the Event Channel to have been exceeded. Correct the problem preventing the processing of received event data in the application, and then check that the es11308 information message is output.

If this message is output frequently, modify the allowed repository data size or the monitoring repository data ratio (threshold ratio) in the Event Channel.

## 5.13.9 es11308

---

**ES: INFO: es11308: [ttttt] Automatic block of EventChannel (%s1::%s2) was cancelled.**

### Variable Information

%s1 = Event channel group name

%s2 = Event channel name

### Explanation

Automatic blocking of Event Channel (%s2) of Event Channel group (%s1) was cancelled because the repository event data size had reached to the auto-block cancellation value after event data reception processing.

### System Action

Re-starts receiving of event data.

## 5.13.10 es11309

---

**ES: INFO: es11309: [ttttt] The repository data of EventChannel (%s1::%s2) was destroyed after the persistent time had lapsed, and its size has recovered to that of the monitor re-open repository data.**

### Variable Information

%s1 = Event channel group name

%s2 = Event channel name

### Explanation

The repository data of Event Channel (%s2) of Event Channel group (%s1) was destroyed after the persistent time had lapsed, and its number had reached that of the monitor restart repository data.

### System Action

Restarts monitoring of the repository data size.

### User Action

There is a consumer that did not receive event data because the reserve data persistent time was exceeded and the data was therefore destroyed.

Check whether there is a consumer running in the application that did not receive event data. Additionally, change the reserve data persistent time if necessary.

## 5.13.11 es11310

---

**ES: INFO: es11310: [ttttt] The repository data of EventChannel (%s1::%s2) was destroyed after the persistent time had lapsed, and the block was cancelled.**

### Variable Information

%s1 = Event channel group name

%s2 = Event channel name

### Explanation

The repository data of Event Channel (%s2) of Event Channel group (%s1) was destroyed after the persistent time had lapsed, and the auto-block was cancelled.

### System Action

Unblock the Event Channel and receive the event data receive request.

## User Action

There is a consumer that did not receive event data because the reserve data persistent time was exceeded and the data was therefore destroyed.

Check whether there is a consumer running in the application that did not receive event data. Additionally, change the reserve data persistent time if necessary.

## 5.13.12 es11311

---

**ES: ERROR: es11311: [ttttt] Block of EventChannel (%s1::%s2) failed.: Exception = %s3, Minor=%s4**

### Variable Information

%s1 = Event channel group name

%s2 = Event channel name

%s3 = Exception handling notification from CORBA Service

%s4 = Minor code notified from CORBA Service

### Explanation

Blocking of Event Channel (%s2) of Event Channel group (%s1) failed.

### System Action

Does not block the Event Channel.

### User Action

Take the following action:

- Rectify the problem by referencing the message output immediately before this message. Perform blocking again.
- Rectify the problem by referencing the exception information (%s3) and minor code (%s4). Perform blocking again.
- If exception information (%s3) is 'COMM\_FAILURE' and the minor code (%s4) is '0x464a0101', the system may be overloaded. Block the Event Channel using the *eschgblock* command or block Interstage. Wait for a short period and then re-execute.

If the same message is output after re-blocking, collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

## 5.13.13 es11312

---

**ES: ERROR: es11312: [ttttt] Blocking EventChannel (%s1::%s2) could not be cancelled.: EXCEPTION=%s3, minor=%s4**

### Variable Information

%s1 = Event channel group name

%s2 = Event channel name

%s3 = Exception handling notification from CORBA Service

%s4 = Minor code notified from CORBA Service

### Explanation

Blocking the Event Channel (%s2) of the Event Channel group (%s1) could not be cancelled.

### System Action

Does not cancel blocking of the Event Channel.

### User Action

Take the following action:

- Rectify the problem by referencing the message output immediately before this message. Cancel blocking again.
- Rectify the problem by referencing the exception information (%s3) and minor code (%s4). Cancel blocking again.
- If exception information (%s3) is 'COMM\_FAILURE' and the minor code (%s4) is '0x464a0101', the system may be overloaded. Cancel blocking of the Event Channel using the *eschgblock* command or Interstage. Wait for a short period and then re-execute.

If the same message is output after cancelling blocking again, collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

## 5.13.14 es11313

---

**ES: INFO: es11313: [ttttt] The blockade state of EventChannel (%s1::%s2) was changed.**

### Variable Information

%s1 = Event channel group name

%s2 = Event channel name

### Explanation

The block status of the Event Channel Group (%s1) the Event Channel (%s2) was changed.

## 5.14 es11500 to es11599

---

This section details messages numbered between es11500 and es11599.

### 5.14.1 es11500

---

**ES: INFO: es11500: [ttttt] The EventChannel Group (%s1) object reference was obtained from the Naming Service and stored in the file (%s2).**

### Variable Information

%s1 = Event Channel Group name

%s2 = File name

### Explanation

The EventChannel Group (%s1) object reference was obtained from the Naming Service and stored in the file (%s2).

### 5.14.2 es11501

---

**ES: INFO: es11501: [ttttt] Processing of all EventChannel object references registered in the Naming Service in the EventChannel Group (%s1) was successful.**

### Variable Information

%s1 = Event Channel Group name

### Explanation

Processing of all EventChannel object references registered in the Naming Service in the EventChannel Group (%s1) was successful.

### 5.14.3 es11502

---

**ES: ERROR: es11502: [ttttt] The file (%s1) already exists in the specified directory.**

### Variable Information

%s1 = File name

## Explanation

Processing stops because the file (%s1) already exists in the directory in which the command was executed.

## System Action

The processing stops.

## User Action

Delete file (%s1) or specify a different path and re-execute the command.

## 5.14.4 es11503

**ES: ERROR: es11503: [ttttt] Failed to access the file (%s1). : errno=%s2**

### Variable Information

%s1 = File name, or function name

**Windows32/64**

%s2 = Error number of Windows® API

**Solaris32/64 Linux32/64**

%s2 = Error number of system call

### Explanation

Processing cannot be performed because access to the file failed.

### System Action

The processing stops.

### User Action

Refer to the table below and take action for error number (%s2) and re-execute the command.

Error number (%s2)	Meaning	Required Action
0	If the [ttttt] maintenance code is [109702], [109703], [109704], or [109706], the trace information file output using the <i>eslogdump</i> command may be corrupt.	Re-execute the <i>eslogdump</i> command.
2	There is a possibility that the path for file %s1 does not exist, or that the maximum length for the path has been exceeded.	Take the following action. <ul style="list-style-type: none"><li>- Check the contents of file %s1.</li><li>- Check that the path for file %s1 exists.</li><li>- Check that the maximum length (in Windows(R) this is 256 and in Solaris/Linux it is 1024) for the path has not been exceeded.</li></ul>
5	An I/O error might have occurred on the disk.	Check whether a hardware error occurred on the disk.
12	<b>Solaris32/64 Linux32/64</b> If function output by the error is "fork1", it might mean that the swap area is insufficient.	<b>Solaris32/64 Linux32/64</b> Expand the swap area, or wait for a while until it is sufficient and then re-execute.
13	There is a possibility that authority for directories and files under the Interstage installation directory was changed from	Check whether administrator authority has been set.

Error number (%s2)	Meaning	Required Action
	administrator authority to general user authority.	
22	<p><b>Solaris32/64</b></p> <p>If function output by the error is 'shmget', it might mean that the shared system parameter memory is insufficient, or that [1] was set for the minimum size of the shared memory segment (shmmin).</p>	<p><b>Solaris32/64</b></p> <p>Check that the system resource settings are correct, and then restart the system.</p> <p>For details about system resources, refer to the "System Tuning" chapter of the Tuning Guide.</p>
	<p><b>Linux32/64</b></p> <p>If function output by the error is 'shmget', it might mean that the shared system parameter memory is insufficient.</p>	<p><b>Linux32/64</b></p> <p>After checking that the system resource settings are correct, execute 'sysctl -p /etc/sysctl.conf' or restart the system.</p> <p>For details about system resources, refer to the "System Tuning" chapter of the Tuning Guide.</p>
28	The disk capacity may be insufficient.	<p><b>Windows32/64</b></p> <p>Check that enough disk capacity is secured for the Interstage installation directory.</p>
		<p><b>Solaris32/64</b> <b>Linux32/64</b></p> <p>Check that enough disk capacity is secured for the partition assigned to /etc/opt/FJSVes.</p>
All other numbers	-	Refer to error number (%s2) to establish the cause of the failure of access to file (%s1).

If the problem is still not resolved by taking the action shown in the above table, collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

## 5.14.5 es11504

**ES: ERROR: es11504: [ttttt] The specified file (%s1) contents are incorrect.**

### Variable Information

%s1 = File name

### Explanation

The file (%s1) that was specified is corrupted, or not the correct file.

### System Action

The processing stops.

### User Action

If this message is outputted while the *esgetchnlior* command is being executed, there is a possibility that the specified file is corrupted, or that the file was not created using the *esgetchnlior* command. Specify the file that was outputted when the *esgetchnlior* command was executed, or re-execute the *esgetchnlior* command to create the file.

## 5.14.6 es11505

**ES: ERROR: es11505: [ttttt] Failed to register to NamingService.: EventChannel=%s1::%s2, EXCEPTION=%s3, minor=%s4**

## Variable Information

%s1 = Event Channel group name

%s2 = Event Channel name

%s3 = Error or Exception handling notification from CORBA Service

%s4 = Minor code notified from CORBA Service

## Explanation

Failed to register the Event Channel (%s1) object reference of the Event Channel group (%s2) in the Naming Service.

## System Action

The processing stops.

## User Action

If the error or exception (%s3) is 'IDL:CosNaming/NamingContext/AlreadyBound:1.0', it means that an object reference with the same name is already registered.

Refer to the contents registered for the displayed Naming Service. Check the object reference detail information registered in the Naming Service in the 'EventChannel Group %s1:: EventChannel %s2' binding. Then check whether the registered object reference is required. In EventChannel object references, the interface repository name is registered as 'IDL:CosNotifyChannelAdmin/EventChannel:1.0' or 'IDL:CosEventChannelAdmin/EventChannel:1.0'.

`odlistns -l`

If the registered object reference is not required, execute the following command to delete the object reference from the Naming Service and then re-execute the *esstetchnlior* command.

```
OD_or_adm -d -n "EventChannel Group:: EventChannel"
```

For details about the *odlistns* and *OD\_or\_adm* commands, refer to "odlistns" and "OD\_or\_adm" in the "CORBA Service Operation Commands" chapter of the Reference Manual (Command Edition).

In cases not shown above, refer to the error or exception (%s3) and minor code (%s4), establish the cause of the failure, and then re-execute processing.

## 5.14.7 es11506

---

**ES: ERROR: es11506: [ttttt] Failed to get the EventChannel (%s1::%s2) object reference from the Naming Service. : EXCEPTION=%s3, minor=%s4**

## Variable Information

%s1 = Event Channel group name

%s2 = Event Channel name

%s3 = Error or Exception handling notification from CORBA Service

%s4 = Minor code notified from CORBA Service

## Explanation

Failed to complete the process of obtaining of the Event Channel object reference from the Naming Service.

## System Action

The processing stops.

## User Action

If error or exception (%s3) is 'IDL:CORBA/StExcep/COMM\_FAILURE:1.0', change the network environment and then re-execute.

In cases not shown above, refer to the error or exception (%s3) and minor code (%s4), establish the cause of the failure and then re-execute processing.

## 5.14.8 es11507

---

**ES: ERROR: es11507: [ttttt] There is no authority for access to file (%s1). : errno=%s2**

### Variable Information

%s1 = File name

**Windows32/64**

%s2 = Error number of Windows® API

**Solaris32/64 Linux32/64**

%s2 = Error number of system call

### Explanation

Processing cannot be performed because there is no authority for access to the file (%s1).

### System Action

The processing stops.

### User Action

Take either of the following steps:

- There is a possibility that authority for access to the specified file has not been set, or that authority for access to the directory containing the file has not been set.
- Check whether access authority has been set. If it has not, then set it.

Otherwise, collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

## 5.14.9 es11508

---

**ES: ERROR: es11508: [ttttt] The specified file (%s1) does not exist. Check the file name. : errno=%s2**

### Variable Information

%s1 = File name

**Windows32/64**

%s2 = Error number of Windows® API

**Solaris32/64 Linux32/64**

%s2 = Error number of system call

### Explanation

The specified file (%s1) does not exist.

### System Action

The processing stops.

### User Action

Take either of the following steps:

- Check that the specified file exists.
- When the specified file exists, Check if there is an error in the specification of the file name. If so, specify a correct file name.

## 5.14.10 es11509

---

---

**ES: INFO:es11509: [ttttt] The EventChannel (%s1::%s2) object reference was deleted from the Naming Service.**

Variable Information

%s1 = Event Channel group name

%s2 = Event Channel name

Explanation

The Event Channel (%s2) object reference of the Event Channel group (%s1) was deleted from the Naming Service.

## 5.14.11 es11510

---

**ES: ERROR: es11510: [ttttt] Failed to delete from NamingService.: EventChannel=%s1::%s2, EXCEPTION=%s3, minor=%s4**

Variable Information

%s1 = Event Channel group name

%s2 = Event Channel name

%s3 = Error or Exception handling notification from CORBA Service

%s4 = Minor code notified from CORBA Service

Explanation

Processing failed when deleting the Event Channel (%s2) object reference of the Event Channel group (%s1) from the Naming Service.

System Action

The process of deleting the object reference from the Naming Service stops.

User Action

Execute the following command to check whether the Event Channel (%s2) object reference of the Event Channel group (%s1) is registered in the Naming Service.

```
odlistns -l
```

If the object reference is registered, execute the following command to delete it from the Naming Service and then re-execute the *esetchnl* command.

```
OD_or_adm -d -n "EventChannel Group:: EventChannel"
```

For details about the *odlistns* and *OD\_or\_adm* commands, refer to "odlistns" and "OD\_or\_adm" in the "CORBA Service Operation Commands" chapter of the Reference Manual (Command Edition).

In cases not shown above, refer to the error or exception (%s3) and minor code (%s4), establish the cause of the failure, and then re-execute processing.

## 5.14.12 es11511

---

**ES: ERROR: es11511: [ttttt] The specified directory (%s1) does not exist. Check the directory name.: errno=%s2**

Variable Information

%s1 = Directory name

 Windows32/64

%s2 = Error number of Windows® API

 Solaris32/64  Linux32/64

%s2 = Error number of system call

#### Explanation

The specified directory (%s1) does not exist.

#### System Action

The processing stops.

#### User Action

Check that the specified directory (%s1) exists, or that the directory name has been spelt correctly.

### 5.14.13 es11512

---

**ES: ERROR: es11512: [ttttt] There is no authority for access to directory (%s1).: errno=%s2**

#### Variable Information

%s1 = Directory name

Windows32/64

%s2 = Error number of Windows® API

Solaris32/64 Linux32/64

%s2 = Error number of system call

#### Explanation

Processing could not be performed because there is no authority to access the directory (%s1).

#### System Action

The processing stops.

#### User Action

If there is no authority to access the directory (%s1), change the settings to grant access and re-execute the command.

If the problem is still not resolved, collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

### 5.14.14 es11513

---

**ES: ERROR: es11513: [ttttt] Failed to access of the directory (%s1).: errno=%s2**

#### Variable Information

%s1 = Directory name

Windows32/64

%s2 = Error number of Windows® API

Solaris32/64 Linux32/64

%s2 = Error number of system call

#### Explanation

Processing could not be performed because access to directory (%s1) failed.

#### System Action

The processing stops.

## User Action

Refer to error number (%s2) to establish the cause of the failure of access to directory (%s1) and re-execute the command.

If the problem is still not resolved, collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

## 5.15 es19300 to es19399

---

This section details messages numbered between es19300 and es19399.

### 5.15.1 es19301

---

**ES: INFO:es19301: [ttttt] Monitoring the creation of dynamic channel (%s1)for maximum of %s2 seconds.**

#### Variable Information

%s1 = Dynamic Event Channel name or Event Channel ID

%s2 = Maximum monitoring time

#### Explanation

Dynamic event channel %s1 is started, and start monitoring is performed for a maximum of %s2 seconds.

### 5.15.2 es19302

---

**ES: INFO:es19302: [ttttt] Time for monitoring the creation of dynamic channel(%s1) has exceeded. It is possible that the creation of dynamic channel has failed.**

#### Variable Information

%s1 = Dynamic Event Channel name or Event Channel ID

#### Explanation

Creation of the dynamic event channel (%s1) was monitored for the maximum monitoring time, but the actual creation could not be confirmed.

If this message is output frequently, there may be a high system load.

#### User Action

Re-execute the dynamic channel create processing.

If this message is also output during re-testing, creation of the dynamic event channel may have failed.

Collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

## 5.16 es20000 to es20099

---

This section details messages numbered between es20000 and es20099.

### 5.16.1 es20000

---

**ES: ERROR: es20000: [ttttt] system error occurred: CODE=%s1 UNIT=%s2**

#### Variable Information

%s1 = System error information

%s2 = Unit name (When multi system operation is being performed, the unit name of the extended system will be displayed by 'system name\_unit name')

## Explanation

A system error occurred.

## System Action

The processing stops.

## User Action

Take one of the following actions:

**Windows32/64**

Take either of the following steps:

- If System error information (%s1) is "QM-XX-XX 12", the directories or files shown below may not exist:
  - A storage directory (trandir, sysdir, userdir) specified in the settings information of the unit that was newly created in the Interstage Management Console, or a file (estranfile, essysmsgfile, essysqfile, esmsgfile0, esuserqfile) in that directory
  - A storage directory (trandir, sysdir, userdir) specified in the unit definition file when the *esmunit* command was executed, or a file (estranfile, essysmsgfile, essysqfile, esmsgfile0, esuserqfile) in that directory

Check whether the above directories and files exist. If they do not all exist, reinstall the Event Service.

- If this message is output when a new event channel is created using the Interstage Management Console and %s1 is "QM-142-1 12", the Event Service logon account may have been incorrectly changed. To correct it, follow the steps below:
  1. Log in with Administrator privileges.
  2. Start [Control Panel]-[Services], or [Control Panel]-[Administrative Tools]-[Services].
  3. In the services list, right-click "EventService", and select "Properties".
  4. Click the [Log On] tab.
  5. If [Local System account] is not selected, select it, click [OK] and restart the operating system.
- Otherwise, collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

**Solaris32/64 Linux32/64**

- Collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

## 5.16.2 es20001

---

**ES: ERROR: es20001: [ttttt] The file system capacity is insufficient: CODE=%s1 UNIT=%s2**

### Variable Information

%s1 = Maintenance information

%s2 = Unit name (When multi system operation is being performed, the unit name of the extended system will be displayed by 'system name\_unit name')

## Explanation

File system capacities ran out.

## System Action

The processing stops.

## User Action

Check the file size specified in the setting information of the unit created on the Interstage Management Console or the file size of the unit definition file specified during execution of the *esmunit* command.

If the file system capacity is insufficient, reserve sufficient capacities for the file system by recreating a partition or by other means, and recreate an environment using the *esmunit* command.

### 5.16.3 es20002

---

**ES: ERROR: es20002: [ttttt] XA library call is invalid: CODE=%s1 UNIT=%s2**

#### Variable Information

%s1 = Error information

%s2 = Unit name (When multi system operation is being performed, the unit name of the extended system will be displayed by 'system name\_unit name')

#### Explanation

The XA library call was incorrect.

#### System Action

The processing stops.

#### User Action

If the error information (%s1) is 1, an incorrect argument was specified. Review the arguments.

If the error information (%s1) is 53, the called sequence was wrong. The Event Service may not be active or the open string may be incorrect. Check the active status of the Event Service or the open string.

Otherwise, collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

### 5.16.4 es20003

---

**ES: WARNING: es20003: [ttttt] The usage rate of the message storage area exceeded the set warning value: ATTRIBUTE=DISK UNIT=%s1**

#### Variable Information

%s1 = Unit name (When multi system operation is being performed, the unit name of the extended system will be displayed by 'system name\_unit name')

#### Explanation

The usage rate of the message storage area exceeded the reference value for warning (defined warning value).

#### System Action

The processing continues.

#### User Action

The usage rate of the message storage area exceeded the set warning value. There is a possibility that the message cannot be accumulated to reach the maximum value of the message storage area when it keeps accumulating the message. Close the communication.

The file size specified in the setting information of the unit created on the Interstage Management Console or the file size of the unit definition file specified during execution of the *esmkunit* command may be incorrect. Make the unit and the Event Channel again after checking whether they are the settings according to operation.

### 5.16.5 es20004

---

**ES: INFO: es20004: [ttttt] The usage rate of the message storage area was restored to the set safety value: ATTRIBUTE=DISK UNIT=%s1**

#### Variable Information

%s1 = Unit name (When multi system operation is being performed, the unit name of the extended system will be displayed by 'system name\_unit name')

## Explanation

The usage rate of the message storage area was restored to the reference value for releasing the warning (defined safety value).

## 5.16.6 es20005

---

**ES: ERROR: es20005: [ttttt] System cannot continue operation because an error occurred: PID=%s1 UNIT=%s2**

### Variable Information

%s1 = Process ID

%s2 = Unit name (When multi system operation is being performed, the unit name of the extended system will be displayed by 'system name\_unit name')

### Explanation

The process with ID (%s1) abnormally terminated, so the system operation could continue. As a result, the unit (%s2) is stopped.

### System Action

The processing stops.

### User Action

Start the unit (%s2) with the *esstartunit* command or Interstage Management Console.

If the unit cannot be started, collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

## 5.16.7 es20006

---

**ES: ERROR: es20006: [ttttt] it failed in the access of the file: ERRNO=%s1 UNIT=%s2**

### Variable Information

%s1 = Error information

%s2 = Unit name (When multi system operation is being performed, the unit name of the extended system will be displayed by 'system name\_unit name')

### Explanation

A file in the storing directory specified by the unit definition file was deleted.

### System Action

The processing stops.

### User Action

Take one of the following actions:

- If 'QM-XX-XX 18' is specified in error information (%s1), check whether there is an abnormality in the disk device on which the following directories exist:
  - A storage directory (trandir, sysdir, userdir) specified in the settings information of the unit that was newly created in the Interstage Management Console
  - A storage directory (trandir, sysdir, userdir) specified in the unit definition file when the *esmkunit* command was executed
- If '2' is specified in error information (%s1), the directories or files shown below may not exist:
  - A storage directory (trandir, sysdir, userdir) specified in the settings information of the unit that was newly created in the Interstage Management Console, or a file (estranfile, essysmsgfile, essysqfile, esmsgfile0, esuserqfile) in that directory
  - A storage directory (trandir, sysdir, userdir) specified in the unit definition file when the *esmkunit* command was executed, or a file (estranfile, essysmsgfile, essysqfile, esmsgfile0, esuserqfile) in that directory

Check whether the above directories and files exist. If they do not all exist, reinstall the Event Service.

- If an error is still not solved by the above procedures, collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

## 5.16.8 es20007

---

**ES: ERROR: es20007: [ttttt] A resource shortage occurred: CODE=%s1 UNIT=%s2**

### Variable Information

%s1 = Error information

%s2 = Unit name

### Explanation

Out of memory

### System Action

The processing stops.

### User Action

Take either of the following steps:

- If the estimated shared-memory size (the setting information of the unit created on the Interstage Management Console or the definition value of the unit definition file specified during execution of the *esmunit* command) to be used by the unit is incorrect, re-estimate the shared-memory size required for the operation and recreate unit (%s2).
- If the error information %s1 is QM-XX-XX 11, close any unnecessary programs.

If the problem is still not resolved, collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

## 5.16.9 es20008

---

**ES: ERROR: es20008: [ttttt] System function call error occurred: Function=%s1, errno=%s2, UNIT=%s3**

### Variable Information

%s1 = Name of function in which error occurred (system call name)

%s2 = Error number of system call

%s3 = Unit name (When multi system operation is being performed, the unit name of the extended system will be displayed by 'system name\_unit name')

### Explanation

A system call error occurred in the Unit (%s3) operation. Alternatively, there were insufficient resources for executing the system call.

### System Action

The processing stops.

### User Action

Take either of the following steps:

- If the function name %s1 in which the error occurred is 'SystemCallName,memory', it can be considered that there was insufficient memory. Close unnecessary programs. Additionally, check that enough memory has been secured for operating the Event Service.
- A system resource (IPC) may be insufficient. Specify the correct system resources, reboot the system, and then restart the Event Service. For more information about system resources, refer to the Tuning Guide.

## 5.16.10 es20009

---

**ES: INFO: es20009: [ttttt] Information of queue manager: CODE=%s1 UNIT=%s2**

### Variable Information

%s1 = Maintenance information

%s2 = Unit name (When multi system operation is being performed, the unit name of the extended system will be displayed by 'system name\_unit name')

### Explanation

This is a queue manager information message.

If "EIDRM,sem" is included in the Maintenance information (%s1), then the semaphore space for IPC resources used by the Event Service was deleted.

If "EIDRM,queue" is included in the Maintenance information (%s1), then the message queue for IPC resources used by the Event Service was deleted.

If "EINVAL,queue" is included in the Maintenance information (%s1), then the message queue for IPC resources used by the Event Service was deleted.

### System Action

The processing stops.

### User Action

No action is necessary.

## 5.16.11 es20010

---

**ES: ERROR: es20010: [ttttt] Exceeded the maximum transaction concurrency: AMOUNT=%s1 DETAIL=%s2 UNIT=%s3**

### Variable Information

%s1 = Upper limit of transaction concurrency level set upon unit creation

%s2 = Maintenance information

%s3 = Unit name (When multi system operation is being performed, the unit name of the extended system will be displayed by 'system name\_unit name')

### Explanation

The upper limit of transaction concurrency level for the EventChannel of the Unit (%s3) was exceeded.

### System Action

The processing stops.

### User Action

Take either of the following steps:

- Decrease the transaction concurrency level.
- Check whether there is a problem with the estimate for the transaction concurrency level set upon unit creation. If there is, then change the values for the settings below and create the unit and EventChannel again if necessary.
  - If the unit was created using the Interstage Management Console:  
The value set for [Transaction Concurrency]
  - If the unit was created using the *esmkunit* command:  
The value set for 'tranmax' in the unit definition file

## 5.16.12 es20011

---

**ES: ERROR: es20011: [ttttt] Exceeded the maximum message size that can be operated in transaction: AMOUNT=%s1 DETAIL=%s2 UNIT=%s3**

### Variable Information

%s1 = Maximum message size in the transaction set upon unit creation

%s2 = Maintenance information

%s3 = Unit name (When multi system operation is being performed, the unit name of the extended system will be displayed by 'system name\_unit name')

### Explanation

The maximum message size that can be operated in transactions of the unit (%s3) was exceeded.

### System Action

The processing stops.

### User Action

Take either of the following steps:

- Decrease the size of the message being operated by the transactions.
- Check whether there is a problem with the maximum message size estimate for 1 transaction that was set when the unit was created. Check the following values for the maximum message size for 1 transaction. If there is a problem with the estimate, then change the settings below and create the unit and EventChannel again if necessary.
  - If the unit was created using the Interstage Management Console:  
Value set for [Maximum Message Size per Transaction]
  - If the unit was created using the *esmunit* command:  
Value set for 'tranunitmax' in the unit definition file

## 5.16.13 es20012

---

**ES: ERROR: es20012: [ttttt] Exceeded the maximum capacity of system file: KIND=%s1 AMOUNT=%s2 DETAIL=%s3 UNIT=%s4**

### Variable Information

%s1 = Type

%s2 = Depends on Type (%s1):

- If "syssize": Capacity of files used by the system (unit control) set upon unit creation
- If "usersize": Capacity of files used by the event data set upon unit creation

%s3 = Maintenance information

%s4 = Unit name (When multi system operation is being performed, the unit name of the extended system will be displayed by 'system name\_unit name')

### Explanation

If Type (%s1) is "syssize", then the capacity (%s2) of files used by the system (unit control) for the unit (%s4) has exceeded the upper limit - this might indicate a problem with the current estimate.

If type (%s1) is "usersize", then the capacity (%s2) of files used by the event data for the unit (%s4) has exceeded the upper limit - this might indicate a problem with the current estimate.

## System Action

The processing stops.

## User Action

Take either of the following steps:

- If Type (%s1) is "sysssize", then check whether there is a problem with estimate of the capacity of files used by the system (unit control) set upon unit creation. If there is, then change the values for the settings below and create the unit and EventChannel again if necessary.
  - If the unit was created using the Interstage Management Console:  
[Capacity for files used by the system (unit control)]
  - If the unit was created using the *esmunit* command:  
Value set for 'sysssize' in the unit definition file
- If Type (%s1) is "usersize", check whether there is a problem with the estimate of the capacity of files used by the event data set upon unit creation. If there is, then change the values for the settings below and create the unit and EventChannel again if necessary.
  - If the unit was created using the Interstage Management Console:  
[File Capacity for Event Data]
  - If the unit was created using the *esmunit* command:  
Value set for 'usersize' in the unit definition file

## 5.16.14 es20013

---

**ES: ERROR: es20013: [ttttt] Exceeded the maximum number of queue: KIND=%s1 AMOUNT=%s2  
DETAIL=%s3 UNIT=%s4**

### Variable Information

%s1 = Type

%s2 = Depends on Type (%s1):

- If "sysssize": Number of data stores (queues) used by the system (unit control) set upon unit creation
- If "usersize": Number of data stores (queues) used by the event data set upon unit creation

%s3 = Maintenance information

%s4 = Unit name (When multi system operation is being performed, the unit name of the extended system will be displayed by 'system name\_unit name')

### Explanation

If Type (%s1) is "sysqnum", then the upper limit for the data store (queue) used by the system (unit control) for the unit (%s4) was exceeded.

If Type (%s1) is "userqnum", then the upper limit for the data store (queue) used by the event data for the unit (%s4) was exceeded.

## System Action

The processing stops.

## User Action

Take either of the following steps:

- If Type (%s1) is "sysqnum", check whether there is a problem with the estimate for the number of data stores (queues) used by the system (unit control) set upon unit creation. If there is, then change the values for the settings below and create the unit and EventChannel again if necessary.
  - If the unit was created using the Interstage Management Console:
 

[Number of data stores used by the system (unit control)]
  - If the unit was created using the *esmkunit* command:
 

Value set for 'sysqnum' in the unit definition file
- If Type (%s1) is "userqnum", check whether there is a problem with the estimate for the number of data stores (queues) used by the event data set upon unit creation. If there is, then change the values for the settings below and create the unit and EventChannel again if necessary.
  - If the unit was created using the Interstage Management Console:
 

[Number of Event Data Storage Directories]
  - If the unit was created using the *esmkunit* command:
 

Value set for 'userqnum' in the unit definition file

## 5.16.15 es20014

---

**ES: ERROR: es20014: [ttttt] Exceeded the maximum size of shared memory used by MessageBuffer: AMOUNT=%s1 DETAIL=%s2 UNIT=%s3**

### Variable Information

%s1 = Shared memory size set upon unit creation

%s2 = Maintenance information

%s3 = Unit name (When multi system operation is being performed, the unit name of the extended system will be displayed by 'system name\_unit name')

### Explanation

The upper limit for the shared memory size used for the message buffer for the unit (%s3) was exceeded.

### System Action

The processing stops.

### User Action

Take either of the following steps:

- Stop any unnecessary transaction applications.
- Check whether there is a problem with the estimate for the shared memory size set upon creation. If there is, then change the values for the settings below and create the unit and EventChannel again if necessary.
  - If the unit was created using the Interstage Management Console:
 

Value set for [Shared Memory Size]
  - If the unit was created using the *esmkunit* command:
 

Value set for 'shmmax' in the unit definition file

## 5.16.16 es20015

---

**ES: ERROR: es20015: [ttttt] File descriptor is insufficient: DETAIL=%s1 UNIT=%s2**

### Variable Information

%s1 = Maintenance information

%s2 = Unit name (When multi system operation is being performed, the unit name of the extended system will be displayed by 'system name\_unit name')

#### Explanation

There were not enough file descriptors for the processing of the unit (%s2).

#### System Action

The processing stops.

#### User Action

Increase the upper limit for the number of file descriptors that can be used in a process, and start the Event Service.

### 5.16.17 es20016

---

**ES: ERROR: es20016: [ttttt] IPC resource is insufficient: KIND=%s1 AMOUNT=%s2 DETAIL=%s3 UNIT=%s4**

#### Variable Information

%s1 = Type

%s2 = Depends on Type (%s1):

Note: If Type (%s1) could not be determined, then "\*" is displayed.

- If "shm": Required shared memory (bytes)
- If "sem": Required semaphore amount (bytes)
- If "msg": Required message queue amount (number of messages)

%s3 = Maintenance information

%s4 = Unit name (When multi system operation is being performed, the unit name of the extended system will be displayed by 'system name\_unit name')

#### Explanation

There were not enough IPC resources for the processing of the unit (%s3).

#### System Action

The processing stops.

#### User Action

Set the system resources correctly, restart the system, and then start the Event Service. For details on the system resources, refer to the Tuning Guide.

### 5.16.18 es20017

---

**ES: ERROR: es20017: [ttttt] Memory is insufficient: AMOUNT=%s1 DETAIL=%s2 UNIT=%s3**

#### Variable Information

%s1 = Required memory amount (bytes)

%s2 = Maintenance information

Note: If Type (%s1) could not be determined, then "\*" is displayed.

%s3 = Unit name (When multi system operation is being performed, the unit name of the extended system will be displayed by 'system name\_unit name')

#### Explanation

There was not enough memory for the processing of the unit (%s3).

## System Action

The processing stops.

## User Action

Stop any unnecessary programs. For Event Service applications, check that enough memory can be secured.

## 5.16.19 es20018

---

**ES: ERROR: es20018: [ttttt] Exceeded the maximum number of thread of channel that can be connected with unit: DETAIL=%s1 UNIT=%s2**

### Variable Information

%s1 = Detail information

%s2 = Unit name (When multi system operation is being performed, the unit name of the extended system will be displayed by 'system name\_unit name')

### Explanation

The upper limit for the number of processes connected to the unit (%s2) was exceeded.

### System Action

The processing stops.

### User Action

Take one of the following actions:

- Close unnecessary applications that have accessed the target unit to reduce the number of event channel threads.
- Specify a low value for the -m option (total number of Suppliers and Consumers that will connect to an event channel) in the *esmchnl* command, then execute the command to create the event channel again. The number of event channel threads is calculated from the total number of Suppliers and Consumers that will connect to an event channel. For details on the total number of Suppliers and Consumers that will connect to an event channel, refer to "Estimating the Total Number of Suppliers and Consumers" in the "Event Service Environment Definition" appendix of the Tuning Guide.

## 5.17 es30000 to es30099

---

This section details messages numbered between es30000 and es30099.

### 5.17.1 es30000

---

**ES: ERROR: es30000: [ttttt] Error in EventService application operating environment.**

#### Explanation

Processing failed because an operating environment abnormality or unexpected error occurred.

#### System Action

The processing stops.

#### User Action

The possible causes of the processing failure are as follows. Take the action required for each of the possible causes.

- If an environment variable (PATH, CLASSPATH, or LD\_LIBRARY\_PATH) is incorrect, check the environment variable settings.
- If the library set in environment variable LD\_LIBRARY\_PATH does not exist, install the product correctly.
- If the JDK/JRE version used is incorrect, replace it with the correct version.

If none of the above causes applies, collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

## 5.17.2 es30001

---

**ES: ERROR: es30001: [ttttt] Memory shortage occurred.**

### Explanation

A memory shortage occurred.

### System Action

The processing stops.

### User Action

Wait a while and re-execute the processing. If this message is output frequently, take the following action and re-execute the processing:

- Change the Java VM memory size.
- Check whether sufficient memory capacity is available for execution. Stop any unnecessary applications.

## 5.17.3 es30003

---

**ES: ERROR: es30003: [ttttt] A package is not installed.**

### Explanation

The Event Service has not been installed.

### System Action

The processing stops.

### User Action

The Event Service installation state of the Managed Servers that already belong to the Server Group and the Reserve Server that you attempted to add to the Server Group must match.

Match the Event Service installation state of the Managed Servers that already belong to the Server Group and the Reserve Server that you attempted to add to the Server Group. After doing so, re-execute the operation to add the server to the Server Group.

## 5.17.4 es30010

---

**ES: ERROR: es30010: [ttttt] EventChannel(%s1) does not exist.**

### Variable Information

%s1 = Event Channel name

### Explanation

The process failed because the operation target Event Channel name (%s1) could not be found.

### System Action

The processing stops.

### User Action

The Event Channel may have been deleted by a request from another user. Reacquire the Event Channel list and then rerun the process.

## 5.18 es30100 to es30199

---

This section details messages numbered between es30100 and es30199.

## 5.18.1 es30100

---

**ES: ERROR: es30100: [ttttt] Failed to start EventService. FUNC '%s1' CODE '%s2'**

### Variable Information

%s1 = Function name where the error occurred

%s2 = Error code

### Explanation

The Event Service could not be started.

### System Action

Event Service startup processing is cancelled.

### User Action

Wait for a few seconds after unsuccessful start of the Event Service, and then restart the Event Service.

If this message continues to be displayed after the Event Service was restarted, collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

## 5.18.2 es30101

---

**ES: ERROR: es30101: [ttttt] Failed to stop EventService. FUNC '%s1' CODE '%s2'**

### Variable Information

%s1 = Function name where the error occurred

%s2 = Error code

### Explanation

The Event Service could not be stopped.

### System Action

Event Service stop processing is cancelled.

### User Action

Wait for a few seconds after unsuccessful stop of the Event Service, and then stop the Event Service again.

If this message continues to be displayed after the Event Service was stopped, collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

## 5.18.3 es30102

---

**ES: ERROR: es30102: [ttttt] EventService status can not be obtained. FUNC '%s1' CODE '%s2'**

### Variable Information

%s1 = Function name where the error occurred

%s2 = Error code

### Explanation

The Event Service status could not be acquired.

### System Action

The processing stops.

#### User Action

Wait for a few seconds after unsuccessful acquisition of the Event Service status and then try to obtain the status again.

If this message continues to be displayed after the status was obtained, collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

---

### 5.18.4 es30103

---

**ES: INFO: es30103: [ttttt] EventService is being running.**

#### Explanation

The Event Service is running.

---

### 5.18.5 es30104

---

**ES: INFO: es30104: [ttttt] EventService is not running.**

#### Explanation

The Event Service is not running.

There is a possibility that the Event Service is not running.

#### User Action

If the Event Service was stopped using the *esstop* command, wait until processing stops completely, start the Event Service using the *esstart* command, and re-execute processing.

If Interstage is not running, start it, then start the Event Service and re-execute processing.

---

### 5.18.6 es30105

---

**ES: INFO: es30105: [ttttt] EventService is being started.**

#### Explanation

The Event Service is running.

#### System Action

Processing of the executed command is cancelled, and Event Service startup processing continues.

#### User Action

After the Event Service start processing is completed, re-execute the processing.

---

### 5.18.7 es30106

---

**ES: INFO: es30106: [ttttt] EventService is being stopped.**

#### Explanation

The Event Service is stopping.

#### System Action

Processing of the executed command is cancelled, and Event Service stop processing continues.

#### User Action

After the Event Service stop processing is completed, re-execute the processing.

---

### 5.18.8 es30107

---

---

**ES: ERROR: es30107: [ttttt] EventChannelGroup(%s1) is not exist.**

Variable Information

%s1 = Event Channel group name

Explanation

Event Channel group (%s1) does not exist.

System Action

The processing stops.

User Action

Take the following steps:

- The Event Channel group may have been deleted by the Event Service operation command.  
Check if the specified Event Channel Group exists with the *esmonitor* command, and delete it with Interstage Management Console.
- The Event Channel group may have been created by the Event Service operation command. A user with Administrators authority must log in the Interstage Management Console of the Managed Server and display the list of definition information to update the information maintained in the Interstage Management Console.

---

### 5.18.9 es30108

---

**ES: INFO: es30108: [ttttt] EventChannelGroup(%s1) is being running.**

Variable Information

%s1 = Event Channel group name

Explanation

Event Channel group (%s1) is running.

User Action

If this message is output while deleting the Event Channel, re-execute the processing after stopping the Event Channel group.

---

### 5.18.10 es30109

---

**ES: ERROR: es30109: [ttttt] Failed to start EventChannelGroup(%s1).**

Variable Information

%s1 = Event Channel group name

Explanation

Event Channel group (%s1) could not be started.

System Action

Channel Service startup processing is cancelled.

User Action

Take one of the following actions:

- If global transaction operation is to be performed, the Database Linkage Service may not be running. Confirm that the Database Linkage Service is running.
- If a normal stop was performed for the Event Channel immediately before this message was output, stop processing for the Event Channel may not have completed. Change the Event Channel stop method to forced stop. Alternatively, start the Event Channel after the es10028 INFO message is output in the event log.

- In cases other than that described above, refer to the message output from the system log before this message and check the cause of the failure. Restart processing after removing the cause of the start failure.

If this message continues to be displayed after the Event Channel was started, collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

### 5.18.11 es30110

---

**ES: INFO: es30110: [ttttt] EventChannelGroup(%s1) is not running.**

#### Variable Information

%s1 = Event Channel group name

#### Explanation

Event Channel group (%s1) is not running.

#### User Action

After starting Event Channel group (%s1), re-execute the processing.

### 5.18.12 es30111

---

**ES: INFO: es30111: [ttttt] EventChannelGroup(%s1) is being started.**

#### Variable Information

%s1 = Event Channel group name

#### Explanation

Event Channel group (%s1) is running.

#### System Action

Processing of the executed command is cancelled, and Event Channel startup processing continues.

#### User Action

After the Event Channel group (%s1) start processing is completed, re-execute the processing.

### 5.18.13 es30112

---

**ES: INFO: es30112: [ttttt] EventChannelGroup(%s1) is being stopped.**

#### Variable Information

%s1 = Event Channel group name

#### Explanation

Event Channel group (%s1) is stopping.

#### System Action

Processing of the executed command is cancelled, and Event Channel stop processing continues.

#### User Action

After the Event Channel group (%s1) stop processing is completed, re-execute the processing.

### 5.18.14 es30113

---

**ES: ERROR: es30113: [ttttt] Unit is not setup.**

#### Explanation

The unit is not set up.

#### System Action

The processing stops.

#### User Action

Set up the unit.

### 5.18.15 es30114

---

**ES: ERROR: es30114: [ttttt] The number of EventChannel started exceeded the upper bound.**

#### Explanation

No more channels can be started because the maximum number of started Event Channels has been exceeded.

#### System Action

Event Channel startup processing is cancelled.

#### User Action

Check the maximum number of started Event Channels in the configuration information. For information about the maximum number of Event Channels that can be started, refer to "esetcnf" in the "Event Service Operation Commands" chapter of the Reference Manual (Command Edition). Or stop any unnecessary Event Channels.

### 5.18.16 es30115

---

**ES: ERROR: es30115: [ttttt] Shared memory operation error occurred. ERROR INFORMATION '%s1'**

#### Variable Information

%s1 = Error information

#### Explanation

Processing has been interrupted due to the detection of memory data corruption during shared-memory access.

#### System Action

The processing stops.

#### User Action

Restart the Event Service.

### 5.18.17 es30116

---

**ES: ERROR: es30116: [ttttt] Unit(%s1) is under use by EventChannelGroup(%s2), cannot be deleted.**

#### Variable Information

%s1 = Unit name

%s2 = Event Channel group

#### Explanation

The unit (%s1) cannot be deleted because it is used in Event Channel group (%s2).

#### System Action

Unit deletion processing is cancelled.

## User Action

Delete the unit (%s1) after deleting Event Channel group (%s2).

## 5.18.18 es30117

---

**ES: ERROR: es30117: [ttttt] Operation to a dynamic channel cannot be performed.**

### Explanation

Operation to a dynamic channel cannot be performed.

### System Action

The processing stops.

### User Action

None.

## 5.18.19 es30118

---

**ES: ERROR: es30118: [ttttt] EventChannel(%s1) is not exist.**

### Variable Information

%s1 = Event Channel name

### Explanation

The process failed because the specified Event Channel name (%s1) could not be found.

### System Action

The processing stops.

### User Action

If this message is displayed when the Event Channel environment settings are reacquired with Interstage Management Console, the settings may have been deleted by a request from another user. Reacquire the Event Channel list and then rerun the process.

If this message is displayed when the Event Channel environment settings are updated with Interstage Management Console, the Event Channel may not have been correctly created. Check the environment settings status in the Event Channel list.

## 5.18.20 es30119

---

**ES: ERROR: es30119: [ttttt] EventService is not setup.**

### Explanation

The Event Service is not set up.

### System Action

The processing stops.

### User Action

If 'Event Service' is not registered in [Interstage Component Services] selected by clicking [System] > [View System Status] from Interstage Management Console, change [Event Service Settings] or [JMS Settings] selected by clicking [System] > [Update System Settings] to 'Yes'. This changes the system configuration.

If 'Event Service' is not registered in [Interstage Component Services], change [Event Service Settings] or [JMS Settings] [Interstage Component Services] is selected by clicking [System] > [Server Group or Managed Server operating alone] > [View System Status] from the Interstage Management Console for the Admin Server. Event Service Settings] or [JMS Settings] is selected by clicking [System] > [Server Group or Managed Server operating alone] > [Update System Settings]. This changes the system configuration.

If the Interstage Management Console is used during Interstage startup, stop, or setup (initialization and configuration updates), the page may not display correctly and this message is output. In this case, wait until the Interstage start, stop, or setup is complete, click the target operation node, and then re-execute processing.

### 5.18.21 es30120

---

**ES: INFO: es30120: [ttttt] The event channel (%s1) has already been closed.**

#### Variable Information

%s1 = Event Channel name

#### Explanation

The Event Channel (%s1) is now in the inhibited state.

### 5.18.22 es30121

---

**ES: INFO: es30121: [ttttt] The inhibited state of the event channel (%s1) has already been cancelled.**

#### Variable Information

%s1 = Event Channel name

#### Explanation

The inhibited state of the Event Channel (%s1) has been cancelled.

## 5.19 es30200 to es30299

---

This section details messages numbered between es30200 and es30299.

### 5.19.1 es30201

---

**ES: ERROR: es30201: [ttttt] An invalid value was specified for Definition information. ERROR INFORMATION '%s1'**

#### Variable Information

%s1 = Error information

#### Explanation

The specified definition information is incorrect.

#### System Action

The processing stops.

#### User Action

Refer to error information (%s1), check the definition information, and re-execute the processing.

### 5.19.2 es30202

---

**ES: ERROR: es30202: [ttttt] The value for Definition information(%s1) is exceeded maximum length(%s2)byte.**

#### Variable Information

%s1 = Definition item name

%s2 = Maximum length which can be specified for definition item

### Explanation

The specified definition information (%s1) exceeded maximum length (%s2) (bytes).

### System Action

The processing stops.

### User Action

Check the maximum length of the specified definition information (%s1) and specify that information within the specifiable range.

## 5.19.3 es30203

---

**ES: ERROR: es30203: [ttttt] The value for Definition information(%s1) is exceeded maximum value '%s2'.**

### Variable Information

%s1 = Definition item name

%s2 = Maximum length which can be specified for definition item

### Explanation

The specified definition information (%s1) exceeded the maximum value (%s2).

### System Action

The processing stops.

### User Action

Check the maximum value of the specified definition information (%s1) and specify that information within the specifiable range.

## 5.19.4 es30204

---

**ES: ERROR: es30204: [ttttt] The value for Definition information(%s1) is smaller than minimum value '%s2'.**

### Variable Information

%s1 = Definition item name

%s2 = Minimum length which can be specified for definition item

### Explanation

The specified definition information (%s1) is smaller than the minimum value (%s2).

### System Action

The processing stops.

### User Action

Check the minimum value of the specified definition information (%s1) and specify that information within the specifiable range.

## 5.19.5 es30205

---

**ES: ERROR: es30205: [ttttt] The value for Definition information(%s1) is error. VALUE '%s2'**

### Variable Information

%s1 = Definition item name

%s2 = Value specified for definition item

## Explanation

An invalid value (%s2) is specified in the specified definition information (%s1).

## System Action

The processing stops.

## User Action

Check the value set in the specified definition information.

In Windows(R), if the definition item name %s1 is output as "unitId" when the save destination is created, check that the specified unit ID is not the DOS device name.

If this message is output when creating an Event Channel, there may be an error in the dependency and exclusivity settings of the definition information. Refer to the table below to modify the definition item name (%s1) and the value specified for the definition item (%s2) as appropriate.

Definition item name (%s1)	Value specified for definition item (%s2)	Explanation	User Action
autodiscon (Automatic connection recovery function)	1	You cannot use the automatic disconnect function when using the notification service and executing a persistent channel operation without executing the transaction operation.	Set [Automatic connection recovery] to 'Disable' when using the notification service and executing a persistent channel operation without executing the transaction operation.
persist_mode (Persistent channel operation)	1	You cannot operate a persistent channel when using a database linkage channel.	Set [Persistent Channel] to 'Off' when using a database linkage channel.
	2	You cannot operate a persistent channel by connection information only when using a global transaction.	Set [Persistent Channel] to 'On (Event Data, Involatile Connection Information)' when using a global transaction.

## 5.19.6 es30206

---

**ES: ERROR: es30206: [ttttt] The value for Definition information(%s1) is characters other than an alphanumeric character. VALUE '%s2'**

### Variable Information

%s1 = Definition item name

%s2 = Value specified for definition item

### Explanation

A non-alphanumeric character is specified in the specified definition information (%s1).

### System Action

The processing stops.

### User Action

Specify only alphanumeric characters in the specified definition information (%s1).

## 5.19.7 es30207

---

---

**ES: ERROR: es30207: [ttttt] The value for Definition information(%s1) is Illegal character. VALUE '%s2' CHARACTER '%s3'**

**Variable Information**

- %s1 = Definition item name
- %s2 = Value specified for definition item
- %s3 = Illegal character

**Explanation**

An invalid code is included in the specified definition information (%s1).

**System Action**

The processing stops.

**User Action**

Specify only valid characters in the specified definition information (%s1).

---

### 5.19.8 es30208

---

**ES: ERROR: es30208: [ttttt] Specified groupName(%s1) cannot be used because of a reservation word.**

**Variable Information**

- %s1 = Event Channel group name

**Explanation**

The specified group name (%s1) cannot be registered because it is a reserved word.

**System Action**

The processing stops.

**User Action**

Change the Event Channel group name and re-execute the processing.

---

### 5.19.9 es30209

---

**ES: ERROR: es30209: [ttttt] The value for Definition information(%s1) is Illegal string literal. VALUE '%s2'**

**Variable Information**

- %s1 = Definition item name
- %s2 = Value specified for definition item

**Explanation**

The specified string literal is invalid in the specified definition information (%s1).

**System Action**

The processing stops.

**User Action**

Specify a valid string literal in the specified definition information (%s1).

---

### 5.19.10 es30210

---

**ES: ERROR: es30210: [ttttt] Unsuitable Definition information(%s1) was specified in JMS employment. VALUE '%s2'**

**Variable Information**

- %s1 = Definition item name
- %s2 = Value specified for definition item

**Explanation**

The specified definition information (%s1) cannot be specified during JMS operation.

**System Action**

The processing stops.

**User Action**

The definition information (%s1) specified during JMS operation has the following restrictions:

- Alphanumeric characters, periods (.), underscores (\_), hyphens (-), and slashes (/) can be used.
- Only an alphanumeric character can be used as the first character.

---

### 5.19.11 es30211

---

**ES: ERROR: es30211: [ttttt] Since the transaction service (OTS) is not set up, a global transaction cannot be used.**

**Explanation**

The transaction service (OTS) is not set up, so the global transaction cannot be used.

**System Action**

The processing stops.

**User Action**

When using the global transaction, you must set up the transaction service (OTS). To set up the transaction service (OTS), change [Transaction Service (OTS)] selected by clicking [System] > [Update System Settings] from Interstage Management Console to 'Yes'. This changes the system configuration.

---

### 5.19.12 es30212

---

**ES: ERROR: es30212: [ttttt] Since the setup of SSL is not performed, SSL cannot be used.**

**Explanation**

SSL cannot be used because it is not set up.

**System Action**

The processing stops.

**User Action**

Take the following action:

- When using SSL, you must set up the environment in which SSL is used, in CORBA Service. To set up the environment in CORBA Service, change [SSL] to 'Yes' in [CORBA Service] selected by clicking [System] > [Update System Settings] from Interstage Management Console. This changes the system configuration.
- If the SSL Accelerator is used for applications on the machine containing the Event Channel, and the SSL environment has not been set up on this machine, the Event Channel cannot be created using the Interstage Management Console. In this case, create

the Event Channel by following the steps below. For details about the *esmkchnl* command, refer to the Reference Manual (Command Edition).

- On the Standalone Server:
  1. Create the Event Channel using the *esmkchnl* command.
- On the [Operate in Batch] of the Admin Server:
  1. Delete the server from the site.
  2. In the Standalone Server, create the Event Channel using the *esmkchnl* command.
  3. Add the server to the site again.

### 5.19.13 es30213

---

**ES: ERROR: es30213: [ttttt] Configuration is currently being updated by another user.**

#### Explanation

The configuration could not be updated because it was being updated by another user.

#### System Action

The processing stops.

#### User Action

The configuration requested to be updated is already updated by another user. Update the latest configuration and rerun the process. To update the definition information maintained in the Interstage Management Console, the user with Administrators authority must display the list of definition information.

### 5.19.14 es30214

---

**ES: ERROR: es30214: [ttttt] EventChannel(%s1) is currently being re-created by another user.**

#### Variable Information

%s1 = Event Channel name

#### Explanation

The process failed because the specified Event Channel was being re-created by another user.

#### System Action

The processing stops.

#### User Action

If this message is displayed when the Event Channel environment settings are reacquired with Interstage Management Console, the specified Event Channel may have been re-created by a request from another user, or the Interstage JMX service may have been restarted. Reacquire the Event Channel list and then rerun the process.

### 5.19.15 es30215

---

**ES: ERROR: es30215: [ttttt] The event channel name (%s1) has been specified in duplication.**

#### Variable Information

%s1 = Event channel name

#### Explanation

The event channel specified has been duplicated.

## System Action

The processing stops.

## User Action

Update the definition information and re-execute processing.

### 5.19.16 es30216

---

**ES: ERROR: es30216: [ttttt] In order to use the repository monitoring restart level (%s1), specify the repository monitoring level (%s2) greater than or equal to 1.**

#### Variable Information

%s1 = Specified monitor restart repository data ratio

%s2 = Specified monitor repository data ratio

#### Explanation

To use a monitor restart repository data ratio (%s1), specify a monitor restart repository data ratio (%s2) greater than or equal to 1.

## System Action

The processing stops.

## User Action

Specify a monitor restart repository data ratio (%s1) greater than or equal to 1, and re-execute processing.

### 5.19.17 es30217

---

**ES: ERROR: es30217: [ttttt] In order to use the repository monitoring level (%s1), specify the repository monitoring restart level.**

#### Variable Information

%s1 = Specified monitor repository data ratio

#### Explanation

The monitor repository data ratio has not been specified.

## System Action

The processing stops.

## User Action

Review the monitor repository data ratio, and re-execute processing.

### 5.19.18 es30218

---

**ES: ERROR: es30218: [ttttt] In order to use the repository monitoring restart level (%s1), specify the repository monitoring level.**

#### Variable Information

%s1 = Specified monitor restart repository data ratio

#### Explanation

The monitor restart repository data ratio has not been specified.

## System Action

The processing stops.

#### User Action

Review the monitor restart repository data ratio, and re-execute processing.

### 5.19.19 es30219

---

**ES: ERROR: es30219: [ttttt] Specify a value as the repository monitoring level (%s2) that is greater than the repository monitoring restart level (%s1) .**

#### Variable Information

%s1 = Specified monitor restart repository data ratio

%s2 = Specified monitor repository data ratio

#### Explanation

Specify a value for the monitor repository data ratio greater than the monitor restart repository data ratio (%s2).

#### System Action

The processing stops.

#### User Action

Review the monitor repository data ratio, and re-execute the processing.

### 5.19.20 es30222

---

**ES: ERROR: es30222: [ttttt] The first character of the specified definition information (%s1) must be alphanumeric. Value: '%s2'**

#### Variable Information

%s1 = Specified definition information

%s2 = Specified definition value

#### Explanation

A non-alphanumeric character has been specified as the first character of the specified definition information (%s1).

#### System Action

The processing stops.

#### User Action

Specify an alphanumeric character as the first character of the specified definition information (%s1), and re-execute the processing.

### 5.19.21 es30225

---

**ES: ERROR: es30225: [ttttt] Raw devices cannot be specified in system storage directories.**

#### Explanation

A raw device was specified in a system storage directory. Raw devices cannot be specified in system storage directories.

#### System Action

The processing stops.

#### User Action

Specify a directory on the normal file system, and then re-execute processing.

## 5.19.22 es30226

---

**ES: ERROR: es30226: [ttttt] Raw devices cannot be specified in event data storage directories.**

### Explanation

A raw device was specified in an event data storage directory. Raw devices cannot be specified in event data storage directories.

### System Action

The processing stops.

### User Action

Specify a directory on the normal file system, and then re-execute processing.

## 5.19.23 es30227

---

**ES: ERROR: es30227: [ttttt] The specified raw device could not be found.**

### Explanation

The specified raw device does not exist on the disk.

### System Action

The processing stops.

### User Action

Specify a raw device that is correct or a directory on the normal file system, and then re-execute processing.

## 5.20 es30300 to es30399

---

This section details messages numbered between es30300 and es30399.

### 5.20.1 es30300

---

**ES: ERROR: es30300: [ttttt] The argument (%s1) has not been specified.**

#### Variable Information

%s1 = Argument name

#### Explanation

The argument (%s1) has not been specified.

#### System Action

The processing stops.

#### User Action

Specify the argument (%s1) and re-execute processing.

### 5.20.2 es30301

---

**ES: ERROR: es30301: [ttttt] The Unit could not be created.**

#### Explanation

An error was generated and the unit could not be created.

### System Action

The processing stops.

### User Action

Refer to the previous message, and identify the cause of the failure. Remove the cause of the failure prevents unit creation and re-execute the creation process.

## 5.20.3 es30302

---

**ES: ERROR: es30302: [tttttt] The Unit could not be deleted.**

### Explanation

An error was generated and the unit could not be deleted.

### System Action

The processing stops.

### User Action

Refer to the previous message, and identify the cause of the failure. Correct the problem preventing unit deletion, and re-execute the deletion process.

## 5.20.4 es30303

---

**ES: ERROR: es30303: [tttttt] The EventChannel could not be created.**

### Explanation

An error was generated and the event channel could not be created.

### System Action

The processing stops.

### User Action

Refer to the previous message, and identify the cause of the failure. Correct the problem preventing event channel creation, and re-execute the creation process.

## 5.20.5 es30304

---

**ES: ERROR: es30304: [tttttt] The EventChannel could not be deleted.**

### Explanation

An error was generated and the event channel could not be deleted.

### System Action

The processing stops.

### User Action

Refer to the previous message, and identify the cause of the failure. Correct the problem preventing event channel deletion, and re-execute the deletion process.

## 5.20.6 es30305

---

**ES: ERROR: es30305: [tttttt] The operation environment for the EventChannel could not be set.**

### Explanation

An error was generated and the operation environment for the event channel could not be set.

### System Action

The processing stops.

### User Action

Refer to the previous message, and identify the cause of the failure. Correct the problem preventing the operation environment from being set, and reset.

## 5.20.7 es30306

---

**ES: ERROR: es30306: [ttttt] Auto-activation of the EventChannel could not be set.**

### Explanation

An error was generated and auto-activation of the event channel could not be set.

### System Action

The processing stops.

### User Action

Refer to the previous message, and identify the cause of the failure. Correct the problem preventing auto-activation from being set, and reset.

## 5.20.8 es30307

---

**ES: ERROR: es30307: [ttttt] The EventChannel could not be activated.**

### Explanation

An error was generated and the event channel could not be activated.

### System Action

The processing stops.

### User Action

Refer to the previous message, and identify the cause of the failure. Correct the problem preventing activation, and re-execute the activation process.

## 5.20.9 es30308

---

**ES: ERROR: es30308: [ttttt] The EventChannel could not be terminated.**

### Explanation

An error was generated and the event channel could not be terminated.

### System Action

The processing stops.

### User Action

Refer to the previous message, and identify the cause of the failure. Correct the problem preventing event channel termination, and re-execute the termination process.

## 5.20.10 es30310

---

---

**ES: ERROR: es30310: [ttttt] Conversion to the EventChannel inhibited state has failed.**

Explanation

An error was generated, and conversion to the Event Channel inhibited state failed.

System Action

The processing stops.

User Action

Refer to the message output immediately before this message and identify the cause of the failure. Correct the problem that is preventing conversion to the inhibited state, and re-execute processing.

---

## 5.21 es30400 to es30499

This section details messages numbered between es30400 and es30499.

---

### 5.21.1 es30400

---

**ES: ERROR: es30400: [ttttt] A system error has been generated. DETAIL '%s1'**

Variable Information

%s1 = Detailed information

Explanation

A system error has been generated.

System Action

The processing stops.

User Action

Refer to the previous message output, identify and remove the cause of the error.

---

### 5.21.2 es30401

---

**ES: ERROR: es30401: [ttttt] Memory is insufficient.**

Explanation

Memory is insufficient.

System Action

The processing stops.

User Action

Re-execute the command after waiting a short time. If this message is output frequently, take the following action and re-open the processing.

- Change the memory size of Java VM.
- Check if the memory size is sufficient for executing processing. If necessary, re-estimate the memory size required for other applications being executed concurrently on the same machine.

---

### 5.21.3 es30402

---

**ES: ERROR: es30402: [ttttt] The argument '%s1' has not been specified.**

#### Variable Information

%s1 = Argument name

#### Explanation

The argument (%s1) has not been specified.

#### System Action

The processing stops.

#### User Action

Specify the argument (%s1).

### 5.21.4 es30403

---

**ES: ERROR: es30403: [ttttt] The specified argument '%s1' contains an error. VALUE '%s2'**

#### Variable Information

%s1 = Argument name

%s2 = Value

#### Explanation

The value (%s2) of the specified argument (%s1) contains an error.

#### System Action

The processing stops.

#### User Action

Review the value (%s2) of the specified argument (%s1), assign a new value, and re-execute processing.

### 5.21.5 es30404

---

**ES: ERROR: es30404: [ttttt] The specified definition information '%s1' contains an error. VALUE '%s2'**

#### Variable Information

%s1 = Definition information name

%s2 = Value

#### Explanation

The value (%s2) of the definition information (%s1) contains an error.

#### System Action

The processing stops.

#### User Action

Review the value (%s2) of the definition information (%s1), assign a new value, and re-execute processing.

### 5.21.6 es30405

---

**ES: ERROR: es30405: [ttttt] The specified server cannot be found on the site. SERVER '%s1'**

#### Variable Information

%s1 = Server name

## Explanation

The specified server (%s1) cannot be found on the site.

## System Action

The processing stops.

## User Action

Specify a server that is found on the site and re-execute processing.

## 5.21.7 es30406

---

**ES: ERROR: es30406: [ttttt] The specified server group cannot be found on the site. SERVERGROUP '%s1'**

## Variable Information

%s1 = Server group name

## Explanation

The specified server group (%s1) cannot be found on the site.

## System Action

The processing stops.

## User Action

Specify a server group that is found on the site and re-execute processing.

## 5.21.8 es30407

---

**ES: ERROR: es30407: [ttttt] The specified server has been registered with the server group. SERVER '%s1'**

## Variable Information

%s1 = Server name

## Explanation

The specified server (%s1) has been registered with the server group.

## System Action

The processing stops.

## User Action

Specify a server that has not been registered with the server group and re-execute processing.

## 5.21.9 es30408

---

**ES: ERROR: es30408: [ttttt] No server has been registered with the specified server group. SERVERGROUP '%s1'**

## Variable Information

%s1 = Server group name

## Explanation

No server has been registered with the specified server group (%s1).

## System Action

The processing stops.

## User Action

Register a server with the server group and re-execute processing.

### 5.21.10 es30409

---

**ES: ERROR: es30409: [tttttt] A event channel with OTS mode cannot be made in standard unit(%s1).**

## Variable Information

%s1 = Unit name

## Explanation

No Event Channel in global transaction mode can be created in the standard unit.

## System Action

Event Channel creation processing is cancelled.

## User Action

Allocate Event Channels in global transaction mode to extended units.

### 5.21.11 es30410

---

**ES: ERROR: es30410: [tttttt] Plural event channel with OTS mode cannot be made in same unit(%s1).**

## Variable Information

%s1 = Unit name

## Explanation

Multiple Event Channels in global transaction mode cannot be created within the same unit.

## System Action

Event Channel creation processing is cancelled.

## User Action

Create Event Channels so that they are allocated to other extended units.

### 5.21.12 es30420

---

**ES: ERROR: es30420: [tttttt] An error was generated during the search process of the definition information.**

## Explanation

An error was generated during the search process of the definition information.

## System Action

The processing stops.

## User Action

Refer to the previous message output, identify and remove the cause of the error, and re-execute processing.

### 5.21.13 es30421

---

---

**ES: ERROR: es30421: [ttttt] An error was generated during the registration process of the definition information.**

Explanation

An error was generated during the registration process of the definition information.

System Action

The processing stops.

User Action

Refer to the previous message output, identify and remove the cause of the error, and re-execute the registration process.

---

### 5.21.14 es30422

---

**ES: ERROR: es30422: [ttttt] An error was generated during the update process of the definition information.**

Explanation

An error was generated during the update process of the definition information.

System Action

The processing stops.

User Action

Refer to the previous message output, identify and remove the cause of the error, and re-execute the update process.

---

### 5.21.15 es30423

---

**ES: ERROR: es30423: [ttttt] An error was generated during the delete process of the definition information.**

Explanation

An error was generated during the delete process of the definition information.

System Action

The processing stops.

User Action

Refer to the previous message output, identify and remove the cause of the error, and re-execute the deletion process.

---

### 5.21.16 es30424

---

**ES: ERROR: es30424: [ttttt] An error was generated during the update confirmation process of the definition information.**

Explanation

An error was generated during the update confirmation process of the definition information.

System Action

The processing stops.

User Action

Refer to the previous message output, identify and remove the cause of the error, and re-execute the update process.

## 5.21.17 es30440

---

**ES: ERROR: es30440: [ttttt] The specified definition information has already been registered. NAME '%s1', TYPE '%s2', KEYS '%s3'**

### Variable Information

%s1 = Definition name

%s2 = Repository type

%s3 = Repository key

### Explanation

The specified definition information has already been registered.

### System Action

The processing stops.

### User Action

Specify the definition information that has not been registered and re-execute processing.

## 5.21.18 es30441

---

**ES: ERROR: es30441: [ttttt] The specified definition information is not the latest. NAME '%s1', TYPE '%s2', KEYS '%s3'**

### Variable Information

%s1 = Definition name

%s2 = Repository type

%s3 = Repository key

### Explanation

The specified definition information is not the latest.

### System Action

The processing stops.

### User Action

Obtain the latest definition information and re-execute processing.

## 5.21.19 es30442

---

**ES: ERROR: es30442: [ttttt] The specified definition information has already been registered. NAME '%s1'**

### Variable Information

%s1 = Definition name

### Explanation

The specified definition information has already been registered.

### System Action

The processing stops.

### User Action

Specify the definition information that has not been registered and re-execute processing.

## 5.21.20 es30443

---

**ES: ERROR: es30443: [ttttt] Standard unit cannot be setup more than two.**

### Explanation

Standard units cannot be set up more than once.

### System Action

Unit setup processing is cancelled.

### User Action

Only one standard unit can be set up. Check that the setting information of the unit on the Interstage Management Console is not duplicating an existing unit, and check the definition value of the unit definition file specified during execution of the *esmkunit* command.

## 5.21.21 es30444

---

**ES: ERROR: es30444: [ttttt] The name is not found. NAME '%s1'**

### Variable Information

%s1 = Definition name

### Explanation

The process failed because the specified definition name (%s1) could not be found.

### System Action

The processing stops.

### User Action

If this message is displayed when Store(Unit) or Event Channel definition information is reacquired with Interstage Management Console, the definition may have been deleted by a request from another user. Reacquire the Store(Unit) or Event Channel list and then re-run the process.

## 5.21.22 es30450

---

**ES: ERROR: es30450: [ttttt] Failed to setup EventService. SERVER '%s1'**

### Variable Information

%s1 = Server name

### Explanation

Failed to set up the Event Service.

### System Action

Event Service setup processing is cancelled.

### User Action

Collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

## 5.21.23 es30451

---

**ES: ERROR: es30451: [ttttt] The resources of EventService remain. SERVER '%s1'**

## Variable Information

%s1 = Server name

## Explanation

Failed to deactivate the Event Service, since the Event Service resources remain.

## System Action

Event Service deactivation is cancelled.

## User Action

Delete the resources (Stores and Event Channels) of the Event Service and rerun the process.

## 5.21.24 es30452

---

**ES: ERROR: es30452: [ttttt] Failed to add the Managed Server to Server Group because Registered definition is different to the other. RESOURCE='%s1' NAME='%s2' INFO='%s3' SERVER='%s4'**

## Variable Information

%s1 = Different resource

%s2 = Different resource name

%s3 = Different content

%s4 = Managed Server name

## Explanation

Because the Event Service definition is different, you cannot add a Managed Server to a Server Group.

## System Action

The processing stops.

## User Action

The Interstage Event Service definition of the Managed Servers that already belong to the Server Group and of the Reserve Server you attempted to add to the Server Group must match.

**Windows32/64**

The installation directory in the multi server environment may not be set correctly. Check the installation directory. For details about the installation directory, refer to "Pre-Installation Preparations", "Notes about using the multiserver management function" in the "Installation (Server Package)" chapter of the Installation manual.

If the installation directory is correct, use the Backup/Restore function to back up all of the Interstage services used by the Managed Servers that already belong to the Server Group, and then create backup resources. Next, restore any Reserve Servers you want to add to the Server Group. Once this has been done, re-execute the operation to add the server to the Server Group.

**Solaris32/64 Linux32/64**

Use the Backup/Restore function to back up all of the Interstage services used by the Managed Servers that already belong to the Server Group, and then create backup resources. Next, restore any Reserve Servers you want to add to the Server Group. Once this has been done, re-execute the operation to add the server to the Server Group.

## 5.22 es30500 to es30599

---

This section details messages numbered between es30500 and es30599.

### 5.22.1 es30500

---

---

**ES: ERROR: es30500: [ttttt] UNKNOWN EXCEPTION.****Explanation**

An internal error has occurred.

**User Action**

Collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

---

**5.22.2 es30501**

---

**ES: ERROR: es30501: [ttttt] Internal error(%s1) occurred. CODE='%s2'****Variable Information**

%s1 = Function name

%s2 = Cause code

**Explanation**

An internal inconsistency occurred.

**System Action**

The processing stops.

**User Action**

The permissions required to access the directories and files under the Interstage installation directory may not be set. In this case, set the required permissions.

In other cases, collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

---

**5.22.3 es30502**

---

**ES: ERROR: es30502: [ttttt] Internal error(%s1) occurred. ERROR INFORMATION='%s2'****Variable Information**

%s1 = Function name

%s2 = Cause code

**Explanation**

An internal inconsistency occurred.

**System Action**

The processing stops.

**User Action**

Take the following actions:

- The permissions required to access the directories and files under the Interstage installation directory may not be set. In this case, set the required permissions.
- If a data file (a file under the directory specified in the setting information of the unit created on the Interstage Management Console) used by the unit when that unit is active is deleted, this message is output in the subsequent operation. In this case, perform the following restore operations and recreate the unit.
  1. Restart the machine temporarily.
  2. Use the *esrmunit* command to delete the unit from which the data file is deleted.
  3. Use the *isstart* command to start Interstage.

4. Use the *esrmchnl* command to delete the Event Channels allocated to the unit.

This deletes the unit normally, so recreate the unit and Event Channels.

In cases other than that described above, collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

---

## 5.23 es31000 to es31099

---

This section details messages numbered between es31000 and es31099.

---

### 5.23.1 es31000

---

**ES: INFO: es31000: [ttttt] Setup has been completed**

Explanation

The configuration information was set.

---

### 5.23.2 es31001

---

**ES: INFO: es31001: [ttttt] EventChannel Group '%s1' setup has been completed**

Variable Information

%s1 = Event Channel group name

Explanation

The setup of Event Channel group (%s1) was completed.

---

### 5.23.3 es31002

---

**ES: INFO: es31002: [ttttt] EventChannel Group '%s1' was deleted**

Variable Information

%s1 = Event Channel group name

Explanation

The setup of Event Channel group (%s1) was deleted.

---

### 5.23.4 es31003

---

**ES: INFO: es31003: [ttttt] EventChannel Group '%s1' was started**

Variable Information

%s1 = Event Channel group name

Explanation

Event Channel group (%s1) was started.

---

### 5.23.5 es31004

---

**ES: INFO: es31004: [ttttt] EventChannel Group '%s1' was stopped**

Variable Information

%s1 = Event Channel group name

## Explanation

Event Channel group (%s1) was stopped.

## User Action

There is no need to take action.

To restart Event Channel group (%s1) immediately after it has been stopped, however, use either of the following procedures:

- Using [EventChannels] > [View Status] > [Start Status], check that the status of Event Channel group (%s1) is 'Stopped'. If it is, then start Event Channel group (%s1).
- Check that the information message (es10028) has been output to the event log, and then start Event Channel group (%s1).

## 5.23.6 es31005

---

**ES: INFO: es31005: [ttttt] Sets the operating environment for EventChannelGroup(%s1).**

### Variable Information

%s1 = Event Channel group name

### Explanation

The operating environment of Event Channel group (%s1) was set.

## 5.23.7 es31006

---

**ES: INFO: es31006: [ttttt] EventChannel '%s1' setup has been completed: group=%s2**

### Variable Information

%s1 = Event Channel name

%s2 = Event Channel group name

### Explanation

The operating environment of Event Channel (%s1) (Event Channel group %s2) was set.

## 5.23.8 es31007

---

**ES: INFO: es31007: [ttttt] Unit (%s1) setup has been completed**

### Variable Information

%s1 = Unit name

### Explanation

The setup of unit (%s1) was completed.

## 5.23.9 es31008

---

**ES: INFO: es31008: [ttttt] Unit (%s1) was deleted**

### Variable Information

%s1 = Unit name

### Explanation

The unit (%s1) was deleted.

## 5.23.10 es31009

---

**ES: INFO: es31009: [ttttt] Auto Start setting of EventChannel has been completed**

### Explanation

The automatic start setting of the Event Channel was changed.

## 5.23.11 es31010

---

**ES: ERROR: es31010: [ttttt] EventChannel (%s1) does not exist.**

### Variable Information

%s1 = Event Channel name

### Explanation

The process failed because the operation target Event Channel name (%s1) could not be found.

### System Action

The processing stops.

### User Action

The Event Channel may have been deleted by a request from another user. Reacquire the Event Channel list and then rerun the process.

## 5.23.12 es31011

---

**ES: ERROR: es31011: [ttttt] EventChannel (%s1) was reset by another user.**

### Variable Information

%s1 = Event Channel name

### Explanation

The process failed because the operation target Event Channel was being re-created by another user.

### System Action

The processing stops.

### User Action

The Event Channel may have been re-created by a request from another user or the Interstage JMX service may have been restarted. Reacquire the Event Channel list and then rerun the process.

## 5.23.13 es31012

---

**ES: INFO: es31012: [ttttt] The event channel (%s1) has been converted to the inhibited state.**

### Variable Information

%s1 = Event Channel name

### Explanation

The Event Channel (%s1) is now in the inhibited state.

## 5.23.14 es31013

---

**ES: INFO: es31013: [ttttt] The inhibited state of the event channel (%s1) has been cancelled.**

## Variable Information

%s1 = Event Channel name

## Explanation

The inhibited state of the Event Channel (%s1) has been cancelled.

---

## 5.24 es31100 to es31199

---

This section details messages numbered between es31100 and es31199.

---

### 5.24.1 es31100

---

**ES: INFO: es31100: [ttttt] The event channel group has been deleted.**

#### Explanation

The deletion process for the event channel group ended normally.

---

### 5.24.2 es31101

---

**ES: INFO: es31101: [ttttt] The event channel group has started successfully.**

#### Explanation

The activation process for the event channel group ended normally.

---

### 5.24.3 es31102

---

**ES: INFO: es31102: [ttttt] The event channel group has been ended.**

#### Explanation

The termination process for the event channel group ended normally.

---

### 5.24.4 es31103

---

**ES: INFO: es31103: [ttttt] The unit has been deleted.**

#### Explanation

The deletion process for the unit ended normally.

---

### 5.24.5 es31104

---

**ES: INFO: es31104: [ttttt] The event channel group is running.**

#### Explanation

The event channel group is running.

---

### 5.24.6 es31105

---

**ES: INFO: es31105: [ttttt] The event channel group is not running.**

#### Explanation

The event channel group is not running.

---

### 5.24.7 es31106

---

---

**ES: ERROR: es31106: [ttttt] The event channel group could not be activated.**

Explanation

The event channel group could not be activated.

System Action

The event channel group startup processing will be cancelled.

User Action

Refer to the message that was output immediately before this error message to determine the cause of the error. Correct the problem and restart the event channel group.

---

## 5.24.8 es31107

---

**ES: ERROR: es31107: [ttttt] The event channel group could not be terminated.**

Explanation

The event channel group could not be terminated.

System Action

The event channel group stop processing will be cancelled.

User Action

Refer to the message that was output immediately before this error message to determine the cause of the error. Correct the problem and restart the event channel group.

---

## 5.24.9 es31108

---

**ES: INFO: es31108: [ttttt] The EventChannel (%s1) has been converted to the inhibited state.**

Variable Information

%s1 = Event Channel name

Explanation

The Event Channel (%s1) is now in the inhibited state.

---

## 5.24.10 es31109

---

**ES: INFO: es31109: [ttttt] The inhibited state of the EventChannel (%s1) has been cancelled.**

Variable Information

%s1 = Event Channel name

Explanation

The inhibited state of the Event Channel (%s1) has been cancelled.

---

## 5.24.11 es31110

---

**ES: ERROR: es31110: [ttttt] Server Group/server does not exist in the site.**

Explanation

The server group or the Managed Server operating alone does not exist in the site.

System Action

The processing stops.

## User Action

Execute processing, ensuring that the Server group or the Managed Server operating alone exists in the Site.

## 5.25 es39900 to es39999

---

This section details messages numbered between es39900 and es39999.

### 5.25.1 es39995

---

**ES: ERROR: es39995: [ttttt] Error occured when collecting information. Error Information '%s1'**

#### Variable Information

%s1 = Error information

#### Explanation

Processing failed because information had been collected during Interstage start or stop processing.

#### System Action

The processing stops.

#### User Action

The start or stop processing of Interstage may have been executed. Re-execute processing after the start or stop processing of Interstage ends.

### 5.25.2 es39996

---

**ES: ERROR: es39996: [ttttt] List acquisition failed. The value containing the illegal character for Definition information(%s1) is registered. VALUE '%s2'**

#### Variable Information

%s1 = Definition item name

%s2 = Value specified for definition item

#### Explanation

List acquisition failed because the registered definition information (%s1) included invalid characters.

#### System Action

The processing stops.

#### User Action

Use the *esmonitor -unit* or *odlistns* command to check the unit ID, group name, or channel name, and use the *esrmunit* or *esrmchnl* command to delete the information.

### 5.25.3 es39997

---

**ES: ERROR: es39997: [ttttt] List acquisition failed. The value of null for Definition information(%s1) is registered.**

#### Variable Information

%s1 = Definition item name

#### Explanation

List acquisition failed because the registered definition information (%s1) included nulls.

## System Action

The processing stops.

## User Action

Use the *esmonitor -unit* or *odlistns* command to check the unit ID, group name, or channel name, and use the *esrmunit* or *esrmchnl* command to delete the information.

## 5.25.4 es39998

---

**ES: ERROR: es39998: [ttttt] System error occurred. EXCEPTION '%s1'**

### Variable Information

%s1 = System error information

### Explanation

A system error occurred.

### System Action

The processing stops.

### User Action

The permissions required to access the directories and files under the Interstage installation directory may not be set. In this case, set the required permissions.

In other cases, collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

## 5.25.5 es39999

---

**ES: ERROR: es39999: [ttttt] System error occurred. METHOD '%s1', EXCEPTION '%s2'**

### Variable Information

%s1 = System error information

%s2 = System error information

### Explanation

System error (%s1) and system error (%s2) occurred.

### System Action

The processing stops.

### User Action

Take the following steps:

- The permissions required to access the directories and files under the Interstage installation directory may not be set. In this case, set the required permissions.
- If this message (system error information (%s1): 'ObjectName', system error information (%s2): 'javax.management.MalformedObjectNameException: ObjectName: 'Event Channel group name or Event Channel name' Invalid character in value') is output when the Interstage Management Console is used, the Event Channel group name or Event Channel name may include characters other than the following:

Table 5.1 Characters Available for Use on the Interstage Management Console

Name	Available Characters
The Event Channel group name	Windows32/64

Name	Available Characters
	<p>Alphanumeric characters, exclamation mark (!), number sign (#), dollar sign (\$), apostrophe ('), left parenthesis ((), right parenthesis ()), plus sign (+), hyphen (-), period (.), slash (/), semicolon (;), at mark (@), left bracket ([), right bracket (]), underscore (_), backward quote (`), left brace ({), right brace (}), tilde (~)</p> <p><b>Solaris32/64</b></p> <p>Alphanumeric characters, exclamation mark (!), plus sign (+), hyphen (-), period (.), slash (/), at mark (@), left bracket ([), right bracket (]), underscore (_), left brace ({), right brace (}), tilde (~)</p> <p><b>Linux32/64</b></p> <p>Alphanumeric characters, plus sign (+), hyphen (-), period (.), slash (/), at mark (@), left bracket ([), right bracket (]), caret (^), underscore (_), left brace ({), right brace (})</p>
The Event Channel name	<p><b>Windows32/64</b></p> <p>Alphanumeric characters, exclamation mark (!), number sign (#), dollar sign (\$), apostrophe ('), left parenthesis ((), right parenthesis ()), asterisk (*), plus sign (+), comma (,), hyphen (-), period (.), slash (/), colon (:), semicolon (;), equal sign (=), question mark (?), at mark (@), left bracket ([), right bracket (]), underscore (_), backward quote (`), left brace ({), right brace (}), tilde (~)</p> <p><b>Solaris32/64</b></p> <p>Alphanumeric characters, exclamation mark (!), asterisk (*), plus sign (+), comma (,), hyphen (-), period (.), slash (/), colon (:), equal sign (=), question mark (?), at mark (@), left bracket ([), right bracket (]), underscore (_), left brace ({), right brace (}), tilde (~)</p> <p><b>Linux32/64</b></p> <p>Alphanumeric characters, percent sign (%), asterisk (*), plus sign (+), comma (,), hyphen (-), period (.), slash (/), colon (:), equal sign (=), question mark (?), at mark (@), left bracket ([), right bracket (]), tilde (~), caret (^), underscore (_), left brace ({), right brace (})</p>

To use the Interstage Management Console, use the *esmonitor* command to check the Event Channel group name or Event Channel name, and use the *esrmchnl* command to delete the Event Channel. Otherwise, use the Event Service operation command to perform these tasks.

- If this message is output where:

- (%s1) = 'getserviceConfig'
- (%s2) = 'javax.management.MBeanException: Exception thrown in managed resource while trying to invoke operation getserviceConfiguration'

while the Interstage Management Console is being used, it could mean that Interstage has not been initialized. If the is20132 error message was output to the event log in Windows(R) (the system log in Solaris/Linux), initialize Interstage.

In cases other than that described above, collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

# Chapter 6 Messages Beginning with 'EXTP'

This chapter describes the messages displayed by the 'EXTP'.

## 6.1 EXTP0500 to EXTP0599

---

This section details messages numbered between EXTP0500 and EXTP0599.

### 6.1.1 EXTP0501

---

**extp: WARNING: EXTP0501:Unable to recover resources: SYSTEM=%s**

#### Variable Information

%s = System name

#### Explanation

Resource recovery failed.

#### System Action

Continues the recovery process.

#### User Action

Contact your software supplier.

### 6.1.2 EXTP0502

---

**extp: ERROR: EXTP0502:An abnormality occurred: ERRSTRING='%s1' SYSTEM=%s2**

#### Variable Information

%s1 = Error information

%s2 = System name

#### Explanation

An error has occurred while linking a DLL.

#### System Action

Stops command processing.

#### User Action

Contact your software supplier.

### 6.1.3 EXTP0503

---

**extp: ERROR: EXTP0503:Process currently being executed cannot be executed simultaneously: SYSTEM=%s**

#### Variable Information

%s = System name

#### Explanation

Invalid multi-processing attempt (program is already executing).

### System Action

Stops command processing.

### User Action

Wait for invalid multiprocessing to end, then re-execute the command.

## 6.1.4 EXTP0504

---

**extp: ERROR: EXTP0504:Setup has not been executed: SYSTEM=%s**

### Variable Information

%s = System name

### Explanation

Setup has not completed.

### System Action

Stops command processing.

### User Action

Use the *isinit* command to initialize Interstage, then re-execute the command.

## 6.2 EXTP0600 to EXTP0699

---

This section details messages numbered between EXTP0600 and EXTP0699.

### 6.2.1 EXTP0690

---

**extp: ERROR: EXTP0690:A memory shortage occurred: CODE='%s1' SYSTEM=%s2**

### Variable Information

%s1 = Error information

%s2 = System name

### Explanation

Insufficient memory.

### System Action

Either terminates the Component Transaction Service or terminates command processing.

### User Action

Execute the process again later. If this message is generated frequently, refer to the Tuning Guide, re-estimate the memory that is needed to run Interstage, and confirm that there is enough memory.

If there is enough memory to run Interstage, there may be inadequate memory to run other applications. Re-estimate the amount of memory needed for the other applications running on the same machine to determine if there is an appropriate amount of memory.

Contact your system administrator if the re-estimation indicates that the memory is insufficient. Ask the system administrator to either increase the size of the main memory or to increase the size of the page file.

### 6.2.2 EXTP0691

---

**extp: ERROR: EXTP0691:A memory shortage occurred: CODE='%s'**

## Variable Information

%s = Error information

## Explanation

Insufficient memory.

## System Action

Stops command processing.

## User Action

Execute the process again later. If this message is generated frequently, refer to the Tuning Guide, re-estimate the memory that is needed to run Interstage, and confirm that there is enough memory.

If there is enough memory to run Interstage, there may be inadequate memory to run other applications. Re-estimate the amount of memory needed for the other applications running on the same machine to determine if there is an appropriate amount of memory.

Contact your system administrator if the re-estimation indicates that the memory is insufficient. Ask the system administrator to either increase the size of the main memory or to increase the size of the page file.

## 6.2.3 EXTP0692

---

**Solaris32/64** **Linux32/64**

**extp: ERROR: EXTP0692: Could not get IPC resource due to duplicated key: CODE=%s1 SYSTEM=%s2**

## Variable Information

%s1 = Error information

%s2 = System name

## Explanation

Resource acquisition failed because IPC resources necessary for Interstage operation were in use.

## System Action

Stops Interstage operation processing.

## User Action

You need to customize the IPC key value because it is duplicated. For more information, see Customizing IPC Resources in the Tuning Guide.

If this error continues after customizing the IPC key value, contact your software supplier.

## 6.2.4 EXTP0695

---

**extp: ERROR: EXTP0695:A system resource shortage occurred: CODE='%s1' SYSTEM=%s2**

## Variable Information

%s1 = Error information

%s2 = System name

## Explanation

Insufficient Component Transaction Service system resources.

**Solaris32/64** **Linux32/64**

An error occurred in the tuning of a system parameter of the shared memory, semaphore, or message queue used in Component Transaction Service.

This message also occurs if more than 98 WorkUnit control commands are executed simultaneously.

## System Action

Stops command processing.

## User Action

Do one of the following, as appropriate:

- Wait for a moment, then re-execute the process.
- Stop the WorkUnit, then re-execute the process.
- If more than 98 WorkUnit control commands were executed simultaneously, wait for these commands to complete, then execute the process again.

**Solaris32/64** **Linux32/64**

- Refer to the Tuning Guide to verify that an appropriate value is specified for the system parameter. If out of range, change the parameter and reboot the system. Then, execute the process again.

If this message appears frequently, contact your software supplier.

## 6.2.5 EXTP0696

---

**extp: ERROR: EXTP0696:An I/O error occurred: FILE=%s1 SYSTEM=%s2**

### Variable Information

%s1 = Filename

%s2 = System name

### Explanation

An I/O error has occurred.

### System Action

Either terminates the Component Transaction Service or terminates command processing.

### User Action

Check the disk containing the file where the I/O error occurred.

## 6.2.6 EXTP0698

---

**extp: ERROR: EXTP0698:A system error occurred: CODE='%s1' INFO=%s2**

### Variable Information

%s1 = Error information 1

%s2 = Error information 2

### Explanation

A system error has occurred.

### System Action

Terminates command processing.

### User Action

After system restart, implement the *tdunsetup* command and uninstall Interstage again.

## 6.2.7 EXTP0699

---

---

**extp: ERROR: EXTP0699:A system error occurred: CODE='%s1' INFO=%s2 SYSTEM=%s3**

#### Variable Information

%s1 = Error information 1  
%s2 = Error information 2  
%s3 = System name

#### Explanation

A system error has occurred, or there is not enough memory.

#### System Action

Either terminates the Component Transaction Service or terminates command processing.

#### User Action

Check the system log whether a message indicating the cause of the failure in processing has been output. If such a message has been output, take action according to that message.

If there is a memory shortage, refer to the Tuning Guide and re-estimate the amount of memory required to run Interstage. Check whether there is enough memory.

If there is enough memory to run Interstage, there may be inadequate memory to run other applications. Re-estimate the amount of memory required for the other applications running on the same machine to determine if there is an appropriate amount of memory.

Contact your system administrator if the re-estimation indicates that the memory is insufficient. Ask the system administrator to either increase the size of the main memory or to increase the size of the page file.

If there is no memory shortage, contact your software supplier.

## 6.3 EXTP0800 to EXTP0899

---

This section details messages numbered between EXTP0800 and EXTP0899.

### 6.3.1 EXTP0850

---

**extp: WARNING: EXTP0850:Cannot setup print environment: CODE='%s'**

#### Variable Information

%s = information

#### Explanation

Could not set the print environment.

#### System Action

Continues processing.

#### User Action

Contact your software supplier about printing from the application.

### 6.3.2 EXTP0890

---

**extp: ERROR: EXTP0890:A memory shortage occurred: CODE='%s1' SYSTEM=%s2**

#### Variable Information

%s1 = Error information  
%s2 = System name

## Explanation

Insufficient memory.

## System Action

Either terminates the Component Transaction Service or terminates command processing.

## User Action

Execute the process again later. If this message is generated frequently, refer to the Tuning Guide, re-estimate the memory that is needed to run Interstage, and confirm that there is enough memory.

If there is enough memory to run Interstage, there may be inadequate memory to run other applications. Re-estimate the amount of memory needed for the other applications running on the same machine to determine if there is an appropriate amount of memory.

Contact your system administrator if the re-estimation indicates that the memory is insufficient. Ask the system administrator to either increase the size of the main memory or to increase the size of the page file.

## 6.3.3 EXTP0891

---

**extp: ERROR: EXTP0891:A memory shortage occurred: CODE='%s'**

### Variable Information

%s = Error information

## Explanation

Insufficient memory.

## System Action

Either terminates the Component Transaction Service or terminates command processing.

## User Action

Execute the process again later. If this message is generated frequently, refer to the Tuning Guide, re-estimate the memory that is needed to run Interstage, and confirm that there is enough memory.

If there is enough memory to run Interstage, there may be inadequate memory to run other applications. Re-estimate the amount of memory needed for the other applications running on the same machine to determine if there is an appropriate amount of memory.

Contact your system administrator if the re-estimation indicates that the memory is insufficient. Ask the system administrator to either increase the size of the main memory or to increase the size of the page file.

## 6.3.4 EXTP0895

---

**extp: ERROR: EXTP0895:A system resource shortage has occurred: CODE='%s1' SYSTEM=%s2**

### Variable Information

%s1 = Error information

%s2 = System name

## Explanation

Insufficient Component Transaction Service System resources.

## System Action

Terminates command processing.

## User Action

Do one of the following:

- Wait for a moment, then re-execute the process.

- Terminate the running WorkUnit, then re-execute the process.

If this message appears frequently, contact your software supplier.

### 6.3.5 EXTP0896

---

**extp: ERROR: EXTP0896:An I/O error occurred: FILE=%s1 SYSTEM=%s2**

#### Variable Information

%s1 = Filename

%s2 = System name

#### Explanation

An I/O Error has occurred.

#### System Action

Either terminates the Component Transaction Service or terminates command processing.

#### User Action

Restore the disk to where the I/O error occurred.

### 6.3.6 EXTP0897

---

**extp: ERROR: EXTP0897:An I/O error occurred: FILE=%s**

#### Variable Information

%s = Filename

#### Explanation

An I/O error has occurred.

#### System Action

Terminates command processing.

#### User Action

Restore the disk to where the I/O error occurred.

### 6.3.7 EXTP0898

---

**extp: ERROR: EXTP0898:A system error occurred: CODE='%s1' INFO=%s2**

#### Variable Information

%s1 = Error information 1

%s2 = Error information 2

#### Explanation

A system error has occurred, or there is not enough memory.

#### System Action

Terminates command processing.

#### User Action

If there is a memory shortage, refer to the Tuning Guide and re-estimate the amount of memory required to run Interstage. Check whether there is enough memory.

If there is enough memory to run Interstage, there may be inadequate memory to run other applications. Re-estimate the amount of memory required for the other applications running on the same machine to determine if there is an appropriate amount of memory.

Contact your system administrator if the re-estimation indicates that the memory is insufficient. Ask the system administrator to either increase the size of the main memory or to increase the size of the page file.

If there is no memory shortage, contact your software supplier.

## 6.3.8 EXTP0899

---

**extp: ERROR: EXTP0899:A system error occurred: CODE='%s1' INFO=%s2 SYSTEM=%s3**

### Variable Information

%s1 = Error information 1

%s2 = Error information 2

%s3 = System name

### Explanation

A system error has occurred, or there is not enough memory.

### System Action

Either terminates the Component Transaction Service, or terminates command processing.

### User Action

If there is a memory shortage, refer to the Tuning Guide and re-estimate the amount of memory required to run Interstage. Check whether there is enough memory.

If there is enough memory to run Interstage, there may be inadequate memory to run other applications. Re-estimate the amount of memory required for the other applications running on the same machine to determine if there is an appropriate amount of memory.

Contact your system administrator if the re-estimation indicates that the memory is insufficient. Ask the system administrator to either increase the size of the main memory or to increase the size of the page file.

If there is no memory shortage, contact your software supplier.

## 6.4 EXTP0900 to EXTP0999

---

This section details messages numbered between EXTP0900 and EXTP0999.

### 6.4.1 EXTP0901

---

**extp: INFO: EXTP0901:System creation is complete: SYSTEM=%s**

### Variable Information

%s = System name

### Explanation

Information message that system creation has completed.

### 6.4.2 EXTP0902

---

**extp: ERROR: EXTP0902: System creation failed: SYSTEM=%s**

### Variable Information

%s = Work System Name

#### Explanation

An error occurred when generating the work system.

#### System Action

Stops the generation of the work system.

#### User Action

Follow the instructions on the message that is generated at the same time.

### 6.4.3 EXTP0903

---

**Command name: ERROR: EXTP0903:Command parameter contains an error**

#### Explanation

Invalid command parameters

#### System Action

Terminates command processing.

#### User Action

Re-execute the command after specifying the correct parameters.

### 6.4.4 EXTP0904

---

**expt: ERROR: EXTP0904:Specified path name is too long**

#### Explanation

The specified pathname exceeds the maximum length limit.

#### System Action

Terminates command processing.

#### User Action

Re-execute the command after specifying the correct pathname.

### 6.4.5 EXTP0906

---

**expt: ERROR: EXTP0906: Only the superuser is able to operate.**

#### Explanation

Only the superuser has permission to execute the command.

#### System Action

Terminates the command processing.

#### User Action

Log on as the superuser, then re-execute the command.

### 6.4.6 EXTP0907

---

**expt: ERROR: EXTP0907:Specified system is already created: SYSTEM=%s**

#### Variable Information

%s = System name

### Explanation

The specified system has already been created.

### System Action

Terminates command processing.

### User Action

Delete the existing system, then recreate it.

## 6.4.7 EXTP0908

---

**extp: ERROR: EXTP0908:An error occurred during system creation processing: CODE='%s1' SYSTEM=%s2**

### Variable Information

%s1 = Error information

%s2 = System name

### Explanation

An error has occurred while the system was being created.

### System Action

Terminates command processing.

### User Action

Carry out the actions described in the message displayed with this message.

## 6.4.8 EXTP0909

---

**extp: ERROR: EXTP0909:Permission to access the file or directory is not granted: PATH=%s1 SYSTEM=%s2**

### Variable Information

%s1 = Filename or folder name

%s2 = System name

### Explanation

The user does not have permission to access the file or directory.

### System Action

Terminates command processing.

### User Action

A screenshot of a file explorer window showing a folder named "Windows32/64". The folder name is highlighted in green.

Check that Interstage has been installed in the correct folder and meets the following condition.

**The folder must be on an NTFS-formatted drive and the Everyone group is not assigned with full control access permissions.**

For example, the following folders meet the condition:

- The Program Files folder in the system drive formatted with NTFS
- A folder in the system drive of Microsoft(R) Windows(R) XP

If a general user (assigned to the Users group only) uses the command for either of the above folders, click on the Security tab in the properties of the Interstage Install Folder, then set the access permission of the target user to full control.

If the Security tab is not displayed in the properties of the Microsoft(R) Windows(R) XP folder:

1. Open the Folder Options from the Control Panel in Start.
2. Click on the View tab, and uncheck the Use simplified file sharing (Recommended) setting, then click the OK button.

**Solaris32/64** **Linux32/64**

Check the file or folder access permissions, or execute the process with the correct access permissions.

## 6.4.9 EXTP0910

---

**extp: ERROR: EXTP0910:Specified path does not exist: PATH=%s1 SYSTEM=%s2**

### Variable Information

%s1 = Path name

%s2 = System name

### Explanation

Invalid path.

The restoration resource storage destination path (used for restoration and import of the component transaction service) may be incorrect.

### System Action

Terminates command processing.

### User Action

Re-execute the command after specifying the correct path.

## 6.4.10 EXTP0911

---

**extp: ERROR: EXTP0911:Disk volume is insufficient: SYSTEM=%s**

### Variable Information

%s = System name

### Explanation

Insufficient disk space.

### System Action

Terminates command processing.

### User Action

Check the disk space.

Wait for invalid multiprocessing to end, then re-execute the command.

## 6.4.11 EXTP0912

---

**extp: ERROR: EXTP0912:The process currently being executed cannot be executed simultaneously: SYSTEM=%s**

### Variable Information

%s = System name

#### Explanation

Another process that cannot be executed at the same time is being executed.

#### System Action

Stops command processing.

#### User Action

Wait until the current process finishes and then execute.

### 6.4.12 EXTP0913

---

**extp: ERROR: EXTP0913:The file or the directory of the system name and this name exists in the specified directory: SYSTEM=%s**

#### Variable Information

%s = System name

#### Explanation

A file or folder with the specified name already exists.

The "td001" folder may be present under the folder specified to "TD path for system" for an Interstage operating environment file.

#### System Action

Terminates command processing.

#### User Action

Delete or rename the file or folder, then re-execute the command.

Delete the "td001" folder under the folder specified to "TD path for system" for an Interstage operating environment file for the restoration and import of the component transaction service, and then execute the command again.

### 6.4.13 EXTP0914

---

**extp: ERROR: EXTP0914:Specified account does not exist: ACCOUNT=%s1 SYSTEM=%s2**

#### Variable Information

%s1 = Specified account

%s2 = System name

#### Explanation

Invalid account.

#### System Action

Terminates command processing.

#### User Action

Check if the account exists.

### 6.4.14 EXTP0915

---

**extp: ERROR: EXTP0915:Must have membership in the Administrators local group to execute this command**

#### Explanation

A user, other than an administrator in the local group, attempted to execute the command.

### System Action

Terminates command processing.

### User Action

Re-execute the command as an administrator in the local group.

## 6.4.15 EXTP0920

---

**extp: ERROR: EXTP0920: The backup resources already exist in the specified directory: PATH=%s1 SYSTEM=%s2**

### Variable Information

%s1 = Path name

%s2 = System name

### Explanation

The folder storing the backup/import resources specified by a command already contains backup/import resources.

### System Action

Terminates command processing.

### User Action

It is not possible to back up or import resource to the same folder multiple times. Specify the correct backup folder as a command option, then execute the command again.

## 6.4.16 EXTP0921

---

**extp: ERROR: EXTP0921: An abnormality occurred when opening the file: FILE=%s1 ERRSTRING=%s2**

### Variable Information

%s1 = File Name

%s2 = OS Error Information

### Explanation

An abnormality occurred in the open processing of a file required for command operation.

Memory may be insufficient, or a file for the component transaction service may be corrupt.

### System Action

Terminates command processing.

### User Action

In the case where memory is insufficient, refer to the Tuning Guide to re-estimate memory volume necessary to operate Interstage, then check whether sufficient memory is provided.

If sufficient memory is provided as memory volume required by Interstage, the memory for another application may be insufficient. Re-estimate the volume of memory required by another application running on the same machine, and check whether memory volume is satisfactory.

In the case where memory is insufficient as a result of re-estimation, contact your system administrator. The system administrator should expand the main memory or extend the page file.

In the case where the file for the component transaction service is corrupted, re-install the component transaction service and execute the command again.

## 6.4.17 EXTP0946

---

**extp: ERROR: EXTP0946:A system error occurred: CODE='%s'**

### Variable Information

%s = Error information

### Explanation

A system error has occurred, or there is not enough memory.

### System Action

Terminates command processing.

### User Action

If there is a memory shortage, refer to the Tuning Guide and re-estimate the amount of memory required to run Interstage. Check whether there is enough memory.

If there is enough memory to run Interstage, there may be inadequate memory to run other applications. Re-estimate the amount of memory required for the other applications running on the same machine to determine if there is an appropriate amount of memory.

Contact your system administrator if the re-estimation indicates that the memory is insufficient. Ask the system administrator to either increase the size of the main memory or to increase the size of the page file.

If there is no memory shortage, contact your software supplier.

## 6.4.18 EXTP0947

---

**extp: ERROR: EXTP0947:An I/O error occurred: FILE=%s1 SYSTEM=%s2**

### Variable Information

%s1 = Filename

%s2 = System name

### Explanation

An I/O error has occurred.

### System Action

Terminates command processing.

### User Action

Check the disk containing the file where the I/O error occurred.

## 6.4.19 EXTP0948

---

**extp: ERROR: EXTP0948:A memory shortage occurred: SYSTEM=%s**

### Variable Information

%s = System name

### Explanation

Insufficient memory

### System Action

Terminates command processing.

## User Action

Execute the process again later. If this message is generated frequently, refer to the Tuning Guide, re-estimate the memory that is needed to run Interstage, and confirm that there is enough memory.

If there is enough memory to run Interstage, there may be inadequate memory to run other applications. Re-estimate the amount of memory needed for the other applications running on the same machine to determine if there is an appropriate amount of memory.

Contact your system administrator if the re-estimation indicates that the memory is insufficient. Ask the system administrator to either increase the size of the main memory or to increase the size of the page file.

## 6.4.20 EXTP0949

---

**extp: ERROR: EXTP0949:A system error occurred: CODE='%s1' SYSTEM=%s2**

### Variable Information

%s1 = Error information

%s2 = System name

### Explanation

A system error has occurred, or there is not enough memory.

### System Action

Terminates command processing.

### User Action

If there is a memory shortage, refer to the Tuning Guide and re-estimate the amount of memory required to operate Interstage. Check whether there is enough memory.

If there is enough memory to run Interstage, there may be inadequate memory to operate other applications. Re-estimate the amount of memory required for the other applications operating on the same machine to determine if there is an appropriate amount of memory.

Contact your system administrator if the re-estimation indicates that the memory is insufficient. Ask the system administrator to either increase the size of the main memory or to increase the size of the page file. If there is no memory shortage, contact your software supplier.

## 6.4.21 EXTP0951

---

**extp: INFO: EXTP0951:Finished deleting the system: SYSTEM=%s**

### Variable Information

%s = System name

### Explanation

Information message that the system deletion has completed.

## 6.4.22 EXTP0952

---

**extp: ERROR: EXTP0952:Failed to delete the system: SYSTEM=%s**

### Variable Information

%s = System name

### Explanation

Failed to delete the system.

### System Action

Terminates the system delete process.

#### User Action

Carry out the actions described in the message displayed with this message.

### 6.4.23 EXTP0953

---

**Command name: ERROR: EXTP0953:Command parameter contains an error**

#### Explanation

Invalid parameters.

#### System Action

Terminates command processing.

#### User Action

Re-execute the command after specifying the correct parameters.

### 6.4.24 EXTP0954

---

**extp: ERROR: EXTP0954:System type error**

#### Explanation

Invalid system type.

#### System Action

Terminates command processing.

#### User Action

Re-execute the command after specifying the correct system type.

### 6.4.25 EXTP0955

---

**extp: ERROR: EXTP0955:Specified system name is too long**

#### Explanation

The specified system name exceeds the maximum length limit.

#### System Action

Terminates command processing.

#### User Action

Re-execute the command after specifying the correct system name.

### 6.4.26 EXTP0956

---

**extp: ERROR: EXTP0956:Only the super user is able to operate**

#### Explanation

The command can only be executed by a superuser.

#### System Action

Stops command processing.

#### User Action

Re-execute the command with superuser authority.

## 6.4.27 EXTP0957

---

**extp: ERROR: EXTP0957:Specified system does not exist: SYSTEM=%s**

### Variable Information

%s = System name

### Explanation

Invalid system name.

For the backup and export of the component transaction service, Interstage may not have been initialized or the Interstage operating environment may have been destroyed.

For the restoration and import of the component transaction service, restoration or import of the Interstage setup resources may not have been executed.

### System Action

Terminates command processing.

### User Action

Check that the system name is correct.

In the case where the Interstage operating environment may have been destroyed for backup and export of the component transaction service, restore the Interstage operating environment.

For the restoration and import of the component transaction service, execute restoration and import of Interstage setup resources then execute the command again.

## 6.4.28 EXTP0958

---

**extp: ERROR: EXTP0958:An error occurred while deleting the system: CODE='%s1' SYSTEM=%s2**

### Variable Information

%s1 = Error information

%s2 = System name

### Explanation

An error has occurred in the system delete process.

### System Action

Terminates command processing.

### User Action

Carry out the actions described in the message displayed with this message.

## 6.4.29 EXTP0959

---

**extp: ERROR: EXTP0959:Permission to access the file or directory not granted: PATH=%s1 SYSTEM=%s2**

### Variable Information

%s1 = Filename or folder name

%s2 = System name

## Explanation

The user does not have file/folder access permission. Alternatively, a file or a folder under the "td001" folder under the folder specified to "TD path for system" for an Interstage operating environment file may be accessed by an application such as the Windows explorer.

## System Action

Terminates command processing.

## User Action

Check the file or folder access permissions, or execute the process with the correct access permissions.

If the file or folder has an access right, check whether a file or a folder under the "td001" folder under the folder specified to "TD path for system" for an Interstage operating environment file is being accessed by an application such as the Windows explorer. If this is the case, terminate the application such as the Windows Explorer.

Then delete the "td001" folder under the folder specified to "TD path for system" for an Interstage operating environment file, and execute the command again.

## 6.4.30 EXTP0960

---

**extp: ERROR: EXTP0960:The process currently being executed cannot be executed simultaneously: SYSTEM=%s**

### Variable Information

%s = System name

### Explanation

Executing invalid multiprocessing.

### System Action

Terminates command processing.

### User Action

Wait for invalid multiprocessing to end, then re-execute the process.

## 6.4.31 EXTP0965

---

**extp: ERROR: EXTP0965:Must have membership in the Administrators local group to execute this command**

### Explanation

A user other than an administrator in the local group attempted to execute the command.

### System Action

Terminates command processing.

### User Action

Re-execute the command as an administrator in the local group.

## 6.4.32 EXTP0980

---

**extp: ERROR: EXTP0980: Failed in the initialization of the IJserver resource**

### Explanation

Failed to initialize the IJServer resources.

### System Action

Continues the Interstage initialization.

### User Action

Establish the cause of the problem from the message or event log message output immediately before, and re-execute the command.

## 6.4.33 EXTP0981

---

**extp: WARNING: EXTP0981: The directory was not able to be deleted: WU=%s1 DIR=%s2 SYSTEM=%s3**

### Variable Information

%s1 = WorkUnit name

%s2 = Directory

%s3 = System name

### Explanation

Directory deletion failed.

### System Action

Continues processing.

### User Action

Delete the displayed directory.

## 6.4.34 EXTP0996

---

**extp: ERROR: EXTP0996:A system error occurred: CODE='%s'**

### Variable Information

%s = Error information

### Explanation

A system error has occurred, or there is not enough memory.

### System Action

Terminates command processing.

### User Action

If there is a memory shortage, refer to the Tuning Guide and re-estimate the amount of memory required to run Interstage. Check whether there is enough memory.

If there is enough memory to run Interstage, there may be inadequate memory to run other applications. Re-estimate the amount of memory required for the other applications running on the same machine to determine if there is an appropriate amount of memory.

Contact your system administrator if the re-estimation indicates that the memory is insufficient. Ask the system administrator to either increase the size of the main memory or to increase the size of the page file.

If there is no memory shortage, contact your software supplier.

## 6.4.35 EXTP0997

---

**extp: ERROR: EXTP0997:An I/O error occurred: FILE=%s1 SYSTEM=%s2**

### Variable Information

%s1 = Filename

%s2 = System name

#### Explanation

An I/O error has occurred.

#### System Action

Terminates command processing.

#### User Action

Check the disk containing the file where the I/O error occurred.

### 6.4.36 EXTP0998

---

**extp: ERROR: EXTP0998:A memory shortage occurred: SYSTEM=%s**

#### Variable Information

%s = System name

#### Explanation

Insufficient memory

#### System Action

Terminates command processing.

#### User Action

Execute the process again later. If this message is generated frequently, refer to the Tuning Guide, re-estimate the memory that is needed to run Interstage, and confirm that there is enough memory.

If there is enough memory to run Interstage, there may be inadequate memory to run other applications. Re-estimate the amount of memory needed for the other applications running on the same machine to determine if there is an appropriate amount of memory.

Contact your system administrator if the re-estimation indicates that the memory is insufficient. Ask the system administrator to either increase the size of the main memory or to increase the size of the page file.

### 6.4.37 EXTP0999

---

**extp: ERROR: EXTP0999:A system error occurred: CODE='%s1' SYSTEM=%s2**

#### Variable Information

%s1 = Error information

%s2 = System name

#### Explanation

A system error has occurred, or there is not enough memory.

#### System Action

Terminates command processing.

#### User Action

If there is a memory shortage, refer to the Tuning Guide and re-estimate the amount of memory required to run Interstage. Check whether there is enough memory.

If there is enough memory to run Interstage, there may be inadequate memory to run other applications. Re-estimate the amount of memory required for the other applications running on the same machine to determine if there is an appropriate amount of memory.

Contact your system administrator if the re-estimation indicates that the memory is insufficient. Ask the system administrator to either increase the size of the main memory or to increase the size of the page file.

If there is no memory shortage, contact your software supplier.

## 6.5 EXTP2000 to EXTP2099

---

This section details messages numbered between EXTP2000 and EXTP2099.

### 6.5.1 EXTP2000

---

**extp: ERROR: EXTP2000:A system error occurred: CODE=%s1 SYSTEM=%s2**

#### Variable Information

%s1 = Error information

%s2 = System name

#### Explanation

A system error has occurred.

#### System Action

Terminates the process.

#### User Action

If this is output when the WorkUnit is created and the WorkUnit definition has been registered, check that the DOS device name is not the same as the WorkUnit name.

If when the [WorkUnit] node is clicked from the Interstage Management Console this message, together with error information of "DEF 407 6 0", is output to the system log, the EXTP package may not be installed. Install the EXTP package, then re-execute processing.

This message may be output during Interstage startup/stop processing, or when Interstage setup is performed in a separate window or command while the Interstage Management Console is being used to delete a CORBA WorkUnit, or deploy/undeploy a CORBA application. In this case, allow the operation being performed through the Management Console to complete, then re-execute the start/stop/setup operation.

In a multiserver environment check the Managed Server system log for a message showing the cause of the error. If found, take action according to the message.

If the problem persists, use the *iscollectinfo* command to collect investigation information, and contact a Fujitsu service engineer.

### 6.5.2 EXTP2001

---

**extp: ERROR: EXTP2001:An error was detected during a system call: CODE=%s1 SYSTEM CALL=%s2 ERRNO=%d1 SYSTEM=%s3**

#### Variable Information

%s1 = Error information

%s2 = System call name

%d1 : Error No.

%s3 = System name

#### Explanation

An error was detected during a system call. Insufficient memory, I/O fault, or insufficient capacity of the file system could be the cause of error.

#### System Action

Stops the processing.

## User Action

If the value indicated by an error number is "14", "8" or "1455", memory is insufficient. Wait a while and execute the processing again. If this message is frequently output, refer to the Tuning Guide to re-estimate memory volume necessary to operate Interstage, then check whether sufficient memory is provided.

If sufficient memory is provided for Interstage, memory for another application may be insufficient. Also re-estimate the volume of memory required by other applications running on the same machine, and check whether memory volume is satisfactory.

If re-estimation proves that memory is insufficient, contact your system administrator. The system administrator should expand the main memory or extend the page file.

If the value indicated by an error number is "5", "19", "32", "33", "67" or "74", access to the file or folder is not granted. Check and modify the access right to the file or folder, or let a user having the access right perform the processing.

If the value indicated by an error number is "19", "21", "29", "30", "1392" or "1393", then an I/O fault has occurred. Restore the disk device storing a file where the I/O fault has taken place.

If the value indicated by an error number is "112", the file system capacity is insufficient. Reserve the free capacity of the file system, then execute again.

Contact your software supplier if one of the above cases applies.

## 6.5.3 EXTP2002

---

**extp: ERROR: EXTP2002:An I/O error occurred: FILE=%s1 SYSTEM=%s2**

### Variable Information

%s1 = Filename

%s2 = System name

### Explanation

An I/O error has occurred.

### System Action

Stops the processing.

### User Action

Check the disk containing the file where the I/O error occurred.

## 6.5.4 EXTP2003

---

**extp: ERROR: EXTP2003:Permission to access the file or parent directory is not granted: USER=%s1 FILE=%s2 SYSTEM=%s3**

### Variable Information

%s1 = User name

%s2 = Filename

%s3 = System name

### Explanation

The user does not have access permission to the parent folder or file.

### System Action

Stops the processing.

### User Action

Check the file or parent folder access permissions, or execute the process with the correct access permissions.

## 6.5.5 EXTP2004

---

**extp: ERROR: EXTP2004:System memory shortage: CODE=%s1 SYSTEM=%s2**

### Variable Information

%s1 = Error information

%s2 = System name

### Explanation

Insufficient memory

### System Action

Stops the processing.

### User Action

Execute the process again later. If this message is generated frequently, refer to the Tuning Guide, re-estimate the memory that is needed to run Interstage, and confirm that there is enough memory.

If there is enough memory to run Interstage, there may be inadequate memory to run other applications. Re-estimate the amount of memory needed for the other applications running on the same machine to determine if there is an appropriate amount of memory.

Contact your system administrator if the re-estimation indicates that the memory is insufficient. Ask the system administrator to either increase the size of the main memory or to increase the size of the page file.

## 6.5.6 EXTP2005

---

**extp: ERROR: EXTP2005:File system volume is insufficient: FILE=%s1 CODE=%s2 SYSTEM=%s3**

### Variable Information

%s1 = Filename

%s2 = Error information

%s3 = System name

### Explanation

The file system capacity is insufficient.

### System Action

Stops the processing.

### User Action

Check the capacity of the file system.

## 6.5.7 EXTP2006

---

**extp: ERROR: EXTP2006:System does not exist: SYSTEM=%s1**

### Variable Information

%s1 = System name

### Explanation

The system does not exist.

### System Action

Stops the processing.

#### User Action

Check the system name.

### 6.5.8 EXTP2007

---

**Command name: ERROR: EXTP2007:Option designation contains an error**

#### Explanation

The specified option is invalid.

#### System Action

Terminates command processing.

#### User Action

Specify a valid option, then re-execute the command.

### 6.5.9 EXTP2008

---

**Command name: ERROR: EXTP2008: No system name specified after -s option**

#### Explanation

The work system name following the -s option is not defined.

#### System Action

Stops the command processing.

#### User Action

Specify the work system name following the -s option, and execute the command again.

### 6.5.10 EXTP2009

---

**Command name: ERROR: EXTP2009:No definition type specified after -t option**

#### Explanation

Definition type is not specified at the -t option.

#### System Action

Terminates command processing.

#### User Action

Re-execute the command, specifying the definition type at the -t option.

### 6.5.11 EXTP2010

---

**Command name: ERROR: EXTP2010:Error in definition type designation**

#### Explanation

The definition type specified for the -t option is invalid.

#### System Action

Terminates command processing.

#### User Action

Re-execute the command, specifying a valid definition type at the -t option.

## 6.5.12 EXTP2011

---

**Command name: ERROR: EXTP2011:-t option has been omitted**

### Explanation

The -t option must be specified with the -d option.

### System Action

Terminates command processing.

### User Action

Re-execute the command, specifying both the -t and -d options.

## 6.5.13 EXTP2012

---

**Command name: ERROR: EXTP2012:-t option is specified**

### Explanation

The -t option must be specified with the -d option.

### System Action

Terminates command processing.

### User Action

If the -d option is necessary, re-execute the command, specifying both the -t and -d options.

If the -d option is not necessary, re-execute the command without specifying the -t option.

## 6.5.14 EXTP2013

---

**Command name: ERROR: EXTP2013:Name of control document file is not specified**

### Explanation

The control statement filename required to register the definition is not specified.

### System Action

Terminates command processing.

### User Action

Specify the control statement filename, then re-execute the command.

## 6.5.15 EXTP2014

---

**Command name: ERROR: EXTP2014:Definition name is not specified**

### Explanation

The definition name to be deleted is not specified.

### System Action

Terminates command processing.

### User Action

When specifying the -d option, first specify the definition name to be deleted, then re-execute the command.

## 6.5.16 EXTP2015

---

**Command name: ERROR: EXTP2015:Multiple control document file names are specified**

### Explanation

The control statement filename is specified more than once.

### System Action

Terminates command processing.

### User Action

Specify the control statement filename once, then re-execute the command.

## 6.5.17 EXTP2016

---

**Command name: ERROR: EXTP2016:Command variable is not specified**

### Explanation

The command argument is omitted.

### System Action

Terminates command processing.

### User Action

Specify the command argument, then re-execute the command.

## 6.5.18 EXTP2017

---

**Command name: ERROR: EXTP2017:Specified file or directory does not exist: FILE=%s1 SYSTEM=%s2**

### Variable Information

%s1 = Filename

%s2 = System name

### Explanation

The specified file/folder does not exist, or restoration/import resources are corrupted.

### System Action

Terminates command processing.

### User Action

Specify the correct filename or folder name and re-execute the command. If this message is output when a restoration command is executed, restoration/import resources may be corrupted.

If this message persists even when a correct folder is specified, execute the backup command again to create restoration/import resources or use the WorkUnit definition registration command to register a WorkUnit definition.

## 6.5.19 EXTP2018

---

**extp: ERROR: EXTP2018:Line %d:Syntax error: FILE=%s1 SYSTEM=%s2**

### Variable Information

%d = Line number

%s1 = Filename

%s2 = System name

#### Explanation

A syntax error exists in the control statement file.

#### System Action

Stops the processing.

#### User Action

Resolve the syntax error in the control statement file, then re-execute the process.

**Windows32/64**

Confirm that the WorkUnit definition file is saved using the ANSI format.

**Solaris32/64** **Linux32/64**

Confirm that the line feed code is LF if the variable information line number is a blank line.

## 6.5.20 EXTP2019

---

**Command name: ERROR: EXTP2019:Line %d:Nonstandard character is specified: FILE=%s1 SYSTEM=%s2**

#### Variable Information

%d = Line number

%s1 = Filename

%s2 = System name

#### Explanation

An external character is specified.

#### System Action

Terminates command processing.

#### User Action

Remove the external character, then re-execute the command.

## 6.5.21 EXTP2020

---

**Command name: ERROR: EXTP2020:Line %d:Number of sections that may be specified has been exceeded: FILE=%s1 SYSTEM=%s2**

#### Variable Information

%d = Line number

%s1 = Filename

%s2 = System name

#### Explanation

The section number limit has been exceeded.

#### System Action

Terminates command processing.

## User Action

Specify a valid section number, then re-execute the command.

### 6.5.22 EXTP2021

---

**Command name: ERROR: EXTP2021:Line %d:Number of statements that may be specified has been exceeded: FILE=%s1 SYSTEM=%s2**

#### Variable Information

%d = Line number

%s1 = Filename

%s2 = System name

#### Explanation

The statement number limit has been exceeded.

#### System Action

Terminates command processing.

#### User Action

Specify a valid statement number, then re-execute the command.

### 6.5.23 EXTP2022

---

**Command name: WARNING: EXTP2022:Specified communication environment already exists: CWB=%s1 SYSTEM=%s2**

#### Variable Information

%s1 = Communication environment name

%s2 = System name

#### Explanation

The specified communication environment already exists.

#### System Action

Continues command processing without registering the specified communication environment definition.

#### User Action

To replace the communication environment definition with the contents of the control statement file, specify the -o option, then re-execute the command.

### 6.5.24 EXTP2024

---

**Command name: ERROR: EXTP2024:Line %d:[Communication Buffer] section is not specified: FILE=%s1 SYSTEM=%s2**

#### Variable Information

%d = Line number

%s1 = Filename

%s2 = System name

### Explanation

The [Communication Buffer] section is not specified.

### System Action

Terminates command processing.

### User Action

Specify the [Communication Buffer] section, then re-execute the command.

## 6.5.25 EXTP2025

---

**Command name: ERROR: EXTP2025:Line %d:[Destination] section is not specified: FILE=%s1 SYSTEM=%s2**

### Variable Information

%d = Line number

%s1 = Filename

%s2 = System name

### Explanation

The [Destination] section is not specified.

### System Action

Terminates command processing.

### User Action

Specify the [Destination] section, then re-execute the command.

## 6.5.26 EXTP2026

---

**Command name: ERROR: EXTP2026:Line %d:"Name:" statement is not specified in the [COMMUNICATION ENVIRONMENT] section: FILE=%s1 SYSTEM=%s2**

### Variable Information

%d = Line number

%s1 = Filename

%s2 = System name

### Explanation

The "Name:" statement is not specified in the [COMMUNICATION ENVIRONMENT] section.

### System Action

Terminates command processing.

### User Action

Specify the "Name:" statement in the [COMMUNICATION ENVIRONMENT] section, then re-execute the command.

## 6.5.27 EXTP2027

---

**Command name: ERROR: EXTP2027:Line %d:"Size:" statement is not specified in the [Communication Buffer] section: FILE=%s1 SYSTEM=%s2**

## Variable Information

%d = Line number

%s1 = Filename

%s2 = System name

## Explanation

The "Size:" statement is not specified in the [Communication Buffer] section.

## System Action

Terminates command processing.

## User Action

Specify the "Size:" statement in the [Communication Buffer] section, then re-execute the command.

## 6.5.28 EXTP2028

---

**Command name: ERROR: EXTP2028:Line %d:"Number:" statement is not specified in the [Communication Buffer] section: FILE=%s1 SYSTEM=%s2**

## Variable Information

%d = Line number

%s1 = Filename

%s2 = System name

## Explanation

The "Number:" statement is not specified in the [Communication Buffer] section.

## System Action

Terminates command processing.

## User Action

Specify the "Number:" statement in the [Communication Buffer] section, then re-execute the command.

## 6.5.29 EXTP2029

---

**Command name: ERROR: EXTP2029:Line %d:"Maximum Destination:" statement is not specified in the [Destination] section: FILE=%s1 SYSTEM=%s2**

## Variable Information

%d = Line number

%s1 = Filename

%s2 = System name

## Explanation

The "Maximum Destination:" statement is not specified in the [Destination] section.

## System Action

Terminates command processing.

## User Action

Specify the "Maximum Destination:" statement in the [Destination] section, then re-execute the command.

## 6.5.30 EXTP2030

---

**Command name: WARNING: EXTP2030:Specified work unit definition already exists: WU=%s1 SYSTEM=%s2**

### Variable Information

%s1 = WorkUnit name

%s2 = System name

### Explanation

The specified WorkUnit definition already exists.

### System Action

Continues command processing without registering the specified WorkUnit definition.

### User Action

To replace the WorkUnit definition with the contents of the control statement file, specify the -o option, then re-execute the command.

## 6.5.31 EXTP2031

---

**Command name: WARNING: EXTP2031:Specified work unit definition does not exist: WU=%s1 SYSTEM=%s2**

### Variable Information

%s1 = WorkUnit name

%s2 = System name

### Explanation

The specified WorkUnit definition does not exist.

### System Action

Continues command processing.

### User Action

Specify the existing WorkUnit definition, then re-execute the command.

If this message is output to the Interstage Management Console, a WorkUnit that was created from the Interstage Management Console may have been deleted using the *isdelwundef* command. Stop all running WorkUnits using the *isstopwu* command, delete CORBA application definition information using the *OD\_impl\_inst* command, and then delete the registered Naming Service name using the *OD\_or\_adm* command. Now, create a new WorkUnit from the Interstage Management Console.

If a CORBA WorkUnit is deleted by the *isdelwundef* command when the Interstage JMX service and the load measuring agent are both running, this message is output either once or several times to the system log. Note that this does not affect the operation.

## 6.5.32 EXTP2032

---

**Command name: ERROR: EXTP2032:Line %d:[Reference Communication Environment] section is not specified: FILE=%s1 SYSTEM=%s2**

### Variable Information

%d = Line number

%s1 = Filename

%s2 = System name

#### Explanation

The [Reference Communication Environment] section is not specified.

#### System Action

Terminates command processing.

#### User Action

Specify the [Reference Communication Environment] section, then re-execute the command.

### 6.5.33 EXTP2033

---

**Command name:** ERROR: EXTP2033:Line %d:[APM] section is not specified: FILE=%s1 SYSTEM=%s2

#### Variable Information

%d = Line number

%s1 = Filename

%s2 = System name

#### Explanation

The [APM] section is not specified.

#### System Action

Terminates command processing.

#### User Action

Specify the [APM] section, then re-execute the command.

### 6.5.34 EXTP2034

---

**Command name:** ERROR: EXTP2034:Line %d:[Control Option] section is not specified: FILE=%s1 SYSTEM=%s2

#### Variable Information

%d = Line number

%s1 = Filename

%s2 = System name

#### Explanation

The [Control Option] section is not specified.

#### System Action

Terminates command processing.

#### User Action

Specify the [Control Option] section, then re-execute the command.

### 6.5.35 EXTP2035

---

**Command name:** ERROR: EXTP2035:Line %d:[Application Program] section is not specified: FILE=%s1 SYSTEM=%s2

### Variable Information

%d = Line number

%s1 = Filename

%s2 = System name

### Explanation

The [Application Program] section is not specified.

### System Action

Terminates command processing.

### User Action

Specify the [Application Program] section, then re-execute the command.

## 6.5.36 EXTP2036

---

**Command name: ERROR: EXTP2036:Line %d:The "Name:" statement is not specified in the [WORK UNIT] section: FILE=%s1 SYSTEM=%s2**

### Variable Information

%d = Line number

%s1 = Filename

%s2 = System name

### Explanation

The "Name:" statement is not specified in [WORK UNIT] section.

### System Action

Terminates command processing.

### User Action

Specify the "Name:" statement in the [WORK UNIT] section, then re-execute the command.

## 6.5.37 EXTP2037

---

**Command name: ERROR: EXTP2037:Line %d:"Kind:" is not specified in the [WORK UNIT] section: FILE=%s1 SYSTEM=%s2**

### Variable Information

%d = Line number

%s1 = Filename

%s2 = System name

### Explanation

The "Kind:" statement is not specified in the [WORK UNIT] section.

### System Action

Terminates command processing.

### User Action

Specify the "Kind:" statement in the [WORK UNIT] section, then re-execute the command.

## 6.5.38 EXTP2038

---

**Command name:** ERROR: EXTP2038:Line %d:The "Name:" statement is not specified in the [Reference Communication Environment] section: FILE=%s1 SYSTEM=%s2

### Variable Information

%d = Line number

%s1 = Filename

%s2 = System name

### Explanation

The "Name:" statement is not specified in the [Reference Communication Environment].

### System Action

Terminates command processing.

### User Action

Specify the "Name:" statement in the [Reference Communication Environment] section, then re-execute the command.

## 6.5.39 EXTP2039

---

**Command name:** ERROR: EXTP2039:Line %d:The "Name:" statement is not specified in the [APM] section: FILE=%s1 SYSTEM=%s2

### Variable Information

%d = Line number

%s1 = Filename

%s2 = System name

### Explanation

The "Name:" statement is not specified in the [APM] section.

### System Action

Terminates command processing.

### User Action

Specify the "Name:" statement in the [APM] section, then re-execute the command.

## 6.5.40 EXTP2040

---

**Command name:** ERROR: EXTP2040:Line %d:The "Path:" statement is not specified in the [Control Option] section: FILE=%s1 SYSTEM=%s2

### Variable Information

%d = Line number

%s1 = Filename

%s2 = System name

### Explanation

The "Path:" statement is not specified in the [Control Option] section.

## System Action

Terminates command processing.

## User Action

Specify the "Path:" statement in the [Control Option] section, then re-execute the command.

### 6.5.41 EXTP2041

---

**Command name: ERROR: EXTP2041:Line %d:The "Current Directory:" statement is not specified in the [Control Option] section: FILE=%s1 SYSTEM=%s2**

#### Variable Information

%d = Line number

%s1 = Filename

%s2 = System name

#### Explanation

The "Current Directory:" statement is not specified in the [Control Option] section.

#### System Action

Terminates command processing.

#### User Action

Specify the "Current Directory:" statement in the [Control Option] section, then re-execute the command.

### 6.5.42 EXTP2044

---

**Command name: ERROR: EXTP2044:Line %d:The "Executable File for Exit Program:" statement is not specified in the [Control Option] section: FILE=%s1 SYSTEM=%s2**

#### Variable Information

%d = Line number

%s1 = Filename

%s2 = System name

#### Explanation

The "Executable File for Exit Program:" statement is not specified in the [Control Option] section.

#### System Action

Terminates command processing.

#### User Action

Specify the "Executable File for Exit Program:" statement in the [Control Option] section, then re-execute the command.

### 6.5.43 EXTP2045

---

**Command name: ERROR: EXTP2045:Line %d:The "Library for Exit Program:" statement is not specified in the [Control Option] section: FILE=%s1 SYSTEM=%s2**

#### Variable Information

%d = Line number

%s1 = Filename

%s2 = System name

#### Explanation

The "Library for Exit Program:" statement is not specified in the [Control Option] section.

#### System Action

Terminates command processing.

#### User Action

Specify the "Library for Exit Program:" statement in the [Control Option] section, then re- execute the command.

### 6.5.44 EXTP2046

---

**Command name: ERROR: EXTP2046:Line %d:The specified path is duplicated: FILE=%s1 SYSTEM=%s2**

#### Variable Information

%d = Line number

%s1 = Filename

%s2 = System name

#### Explanation

The specified path is duplicated.

#### System Action

Terminates command processing.

#### User Action

Specify a valid path, then re-execute the command.

### 6.5.45 EXTP2047

---

**Command name: ERROR: EXTP2047:Line %d:The name of the communication environment is duplicated: FILE=%s1 SYSTEM=%s2**

#### Variable Information

%d = Line number

%s1 = Filename

%s2 = System name

#### Explanation

The communication environment name is duplicated.

#### System Action

Terminates command processing.

#### User Action

Specify a valid communication environment name, then re-execute the command.

### 6.5.46 EXTP2048

---

**Command name: ERROR: EXTP2048:Line %d:The names of the communication environment and the communication environment in use are duplicated: FILE=%s1 SYSTEM=%s2**

## Variable Information

%d = Line number

%s1 = Filename

%s2 = System name

## Explanation

The names of the communication environment and the communication environment in use are duplicated.

## System Action

Terminates command processing.

## User Action

Specify a new valid name for the duplicated communication environment or the communication environment in use, then re-execute the command.

## 6.5.47 EXTP2050

---

**Command name: ERROR: EXTP2050:Line %d:The "Name:" statement is not specified in the [Application Program] section: FILE=%s1 SYSTEM=%s2**

## Variable Information

%d = Line number

%s1 = Filename

%s2 = System name

## Explanation

The "Name:" statement is not specified in the [Application Program] section.

## System Action

Terminates command processing.

## User Action

Specify the "Name:" statement in the [Application Program] section, then re-execute the command.

## 6.5.48 EXTP2051

---

**Command name: ERROR: EXTP2051:Line %d:The "Destination:" statement is not specified in the [Application Program] section: FILE=%s1 SYSTEM=%s2**

## Variable Information

%d = Line number

%s1 = Filename

%s2 = System name

## Explanation

The "Destination:" statement is not specified in the [Application Program] section

## System Action

Terminates command processing.

## User Action

Specify the "Destination:" statement in the [Application Program] section, then re-execute the command.

## 6.5.49 EXTP2052

---

**Command name:** ERROR: EXTP2052:Line %d:The "PSYS:" statement is not specified in the Application Program] section: FILE=%s1 SYSTEM=%s2

### Variable Information

%d = Line number

%s1 = Filename

%s2 = System name

### Explanation

The "PSYS:" statement is not specified in the [Application Program] section

### System Action

Terminates command processing.

### User Action

Specify the "PSYS:" statement in the [Application Program] section, then re-execute the command.

## 6.5.50 EXTP2053

---

**Command name:** ERROR: EXTP2053:Line %d:The "Executable File:" statement is not specified in the [Application Program] section: FILE=%s1 SYSTEM=%s2

### Variable Information

%d = Line number

%s1 = Filename

%s2 = System name

### Explanation

The "Executable File:" statement is not specified in the [Application Program] section.

### System Action

Terminates command processing.

### User Action

Specify the "Executable File:" statement in the [Application Program] section, then re- execute the command.

## 6.5.51 EXTP2056

---

**Command name:** ERROR: EXTP2056:Line %d:The execution file name of the nonresident application and the execution file name of the exit program are duplicated: FILE=%s1 SYSTEM=%s2

### Variable Information

%d = Line number

%s1 = Filename

%s2 = System name

### Explanation

The nonresident application and exit program executable filenames are duplicated.

### System Action

Terminates command processing.

### User Action

Rename one of the files, then re-execute the command.

## 6.5.52 EXTP2057

---

**Command name: ERROR: EXTP2057:Line %d:The application file name is duplicated: FILE=%s1 SYSTEM=%s2**

### Variable Information

%d = Line number

%s1 = Filename

%s2 = System name

### Explanation

The application executable filename is duplicated.

### System Action

Terminates command processing.

### User Action

Specify a valid application executable filename, then re-execute the command.

## 6.5.53 EXTP2058

---

**Command name: ERROR: EXTP2058:Line %d:The application destination name is duplicated: FILE=%s1 SYSTEM=%s2**

### Variable Information

%d = Line number

%s1 = Filename

%s2 = System name

### Explanation

The application destination name is duplicated.

### System Action

Terminates command processing.

### User Action

Specify a valid application destination name, then re-execute the command.

## 6.5.54 EXTP2059

---

**Command name: INFO: EXTP2059:The work unit definition has been registered: WU=%s1 SYSTEM=%s2**

### Variable Information

%s1 = WorkUnit name

%s2 = System name

## Explanation

The specified WorkUnit definition is registered.

### 6.5.55 EXTP2060

---

**Command name: INFO: EXTP2060:The communication environment definition has been registered: CWB=%s1 SYSTEM=%s2**

#### Variable Information

%s1 = Communication environment name

%s2 = System name

#### Explanation

The specified communication environment definition is registered.

### 6.5.56 EXTP2061

---

**Command name: INFO: EXTP2061:The work unit definition has been deleted: WU=%s1 SYSTEM=%s2**

#### Variable Information

%s1 = WorkUnit name

%s2 = System name

#### Explanation

The specified WorkUnit definition is deleted. This message is displayed only if the definition to be deleted exists.

### 6.5.57 EXTP2062

---

**Command name: INFO: EXTP2062:The communication environment definition has been deleted: CWB=%s1 SYSTEM=%s2**

#### Variable Information

%s1 = Communication environment name

%s2 = System name

#### Explanation

The specified communication environment definition is deleted. This message is displayed only if the definition to be deleted exists.

### 6.5.58 EXTP2063

---

**extp: ERROR: EXTP2063:The file or directory does not exist: SYSTEM=%s1**

#### Variable Information

%s = System name

#### Explanation

File/folder does not exist.

#### System Action

Stops the processing.

#### User Action

If the WorkUnit definition appears to have been deleted, reregister the WorkUnit definition.

If the WorkUnit definition has not been deleted, a business system probably has an error. To resolve, set up the business system environment, and reregister the definition.

## 6.5.59 EXTP2064

---

**extp: ERROR: EXTP2064:The system environment contains an abnormality: CODE=%s1 SYSTEM=%s2**

### Variable Information

%s1 = Error information

%s2 = System name

### Explanation

The system environment contains an abnormality.

### System Action

Stops the processing.

### User Action

Create the application system environment to re-register the definition, or use the resource restoration/import command for the component transaction service to restore resources.

## 6.5.60 EXTP2065

---

**extp: ERROR: EXTP2065:Line %d:The "PlugName:" statement is not specified: FILE=%s1 SYSTEM=%s2**

### Variable Information

%d = Line number

%s1 = Filename

%s2 = System name

### Explanation

The "PlugName:" statement is not specified.

### System Action

Stops the processing.

### User Action

Specify the "PlugName:" statement, then re-execute the command.

## 6.5.61 EXTP2066

---

**extp: ERROR: EXTP2066:Line %d:The "LibPath:" statement is not specified: FILE=%s1 SYSTEM=%s2**

### Variable Information

%d = Line number

%s1 = Filename

%s2 = System name

### Explanation

The "LibPath:" statement is not specified

### System Action

Stops the processing.

### User Action

Specify the "LibPath:" statement, then re-execute the command.

## 6.5.62 EXTP2067

---

**extp: ERROR: EXTP2067:Line %d:The "LibName:" statement is not specified: FILE=%s1 SYSTEM=%s2**

### Variable Information

%d = Line number

%s1 = Filename

%s2 = System name

### Explanation

The "LibName:" statement is not specified.

### System Action

Stops the processing.

### User Action

Specify the "LibName:" statement, then re-execute the command.

## 6.5.63 EXTP2068

---

**extp: ERROR: EXTP2068:Line %d:The "Func:" statement is not specified: FILE=%s1 SYSTEM=%s2**

### Variable Information

%d = Line number

%s1 = Filename

%s2 = System name

### Explanation

The "Func:" statement is not specified.

### System Action

Stops the processing.

### User Action

Specify the "Func:" statement, then re-execute the command.

## 6.5.64 EXTP2069

---

**extp: ERROR: EXTP2069:Line %d:The "ProcNum:" statement is not specified: FILE=%s1 SYSTEM=%s2**

### Variable Information

%d = Line number

%s1 = Filename

%s2 = System name

#### Explanation

The "ProcNum:" statement is not specified.

#### System Action

Stops the processing.

#### User Action

Specify the "ProcNum:" statement, then re-execute the command.

### 6.5.65 EXTP2070

---

**extp: ERROR: EXTP2070:Line %d:The "ErrAction:" statement is not specified: FILE=%s1 SYSTEM=%s2**

#### Variable Information

%d = Line number

%s1 = Filename

%s2 = System name

#### Explanation

The "ErrAction:" statement is not specified

#### System Action

Stops the processing.

#### User Action

Specify the "ErrAction:" statement, then re-execute the command.

### 6.5.66 EXTP2071

---

**extp: ERROR: EXTP2071:Line %d:The total length of the path name and file name exceeds 255 bytes: FILE=%s1 SYSTEM=%s2**

#### Variable Information

%d = Line number

%s1 = Filename

%s2 = System name

#### Explanation

The total path + filename length exceeds 255 bytes.

#### System Action

Stops the processing.

#### User Action

Specify a valid path and filename, then re-execute the command.

### 6.5.67 EXTP2072

---

**Command name: INFO: EXTP2072:Definition registration is complete: SYSTEM=%s**

#### Variable Information

%s = System name

## Explanation

Definition registration is complete.

### 6.5.68 EXTP2073

---

**Command name: INFO: EXTP2073:Definition deletion is complete: SYSTEM=%s**

#### Variable Information

%s = System name

#### Explanation

Definition deletion is complete.

### 6.5.69 EXTP2074

---

**Command name: WARNING: EXTP2074:Complete registration of the specified definitions could not be done: SYSTEM=%s**

#### Variable Information

%s = System name

#### Explanation

Could not register all the definitions. No registered definitions exist.

#### User Action

Check the previous message or event log message, then re-execute the command.

### 6.5.70 EXTP2075

---

**Command name: WARNING: EXTP2075:Complete deletion of the specified definitions could not be done: SYSTEM=%s**

#### Variable Information

%s = System name

#### Explanation

Could not delete all the definitions. Undeleted definitions exist.

#### User Action

Check the previous message or event log message, then re-execute the command.

### 6.5.71 EXTP2076

---

**Command name: ERROR: EXTP2076:Definition could not be registered: SYSTEM=%s**

#### Variable Information

%s = System name

#### Explanation

Could not register the definition.

#### System Action

Terminates command processing.

## User Action

Check the previous message or event log message, then re-execute the command.

## 6.5.72 EXTP2077

---

**Command name: ERROR: EXTP2077:Definition could not be deleted: SYSTEM=%s**

### Variable Information

%s = System name

### Explanation

Could not delete the definition.

### System Action

Terminates command processing.

### User Action

Check the previous message or event log message, then re-execute the command.

## 6.5.73 EXTP2078

---

**extp: ERROR: EXTP2078:A system call error was detected: SYSTEM CALL=%s1 INFO=%s2 SYSTEM=%s3**

### Variable Information

%s1 = System call name

%s2 = Error information

%s3 = System name

### Explanation

An error has occurred in a system call

### System Action

Stops the processing.

### User Action

Contact your software supplier.

## 6.5.74 EXTP2079

---

**Command name: ERROR: EXTP2079:The file name is too long: FILE=%s1 SYSTEM=%s2**

### Variable Information

%s1 = Filename

%s2 = System name

### Explanation

The filename is too long.

### System Action

Terminates command processing.

## User Action

Specify a valid filename, then re-execute the command.

### 6.5.75 EXTP2080

---

**extp: ERROR: EXTP2080:Definition contains an abnormality: DEF=%s1 SYSTEM=%s2**

#### Variable Information

%s1 = Definition name

%s2 = System name

#### Explanation

Abnormal definition.

#### System Action

Stops the processing.

#### User Action

Re-register the relevant definition, then re-execute the process.

### 6.5.76 EXTP2081

---

**Command name: ERROR: EXTP2081:An existing definition contains an abnormality: DEF=%s1 SYSTEM=%s2**

#### Variable Information

%s1 = Definition name

%s2 = System name

#### Explanation

The existing definition is abnormal.

#### System Action

Terminates command processing.

#### User Action

Delete the definition with the *tddeldef* command, then re-execute the command.

### 6.5.77 EXTP2082

---

**Command name: ERROR: EXTP2082:A directory cannot be specified for the control document file: FILE=%s1 SYSTEM=%s2**

#### Variable Information

%s1 = Filename

%s2 = System name

#### Explanation

The folder cannot be specified for the control statement filename.

#### System Action

Terminates command processing.

## User Action

Specify the control statement filename.

## 6.5.78 EXTP2084

---

**Command name: ERROR: EXTP2084: Line %d : "RM:" is not specified in the [Resource Manager] section: FILE=%s1 SYSTEM=%s2**

### Variable Information

%d = Line No.

%s1 = Filename

%s2 = System name

### Explanation

The "RM:" statement is not specified in the [Resource Manager] section.

### System Action

Stops the command processing.

### User Action

Specify the "RM:" statement in the [Resource Manager] section, then re-execute the command.

## 6.6 EXTP2100 to EXTP2199

---

This section details the messages with message numbers between EXTP2100 and EXTP2199.

### 6.6.1 EXTP2136

---

**Command name: ERROR: EXTP2136:Line %d:The dynamic link library name is duplicated: FILE=%s1 SYSTEM=%s2**

### Variable Information

%d = Line Number

%s1 = Filename

%s2 = System Name

### Explanation

Dynamic Link Library (DLL) name is duplicated.

### System Action

Stops the command processing.

### User Action

Correct the duplicated DLL name, then re-execute the command.

### 6.6.2 EXTP2137

---

**Command name: ERROR: EXTP2137:[Nonresident Application Process] section is not specified: FILE=%s1 SYSTEM=%s2**

### Variable Information

%s1 = Filename

%s2 = System Name

#### Explanation

The [Nonresident Application Process] section is not specified.

#### System Action

Stops the command processing.

#### User Action

Specify the [Nonresident Application Process] section, then re-execute the command.

### 6.6.3 EXTP2138

---

**Command name: ERROR: EXTP2138:Line %d:The languages for nonresident application disagree: FILE=%s1 SYSTEM=%s2**

#### Variable Information

%d = Line Number

%s1 = Filename

%s2 = System Name

#### Explanation

The Nonresident Application language type does not match.

#### System Action

Stops the command processing.

#### User Action

Specify the same language in the nonresident application type, then re-execute the command.

### 6.6.4 EXTP2139

---

**Command name: ERROR: EXTP2139:Line %d:The "Method Name to Begin Session:" statement is not specified: FILE=%s1 SYSTEM=%s2**

#### Variable Information

%d = Line Number

%s1 = Filename

%s2 = System Name

#### Explanation

The "Method Name to Begin Session:" statement is not specified.

#### System Action

Stops the command processing.

#### User Action

Specify the "Method Name to Begin Session:" statement, then re-execute the command.

### 6.6.5 EXTP2140

---

---

**Command name: ERROR: EXTP2140:Line %d:The "Port of Reference:" statement is not specified: FILE=%s1 SYSTEM=%s2**

**Variable Information**

- %d = Line Number
- %s1 = Filename
- %s2 = System Name

**Explanation**

The "Port of Reference:" statement is not specified.

**System Action**

Stops the command processing.

**User Action**

Specify the "Port of Reference:" statement, then re-execute the command.

---

### 6.6.6 EXTP2141

---

**Command name: ERROR: EXTP2141:Line %d:The "Start Method:" statement is not specified: FILE=%s1 SYSTEM=%s2**

**Variable Information**

- %d = Line Number
- %s1 = Filename
- %s2 = System Name

**Explanation**

The "Start Method:" statement is not specified.

**System Action**

Stops the command processing.

**User Action**

Specify the "Start Method:" statement, then re-execute the command.

---

### 6.6.7 EXTP2142

---

**Command name: ERROR: EXTP2142:Line %d:The process concurrency for instance management function is invalid: FILE=%s1 SYSTEM=%s2**

**Variable Information**

- %d = Line Number
- %s1 = Filename
- %s2 = System Name

**Explanation**

An error in process multilevel concurrency occurred in the instance control function.

**System Action**

Stops the command processing.

## User Action

Correct the process multilevel concurrency in the instance control function, then re-execute the command.

### 6.6.8 EXTP2143

---

**Command name: ERROR: EXTP2143:Line %d:The language of nonresident application is invalid: FILE=%s1 SYSTEM=%s2**

#### Variable Information

%d = Line No.

%s1 = Filename

%s2 = System name

#### Explanation

This language type cannot be specified for a nonresident application.

#### System Action

Stops the command processing.

#### User Action

Specify the nonresident application language type as C or COBOL, then re-execute the command.

### 6.6.9 EXTP2144

---

**Command name: ERROR: EXTP2144:Line %d:"Executable File for Exit Program:" is not specified in the [Nonresident Application Process] section: FILE=%s1 SYSTEM=%s2**

#### Variable Information

%d = Line No.

%s1 = Filename

%s2 = System name

#### Explanation

The "Executable File for Exit Program:" statement is not specified in the [Nonresident Application Process] section.

#### System Action

Stops the command processing.

#### User Action

Specify "Executable File for Exit Program:" statement in the [Nonresident Application Process] section, the re-execute the command.

### 6.6.10 EXTP2145

---

**Command name: ERROR: EXTP2145:Line %d:The "Concurrency:" statement is not specified: FILE=%s1 SYSTEM=%s2**

#### Variable Information

%d = Line No.

%s1 = Filename

%s2 = System name

### Explanation

The "Concurrency:" statement is not specified.

### System Action

Stops the command processing.

### User Action

Specify the "Concurrency:" statement, then re-execute the command.

## 6.6.11 EXTP2146

---

**Command Name:** ERROR: EXTP2146:Line %d:"Session ID Param:" statement is not defined: FILE=%s1 SYSTEM=%s2

### Variable Information

%d = Line Number

%s1 = File Name

%s2 = System Name

### Explanation

"Session ID Param:" statement not defined.

### System Action

Stops the command processing.

### User Action

Define the "Session ID Param:" statement, and execute the command again.

## 6.6.12 EXTP2147

---

**Command Name:** ERROR: EXTP2147: The Line %d: "Access Control Base DN:" statement is not defined: FILE=%s1 SYSTEM=%s2

### Variable Information

%d = Line Number

%s1 = File Name

%s2 = System Name

### Explanation

The "Access Control Base DN:" statement not defined.

### System Action

Stops the command processing.

### User Action

Define the "Access Control Base DN:" statement, and execute the command again.

## 6.6.13 EXTP2148

---

**Command Name:** ERROR: EXTP2148: The Line %d: "User DN Param:" statement is not defined: FILE=%s1 SYSTEM=%s2

### Variable Information

%d = Line Number

%s1 = File Name

%s2 = System Name

### Explanation

The "User DN Param:" statement not defined.

### System Action

Stops the command processing.

### User Action

Define the "User DN Param:" statement, and execute the command again.

## 6.6.14 EXTP2149

---

**Command Name:** ERROR: EXTP2149: The Line %d: "Password Param:" statement is not defined: FILE=%s1 SYSTEM=%s2

### Variable Information

%d = Line Number

%s1 = File Name

%s2 = System Name

### Explanation

The "Password Param:" statement not defined.

### System Action

Stops the command processing.

### User Action

Define the "Password Param:" statement, and execute the command again.

## 6.6.15 EXTP2150

---

**Command Name:** ERROR: EXTP2150: Line %d: The bind type for the application language is invalid: FILE=%s1 SYSTEM=%s2

### Variable Information

%d = Line Number

%s1 = File Name

%s2 = System Name

### Explanation

There is an error in the "Bind Type:" statement.

### System Action

Stops the command processing.

### User Action

Correct the "Bind Type:" statement and execute the command again.

## 6.6.16 EXTP2151

---

**Command name: ERROR: EXTP2151: No work unit definition exists: SYSTEM=%s**

### Variable Information

%s = System Name

### Explanation

No WorkUnit definition exists.

## 6.6.17 EXTP2152

---

**Command name: ERROR: EXTP2152: Line %d: The bind type of nonresident application is invalid: FILE=%s1 SYSTEM=%s2**

### Variable Information

%d = Line Number

%s1 = File Name

%s2 = System Name

### Explanation

The bind type of the nonresident application is invalid.

### System Action

Stops the command processing.

### User Action

Change the bind type of the nonresident application and re-execute the command.

## 6.6.18 EXTP2153

---

**Command name: ERROR: EXTP2153: [Multiresident Application Process] section is not specified: FILE=%s1 SYSTEM=%s2**

### Variable Information

%s1 = File Name

%s2 = System Name

### Explanation

The [Multiresident Application Process] section is not specified.

### System Action

Stops the command processing.

### User Action

Specify the [Multiresident Application Process] section and re-execute the command.

## 6.6.19 EXTP2154

---

**Command name: ERROR: EXTP2154: Line %d: The execution file name for the application and the execution file name of the exit program for the multiresident application are duplicated: FILE=%s1 SYSTEM=%s2**

### Variable Information

%d = Line Number

%s1 = File Name

%s2 = System Name

### Explanation

The executable file name for the application and the executable file name of the exit program for the multiresident application are duplicated.

### System Action

Stops the command processing.

### User Action

Change either the executable file name for the application or the executable file name of the exit program for the multiresident application, and re-execute the command.

## 6.6.20 EXTP2155

---

**Command name: ERROR: EXTP2155: Line %d: The language of multiresident application is invalid: FILE=%s1 SYSTEM=%s2**

### Variable Information

%d = Line Number

%s1 = File Name

%s2 = System Name

### Explanation

The language of the multiresident application is invalid.

### System Action

Stops the command processing.

### User Action

Change the language of the multiresident application and re-execute the command.

## 6.6.21 EXTP2156

---

**Command name: ERROR: EXTP2156: Line %d: The languages for multiresident application disagree: FILE=%s1 SYSTEM=%s2**

### Variable Information

%d = Line Number

%s1 = File Name

%s2 = System Name

### Explanation

The languages specified for the multi-resident application do not match.

### System Action

Stops the command processing.

## User Action

Specify the same language for the multi-resident application and re-execute the command.

## 6.6.22 EXTP2157

---

**Command name: ERROR: EXTP2157: Line %d: "Executable File for Exit Program:" is not specified in the [Multiresident Application Process] section: FILE=%s1 SYSTEM=%s2**

### Variable Information

%d = Line Number

%s1 = File Name

%s2 = System Name

### Explanation

The "Executable File for Exit Program:" statement is not specified in the [Multiresident Application Process] section.

### System Action

Stops the command processing.

### User Action

Specify the "Executable File for Exit Program:" statement in the [Multiresident Application Process] section and re-execute the command.

## 6.6.23 EXTP2158

---

**Command name: ERROR: EXTP2158: Line %d: The "User Name Param:" statement is not specified: FILE=%s1 SYSTEM=%s2**

### Variable Information

%d = Line Number

%s1 = File Name

%s2 = System Name

### Explanation

The "User Name Param:" statement is not specified.

### System Action

Stops the command processing.

### User Action

Specify the "User Name Param:" statement and re-execute the command.

## 6.6.24 EXTP2159

---

**Command name: ERROR: EXTP2159: Line %d: The "User Base DN:" statement is not specified: FILE=%s1 SYSTEM=%s2**

### Variable Information

%d = Line Number

%s1 = File Name

%s2 = System Name

#### Explanation

The "User Base DN:" statement is not specified.

#### System Action

Stops the command processing.

#### User Action

Specify the "User Base DN:" statement and re-execute the command.

### 6.6.25 EXTP2160

---

**Command name: ERROR: EXTP2160: Line %d: The "Destination Priority:" statement cannot be specified for the installed edition: FILE=%s1 SYSTEM=%s2**

#### Variable Information

%d = Line Number

%s1 = File Name

%s2 = System Name

#### Explanation

The "Destination Priority:" statement cannot be specified for the installed Interstage edition.

#### System Action

Stops the command processing.

#### User Action

Delete the "Destination Priority:" statement and re-execute the command.

### 6.6.26 EXTP2161

---

**Command name: ERROR: EXTP2161: Line %d: Both nonresident application and multiresident application types are specified: FILE=%s1 SYSTEM=%s2**

#### Variable Information

%d = Line Number

%s1 = File Name

%s2 = System Name

#### Explanation

Both nonresident application and multiresident application types are specified.

#### System Action

Stops the command processing.

#### User Action

Specify either the nonresident application or multiresident application type and re-execute the command.

### 6.6.27 EXTP2162

---

**Command name: ERROR: EXTP2162: Line %d: The value of the "Queuing Message To Notify Alarm:" statement exceeds the value of the "Maximum Queuing Message:" statement : FILE=%s1 SYSTEM=%s2**

### Variable Information

%d = Line Number

%s1 = File Name

%s2 = System Name

### Explanation

The value of the "Queuing Message To Notify Alarm:" statement exceeds the value of the "Maximum Queuing Message:" statement.

### System Action

Stops the command processing.

### User Action

Adjust the value of the "Queuing Message To Notify Alarm:" statement to less than the value of the "Maximum Queuing Message:" statement and re-execute the command.

## 6.6.28 EXTP2163

---

**Command name: ERROR: EXTP2163: Line %d: The value of the "Queuing Message To Notify Resumption:" statement is greater than or equal to the value of the "Queuing Message To Notify Alarm:" statement: FILE=%s1 SYSTEM=%s2**

### Variable Information

%d = Line Number

%s1 = File Name

%s2 = System Name

### Explanation

The value of the "Queuing Message To Notify Resumption:" statement is greater than or equal to the value of the "Queuing Message To Notify Alarm:" statement.

### System Action

Stops the command processing.

### User Action

Adjust the value of the "Queuing Message To Notify Resumption: " statement to less than the value of the "Queuing Message To Notify Alarm:" statement and re-execute the command.

## 6.6.29 EXTP2164

---

**Command name: ERROR: EXTP2164: The specified work unit definition cannot be deleted: WU=%s1 SYSTEM=%s2**

### Variable Information

%s1 = WorkUnit Name

%s2 = System Name

### Explanation

The specified WorkUnit definition cannot be deleted by the *tddeldef* command.

### System Action

Stops the command processing.

## User Action

Use the *isdelwundef* command to delete the specified WorkUnit definition.

This message may be output after the deletion (using the *isdelwundef* command) of a definition of an active WorkUnit if an IJServer with the same name is created on the Interstage Management Console.

If so, terminate the active WorkUnit with that name, then restart the Interstage JMX service.

### Note

If IJServer is started when the above services are restarted, it will not be possible to execute monitor reference or use the HotDeploy function for that IJServer. Restart the IJServer at the same time as the above operation.

## 6.6.30 EXTP2165

---

**Command name: ERROR: EXTP2165: Line %d: The execution file name for the application and the execution file name of the exit program for the nonresident application are duplicated: FILE=%s1 SYSTEM=%s2**

### Variable Information

%d = Line Number

%s1 = File Name

%s2 = System Name

### Explanation

The executable file name for the application and the executable file name of the exit program for the nonresident application are duplicated.

### System Action

Stops the command processing.

### User Action

Change either the executable file name for the application or the executable file name of the exit program for the nonresident application and re-execute the command.

## 6.6.31 EXTP2166

---

**Command name: ERROR: EXTP2166: Line %d: The "Queuing Message To Notify Alarm:" statement cannot be specified for the installed edition: FILE=%s1 SYSTEM=%s2**

### Variable Information

%d = Line Number

%s1 = File Name

%s2 = System Name

### Explanation

The "Queuing Message To Notify Alarm:" statement cannot be specified for the installed Interstage edition.

### System Action

Stops the command processing.

### User Action

Delete the "Queuing Message To Notify Alarm:" statement and re-execute the command.

## 6.6.32 EXTP2167

---

**Command name: ERROR: EXTP2167: Line %d: The "Queuing Message To Notify Resumption:" statement cannot be specified for the installed edition: FILE=%s1 SYSTEM=%s2**

### Variable Information

%d = Line Number

%s1 = File Name

%s2 = System Name

### Explanation

The "Queuing Message To Notify Resumption:" statement cannot be specified for the installed Interstage edition.

### System Action

Stops the command processing.

### User Action

Delete the "Queuing Message To Notify Resumption:" statement and re-execute the command.

## 6.6.33 EXTP2168

---

**Command name: ERROR: EXTP2168: A condition exists that the command cannot be used**

### Explanation

The command cannot be used under the current conditions.

### System Action

Stops the command processing.

### User Action

Install a package that supports the function to be used and re-execute the command.

## 6.6.34 EXTP2169

---

**Command name: ERROR: EXTP2169: Line %d: "Executable File of Exit Program for Salvage:" is not specified in the [Control Option] section: FILE=%s1 SYSTEM=%s2**

### Variable Information

%d = Line Number

%s1 = File Name

%s2 = System Name

### Explanation

The statement "Executable File of Exit Program for Salvage:" is not specified in the [Control Option] section.

### System Action

Stops the command processing.

### User Action

Specify the statement "Executable File of Exit Program for Salvage:" in the [Control Option] section and re-execute the command.

## 6.6.35 EXTP2170

---

---

**Command name: ERROR: EXTP2170: Line %d: The execution file name of exit program for salvage is duplicated: FILE=%s1 SYSTEM=%s2**

**Variable Information**

- %d = Line Number
- %s1 = File Name
- %s2 = System Name

**Explanation**

The executable file name of the exit program for salvage is duplicated.

**System Action**

Stops the command processing.

**User Action**

Change the file name and re-execute the command.

---

### 6.6.36 EXTP2171

---

**Command name: ERROR: EXTP2171: Line %d: The "Pre Exit Program for Standby:" statement cannot be specified for the installed edition: FILE=%s1 SYSTEM=%s2**

**Variable Information**

- %d = Line Number
- %s1 = File Name
- %s2 = System Name

**Explanation**

The statement "Pre-exit Program for Standby:" cannot be specified for the installed Interstage edition.

**System Action**

Stops the command processing.

**User Action**

Delete the statement "Pre-exit Program for Standby:" and re-execute the command.

---

### 6.6.37 EXTP2173

---

**Command name: WARNING: EXTP2173: The work unit definition is not restored: WU=%s1 CODE=%s2 SYSTEM=%s3**

**Variable Information**

- %s1 = WorkUnit Name
- %s2 = Error Information
- %s3 = System Name

**Explanation**

WorkUnit definition shown in WU is not restored due to a cause outlined in the error information.

**System Action**

Continues the processing without restoring the WorkUnit definition of the WorkUnit shown in WU.

## User Action

Error information is displayed in the format "DEF nnn nnn XXX". The meaning of a code in XXX and the corresponding action to take are shown below.

Table 6.1 EXTP2173 Code Meaning

Code	Meaning	Action
2	The WorkUnit definition that defines the [Resource Manager] section among those backed up via Interstage V3.1, cannot be restored.	Correct the [Resource Manager] section of the WorkUnit definition file, then use the <i>isaddwundef</i> command to register the WorkUnit definition.  For a description of the [Resource Manager] section, refer to the OLTP Server User's Guide.
3	The following definitions are valid for the Enterprise Edition only. <ul style="list-style-type: none"><li>- Object priority</li><li>- Monitoring queuing count</li><li>- Monitoring restart queuing count</li><li>- Exit program name before prior activation</li></ul>	Delete definition items on the left as required from the WorkUnit definition file and use the <i>isaddwundef</i> command to register the WorkUnit definition.

## 6.6.38 EXTP2176

---

**Command name: ERROR: EXTP2176: Line %d: The "Name:" statement is not specified in the [Resource Manager] section: FILE=%s1 SYSTEM=%s2**

### Variable Information

%d = Line number

%s1 = File name

%s2 = System name

### Explanation

"Name:" statement is not specified in the [Resource Manager] section.

### System Action

Stops command processing.

### User Action

Specify "Name:" statement in the [Resource Manger] section, and execute the command again.

## 6.6.39 EXTP2177

---

**Command name: ERROR: EXTP2177: Line %d: The resource definition name of the resource manager information are duplicated: FILE=%s1 SYSTEM=%s2**

### Variable Information

%d = Line number

%s1 = File name

%s2 = System name

### Explanation

Resource definition name of the resource manager information is duplicated.

### System Action

Terminates command processing.

### User Action

Correct the duplicated resource definition name of the resource manager information and execute the command again.

## 6.6.40 EXTP2179

---

**extp: ERROR: EXTP2179: A system resource shortage occurred: CODE=%s1 SYSTEM=%s2**

### Variable Information

%s1 = Error information

%s2 = System name

### Explanation

A system resource shortage occurred.

### System Action

Terminates command processing.

### User Action

Wait for a while, then retry processing. If this message appears frequently, collect error information using the *iscollectinfo* command, and contact a service engineer.

## 6.6.41 EXTP2180

---

**Command name: ERROR: EXTP2180: Line %d: The "Impl ID:" statement is not specified in the [Application Program] section: FILE=%s1 SYSTEM=%s2**

### Variable Information

%d= Line number

%s1 = File name

%s2 = System name

### Explanation

The "Impl ID:" statement is not specified in the [Application Program] section.

### System Action

Terminates command processing.

### User Action

Specify "Impl ID:" statement to [Application Program] section, and try the command again.

## 6.6.42 EXTP2181

---

**Command name: EXTP2181: Line %d: The Implementation Repository ID is duplicated: FILE=%s1 SYSTEM=%s2**

### Variable Information

%d = Line number

%s1 = File name

%s2 = System name

#### Explanation

The Implementation Repository ID is duplicated.

#### System Action

Terminates command processing.

#### User Action

Modify the duplicate Implementation Repository ID, and try the command again.

### 6.6.43 EXTP2182

---

**extp: ERROR: EXTP2182: Line %d: The "Buffer Number:" statement is not specified in the [Application Program] section: FILE=%s1 SYSTEM=%s2**

#### Variable Information

%d = Line number

%s1 = File name

%s2 = System name

#### Explanation

The "Buffer Number:" statement is not specified in the [Application Program] section.

#### System Action

Terminates command processing.

#### User Action

Specify the "Buffer Number:" statement in the [Application Program] section, and try the command again.

### 6.6.44 EXTP2183

---

**extp: ERROR: EXTP2183: Line %d: The "Buffer Size:" statement is not specified in the [Application Program] section: CODE=%s1 SYSTEM=%s2**

#### Variable Information

%d = Line number

%s1 = Error information

%s2 = System name

#### Explanation

The "Buffer Size:" statement is not specified in the [Application Program] section.

#### System Action

Terminates command processing.

#### User Action

Specify the "Buffer Size:" statement in the [Application Program] section, and try the command again.

### 6.6.45 EXTP2187

---

**extp: INFO: EXTP2187: The work unit definition has been registered: WU=%s1 SYSTEM=%s2**

#### Variable Information

%s1 = WorkUnit name

%s2 = System name

#### Explanation

The WorkUnit definition has been registered.

### 6.6.46 EXTP2188

---

**extp: INFO: EXTP2188: The work unit definition has been deleted: WU=%s1 SYSTEM=%s2**

#### Variable Information

%s1 = WorkUnit name

%s2 = System name

#### Explanation

The WorkUnit definition has been deleted.

### 6.6.47 EXTP2190

---

**Command name: ERROR: EXTP2190: The definition cannot register in the superscription because the work unit type is different: WU=%s1 SYSTEM=%s2**

#### Variable Information

%s1 = WorkUnit name

%s2 = System name

#### Explanation

The definition cannot register in the superscription because the WorkUnit type is different.

#### System Action

Terminates command processing.

#### User Action

If the WorkUnit type specified in the "Kind" statement is wrong, modify the type and try the command again or change the WorkUnit name and try the command again.

### 6.6.48 EXTP2191

---

**Command name: ERROR: EXTP2191: The work unit kind is invalid: WU=%s1 SYSTEM=%s2**

#### Variable Information

%s1 = WorkUnit name

%s2 = System name

#### Explanation

The WorkUnit kind is invalid.

#### System Action

Terminates command processing.

## User Action

If the WorkUnit type specified in the "Kind" statement is wrong, modify the type and try the command again or register the WorkUnit using the Interstage Management Console.

## 6.6.49 EXTP2192

---

**extp: ERROR: EXTP2192: The mistake is found in input information: ITEM=%s**

### Variable Information

%s = WorkUnit setting item

### Explanation

An error has been found in the input information of the WorkUnit setting item.

### System Action

Terminates command processing.

### User Action

Modify the value specified in the WorkUnit setting item, Re-execute the process. Refer to the Interstage Management Console help.

## 6.6.50 EXTP2193

---

**extp: INFO: EXTP2193: The work unit definition has been updated: WU=%s1 SYSTEM=%s2**

### Variable Information

%s1 = WorkUnit name

%s2 = System name

### Explanation

The WorkUnit definition has been updated.

### System Action

Terminates command processing.

## 6.6.51 EXTP2194

---

**extp: ERROR: EXTP2194: The specified execution file does not exist: %s1=%s2**

### Variable Information

%s1 = WorkUnit setting item

%s2 = Execution file name

### Explanation

The execution file specified in the variable does not exist.

### System Action

Stops the processing.

### User Action

Deploy the execution file specified in the variable.

## 6.6.52 EXTP2195

---

---

**extp: ERROR: EXTP2195: The package is not installed: PACKAGE=%s**

Variable Information

%s = Package name

Explanation

The package specified in the variable does not exist.

System Action

Stops the processing.

User Action

Install the package specified in the variable.

---

### 6.6.53 EXTP2196

**extp: ERROR: EXTP2196 Interstage is not started: SYSTEM=%s**

Variable Information

%s = System name

Explanation

Interstage has not been started. Interstage must be started before this operation is performed.

System Action

Stops the processing.

User Action

Start up Interstage.

---

### 6.6.54 EXTP2197

**extp: ERROR: EXTP2197: The maximum number of the application which can deploy was exceeded: WU=%s1 SYSTEM=%s2**

Variable Information

%s1 = WorkUnit name

%s2 = System name

Explanation

The maximum number of applications that can be deployed to a single WorkUnit (256) has been exceeded.

System Action

Stops the processing.

User Action

Deploy the application to another WorkUnit.

---

### 6.6.55 EXTP2198

**extp: ERROR: EXTP2198: It may have been updated by other users. Please acquire the newest information: WU=%s1 SYSTEM=%s2**

## Variable Information

%s1 = WorkUnit name

%s2 = System name

## Explanation

The stored information may have been updated by another user, and may not be up to date. You need to get the latest information.

## System Action

Stops the processing.

## User Action

Open another window, and then re-open this window. This will update the information.

## 6.6.56 EXTP2199

---

**extp: ERROR: EXTP2199: Application information does not exist: WU=%s1 SYSTEM=%s2**

## Variable Information

%s1 = WorkUnit name

%s2 = System name

## Explanation

Information required to run the application has been deleted.

## System Action

Stops the processing.

## User Action

Re-execute application deployment.

## 6.7 EXTP2200 to EXTP2299

---

This section details the messages with message numbers between EXTP2200 and EXTP2299.

### 6.7.1 EXTP2200

---

**extp: ERROR: EXTP2200: The work unit is in a running state: WU=%s1 SYSTEM=%s2**

## Variable Information

%s1 = WorkUnit name

%s2 = System name

## Explanation

This process cannot be executed while the WorkUnit is running.

## System Action

Stops the processing.

## User Action

Stop the WorkUnit, and execute the process again.

## 6.7.2 EXTP2201

---

**extp: ERROR: EXTP2201 The work unit is in a stopped state: WU=%s1 SYSTEM=%s2**

### Variable Information

%s1 = WorkUnit name

%s2 = System name

### Explanation

The WorkUnit is stopped.

### System Action

Stops the processing.

### User Action

Start the WorkUnit, and execute the processing again.

## 6.7.3 EXTP2202

---

**extp: ERROR: EXTP2202: The target application is already developed by other work units: ImplementationRepositoryID=%s1 WU=%s2 SYSTEM=%s3**

### Variable Information

%s1 = ImplementationRepositoryID

%s2 = WorkUnit name

%s3 = System name

### Explanation

The implementation repository ID of the specified application has already been used for a WorkUnit other than the WorkUnit to be deployed.

Alternately, deployment was attempted when the target implementation repository ID had been registered in the CORBA service.

### System Action

Stops the processing.

### User Action

Change the implementation repository ID, or delete the implementation repository ID that has been registered previously.

To delete the deployed implementation repository ID using the Interstage management console, remove the application.

In addition to the Interstage management console, the `islistwundef` command and `isinfwundef` command can be used to check whether the implementation repository ID has already been deployed in the WorkUnit. Refer to the displayed result of the `isinfwundef` command, and check if the target implementation repository ID exists in 'Impl ID' in the [Application Program] section of another WorkUnit definition. Stop the WorkUnit, or remove the application if necessary.

If the target implementation repository ID does not exist in the WorkUnit definition, an application that does not perform WorkUnit operation may have been registered in the CORBA service. Enter the `OD_impl_inst` command 'OD\_impl\_inst -p -r target-implementation-repository-ID'. If the implementation information is displayed, the target implementation repository ID has been registered in the CORBA service. Stop or unregister the application if necessary.

## 6.7.4 EXTP2203

---

**extp: ERROR: EXTP2203: Line %d: Number of characters that may be specified has been exceeded: FILE=%s1 SYSTEM=%s2**

### Variable Information

%d = Line number

%s1 = File name

%s2 = System name

### Explanation

The character sequence described to the WorkUnit definition is 10238 bytes over the maximum number of bytes that can be used.

### System Action

Stops the processing.

### User Action

Please correct the character sequence and re-execute the command.

## 6.7.5 EXTP2204

---

**extp: ERROR: EXTP2204: "%d"-th line: The "Path:" statement is not specified in the [Application Program] section or the [Control Option] section: FILE=%s1 SYSTEM=%s2**

### Variable Information

%d = Line number

%s1 = File name

%s2 = System name

### Explanation

The "Path:" statement is not specified in the [Application Program] section or the [Control Option] section.

### System Action

Stops the command processing.

### User Action

Specify the "Path" statement in the [Application Program] section or the [Control Option] section, and re-execute the command.

## 6.7.6 EXTP2205

---

**extp: ERROR: EXTP2205: This operation cannot be executed on the managed server: WU=%s1 SYSTEM=%s2**

### Variable Information

%s1 = WorkUnit name

%s2 = System name

### Explanation

The following operation cannot be executed on the managed server:

Registration of a CORBA WorkUnit definition.

Deletion of a CORBA WorkUnit definition.

### System Action

Stops the processing.

## User Action

Please log in to the management server using the Interstage Management Console, and perform the same operation on this server.

### 6.7.7 EXTP2206

---

**extp: ERROR: EXTP2206: The user does not have the authority to operate the wort: USER=%s1 SYSTEM=%s2**

#### Variable Information

%s1 = User name

%s2 = System name

#### Explanation

When secure mode is active, WorkUnit operations can only be executed by user members of the group nominated for secure mode operation or super users.

#### System Action

Terminates the processing.

#### User Action

Have a specific user or a super user execute the processing again.

### 6.7.8 EXTP2207

---

**extp: WARNING: EXTP2207: Linkage with 1% failed: CODE=%s2 SYSTEM=%s3**

#### Variable Information

%s1 = Linkage function name

%s2 = Error information

%s3 = System name

#### Explanation

Linkage with the function shown in 1% failed.

#### System Action

Continues processing.

#### User Action

If the function shown in the linkage function name is not used, ignore this message.

If the function shown in the linkage function name is used, take action according to the error information.

Error information: "TRD 1 4"

Possible causes are as follows:

- The system was not restarted after Interstage was installed
- Files disappeared following disk trouble
- A load measuring agent that supports the Interstage Application Server linkage function has not been installed.

Take the following action:

- Restart the system and re-execute processing
- Change the disk, and then restore the system by reinstalling it

- To use the IPCOM Interstage Application Server linkage function, install a load measuring agent that supports the Interstage Application Server linkage function.

Error information: "TRD 1 12"

Possible causes are as follows:

- There was insufficient memory
- There was insufficient disk space
- There was an error in the OS tuning parameter such as insufficient file descriptor
- Take the following action:
- Increase the memory
- Secure disk space
- Change the OS tuning parameter settings

Error information: "TRD 1 14"

Possible causes are as follows:

- The load measuring agent is not running.
- The number of load measuring agents that can be processed at the same time (32) when a WorkUnit is registered or deleted was exceeded.

Take the following action:

- If the load measuring agent is not running, then start it. For details on how to start the load measuring agent, refer to one of the IPCOM manuals.
- If a WorkUnit is registered or deleted, then this message can be ignored, because registration or deletion of the WorkUnit in the load measuring agent is performed normally. If this occurs frequently, set a maximum of 32 for the number of WorkUnits that are registered or deleted at the same time.

If the above error information does not apply, use the *iscollectinfo* command to collect investigation information. Send this information to a Systems Engineer.

## 6.7.9 EXTP2208

---

**extp: ERROR: EXTP2208: Work unit unable to process: INFO=%s1 SYSTEM=%s2**

### Variable Information

%s1 = Detailed information

%s2 = System name

### Explanation

An error occurred in the processing of the WorkUnit for the reason indicted by the detailed information.

### System Action

Stops processing.

### User Action

Take action according to the detailed information and then re-execute processing. If another message is also output at the same time, take action according to that message. If no other messages are output, or the cause of the error cannot be established, use the *iscollectinfo* command to collect diagnostic information. Send the information to a Systems Engineer.

## 6.7.10 EXTP2209

---

---

**extp: ERROR: EXTP2209: An activated change for a WorkUnit of the same name is being processed: WU=%s1 SYSTEM=%s2**

Variable Information

%s1 = WorkUnit name

%s2 = System name

Explanation

The WorkUnit is undergoing activation change.

System Action

Stops WorkUnit processing.

User Action

Check the WorkUnit status. If the specified WorkUnit name is incorrect, correct it and re-execute processing.

---

## 6.7.11 EXTP2210

---

**extp: ERROR: EXTP2210: The WorkUnit configuration cannot be registered: WU=%s1 SYSTEM=%s2**

Variable Information

%s1 = WorkUnit name

%s2 = System name

Explanation

The WorkUnit cannot be registered in its current configuration.

System Action

Stops WorkUnit processing.

User Action

**Windows32/64**

Take action based on the Event Log message output immediately before this message, or based on the standard error message. If no message was output, use the *iscollectinfo* command to collect investigation information. Send the error information to a Systems Engineer.

**Solaris32/64 Linux32/64**

Take action based on the Console message output immediately before this message, or based on the standard error message. If no message was output, use the *iscollectinfo* command to collect investigation information. Send the error information to a Systems Engineer.

Other possibilities are shown below:

1. A configuration option that cannot be changed was changed.  
Refer to 'WorkUnit Configurations that can be Changed during Activation Change' in Appendix F of the 'OLTP Server User's Guide'. If the WorkUnit configuration is incorrect, correct it and then re-execute processing.
2. The WorkUnit configuration has been deleted.  
If this is the case, register the WorkUnit configuration that is currently running, and then re-execute processing.

---

## 6.7.12 EXTP2211

---

**extp: ERROR: EXTP2211: The specified WorkUnit is not in the process of activated change: WU=%s1 SYSTEM=%s2**

### Variable Information

%s1 = WorkUnit name

%s2 = System name

### Explanation

The WorkUnit configuration could not be displayed.

### System Action

Stops processing of the command.

### User Action

Check the WorkUnit activation change status using the *ischeckwustat* command. The command cannot be used during activation change.

It is also possible that the WorkUnit configuration does not exist.

## 6.7.13 EXTP2212

---

**Command name: INFO: EXTP2212: The registration of the activated change WorkUnit configuration is complete: SYSTEM=%s**

### Variable Information

%s = System name

### Explanation

Registration of the configuration for the WorkUnit that underwent activation change is complete.

## 6.7.14 EXTP2213

---

**Command name: ERROR: EXTP2213 Failed to register the activated change WorkUnit configuration: SYSTEM=%s**

### Variable Information

%s = System name

### Explanation

The configuration could not be registered.

### System Action

Stops processing of the command.

### User Action

**Windows32/64**

Investigate the cause using the message that was output immediately before this one or the Event Log message, and then execute the command again.

**Solaris32/64 Linux32/64**

Investigate the cause using the message that was output immediately before this one or the message output in the Console, and then execute the command again.

## 6.7.15 EXTP2214

---

---

**extp: ERROR: EXTP2214 Because the user name exceeds eight bytes, the Work Unit can not be operated: USER=%s1 SYSTEM=%s2**

**Variable Information**

- %s1= User name
- %s2= System name

**Explanation**

User names larger than eight bytes are not supported for WorkUnit operation.

**System Action**

Stops WorkUnit processing.

**User Action**

Specify a correct user name, and execute the operation again.

---

## 6.7.16 EXTP2250

---

**extp: ERROR: EXTP2250: This function cannot be used: WU=%s1 CODE=%s2 SYSTEM=%s3**

**Variable Information**

- %s1= WorkUnit name
- %s2= Error infomation
- %s3= System name

**Explanation**

This function cannot be used.

**System Action**

Stops processing.

**User Action**

Error information	Action
1	Cannot create IJServer. Check that the function range can be used in this edition of the software.

---

## 6.8 EXTP3500 to EXTP3599

This section details messages numbered between EXTP3500 and EXTP3599.

---

### 6.8.1 EXTP3550

---

**extp: ERROR: EXTP3550:A system error occurred: CODE='%s1' SYSTEM=%s2**

**Variable Information**

- %s1 = Error information
- %s2 = System name

**Explanation**

A system error has occurred, or there is not enough memory.

## System Action

Stops extracting subsequent snapshots.

## User Action

If there is a memory shortage, refer to the Tuning Guide and re-estimate the amount of memory required to run Interstage. Check whether there is enough memory.

If there is enough memory to run Interstage, there may be inadequate memory to run other applications. Re-estimate the amount of memory required for the other applications running on the same machine to determine if there is an appropriate amount of memory.

Contact your system administrator if the re-estimation indicates that the memory is insufficient. Ask the system administrator to either increase the size of the main memory or to increase the size of the page file.

If the cause is other than the above, use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer.

## 6.8.2 EXTP3551

---

**extp: ERROR: EXTP3551:A system error occurred: SYMBOL=%s1 CODE=%s2 SYSTEM=%s3**

### Variable Information

%s1 = Symbol name

%s2 = Detailed information

%s3 = System Name

### Explanation

A system error has occurred, or memory may be insufficient.

### System Action

Stops processing the component transaction service.

### User Action

If memory may be insufficient, refer to the Tuning Guide to re-estimate the memory volume required to operate Interstage, then check whether sufficient memory is provided.

If sufficient memory is provided as required by Interstage, memory for other applications may be insufficient. Re-estimate the volume of memory required by other applications running on the same machine, and check whether memory volume is satisfactory.

If memory is proven insufficient as a result of re-estimation, contact your system administrator. The system administrator should expand the main memory or extend the swap area.

Use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer.

## 6.8.3 EXTP3552

---

**extp: ERROR: EXTP3552:A memory shortage occurred: CODE='%s1' SYSTEM=%s2**

### Variable Information

%s1 = Error information

%s2 = System name

### Explanation

Insufficient memory

### System Action

Either stops the processing, or stops the snapshot extraction process.

## User Action

Execute the process again later. If this message is generated frequently, refer to the Tuning Guide, re-estimate the memory that is needed to run Interstage, and confirm that there is enough memory.

If there is enough memory to run Interstage, there may be inadequate memory to run other applications. Re-estimate the amount of memory needed for the other applications running on the same machine to determine if there is an appropriate amount of memory.

Contact your system administrator if the re-estimation indicates that the memory is insufficient. Ask the system administrator to either increase the size of the main memory or to increase the size of the page file.

---

## 6.8.4 EXTP3553

---

### **extp: ERROR: EXTP3553:Shared memory size is inappropriate**

#### Explanation

The shared memory size for the snapshot is inappropriate.

#### System Action

Either stops the processing, or stops the snapshot extraction process.

#### User Action

If this message is generated frequently, use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer.

---

## 6.8.5 EXTP3554

---

### **extp: ERROR: EXTP3554:Unable to open the snapshot capture file**

#### Explanation

Unable to open the snapshot extraction file.

#### System Action

Stop the snapshot extraction process.

#### User Action

Carry out one of the following actions:

- Add access permissions to the current folder, or the snapshot output path folder specified in the WorkUnit definition, then re-execute the process.
- Correct the WorkUnit definition snapshot output path, then re-execute the process.

---

## 6.8.6 EXTP3555

---

### **extp: ERROR: EXTP3555:The snapshot domain does not exist**

#### Explanation

The snapshot domain does not exist in shared memory.

#### System Action

Stops extracting the shared memory snapshot of the specified WorkUnit.

#### User Action

Delete the unwanted snapshot, then re-execute the process.

## 6.9 EXTP4000 to EXTP4099

---

This section details the messages with message numbers between EXTP4000 and EXTP4099.

### 6.9.1 EXTP4001

---

**extp: ERROR: EXTP4001:A memory shortage occurred: CODE='%s1' SYSTEM=%s2**

#### Variable Information

%s1 = Error information

%s2 = System name

#### Explanation

Insufficient memory.

#### System Action

Stops the processing.

#### User Action

Execute the process again later. If this message is generated frequently, refer to the Tuning Guide, re-estimate the memory that is needed to run Interstage, and confirm that there is enough memory.

If there is enough memory to run Interstage, there may be inadequate memory to run other applications. Re-estimate the amount of memory needed for the other applications running on the same machine to determine if there is an appropriate amount of memory.

Contact your system administrator if the re-estimation indicates that the memory is insufficient. Ask the system administrator to either increase the size of the main memory or to increase the size of the page file.

### 6.9.2 EXTP4002

---

**extp: ERROR: EXTP4002:A system error occurred: CODE='%s1' INFO=%d SYSTEM=%s2**

#### Variable Information

%s1 = Error information 1

%d = Error information 2

%s2 = System name

#### Explanation

**Windows32/64**

A system error has occurred, or there is not enough memory.

**Solaris32/64 Linux32/64**

A system error has occurred. Either there is insufficient memory on the machine, or IPC resource retrieval may have failed because the required IPC resource is in use.

If the following code is output to the variable information, the machine might be shut down while Interstage is operating.

"CODE='ITP 301 53' INFO=11"

#### System Action

Stops the Component Transaction Service.

#### User Action

If there is a memory shortage, refer to the Tuning Guide and re-estimate the amount of memory required to run Interstage. Check whether there is enough memory.

If there is enough memory to run Interstage, there may be inadequate memory to run other applications. Re-estimate the amount of memory required for the other applications running on the same machine to determine if there is an appropriate amount of memory.

**Windows32/64**

Contact your system administrator if the re-estimation indicates that the memory is insufficient. Ask the system administrator to either increase the size of the main memory or to increase the size of the page file.

If there is no memory shortage, contact your software supplier.

**Solaris32/64** **Linux32/64**

Contact your system administrator if the re-estimation indicates that the memory is insufficient. Ask the system administrator to either increase the size of the main memory or to increase the size of the swap region.

If insufficient memory is not the cause, execute the command again. If the message is output again, change the key value of the path name required for IPC resource retrieval, then re-execute the command.

If this message is output in an environment where security is stepped up, refer to the message output before this message, and take an appropriate action.

Contact your software supplier, if these steps do not resolve the problem.

If the machine is shut down while Interstage is operating, this message and possibly the core file might be generated.

Ensure you stop Interstage before shutting down the machine.

### 6.9.3 EXTP4003

---

**extp: ERROR: EXTP4003:A system resource shortage has occurred: CODE='%s1' KIND=%d SYSTEM=%s2**

#### Variable Information

%s1 = Error information

%d = Resource type

%s2 = System name

#### Explanation

Insufficient Component Transaction Service System resources, or there is not enough memory.

#### System Action

Stops the Component Transaction Service.

#### User Action

If there is a memory shortage, refer to the Tuning Guide and re-estimate the amount of memory required to run Interstage. Check whether there is enough memory.

If there is enough memory to run Interstage, there may be inadequate memory to run other applications. Re-estimate the amount of memory required for the other applications running on the same machine to determine if there is an appropriate amount of memory.

Contact your system administrator if the re-estimation indicates that the memory is insufficient. Ask the system administrator to either increase the size of the main memory or to increase the size of the page file.

If there is no memory shortage, contact your software supplier.

### 6.9.4 EXTP4004

---

**extp: ERROR: EXTP4004:A system error occurred: SYMBOL=%s1 CODE='%s2' SYSTEM=%s3**

#### Variable Information

%s1 = Symbol

%s2 = Error information

%s3 = System name

#### Explanation

A system error has occurred.

#### System Action

Stops the Component Transaction Service.

#### User Action

Contact your software supplier.

### 6.9.5 EXTP4005

---

**extp: ERROR: EXTP4005:A system resource shortage has occurred: CODE='%s1' SYSTEM=%s2**

#### Variable Information

%s1 = Error information 1

%s2 = System name

#### Explanation

The operating system resources have become insufficient.

#### System Action

Stops the processing.

#### User Action

Change the system parameter values according to the Tuning Guide and reboot the system. Then, re-execute the processing.

### 6.9.6 EXTP4021

---

**extp: ERROR: EXTP4021:Description of the plugin file contains an error: PLUGIN=%s1 SYSTEM=%s2**

#### Variable Information

%s1 = Plug-in name

%s2 = System name

#### Explanation

An error occurred in the contents of the plug-in file.

#### System Action

Stops the Component Transaction Service.

#### User Action

Contact your software supplier.

### 6.9.7 EXTP4022

---

**extp: ERROR: EXTP4022:Plugin could not be executed: PLUGIN=%s1 SYSTEM=%s2 ERRSTRING='%s3'**

#### Variable Information

%s1 = Plug-in name

%s2 = System name

%s3 = Error information

#### Explanation

An error has occurred in the plug-in process.

#### System Action

Stops the Component Transaction Service

#### User Action

Contact your software supplier.

### 6.9.8 EXTP4023

---

**extp: ERROR: EXTP4023:Attempt to execute plugin failed: PLUGIN=%s1 SYSTEM=%s2**

#### Variable Information

%s1 = Plug-in name

%s2 = System name

#### Explanation

An error occurred in the plug-in exit process.

#### System Action

Stops the Component Transaction Service

#### User Action

Contact your software supplier.

### 6.9.9 EXTP4031

---

**extp: ERROR: EXTP4031:Communication environment definition contains an error: CWB=%s1 SYSTEM=%s2**

#### Variable Information

%s1 = Communication environment name

%s2 = System name

#### Explanation

An error has occurred in the communication environment definition

#### System Action

Stops creating the communication environment.

#### User Action

Contact your software supplier.

### 6.9.10 EXTP4041

---

**extp: WARNING: EXTP4041:A resource recovery failure occurred: SYSTEM=%s**

#### Variable Information

%s = System name

#### Explanation

Resource recovery failed.

#### System Action

Continues the recovery process.

#### User Action

Resource recovery may be incomplete. Contact your software supplier.

## 6.10 EXTP4100 to EXTP4199

---

This section details the messages with message numbers between EXTP4100 and EXTP4199.

### 6.10.1 EXTP4103

---

**extp: ERROR: EXTP4103:System cannot be stopped: SYSTEM=%s**

#### Variable Information

%s = System name

#### Explanation

Executing the WorkUnit, therefore, cannot stop the Component Transaction Service.

#### System Action

Stops the Component Transaction Service terminate process.

#### User Action

Stop the WorkUnit being executed, then re-execute the command.

### 6.10.2 EXTP4153

---

**extp: ERROR: EXTP4153:The communication environment has not been created: CWB=%s1 SYSTEM=%s2**

#### Variable Information

%s1 = Communication environment name

%s2 = System name

#### Explanation

The communication environment was not created.

#### System Action

Stops the communication environment delete process.

#### User Action

Contact your software supplier.

### 6.10.3 EXTP4154

---

**extp: ERROR: EXTP4154:The communication environment has been created: CWB=%s1 SYSTEM=%s2**

#### Variable Information

%s1 = Communication environment name

%s2 = System name

#### Explanation

The communication environment has already been created.

#### System Action

Stops the communication environment create process.

#### User Action

Contact your software supplier.

### 6.10.4 EXTP4155

---

**extp: ERROR: EXTP4155:The communication environment definition has not been created: CWB=%s1 SYSTEM=%s2**

#### Variable Information

%s1 = Communication environment name

%s2 = System name

#### Explanation

The communication environment definition was not created.

#### System Action

Stops the communication environment create process.

#### User Action

Contact your software supplier.

### 6.10.5 EXTP4156

---

**extp: ERROR: EXTP4156:The communication environment cannot be created because the maximum number that can be created has been exceeded: CWB=%s1 SYSTEM=%s2**

#### Variable Information

%s1 = Communication environment name

%s2 = System name

#### Explanation

The maximum number limit has been exceeded - the communication environment cannot be created.

#### System Action

Stops the communication environment create process.

#### User Action

Contact your software supplier.

## 6.11 EXTP4300 to EXTP4399

---

This section details the messages with message numbers between EXTP4300 and EXTP4399.

### 6.11.1 EXTP4300

---

---

**extp: ERROR: EXTP4300:A memory shortage has occurred: WU=%s1 USER=%s2 CODE='%s3' SYSTEM=%s4**

**Variable Information**

- %s1 = WorkUnit name
- %s2 = User name
- %s3 = Error information
- %s4 = System name

**Explanation**

Insufficient memory.

**System Action**

Stops the WorkUnit processing.

**User Action**

Execute the process again later. If this message is generated frequently, refer to the Tuning Guide, re-estimate the memory that is needed to run Interstage, and confirm that there is enough memory.

If there is enough memory to run Interstage, there may be inadequate memory to run other applications. Re-estimate the amount of memory needed for the other applications running on the same machine to determine if there is an appropriate amount of memory.

Contact your system administrator if the re-estimation indicates that the memory is insufficient. Ask the system administrator to either increase the size of the main memory or to increase the size of the page file.

---

### 6.11.2 EXTP4301

---

**extp: ERROR: EXTP4301:A system resources shortage occurred: WU=%s1 USER=%s2 SYSTEM=%s3**

**Variable Information**

- %s1 = WorkUnit name
- %s2 = User name
- %s3 = System name

**Explanation**

Insufficient Component Transaction Service System resources.

**System Action**

Stops the WorkUnit processing.

**User Action**

Wait a short period of time, then re-execute the WorkUnit process. If this message appears frequently, contact your software supplier.

---

### 6.11.3 EXTP4302

---

**extp: ERROR: EXTP4302:Two work units have begun processing under the same name: WU=%s1 USER=%s2 SYSTEM=%s3**

**Variable Information**

- %s1 = WorkUnit name
- %s2 = User name
- %s3 = System name

#### Explanation

Two WorkUnits with the same name have begun processing.

#### System Action

Stops the WorkUnit from starting or stopping.

#### User Action

The WorkUnit name is invalid. Specify the correct WorkUnit name, then restart.

### 6.11.4 EXTP4303

---

**extp: ERROR: EXTP4303:Two work units of the same name are being started: WU=%s1 USER=%s2 SYSTEM=%s3**

#### Variable Information

%s1 = WorkUnit name

%s2 = User name

%s3 = System name

#### Explanation

Two WorkUnits with the same name have begun processing.

#### System Action

Stops the WorkUnit processing.

#### User Action

The WorkUnit name is invalid. Specify the correct WorkUnit name, then re-execute processing.

### 6.11.5 EXTP4304

---

**extp: ERROR: EXTP4304:Two work units of the same name are being stopped: WU=%s1 USER=%s2 SYSTEM=%s3**

#### Variable Information

%s1 = WorkUnit name

%s2 = User name

%s3 = System name

#### Explanation

Executing the stop process of more than one WorkUnit with the same name.

#### System Action

Stops the WorkUnit processing.

#### User Action

The WorkUnit name is invalid. Specify the correct WorkUnit name, then re-execute processing.

### 6.11.6 EXTP4306

---

**extp: ERROR: EXTP4306:A capacity shortage has occurred : WU=%s1 USER=%s2 SYSTEM=%s3**

### Variable Information

%s1 = WorkUnit name

%s2 = User Name

%s3 = System Name

### Explanation

Insufficient space.

### System Action

Stops the WorkUnit processing.

### User Action

The setup folder disk is full. Create free space, then re-execute.

## 6.11.7 EXTP4307

---

**extp: ERROR: EXTP4307:An I/O error occurred: WU=%s1 USER=%s2 DIR=%s3 SYSTEM=%s4**

### Variable Information

%s1 = WorkUnit name

%s2 = User name

%s3 = Folder name

%s4 = System name

### Explanation

An I/O error has occurred. Or a directory having the same name as the WorkUnit exists.

### System Action

Stops the WorkUnit processing.

### User Action

A folder with the same name as the WorkUnit may exist under the folder output in DIR. If it does, delete it, or change the current folder in the WorkUnit definition to a different one.

If there is not a folder having the same name as the WorkUnit, stop the WorkUnit, and restore the disk device containing the folder where the I/O error occurred.

## 6.11.8 EXTP4308

---

**extp: ERROR: EXTP4308:Work unit definition does not exist: WU=%s1 USER=%s2 SYSTEM=%s3**

### Variable Information

%s1 = WorkUnit name

%s2 = User name

%s3 = System name

### Explanation

The WorkUnit definition does not exist.

### System Action

Stops the WorkUnit processing.

## User Action

Create the WorkUnit definition, then restart the WorkUnit.

### 6.11.9 EXTP4309

---

**extp: ERROR: EXTP4309:Work unit definition contains an error: WU=%s1 USER=%s2 SYSTEM=%s3**

#### Variable Information

%s1 = WorkUnit name

%s2 = User name

%s3 = System name

#### Explanation

An error occurred in the contents of the WorkUnit definition.

#### System Action

Stops the WorkUnit processing.

#### User Action

Carry out the actions described in the previous message, and correct the WorkUnit definition.

### 6.11.10 EXTP4310

---

**extp: ERROR: EXTP4310:APM specified in the work unit definition does not exist: WU=%s1 USER=%s2 APM=%s3 SYSTEM=%s4**

#### Variable Information

%s1 = WorkUnit name

%s2 = User name

%s3 = APM name

%s4 = System name

#### Explanation

The APM specified in the WorkUnit definition does not exist.

#### System Action

Stops the WorkUnit processing.

#### User Action

Remove the cause of the error or prepare the APM specified in the WorkUnit definition, then restart the WorkUnit processing.

### 6.11.11 EXTP4312

---

**extp: ERROR: EXTP4312:Process creation failed during automatic startup of the application: WU=%s1 USER=%s2 SYSTEM=%s3**

#### Variable Information

%s1 = WorkUnit name

%s2 = User name

%s3 = System name

## Explanation

The maximum limit for the total number of processes generated per user has been exceeded.

## System Action

Stops the WorkUnit.

## User Action

Wait a short period of time, then re-execute the process. If this message appears frequently, contact your System Administrator. The System Administrator must expand main memory or increase the swap area.

## 6.11.12 EXTP4313

---

**extp: WARNING: EXTP4313:An abnormality occurred while stopping the work unit: WU=%s1 USER=%s2 SYSTEM=%s3**

### Variable Information

%s1 = WorkUnit name

%s2 = User name

%s3 = System name

## Explanation

One of the following occurred during WorkUnit stop processing:

- A timeout occurred in the post exit program
- The post exit program process could not complete
- The asynchronous application linkage execution infrastructure ended abnormally during business processing (including pre and post processing) or termination processing.

## User Action

If an error exists in the post exit program, resolve the error.

If a timeout occurred, then either improve system performance, or increase the timeout value.

If an asynchronous WorkUnit is used, and an error occurs during business processing (including pre and post processing) or termination processing, establish the cause of the error. If a message was output immediately before, take action according to that message.

## 6.11.13 EXTP4314

---

**extp: ERROR: EXTP4314:The work unit under the start exists: WU=%s1 SYSTEM=%s2**

### Variable Information

%s1 = WorkUnit name

%s2 = System name

## Explanation

The WorkUnit is still active.

## System Action

Halts the Component Transaction Service stop process.

## User Action

Stop the WorkUnit, then re-execute the process.

## 6.11.14 EXTP4315

---

**extp: ERROR: EXTP4315:The work unit is stopped: WU=%s1 USER=%s2 SYSTEM=%s3**

### Variable Information

%s1 = WorkUnit name

%s2 = User name

%s3 = System name

### Explanation

The WorkUnit has already stopped.

### System Action

Terminates the WorkUnit.

### User Action

If the WorkUnit name is invalid, specify a valid WorkUnit name, then re-execute processing.

## 6.11.15 EXTP4316

---

**extp: ERROR: EXTP4316:Permission to access the current directory specified by the work unit definition is not granted: WU=%s1 USER=%s2 DIR=%s3 SYSTEM=%s4**

### Variable Information

%s1 = WorkUnit name

%s2 = User name

%s3 = Folder name

%s4 = System name

### Explanation

The user does not have access permission to the current folder specified in the WorkUnit definition.

### System Action

Stops the WorkUnit processing.

### User Action

Add user access permission to the directory specified in the WorkUnit definition. When the right to access is in a current folder, check whether the current folder is accessed by Windows Explorer etc., and when you have accessed, end Windows Explorer etc. Then re-execute WorkUnit processing.

Alternatively, a file with the same name as the WorkUnit name may exist under the current folder specified in the WorkUnit definition. Delete the file with the same name as the WorkUnit name or move the file, then re-execute WorkUnit processing.

## 6.11.16 EXTP4317

---

**extp: ERROR: EXTP4317:Current directory specified by the work unit definition does not exist: WU=%s1 USER=%s2 DIR=%s3 SYSTEM=%s4**

### Variable Information

%s1 = WorkUnit name

%s2 = User name

%s3 = Folder name

%s4 = System name

#### Explanation

The current folder specified in the WorkUnit definition does not exist.

#### System Action

Stops the WorkUnit processing.

#### User Action

Create the current folder specified in the WorkUnit definition, then re-execute the WorkUnit processing.

### 6.11.17 EXTP4318

---

**extp: ERROR: EXTP4318:Process creation failed during automatic startup of the application: WU=%s1 USER=%s2 SYSTEM=%s3**

#### Variable Information

%s1 = WorkUnit name

%s2 = User name

%s3 = System name

#### Explanation

Application auto restart failed due to insufficient memory.

#### System Action

Stops the WorkUnit.

#### User Action

Execute the process again later. If this message is generated frequently, refer to the Tuning Guide, re-estimate the memory that is needed to run Interstage, and confirm that there is enough memory.

If there is enough memory to run Interstage, there may be inadequate memory to run other applications. Re-estimate the amount of memory needed for the other applications running on the same machine to determine if there is an appropriate amount of memory.

Contact your system administrator if the re-estimation indicates that the memory is insufficient. Ask the system administrator to either increase the size of the main memory or to increase the size of the page file.

### 6.11.18 EXTP4319

---

**extp: ERROR: EXTP4319:Process creation failed during startup of the application: WU=%s1 USER=%s2 SYSTEM=%s3**

#### Variable Information

%s1 = WorkUnit name

%s2 = User name

%s3 = System name

#### Explanation

The maximum limit for the total number of processes generated per user has been exceeded.

#### System Action

Stops the WorkUnit.

## User Action

Wait a short period of time, then re-execute the process. If this message appears frequently, contact your System Administrator. The System Administrator must tune the total process number to be generated for each user.

## 6.11.19 EXTP4320

---

**extp: ERROR: EXTP4320:Maximum number of destinations within the communication environment has been exceeded: WU=%s1 USER=%s2 SYSTEM=%s3**

### Variable Information

%s1 = WorkUnit name

%s2 = User name

%s3 = System name

### Explanation

The maximum number of destinations (objects) useable in the Component Transaction Service has been exceeded.

### System Action

Stops the WorkUnit processing.

### User Action

Halt other WorkUnit processing, then restart the WorkUnit.

The number of objects registered in the WorkUnit has exceeded the internal limit of Interstage. Change the system scale and carry out a re-setup of Interstage. Then, re-register the WorkUnit and start it.

The number of objects that can be registered in WorkUnits in each system scale can be calculated with the following expression.

[Conditional expression]

Number of objects that can be registered = Internal limit of the system scale - (Number of WorkUnits + Total number of objects registered)

[Internal limit]

small: 202

moderate: 402

large: 602

super: 1002

## 6.11.20 EXTP4321

---

**extp: ERROR: EXTP4321:Another work unit is already using the specified destination (object): WU=%s1 USER=%s2 DEST=%s3 SYSTEM=%s4**

### Variable Information

%s1 = WorkUnit name

%s2 = User name

%s3 = Destination name (object name)

%s4 = System name

### Explanation

The specified destination (object) is in use in another WorkUnit.

## System Action

Stops the WorkUnit processing.

## User Action

Change the destination name (object name) of the WorkUnit definition, or stop the WorkUnit that is using the destination (object), then re-execute the process.

### 6.11.21 EXTP4323

---

**extp: ERROR: EXTP4323:Two work units of the same are dealing with a start in advance: WU=%s1 USER=%s2 SYSTEM=%s3**

#### Variable Information

%s1 = WorkUnit name

%s2 = User Name

%s3 = System Name

#### Explanation

A WorkUnit with the same name is already running.

#### System Action

Stops the WorkUnit processing.

#### User Action

If WorkUnit name is invalid, specify a valid WorkUnit name, then re-execute the process.

### 6.11.22 EXTP4324

---

**extp: ERROR: EXTP4324:Two work units of the same during the start activated treatment in advance: WU=%s1 USER=%s2 SYSTEM=%s3**

#### Variable Information

%s1 = WorkUnit name

%s2 = User Name

%s3 = System Name

#### Explanation

The WorkUnit of the same name is already active.

#### System Action

Stops the WorkUnit processing.

#### User Action

If the WorkUnit name is invalid, specify a valid WorkUnit name, then re-execute the process.

### 6.11.23 EXTP4325

---

**extp: ERROR: EXTP4325:Two work units of the same are dealing with an activated change: WU=%s1 USER=%s2 SYSTEM=%s3**

#### Variable Information

%s1 = WorkUnit name

%s2 = User Name

%s3 = System Name

#### Explanation

A WorkUnit activation change process with the same name is already running.

#### System Action

Stops the WorkUnit processing.

#### User Action

If the WorkUnit name is invalid, specify a valid WorkUnit name, then re-execute the process.

### 6.11.24 EXTP4326

---

**extp: ERROR: EXTP4326:The revitalization change processing cannot be done because of the wrapper work unit: WU=%s1 SYSTEM=%s2**

#### Variable Information

%s1 = WorkUnit name

%s2 = System Name

#### Explanation

An activation change process cannot be executed for the wrapper WorkUnit.

#### System Action

Stops the activation change process.

#### User Action

If the WorkUnit type is invalid, correct it, then re-execute the activation change process.

### 6.11.25 EXTP4327

---

**extp: ERROR: EXTP4327:The revitalization change processing cannot be done because of the work unit is not a work unit started with the -d option specified: WU=%s1 SYSTEM=%s2**

#### Variable Information

%s1 = WorkUnit name

%s2 = System Name

#### Explanation

Since the specified WorkUnit was started with the -d option, the activation change process cannot be executed.

#### System Action

Stops the activation change process.

#### User Action

If the WorkUnit name is invalid, correct it, then re-execute the activation change process.

### 6.11.26 EXTP4328

---

**extp: ERROR: EXTP4328:An abnormality occurred when starting the execution file: WU=%s1 SYSTEM=%s2**

## Variable Information

%s1 = WorkUnit name

%s2 = System Name

## Explanation

One of the following abnormalities occurred when starting the executable file:

The executable file does not exist in the folder specified in the application library path of the WorkUnit definition.

The library to be used by the application is not linked to the executable file.

The library path to be used by the application is not specified in the application usage library of the WorkUnit definition.

## System Action

Halts APM or WorkUnit startup, or stops the WorkUnit processing.

## User Action

Resolve the problem stated in [Explanation], then re-execute the WorkUnit process.

## 6.11.27 EXTP4329

---

**extp: ERROR: EXTP4329: The revitalization change processing cannot be done because there is a change in the application program type: WU=%s1 SYSTEM=%s2**

## Variable Information

%s1 = WorkUnit name

%s2 = System Name

## Explanation

Since application type has changed, the activation change process cannot be executed.

## System Action

Stops the activation change process.

## User Action

Correct the application type, then restart the activation change.

## 6.11.28 EXTP4330

---

**extp: ERROR: EXTP4330: A abnormality occurred when APM executing: WU=%s1 USER=%S2 ERRORSTRING=%S3' SYSTEM=%s4**

## Variable Information

%s1 = WorkUnit name

%s2 = User name

%s3 = Error Information

%s4 = System name

## Explanation

An error occurred during startup of the executable file because either:

- there is not an executable file in the folder specified in the application library path in the WorkUnit definition
- the library to be used for the application is not linked with the executable file
- the drive to which the executable file is specified is not available, or

- some other reason

#### System Action

Stops the WorkUnit processing.

#### User Action

Rectify as suggested above, then restart WorkUnit processing.

If you can not determine the cause of the error, rectify any OS errors that have occurred.

### 6.11.29 EXTP4331

---

**extp: ERROR: EXTP4331: The revitalization change processing cannot be done because of the work unit for which the bind type is specified: WU=%s1 SYSTEM=%s2**

#### Variable Information

%s1 = WorkUnit Name

%s2 = System Name

#### Explanation

Cannot carry out activation change process performed for the WorkUnit for which the bind format is specified

#### System Action

Stops the activation change processing.

#### User Action

If there is an error in the WorkUnit name, correct the WorkUnit name again and perform the process.

### 6.11.30 EXTP4332

---

**extp: ERROR: EXTP4332: The multiple degree of process change processing cannot be done because of the object for which the bind type is specified: WU=%s1 DEST=%s2 SYSTEM=%s3**

#### Variable Information

%s1 = WorkUnit Name

%s2 = Destination Name (Object Name)

%s3 = System Name

#### Explanation

Cannot dynamically change the number of processes for an object for which bind format is specified.

#### System Action

Stops dynamically changing the process number of processes.

#### User Action

If there is an error in the object name, correct the object name and perform the processing again.

### 6.11.31 EXTP4333

---

**extp: ERROR: EXTP4333: The multiple degree of process change processing cannot be done because of the object for which the bind type is specified: WU=%s1 DEST=%s2 SYSTEM=%s3**

#### Variable Information

%s1 = WorkUnit Name

%s2 = User Name

%s3 = System Name

#### Explanation

A WorkUnit with the same name is currently having its process concurrency changed.

#### System Action

Stops processing on the WorkUnit.

#### User Action

If there is an error in the WorkUnit name, perform the processing again with the correct WorkUnit name.

### 6.11.32 EXTP4334

---

**extp: ERROR: EXTP4334: The multiple degree of process change processing cannot be done because of the wrapper work unit: WU=%s1 SYSTEM=%s2**

#### Variable Information

%s1 = WorkUnit Name

%s2 = System Name

#### Explanation

Cannot change process concurrency for the wrapper WorkUnit.

#### System Action

Stops changing process concurrency.

#### User Action

If there is an error in the WorkUnit type, change the process concurrency again after correcting the WorkUnit type.

### 6.11.33 EXTP4335

---

**extp: ERROR: EXTP4335: The multiple degree of process change processing cannot be done because of the work unit is not a work unit started with the -d option specified: WU=%s1 SYSTEM=%s2**

#### Variable Information

%s1 = WorkUnit Name

%s2 = System Name

#### Explanation

Cannot change process concurrency for the specified WorkUnit because the specified WorkUnit was launched with the -d option specified.

#### System Action

Stops changing process concurrency.

#### User Action

If there is an error in the WorkUnit name, correct the WorkUnit name and change the process concurrency again.

### 6.11.34 EXTP4336

---

**extp: ERROR: EXTP4336: Object does not exist: WU=%s1 DEST=%s2 SYSTEM=%s3**

### Variable Information

%s1 = WorkUnit Name

%s2 = Destination Name (Object Name)

%s3 = System Name

### Explanation

Cannot dynamically change the number of processes because the specified object does not exist.

### System Action

Stops the process concurrency change process.

### User Action

If there is an error in the object name, correct the object name and perform the processing again.

## 6.11.35 EXTP4337

---

**extp: ERROR: EXTP4337: The work unit of the same name is starting beforehand: WU=%s1 USER=%s2 SYSTEM=%s3**

### Variable Information

%s1 = WorkUnit Name

%s2 = User Name

%s3 = System Name

### Explanation

A WorkUnit with the same name is already started.

### System Action

Stops processing on the WorkUnit.

### User Action

If there is an error in the WorkUnit name, perform the processing again with the correct WorkUnit name.

## 6.11.36 EXTP4340

---

**extp: ERROR: EXTP4340: Abnormality occurred when the APM process was terminated: WU=%s1 USER=%s2 SYSTEM=%s3**

### Variable Information

%s1 = WorkUnit Name

%s2 = User Name

%s3 = System Name

### Explanation

The post exit program did not complete because one of the following conditions occurred in the APM process termination processing:

An error occurred in the post exit program

A timeout occurred in the post exit program

### System Action

Stops processing on the WorkUnit.

## User Action

If an error occurred in the post exit program, eliminate the error. If there was a timeout in the post exit program, re-estimate the observation time in view of the system performance on the server.

### 6.11.37 EXTP4341

---

**extp: WARNING: EXTP4341: Failed to delete the current directory or the file under the current directory: DIR=%s1 ERRNO=%d SYSTEM=%s2**

#### Variable Information

%s1 = Folder Name

%d = System Call Error Number

%s2 = System Name

#### Explanation

The current folder or the files under the current folder failed to be deleted.

#### System Action

Continues processing.

#### User Action

Take the action corresponding to the system call error number, then delete the current folder or the files under the current folder. If the current folder or the files under the folder need not be deleted, no action is required.

### 6.11.38 EXTP4342

---

**extp: ERROR: EXTP4342: A abnormality occurred when application executing: WU=%s1 ERRORSTRING='%s2' SYSTEM=%s3**

#### Variable Information

%s1 = WorkUnit Name

%s2 = Error Information

%s3 = System Name

#### Explanation

An error occurred during application startup processing.

#### System Action

Stops WorkUnit processing.

#### User Action

Carry out the actions indicated in the event log message output before this message to remove the cause of the error, then restart the WorkUnit.

### 6.11.39 EXTP4343

---

**extp: ERROR: EXTP4343: The environment variable specified by the work unit definition violates the construction rule: ENV=%s1 WU=%s2 SYSTEM=%s3**

#### Variable Information

%s1 = Environment Variable

%s2 = WorkUnit Name

%s3 = System Name

#### Explanation

The environment variable specified in the WorkUnit definition violates the syntax.

#### System Action

Stops processing.

#### User Action

Specify the correct environment variable in the WorkUnit definition and re-execute processing.

### 6.11.40 EXTP4344

---

**extp: ERROR: EXTP4344: The work unit cannot be started because failed in the opening of the EJB library: WU=%s1 ERRORSTRING='%s2' SYSTEM=%s3**

#### Variable Information

%s1 = WorkUnit Name

%s2 = Error Information

%s3 = System Name

#### Explanation

The WorkUnit cannot be started because the EJB library failed to open.

#### System Action

Stops processing.

#### User Action

Determine whether the EJB has been installed. If it has, carry out the actions indicated by the error information then restart Interstage.

### 6.11.41 EXTP4345

---

**extp: ERROR: EXTP4345: The work unit cannot be started because failed in reading the EJB function: WU=%s1 ERRORSTRING='%s2' SYSTEM=%s3**

#### Variable Information

%s1 = WorkUnit Name

%s2 = Error Information

%s3 = System Name

#### Explanation

The WorkUnit cannot be started because reading of the EJB function failed.

#### System Action

Stops processing.

#### User Action

Determine whether the correct EJB version has been installed. If it has, carry out the actions indicated by the error information then restart Interstage.

### 6.11.42 EXTP4346

---

---

**extp: ERROR: EXTP4346: The work unit cannot be started because failed in the initialization of EJB: WU=%s1 ERRCODE=%d SYSTEM=%s2**

**Variable Information**

- %s1 = WorkUnit Name
- %d = Error Information
- %s2 = System Name

**Explanation**

The WorkUnit cannot be started because EJB initialization failed.

**System Action**

Stops processing.

**User Action**

- Refer to the Tuning Guide, re-estimate the amount of memory required for running Interstage, and check whether there is enough memory.
- If there is enough memory to run Interstage, there may be inadequate memory to run other applications. Re-estimate the amount of memory required for the other applications running on the same machine to determine if there is an appropriate amount of memory.
- Contact your system administrator if the re-estimation indicates that the memory is insufficient. Ask the system administrator to either increase the size of the main memory or to increase the size of the page file.
- If there is no memory shortage, contact your software supplier.

---

### 6.11.43 EXTP4347

---

**extp: ERROR: EXTP4347: The work unit cannot be started because failed in the opening of the ObjectDirector library: WU=%s1 ERRORSTRING='%s2' SYSTEM=%s3**

**Variable Information**

- %s1 = WorkUnit Name
- %s2 = Error Information
- %s3 = System Name

**Explanation**

The WorkUnit cannot be started because the ObjectDirector library failed to open.

**System Action**

Stops processing.

**User Action**

Determine whether ObjectDirector has been installed. If it has, carry out the actions indicated in the error information.

---

### 6.11.44 EXTP4348

---

**extp: ERROR: EXTP4348: The work unit cannot be started because failed in reading the ObjectDirector function: WU=%s1 ERRORSTRING='%s2' SYSTEM=%s3**

**Variable Information**

- %s1 = WorkUnit Name
- %s2 = Error Information
- %s3 = System Name

## Explanation

The WorkUnit cannot be started because reading of the ObjectDirector function failed.

## System Action

Stops processing.

## User Action

Determine whether the correct version of ObjectDirector has been installed. If it has, carry out the actions indicated by the error information then restart Interstage.

## 6.11.45 EXTP4349

---

**extp: ERROR: EXTP4349: The work unit cannot be started because failed in the initialization of ObjectDirector: WU=%s1 ERRCODE=%d ERRORSTRING='%s2' SYSTEM=%s3**

### Variable Information

%s1 = WorkUnit Name

%d = Error Information1

%s2 = Error Information2

%s3 = System Name

## Explanation

The WorkUnit cannot be started because ObjectDirector initialization failed.

## System Action

Stops processing.

## User Action

Carry out the actions indicated by the error information then restart Interstage.

## 6.11.46 EXTP4350

---

**extp: ERROR: EXTP4350: An abnormality occurred while stopping the work unit: WU=%s1 ERRCODE=%d ERRORSTRING='%s2' SYSTEM=%s3**

### Variable Information

%s1 = WorkUnit Name

%d = Error Information1

%s2 = Error Information2

%s3 = System Name

## Explanation

An error occurred during the normal stop processing of the WorkUnit.

## System Action

Stops processing.

## User Action

Contact your software supplier.

## 6.11.47 EXTP4351

---

---

**extp: ERROR: EXTP4351: An abnormality occurred while stopping the work unit: WU=%s1 ERRCODE=%d ERRORSTRING='%s2' SYSTEM=%s3**

**Variable Information**

%s1 = WorkUnit Name

%d = Error Information1

%s2 = Error Information2

%s3 = System Name

**Explanation**

An error occurred during the normal stop processing of the WorkUnit.

**System Action**

Stops processing.

**User Action**

Contact your software supplier.

---

## **6.11.48 EXTP4352**

---

**extp: ERROR: EXTP4352: An abnormality occurred while stopping the work unit: WU=%s1 ERRCODE=%d ERRORSTRING='%s2' SYSTEM=%s3**

**Variable Information**

%s1 = WorkUnit Name

%d = Error Information1

%s2 = Error Information2

%s3 = System Name

**Explanation**

An error occurred during the normal stop processing of the WorkUnit.

**System Action**

Stops processing.

**User Action**

Contact your software supplier.

---

## **6.11.49 EXTP4353**

---

**extp: ERROR: EXTP4353: A abnormality occurred when application stopping: WU=%s1 USER=%s2 SYSTEM=%s3**

**Variable Information**

%s1 = WorkUnit Name

%s2 = User Name

%s3 = System Name

**Explanation**

An error occurred during the application stop processing.

## System Action

Stops processing.

## User Action

Carry out the actions described in the previous event log message, or the standard error output message.

## 6.11.50 EXTP4354

---

**extp: ERROR: EXTP4354: Application quit abnormally: WU=%s1 USER=%s2 PID=%d SYSTEM=%s3**

### Variable Information

%s1 = WorkUnit Name

%s2 = User Name

%d = Process ID

%s3 = System Name

### Explanation

The application quit abnormally.

### System Action

Application stopped.

### User Action

Investigate the cause as described in the previous event log message, or the standard error output message. Consider the cause application error when the event log message is not output immediately before. Perform processing again after investigating application and removing the cause of the problem.

## 6.11.51 EXTP4355

---

**extp: ERROR: EXTP4355: The revitalization change processing cannot be done because there is a change in the work unit kind. WU=%s1 SYSTEM=%s2**

### Variable Information

%s1 = WorkUnit Name

%s2 = System Name

### Explanation

The activation change process cannot be executed because the WorkUnit type has changed.

### System Action

Stops the activation change process.

### User Action

This function cannot be used when the WorkUnit type has been changed. To use this function, correct the WorkUnit type and re-execute processing.

## 6.11.52 EXTP4356

---

**extp: ERROR: EXTP4356: Work unit kind contains an error: WU=%s1 SYSTEM=%s2**

### Variable Information

%s1 = WorkUnit Name

%s2 = System Name

#### Explanation

There is an error in the WorkUnit type.

#### System Action

Halts stopping the WorkUnit.

#### User Action

This function cannot be used for this WorkUnit type for the specified WorkUnit.

## 6.11.53 EXTP4357

---

**extp: ERROR: EXTP4357: The application program startup processing time of the CORBA work unit exceeded the observation time: PID=%d SYSTEM=%s**

#### Variable Information

%d = Process ID

%s = System Name

#### Explanation

Startup of the CORBA WorkUnit application program did not complete within 120 seconds.

#### System Action

Halts stopping the WorkUnit.

#### User Action

Check that the application program does not have an error and that there is not any other problem that might slow down the startup process.

If there is an unusually high process concurrency or heavy system load, consider performing tuning of the process startup monitoring time.

Add the following setting to the WorkUnit definition.

[Control Option]

Environment Variable: INTERSTAGE\_CORBA\_WU\_MAX\_TIME=300

Specify an appropriate value for the monitoring time. In this example, it is set to 300 seconds.

When the DISPLAY statement is used in the COBOL application, check that the SSOUT (environment variable information name) is specified for the compilation option. Also, check that the file name for data output destination is specified in the Control Option section in the WorkUnit definition or Environment Variable: statement of the Application Program section.

If either of the above specifications is incorrect, specify the compilation option, and recompile the application. Then, specify the file name for the destination of data output in the Control Option section in the WorkUnit definition or Environment Variable: statement of the Application Program section.

## 6.11.54 EXTP4358

---

**extp: ERROR: EXTP4358: An abnormality occurred by the start processing in the server application process which operated under the control of the work unit: WU=%s1 APL=%s2 PID=%d SYSTEM=%s3**

#### Variable Information

%s1 = WorkUnit Name

%s2 = Application Name

%d = Process ID

%s3 = System Name

### Explanation

An error occurred during startup of a server application process running under control of a WorkUnit.

### System Action

Stopping the process.

### User Action

Rectify according to the event log message immediately before this message.

Check the state of the WorkUnit. If the WorkUnit is active, terminate it, then re-execute processing. If the WorkUnit remains in the startproc or stopproc state when the state is checked, use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer.

## 6.11.55 EXTP4359

---

**extp: ERROR: EXTP4359: The work unit cannot be started because the Servlet library failed to open: WU=%s1 ERRORSTRING='%s2' SYSTEM=%s3**

### Variable Information

%s1 = WorkUnit name

%s2 = Error information

%s3 = System name

### Explanation

The WorkUnit could not be started because the Servlet Service library could not be opened.

### System Action

Stops processing for the WorkUnit.

### User Action

Check whether the Servlet Service is installed. If the Servlet Service is installed, take the action indicated by the error information.

## 6.11.56 EXTP4360

---

**extp: ERROR: EXTP4360: The work unit cannot be started because the Servlet function could not be read: WU=%s1 ERRORSTRING='%s2' SYSTEM=%s3**

### Variable Information

%s1 = WorkUnit name

%s2 = Error information

%s3 = System name

### Explanation

The WorkUnit could not be started because the Servlet Service function could not be read.

### System Action

Stops processing for the WorkUnit.

### User Action

Check whether a valid version of the Servlet Service is installed. If a valid version of the Servlet Service is installed, take the action indicated by the error information and then restart Interstage.

## 6.11.57 EXTP4361

---

**extp: ERROR: EXTP4361: The startup time of the IJServer work unit exceeded the process monitoring time: WU=%s1 PSN=%d1 PID=%d2 SYSTEM=%s2**

### Variable Information

%s1 = WorkUnit name

%d1 = Process serial number

%d2 = Process ID

%s2 = System name

### Explanation

WorkUnit start processing was not completed even after the lapse of the monitoring time.

### System Action

Stops processing for the WorkUnit.

### User Action

Re-estimate the monitoring time (taking into account system performance and process multiplicity), change the WorkUnit start wait time, then re-execute processing. An error in the application program is a likely cause of prolonged WorkUnit start processing time. Check the application program, remove the error cause, and re-execute processing.

If an IJServer WorkUnit is used, a thread dump is output to the IJServer container information log (info.log). Using the output thread dump, investigate the problem with the application. For details about thread dumps, see "Action to be Taken If a Thread Dump Is Output" in "Troubleshooting."

## 6.11.58 EXTP4362

---

**extp: ERROR: EXTP4362: The shutdown time of the IJServer work unit exceeded the process monitoring time: WU=%s1 PSN=%d1 PID=%d2 SYSTEM=%s2**

### Variable Information

%s1 = WorkUnit name

%d1 = Process serial number

%d2 = Process ID

%s2 = System name

### Explanation

WorkUnit stop processing was not completed even after the lapse of the monitoring time.

### System Action

Forcibly stops the application process.

### User Action

Refer to the log file to determine the cause of the prolonged application process stop time.

If an IJServer WorkUnit is used, a thread dump is output to the IJServer container information log (info.log). Using the output thread dump, investigate the problem with the application. For details about thread dumps, see "Action to be Taken If a Thread Dump Is Output" in "Troubleshooting."

## 6.11.59 EXTP4363

---

**extp: ERROR: EXTP4363: An error occurred while saving the current directory: WU=%s1 DIR=%s2 SYSTEM=%s3**

### Variable Information

%s1 = WorkUnit name

%s2 = Directory name

%s3 = System name

### Explanation

An error occurred during processing to save the current directory.

### System Action

Stops processing for the WorkUnit.

### User Action

If access authority is granted for the current folder, check whether Explorer is used to access the current folder. If it is, terminate Explorer.

## 6.11.60 EXTP4364

---

**extp: ERROR: EXTP4364: System error occurred: WU=%s1 CODE='%s2' SYSTEM=%s3**

### Variable Information

%s1 = WorkUnit name

%s2 = Detail code

%s3 = System name

### Explanation

A system error occurred.

### System Action

Stops processing for the WorkUnit.

### User Action

Contact your software supplier.

## 6.11.61 EXTP4365

---

**extp: ERROR: EXTP4365: Application processing time exceeded monitoring time: WU=%s1 PSN=%d1 PID=%d2 SYSTEM=%s2**

### Variable Information

%s1 = WorkUnit name

%d1 = Process serial number

%d2 = Process ID

%s2 = System name

### Explanation

The application terminated abnormally because the application processing time exceeded the monitoring time.

### System Action

Stops the application.

## User Action

Re-estimate the monitoring time (taking into account system performance on the server), change the maximum application processing time, then re-execute processing. An error in the application program is a likely cause of prolonged WorkUnit start processing time. Check the application program, remove the error cause, and re-execute processing.

If an IJServer WorkUnit is used, a thread dump is output to the IJServer container information log (info.log). Using the output thread dump, investigate the problem with the application. For details about thread dumps, see "Action to be Taken If a Thread Dump Is Output" in "Troubleshooting."

## 6.11.62 EXTP4366

---

**extp: WARNING: EXTP4366: Application processing time exceeded monitoring time: WU=%s1 PSN=%d1 PID=%d2 SYSTEM=%s2**

### Variable Information

%s1 = WorkUnit name

%d1 = Process serial number

%d2 = Process ID

%s2 = System name

### Explanation

The application processing time exceeded the monitoring time.

### System Action

Continues application processing.

### User Action

Re-estimate the monitoring time (taking into account system performance on the server), change the maximum application processing time, then re-execute processing. An error in the application program is a likely cause of prolonged WorkUnit start processing time. Check the application program, remove the error cause, and re-execute processing.

If an IJServer WorkUnit is used, a thread dump is output to the IJServer container information log (info.log). Using the output thread dump, investigate the problem with the application. For details about thread dumps, see "Action to be Taken If a Thread Dump Is Output" in "Troubleshooting."

## 6.11.63 EXTP4367

---

**extp: ERROR: EXTP4367: No response from JavaVM: WU=%s1 PSN=%d1 PID=%d2 SYSTEM=%s2**

### Variable Information

%s1 = WorkUnit name

%d1 = Process serial number

%d2 = Process ID

%s2 = System name

### Explanation

No response was received from the JavaVM. The system load may have been too high or a memory shortage may have occurred.

### System Action

The system forcibly stops the application process if:

- A value other than 0 is specified for the maximum application processing time, and
- Application processing time monitoring is enabled, and

- "Forcibly stop processing" is specified for the operation to be performed when the maximum application processing time is exceeded.

The system continues processing if:

- "Output a warning message" is specified for the operation to be performed when the maximum application processing time is exceeded, and
- 0 is specified for the maximum application processing time, and
- Application processing time monitoring is disabled.

### User Action

Check the reason for no response from the JavaVM, taking into account the system load, memory usage, and log file.

If an IJServer WorkUnit is used, a thread dump is output to the IJServer container information log (info.log). Using the output thread dump, investigate the problem with the application. For details about thread dumps, see "Action to be Taken If a Thread Dump Is Output" in "Troubleshooting."

## 6.11.64 EXTP4368

**extp: ERROR: EXTP4368: JavaVM may have run out of memory: WU=%s1 PSN=%d1 PID=%d2 DETAIL=%s2 SYSTEM=%s3**

### Variable Information

%s1 = WorkUnit name

%d1 = Process serial number

%d2 = Process ID

%s2 = Detail message

%s3 = System name

### Explanation

Heap memory usage by the JavaVM exceeded the specified warning level. An OutOfMemory situation may occur.

Table 6.2 EXTP4368 Detail Message

Message	Explanation (*1)	Resource to be Tuned
OutOfMemoryError warning is occurred because the Perm region is exhausted: TIME={0} SIZE={1} TIME: Time of occurrence SIZE: Perm area size, usage of which has increased rapidly	The OutOfMemory warning may have occurred because usage of the Perm area has increased rapidly.	Perm area
It takes long time to do the garbage collections many times: TIME={0} AVERAGE={1} TIME: Time of occurrence AVERAGE: Mean time of the past three garbage collections	The condition in which garbage collection takes a long time has persisted. This message is typically output when there is a persistently high CPU load status.	Heap area
Inefficient garbage collections are run with the short intervals: TIME={0} WEIGHT={1} TIME: Time of occurrence WEIGHT: Utilization of old memory immediately before garbage collection	Inefficient garbage collection has occurred at short intervals.	Heap area
The garbage collections are run with the short intervals because of the lack of the memory: TIME={0} SIZE={1} TIME: Time of occurrence	Garbage collection has occurred at short intervals due to a memory shortage.	Heap area

Message	Explanation (*1)	Resource to be Tuned
SIZE: Insufficient heap size when the warning occurred		
There are possibilities of OutOfMemoryError because of the lack of the memory: TIME={0} SIZE={1} TIME: Time of occurrence SIZE: Insufficient heap size when the warning occurred	There is a risk of an OutOfMemory error occurring due to a memory shortage.	Heap area
There are possibilities of OutOfMemoryError because of the lack of the Perm region: TIME={0} SIZE={1} TIME: Time of occurrence SIZE: Insufficient perm area size when the warning occurred	There is a risk of an OutOfMemory error due to a Perm area shortage.	Perm area
The garbage collections are run with the short intervals: TIME={0} INTERVAL={1} TIME: Time of occurrence INTERVAL: Interval time for garbage collection	Garbage collection has occurred at short intervals.	Heap area
System.gc() are run with the short intervals: TIME={0} INTERVAL={1} TIME: Time of occurrence INTERVAL: Interval time for System.gc	System.gc has occurred at short intervals.	Heap area

\*1 The garbage collection uses the Full GC information.

The time information is formatted as:

**year/month/day hour:minute:second.millisecond**

#### System Action

Continues application processing.

#### User Action

Refer to the JavaVM performance information on the Interstage management console monitor and perform the tuning required to resolve the problem indicated in the detail message. For details of the tuning procedure, refer to Proactive Monitoring in the Operator's Guide.

## 6.11.65 EXTP4369

**extp: ERROR: EXTP4369: The work unit cannot be started because no applications have been deployed on this work unit: WU=%s1 SYSTEM=%s2**

#### Variable Information

%s1 = WorkUnit name

%s2 = System name

#### Explanation

The WorkUnit cannot be started because no application has been deployed.

#### System Action

Stops processing for the WorkUnit.

## User Action

Deploy an application, then re-execute processing.

For an IJServer WorkUnit with an IJServer type of 1VM, check whether Web applications are deployed.

If there is a message before this message, also refer to that message.

If the IJServer terminates abnormally, investigate the problem from the information output to the IJServer container log (container.log) and the container information log (info.log).

## 6.11.66 EXTP4370

---

**extp: ERROR: EXTP4370: Error occurred during startup of server application running under work unit: WU=%s1 PSN=%d1 PID=%d2 SYSTEM=%s2**

### Variable Information

%s1 = WorkUnit name

%d1 = Process serial number

%d2 = Process ID

%s2 = System name

### Explanation

An error occurred during processing to start the server application process that runs under control of the WorkUnit.

### System Action

Stops processing for the WorkUnit.

### User Action

Check the cause of the failure to start the application process according to the details provided in the event log message output immediately before this message. If no event log message was output, check the cause of failure to start the process by referring to the log file.

If the IJServer terminates abnormally, investigate the problem from the information output to the IJServer container log (container.log) and the container information log (info.log).

If there is enough memory, use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer.

## 6.11.67 EXTP4371

---

**extp: ERROR: EXTP4371: A server application running under the work unit terminated abnormally: WU=%s1 PSN=%d1 PID=%d2 SYSTEM=%s2**

### Variable Information

%s1 = WorkUnit name

%d1 = Process serial number

%d2 = Process ID

%s2 = System name

### Explanation

The server application process running under control of the WorkUnit terminated abnormally.

### System Action

Stops processing.

## User Action

Check the cause of the abnormal application termination according to the details provided in the event log message output immediately before this message. If no event log message was output, the application probably contains an error. Check the application by referring to the log file.

If the IJServer terminates abnormally, investigate the problem from the information output to the IJServer container log (container.log) and the container information log (info.log).

## 6.11.68 EXTP4372

---

**extp: ERROR: EXTP4372: Interstage working directory could not be found: DIR=%s1 SYSTEM=%s2**

### Variable Information

%s1 = Directory name

%s2 = System name

### Explanation

The directory to be used by Interstage does not exist.

### System Action

Stops processing for the WorkUnit.

### User Action

Check whether the directory indicated in the message exists. If not, check whether the directory has been deleted by mistake.

Use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer.

## 6.11.69 EXTP4373

---

**extp: ERROR: EXTP4373: Errors occurred when saving the log file: WU=%s1 FILE=%s2 ERRNO=%d SYSTEM=%s3**

### Variable Information

%s1 = WorkUnit name

%s2 = File name

%d = Error number

%s3 = System name

### Explanation

An error occurred during processing to save the log file. An application may have attempted to access the log file.

### System Action

Stops processing for the WorkUnit.

### User Action

If an application is attempting to access the log file, stop it. In other cases, contact your software supplier.

Use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer.

## 6.11.70 EXTP4374

---

**extp: ERROR: EXTP4374: Errors occurred when opening the log file: WU=%s1 FILE=%s2 ERRNO=%d SYSTEM=%s3**

### Variable Information

%s1 = WorkUnit name

%s2 = File name

%d = Error number

%s3 = System name

### Explanation

The log file could not be opened.

### System Action

Stops processing for the WorkUnit.

### User Action

Use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer.

## 6.11.71 EXTP4375

---

**extp: ERROR: EXTP4375: Errors occurred when creating the log file: WU=%s1 FILE=%s2 ERRNO=%d SYSTEM=%s3**

### Variable Information

%s1 = WorkUnit name

%s2 = File name

%d = Error number

%s3 = System name

### Explanation

Log file allocation failed.

### System Action

Stops processing for the WorkUnit.

### User Action

If the cause is other than the above, use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer.

## 6.11.72 EXTP4376

---

**extp: ERROR: EXTP4376: The user does not have access permissions for the specified directory: WU=%s1 USER=%s2 DIR=%s3 SYSTEM=%s4**

### Variable Information

%s1 = WorkUnit name

%s2 = User name

%s3 = Directory name

%s4 = System name

### Explanation

Access authority has not been granted for the directory.

## System Action

Stops processing for the WorkUnit.

## User Action

Use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer.

## 6.11.73 EXTP4377

---

**extp: WARNING: EXTP4377: Thread dump output failed: WU=%s1 PSN=%d1 PID=%d2 CODE='%s2' SYSTEM=%s3**

### Variable Information

%s1 = WorkUnit name

%d1 = Process serial number

%d2 = Process ID

%s2 = Detail code

%s3 = System name

### Explanation

A thread dump could not be output.

### System Action

Continues processing.

### User Action

If the message "IJSERVER: IJSERVER11102: Output of FullThreadDump may have gone wrong" is output before this message, memory consumption may exceed the maximum allowable consumption of system resources, or the system may be in a high-load state. Take the following action:

- Reduce the process multiplicity of the IJSERVER WorkUnit or the number of active IJSERVER WorkUnits.
- Terminate unnecessary applications other than the IJSERVER that is running.
- Check whether sufficient memory capacity has been made available by referring to "When Using Application Server" in "Memory Capacity" in the Tuning Guide. If the memory capacity is insufficient, expand the main memory or swap area.

If the message "UX:extp: WARNING: EXTP4435: The process has stopped because JavaVM ran out of memory" is output before this message, memory consumption may have exceeded the system resource limit, or the Java heap or Java permanent area may be insufficient.

Refer to Message EXTP4435 for details on how to address these problems.

## 6.11.74 EXTP4378

---

**extp: ERROR: EXTP4378: Errors occurred when creating directory: DIR=%s1 ERRNO=%d SYSTEM=%s2**

### Variable Information

%s1 = Directory name

%d = Error number

%s2 = System name

### Explanation

An error occurred during processing to create a directory.

## System Action

Stops processing for the WorkUnit.

## User Action

Take action according to the OS error information. For details about OS error information, see the manual of intro(2).

## 6.11.75 EXTP4380

---

**extp: ERROR: EXTP4380: The startup time of the work unit exceeded the process monitoring time: WU=%s1 APL=%s2 PID=%d SYSTEM=%s3**

### Variable Information

%s1 = WorkUnit name

%s2 = Application name

%d = Process ID

%s3 = System name

### Explanation

Startup of the WorkUnit was not complete before the process monitoring time had elapsed.

### System Action

Stops the processing.

### User Action

Re-estimate the monitoring time taking system performance and process process concurrency into account. Then, change the WorkUnit startup time and execute the processing again. An application program error can also result in extended WorkUnit startup time. Check the application program, remove the cause, and execute the processing again.

## 6.11.76 EXTP4381

---

**extp: ERROR: EXTP4381: The shutdown time of the work unit exceeded the process monitoring time: WU=%s1 APL=%s2 PID=%d SYSTEM=%s3**

### Variable Information

%s1 = WorkUnit name

%s2 = Application name

%d = Process ID

%s3 = System name

### Explanation

Shutdown of the WorkUnit was not complete, even after process monitoring time had elapsed.

### System Action

Terminates processing for the WorkUnit.

### User Action

Refer to the log file to determine why it takes so long to shut down the application process.

## 6.11.77 EXTP4382

---

**extp: ERROR: EXTP4382: %s1 package may have not been installed: WU=%s2 ERRORSTRING=%s3 SYSTEM=%s4**

### Variable Information

%s1 = Package name

%s2 WorkUnit name

%s3 = OS error information

%s4 = System name

### Explanation

A required package may not have been installed.

### System Action

Terminates processing for the WorkUnit.

### User Action

Install the package specified in %s1 of [Variable information], and execute processing again.

## 6.11.78 EXTP4383

---

**exp: ERROR: EXTP4383: An activation change process cannot be executed because "%s1" statement of the work unit definition has been changed: WU=%s2 SYSTEM=%s3**

### Variable Information

%s1 = Statement name

%s2 = WorkUnit name

%s3 = System name

### Explanation

An activation change process cannot be executed because the "%s1" statement of the WorkUnit definition has been changed.

### System Action

Terminates the activation change process.

### User Action

Restore the statement specified in %s1 of [Variable information] in the WorkUnit definition to the startup state of the WorkUnit.

## 6.11.79 EXTP4384

---

**exp: ERROR: EXTP4384: The specified directory does not exist: DIR=%s1 SYSTEM=%s2**

### Variable Information

%s1 = Directory

%s2 = System name

### Explanation

The specified directory does not exist.

### System Action

Terminates processing for the WorkUnit.

### User Action

The directory may have been deleted. Create the directory, and execute processing again.

 Windows32/64

If a nonexistent drive was specified, specify an existing local drive.

## 6.11.80 EXTP4385

---

**extp: ERROR: EXTP4385: The specified user does not exist: WU=%s USER=%s SYSTEM=%s**

### Variable Information

%s1 = WorkUnit name

%s2 = User name

%s3 = System name

### Explanation

The specified user does not exist.

### System Action

Stops processing on the WorkUnit.

### User Action

Re-execute processing after specifying the correct user name. Before a WorkUnit can be operated in a multiserver environment, the name of the user logged in to the Admin Server Interstage Management Console must be registered in the Managed Server.

## 6.11.81 EXTP4386

---

**extp: ERROR: EXTP4386: The application process could not be reactivated automatically: WU=%s1 APL=%s2 PID=%d1 SYSTEM=%s3**

### Variable Information

%s1 = WorkUnit name

%s2 = Application name

%d1 = Process ID

%s3 = System name

### Explanation

System down or timeout caused the CORBA WorkUnit application process to be forcibly terminated. Process automatic reactivation was subsequently performed but the process could not be reactivated.

### System Action

The system terminates the WorkUnit.

The operation for the WorkUnit continues with the process concurrency being reduced by 1 in one of the following instances: When "Process degeneracy" is defined as YES for the WorkUnit. When "Continue the operation of the WorkUnit" is selected for the "Control at an application automatic reactivation failure" field of "System > WorkUnit > [WorkUnit name] > Environment setting" on the Interstage Management Console and at least one of the application processes subject to the concurrent operation has survived.

### User Action

Follow the event log message output immediately before the failure, or take the action indicated in the standard error message that is output. If no event log message was output, investigate the cause of the application process activation failure using the application log data.

## 6.11.82 EXTP4387

---

**extp: ERROR: EXTP4387: The application process could not be reactivated automatically: WU=%s1 PSN=%d1 PID=%d2 SYSTEM=%s2**

### Variable Information

%s1=WorkUnit name  
%d1=Process serial number  
%d2=ProcessID  
%s2=System name

### Explanation

System down or timeout caused the CORBA WorkUnit application process to be forcibly terminated. Process automatic reactivation was subsequently performed but the process could not be reactivated.

### System Action

The system terminates the WorkUnit.

The operation for the WorkUnit continues with the process concurrency being reduced by 1 when "Continue the operation of the WorkUnit" is selected for the "Control at an application automatic reactivation failure" field of "System > WorkUnit > [WorkUnit name] > Environment setting" on the Interstage Management Console and at least one of the application processes subject to the concurrent operation has survived.

### User Action

Follow the event log message output immediately before the failure and investigate the cause of the application process activation failure. If no message was output, investigate the failure using the data output in the IIServer container log and container info log.

## 6.11.83 EXTP4388

---

**extp: ERROR: EXTP4388: All the application (%s1) processes have been terminated: WU=%s2 SYSTEM=%s3**

### Variable Information

%s1 = Application name  
%s2 = WorkUnit name  
%s3 = System name

### Explanation

The CORBA WorkUnit application process could not be reactivated automatically. The process concurrency for the current operation has been set to 0.

### System Action

Terminates the WorkUnit.

### User Action

Remove the cause of application process reactivation failure, and reactivate the WorkUnit.

## 6.11.84 EXTP4389

---

**extp: ERROR: EXTP4389: All the application processes have been terminated: WU=%s1 SYSTEM=%s2**

### Variable Information

%s1 = WorkUnit name  
%s2 = System name

### Explanation

The IIServer WorkUnit application process could not be reactivated automatically. The process concurrency for the current operation has been set to 0.

### System Action

Terminates the WorkUnit

### User Action

Remove the cause of application process reactivation failure, and reactivate the WorkUnit.

## 6.11.85 EXTP4390

---

**extp: WARNING: EXTP4390: The WorkUnit degeneration operation will commence: WU=%s1 SYSTEM=%s2**

### Variable Information

%s1 = WorkUnit name

%s2 = System name

### Explanation

The process could not be reactivated. The WorkUnit will operate with the degraded process concurrency.

### System Action

Continues the WorkUnit operation.

### User Action

After removing the problem that caused the application process reactivation, execute the *isrecoverwu* command or click the "Restore the WorkUnit" button on the Interstage Management Console, to restore the process concurrency for the WorkUnit.

## 6.11.86 EXTP4391

---

**extp: ERROR: EXTP4391: A WorkUnit with the same name is being recovered: WU=%s1 USER=%s2 SYSTEM=%s3**

### Variable Information

%s1 = WorkUnit name

%s2 = User name

%s3 = System name

### Explanation

One of the following actions was performed for the WorkUnit being restored:

- Restoration of the WorkUnit
- Changing the process concurrency dynamically

### System Action

Stops the WorkUnit processing.

### User Action

Check the status of the WorkUnit. If the WorkUnit name is incorrect, re-execute the processing using the correct WorkUnit name.

## 6.11.87 EXTP4392

---

**extp: ERROR: EXTP4392: The number of the processes cannot be changed dynamically because the WorkUnit is operating in degeneracy mode: WU=%s1 USER=%s2 SYSTEM=%s3**

## Variable Information

%s1 = WorkUnit name

%s2 = User name

%s3 = System name

## Explanation

The *ismodifyprocnum* command or the "Change the process concurrency" button on the Interstage Management Console was executed for a WorkUnit operating in degeneracy mode.

## System Action

Stops the processing that changes the number of the processes dynamically.

## User Action

Restore the WorkUnit and re-execute the processing.

## 6.11.88 EXTP4393

---

**extp: ERROR: EXTP4393: The WorkUnit is not in degeneracy mode: WU=%s1 USER=%s2 SYSTEM=%s3**

## Variable Information

%s1 = WorkUnit name

%s2 = User name

%s3 = System name

## Explanation

The *iisrecoverwu* command or the "Restore the WorkUnit" button on the Interstage Management Console was executed for a WorkUnit not in degeneracy mode.

## System Action

Terminates the processing for the WorkUnit.

## User Action

Check the status of the WorkUnit. If the WorkUnit name is incorrect, re-execute the processing using the correct WorkUnit name.

## 6.11.89 EXTP4394

---

**extp: ERROR: EXTP4394: The application process could not be activated during the WorkUnit recovery processing: WU=%s1 APL=%s2 PID=%d SYSTEM=%s3**

## Variable Information

%s1 = WorkUnit name

%s2 = Application name

%d = Process ID

%s3 = System name

## Explanation

The application process could not be activated during the WorkUnit restoration processing.

## System Action

Continues the degeneration operation.

## User Action

Refer to the Message output to the event log immediately before failure or the Message output as the standard error output. If there is no event log Message, refer to the data output in the application log. Remove the cause of the activation failure and re-execute processing.

## 6.11.90 EXTP4395

---

**extp: ERROR: EXTP4395: The application process could not be activated during the WorkUnit recovery processing: WU=%s1 PSN=%d1 PID=%d2 SYSTEM=%s2**

### Variable Information

%s1 = WorkUnit name

%d1 = Process serial number

%d2 = Process ID

%s2 = System name

### Explanation

The application process could not be activated during the WorkUnit restoration processing.

### System Action

Continues the degeneration operation.

### User Action

Refer to the Message output to the event log immediately before failure. Remove the cause of the failure and re-execute processing. If there is no event log Message, refer to the data output in the IJServer container log and container info log.

## 6.11.91 EXTP4396

---

**extp: WARNING: EXTP4396: The log file could not be created: WU=%s1 FILE=%s2 SYSTEMCALL= %s3 ERRNO=%d SYSTEM=%s4**

### Variable Information

%s1 = WorkUnit name

%s2 = File name

%s3 = System call

%d = Error number

%s4 = System name

### Explanation

The log file could not be created.

### System Action

Continues start processing of the WorkUnit.

### User Action

Investigate the cause of the failure to create the file by looking at the error number.

## 6.11.92 EXTP4397

---

**extp: WARNING: EXTP4397: The log file could not be written to: WU=%s1 FILE=%s2 SYSTEMCALL= %s3 ERRNO=%d SYSTEM=%s4**

### Variable Information

%s1 = WorkUnit name

%s2 = File name

%s3 = System call

%d = Error number

%s4 = System name

### Explanation

The log file could not be written to.

### System Action

Continues start processing of the WorkUnit.

### User Action

Investigate the cause of the failure to write to the file by looking at the error number.

## 6.11.93 EXTP4398

---

**extp: WARNING: EXTP4398: The log file could not be created because of insufficient disk capacity: WU=%s1 FILE=%s2 SYSTEM=%s3**

### Variable Information

%s1 = WorkUnit name

%s2 = File name

%s3 = System name

### Explanation

The log file could not be created because of insufficient disk capacity.

### System Action

Continues start processing of the WorkUnit.

### User Action

Allocate more free disk space to the current directory specified in the WorkUnit definition.

## 6.11.94 EXTP4399

---

**extp: WARNING: EXTP4399: The standby process could not be started: WU=%s1 USER=%s2 SYSTEM=%s3**

### Variable Information

%s1 = WorkUnit name

%s2 = User name

%s3 = System name

### Explanation

The standby process could not be started.

### System Action

Continues processing.

## User Action

Perform the action indicated in any message output before and/or after this message.

## 6.12 EXTP4400 to EXTP4499

---

This section details the messages with message numbers between EXTP4400 and EXTP4499.

### 6.12.1 EXTP4400

---

**extp: ERROR: EXTP4400:The work unit quit abnormally: WU=%s1 USER=%s2 SYSTEM=%s3**

#### Variable Information

%s1 = WorkUnit name

%s2 = User name

%s3 = System name

#### Explanation

The APM process terminated abnormally, therefore, the WorkUnit has stopped.

#### System Action

Stops the WorkUnit.

#### User Action

Carry out the instructions given in the previous event log message to resolve the error, then restart the WorkUnit.

Abnormal termination of the WorkUnit may be attributable to:

- 1) The number of consecutive abnormal terminations of an application has reached the consecutive abnormal termination count set in the "Application Retry Count:" statement of the [Control Option] section of the WorkUnit definition.
- 2) Automatic restart of an application process failed.

### 6.12.2 EXTP4401

---

**extp: INFO: EXTP4401:The work unit was started up: WU=%s1 USER=%s2 SYSTEM=%s3**

#### Variable Information

%s1 = WorkUnit name

%s2 = User name

%s3 = System name

#### Explanation

The WorkUnit was started up.

### 6.12.3 EXTP4402

---

**extp: INFO: EXTP4402:The work unit was stopped: WU=%s1 USER=%s2 SYSTEM=%s3**

#### Variable Information

%s1 = WorkUnit name

%s2 = User name

%s3 = System name

## Explanation

The WorkUnit was stopped.

### 6.12.4 EXTP4403

---

**extp: INFO: EXTP4403:The work unit was stopped forcibly: WU=%s1 USER=%s2 SYSTEM=%s3**

#### Variable Information

%s1 = WorkUnit name

%s2 = User name

%s3 = System name

## Explanation

The WorkUnit was forcibly stopped.

### 6.12.5 EXTP4404

---

**extp: ERROR: EXTP4404:The work unit is not starting: WU=%s1 USER=%s2 SYSTEM=%s3**

#### Variable Information

%s1 = WorkUnit name

%s2 = User name

%s3 = System name

## Explanation

The WorkUnit has not been initiated.

## System Action

Halts stopping the WorkUnit.

## User Action

If the WorkUnit name is invalid, specify a valid WorkUnit name, then re-execute the process.

### 6.12.6 EXTP4405

---

**extp: ERROR: EXTP4405:This is not the user who started the work unit: WU=%s1 USER1=%s2 USER2=%s3 SYSTEM=%s4**

#### Variable Information

%s1 = WorkUnit name

%s2 = User name

%s3 = WorkUnit user name

%s4 = System name

## Explanation

Stops the WorkUnit processing due to an invalid user.

## System Action

Stops the WorkUnit processing.

## User Action

Execute WorkUnit processing as the user who started it.

## 6.12.7 EXTP4406

---

**extp: ERROR: EXTP4406: The work unit cannot be stopped as the application is being executed: WU=%s1 USER=%s2 SYSTEM=%s3**

### Variable Information

%s1 = WorkUnit name

%s2 = User name

%s3 = System name

### Explanation

The WorkUnit cannot be terminated because the application is executing. In the case of an EJB application, the WorkUnit may fail to be terminated because the instance has not been deleted.

### System Action

Cancels application termination.

### User Action

Wait for all applications to end, or forcibly terminate the WorkUnit. In the case of an EJB application, the client application may have terminated without the instance being deleted or may have terminated abnormally before the instance was deleted. In such cases, forcibly terminate the WorkUnit.

## 6.12.8 EXTP4407

---

**extp: ERROR: EXTP4407: Because the APM invoked from the debugger, it is not possible to stop: WU=%s1 USER=%s2 PID=%d SYSTEM=%s3**

### Variable Information

%s1 = WorkUnit name

%s2 = User Name

%d = Process ID of the APM started under debug mode.

%s3 = System Name

### Explanation

The APM started in debug mode is still active.

### System Action

Cancels WorkUnit or Component Transaction Service termination.

### User Action

Terminate the APM started in debug mode, then re-execute the command.

## 6.12.9 EXTP4408

---

**extp: INFO: EXTP4408: The start in advance of work unit was completed: WU=%s1 USER=%s2 SYSTEM=%s3**

### Variable Information

%s1 = WorkUnit name

%s2 = User Name

%s3 = System Name

#### Explanation

The start in advance of WorkUnit was completed.

### 6.12.10 EXTP4410

---

**extp: ERROR: EXTP4410: Because the session is continuing, the work unit cannot be stopped: WU=%s1 USER=%s2 SYSTEM=%s3**

#### Variable Information

%s1 = WorkUnit Name

%s2 = User Name

%s3 = System Name

#### Explanation

The WorkUnit cannot be terminated because a session is being continued.

#### System Action

Cancels the termination of the WorkUnit.

#### User Action

Either wait for all of the WorkUnit's session continuation processing to finish, or perform a WorkUnit forced stop.

### 6.12.11 EXTP4411

---

**extp: INFO: EXTP4411: The WorkUnit recovery will commence: WU=%s1 PROCNUM=%d SYSTEM=%s2**

#### Variable Information

%s1 = WorkUnit name

%d = Process number

%s2 = System name

#### Explanation

The *isrecoverwu* command was executed or the "Restore WorkUnit" button on "System > WorkUnit > [WorkUnit name] > Operation" on the Interstage Management Console was clicked. As a result restoration of the WorkUnit process concurrency has commenced.

#### System Action

Commences restoration of the WorkUnit that has been degraded.

### 6.12.12 EXTP4412

---

**extp: INFO: EXTP4412: The WorkUnit under the degradation operation has been recovered: WU=%s1 USER=%s2 SYSTEM=%s3**

#### Variable Information

%s1 = WorkUnit name

%s2 = User name

%s3 = System name

## Explanation

The *isrecoverwu* command was executed or the "Restore WorkUnit" button on "System > WorkUnit > [WorkUnit name] > Operation" on the Interstage Management Console was clicked and restoration processing of the process concurrency for the WorkUnit ended normally.

## System Action

Continues the WorkUnit operation.

## 6.12.13 EXTP4413

---

**extp: ERROR: EXTP4413: The WorkUnit under the degradation operation could not be recovered: WU=%s1 USER=%s2 SYSTEM=%s3**

### Variable Information

%s1 = WorkUnit name

%s2 = User name

%s3 = System name

## Explanation

The *isrecoverwu* command was executed or the "Restore WorkUnit" button on "System > WorkUnit > [WorkUnit name] > Operation" on the Interstage Management Console was clicked but the process concurrency for the WorkUnit could not be restored.

## System Action

Continues the WorkUnit degradation operation.

## User Action

Remove the cause of application process reactivation failure, and retry processing.

## 6.12.14 EXTP4414

---

**extp: ERROR: EXTP4414: The application cannot be found: WU=%s1 APL=%s2 SYSTEM=%s3**

### Variable Information

%s1 = Work unit name

%s2 = Application name

%s3 = System name

## Explanation

The application specified in the processing required to change the process concurrency cannot be found.

## System Action

Terminates the processing that is used to change the process concurrency.

## User Action

Enter the correct application name (if incorrect), then re-execute processing.

## 6.12.15 EXTP4415

---

**extp: ERROR: EXTP4415: Because the application retains the instances, the processing to dynamically change the number of processes cannot be executed: WU=%s1 APL=%s2 SYSTEM=%s3**

### Variable Information

%s1 = Work unit name

%s2 = Application name

%s3 = System name

#### Explanation

Because it is set to retain the instances, the processing used to dynamically change the number of processes cannot be executed.

#### System Action

Terminates the processing that is used to dynamically change the number of processes.

#### User Action

Enter the correct application name (if incorrect), then re-execute processing.

## 6.12.16 EXTP4416

---

**extp: WARNING: EXTP4416: The termination information of the process could not be output: SYSTEM CALL=%s1 ERRNO=%d ERRSTRING=%s2 SYSTEM=%s4**

#### Variable Information

%s1 = System call name

%d = System call error number

%s2 = OS error information

%s3 = System name

#### Explanation

An error was generated when the process termination information was output to the following file:

[Default system]

/var/opt/FJSVisas/system/default/FSUNextp/td001/tmp/is/proc\_term\_status.log

[Extended system]

/var/opt/FJSVisas/system/[system name]/FSUNextp/[system name]/tmp/is/proc\_term\_status.log

The following may be the cause of the error:

- Disk space for the Interstage setup directory is insufficient.
- An I/O error was generated.

#### System Action

Continues the system operation.

#### User Action

Contents of this message does not affect the operation.

Take the action corresponding to the cause shown in the [Meaning], and execute the processing again. For other causes, take the action corresponding to the system call error number and OS error information. Refer to the intro (2) manual for the system call error number.

## 6.12.17 EXTP4417

---

**extp: ERROR: EXTP4417: Execution permission is not authorised from the current directory: WU=%s1 USER=%s2 DIR=%s3 SYSTEM=%s4**

#### Variable Information

%s1 = Work unit name

%s2 = User name

%s3 = Current directory

%s4 = System name

## Explanation

The user under which processing is executed in the current directory does not have authority to execute if 'Make this a unique current directory in IJServer' was specified during the IJServer creation.

## System Action

Terminates WorkUnit processing.

## User Action

Authorise execution and write privilege to the current directory, and execute the processing again.

## 6.12.18 EXTP4418

---

**extp: WARNING: EXTP4418: Write permission is is not authorised for the current directory: WU=%s1 USER=%s2 DIR=%s3 SYSTEM=%s4**

### Variable Information

%s1 = Work unit name

%s2 = User name

%s3 = Current directory

%s4 = System name

## Explanation

The user under which processing is executed in the current directory does not have authority to write if 'Make this a unique current directory in IJServer' was specified during the IJServer creation. Core file and log file output to the current directory may not be possible.

## System Action

Continues processing.

## User Action

Authorise write from the current directory.

## 6.12.19 EXTP4419

---

**extp: ERROR: EXTP4419: The user does not have the authority to activate the work unity: WU=%s1 USER=%s2 SYSTEM=%s3**

### Variable Information

%s1 = Work unit name

%s2 = User name

%s3 = System name

## Explanation

In secure mode, the work unit can only be started by members of the group nominated for secure mode or by super users.

## System Action

Terminates the processing of the work unit.

## User Action

To start the WorkUnit, login as a member of the group nominated for secure mode or as a super user.

If this message is output when Interstage is running, the user defined for automatic WorkUnit startup is incorrect. Specify a user from the group nominated for secure mode as the automatic WorkUnit startup user. The startup user can be specified from the Interstage Management Console's WorkUnit environment settings page.

In secure mode, a super user or user belonging to the group nominated for secure mode must be specified.

Use the *issetsecuritymode* command to check the active security mode, and the nominated group for secure mode operation (if in secure mode).

## 6.12.20 EXTP4420

---

**extp: ERROR: EXTP4420: The preparation (prepare phase) of the activated change for the WorkUnit is being processed: WU=%s1 USER=%s2 SYSTEM=%s3**

### Variable Information

%s1 = Work unit name

%s2 = User name

%s3 = System name

### Explanation

Processing was executed for the WorkUnit while the preparation (prepare) phase of the WorkUnit activation change was being processed.

### System Action

Stops WorkUnit processing.

### User Action

Check the WorkUnit status. If the WorkUnit name specified is incorrect, correct it and re-execute processing.

## 6.12.21 EXTP4421

---

**extp: ERROR: EXTP4421 The status of the preparation (prepare phase) of the activated change for the WorkUnit is complete: WU=%s1 USER=%s2 SYSTEM=%s3**

### Variable Information

%s1 = Work unit name

%s2 = User name

%s3 = System name

### Explanation

The preparation (prepare) phase of the WorkUnit activation change is complete, but the switch to new environment (change) phase processing was not executed.

### System Action

Stops WorkUnit processing.

### User Action

Check the WorkUnit status. If the WorkUnit name specified is incorrect, correct it and re-execute processing.

## 6.12.22 EXTP4422

---

**extp: ERROR: EXTP4422 The status of the WorkUnit environment changeover (change phase) of the activated change for the WorkUnit is complete: WU=%s1 USER=%s2 SYSTEM=%s3**

### Variable Information

%s1 = Work unit name

%s2 = User name

%s3 = System name

### Explanation

The switch to new environment (change) phase of the WorkUnit activation change is complete, but the previous environment was deleted, or processing was not executed for recovery of the previous environment.

### System Action

Stops WorkUnit processing

### User Action

Check the WorkUnit status. If the WorkUnit name specified is incorrect, correct it and re-execute processing.

## 6.12.23 EXTP4423

---

**extp: ERROR: EXTP4423 The previous environment deletion of the activated change for the WorkUnit is being processed: WU=%s1 USER=%s2 SYSTEM=%s3**

### Variable Information

%s1 = Work unit name

%s2 = User name

%s3 = System name

### Explanation

WorkUnit processing was executed during the old environment deletion phase of the WorkUnit activation change.

### System Action

Stops WorkUnit processing.

### User Action

Check the WorkUnit status. If the WorkUnit name specified is incorrect, correct it and re-execute processing.

## 6.12.24 EXTP4424

---

**extp: ERROR: EXTP4424 The previous environment recovery of the activated change for the WorkUnit is being processed: WU=%s1 USER=%s2 SYSTEM=%s3**

### Variable Information

%s1 = Work unit name

%s2 = User name

%s3 = System name

### Explanation

WorkUnit processing was executed during the old environment restoration (commit or rollback) phase of the activation change for the WorkUnit.

### System Action

Stops WorkUnit processing.

### User Action

Check the WorkUnit status. If the WorkUnit name specified is incorrect, correct it and re-execute processing.

## 6.12.25 EXTP4425

---

---

**extp: ERROR: EXTP4425 An application was added or deleted in an activated change WorkUnit configuration: WU=%s1 APL=%s2 SYSTEM=%s3**

**Variable Information**

%s1 = Work unit name

%s2 = Application name

%s3 = System name

**Explanation**

Applications cannot be added or deleted to/from a CORBA WorkUnit configuration during activation change.

The application (Impl ID) given in %s2 may have been added to/deleted from the %1 WorkUnit configuration while it was undergoing activation change.

**System Action**

Stops WorkUnit processing.

**User Action**

Correct the WorkUnit configuration, and re-execute processing.

---

## 6.12.26 EXTP4426

---

**extp: ERROR: EXTP4426 The activated change WorkUnit configuration has not been registered: WU=%s1 USER=%s2 SYSTEM=%s3**

**Variable Information**

%s1 = Work unit name

%s2 = User name

%s3 = System name

**Explanation**

The configuration of the WorkUnit that underwent activation change has not been registered

**System Action**

Stops WorkUnit processing.

**User Action**

Register the configuration for the WorkUnit that underwent activation change, and re-execute processing.

---

## 6.12.27 EXTP4427

---

**extp: ERROR: EXTP4427 The status of the preparation (prepare phase) of the activated change for the WorkUnit is not complete: WU=%s1 USER=%s2 SYSTEM=%s3**

**Variable Information**

%s1 = Work unit name

%s2 = User name

%s3 = System name

**Explanation**

The preparation (prepare) phase of the activation change is not complete.

**System Action**

Stops processing of the WorkUnit.

## User Action

Check the WorkUnit status. If the WorkUnit name specified is incorrect, correct it and re-execute processing.

### 6.12.28 EXTP4428

---

**extp: ERROR: EXTP4428 The status is that processing of the activated change for the WorkUnit cannot be executed: WU=%s1 USER=%s2 SYSTEM=%s3**

#### Variable Information

%s1 = Work unit name

%s2 = User name

%s3 = System name

#### Explanation

Activation change cannot be executed for WorkUnit, %1, since deletion of the previous environment during the last activation change processing for this WorkUnit failed.

#### System Action

Stops WorkUnit processing. WorkUnit operations are not affected.

#### User Action

Since activation change cannot be executed for the WorkUnit, restart the WorkUnit to change the WorkUnit environment.

### 6.12.29 EXTP4430

---

**extp: INFO: EXTP4430 The registration of the activated change WorkUnit configuration is complete: WU=%s1 USER=%s2 SYSTEM=%s3**

#### Variable Information

%s1 = Work unit name

%s2 = User name

%s3 = System name

#### Explanation

Registration of the configuration for the WorkUnit that underwent activation change is complete.

### 6.12.30 EXTP4431

---

**extp: INFO: EXTP4431 The preparation (prepare phase) of the activated change for the WorkUnit is complete: WU=%s1 USER=%s2 SYSTEM=%s3**

#### Variable Information

%s1 = Work unit name

%s2 = User name

%s3 = System name

#### Explanation

The preparation (prepare) phase of the WorkUnit activation change is complete.

### 6.12.31 EXTP4432

---

---

**extp: INFO: EXTP4432 The status of the changeover (change phase) to the new environment of the activated change for the WorkUnit is complete: WU=%s1 USER=%s2 SYSTEM=%s3**

**Variable Information**

%s1 = Work unit name

%s2 = User name

%s3 = System name

**Explanation**

The switch to new environment (change) phase of the for the WorkUnit activation change is complete.

### 6.12.32 EXTP4433

---

**extp: INFO: EXTP4433 The previous environment deletion of the activated change for the WorkUnit is complete: WU=%s1 USER=%s2 SYSTEM=%s3**

**Variable Information**

%s1 = Work unit name

%s2 = User name

%s3 = System name

**Explanation**

The old environment deletion phase of the for the WorkUnit activation change is complete.

### 6.12.33 EXTP4434

---

**extp: INFO: EXTP4434 The previous environment recovery of the activated change for the WorkUnit is complete: WU=%s1 USER=%s2 SYSTEM=%s3**

**Variable Information**

%s1 = Work unit name

%s2 = User name

%s3 = System name

**Explanation**

The old environment restoration phase of the for the WorkUnit activation change is complete.

### 6.12.34 EXTP4435

---

**extp: WARNING: EXTP4435: The process has stopped because JavaVM ran out of memory: WU=%s1 KIND=%d1 PSN=%d2 PID=%d3 SYSTEM=%s2**

**Variable Information**

%s1 = Work unit name

%d1 = Memory type code

%d2 = Process serial number

%d3 = Process number

%s2 = System name

**Explanation**

The IJServer was stopped because the JavaVM heap area was insufficient.

## System Action

Stops the IJServer process that caused the JavaVM heap shortage to occur, and restarts the IJServer process as many times as specified by the retry count in the Work Unit settings.

## User Action

If the problem occurs frequently, use the information in the following table to change the heap area specified in the JavaVM options.

Memory type code	Insufficient memory area, or meaning	Action
0	C heap area	<p>Reestimate the amount of memory needed to operate the IJServer, and check if sufficient memory is being made available.</p> <p>If there is enough memory for the IJServer to operate, there may not be enough memory for other applications.</p> <p>Reestimate the memory requirements of other applications running on the same machine and check if the amount of memory is sufficient.</p> <p>If the memory review reveals a memory shortage, contact the system administrator.</p> <p>The system administrator should increase the amount of main memory or expand the swap space.</p> <p>If the Java heap is larger than necessary, reduce the value specified by -Xmx or -XX:MaxPermSize.</p>
1	Java heap area	<p>Use the -Xmx JavaVM option to increase the maximum value of the Java heap area and then restart the IJServer.</p> <p>If an OutOfMemoryError occurs, examine the value of heap_size in the container information log (info.log) to determine the Java heap area.</p> <p>Even if heap_size is less than max_heap_size, the size of the heap can be insufficient in the following situations. The heap area should be increased in such cases.</p> <ul style="list-style-type: none"> <li>- When objects being generated are extremely large</li> <li>- When there is no contiguous heap area</li> </ul> <p>Example: To set the maximum heap size to 512 MB: -Xmx512m</p>
2	Java Permanent area	<p>Use the -XX:MaxPermSize JavaVM option to increase the maximum value of the Java permanent area, then restart the IJServer.</p> <p>If an OutOfMemoryError occurs, examine the value of perm_size in the container information log (info.log) to determine the Java permanent area.</p> <p>Example: To set the maximum heap size to 512 MB: -XX:MaxPermSize=512m</p>
-1	An array generation expression to be used during execution of a Java application was evaluated. It was then determined from the array length (the number of array elements) that there is not enough space to allocate the array objects, or there was insufficient memory during the class loading process.	<p>If the length (the number of array elements) of a defined array is adequate and the array's objects are in the order of 2 GB or more, reduce the length of the array.</p> <p>If the array length is suitable, consider the actions defined for a memory type code of 0.</p>

Memory type code	Insufficient memory area, or meaning	Action
A value less than -1	Unable to obtain information from the JavaVM	Refer to the value of heap_type in the container information log (info.log) to determine the memory type code.  Implement the above measures for the Java heap area, Java permanent area, or C heap area.

Note that detailed information about JavaVM heap area shortages will be output to the IJServer Container information log (info.log). Examine this information and make any adjustments that are necessary. Refer to "When an EXTP4435 or ISJEE\_OM1018 message is output" in the "Tuning Guide" for the format of detailed information.

Example of information output to the IJServer container information log (when the Java heap is insufficient)

```

:
-----
OutOfMemory Log
-----
pid=4636
heap_type=1
heap_size=136816
max_heap_size=4194304
perm_size=1811104
max_perm_size=67108864
requested_size=40000016
-----
VM is terminated by occurred OutOfMemoryError on Java heap.
"main" prio=6 tid=0x00036840 nid=0x254 runnable [0x0007f000..0x0007fbf8]
   at test.<init>(test.java:10)
   at test.main(test.java:5)

```

## 6.12.35 EXTP4436

**extp: ERROR: EXTP4436:Failed to create the internal resources: CODE='%s1' INFO=%d SYSTEM=%s2**

### Variable Information

- %s1: Error information
- %d: OS error information
- %s2: System name

### Explanation

Failed to create the internal resources.

### System Action

Continues system processing.

### User Action

If the OS error information is "21", "29", "30", "1392", or "1393", it means that input/output errors occurred. In this case, recover the disk used to install Interstage.

If the OS error information is "8", "14", or "1455", it means that there is insufficient memory. If this message is output frequently, refer to the "Tuning Guide", re-estimate the memory required for running Interstage, and check that there is enough available memory. If there is sufficient memory for Interstage, it may mean that there is insufficient memory for running other applications. Re-estimate the memory required for running other applications in the same server and check that there is enough.

If the OS error information is "112", it means that the file system capacity is insufficient. Secure available capacity for the file system.

**Solaris32/64 Linux32/64**

If the OS error information is "5", it means that input/output errors occurred. In this case, recover the disk used to install Interstage.

If the OS error information is "12", it means that the memory is insufficient. If this message is output frequently, refer to the "Tuning Guide", re-estimate the memory required for running Interstage, and check that there is enough available memory. If there is sufficient memory for Interstage, it may mean that there is insufficient memory for running other applications. Re-estimate the memory required for running other applications in the same server and check that there is enough.

If the OS error information is "23" or "24", it means that there are insufficient file descriptors. In this case, perform system tuning.

If the OS error information is "28", it means that the file system capacity is insufficient. Secure available capacity for the file system.

For details about other OS error information, refer to the intro(2) manual and take action according to the OS error number. If the cause of the problem cannot be determined, use the *iscollectinfo* command to collect investigation information. Send the error information to a Systems Engineer.

## 6.12.36 EXTP4437

---

**extp: ERROR: EXTP4437:Failed to delete the internal resources: CODE='%s1' INFO=%d SYSTEM=%s2**

### Variable Information

%s1: Error information

%d: OS error information

%s2: System name

### Explanation

Failed to delete the internal resources.

### System Action

Continues system processing.

### User Action

**Windows32/64**

Take action according to the OS error number. If the cause of the problem cannot be determined, use the *iscollectinfo* command to collect investigation information. Send the error information to a Systems Engineer.

**Solaris32/64 Linux32/64**

Refer to the intro(2) manual and take action according to the OS error number. If the cause of the problem cannot be determined, use the *iscollectinfo* command to collect investigation information. Send the error information to a Systems Engineer.

## 6.12.37 EXTP4438

---

**extp: ERROR: EXTP4438:Input/output trouble occurred: CODE='%s1' SYSTEM=%s2**

### Variable Information

%s1: Error information

%s2: System name

### Explanation

Input/output errors occurred.

### System Action

Continues system processing.

## User Action

Recover the disk used to install Interstage.

### 6.12.38 EXTP4440

---

**extp: ERROR: EXTP4440: The WorkUnit cannot start because the specified WorkUnit type is not supported: WU=%s1 KIND=%s2 SYSTEM=%s3**

#### Variable Information

%s1 = WorkUnit name

%s2 = WorkUnit type

%s3 = System name

#### Explanation

The EJB WorkUnit cannot start because it is not supported in this version.

#### System Action

Stops processing.

#### User Action

To use EJB WorkUnits, switch to an application that uses IIServers. For details on the migration procedure, refer to the "Migration Guide".

**Windows32/64**

If this message is output when Interstage starts, delete the automatic start settings for the WorkUnit to fix the automatic start settings file. When the description for the target WorkUnit is deleted from the WorkUnit automatic start settings file, the automatic start settings for the WorkUnit are deleted. For details on WorkUnit automatic start settings files, refer to "WorkUnit automatic start settings file" in the "OLTP Server Operator's Guide".

### 6.12.39 EXTP4441

---

**extp: ERROR: EXTP4441: The specified number of processes exceeded the maximum allowed. The number of processes cannot be dynamically changed: WU=%s1 USER=%s2 SYSTEM=%s3**

#### Variable Information

%s1 = WorkUnit name

%s2 = User name

%s3 = System name

#### Explanation

The current number of processes exceeds the allowable maximum. This maximum is limited by the current process concurrency setting.

#### System Action

Terminates the processing that is dynamically changing the number of processes.

#### User Action

The number of processes must be within the permitted range.

The maximum allowable value is twice the process concurrency setting in the WorkUnit configuration.

For example, if the process concurrency is 3, the maximum value is 6 (3x2).

This value is configured as the process concurrency in the WorkUnit configuration.

To configure this setting, stop the WorkUnit, change the process concurrency, then restart the WorkUnit.

## 6.12.40 EXTP4442

---

**extp: ERROR: EXTP4442: The specified process does not exist, therefore it cannot be stopped: WU=%s1 CODE='%s2' SYSTEM=%s3**

### Variable Information

%s1 = WorkUnit name

%s2 = Detail code

%s3 = System name

### Explanation

The process specified by the argument in the isstopaplproc command does not exist.

### System Action

Aborts the isstopaplproc command processing.

### User Action

Check the ID or serial number of the process that was being stopped, then try to stop it again.

The process ID and serial number can be checked using either of the following:

- The WorkUnit > [workunit name] > Monitor tab of the Interstage Management Console
- The islistaplproc command (process IDs only).

## 6.12.41 EXTP4443

---

**extp: ERROR: EXTP4443: The specified application is running using a concurrency of 1. The process stop functionality cannot be used for such applications: WU=%s1 USER=%s2 SYSTEM=%s3**

### Variable Information

%s1 = WorkUnit name

%s2 = User name

%s3 = System name

### Explanation

Process concurrency for the application is currently set to 1, so the process cannot be stopped using the process stop functionality.

### System Action

Aborts isstopaplproc command processing.

### User Action

Change the process concurrency to 2 or more to be able stop individual processes.

## 6.12.42 EXTP4444

---

**extp: INFO: EXTP4444: A process was stopped using the process stop functionality: WU=%s1 PSN=%d1 PID=%d2 SYSTEM=%s2**

### Variable Information

%s1 = WorkUnit name

%d1 = Process serial number

%d2 = Process ID

%s2 = System name

## Explanation

The process specified by the argument of the `isstopaplproc` command was successfully stopped.

## 6.12.43 EXTP4445

---

**extp: ERROR: EXTP4445: An attempt to stop a process using the process stop functionality failed: WU=%s1 USER=%s2 SYSTEM=%s3**

### Variable Information

%s1 = WorkUnit name

%s2 = User name

%s3 = System name

### Explanation

An attempt to stop the process specified as an argument of the `isstopaplproc` command failed.

### System Action

Aborts `isstopaplproc` command processing.

### User Action

**Windows32/64**

Fix the problem as described by 'Action' in the event log message listed before this message, then re-execute the command.

**Solaris32/64 Linux32/64**

Fix the problem as described by 'Action' in the console message displayed before this message, then re-execute the command.

## 6.12.44 EXTP4450

---

**extp: ERROR: EXTP4450:A memory shortage occurred: CODE='%s1' SYSTEM=%s2**

### Variable Information

%s1 = Error information

%s2 = System name

### Explanation

Insufficient memory.

### System Action

Stops the processing.

### User Action

Execute the process again later. If this message is generated frequently, refer to the Tuning Guide, re-estimate the memory that is needed to run Interstage, and confirm that there is enough memory.

If there is enough memory to run Interstage, there may be inadequate memory to run other applications. Re-estimate the amount of memory needed for the other applications running on the same machine to determine if there is an appropriate amount of memory.

Contact your system administrator if the re-estimation indicates that the memory is insufficient. Ask the system administrator to either increase the size of the main memory or to increase the size of the page file.

## 6.12.45 EXTP4451

---

**extp: ERROR: EXTP4451:A system resource shortage occurred: SYSTEM=%s**

## Variable Information

%s = System name

## Explanation

Insufficient component transaction service system resources.

## System Action

Stops the processing.

## User Action

Wait a short period of time, then re-execute the process. If this message appears frequently, contact your software supplier.

## 6.12.46 EXTP4452

---

**extp: ERROR: EXTP4452: A system resource shortage occurred: SYSTEM=%s**

## Variable Information

%s = System name

## Explanation

Insufficient operating system resources.

## System Action

Stops the processing.

## User Action

Change the system parameter by referring to the Tuning Guide, and reboot the system.

Then re-execute the process.

## 6.12.47 EXTP4498

---

**extp: ERROR: EXTP4498:Some errors occurred: WU=%s1 USER=%s2 SYSTEM=%s3**

## Variable Information

%s1 = WorkUnit name

%s2 = User name

%s3 = System name

## Explanation

An unknown error occurred.

## System Action

Stops the processing.

## User Action

If the application language set up with the WorkUnit definition is Java, check whether the CLASSPATH environment variable is set correctly.

Carry out the actions described in the previous event log message, or the standard error output message.

Also confirm that the correct library is being linked with the file which can be carried out when the application language to set up with WorkUnit definition is C++. In the case of an EJB application, the maximum amount of memory space for the EJB application specified in the WorkUnit definitions may be incorrect.

If this message continues to be output after the action, use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer.

## 6.12.48 EXTP4499

---

**extp: ERROR: EXTP4499:A system error occurred: CODE='%s1' INFO='%s2' SYSTEM=%s3**

### Variable Information

%s1 = Error information 1

%s2 = Error information 2

%s3 = System name

### Explanation

A system error has occurred, or there is insufficient memory.

### System Action

Stops the Component Transaction Service

### User Action

If there is a memory shortage, refer to the Tuning Guide and re-estimate the amount of memory required to run Interstage. Check whether there is enough memory.

If there is enough memory to run Interstage, there may be inadequate memory to run other applications. Re-estimate the amount of memory required for the other applications running on the same machine to determine if there is an appropriate amount of memory.

Contact your system administrator if the re-estimation indicates that the memory is insufficient. Ask the system administrator to either increase the size of the main memory or to increase the size of the page file.

If this message continues to be output after the action, use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer.

For a CORBA application, take the action indicated in the event log message output immediately before this message or in the message output to the standard error output.

If no message is output immediately before this message, the CORBA application may have been terminated before the CORBA application activates the server (for C, issues CORBA\_BOA\_impl\_is\_ready; for other languages, see "Application Development Guide (CORBA Service Edition)"). Review the application logic.

If the cause is other than the above, use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer.

For a CORBA application, take the action indicated in the event log message output immediately before this message or in the message output to the standard error output.

If no message is output immediately before this message, the CORBA application may have been terminated before the CORBA application activates the server (for C, issues CORBA\_BOA\_impl\_is\_ready; for other languages, see "Application Development Guide (CORBA Service Edition)"). Review the application logic.

## 6.13 EXTP4500 to EXTP4599

---

### 6.13.1 EXTP4501

---

**extp: ERROR: EXTP4501: A system error occurred: CODE='%s1' SYSTEM=%s2**

### Variable Information

%s1 = Error information

%s2 = System name

## Explanation

A system error has occurred, the system load is too heavy to continue processing, or there is not enough memory.

## System Action

Stops the processing.

## User Action

Carry out the actions described in the previous event log message, or the standard error output message. If such a message is not displayed, re-execute the process later.

If there is a memory shortage, refer to the Tuning Guide and re-estimate the amount of memory required to run Interstage. Check whether there is enough memory.

If there is enough memory to run Interstage, there may be inadequate memory to run other applications. Re-estimate the amount of memory required for the other applications running on the same machine to determine if there is an appropriate amount of memory.

Contact your system administrator if the re-estimation indicates that the memory is insufficient. Ask the system administrator to either increase the size of the main memory or to increase the size of the page file.

Use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer.

## 6.13.2 EXTP4502

---

**extp: ERROR: EXTP4502: A memory shortage occurred: CODE='%s1' SYSTEM=%s2**

### Variable Information

%s1 = Error information

%s2 = System name

### Explanation

Insufficient memory.

### System Action

Stops the processing.

### User Action

Execute the process again later. If this message is generated frequently, refer to the Tuning Guide, re-estimate the memory that is needed to run Interstage, and confirm that there is enough memory.

If there is enough memory to run Interstage, there may be inadequate memory to run other applications. Re-estimate the amount of memory needed for the other applications running on the same machine to determine if there is an appropriate amount of memory.

Contact your system administrator if the re-estimation indicates that the memory is insufficient. Ask the system administrator to either increase the size of the main memory or to increase the size of the page file.

## 6.13.3 EXTP4503

---

**extp: ERROR: EXTP4503: System resource shortage occurred: CODE='%s1' SYSTEM=%s2**

### Variable Information

%s1 = Error information

%s2 = System name

### Explanation

Insufficient Component Transaction Service system resources.

## System Action

Stops the processing.

## User Action

If the cause is other than the above, use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer.

## 6.13.4 EXTP4504

---

**extp: ERROR: EXTP4504: An I/O error has occurred: FILE=%s1 CODE=%s2' SYSTEM=%s3**

### Variable Information

%s1 = Filename

%s2 = Error information

%s3 = System name

### Explanation

An I/O error has occurred.

### System Action

Stops the processing.

### User Action

If this message appears frequently, terminate the WorkUnit and check the disk containing the file where the I/O error occurred. If the file name is not displayed, restore the disk device on which Interstage is installed.

## 6.13.5 EXTP4505

---

**extp: ERROR: EXTP4505: Abnormality occurred by the execution processing of the exit program: CODE=%s1' WU=%s2 TYPE=%s3' PROGRAM=%s4 PID=%d USER=%s5 SYSTEM=%s6**

### Variable Information

%s1 = Error information

%s2 = WorkUnit name

%s3 = Exit program type

%s4 = Exit program name

%d = Process ID

%s5 = WorkUnit startup user name

%s6 = System name

Table 6.3 Exit Program Type

Exit Program Type Displayed in Variable Information	Corresponding Exit Program Type
WorkUnit exit program	WorkUnit exit program
Application process resource recovery exit program	Application process resource recovery program
Application process stop program	Application process stop program

### Explanation

An error occurred while executing the exit program.

## System Action

Stops the processing.

## User Action

Take the action indicated by the event log message displayed immediately before this message. If such a message is not displayed, contact your software supplier.

## 6.13.6 EXTP4506

---

**extp: ERROR: EXTP4506: It failed in the creation of the process which calls the exit program: ERRNO=%d ERRSTRING='%s1' WU=%s2 TYPE='%s3' PROGRAM=%s4 USER=%s5 SYSTEM=%s6**

### Variable Information

%d = System call error number

%s1 = Error information

%s2 = WorkUnit name

%s3 = Exit program type

%s4 = Exit program name

%s5 = WorkUnit startup user name

%s6 = System name

### Exit Program Type

Refer to the exit program type list in the EXTP4505 message.

### Explanation

An error occurred while generating a process for calling the exit program.

### System Action

Stops the processing.

### User Action

Resolve the problems described in the Error information.

If there is a memory shortage, refer to the Tuning Guide and re-estimate the amount of memory required to run Interstage. Check whether there is enough memory.

If there is enough memory to run Interstage, there may be inadequate memory to run other applications. Re-estimate the amount of memory required for the other applications running on the same machine to determine if there is an appropriate amount of memory.

Contact your system administrator if the re-estimation indicates that the memory is insufficient. Ask the system administrator to either increase the size of the main memory or to increase the size of the page file.

If the cause is other than the above, use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer.

## 6.13.7 EXTP4507

---

**extp: ERROR: EXTP4507: File specified in the work unit definition or directory does not exist: FILE=%s1 WU=%s2 PID=%d USER=%s3 SYSTEM=%s4**

### Variable Information

%s1 = Filename

%s2 = WorkUnit name

%d = Process ID

%s3 = WorkUnit startup user name

%s4 = System name

### Explanation

Either the file or folder specified in the WorkUnit definition does not exist, or there is insufficient available disk space for the current directory specified in the WorkUnit definition.

### System Action

Stops the processing.

### User Action

Based on the cause, either create the required file or folder, then re-execute the process; or secure sufficient disk space for the current directory specified in the WorkUnit definition.

## 6.13.8 EXTP4508

---

**extp: ERROR: EXTP4508: An abnormality occurred when opening the exit program execution file: FILE=%s1 ERRSTRING='%s2' WU='%s3' TYPE='%s4' PID=%d USER='%s5' SYSTEM='%s6'**

### Variable Information

%s1 = Name of executable file for exit program

%s2 = Error information

%s3 = WorkUnit name

%s4 = Exit program type

%d = Process ID

%s5 = WorkUnit startup user name

%s6 = System name

### Exit Program Type

Refer to the exit program type list in the EXTP4505 message.

### Explanation

Opening the executable file caused an error for one of the following reasons:

- The exit program executable file could not be found in the folder set in the WorkUnit definition application library path.
- The library used by the application is not linked to the exit program executable file.
- The path of the library used by the exit program is not set for the library used by the application in the WorkUnit definition.
- Other reasons.

### System Action

Stops the processing.

### User Action

For errors described in [Explanation] above, resolve the associated problems then re-execute the processing.

For other errors, resolve the problems described in the system call error number.

## 6.13.9 EXTP4509

---

**extp: ERROR: EXTP4509: The exit program does not exist in the exit program execution file: PROGRAM=%s1 FILE=%s2 ERRSTRING='%s3' WU='%s4' TYPE='%s5' PID=%d USER='%s6' SYSTEM='%s7'**

## Variable Information

%s1 = Exit program name  
%s2 = Name of executable file for exit program  
%s3 = Error information  
%s4 = WorkUnit name  
%s5 = Exit program type  
%d = Process ID  
%s6 = WorkUnit startup user name  
%s7 = System name

## Exit Program Type

Refer to the exit program type list in the EXTP4505 message.

## Explanation

A symbol of the exit program does not exist in the exit program execution file.

## System Action

Stops the processing.

## User Action

Check that the WorkUnit definition is correct and that the exit program execution file has been created correctly.

## 6.13.10 EXTP4510

---

**extp: ERROR: EXTP4510: Exit program quit abnormally: WU=%s1 TYPE='%s2' PROGRAM=%s3 PID=%d  
USER=%s4 SYSTEM=%s5**

## Variable Information

%s1 = WorkUnit name  
%s2 = Exit program type  
%s3 = Exit program name  
%d = Process ID  
%s4 = WorkUnit startup user name  
%s5 = System name

## Exit Program Type

Refer to the exit program type list in the EXTP4505 message.

## Explanation

The exit program has terminated abnormally.

## System Action

Stops the processing.

## User Action

Determine why the application terminated abnormally, by referring to the previous event log message. If no previous event log message is displayed, an application error may have occurred. Check the application, and eliminate the cause of the error, and then execute the process again.

## 6.13.11 EXTP4511

---

**extp: ERROR: EXTP4511: Exit program returned abnormally: ECODE=%d1 WU=%s1 TYPE='%s2' PROGRAM=%s3 PID=%d2 USER=%s4 SYSTEM=%s5**

### Variable Information

%d1 : Return code specified by the exit program

%s1 = WorkUnit name

%s2 = Exit program type

%s3 = Exit program name

%d2 = Process ID

%s4 = WorkUnit startup user name

%s5 = System name

### Exit Program Type

Refer to the exit program type list in the EXTP4505 message.

### Explanation

The exit program returned abnormally.

### System Action

Stops the processing.

### User Action

Use the return code specified by the exit program to determine why the exit program terminated abnormally, eliminate the cause of the error, and re-execute the process.

## 6.13.12 EXTP4512

---

**extp: ERROR: EXTP4512: Exit program processing time exceeded the observation time: WU=%s1 TYPE='%s2' PROGRAM=%s3 PID=%d USER=%s4 SYSTEM=%s5**

### Variable Information

%s1 = WorkUnit name

%s2 = Exit program type

%s3 = Exit program name

%d = Process ID

%s4 = WorkUnit startup user name

%s5 = System name

### Exit Program Type

Refer to the exit program type list in the EXTP4505 message.

### Explanation

The exit program terminated abnormally because the exit program processing time exceeded the monitoring time.

### System Action

Stops the processing.

## User Action

A bug may have increased the exit program processing time. Check the exit program, remove the possible cause of the error and re-execute the program. If the cause of the error is still unknown, contact your software supplier.

## 6.13.13 EXTP4513

---

**extp: ERROR: EXTP4513: An error was detected during a system call: CODE='%s1' SYSTEM CALL=%s2 ERRNO=%d SYSNAME=%s3**

### Variable Information

%s1 = Error information

%s2 = System call name

%d = System call error number

%s3 = System name

### Explanation

An error was detected during a system call.

### System Action

Stops the processing.

### User Action

Take the appropriate action based on the system call error number. Contact your software supplier if the cause cannot be identified.

## 6.14 EXTP4600 to EXTP4699

---

This section details the messages with message numbers between EXTP4600 and EXTP4699.

### 6.14.1 EXTP4601

---

**extp: ERROR: EXTP4601: APM terminated due to a system error: CODE='%s1' WU=%s2 PID=%d SYSTEM=%s3**

### Variable Information

%s1 = Detail code

%s2 = WorkUnit name

%d = Process ID

%s3 = System name

### Explanation

A system error has occurred, the system load is too heavy to continue processing, or there is not enough memory.

### System Action

Stops the processing.

### User Action

Carry out the actions described in the previous event log message, or the standard error output message. If such a message is not displayed, execute the process again later.

If there is a memory shortage, refer to the Tuning Guide and re-estimate the amount of memory required to run Interstage. Check whether there is enough memory.

If there is enough memory to run Interstage, there may be inadequate memory to run other applications. Re-estimate the amount of memory required for the other applications running on the same machine to determine if there is an appropriate amount of memory.

Contact your system administrator if the re-estimation indicates that the memory is insufficient. Ask the system administrator to either increase the size of the main memory or to increase the size of the page file.

If this message appears frequently, contact your software supplier.

## 6.14.2 EXTP4602

---

**extp: ERROR: EXTP4602:Work unit terminated due to a system error: CODE='%s1' WU=%s2 PID=%d SYSTEM=%s3**

### Variable Information

%s1 = Error information

%s2 = WorkUnit name

%d = Process ID

%s3 = System name

### Explanation

A system error has occurred.

### System Action

Stops the WorkUnit.

### User Action

Carry out the actions described in the previous event log message, or the standard error output message. If the message is not displayed, contact your software supplier.

## 6.14.3 EXTP4603

---

**extp: ERROR: EXTP4603:System terminated due to a system error: CODE='%s1' WU=%s2 PID=%d SYSTEM=%s3**

### Variable Information

%s1 = Error information

%s2 = WorkUnit name

%d = Process ID

%s3 = System name

### Explanation

A system error has occurred.

### System Action

Stops the Component Transaction Service

### User Action

Carry out the actions described in the previous event log message, or the standard error output message. If the message is not displayed, contact your software supplier.

## 6.14.4 EXTP4610

---

---

**extp: ERROR: EXTP4610:Permission to access is not granted: FILE=%s1 WU=%s2 USER=%s3 PID=%d SYSTEM=%s4**

#### Variable Information

%s1 = Filename  
%s2 = WorkUnit name  
%s3 = User name  
%d = Process ID  
%s4 = System name

#### Explanation

The user does not have access permission to the file.

#### System Action

Stops the processing.

#### User Action

Set the access permission to the file. When the right to access is in a file, please check whether the current folder is accessed by Windows Explorer etc., and when you have accessed, end Windows Explorer etc. Then re-execute the process.

### 6.14.5 EXTP4611

---

**extp: ERROR: EXTP4611:A memory shortage occurred: CODE='%s1' WU=%s2 USER=%s3 PID=%d SYSTEM=%s4**

#### Variable Information

%s1 = Error information  
%s2 = WorkUnit name  
%s3 = User name  
%d = Process ID  
%s4 = System name

#### Explanation

Either insufficient memory, or an error occurred in setting the WorkUnit definition environment variables.

#### System Action

Stops the processing. There may be no command response if the WorkUnit is being started.

#### User Action

Execute the process again later. If this message is generated frequently, refer to the Tuning Guide, re-estimate the memory that is needed to run Interstage, and confirm that there is enough memory.

If there is enough memory to run Interstage, there may be inadequate memory to run other applications. Re-estimate the amount of memory needed for the other applications running on the same machine to determine if there is an appropriate amount of memory.

Contact your system administrator if the re-estimation indicates that the memory is insufficient. Ask the system administrator to either increase the size of the main memory or to increase the size of the page file.

Verify that the correct syntax is used for the environment variables defined in the WorkUnit definition, correct them if necessary, then re-execute the process.

If there is no command response, restart Interstage.

## 6.14.6 EXTP4612

---

**extp: ERROR: EXTP4612:File specified in the work unit definition or directory does not exist: FILE=%s1 WU=%s2 USER=%s3 PID=%d SYSTEM=%s4**

### Variable Information

%s1 = Filename  
%s2 = WorkUnit name  
%s3 = User name  
%d = Process ID  
%s4 = System name

### Explanation

The file or folder specified in the WorkUnit definition does not exist.

### System Action

Stops the processing.

### User Action

Create the file or folder, then re-execute the process.

## 6.14.7 EXTP4613

---

**extp: ERROR: EXTP4613:An I/O error has occurred: FILE=%s1 WU=%s2 USER=%s3 PID=%d SYSTEM=%s4**

### Variable Information

%s1 = Filename  
%s2 = WorkUnit name  
%s3 = User name  
%d = Process ID  
%s4 = System name

### Explanation

An I/O error occurred.

### System Action

Stops the processing.

### User Action

If this message appears frequently, terminate the WorkUnit and check the disk containing the file where the I/O error occurred. If the file name is not displayed, restore the disk device on which Interstage is installed.

## 6.14.8 EXTP4620

---

**extp: ERROR: EXTP4620:COBOL runtime library cannot be found: ERRSTRING='%s1' WU=%s2 USER=%s3 PID=%d SYSTEM=%s4**

### Variable Information

%s1 = Error information  
%s2 = WorkUnit name

%s3 = User name  
%d = Process ID  
%s4 = System name

#### Explanation

An error has occurred in the COBOL runtime library open process.

#### System Action

Stops the processing.

#### User Action

Check that the COBOL runtime system is properly installed. If it is, check that the COBOL runtime library path is set to the Environment Variable PATH. If the path is not properly set, set the COBOL runtime library path, then re-execute the processing. If it is set properly, resolve the problem described in the Error information (%s1).

### 6.14.9 EXTP4621

---

**extp: ERROR: EXTP4621:Specified destination name (object name) contains an error: DEST=%s1 WU=%s2 USER=%s3 SYSTEM=%s4**

#### Variable Information

%s1 = Destination name (Object name)  
%s2 = WorkUnit name  
%s3 = User name  
%s4 = System name

#### Explanation

The specified destination name (object name) is invalid.

#### System Action

Terminates APM startup.

#### User Action

Set a valid destination name (object name), then restart the APM.

### 6.14.10 EXTP4622

---

**extp: ERROR: EXTP4622:Specified APM module name contains an error: APM=%s1 SYSTEM=%s2**

#### Variable Information

%s1 = APM module name  
%s2 = System name

#### Explanation

The APM module name is invalid.

#### System Action

Terminates APM startup.

#### User Action

Specify a valid APM module name, then restart the APM.

## 6.14.11 EXTP4623

---

**extp: ERROR: EXTP4623: The work unit has not started or the specified work unit name contains an error: WU=%s1 USER=%s2 SYSTEM=%s3**

### Variable Information

%s1 = WorkUnit name

%s2 = User name

%s3 = System name

### Explanation

Either the WorkUnit is not started, or the specified WorkUnit name is invalid.

### System Action

Terminates APM startup.

### User Action

If the WorkUnit is not started, restart the APM with the -d option. If the WorkUnit name is invalid, specify a valid WorkUnit name, then restart the APM.

## 6.14.12 EXTP4624

---

**extp: ERROR: EXTP4624: A parameter error occurred at APM startup: APM=%s1 SYSTEM=%s2 WU=%s3 DEST=%s4 MODE=%s5**

### Variable Information

%s1 = APM module name

%s2 = System name

%s3 = WorkUnit name

%s4 = Destination name (Object name)

%s5 = Operating system type

### Explanation

The APM start parameters are invalid.

### System Action

Terminates APM startup.

### User Action

Restart the APM with valid parameters.

## 6.14.13 EXTP4630

---

**extp: ERROR: EXTP4630: System has not started or there is an error in the specified system name: SYSTEM=%s**

### Variable Information

%s = System name

### Explanation

Either the system is not started, or the system name is not valid.

## System Action

Terminates APM startup.

## User Action

If the Component Transaction Service is not started, start the Component Transaction Service, start the WorkUnit with the -d option, then restart the APM. If the Component Transaction Service is already started, specify the correct system name, then restart the APM.

## 6.14.14 EXTP4631

---

**extp: ERROR: EXTP4631:The specified work unit is not a work unit started with the -d option specified: WU=%s1 SYSTEM=%s2**

### Variable Information

%s1 = WorkUnit name

%s2 = System name

### Explanation

The APM did not start due to one of the following reasons:

- The specified WorkUnit was not started with the -d option.
- The WorkUnit for the wrapper was specified.

## System Action

Terminates APM startup.

## User Action

Resolve the error, then restart the APM.

## 6.14.15 EXTP4640

---

**extp: ERROR: EXTP4640:An abnormality occurred when opening the execution file: FILE=%s1 ERRSTRING='%s2' WU=%s3 USER=%s4 PID=%d SYSTEM=%s5**

### Variable Information

%s1 = Filename

%s2 = Error information

%s3 = WorkUnit name

%s4 = User name

%d = Process ID

%s5 = System name

### Explanation

Opening the executable file caused an error due to one of the following reasons:

- The executable file could not be found in the folder set in the WorkUnit definition application library path.
- The library used by the application is not linked to the executable file.
- The path of the library used by the application and exit program is not set for the library used by the application in the WorkUnit definition.
- It is possible that the executable or a library linked to the executable was incorrectly built in debug mode. When debug mode is specified for program build, the module for debugging Windows (e.g. MSVCRTD.DLL) is linked. This error is generated when

the WorkUnit is run in an environment where neither Microsoft(R) Visual C++ nor Microsoft(R) Visual C++ .NET is installed and the module for debugging Windows does not exist. The build must be performed in release mode.

#### System Action

Stops the processing.

#### User Action

For errors described in [Explanation], above, resolve the problems described therein, then re-execute the processing.

For other errors, resolve the problems described in the Error information (%s2).

### 6.14.16 EXTP4641

---

**extp: ERROR: EXTP4641:Function specified by the work unit definition does not exist: FUNC=%s1 FILE=%s2 ERRSTRING=%s3' WU=%s4 USER=%s5 PID=%d SYSTEM=%s6**

#### Variable Information

%s1 = Function name

%s2 = Filename

%s3 = Error information

%s4 = WorkUnit name

%s5 = User name

%d = Process ID

%s6 = System name

#### Explanation

The function specified in the WorkUnit definition does not exist in the executable file.

#### System Action

Stops the processing.

#### User Action

Resolve the problems described in the Error information (%s3).

### 6.14.17 EXTP4642

---

**extp: ERROR: EXTP4642:System resource shortage occurred: CODE='%s1' WU=%s2 USER=%s3 PID=%d SYSTEM=%s4**

#### Variable Information

%s1 = Error information

%s2 = WorkUnit name

%s3 = User name

%d = Process ID

%s4 = System name

#### Explanation

A shortage occurred in the communication buffer of the transaction application.

#### System Action

Stops the processing.

## User Action

If this message appears frequently, the number of communication buffers for the transaction application may be insufficient. Refer to the Tuning Guide and modify the environment definition of the component transaction service to correct the number of communication buffers.

## 6.14.18 EXTP4643

---

**extp: ERROR: EXTP4643:An abnormality occurred when opening the exit program execution file: FILE=%s1 ERRSTRING='%s2' WU=%s3 USER=%s4 PID=%d SYSTEM=%s5**

### Variable Information

%s1 = Name of executable file for exit program

%s2 = Error information

%s3 = WorkUnit name

%s4 = User name

%d = Process ID

%s5 = System name

### Explanation

An error occurred in open process of the exit program executable file.

### System Action

Stops the processing.

### User Action

Resolve the problems described in the Error information (%s2).

## 6.14.19 EXTP4644

---

**extp: ERROR: EXTP4644:No skeletons exist for the specified execution file: FILE=%s1 ERRSTRING='%s2' WU=%s3 USER=%s4 PID=%d SYSTEM=%s5**

### Variable Information

%s1 = Name of executable file for exit program

%s2 = Error information

%s3 = WorkUnit name

%s4 = User name

%d = Process ID

%s5 = System name

### Explanation

The skeleton does not exist in the specified executable file.

### System Action

Stops the processing.

### User Action

Link the skeleton when creating the application, then re-execute the processing. If the skeleton is already linked to the application, resolve the problems described in the Error information (%s2).

## 6.14.20 EXTP4645

---

**extp: ERROR: EXTP4645:An abnormality occurred when opening the abnormal exit program execution file: FILE=%s1 ERRSTRING='%s2' WU=%s3 USER=%s4 PID=%d SYSTEM=%s5**

### Variable Information

%s1 = Abnormal exit program executable filename

%s2 = Error Information

%s3 = WorkUnit name

%s4 = User name

%d = Process ID

%s5 = System name

### Explanation

An abnormality occurred while opening an abnormal exit program executable file.

### System Action

Stops the processing.

### User Action

Resolve the problems described in the Error information (%s2).

## 6.14.21 EXTP4646

---

**extp: ERROR: EXTP4646:An abnormality occurred when starting the execution file: FILE=%s1 WU=%s2 SYSTEM=%s3 ERRNO=%d**

### Variable Information

%s1 = Executable filename

%s2 = WorkUnit name

%s3 = System Name

%d = System call error number

### Explanation

An abnormality occurred in the executable file start process, due to the following causes:

The executable file does not exist in the folder set in the application library path of WorkUnit definition.

The library to be used by the application is not linked to the executable file.

The library path to be used by the application is not set to the application usage library of the WorkUnit definition.

The user does not have access permission to the executable file.

Other errors.

### System Action

Stops the processing.

### User Action

For errors described in [Explanation], above, resolve the problems described therein, then re-execute the processing.

For other errors, resolve the problems described in the system call error number.

## 6.14.22 EXTP4656

---

**extp: ERROR: EXTP4656:Application quit abnormally: DEST=%s1 WU=%s2 USER=%s3 PID=%d SYSTEM=%s4**

### Variable Information

%s1 = Destination name (Object name)

%s2 = WorkUnit name

%s3 = User name

%d = Process ID

%s4 = System name

### Explanation

The application terminated abnormally.

### System Action

Stops the APM.

### User Action

Determine why the application terminated abnormally, from the previous event log message. If no previous event log message is displayed, an application error can be considered. Check the application, and if the cause of the error is still unknown, contact your software supplier.

## 6.14.23 EXTP4657

---

**extp: ERROR: EXTP4657:Application processing time exceeded the observation time: DEST=%s1 WU=%s2 USER=%s3 PID=%d SYSTEM=%s4**

### Variable Information

%s1 = Destination name (Object name)

%s2 = WorkUnit name

%s3 = User name

%d = Process ID

%s4 = System name

### Explanation

The application terminated due to an application observation timeout.

### System Action

Stops the APM.

### User Action

Reset the observation time based on server system performance. A bug may be responsible for lengthening the application processing time. Check the application and eliminate the cause of the error, and then re-execute the process.

## 6.14.24 EXTP4659

---

**extp: ERROR: EXTP4659:Pre-exit program quit abnormally: DEST=%s1 WU=%s2 USER=%s3 PID=%d SYSTEM=%s4**

### Variable Information

%s1 = Destination name (Object name)

%s2 = WorkUnit name

%s3 = User name

%d = Process ID

%s4 = System name

#### Explanation

The pre-exit program terminated abnormally.

#### System Action

Stops the processing.

#### User Action

Determine why the pre-exit program terminated abnormally, from the previous event log message. If no previous event log message is displayed, a pre-exit program error can be considered. Check the pre-exit program, and eliminate the cause of the error, and then execute the process again.

### 6.14.25 EXTP4660

---

**extp: ERROR: EXTP4660:Pre-exit program processing time exceeded the observation time: DEST=%s1 WU=%s2 USER=%s3 PID=%d SYSTEM=%s4**

#### Variable Information

%s1 = Destination name (Object name)

%s2 = WorkUnit name

%s3 = User name

%d = Process ID

%s4 = System name

#### Explanation

The pre-exit program terminated abnormally due to an observation timeout.

#### System Action

Stops the processing.

#### User Action

Reset the observation time based on server system performance. A bug may be responsible for lengthening the pre-exit program processing time. Check the pre-exit program, and eliminate the cause of the error, and then execute the process again.

### 6.14.26 EXTP4661

---

**extp: ERROR: EXTP4661:Pre-exit program returned abnormally: ECODE=%d1 DEST=%s1 WU=%s2 USER=%s3 PID=%d2 SYSTEM=%s4**

#### Variable Information

%d1 : Returned code specified by pre-exit program

%s1 = Destination name (Object name)

%s2 = WorkUnit name

%s3 = User name

%d2 = Process ID

%s4 = System name

## Explanation

The pre-exit program terminated abnormally.

## System Action

Stops the processing.

## User Action

Determine the cause of the abnormal termination from the return code.

## 6.14.27 EXTP4662

---

**extp: ERROR: EXTP4662:Post-exit program quit abnormally: DEST=%s1 WU=%s2 USER=%s3 PID=%d SYSTEM=%s4**

### Variable Information

%s1 = Destination name (Object name)

%s2 = WorkUnit name

%s3 = User name

%d = Process ID

%s4 = System name

## Explanation

The post exit program terminated abnormally.

## System Action

Stops the WorkUnit or APM.

## User Action

Determine why the post exit program terminated abnormally, from the previous event log message. If no previous event log message is displayed, a post exit program error can be considered. Check the post exit program, and eliminate the cause of the error, and then execute the process again.

## 6.14.28 EXTP4663

---

**extp: ERROR: EXTP4663:Post-exit program processing time exceeded the observation time: DEST=%s1 WU=%s2 USER=%s3 PID=%d SYSTEM=%s4**

### Variable Information

%s1 = Destination name (Object name)

%s2 = WorkUnit name

%s3 = User name

%d = Process ID

%s4 = System name

## Explanation

The post exit program terminated abnormally due to an observation timeout.

## System Action

APM or WorkUnit is forcibly terminated.

## User Action

Reset the observation time based on server system performance. A bug may be responsible for lengthening the post exit program processing time. Check the post exit program and eliminate the cause of the error, and then execute the process again.

### 6.14.29 EXTP4664

---

**extp: ERROR: EXTP4664:Post-exit program returned abnormally: ECODE=%d DEST=%s1 WU=%s2 USER=%s3 PID=%d SYSTEM=%s4**

#### Variable Information

%d1 = Returned code specified by post exit program

%s1 = Destination name (Object name)

%s2 = WorkUnit name

%s3 = User name

%d2 = Process ID

%s4 = System name

#### Explanation

The post exit program terminated abnormally.

#### System Action

Stops the WorkUnit or APM.

#### User Action

Determine the cause of the abnormal termination from the return code.

### 6.14.30 EXTP4665

---

**extp: ERROR: EXTP4665: Abnormal exit program quit abnormally: DEST=%s1 WU=%s2 USER=%s3 PID=%d SYSTEM=%s4**

#### Variable Information

%s1 = Destination (Object Name)

%s2 = WorkUnit Name

%s3 = User Name

%d = Process ID

%s4 = Work System Name

#### Explanation

Error exit program terminated in error.

#### System Action

Stops the APM.

#### User Action

Follow the event log message output immediately preceding the error to investigate the cause of the error in the error exit program. If no message was output immediately preceding the error, there may be an error in the error exit program. Review the error exit program, remove the cause of the error, and execute the process again.

### 6.14.31 EXTP4666

---

---

**extp: ERROR: EXTP4666: Abnormal exit program returned abnormally: ECODE=%d1 DEST=%s1 WU=%s2 USER=%s3 PID=%d2 SYSTEM=%s4**

**Variable Information**

- %s1 = Destination Name (Object Name)
- %s2 = WorkUnit Name
- %s3 = User Name
- %d = Process ID
- %s4 = System Name

**Explanation**

The error exit program terminated in error because the error exit program processing time exceeded the observation time.

**System Action**

Stops the APM.

**User Action**

After re-estimating the observation time in view of the system performance on the server, change the WorkUnit definition exit program maximum processing time and perform the processing again.

An error in the error exit program could also have caused the error exit program processing time to overrun. Review the error exit program, fix the cause of the error, and then execute the process again.

---

### 6.14.32 EXTP4667

---

**extp: ERROR: EXTP4667: Abnormal exit program returned abnormally: ECODE=%d1 DEST=%s1 WU=%s2 USER=%s3 PID=%d2 SYSTEM=%s4**

**Variable Information**

- %d1 = Return Code Indicated by the Error Exit Program
- %s1 = Destination Name(Object Name)
- %s2 = WorkUnit Name
- %s3 = User Name
- %d2 = Process ID
- %s4 = System Name

**Explanation**

The error exit program returned an error.

**System Action**

Stops the APM.

**User Action**

Use the return code indicated by the error exit program to research the reason why the error exit program terminated in an error, eliminate the cause of the error, and then execute the process again.

---

### 6.14.33 EXTP4668

---

**extp: ERROR: EXTP4668: Return post-exit program quit abnormally:DEST=%s1 WU=%s2 USER=%s3 PID=%d SYSTEM=%s4**

### Variable Information

%s1 = Destination Name (object name)

%s2 = WorkUnit Name

%s3 = User Name

%d = Process ID

%s4 = System Name

### Explanation

The return post-exit program terminated abnormally.

### System Action

Stops the APM or WorkUnit.

### User Action

Carry out the action described in the preceding event log message to determine the cause of the abnormal termination. If there is no preceding event log message, the return post-exit program may contain an error. Check the return post-exit program, remove the cause of the error and re-execute processing.

## 6.14.34 EXTP4669

---

**extp: ERROR: EXTP4669: Return post-exit program processing time exceeded the observation time:DEST=%s1 WU=%s2 USER=%s3 PID=%d SYSTEM=%s4**

### Variable Information

%s1 = Destination Name (object name)

%s2 = WorkUnit Name

%s3 = User Name

%d = Process ID

%s4 = System Name

### Explanation

The return post-exit program terminated abnormally because the return post-exit program processing time exceeded the monitoring time.

### System Action

Forcibly stops the APM or WorkUnit.

### User Action

After re-estimating the monitoring time in light of the system performance on the server, change the maximum exit program processing time in the WorkUnit definitions and perform the processing again. An error in the return post-exit program could also have caused the return post-exit program processing time to overrun. Review the return post-exit program, eliminate the cause of the error, and then re-execute the process.

## 6.14.35 EXTP4670

---

**extp: ERROR: EXTP4670: Return post-exit program returned abnormally:ECODE=%d1 DEST=%s1 WU=%s2 USER=%s3 PID=%d2 SYSTEM=%s4**

### Variable Information

%d1 = Return Code indicated by the return post-exit program

%s1 = Destination Name (object name)

%s2 = WorkUnit Name

%s3 = User Name

%d2 = Process ID

%s4 = System Name

#### Explanation

The return post-exit program returned abnormally.

#### System Action

Stops the APM or WorkUnit.

#### User Action

Check the return code indicated by the return post-exit program to determine the cause of the error. Remove the cause of the error and re-execute processing.

### 6.14.36 EXTP4671

---

**extp: ERROR: EXTP4671:An abnormality occurred in the definition info read: CODE='%s1' WU=%s2 USER=%s3 PID=%d SYSTEM=%s4**

#### Variable Information

%s1 = Error information

%s2 = WorkUnit name

%s3 = User name

%d = Process ID

%s4 = System name

#### Explanation

An error occurred while reading the definition information.

#### System Action

Stops the processing.

#### User Action

Determine the cause of the error from the previous event log message. If no previous event log message is displayed, a definition file error can be considered.

### 6.14.37 EXTP4672

---

**extp: WARNING: EXTP4672: There is a possibility that the collection of an application abnormal log does not operate normally because the error had been detected with APM: CODE='%s1' WU=%s2 USER=%s3 PID=%d SYSTEM=%s4**

#### Variable Information

%s1 = Error information

%s2 = WorkUnit name

%s3 = User name

%d = Process ID

%s4 = System name

## Explanation

An application error log may fail to be collected normally due to memory shortage, system resource shortage, and other errors.

## System Action

Continues the processing.

## User Action

If a console message and standard error message have been displayed at the same time, take action according to the messages.

## 6.14.38 EXTP4673

---

**extp: WARNING: EXTP4673: Because the error had been detected with APM, an application abnormal log was not able to be gathered: CODE='%s1' WU=%s2 USER=%s3 PID=%d SYSTEM=%s4**

## Variable Information

%s1 = Error information

%s2 = WorkUnit name

%s3 = User name

%d = Process ID

%s4 = System name

## Explanation

An application error log failed to be collected normally due to memory shortage, system resource shortage, or other errors.

## System Action

Continues the processing.

## User Action

If a console message and standard error message have been displayed at the same time, take action according to the messages.

## 6.14.39 EXTP4690

---

**extp: ERROR: EXTP4690:A memory shortage occurred: PID=%d**

## Variable Information

%d = Process ID

## Explanation

Insufficient memory.

## System Action

Stops the processing.

## User Action

Execute the process again later. If this message is generated frequently, refer to the Tuning Guide, re-estimate the memory that is needed to run Interstage, and confirm that there is enough memory.

If there is enough memory to run Interstage, there may be inadequate memory to run other applications. Re-estimate the amount of memory needed for the other applications running on the same machine to determine if there is an appropriate amount of memory.

Contact your system administrator if the re-estimation indicates that the memory is insufficient. Ask the system administrator to either increase the size of the main memory or to increase the size of the page file.

## 6.14.40 EXTP4691

---

**extp: ERROR: EXTP4691:APM terminated due to a memory shortage: PID=%d**

### Variable Information

%d = Process ID

### Explanation

Insufficient memory.

### System Action

Stops the APM.

### User Action

Execute the process again later. If this message is generated frequently, refer to the Tuning Guide, re-estimate the memory that is needed to run Interstage, and confirm that there is enough memory.

If there is enough memory to run Interstage, there may be inadequate memory to run other applications. Re-estimate the amount of memory needed for the other applications running on the same machine to determine if there is an appropriate amount of memory.

Contact your system administrator if the re-estimation indicates that the memory is insufficient. Ask the system administrator to either increase the size of the main memory or to increase the size of the page file.

## 6.14.41 EXTP4692

---

**extp: ERROR: EXTP4692:APM terminated due to a system error: PID=%d**

### Variable Information

%d = Process ID

### Explanation

A system error has occurred.

### System Action

Stops the WorkUnit.

### User Action

Use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer.

## 6.14.42 EXTP4693

---

**extp: ERROR: EXTP4693:Resource manager information is not described in the work unit definition: WU=%s1 USER=%s2 PID=%d SYSTEM=%s3**

### Variable Information

%s1 = WorkUnit name

%s2 = User name

%d = Process ID

%s3 = System name

### Explanation

Resource manager information is not mentioned in the WorkUnit definition.

### System Action

Stops the processing.

## User Action

Specify the resource manager information in the WorkUnit definition, then re-execute the process. This message is output when there is an error in the link library specified at the time of the link. This occurs only when the application program language is C++ and when a global transaction connection is not used. For such situations, specify Component Transaction Service runtime for links when global transaction connection are not used, and re-link the application.

## 6.14.43 EXTP4694

---

**extp: ERROR: EXTP4694:An error was detected during an APM: WU=%s1 USER=%s2 PID=%d SYSTEM=%s3 CODE='%s4'**

### Variable Information

%s1 = WorkUnit name

%s2 = User Name

%d = Process ID

%s3 = System Name

%s4 = Error Information

### Explanation

An unknown error was found in the APM.

### System Action

Stops the WorkUnit or APM.

### User Action

Carry out the actions described in the previous console message, or the standard error output message. If this message is generated frequently, use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer.

## 6.14.44 EXTP4695

---

**extp: ERROR: EXTP4695:The environment variable specified by the work unit definition violates the construction rule: ENV=%s1 WU=%s2 USER=%s3 PID=%d SYSTEM=%s4**

### Variable Information

%s1 = Environment Variable

%s2 = WorkUnit name

%s3 = User Name

%d = Process ID

%s4 = System Name

### Explanation

A syntax error exists in the environment variables specified in the WorkUnit definition.

### System Action

Stops the processing.

### User Action

Resolve the environment variable syntax error in the WorkUnit definition, then re-execute the process.

## 6.14.45 EXTP4696

---

---

**extp: ERROR: EXTP4696: An abnormality occurred when opening the dynamic link library specified by the work unit definition: FILE=%s1 ERRSTRING='%s2' WU=%s3 USER=%s4 PID=%d SYSTEM=%s5**

#### Variable Information

%s1 = Dynamic Link Library Name  
%s2 = Error Information  
%s3 = WorkUnit name  
%s4 = User Name  
%d = Process ID  
%s5 = System Name

#### Explanation

An abnormality occurred while opening the dynamic link library (DLL) specified in the WorkUnit definition, due to following reasons:

- The path of the DLL, and libraries used by the DLL, are not set in the WorkUnit definition application usage library.
- Other reasons.

#### System Action

Stops the processing.

#### User Action

For errors described in [Explanation], above, resolve the problems described therein, then re-execute the processing.

For other errors, resolve the problems described in the Error information (%s2).

## 6.14.46 EXTP4697

---

**extp: ERROR: EXTP4697: An abnormality occurred when making a file or a directory: WU=%s1 PID=%d1 SYSTEM=%s2 ERRNO=%d2 CODE='%s3'**

#### Variable Information

%s1 = WorkUnit name  
%d1 : Process ID  
%s2 = System Name  
%d2 : System call error number  
%s3 = Error Information

#### Explanation

An abnormality occurred when making a file or a folder.

#### System Action

Stops the processing.

#### User Action

Determine whether there is free space in the file system containing the folder specified as the current folder in the WorkUnit definitions.

If there is insufficient free space, delete unnecessary files to free up some space, then rerun the job.

If there is enough free space, determine the name of the WorkUnit in which the active APM process is running by referring to the WorkUnit definition file. Then delete all subdirectories of that WorkUnit except for the subdirectory containing the active APM process and rerun the job.

## 6.14.47 EXTP4698

---

**extp: ERROR: EXTP4698: An abnormality occurred when starting the APM: WU=%s1 USER=%s2 PID=%d SYSTEM=%s3 ERRSTRING='%s4'**

### Variable Information

%s1 = WorkUnit name  
%s2 = User name  
%d = Process ID  
%s3 = System name  
%s4 = Error information

### Explanation

An abnormality occurred when starting the APM.

### System Action

Stops the processing.

### User Action

Resolve the problem described in the Error information, then re-execute the process.

## 6.15 EXTP4700 to EXTP4799

---

This section details the messages with message numbers between EXTP4700 and EXTP4799.

### 6.15.1 EXTP4701

---

**extp: ERROR: EXTP4701: An abnormality occurred by the start processing in the server application process which operated under the control of the work unit: CODE='%s1' APL=%s2 WU=%s3 USER=%s4 PID=%d SYSTEM=%s5**

### Variable Information

%s1 = Error Information  
%s2 = Application Name  
%s3 = WorkUnit Name  
%s4 = User Name  
%d = Process ID  
%s5 = System Name

### Explanation

An error occurred in the start processing of the server application process that was running under the control of the WorkUnit.

### System Action

Stops processing.

### User Action

Use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer.

### 6.15.2 EXTP4702

---

---

**extp: ERROR: EXTP4702: An error was detected in the server application process which operated under the control of the work unit: CODE='%s1' APL=%s2 WU=%s3 USER=%s4 PID=%d SYSTEM=%s5**

#### Variable Information

%s1 = Error Information

%s2 = Application Name

%s3 = WorkUnit Name

%s4 = User Name

%d = Process ID

%s5 = System Name

#### Explanation

An error was detected in the server application process that was running under the control of the WorkUnit.

#### System Action

Stops processing.

#### User Action

Use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer.

### 6.15.3 EXTP4703

---

**extp: ERROR: EXTP4703: A server application process which operated under the control of the work unit terminated abnormally: APL=%s1 WU=%s2 USER=%s3 PID=%d SYSTEM=%s4**

#### Variable Information

%s1 = Application Name

%s2 = WorkUnit Name

%s3 = User Name

%d = Process ID

%s4 = System Name

#### Explanation

A server application process that was running under the control of the WorkUnit terminated abnormally.

#### System Action

Stops processing.

#### User Action

Refer to the event log message output immediately preceding the error to investigate the cause of the error. If no event log message was output, there may be an error in the application. Check the application, remove the cause of the error, and re-execute the processing.

### 6.15.4 EXTP4704

---

**extp: ERROR: EXTP4704: Application processing time exceeded the observation time: APL=%s1 WU=%s2 USER=%s3 PID=%d SYSTEM=%s4**

#### Variable Information

%s1 = Application Name

%s2 = WorkUnit Name

%s3 = User Name

%d = Process ID

%s4 = System Name

#### Explanation

The application terminated abnormally because the application processing time exceeded the monitoring time.

#### System Action

Stops the application.

#### User Action

After re-estimating the monitoring time in light of the system performance on the server, change the maximum application processing time in the WorkUnit definitions and perform the processing again.

An error in the application could also have caused the application processing time to overrun. Review the application, eliminate the cause of the error, and then re-execute the processing.

### 6.15.5 EXTP4705

---

**extp: WARNING: EXTP4705: Application processing time exceeded the observation time: APL=%s1 WU=%s2 USER=%s3 PID=%d SYSTEM=%s4**

#### Variable Information

%s1 = Application Name

%s2 = WorkUnit Name

%s3 = User Name

%d = Process ID

%s4 = System Name

#### Explanation

The application processing time exceeded the monitoring time.

#### System Action

Continues application processing

#### User Action

After re-estimating the monitoring time in light of the system performance on the server, change the maximum application processing time in the WorkUnit definitions and perform the processing again.

An error in the application could also have caused the application processing time to overrun. Review the application, eliminate the cause of the error, and then re-execute the processing.

### 6.15.6 EXTP4706

---

**extp: ERROR: EXTP4706: A memory shortage occurred: CODE='%s1' SYSTEM=%s2**

#### Variable Information

%s1 = Error information

%s2 = System Name

#### Explanation

There was insufficient memory.

#### System Action

Stops processing.

## User Action

Wait for a while and re-execute processing. If this message is output frequently, refer to the Tuning Guide, re-estimate the memory that is needed to run Interstage, and confirm that there is enough.

If enough memory has been reserved to run Interstage, there may not be enough memory to run other applications. Re-estimate the memory needed to run other applications in the same machine, and investigate the amount of memory that is appropriate.

If, as a result of re-estimating the memory, it is confirmed that there is not enough, contact the system administrator.

**Windows32/64**

Ask the system administrator to increase the main memory or to extend the page file.

**Solaris32/64 Linux32/64**

Ask the system administrator to increase the main memory or to extend the swap area.

## 6.15.7 EXTP4707

---

**extp: ERROR: EXTP4707: An I/O error has occurred: CODE='%s1' SYSTEM=%s2**

### Variable Information

%s1 = Error information

%s2 = System Name

### Explanation

An input/output error occurred.

### System Action

Stops processing.

### User Action

If this message is output frequently, recover the disk on which Interstage was installed.

## 6.15.8 EXTP4708

---

**extp: ERROR: EXTP4708: System resource shortage occurred: CODE='%s1' SYSTEM=%s2**

### Variable Information

%s1 = Error information

%s2 = System Name

### Explanation

There were insufficient system resources.

### System Action

Stops processing.

### User Action

**Windows32/64**

Reduce the system load.

If there is a possibility of insufficient memory, refer to the Tuning Guide, re-estimate the memory that is needed to run Interstage, and confirm that there is enough.

If enough memory has been reserved to run Interstage, there may not be enough memory to run other applications. Re-estimate the memory needed to run other applications in the same machine, and investigate the amount of memory that is appropriate.

If, as a result of re-estimating the memory, it is confirmed that there is not enough, contact the system administrator. Ask the system administrator to increase the main memory or to extend the page file.

If there is no problem with the value estimated for the system, use the *iscollectinfo* command to collect diagnostic information. Send the error information to a Systems Engineer.

**Solaris32/64 Linux32/64**

Refer to the Tuning Guide, change the system parameter, and then reboot the system.

Then, re-execute processing.

## 6.15.9 EXTP4709

---

**extp: ERROR: EXTP4709: A system error occurred: CODE='%s1' SYSTEM=%s2**

### Variable Information

%s1 = Error information

%s2 = System Name

### Explanation

A system error occurred.

### System Action

Stops processing.

### User Action

If this message is output frequently, use the *iscollectinfo* command to collect diagnostic information. Send the error information to a Systems Engineer.

## 6.15.10 EXTP4710

---

**extp: ERROR: EXTP4710: An abnormality occurred when opening the file: FILE=%s1 CODE='%s2' ERRSTRING='%s3' SYSTEM=%s4**

### Variable Information

%s1 = File name

%s2 = Error information

%s3 = OS Error information

%s4 = System Name

### Explanation

Failed to open the component transaction service library.

### System Action

Stops processing.

### User Action

Take action according to the OS Error information. If this message is output frequently, use the *iscollectinfo* command to collect diagnostic information. Send the error information to a Systems Engineer.

## 6.16 EXTP4800 to EXTP4899

---

This section details messages numbered between EXTP4800 and EXTP4899.

## 6.16.1 EXTP4801

---

**extp: ERROR:EXTP4801:A memory shortage occurred**

### Explanation

Insufficient memory.

### System Action

Halts the WorkUnit or APM startup.

### User Action

Execute the process again later. If this message is generated frequently, refer to the Tuning Guide, re-estimate the memory that is needed to run Interstage, and confirm that there is enough memory.

If there is enough memory to run Interstage, there may be inadequate memory to run other applications. Re-estimate the amount of memory needed for the other applications running on the same machine to determine if there is an appropriate amount of memory.

Contact your system administrator if the re-estimation indicates that the memory is insufficient. Ask the system administrator to either increase the size of the main memory or to increase the size of the page file.

## 6.16.2 EXTP4802

---

**extp: ERROR:EXTP4802:A system error occurred: CODE='%s1'**

### Variable Information

%s1 = Error Information

### Explanation

System error has occurred.

### System Action

Stops the processing.

### User Action

Use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer.

## 6.17 EXTP4900 to EXTP4999

---

This section details messages numbered between EXTP4900 and EXTP4999.

### 6.17.1 EXTP4900

---

**extp: ERROR: EXTP4900: A package necessary to use this function is not installed: WU=%s SYSTEM=%s2**

### Variable Information

%s1 = WorkUnit name

%s2 = System name

### Explanation

Interstage Business Application Server must be installed to use asynchronous WorkUnits.

### System Action

Stops processing of the WorkUnit.

## User Action

Install the package required to use asynchronous WorkUnits, and restart Interstage.

### 6.17.2 EXTP4901

---

**extp: ERROR: EXTP4901: The library failed to open: WU=%s1 ERRORSTRING='%s2' SYSTEM=%s3**

#### Variable Information

%s1 = WorkUnit name

%s2 = Error Information

%s3 = System name

#### Explanation

The WorkUnit cannot be started because the library failed to open.

#### System Action

Stops processing of the WorkUnit.

#### User Action

An error may have occurred in the product installation environment. Re-install the package.

### 6.17.3 EXTP4902

---

**extp: ERROR: EXTP4902: The function could not be read: WU=%s1 ERRORSTRING='%s2' SYSTEM=%s3**

#### Variable Information

%s1 = WorkUnit name

%s2 = Error Information

%s3 = System name

#### Explanation

The WorkUnit cannot be started because the attempt to read the function failed.

#### System Action

Stops processing of the WorkUnit.

#### User Action

An error may have occurred in the product installation environment. Re-install the package.

### 6.17.4 EXTP4903

---

**extp: ERROR: EXTP4903: Failed to create the environment for starting the asynchronous WorkUnit: WU=%s1 ERRCODE=%d ERRSTRING='%s2' SYSTEM=%s3**

#### Variable Information

%s1 = WorkUnit name

%d = Error Information 1

%s2 = Error Information 2

%s3 = System name

## Explanation

Failed to create the environment for starting the asynchronous WorkUnit.

## System Action

Stops processing of the WorkUnit.

## User Action

Take action according to Error Information 1, and then restart Interstage Application Server.

Table 6.4 EXTP4903 Code Meaning

Code	Meaning	Action
12	There was insufficient memory.	<b>Windows32/64</b> Ask the system administrator to increase the main memory or to extend the page file. <b>Solaris32/64 Linux32/64</b> Ask the system administrator to increase the main memory or to extend the swap area. Note: Maintenance information is output in Error Information 2.
13	There were insufficient system resources.	Shared memory, semaphores, and message queue system parameters used by Interstage Business Application Server are tuned incorrectly. Refer to the manual, and check that the system parameters are correct. If they are not correct, modify them, reboot the machine, and then re-execute processing. Note: Maintenance information is output in Error Information 2.
19	An I/O error occurred.	Restore the file system that is output in Error Information 2.
20	Failed to read the library.	Possible causes include: <ul style="list-style-type: none"><li>- Insufficient memory</li><li>- An I/O error</li></ul> Details are output in Error Information 2. Take action according to these details.
99	A system error occurred.	Use the <i>iscollectinfo</i> command to collect investigation information. Send the error information to a Systems Engineer. Note: Maintenance information is output in Error Information 2.

## 6.17.5 EXTP4904

**extp: ERROR: EXTP4904: A system error occurred: CODE='%s1' SYSTEM=%s2**

### Variable Information

%s1 = Error Information

%s2 = System name

### Explanation

A system error occurred.

## System Action

Stops processing.

## User Action

If this message is output frequently, use the *iscollectinfo* command to collect investigation information. Send the error information to a Systems Engineer.

## 6.17.6 EXTP4905

---

**extp: INFO: EXTP4905: The execution base for asynchronous application was stopped: WU=%s1 DEST=%s2 PID=%d SYSTEM=%s3**

### Variable Information

%s1 = WorkUnit name

%s2 = Destination name

%d = Process ID

%s3 = System name

### Explanation

The Business processing time was not completed even though the monitoring time was exceeded.

### System Action

Continues Business processing.

### User Action

Consider system performance before re-estimating the monitoring time. Modify the application "Maximum Processing Time", and then re-execute processing. It is possible that the incorrect Business processing was caused by the processing time being too long. Investigate the Business processing, establish the cause, and then re-execute processing.

**Solaris32/64**

In the WorkUnit configuration, set "Output of Stack Trace" to "YES" to output the process stack trace information ([Process ID]\_[date].pstack) in the current directory of the WorkUnit. The stack trace information can be used to determine the location in which the process is backed up.

## 6.17.7 EXTP4907

---

**extp: ERROR: EXTP4907: The execution base for asynchronous application start processing time exceeded the monitoring time: WU=%s1 DEST=%s2 PID=%d1 TIME=%d2 SYSTEM=%s3**

### Variable Information

%s1 = WorkUnit name

%s2 = Destination name

%d1 = Process ID

%d2 = Monitoring time

%s3 = System name

### Explanation

The start processing for the asynchronous application linkage execution infrastructure was not completed even though the monitoring time was exceeded.

### System Action

Stops the start processing for the asynchronous application linkage execution infrastructure.

## User Action

Consider system performance and process concurrency before re-estimating the monitoring time. Modify the WorkUnit start wait time, and then re-execute processing. It is possible that the incorrect initial processing was caused by the asynchronous application linkage execution infrastructure start processing time being too long. Investigate the initial processing, establish the cause, and then re-execute processing.

**Solaris32/64**

In the WorkUnit configuration, set "Output of Stack Trace" to "YES" to output the process stack trace information ([Process ID]\_[date].pstack) in the current directory of the WorkUnit. The stack trace information can be used to determine the location in which the process is backed up.

## 6.17.8 EXTP4908

---

**extp: ERROR: EXTP4908: The execution base for asynchronous application stop processing time exceeded the monitoring time: WU=%s1 DEST=%s2 PID=%d1 TIME=%d2 SYSTEM=%s3**

### Variable Information

%s1 = WorkUnit name

%s2 = Destination name

%d1 = Process ID

%d2 = Monitoring time

%s3 = System name

### Explanation

Stop processing for the asynchronous application linkage execution infrastructure did not complete within then specified monitoring time.

### System Action

Stops the asynchronous application linkage execution infrastructure by force.

### User Action

Check whether the "atexit" function is registered as the function called when the process closes. The "atexit" function cannot be used in asynchronous WorkUnits.

**Solaris32/64 Linux32/64**

If the process mode is used, check whether the signal (SIGTERM) behavior has been changed. The signal behavior cannot be changed in asynchronous WorkUnits.

**Solaris32/64**

In the WorkUnit configuration, set "Output of Stack Trace" to "YES" to output the process stack trace information ([Process ID]\_[date].pstack) in the current directory of the WorkUnit. The stack trace information can be used to determine the location in which the process is backed up.

## 6.17.9 EXTP4909

---

**extp: ERROR: EXTP4909: The execution base for asynchronous application was terminated during initial processing: WU=%s1 DEST=%s2 PID=%d SYSTEM=%s3**

### Variable Information

%s1 = WorkUnit name

%s2 = Destination name

%d = Process ID

%s3 = System name

### Explanation

The asynchronous application linkage execution infrastructure was terminated during initial processing.

### System Action

Stops processing of the WorkUnit.

### User Action

The initial processing logic may be incorrect. It is also possible that the "exit" function was used to exit the asynchronous application linkage execution infrastructure in initial processing.

Investigate the initial processing, establish the cause, and then re-execute processing.

**Solaris32/64 Linux32/64**

If the "core" file is output in the current directory of the WorkUnit, use this file to investigate.

## 6.17.10 EXTP4910

---

**extp: ERROR: EXTP4910: An error occurred in execution base for asynchronous application start processing: WU=%s1 DEST=%s2 PID=%d SYSTEM=%s3**

### Variable Information

%s1 = WorkUnit name

%s2 = Destination name

%d = Process ID

%s3 = System name

### Explanation

An error occurred in the start processing for the asynchronous application linkage execution infrastructure.

Possible causes include:

- An error was returned in initial processing.
- The EventChannel was not created.
- The EventChannel did not start.
- The Notification Service and local transactions cannot be used in the EventChannel.

### System Action

Stops processing of the WorkUnit.

### User Action

Take action according to the message that was output immediately before, or as the standard error message (the "stderr" file output in the current directory of the WorkUnit).

## 6.17.11 EXTP4911

---

**extp: ERROR: EXTP4911: The execution base for asynchronous application was terminated: WU=%s1 DEST=%s2 PID=%d SYSTEM=%s3**

### Variable Information

%s1 = WorkUnit name

%s2 = Destination name

%d = Process ID

%s3 = System name

### Explanation

The asynchronous application linkage execution infrastructure was terminated.

### System Action

Automatically restarts the asynchronous application linkage execution infrastructure according to the WorkUnit configuration "Application Retry Count" value.

### User Action

The Business processing logic may be incorrect. It is also possible that the "exit" function was used to exit the asynchronous application linkage execution infrastructure in Business processing.

Investigate the Business processing, establish the cause, and then re-execute processing.

**Solaris32/64 Linux32/64**

If the "core" file is output in the current directory of the WorkUnit, use this file to investigate.

## 6.17.12 EXTP4912

---

**extp: ERROR: EXTP4912: An error occurred in the execution base for asynchronous application: WU=%s1 DEST=%s2 PID=%d SYSTEM=%s3**

### Variable Information

%s1 = WorkUnit name

%s2 = Destination name

%d = Process ID

%s3 = System name

### Explanation

An error occurred in the asynchronous application linkage execution infrastructure.

Possible causes include:

- An error was returned in Business processing.

### System Action

Stops processing.

### User Action

Take action according to the message that was output immediately before, or as the standard error message (the "stderr" file output in the current directory of the WorkUnit). An error may also have been returned in Business processing. In this case, check the Business processing logic.

## 6.17.13 EXTP4913

---

**extp: ERROR: EXTP4913: The execution base for asynchronous application was terminated during WorkUnit stop processing: WU=%s1 DEST=%s2 PID=%d SYSTEM=%s3**

### Variable Information

%s1 = WorkUnit name

%s2 = Destination name

%d = Process ID

%s3 = System name

#### Explanation

The asynchronous application linkage execution infrastructure was terminated during WorkUnit stop processing.

#### System Action

Continues WorkUnit stop processing.

#### User Action

The Business processing and exit processing logic may be incorrect. It is also possible that the "exit" function was used to exit the asynchronous application linkage execution infrastructure.

Investigate the Business processing and exit processing logic, and establish the cause.

**Solaris32/64 Linux32/64**

If the "core" file is output in the current directory of the WorkUnit, use this file to investigate.

## 6.17.14 EXTP4914

---

**extp: ERROR: EXTP4914: An error occurred in execution base for asynchronous application stop processing: WU=%s1 DEST=%s2 PID=%d SYSTEM=%s3**

#### Variable Information

%s1 = WorkUnit name

%s2 = Destination name

%d = Process ID

%s3 = System name

#### Explanation

An error occurred in the stop processing for the asynchronous application linkage execution infrastructure.

Possible causes include:

- An error was returned in Business processing and exit processing.

#### System Action

Continues WorkUnit stop processing.

#### User Action

Take action according to the message that was output immediately before, or as the standard error message (the "stderr" file output in the current directory of the WorkUnit).

## 6.17.15 EXTP4915

---

**extp: ERROR: EXTP4915: The execution base for asynchronous application failed to restart automatically: WU=%s1 DEST=%s2 PID=%d SYSTEM=%s3**

#### Variable Information

%s1 = WorkUnit name

%s2 = Destination name

%d = Process ID

%s3 = System name

## Explanation

The asynchronous application linkage execution infrastructure failed to restart automatically.

## System Action

Stops the WorkUnit.

If the "Process degeneracy" statement of the WorkUnit configuration is "YES", and an active asynchronous application linkage execution infrastructure is left in a concurrency, however, application of the WorkUnit continues.

## User Action

Take action according to the message that was output immediately before.

## 6.17.16 EXTP4916

---

**extp: ERROR: EXTP4916: All execution base for asynchronous applications have been stopped: WU=%s1 DEST=%s2 SYSTEM=%s3**

### Variable Information

%s1 = WorkUnit name

%s2 = Destination name

%s3 = System name

## Explanation

Automatic restart of the asynchronous application linkage execution infrastructures in the asynchronous WorkUnit failed. There are no active asynchronous application linkage execution infrastructures.

## System Action

Stops the WorkUnit.

## User Action

Take action according to the message that was output immediately before.

## 6.17.17 EXTP4917

---

**extp: ERROR: EXTP4917: WorkUnit recovery processing failed: WU=%s1 DEST=%s2 PID=%d SYSTEM=%s3**

### Variable Information

%s1 = WorkUnit name

%s2 = Destination name

%s3 = System name

## Explanation

WorkUnit recovery processing failed.

## System Action

Continues degeneracy.

## User Action

Take action according to the message that was output immediately before.

## 6.17.18 EXTP4918

---

---

**extp: ERROR: EXTP4918: An error occurred in WorkUnit stop processing: CODE=%d WU=%s1 SYSTEM=%s2**

**Variable Information**

%d = Error Information

%s1 = WorkUnit name

%s3 = System name

**Explanation**

An error occurred in WorkUnit stop processing.

**System Action**

Stops WorkUnit stop processing.

**User Action**

Take action according to the message that is output immediately before. To stop the WorkUnit, stop the WorkUnit by force.

---

## 6.17.19 EXTP4920

**extp: ERROR: EXTP4920: An error occurred in execution base for asynchronous application start processing: CODE='%s1' WU=%s2 USER=%s3 DEST=%s4 PID=%d SYSTEM=%s5**

**Variable Information**

%s1 = Error Information

%s2 = WorkUnit name

%s3 = User name

%s4 = Destination name

%d = Process ID

%s5 = System name

**Explanation**

An error occurred in the start processing for the asynchronous application linkage execution infrastructure.

**System Action**

Stops processing.

**User Action**

Use the *iscollectinfo* command to collect investigation information. Send the error information to a Systems Engineer.

---

## 6.17.20 EXTP4921

**extp: ERROR: EXTP4921: There was insufficient memory: CODE='%s1' WU=%s2 USER=%s3 DEST=%s4 PID=%d SYSTEM=%s5**

**Variable Information**

%s1 = Error Information

%s2 = WorkUnit name

%s3 = User name

%s4 = Destination name

%d = Process ID

%s5 = System name

### Explanation

There was insufficient memory.

### System Action

Stops processing.

### User Action

Wait a few moments and then re-execute processing. If this message is output frequently, refer to the "Tuning Guide", re-estimate the memory that is needed to run Interstage, and confirm that there is sufficient memory.

If enough memory has been reserved to run Interstage, confirm that there is sufficient memory to run other applications. Re-estimate the memory needed to run other applications in the same machine, and investigate the amount of memory that is appropriate.

If, as a result of re-estimating the memory, you confirm that there is not enough, contact the system administrator.

**Windows32/64**

Ask the system administrator to increase the main memory or to extend the page file.

**Solaris32/64 Linux32/64**

Ask the system administrator to increase the main memory or to extend the swap area.

## 6.17.21 EXTP4922

---

**extp: ERROR: EXTP4922: There were insufficient system resources: CODE='%s1' WU=%s2 USER=%s3 DEST=%s4 PID=%d SYSTEM=%s5**

### Variable Information

%s1 = Error Information

%s2 = WorkUnit name

%s3 = User name

%s4 = Destination name

%d = Process ID

%s5 = System name

### Explanation

There were insufficient system resources.

### System Action

Stops processing.

### User Action

**Windows32/64**

Reduce the system load.

If there is potentially insufficient memory, refer to the "Tuning Guide", re-estimate the memory that is needed to run Interstage, and confirm that there is sufficient memory.

If enough memory has been reserved to run Interstage, confirm that there is sufficient memory to run other applications. Re-estimate the memory needed to run other applications in the same machine, and investigate the amount of memory that is appropriate.

If, as a result of re-estimating the memory, you confirm that there is not enough, contact the system administrator. Ask the system administrator to increase the main memory or to extend the page file.

If there is no problem with the value estimated for the system, use the "iscollectinfo" command to collect investigation information. Send the error information to a Systems Engineer.

**Solaris32/64** **Linux32/64**

Refer to the "Tuning Guide", change the system parameter, and then reboot the system. Then, re-execute processing.

## 6.17.22 EXTP4923

---

**extp: ERROR: EXTP4923: Input/output trouble occurred: CODE='%s1' WU=%s2 USER=%s3 DEST=%s4 PID=%d SYSTEM=%s5**

### Variable Information

%s1 = Error Information

%s2 = WorkUnit name

%s3 = User name

%s4 = Destination name

%d = Process ID

%s5 = System name

### Explanation

An Input/output error occurred.

### System Action

Stops processing.

### User Action

**Windows32/64**

Take action according to the event log message that was output immediately before this one. If no message is output, check whether there is a problem with the disk used to install Interstage.

**Solaris32/64**

Take action according to the system log message that was output immediately before this one. If no message is output, check whether there is a problem with the disk used to install the FSUNextp package, or the disk used to create the operating environment for the Component Transaction Service described in the Interstage operating environment configuration.

**Linux32/64**

Take action according to the system log message that was output immediately before this one. If no message is output, check whether there is a problem with the disk used to install the FJSVextp package, or the disk used to create the operating environment for the Component Transaction Service described in the Interstage operating environment configuration.

## 6.17.23 EXTP4924

---

**extp: ERROR: EXTP4924: There was insufficient disk space: CODE='%s1' WU=%s2 USER=%s3 DEST=%s4 PID=%d SYSTEM=%s5**

### Variable Information

%s1 = Error Information

%s2 = WorkUnit name

%s3 = User name

%s4 = Destination name

%d = Process ID

%s5 = System name

### Explanation

There was insufficient disk space.

### System Action

Stops processing.

### User Action

#### Windows32/64

There was insufficient disk space on the disk used to install Interstage. Acquire more disk space, and re-execute processing.

#### Solaris32/64

There was insufficient disk space on the disk used to install the FSUNextp package or create the operating environment for the Component Transaction Service described in the Interstage operating environment configuration. Acquire more disk space, and re-execute processing.

#### Linux32/64

There was insufficient disk space on the disk used to install the FJSVextp package or create the operating environment for the Component Transaction Service described in the Interstage operating environment configuration. Acquire more disk space, and re-execute processing.

## 6.17.24 EXTP4925

---

**extp: ERROR: EXTP4925: Nothing is running under the WorkUnit: PID=%d**

### Variable Information

%d = Process ID

### Explanation

An executable file may have been started directly.

### System Action

Stops processing.

### User Action

Executable files cannot be started directly. Start the WorkUnit.

# Chapter 7 Messages Beginning with 'ihs'

This chapter describes the messages with message number beginning 'ihs'.

## Note

In Messages Beginning with 'ihs', the following information is output in [Variable Information]:

- For a Web server created on installation: "FJapache"
- For a Web server created using the *ihscreate* command: The Web server name specified in the -n option
- For a Web server created using the Interstage Management Console: The Web server name specified in [Web Server Name] of the [Web Server Settings] window
- For the Interstage Management Console Web server (Interstage HTTP Server): "#ISCONSOLE"

## 7.1 ihs00000 to ihs00099

This section details the messages numbered between ihs00000 and ihs00099.

### 7.1.1 ihs00001

**IHS: INFO: ihs00001: HTTP Server started. [%s1]**

Variable Information

%s1 = Web Server name

Explanation

The Web Server (%s1) has been started.

### 7.1.2 ihs00002

**IHS: INFO: ihs00002: HTTP Server stopped. [%s1]**

Variable Information

%s1 = Web Server name

Explanation

The Web Server (%s1) has been stopped.

### 7.1.3 ihs00003

**IHS: INFO: ihs00003: HTTP Server restarted. [%s1]**

Variable Information

%s1 = Web Server name

Explanation

The Web Server (%s1) has been restarted.

### 7.1.4 ihs00004

**IHS: ERROR: ihs00004: Pre-configuration failed [%s1]**

Variable Information

%s1 = Web Server name

## Explanation

An error occurred during initialization preprocessing.

## System Action

Web Server program execution processing is aborted.

## User Action

Refer to the message that was output at the same time and fix the error.

## 7.1.5 ihs00005

---

### IHS: ERROR: ihs00005: Unable to open logs [%s1]

#### Variable Information

%s1 = Web Server name

#### Explanation

An error occurred during log initialization processing.

The File Descriptor number required to run the Web Server may be invalid.

#### System Action

Web Server program execution processing is aborted.

#### User Action

Take one of the following actions:

- Check whether there is a problem with the File Descriptor number required to run the Web Server.
- If the above case does not apply, refer to the message that was output at the same time and fix the error.

## 7.1.6 ihs00006

---

### IHS: ERROR: ihs00006: Configuration Failed [%s1]

#### Variable Information

%s1 = Web Server name

#### Explanation

An error occurred during initialization processing.

#### System Action

Web Server program execution processing is aborted.

#### User Action

Refer to the message that was output at the same time and fix the error.

## 7.1.7 ihs00007

---

### IHS: ERROR: ihs00007: Ouch! Out of memory in ap\_setup\_prelinked\_modules()!

#### Explanation

There is insufficient memory available.

## System Action

Web Server program execution processing is aborted.

## User Action

Close unnecessary programs. Alternatively, check whether sufficient memory is reserved for Web Server operation.

## 7.1.8 ihs00008

---

**IHS: ERROR: ihs00008: %s1: module "%s2" is not compatible with this version of Apache (found %s3, need %s4). [%s5]**

### Variable Information

%s1 = Web Server program name

%s2 = Plug-in module name

%s3 = Plug-in module major version

%s4 = Web Server program major version

%s5 = Web Server name

### Explanation

The major version (%s4) of the Web Server program and the major version (%s3) of the plug-in module are different.

### System Action

Web Server program execution processing is aborted.

### User Action

Check the major version of the plug-in module specified in the LoadModule directive in the environment definition file (httpd.conf).

## 7.1.9 ihs00009

---

**IHS: ERROR: ihs00009: %s1: module "%s2" could not be loaded, because the dynamic module limit was reached. Please increase DYNAMIC\_MODULE\_LIMIT and recompile. [%s3]**

### Variable Information

%s1 = Web Server program name

%s2 = Plug-in module name

%s3 = Web Server name

### Explanation

The maximum number of plug-in modules that can be used has been exceeded.

### System Action

Web Server program execution processing is aborted.

### User Action

**Windows32/64**

Check whether 58 or more LoadModule directives have been set in the environment definition file (httpd.conf). A maximum of 57 LoadModule directives can be set.

**Solaris32/64 Linux32/64**

Check whether 60 or more LoadModule directives have been set in the environment definition file (httpd.conf). A maximum of 59 LoadModule directives can be set.

## 7.1.10 ihs00010

---

**IHS: ERROR: ihs00010: Syntax error in -C/-c directive: %s1 [%s2]**

### Variable Information

%s1 = Syntax error description

%s2 = Web Server name

### Explanation

The syntax of the directive specified for the -C or -c options is incorrect.

### System Action

Web Server program execution processing is aborted.

### User Action

Check the syntax of the directive specified for the -C or -c options.

## 7.1.11 ihs00011

---

**IHS: ERROR: ihs00011: %s1: could not open document config file %s2 [%s3]**

### Variable Information

%s1 = Web Server program name

%s2 = Environment definition file path

%s3 = Web Server name

### Explanation

The environment definition file (%s2) could not be opened.

### System Action

Web Server program execution processing is aborted.

### User Action

Check whether the environment definition file (%s2) exists.

## 7.1.12 ihs00012

---

**IHS: ERROR: ihs00012: Syntax error on line %s1 of %s2: %s3 [%s4]**

### Variable Information

%s1 = The line in the environment definition file at which the error occurred

%s2 = Environment definition file path

%s3 = Syntax error description

%s4 = Web Server name

### Explanation

One of the following causes is assumed:

- If the syntax error description (%s3) contains the following information, Interstage Directory Service SDK is not installed. Interstage Directory Service SDK is required to use the Online Collation function.

**Windows32/64**

```
Cannot load C:/Interstage/F3FMihs/modules/mod_auth_ldap.so into server:
The specified module could not be found.
```

#### Solaris32/64

```
Cannot load /opt/FJSVihs/modules/mod_auth_ldap.so into server:
ld.so.1: /opt/FJSVihs/bin/httpd: fatal:
libirepldap2.so: open failed: No such file or directory
```

#### Linux32/64

```
Cannot load /opt/FJSVihs/modules/mod_auth_ldap.so into server:
libirepldap2.so: cannot open shared object file: No such file or directory
```

#### - Windows32/64

If the syntax error description (%s3) contains the following information, it is possible that the Terminal service was installed in application mode.

```
Cannot load C:/Interstage/F3FMjs2su/gateway/jsgw_ap2api.so into server:
The specified module could not be found.
```

Or,

```
Cannot load C:/Interstage/F3FMssso/ssoatcag/lib/F3FMsssoatzihs.dll into server:
The specified module could not be found.
```

#### - Solaris32/64

If the syntax error description (%s3) contains the following information, it means that the attempt to get the address information for "\_default\_" or "255.255.255.255" that is set in the <VirtualHost> section failed.

```
Could not resolve address '255.255.255.255' -- check resolver configuration.
```

- Syntax error (%s3) occurred in environment definition file (%s2).

## System Action

Web Server program execution processing is aborted.

## User Action

Take one of the following actions:

- If the Online Collation function is not being used, check the settings of the online access management function for environment definition (%s2).

If the Online Collation function is being used, install Interstage Directory Service SDK on the same machine as the Web Server (%s4).

#### Windows32/64

- If Interstage Application Server was installed when the Terminal service was in application mode, take one of the following actions:
  1. Uninstall Interstage Application Server.
  2. Execute [CHANGE USER /INSTALL]
  3. Reinstall Interstage Application Server.
  4. Execute [CHANGE USER /EXECUTE].

#### Solaris32/64

- If the attempt to get the address information for "\_default\_" or "255.255.255.255" that is set in the <VirtualHost> section failed, for Solaris 10, add "dns" to the 'hosts' line in the /etc/nsswitch.conf file and then restart the Web server, or apply the patch "124235-03" or later.

For cases other than those described above, reexamine the environment definition file (%s2) by referring to the explanation of syntax error (%s3).

## 7.1.13 ihs00013

---

**IHS: ERROR: ihs00013: (%s1)%s2: Invalid config file path %s3 [%s4]**

### Variable Information

%s1 = Error details number

%s2 = Error details context

%s3 = Environment definition file name

%s4 = Web Server name

### Explanation

The specified environment definition file (%s3) path is incorrect.

### System Action

Web Server program execution processing is aborted.

### User Action

Check the path of the specified environment definition file (%s3).

## 7.1.14 ihs00014

---

**IHS: ERROR: ihs00014: (%s1)%s2: alloc\_listener: failed to set up sockaddr for %s3 [%s4]**

### Variable Information

%s1 = Error details number

%s2 = Error details context

%s3 = Host name

%s4 = Web Server name

### Explanation

The host name information specified for the Listen directive in the environment definition file (httpd.conf) could not be found.

### System Action

Web Server program execution processing is aborted.

### User Action

Resolve the cause of the error according to the error details context (%s2).

## 7.1.15 ihs00015

---

**IHS: ERROR: ihs00015: (%s1)%s2: alloc\_listener: failed to get a socket for %s3 [%s4]**

### Variable Information

%s1 = Error details number

%s2 = Error details context

%s3 = Host name

%s4 = Web Server name

## Explanation

A communication socket could not be created.

## System Action

Web Server program execution processing is aborted.

## User Action

Resolve the cause of the error according to the error details context (%s2).

## 7.1.16 ihs00016

---

**IHS: ERROR: ihs00016: (%s1)%s2: make\_sock: for address %s3, apr\_socket\_opt\_set: (%s4) [%s5]**

### Variable Information

%s1 = Error details number

%s2 = Error details context

%s3 = IP address:Port number

%s4 = Socket option

%s5 = Web Server name

## Explanation

The socket option (%s4) could not be set.

## System Action

The Web Server start processing is canceled.

## User Action

Resolve the cause of the error according to the error details context (%s2).

## 7.1.17 ihs00017

---

**IHS: WARNING: ihs00017: (%s1)%s2: make\_sock: failed to set %s3 for address %s4, using default [%s5]**

### Variable Information

%s1 = Error details number

%s2 = Error details context

%s3 = IP address:Port number

%s4 = Socket option

%s5 = Web Server name

## Explanation

The socket option (%s4) could not be set.

## System Action

Web Server start processing is continued.

## User Action

Resolve the cause of the error according to the error details context (%s2).

## 7.1.18 ihs00018

---

---

## IHS: ERROR: ihs00018: (%s1)%s2: make\_sock: could not bind to address %s3 [%s4]

### Variable Information

- %s1 = Error details number
- %s2 = Error details context
- %s3 = IP address:Port number
- %s4 = Web Server name

### Explanation

An address could not be assigned to the socket. This may be due to one of the following causes:

#### Windows32/64

- The message "OS 10049" in the error details number (%s1) indicates that an invalid address was specified.
- If the message "OS 10013" or "OS 10048" is included in the error details number (%s1) when the Web Server is started, check the following possible causes:
  - Another service is using the IP address and port number (%s3).
  - Another service is using the port number (%s3).
  - In the environment definition file (httpd.conf), more than one Listen directive with the same IP address and port number combination has been set.

#### Solaris32/64

- The message "126" in the error details number (%s1) indicates that an invalid address was specified.
- If the message "125" is included in the error details number (%s1) when the Web Server is started, check the following possible causes:
  - Another service is using the IP address and port number (%s3).
  - Another service is using the port number (%s3).
  - In the environment definition file (httpd.conf), more than one Listen directive with the same IP address and port number combination has been set.

#### Linux32/64

- The message "99" in the error details number (%s1) may be due to one of the following causes:
  - An invalid address is specified.
  - The IP address (%3) was mapped to an invalid network interface.
- The message "22" in the error details number (%s1) indicates that an invalid address was specified.
- The message "98" in the error details number (%s1) when the Web Server is started may be due to one of the following causes:
  - Another service is using the IP address and port number (%s3).
  - Another service is using the port number (%s3).
  - In the environment definition file (httpd.conf), more than one Listen directive with the same IP address and port number combination has been set.

### System Action

The Web Server start processing is canceled.

### User Action

Take one of the following actions:

- If an invalid address is specified, check the following:
  - When setting a virtual host with the Standalone Server of the Interstage Management Console:
    - 1) Open the Virtual Host list by clicking [System] > [Services] > [Web Server] > [Web Server name] > [Virtual Hosts] on the Interstage Management Console. From the list, click on the virtual host name including the IP address and port number (%s3).
    - 2) Check the [IP Address] settings in the [Virtual Host Name: Configuration] window.

**Windows32/64** **Linux32/64**

If an IPv6 address is specified in [IP Address], check that there are no problems with the [Port Number] settings. To create a new virtual host or modify an existing one, either of the following criteria must be met:

- The port number that was set in [Port Number] of the [Web Server Settings] window for setting the Web server environment definition is also set in [Port Number] of the virtual host.
  - [Port Number] of the virtual host is omitted.
- When setting a virtual host with the Admin Server of the Interstage Management Console:
    - 1) Open the Virtual Host list by clicking [Application Management] > [Interstage] > [Interstage Application Server] > [Services] > [Web Server] > [FJapache(Server Group name or Server name)] > [Virtual Hosts] on the Interstage Management Console. From the list, click on the virtual host name including the IP address and port number (%s3).
    - 2) Check the [IP Address] settings in the [Virtual Host Name: Configuration] page.

**Windows32/64** **Linux32/64**

If an IPv6 address is specified in [IP Address], check that there are no problems with the [Port Number] settings. To create a new virtual host or modify an existing one, either of the following criteria must be met:

- The port number that was set in [Port Number] of the [Web Server Settings] window for setting the Web server environment definition is also set in [Port Number] of the virtual host.
  - [Port Number] of the virtual host is omitted.
- When setting an IP address with the Listen directive in the environmental definition file: (*httpd.conf*)
    - 1) Check the settings of the Listen directive in the environment definition file (*httpd.conf*).
- If the IP address and port number (%s3), or just the port number (%s3) is being used by another service, take the following action:
    - Check whether the IP address and port number specified for the Web Server is also specified for another service.
    - Check whether the port number specified for the Web Server is also specified for another service.

If so, terminate that service, or use a different IP address and/or port number.

If the IP address and port number settings are correct, collect diagnostic information with the *iscollectinfo* command, and then contact your SE (systems engineer).

- If more than one Listen directive with the same IP address and port number combination has been set in the environment definition file (*httpd.conf*), delete the one that is not needed.

- **Linux32/64**

To check if the network interface is invalid, verify the settings of the network interface to which the IP address (%3) was mapped.

If the settings are correct, collect diagnostic information with the *iscollectinfo* command, and then contact your SE (systems engineer).

- In all other cases, remove the cause of error by referring to the error details (%s2).

## 7.1.19 ihs00019

**IHS: ERROR: ihs00019: (%s1)%s2: make\_sock: unable to listen for connections on address %s3 [%s4]**

### Variable Information

%s1 = Error details number

%s2 = Error details context

%s3 = IP address:Port number

%s4 = Web Server name

#### Explanation

Socket wait status transition failed.

#### System Action

The Web Server start processing is canceled.

#### User Action

Resolve the cause of the error according to the error details context (%s2).

### 7.1.20 ihs00020

---

**IHS: ERROR: ihs00020: no listening sockets available, shutting down [%s1]**

#### Variable Information

%s1 = Web Server name

#### Explanation

A valid Listen directive has not been set in the environment definition file (httpd.conf).

#### System Action

Web Server program execution processing is aborted.

#### User Action

If the Listen directive has not been set in the environment definition file (httpd.conf), set it. If the Listen directive has been set, refer to the message that was output at the same time and fix the error.

### 7.1.21 ihs00021

---

**IHS: ERROR: ihs00021: (%s1)%s2: Couldn't start ErrorLog process [%s3]**

#### Variable Information

%s1 = Error details number

%s2 = Error details context

%s3 = Web Server name

#### Explanation

The log output program specified for the ErrorLog directive in the environment definition file (httpd.conf) could not be started.

#### System Action

Web Server program execution processing is aborted.

#### User Action

Take one of the following actions:

- Resolve the cause of the error according to the error details context (%s2).
- Check the ErrorLog directive that is set in the environment definition file (httpd.conf).

### 7.1.22 ihs00022

---

---

**IHS: ERROR: ihs00022: (%s1)%s2: %s3: Invalid error log path %s4. [%s5]****Variable Information**

%s1 = Error details number

%s2 = Error details context

%s3 = Web Server program name

%s4 = Error log file name

%s5 = Web Server name

**Explanation**

The full path of the error log file (%s4) could not be found.

**System Action**

Web Server program execution processing is aborted.

**User Action**

Take one of the following actions:

- Resolve the cause of the error according to the error details context (%s2).
- Check the path of the error log file (%s4) specified for the ErrorLog directive in the environment definition file (httpd.conf).

---

**7.1.23 ihs00023**

---

**IHS: ERROR: ihs00023: (%s1)%s2: %s3: could not open error log file %s4. [%s5]****Variable Information**

%s1 = Error details number

%s2 = Error details context

%s3 = Web Server program name

%s4 = Error log file name

%s5 = Web Server name

**Explanation**

The error log file (%s4) specified for the ErrorLog directive in the environment definition file (httpd.conf) could not be opened.

**System Action**

Web Server program execution processing is aborted.

**User Action**

Take one of the following actions:

- Resolve the cause of the error according to the error details context (%s2).
- Check that the error log file (%s4) specified for the ErrorLog directive in the environment definition file (httpd.conf) is correct.

---

**7.1.24 ihs00024**

---

**IHS: ERROR: ihs00024: piped\_log\_spawn: unable to setup child process '%s1': %s2 [%s3]****Variable Information**

%s1 = Log output program name

%s2 = Error details context

%s3 = Web Server name

#### Explanation

Initialization processing for the log output program (%s1) failed.

#### System Action

Web Server program execution processing is aborted.

#### User Action

Resolve the cause of the error according to the error details context (%s2).

### 7.1.25 ihs00025

---

**IHS: ERROR: ihs00025: unable to start piped log program '%s1': %s2 [%s3]**

#### Variable Information

%s1 = Log output program name

%s2 = Error details context

%s3 = Web Server name

#### Explanation

The log output program (%s1) could not be started.

#### System Action

Web Server program execution processing is aborted.

#### User Action

Resolve the cause of the error according to the error details context (%s2).

### 7.1.26 ihs00026

---

**IHS: ERROR: ihs00026: (%s1)%s2: Invalid PID file path %s3, ignoring. [%s4]**

#### Variable Information

%s1 = Error details number

%s2 = Error details context

%s3 = Process management file name

%s4 = Web Server name

#### Explanation

The full path of the process management file (%s3) could not be found.

#### System Action

Web Server start processing is continued.

#### User Action

Resolve the cause of the error according to the error details context (%s2).

### 7.1.27 ihs00028

---

**IHS: ERROR: ihs00028: (%s1)%s2: %s3: could not log pid to file %s4 [%s5]**

## Variable Information

%s1 = Error details number

%s2 = Error details context

%s3 = Web Server program name

%s4 = Process management file name

%s5 = Web Server name

## Explanation

The log output program (%s1) failed to start.

## System Action

Web Server start processing is continued.

## User Action

Resolve the cause of the error according to the error details context (%s2).

## 7.1.28 ihs00029

---

**IHS: ERROR: ihs00029: [%s1] file %s2, line %s3, assertion "%s4" failed [%s5]**

## Variable Information

%s1 = Time of occurrence

%s2 = Source file name

%s3 = Source file line number

%s4 = Details information

%s5 = Web Server name

## Explanation

An error occurred in the Web Server (%s5).

## System Action

Web Server program execution processing is aborted.

## User Action

Collect diagnostic information using the *iscollectinfo* command, and then contact your SE (systems engineer).

## 7.1.29 ihs00030

---

**IHS: ERROR: ihs00030: (%s1)%s2: Fatal error: unable to create global pool for use with by the scoreboard [%s3]**

## Variable Information

%s1 = Error details number

%s2 = Error details context

%s3 = Web Server name

## Explanation

The memory management area that is used in scoreboard management could not be created.

## System Action

The Web Server start processing is canceled.

## User Action

Resolve the cause of the error according to the error details context (%s2).

### 7.1.30 ihs00031

---

**IHS: ERROR: ihs00031: (%s1)%s2: Fatal error: Invalid Scoreboard path %s3 [%s4]**

#### Variable Information

%s1 = Error details number

%s2 = Error details context

%s3 = Scoreboard file path

%s4 = Web Server name

#### Explanation

The full path of the scoreboard file (%s3) could not be found.

#### System Action

The Web Server start processing is canceled.

#### User Action

Resolve the cause of the error according to the error details context (%s2).

### 7.1.31 ihs00032

---

**IHS: ERROR: ihs00032: (%s1)%s2: Unable to create scoreboard (anonymous shared memory failure) [%s3]**

#### Variable Information

%s1 = Error details number

%s2 = Error details context

%s3 = Web Server name

#### Explanation

The shared memory that is used in the scoreboard could not be acquired.

#### System Action

The Web Server start processing is canceled.

#### User Action

Resolve the cause of the error according to the error details context (%s2).

### 7.1.32 ihs00033

---

**IHS: ERROR: ihs00033: (%s1)%s2: cannot allocate scoreboard [%s3]**

#### Variable Information

%s1 = Error details number

%s2 = Error details context

%s3 = Web Server name

#### Explanation

The dynamic memory that is used in the scoreboard could not be acquired.

#### System Action

The Web Server start processing is canceled.

#### User Action

Resolve the cause of the error according to the error details context (%s2).

### 7.1.33 ihs00034

---

**IHS: ERROR: ihs00034: (%s1)%s2: unable to create scoreboard "%s3" (name-based shared memory failure) [%s4]**

#### Variable Information

%s1 = Error details number

%s2 = Error details context

%s3 = Scoreboard name

%s4 = Web Server name

#### Explanation

The shared memory that is used in the scoreboard (%s3) could not be acquired.

#### System Action

The Web Server start processing is canceled.

#### User Action

Resolve the cause of the error according to the error details context (%s2).

### 7.1.34 ihs00035

---

**IHS: ERROR: ihs00035: (%s1)%s2: invalid transfer log path %s3. [%s4]**

#### Variable Information

%s1 = Error details number

%s2 = Error details context

%s3 = Access log file name

%s4 = Web Server name

#### Explanation

The full path of the access log file (%s3) could not be found.

#### System Action

Web Server program execution processing is aborted.

#### User Action

Take one of the following actions:

- Resolve the cause of the error according to the error details context (%s2).
- Check the CustomLog directive and the TransferLog directive that is set in the environment definition file (httpd.conf).

## 7.1.35 ihs00036

---

**IHS: ERROR: ihs00036: (%s1)%s2: could not open transfer log file %s3. [%s4]**

### Variable Information

%s1 = Error details number

%s2 = Error details context

%s3 = Access log file name

%s4 = Web Server name

### Explanation

The access log file (%s3) could not be found.

### System Action

Web Server program execution processing is aborted.

### User Action

Take one of the following actions:

- Resolve the cause of the error according to the error details context (%s2).
- Check the CustomLog directive and the TransferLog directive that is set in the environment definition file (httpd.conf).

## 7.1.36 ihs00037

---

**IHS: ERROR: ihs00037: (%s1)%s2: Invalid mime types config path %s3 [%s4]**

### Variable Information

%s1 = Error details number

%s2 = Error details context

%s3 = MIME type settings file name

%s4 = Web Server name

### Explanation

The full path of the MIME type settings file (%s3) could not be found.

### System Action

The Web Server start processing is canceled.

### User Action

Take one of the following actions:

- Resolve the cause of the error according to the error details context (%s2).
- Check the TypesConfig directive that is set in the environment definition file (httpd.conf).

## 7.1.37 ihs00038

---

**IHS: ERROR: ihs00038: (%s1)%s2: could not open mime types config file %s3. [%s4]**

### Variable Information

%s1 = Error details number

%s2 = Error details context

%s3 = MIME type settings file name

%s4 = Web Server name

#### Explanation

The MIME type settings file (%s3) could not be opened.

#### System Action

The Web Server start processing is canceled.

#### User Action

Take one of the following actions:

- Resolve the cause of the error according to the error details context (%s2).
- Check the TypesConfig directive that is set in the environment definition file (httpd.conf).

### 7.1.38 ihs00039

---

**IHS: ERROR: ihs00039: (%s1)%s2: mod\_rewrite: could not create rewrite\_log\_lock [%s3]**

#### Variable Information

%s1 = Error details number

%s2 = Error details context

%s3 = Web Server name

#### Explanation

The lock resources for the rewrite log could not be created.

#### System Action

The Web Server start processing is canceled.

#### User Action

Resolve the cause of the error according to the error details context (%s2).

### 7.1.39 ihs00040

---

**IHS: ERROR: ihs00040: (%s1)%s2: mod\_rewrite: Parent could not create RewriteLock file %s3 [%s4]**

#### Variable Information

%s1 = Error details number

%s2 = Error details context

%s3 = Name of the lock file for the rewrite function

%s4 = Web Server name

#### Explanation

The lock file (%s3) for the rewrite function could not be created.

#### System Action

The Web Server start processing is canceled.

#### User Action

Resolve the cause of the error according to the error details context (%s2).

## 7.1.40 ihs00041

---

**IHS: ERROR: ihs00041: (%s1)%s2: mod\_unique\_id: unable to find hostname of the server [%s3]**

### Variable Information

%s1 = Error details number

%s2 = Error details context

%s3 = Web Server name

### Explanation

The host name could not be acquired.

### System Action

The Web Server start processing is canceled.

### User Action

Resolve the cause of the error according to the error details context (%s2).

## 7.1.41 ihs00042

---

**IHS: ERROR: ihs00042: (%s1)%s2: mod\_unique\_id: unable to find IPv4 address of "%s3" [%s4]**

### Variable Information

%s1 = Error details number

%s2 = Error details context

%s3 = Host name

%s4 = Web Server name

### Explanation

The socket information could not be found.

### System Action

The Web Server start processing is canceled.

### User Action

Resolve the cause of the error according to the error details context (%s2).

## 7.1.42 ihs00043

---

**IHS: WARNING: ihs00043: Require %s1 > 0, setting to 1 [%s2]**

### Variable Information

%s1 = Directive name

%s2 = Web Server name

### Explanation

A value of 0 or less was set for the directive (%s1) in the environment definition file (httpd.conf). The directive (%s1) requires a value of 1.

### System Action

Web Server processing is continued.

## User Action

Set a value of 1 or more for the directive (%s1) in the environment definition file (httpd.conf).

## 7.2 ihs00100 to ihs00199

---

This section details the messages numbered between ihs00100 and ihs00199.

### 7.2.1 ihs00100

---

#### **IHS: ERROR: ihs00100: (%s1)%s2: Failed to get the full path of %s3**

##### Variable Information

%s1 = Error details number

%s2 = Error details context

%s3 = Web Server program name

##### Explanation

The full path of the Web Server program (%s3) could not be found.

##### System Action

Web Server program execution processing is aborted.

##### User Action

Resolve the cause of the error according to the error details context (%s2).

### 7.2.2 ihs00101

---

#### **IHS: ERROR: ihs00101: %s1: Service is already installed.**

##### Variable Information

%s1 = Service name

##### Explanation

The Web Server service (%s1) has already been registered.

##### System Action

Web Server service registration processing is aborted.

##### User Action

Check the service (%s1) registration status in the Services window ([Control Panel] > [Administrative Tools] > [Services]).

### 7.2.3 ihs00102

---

#### **IHS: ERROR: ihs00102: (%s1)%s2: No installed service named "%s3".**

##### Variable Information

%s1 = Error details number

%s2 = Error details context

%s3 = Service name

Note: The error details number (%s1) and the error details context (%s2) "(%s1)%s2: " may not be output.

#### Explanation

The Web Server service (%s3) has not been registered.

#### System Action

Web Server program execution processing is aborted.

#### User Action

Create the Web Server operating environment using the *ihsc* command or via the Interstage Management Console.

### 7.2.4 ihs00103

---

**IHS: ERROR: ihs00103: (%s1)%s2: %s3: Unable to start the service manager. [%s4]**

#### Variable Information

%s1 = Error details number

%s2 = Error details context

%s3 = Service name

%s4 = Web Server name

#### Explanation

The service control manager could not be started.

#### System Action

The Web Server start processing is canceled.

#### User Action

Resolve the cause of the error according to the error details context (%s2).

### 7.2.5 ihs00104

---

**IHS: ERROR: ihs00104: (%s1)%s2: Parent: Cannot create shutdown event %s3 [%s4]**

#### Variable Information

%s1 = Error details number

%s2 = Error details context

%s3 = Event object name

%s4 = Web Server name

#### Explanation

The shutdown event object (%s3) could not be created.

#### System Action

The Web Server start processing is canceled.

#### User Action

Resolve the cause of the error according to the error details context (%s2).

### 7.2.6 ihs00105

---

**IHS: ERROR: ihs00105: (%s1)%s2: Parent: Cannot create restart event %s3 [%s4]**

### Variable Information

%s1 = Error details number

%s2 = Error details context

%s3 = Event object name

%s4 = Web Server name

### Explanation

The restart event object (%s3) could not be created.

### System Action

The Web Server start processing is canceled.

### User Action

Resolve the cause of the error according to the error details context (%s2).

## 7.2.7 ihs00106

---

**IHS: ERROR: ihs00106: (%s1)%s2: %s3: Unable to create the start\_mutex. [%s4]**

### Variable Information

%s1 = Error details number

%s2 = Error details context

%s3 = Service name

%s4 = Web Server name

### Explanation

Exclusive resources for the daemon process could not be created.

### System Action

The Web Server start processing is canceled.

### User Action

Resolve the cause of the error according to the error details context (%s2).

## 7.2.8 ihs00107

---

**IHS: ERROR: ihs00107: (%s1)%s2: master\_main: create child process failed. Exiting. [%s3]**

### Variable Information

%s1 = Error details number

%s2 = Error details context

%s3 = Web Server name

Note: The error details number (%s1) and the error details context (%s2) may not be output.

### Explanation

An error occurred in daemon process create processing.

### System Action

The Web Server start processing is canceled.

## User Action

Refer to the message that was output at the same time and fix the error.

## 7.2.9 ihs00108

---

**IHS: ERROR: ihs00108: (%s1)%s2: master\_main: WaitForMultipleObjects WAIT\_FAILED -- doing server shutdown [%s3]**

### Variable Information

%s1 = Error details number

%s2 = Error details context

%s3 = Web Server name

### Explanation

An error occurred in daemon process status monitoring.

### System Action

The Web Server is stopped.

### User Action

Resolve the cause of the error according to the error details context (%s2).

## 7.2.10 ihs00109

---

**IHS: ERROR: ihs00109: (%s1)%s2: master\_main: WaitForMultipleObjects with INFINITE wait exited with WAIT\_TIMEOUT [%s3]**

### Variable Information

%s1 = Error details number

%s2 = Error details context

%s3 = Web Server name

### Explanation

A timeout occurred in daemon process status monitoring.

### System Action

The Web Server is stopped.

### User Action

Resolve the cause of the error according to the error details context (%s2).

## 7.2.11 ihs00110

---

**IHS: INFO: ihs00110: Parent: Received restart signal -- Restarting the server. [%s1]**

### Variable Information

%s1 = Web Server name

### Explanation

Web Server (%s1) restart processing has started.

## 7.2.12 ihs00111

---

**IHS: ERROR: ihs00111: Parent: child process exited with status %s1 -- Aborting. [%s2]**

### Variable Information

%s1 = Daemon process exit code

%s2 = Web Server name

### Explanation

An error occurred in the daemon process.

### System Action

The daemon process is restarted.

### User Action

Refer to the message that was output at the same time and fix the error.

For details of Web Server error logs, refer to the "Messages Output by Interstage HTTP Server" chapter.

## 7.2.13 ihs00112

---

**IHS: ERROR: ihs00112: (%s1)%s2: GetModuleFileName failed [%s3]**

### Variable Information

%s1 = Error details number

%s2 = Error details context

%s3 = Web Server name

### Explanation

The full pathname of the Web Server program could not be acquired.

### System Action

Web Server service registration processing is aborted.

### User Action

Resolve the cause of the error according to the error details context (%s2).

## 7.2.14 ihs00113

---

**IHS: ERROR: ihs00113: (%s1)%s2: Failed to open the WinNT service manager [%s3]**

### Variable Information

%s1 = Error details number

%s2 = Error details context

%s3 = Web Server name

### Explanation

A connection could not be established with the service control manager.

### System Action

Web Server program execution processing is aborted.

## User Action

Resolve the cause of the error according to the error details context (%s2).

## 7.2.15 ihs00114

---

### IHS: ERROR: ihs00114: (%s1)%s2: OpenService failed [%s3]

#### Variable Information

%s1 = Error details number

%s2 = Error details context

%s3 = Web Server name

#### Explanation

The Web Server (%s3) service could not be opened.

#### System Action

Web Server program execution processing is aborted.

#### User Action

Resolve the cause of the error according to the error details context (%s2).

## 7.2.16 ihs00115

---

### IHS: ERROR: ihs00115: (%s1)%s2: ChangeServiceConfig failed [%s3]

#### Variable Information

%s1 = Error details number

%s2 = Error details context

%s3 = Web Server name

#### Explanation

The Web Server service configuration parameter could not be modified.

#### System Action

Web Server program execution processing is aborted.

#### User Action

Resolve the cause of the error according to the error details context (%s2).

## 7.2.17 ihs00116

---

### IHS: ERROR: ihs00116: (%s1)%s2: Failed to create WinNT Service Profile [%s3]

#### Variable Information

%s1 = Error details number

%s2 = Error details context

%s3 = Web Server name

#### Explanation

The Web Server (%s3) service could not be registered.

## System Action

Web Server service registration processing is aborted.

## User Action

Resolve the cause of the error according to the error details context (%s2).

## 7.2.18 ihs00117

---

**IHS: ERROR: ihs00117: (%s1)%s2: %s3: Failed to store the ConfigArgs in the registry. [%s4]**

### Variable Information

%s1 = Error details number

%s2 = Error details context

%s3 = Service name

%s4 = Web Server name

### Explanation

The registry for the option used when the Web Server (%s4) service (%s3) starts could not be registered.

### System Action

Web Server service registration processing is aborted.

### User Action

Resolve the cause of the error according to the error details context (%s2).

## 7.2.19 ihs00118

---

**IHS: ERROR: ihs00118: (%s1)%s2: %s3: Failed to delete the service. [%s4]**

### Variable Information

%s1 = Error details number

%s2 = Error details context

%s3 = Service name

%s4 = Web Server name

### Explanation

The Web Server (%s4) service (%s3) could not be deleted.

### System Action

Web Server service deletion processing is aborted.

### User Action

Resolve the cause of the error according to the error details context (%s2).

## 7.2.20 ihs00119

---

**IHS: ERROR: ihs00119: (%s1)%s2: Query of Service %s3 failed [%s4]**

### Variable Information

%s1 = Error details number

%s2 = Error details context

%s3 = Service name

%s4 = Web Server name

#### Explanation

The Web Server (%s4) service (%s3) status could not be obtained.

#### System Action

The Web Server stop processing is canceled.

#### User Action

Resolve the cause of the error according to the error details context (%s2).

## 7.2.21 ihs00120

---

**IHS: ERROR: ihs00120: (%s1)%s2: ISAPI: could not create the isapi cache pool [%s3]**

#### Variable Information

%s1 = Error details number

%s2 = Error details context

%s3 = Web Server name

#### Explanation

The memory management area for the mod\_isap module could not be created.

#### System Action

Web Server program execution processing is aborted.

#### User Action

Resolve the cause of the error according to the error details context (%s2).

## 7.2.22 ihs00121

---

**IHS: WARNING: ihs00121: ThreadsPerChild of %s1 exceeds ThreadLimit value of %s2 threads, lowering ThreadsPerChild to %s2. To increase, please see the ThreadLimit directive. [%s3]**

#### Variable Information

%s1 = The value set for the ThreadsPerChild directive

%s2 = Limit for the ThreadsPerChild directive

%s3 = Web Server name

#### Explanation

The value set for the ThreadsPerChild directive in the environment definition file (httpd.conf) (%s1) has exceeded the limit (%s2). The ThreadsPerChild directive requires a value of limit %s2 to be set.

#### System Action

Web Server processing is continued.

#### User Action

Set a value that does not exceed the limit (%s2) for the ThreadsPerChild directive in the environment definition file (httpd.conf).

## 7.2.23 ihs00122

---

---

**IHS: WARNING: ihs00122: ThreadLimit of %s1 exceeds compile time limit of %s2 threads, lowering ThreadLimit to %s2. [%s3]**

**Variable Information**

%s1 = The value set for the ThreadLimit directive

%s2 = Limit for the ThreadLimit directive

%s3 = Web Server name

**Explanation**

The value set for the ThreadLimit directive in the environment definition file (httpd.conf) (%s1) has exceeded the limit (%s2). The ThreadLimit directive requires a value of limit %s2 to be set.

**System Action**

Web Server processing is continued.

**User Action**

Set a value that does not exceed the limit (%s2) for the ThreadLimit directive in the environment definition file (httpd.conf).

---

## 7.2.24 ihs00123

---

**IHS: ERROR: ihs00123: (%s1)%s2: Parent: Failed to get full path of %s3 [%s4]**

**Variable Information**

%s1 = Error details number

%s2 = Error details context

%s3 = Web Server program name

%s4 = Web Server name

**Explanation**

The full path of the Web Server program (%s3) could not be found.

**System Action**

The Web Server start processing is canceled.

**User Action**

Resolve the cause of the error according to the error details context (%s2).

---

## 7.2.25 ihs00124

---

**IHS: ERROR: ihs00124: (%s1)%s2: Parent: Unable to %s3 [%s4]**

**Variable Information**

%s1 = Error details number

%s2 = Error details context

%s3 = Erroneous processing contents

%s4 = Web Server name

**Explanation**

Processing (%s3) failed.

**System Action**

The Web Server start processing is canceled.

## User Action

Resolve the cause of the error according to the error details context (%s2).

## 7.2.26 ihs00125

---

**IHS: ERROR: ihs00125: (%s1)%s2: Parent: Could not create %s3 event for child process [%s4]**

### Variable Information

%s1 = Error details number

%s2 = Error details context

%s3 = Event type

%s4 = Web Server name

### Explanation

An event object could not be created.

### System Action

The Web Server start processing is canceled.

### User Action

Resolve the cause of the error according to the error details context (%s2).

## 7.2.27 ihs00126

---

**IHS: ERROR: ihs00126: (%s1)%s2: Parent: Failed to create the child process. [%s3]**

### Variable Information

%s1 = Error details number

%s2 = Error details context

%s3 = Web Server name

### Explanation

A daemon process could not be created.

### System Action

The Web Server start processing is canceled.

### User Action

Resolve the cause of the error according to the error details context (%s2).

## 7.2.28 ihs00127

---

**IHS: ERROR: ihs00127: (%s1)%s2: Parent: WSADuplicateSocket failed for socket %s3. Check the FAQ. [%s4]**

### Variable Information

%s1 = Error details number

%s2 = Error details context

%s3 = Socket descriptor

%s4 = Web Server name

## Explanation

The socket could not be reproduced.

## System Action

The Web Server start processing is canceled.

## User Action

Resolve the cause of the error according to the error details context (%s2).

## 7.2.29 ihs00128

---

**IHS: ERROR: ihs00128: %s1: Failed to start the service process. [%s2]**

### Variable Information

%s1 = Service name

%s2 = Web Server name

### Explanation

An error occurred starting the Web Server service (%s1).

### System Action

The Web Server start processing is canceled.

### User Action

Refer to the message that was output at the same time and fix the error.

## 7.2.30 ihs00129

---

**IHS: ERROR: ihs00129: (%s1)%s2: Child %s3: \_beginthreadex failed. Unable to create all worker threads. Created %s4 of the %s5 threads requested with the ThreadsPerChild configuration directive. [%s6]**

### Variable Information

%s1 = Error details number

%s2 = Error details context

%s3 = Process ID of the daemon process

%s4 = The number of created communication threads

%s5 = The value set for the ThreadsPerChild directive

%s6 = Web Server name

### Explanation

The communication thread could not be created.

### System Action

The Web Server is stopped.

### User Action

Resolve the cause of the error according to the error details context (%s2).

## 7.2.31 ihs00130

---

**IHS: INFO: ihs00130: Parent: child process exited with status %s1 -- Restarting. [%s2]**

## Variable Information

%s1 = Process ID of the daemon process

%s2 = Web Server name

## Explanation

The daemon process is closed.

## System Action

The daemon process is restarted.

## 7.2.32 ihs00131

---

**IHS: WARNING: ihs00131: Server ran out of threads to serve requests. Consider raising the ThreadsPerChild setting[%s1]**

## Variable Information

%s1 = Web Server name

## Explanation

The number of simultaneous connection requests from the client has exceeded the value set for the ThreadsPerChild directive in the environment definition file (httpd.conf) (maximum number of requests).

This message is output the first time the number of requests exceeds the maximum value for the number of simultaneous connections after the Web Server starts up. Once this message is output, it is not output again until the Web Server restarts.

## System Action

Web Server processing is continued.

## User Action

If necessary, check the value set for the ThreadsPerChild directive in the environment definition file (httpd.conf) (maximum number of requests).

## 7.3 ihs00200 to ihs00299

---

This section details the messages numbered between ihs00200 and ihs00299.

### 7.3.1 ihs00200

---

**IHS: ERROR: ihs00200: (%s1)%s2: Error retrieving pid file %s3 [%s4]**

## Variable Information

%s1 = Error details number

%s2 = Error details context

%s3 = Process management file

%s4 = Web Server name

## Explanation

The process management file (%s3) could not be read.

## System Action

Web Server program execution processing is aborted.

## User Action

Resolve the cause of the error according to the error details context (%s2).

### 7.3.2 ihs00201

---

**IHS: WARNING: ihs00201: httpd (pid %s1) already running [%s2]**

#### Variable Information

%s1 = Process ID

%s2 = Web Server name

#### Explanation

The Web Server (%s2) is already running.

#### System Action

The Web Server start processing is canceled.

### 7.3.3 ihs00202

---

**IHS: WARNING: ihs00202: httpd (no pid file) not running [%s1]**

#### Variable Information

%s1 = Web Server name

#### Explanation

The Web Server (%s1) is not running.

#### System Action

The Web Server stop processing is canceled.

### 7.3.4 ihs00203

---

**IHS: WARNING: ihs00203: httpd (pid %s1?) not running [%s2]**

#### Variable Information

%s1 = Process ID

%s2 = Web Server name

#### Explanation

The Web Server (%s2) process (%s1) does not exist.

#### System Action

The Web Server stop processing is canceled.

### 7.3.5 ihs00204

---

**IHS: WARNING: ihs00204: httpd not running, trying to start [%s1]**

#### Variable Information

%s1 = Web Server name

#### Explanation

The Web Server (%s1) is not running.

## System Action

Web Server start processing is started.

### 7.3.6 ihs00205

---

**IHS: ERROR: ihs00205: (%s1)%s2: sending signal to server [%s3]**

#### Variable Information

%s1 = Error details number

%s2 = Error details context

%s3 = Web Server name

#### Explanation

The signal failed to be sent to the daemon process.

#### System Action

Web Server program execution processing is aborted.

#### User Action

Resolve the cause of the error according to the error details context (%s2).

### 7.3.7 ihs00206

---

**IHS: ERROR: ihs00206: Child %s1 returned a Fatal error... Apache is exiting! [%s2]**

#### Variable Information

%s1 = Process ID of the communication process

%s2 = Web Server name

#### Explanation

An error occurred in the communication process (%s1).

#### System Action

The Web Server is stopped.

#### User Action

Refer to the message that was output at the same time and fix the error.

### 7.3.8 ihs00207

---

**IHS: ERROR: ihs00207: (%s1)%s2: apr\_proc\_detach failed [%s3]**

#### Variable Information

%s1 = Error details number

%s2 = Error details context

%s3 = Web Server name

#### Explanation

A daemon process could not be generated.

#### System Action

The Web Server start processing is canceled.

## User Action

Resolve the cause of the error according to the error details context (%s2).

### 7.3.9 ihs00208

---

**IHS: ERROR: ihs00208: (%s1)%s2: Could not open pipe-of-death. [%s3]**

#### Variable Information

%s1 = Error details number

%s2 = Error details context

%s3 = Web Server name

#### Explanation

A pipe could not be created.

#### System Action

The Web Server start processing is canceled.

#### User Action

Resolve the cause of the error according to the error details context (%s2).

### 7.3.10 ihs00209

---

**IHS: ERROR: ihs00209: (%s1)%s2: Couldn't create accept lock [%s3]**

#### Variable Information

%s1 = Error details number

%s2 = Error details context

%s3 = Web Server name

#### Explanation

Exclusive resources for connection could not be created.

#### System Action

The Web Server start processing is canceled.

#### User Action

Resolve the cause of the error according to the error details context (%s2).

### 7.3.11 ihs00210

---

**IHS: ERROR: ihs00210: (%s1)%s2: Couldn't set permissions on cross-process lock; check User and Group directives [%s3]**

#### Variable Information

%s1 = Error details number

%s2 = Error details context

%s3 = Web Server name

#### Explanation

Authority failed to be set for exclusive resources for connection.

### System Action

The Web Server start processing is canceled.

### User Action

Resolve the cause of the error according to the error details context (%s2).

## 7.3.12 ihs00211

---

**IHS: INFO: ihs00211: Graceful restart requested, doing restart [%s1]**

### Variable Information

%s1 = Web Server name

### Explanation

Web Server (%s1) restart processing is started.

## 7.3.13 ihs00212

---

**IHS: INFO: ihs00212: SIGHUP received. Attempting to restart [%s1]**

### Variable Information

%s1 = Web Server name

### Explanation

Web Server (%s1) restart processing is started.

## 7.3.14 ihs00213

---

**IHS: ERROR: ihs00213: (%s1)%s2: Couldn't initialize cross-process lock in child [%s3]**

### Variable Information

%s1 = Error details number

%s2 = Error details context

%s3 = Web Server name

### Explanation

Exclusive resources for connection could not be initialized.

### System Action

The Web Server is stopped.

### User Action

Resolve the cause of the error according to the error details context (%s2).

## 7.3.15 ihs00214

---

**IHS: ERROR: ihs00214: (%s1)%s2: setuid: unable to change to uid: %s3 [%s4]**

### Variable Information

%s1 = Error details number

%s2 = Error details context

%s3 = User ID

%s4 = Web Server name

#### Explanation

The User ID (%s3) specified for the User directive in the environment definition file (httpd.conf) could not be set.

#### System Action

The Web Server is stopped.

#### User Action

Take one of the following actions:

- Resolve the cause of the error according to the error details context (%s2).
- Check User ID (%s3) specified by the User directive in the environment definition file (httpd.conf).

### 7.3.16 ihs00215

---

**IHS: ERROR: ihs00215: (%s1)%s2: getpwuid: couldn't determine user name from uid %s3, you probably need to modify the User directive [%s4]**

#### Variable Information

%s1 = Error details number

%s2 = Error details context

%s3 = User ID

%s4 = Web Server name

Note: Error details number (%s1) and Error details context (%s2) may not be output.

#### Explanation

The User ID (%s3) entry specified for the User directive in the environment definition file (httpd.conf) could not be found.

#### System Action

The Web Server is stopped.

#### User Action

Take one of the following actions:

- Resolve the cause of the error according to the error details context (%s2).
- Check the User ID (%s3) specified by the User directive in the environment definition file (httpd.conf).

### 7.3.17 ihs00216

---

**IHS: ERROR: ihs00216: (%s1)%s2: setgid: unable to set group id to Group %s3 [%s4]**

#### Variable Information

%s1 = Error details number

%s2 = Error details context

%s3 = Group ID

%s4 = Web Server name

#### Explanation

The Group ID (%s3) specified for the Group directive in the environment definition file (httpd.conf) could not be set.

## System Action

The Web Server is stopped.

## User Action

Take one of the following actions:

- Resolve the cause of the error according to the error details context (%s2).
- Check the Group ID (%s3) specified by the Group directive in the environment definition file (httpd.conf).

## 7.3.18 ihs00217

---

**IHS: ERROR: ihs00217: (%s1)%s2: initgroups: unable to set groups for User %s3 and Group %s4 [%s5]**

### Variable Information

%s1 = Error details number

%s2 = Error details context

%s3 = User ID

%s4 = Group ID

%s5 = Web Server name

### Explanation

The group access list could not be initialized.

### System Action

The Web Server is stopped.

### User Action

Resolve the cause of the error according to the error details context (%s2).

## 7.3.19 ihs00218

---

**IHS: ERROR: ihs00218: (%s1)%s2: mod\_rewrite: Could not set permissions on rewrite\_log\_lock; check User and Group directives [%s3]**

### Variable Information

%s1 = Error details number

%s2 = Error details context

%s3 = Web Server name

### Explanation

The authority for lock resources for the rewrite log could not be set.

### System Action

The Web Server start processing is canceled.

### User Action

Resolve the cause of the error according to the error details context (%s2).

## 7.3.20 ihs00219

---

**IHS: ERROR: ihs00219: (%s1)%s2: mod\_rewrite: Parent could not set permissions on RewriteLock; check User and Group directives [%s3]**

### Variable Information

%s1 = Error details number

%s2 = Error details context

%s3 = Web Server name

### Explanation

The authority for the lock file for the rewrite function could not be set.

### System Action

The Web Server start processing is canceled.

### User Action

Resolve the cause of the error according to the error details context (%s2).

## 7.3.21 ihs00220

---

**IHS: WARNING: ihs00220: detected MinSpareServers set to non-positive. Resetting to 1 to avoid almost certain Apache failure. Please read the documentation. [%s1]**

### Variable Information

%s1 = Web Server name

### Explanation

A value of 0 or less has been set for the MinSpareServers directive in the environment definition file (httpd.conf). The MinSpareServers directive requires a value of 1.

### System Action

The Web Server start processing is canceled.

### User Action

Set a value of 1 or more for the MinSpareServers directive in the environment definition file (httpd.conf).

## 7.3.22 ihs00221

---

**IHS: WARNING: ihs00221: MaxClients of %s1 exceeds ServerLimit value of %s2 servers, lowering MaxClients to %s2. To increase, please see the ServerLimit directive. [%s3]**

### Variable Information

%s1 = The value set for the MaxClients directive

%s2 = Limit for the MaxClients directive

%s3 = Web Server name

### Explanation

The value set for the MaxClients directive in the environment definition file (httpd.conf) (%s1) has exceeded the limit (%s2). The MaxClients directive requires a value of limit (%s2).

### System Action

Web Server processing is continued.

### User Action

Set a value that does not exceed the limit (%s2) for the MaxClients directive in the environment definition file (httpd.conf).

## 7.3.23 ihs00222

---

**IHS: WARNING: ihs00222: ServerLimit of %s1 exceeds compile time limit of %s2 servers, lowering ServerLimit to %s2. [%s3]**

### Variable Information

%s1 = The value set for the ServerLimit directive

%s2 = Limit for the ServerLimit directive

%s3 = Web Server name

### Explanation

The value set for the ServerLimit directive in the environment definition file (httpd.conf) (%s1) has exceeded the limit (%s2). The ServerLimit directive requires a value of limit (%s2).

### System Action

Web Server processing is continued.

### User Action

Set a value that does not exceed the limit (%s2) for the ServerLimit directive in the environment definition file (httpd.conf).

## 7.3.24 ihs00223

---

**IHS: ERROR: ihs00223: %s1: bad user name %s2 [%s3]**

### Variable Information

%s1 = Web Server program name

%s2 = User name specified in the User directive

%s3 = Web Server name

### Explanation

The password file information of the user name (%s2) specified in the User directive of the environment definition file (httpd.conf) could not be acquired.

### System Action

Web Server program execution processing is aborted.

### User Action

Check whether the user name (%s2) specified in the User directive of the environment definition file (httpd.conf) is registered.

## 7.3.25 ihs00224

---

**IHS: ERROR: ihs00224: %s1: bad group name %s2 [%s3]**

### Variable Information

%s1 = Web Server program name

%s2 = Group name specified in the Group directive

%s3 = Web Server name

### Explanation

The group information of the group name (%s2) specified in the Group directive of the environment definition file (httpd.conf) could not be acquired.

## System Action

Web Server program execution processing is aborted.

## User Action

Check whether the group name (%s2) specified in the Group directive of the environment definition file (httpd.conf) is registered.

## 7.3.26 ihs00225

---

**IHS: ERROR: ihs00225: (%s1)%s2: couldn't grab the accept mutex [%s3]**

### Variable Information

%s1 = Error details number

%s2 = Error details context

%s3 = Web Server name

### Explanation

Exclusive resources that wait for connection from a client could not be acquired.

### System Action

The Web Server is stopped.

### User Action

Resolve the cause of the error according to the error details context (%s2).

## 7.3.27 ihs00226

---

**IHS: ERROR: ihs00226: (%s1)%s2: couldn't release the accept mutex [%s3]**

### Variable Information

%s1 = Error details number

%s2 = Error details context

%s3 = Web Server name

### Explanation

Exclusive resources that wait for connection from a client could not be released.

### System Action

The Web Server is stopped.

### User Action

Resolve the cause of the error according to the error details context (%s2).

## 7.3.28 ihs00227

---

**IHS: ERROR: ihs00227: (%s1)%s2: ap\_listen\_open: unable to make socket non-blocking [%s3]**

### Variable Information

%s1 = Error details number

%s2 = Error details context

%s3 = Web Server name

## Explanation

The non-blocking of the socket failed.

## System Action

The Web Server start processing is canceled.

## User Action

Resolve the cause of the error according to the error details context (%s2).

## 7.3.29 ihs00228

---

**IHS: WARNING: ihs00228: The number of requests received simultaneously reached the value set in the MaxClients directive. [%s1]**

### Variable Information

%s1 = Web Server name

### Explanation

The number of simultaneous connection requests from the client has exceeded the value set for the MaxClients directive in the environment definition file (httpd.conf) (maximum number of requests).

This message is output the first time the number of requests exceeds the maximum value for the number of simultaneous connections after the Web Server starts up. Once this message is output, it is not output again until the Web Server restarts.

### System Action

Web Server processing is continued.

### User Action

If necessary, check the value set for the MaxClients directive in the environment definition file (httpd.conf) (maximum number of requests).

## 7.4 ihs00300 to ihs00399

---

This section details the messages numbered between ihs00300 and ihs00399.

### 7.4.1 ihs00300

---

**IHS: ERROR: ihs00300: Internal error. Detail=(%s1) [%s2]**

#### Variable Information

%s1 = Error details context

%s2 = Web Server name

#### Explanation

An internal error occurred.

#### System Action

Terminates the processing.

#### User Action

Collect troubleshooting information using the *iscollectinfo* command, and then contact your SE (systems engineer).

### 7.4.2 ihs00301

---

---

**IHS: ERROR: ihs00301: The path to an environment definition file is invalid. Detail=%s1(%s2) [%s3]**

**Variable Information**

- %s1 = Environment definition file name
- %s2 = Error details number
- %s3 = Web Server name

**Explanation**

The path (%s1) of the environment definition file is incorrect.

**System Action**

Terminates the processing.

**User Action**

Collect troubleshooting information using the *iscollectinfo* command, and then contact your SE (systems engineer).

### 7.4.3 ihs00302

---

**IHS: ERROR: ihs00302: File copy failed. Detail=%s1->%s2(%s3) [%s4]**

**Variable Information**

- %s1 = Copy source file name
- %s2 = Copy destination file name
- %s3 = Error details number
- %s4 = Web Server name

**Explanation**

Copying from file (%s1) to file (%s2) failed.

**System Action**

Terminates the processing.

**User Action**

Collect troubleshooting information using the *iscollectinfo* command, and then contact your SE (systems engineer).

### 7.4.4 ihs00303

---

**IHS: ERROR: ihs00303: File open failed. Detail=%s1(%s2) [%s3]**

**Variable Information**

- %s1 = File name
- %s2 = Error details number
- %s3 = Web Server name

**Explanation**

The file (%s1) could not be opened.

**System Action**

Terminates the processing.

**User Action**

Collect troubleshooting information using the *iscollectinfo* command, and then contact your SE (systems engineer).

## 7.4.5 ihs00304

---

**IHS: ERROR: ihs00304: File lock failed. Detail=%s1(%s2) [%s3]**

### Variable Information

- %s1 = File name
- %s2 = Error details number
- %s3 = Web Server name

### Explanation

The file (%s1) could not be locked.

### System Action

Terminates the processing.

### User Action

Collect troubleshooting information using the *iscollectinfo* command, and then contact your SE (systems engineer).

## 7.5 ihs00400 to ihs00499

---

This section details the messages numbered between ihs00400 and ihs00499.

### 7.5.1 ihs00400

---

**IHS: ERROR: ihs00400: %s1: An error occurred during the Web server program execution processing. [%s2]**

### Variable Information

- %s1 = Web Server program name
- %s2 = Web Server name

Note: The Web server (%s2) may not be output, depending on the method used to execute the Web server program (%s1).

### Explanation

An error occurred in the Web Server program (%s1) execution processing.

One of the following causes is assumed:

#### Windows32/64

- The Web Server operation was performed by executing the Apache command.

#### Solaris32/64 Linux32/64

- The option specified when Interstage HTTP Server (for the Interstage Management Console) was started by executing the *httpd* command is invalid.
- In Systemwalker Centric Manager, the option specified when Interstage HTTP Server (for the Interstage Management Console) was started by executing the *httpd* command using the *swexec* command is invalid.
- The Web Server operation was performed by executing the *httpd* command.

### System Action

Web Server program execution processing is aborted.

### User Action

Take one of the following actions:

#### Windows32/64

- The Apache command cannot be used. To start/stop the Web server, run Web server (%s2) using the Interstage Management Console or Interstage HTTP Server operation command.

#### Solaris32/64 Linux32/64

- To start Interstage HTTP Server (for the Interstage Management Console) using the *httpd* command, specify and then execute the following options and parameters. For details on the method used to start Interstage HTTP Server (for the Interstage Management Console), refer to the Operator's Guide.

```
/opt/FJSVihs/bin/httpd -f /etc/opt/FJSVihs/httpd.conf -s "#ISCONSOLE" -K
```

- In Systemwalker Centric Manager, to start Interstage HTTP Server (for the Interstage Management Console) by executing the *httpd* command using the *swexec* command, specify and then execute the following options and parameters. A backslash (\) escape character must precede each double quote ("). For details on the *swexec* command, refer to the Systemwalker Centric Manager Reference Guide.

```
swexec /opt/FJSVihs/bin/httpd -f /etc/opt/FJSVihs/httpd.conf -s \"#ISCONSOLE\" -K
```

- In all other cases, the *httpd* command cannot be used. To start/stop the Web server, run Web server %s2 using the Interstage Management Console or Interstage HTTP Server operation command.

## 7.5.2 ihs00401

---

**IHS: ERROR: ihs00401: (%s1)%s2: Couldn't start TraceLog process. [%s1]**

### Variable Information

%s1 = Error details number

%s2 = Error details context

%s3 = Web Server name

Note: The error details number (%s1) and the error details context (%s2) "(%s1)%s2: " may not be output.

### Explanation

The log output program specified for the IHSTraceLog directive in the environment definition file (httpd.conf) could not be started.

### System Action

Web Server program execution processing is aborted.

### User Action

Take one of the following actions:

- Refer to the message that was output at the same time and fix the error.
- Check the IHSTraceLog directive that is set in the environment definition file (httpd.conf).

## 7.5.3 ihs00402

---

**IHS: ERROR: ihs00402: (%s1)%s2: Invalid TraceLog file path %s3. [%s4]**

### Variable Information

%s1 = Error details number

%s2 = Error details context

%s3 = Name of the log file for trace output

%s4 = Web Server name

## Explanation

The full path of the log file (%s3) for trace output could not be found.

## System Action

Web Server program execution processing is aborted.

## User Action

Take one of the following actions:

- Resolve the cause of the error according to the error details context (%s2).
- Check the IHSTraceLog directive that is set in the environment definition file (httpd.conf).

## 7.5.4 ihs00403

---

**IHS: ERROR: ihs00403: (%s1)%s2: Could not open TraceLog file %s3. [%s4]**

### Variable Information

%s1 = Error details number

%s2 = Error details context

%s3 = Name of the log file for trace output

%s4 = Web Server name

### Explanation

The log file (%s3) for trace output could not be opened.

### System Action

Web Server program execution processing is aborted.

### User Action

Take one of the following actions:

- Resolve the cause of the error according to the error details context (%s2).
- Check the IHSTraceLog directive that is set in the environment definition file (httpd.conf).

## 7.5.5 ihs00404

---

**IHS: ERROR: ihs00404: Failed to set the environment variable.(%s1,%s2,%s3,%s4) [%s5]**

### Variable Information

%s1 = Error issuer function name

%s2 = Error details number 1

%s3 = Error details number 2

%s4 = Error details number 3

%s5 = Web Server name

### Explanation

The environment variable could not be set.

### System Action

Web Server program execution processing is aborted.

## User Action

Collect troubleshooting information using the *iscollectinfo* command, and then contact your SE (systems engineer).

## 7.6 ihs00500 to ihs00599

---

This section details the messages numbered between ihs00500 and ihs00599.

### 7.6.1 ihs00500

---

#### IHS: ERROR: ihs00500: SSL: Library initialization failed.(%s1,%s2) [%s3]

##### Variable Information

%s1 = Error details context 1

%s2 = Error details context 2

%s3 = Web Server name

##### Explanation

Loading of a library required for SSL communication failed.

##### System Action

The Web Server start processing is canceled.

##### User Action

Install the following functions (packages).

Platform	Functions	Package name
Windows32/64	Secure Communication Service package	-
Solaris32	Interstage Secure Communication Service	FJSVisscs
	CA/EE common certificate management function, key management function	FJSVsmee
	Securecrypto Library RunTime	FJSVsclr
	Secure Socket Option	FSUNssl
Solaris64	Interstage Secure Communication Service	FJSVisscs
	CA/EE common certificate management function, key management function	FJSVsme64
	Securecrypto Library RunTime	FJSVsl64
Linux32	Interstage Secure Communication Service	FJSVsmee
	CA/EE common certificate management function, key management function	FJSVisscs
	Securecrypto Library RunTime	FJSVsclr
Linux64	Interstage Secure Communication Service	FJSVisscs
	CA/EE common certificate management function, key management function	FJSVsmee64
	Securecrypto Library RunTime	FJSVsclr64

If this error message continues to be displayed, collect diagnostic information using the *iscollectinfo* command, and then contact your SE (systems engineer).

## 7.6.2 ihs00501

---

**IHS: ERROR: ihs00501: SSL: Insufficient memory.(%s1,%s2,%s3,%s4) [%s5]**

### Variable Information

%s1 = Error issuer function name

%s2 = Error details context 1

%s3 = Error details context 2

%s4 = SSL definition name or site certificate nickname

%s5 = Web Server name

Note: The SSL definition name or site certificate nickname (%s4) may not be output.

### Explanation

The SSL library memory became insufficient.

### System Action

The Web Server start processing is canceled.

### User Action

Close any unnecessary programs, or check that sufficient memory is reserved for Web Server operation.

## 7.6.3 ihs00502

---

**IHS: ERROR: ihs00502: SSL: Slot information directory error.(%s1,%s2,%s3) [%s4]**

### Variable Information

%s1 = Error issuer function name

%s2 = Error details context 1

%s3 = Error details context 2

%s4 = Web Server name

### Explanation

There is an error in the slot information directory.

### System Action

The Web Server start processing is canceled.

### User Action

Take one of the following actions:

- Check the settings of the SSLSlotDir directive in the environment definition file (httpd.conf).
- Check the settings of the private key management environment.

## 7.6.4 ihs00503

---

**IHS: ERROR: ihs00503: SSL: Invalid Token label.(%s1,%s2,%s3) [%s4]**

### Variable Information

%s1 = Error issuer function name

%s2 = Error details context 1

%s3 = Error details context 2

%s4 = Web Server name

#### Explanation

The token label is incorrect.

#### System Action

The Web Server start processing is canceled.

#### User Action

Check that the token label matches the token label to which the site key certificate was registered.

## 7.6.5 ihs00504

---

**IHS: ERROR: ihs00504: SSL: The site certificate has expired.(%s1,%s2,%s3,%s4) [%s5]**

#### Variable Information

%s1 = Error issuer function name

%s2 = Error details context 1

%s3 = Error details context 2

%s4 = SSL definition name or site certificate nickname.

%s5 = Web Server name

Note: The SSL definition name or site certificate nickname (%s4) may not be output.

#### Explanation

The site certificate has expired.

#### System Action

The Web Server start processing or communication processing is canceled.

#### User Action

Request the CA to issue a new site certificate, and reregister the new site certificate.

The validity term of the site certificate can be checked by performing the following steps:

- For the Interstage certificate environment:
  1. In the Interstage Management Console, click [Security] > [Certificates] > [Site Certificate].
  2. Check [Validity Term] in the [Certificates: Site Certificate] page.
- For a certificate/key management environment configured with the SMEE command:

Check the validity term using the *cmdspcert* command.

## 7.6.6 ihs00505

---

**IHS: ERROR: ihs00505: SSL: The CA certificate has expired.(%s1,%s2,%s3,%s4) [%s5]**

#### Variable Information

%s1 = Error issuer function name

%s2 = Error details context 1

%s3 = Error details context 2

%s4 = SSL definition name or site certificate nickname

%s5 = Web Server name

Note: The SSL definition name or site certificate nickname (%s4) may not be output.

## Explanation

One of the following causes is assumed:

- If this message is output when the web server (%s5) starts, the certification authority (CA) certificate in Interstage has expired.
- If this message is output during SSL communication with the client, the certification authority (CA) certificate in Interstage or the client (**Note**) has expired.

**Note**) Client authentication must have been performed in these cases.

## System Action

One of the following processing types will be performed:

- If this message is output when the web server starts, the web server start processing is canceled.
- If this message is output during SSL communication with the client, the communication with the client ends.

## User Action

Take one of the following actions:

- If the certification authority (CA) certificate registered in Interstage has expired, obtain a new CA certificate from the CA, and reregister the new CA certificate in Interstage.
- If the certification authority (CA) certificate registered in the client has expired, obtain a new CA certificate from the CA, and reregister the new CA certificate in the client.

### Point

The validity term of the CA certificate can be checked by performing the following steps:

- For the Interstage certificate environment:
  1. In the Interstage Management Console, click [Security] > [Certificates] > [CA Certificate].
  2. Check [Validity Term] in the [Certificates: CA Certificate] page.
- For a certificate/key management environment configured with the SMEE command:

Check the validity term using the *cmdspcert* command.

## 7.6.7 ihs00506

**IHS: ERROR: ihs00506: SSL: Couldn't verify the site certificate.(%s1,%s2,%s3,%s4) [%s5]**

### Variable Information

%s1 = Error issuer function name

%s2 = Error details context 1

%s3 = Error details context 2

%s4 = SSL definition name or site certificate nickname

%s5 = Web Server name

Note: The SSL definition name or site certificate nickname (%s4) may not be output.

### Explanation

Verification of the CA certificate and the site certificate failed.

### System Action

The Web Server start processing is canceled.

## User Action

Check that there is no error in the relationship between the CA certificate and the site certificate.

## 7.6.8 ihs00507

---

**IHS: ERROR: ihs00507: SSL: Couldn't verify the CA certificate.(%s1,%s2,%s3,%s4) [%s5]**

### Variable Information

%s1 = Error issuer function name

%s2 = Error details context 1

%s3 = Error details context 2

%s4 = SSL definition name or site certificate nickname

%s5 = Web Server name

Note: The SSL definition name or site certificate nickname (%s4) may not be output.

### Explanation

Verification of the CA certificate failed.

### System Action

The Web Server start processing is canceled.

### User Action

Check that there is no error in the relationship between the CA certificate and the site certificate.

## 7.6.9 ihs00508

---

**IHS: ERROR: ihs00508: SSL: Couldn't analyze the site certificate.(%s1,%s2,%s3,%s4) [%s5]**

### Variable Information

%s1 = Error issuer function name

%s2 = Error details context 1

%s3 = Error details context 2

%s4 = SSL definition name or site certificate nickname

%s5 = Web Server name

Note: The SSL definition name or site certificate nickname (%s4) may not be output.

### Explanation

Analysis of the site certificate failed.

### System Action

The Web Server start processing is canceled.

### User Action

Request the CA to issue a new site certificate, and reregister the newly issued site certificate.

## 7.6.10 ihs00509

---

**IHS: ERROR: ihs00509: SSL: Couldn't analyze the CA certificate.(%s1,%s2,%s3,%s4) [%s5]**

## Variable Information

%s1 = Error issuer function name

%s2 = Error details context 1

%s3 = Error details context 2

%s4 = SSL definition name or site certificate nickname

%s5 = Web Server name

Note: The SSL definition name or site certificate nickname (%s4) may not be output.

## Explanation

Analysis of the CA certificate failed.

## System Action

The Web Server start processing is canceled.

## User Action

Obtain a new CA certificate from the CA, and reregister the obtained CA certificate.

## 7.6.11 ihs00510

---

**IHS: ERROR: ihs00510: SSL: The site certificate has been revoked.(%s1,%s2,%s3,%s4) [%s5]**

### Variable Information

%s1 = Error issuer function name

%s2 = Error details context 1

%s3 = Error details context 2

%s4 = SSL definition name or site certificate nickname

%s5 = Web Server name

Note: The SSL definition name or site certificate nickname (%s4) may not be output.

### Explanation

The site certificate has been revoked.

### System Action

The Web Server start processing is canceled.

### User Action

Request the CA to issue a new site certificate, and reregister the newly issued site certificate.

## 7.6.12 ihs00511

---

**IHS: ERROR: ihs00511: SSL: The CA certificate has been revoked.(%s1,%s2,%s3,%s4) [%s5]**

### Variable Information

%s1 = Error issuer function name

%s2 = Error details context 1

%s3 = Error details context 2

%s4 = SSL definition name or site certificate nickname

%s5 = Web Server name

Note: The SSL definition name or site certificate nickname (%s4) may not be output.

#### Explanation

The CA certificate has been revoked.

#### System Action

The Web Server start processing is canceled.

#### User Action

Obtain a new CA certificate from the CA, and reregister the newly obtained CA certificate.

### 7.6.13 ihs00512

---

**IHS: ERROR: ihs00512: SSL: Invalid Site certificate nickname.(%s1,%s2,%s3,%s4) [%s5]**

#### Variable Information

%s1 = Error issuer function name

%s2 = Error details context 1

%s3 = Error details context 2

%s4 = SSL definition name or site certificate nickname

%s5 = Web Server name

Note: The SSL definition name or site certificate nickname (%s4) may not be output.

#### Explanation

The nickname of the site certificate is incorrect.

#### System Action

The Web Server start processing is canceled.

#### User Action

Check that the nickname of the site certificate specified in the SSLCertName directive is the same as the nickname that was registered in the certificate/key management environment using the *cmlistcert* command.

### 7.6.14 ihs00513

---

**IHS: ERROR: ihs00513: SSL: Invalid Client CA certificate nickname.(%s1,%s2,%s3,%s4) [%s5]**

#### Variable Information

%s1 = Error issuer function name

%s2 = Error details context 1

%s3 = Error details context 2

%s4 = SSL definition name or site certificate nickname

%s5 = Web Server name

Note: The SSL definition name or site certificate nickname (%s4) may not be output.

#### Explanation

The nickname of the client CA certificate is incorrect.

#### System Action

The Web Server start processing is canceled.

## User Action

Check that the nickname of the client CA certificate matches the one registered in the certificates and in the key management environment.

## 7.6.15 ihs00514

---

**IHS: ERROR: ihs00514: SSL: The site certificate has no path list.(%s1,%s2,%s3,%s4) [%s5]**

### Variable Information

%s1 = Error issuer function name

%s2 = Error details context 1

%s3 = Error details context 2

%s4 = SSL definition name or site certificate nickname

%s5 = Web Server name

Note: The SSL definition name or site certificate nickname (%s4) may not be output.

### Explanation

The certificate pathway for the site certificate does not exist.

### System Action

The Web Server start processing is canceled.

### User Action

Register the CA certificate which issued the site certificate in the certificate/key management environment, starting with the root CA.

## 7.6.16 ihs00515

---

**IHS: ERROR: ihs00515: SSL: The CA certificate has no path list.(%s1,%s2,%s3,%s4) [%s5]**

### Variable Information

%s1 = Error issuer function name

%s2 = Error details context 1

%s3 = Error details context 2

%s4 = SSL definition name or site certificate nickname

%s5 = Web Server name

Note: The SSL definition name or site certificate nickname (%s4) may not be output.

### Explanation

The certificate pathway for the CA certificate does not exist.

### System Action

The Web Server start processing is canceled.

### User Action

Register the CA certificate in the certificates and in the key management environment sequentially from the root CA.

## 7.6.17 ihs00516

---

**IHS: ERROR: ihs00516: SSL: The site certificate path is invalid.(%s1,%s2,%s3,%s4) [%s5]**

## Variable Information

%s1 = Error issuer function name

%s2 = Error details context 1

%s3 = Error details context 2

%s4 = SSL definition name or site certificate nickname

%s5 = Web Server name

Note: The SSL definition name or site certificate nickname (%s4) may not be output.

## Explanation

The certificate pathway for the site certificate is incomplete.

## System Action

The Web Server start processing is canceled.

## User Action

Register the CA certificate which issued the site certificate in the certificate/key management environment, starting with the root CA.

## 7.6.18 ihs00517

---

**IHS: ERROR: ihs00517: SSL: The CA certificate path is invalid.(%s1,%s2,%s3,%s4) [%s5]**

### Variable Information

%s1 = Error issuer function name

%s2 = Error details context 1

%s3 = Error details context 2

%s4 = SSL definition name or nickname of the site certificate

%s5 = Web Server name

Note: The SSL definition name or site certificate nickname (%s4) may not be output.

### Explanation

The certificate pathway for the CA certificate is incomplete.

### System Action

The Web Server start processing is canceled.

### User Action

Register the CA certificate in the certificates and in the key management environment sequentially from the root CA.

## 7.6.19 ihs00518

---

**IHS: ERROR: ihs00518: SSL: Private key does not exist.(%s1,%s2,%s3,%s4) [%s5]**

### Variable Information

%s1 = Error issuer function name

%s2 = Error details context 1

%s3 = Error details context 2

%s4 = SSL definition name or site certificate nickname

%s5 = Web Server name

Note: The SSL definition name or site certificate nickname (%s4) may not be output.

### Explanation

One of the following causes is assumed:

- The site private key is not registered in the private key management environment.
- A certificate in use was issued by an unsupported certificate authority.

### System Action

The Web Server start processing is canceled.

### User Action

Take one of the following actions:

- Check that the site certificate was issued by the CSR created using the *scsmakeenv* or *cmmakecsr* commands on the server that uses the certificate.
- If a site certificate issued by Systemwalker PKI Manager is used, and the Site private key is not registered in the private key management environment, use the *cmenterkey* command to register the site private key in the private key management environment.
- If a certificate issued by an unsupported certificate authority is used, create a certificate signing request again, and submit it to the following certificate authorities to request the issuing of a certificate:
  - "Secure Site" certificates issued by the VeriSign Inc.
  - "Secure Site with EV SSL Certificates" certificates and CRL issued by the VeriSign Inc.
  - "Cybertrust SureServer Certificate" and CRL issued by the Cybertrust, Inc.

## 7.6.20 ihs00519

---

**IHS: ERROR: ihs00519: SSL: Invalid User pin.(%s1,%s2,%s3,%s4) [%s5]**

### Variable Information

%s1 = Error issuer function name

%s2 = Error details context 1

%s3 = Error details context 2

%s4 = SSL definition name or site certificate nickname

%s5 = Web Server name

Note: The SSL definition name or site certificate nickname (%s4) may not be output.

### Explanation

The user PIN is incorrect.

### System Action

The Web Server start processing is canceled.

### User Action

Reregister the user PIN.

## 7.6.21 ihs00520

---

**IHS: ERROR: ihs00520: SSL: Certificate environment directory error.(%s1,%s2,%s3,%s4) [%s5]**

### Variable Information

%s1 = Error issuer function name

%s2 = Error details context 1

%s3 = Error details context 2

%s4 = SSL definition name or site certificate nickname

%s5 = Web Server name

Note: The SSL definition name or site certificate nickname (%s4) may not be output.

### Explanation

There is an error in the operation control directory.

### System Action

The Web Server start processing is canceled.

### User Action

Take one of the following actions:

- Check the settings of the SSLEnvDir directive in the environment definition file (httpd.conf).
- Check the settings of the certificate and key management environment.

## 7.6.22 ihs00521

---

**IHS: ERROR: ihs00521: SSL: Invalid cipher suite.(%s1,%s2,%s3,%s4) [%s5]**

### Variable Information

%s1 = Error issuer function name

%s2 = Error details context 1

%s3 = Error details context 2

%s4 = SSL definition name or site certificate nickname

%s5 = Web Server name

Note: The SSL definition name or site certificate nickname (%s4) may not be output.

### Explanation

The SSLCipherSuite directive has been specified incorrectly in the environment definition file (httpd.conf).

### System Action

The Web Server start processing is canceled.

### User Action

Check that the method of encryption specified in the SSLCipherSuite directive in the environment definition file (httpd.conf) can be specified.

## 7.6.23 ihs00522

---

**IHS: ERROR: ihs00522: SSL: SSL definition name specification is invalid.(%s1) [%s2]**

### Variable Information

%s1 = SSL definition name

%s2 = Web Server name

### Explanation

The SSL definition name (%s1) does not exist.

## System Action

The Web Server start processing is canceled.

## User Action

Check whether the Interstage certificate environment has been set up correctly.

If it has, specify the correct SSL definition name for the SSLConfName directive in the environment definition file (httpd.conf).

## 7.6.24 ihs00523

---

**IHS: ERROR: ihs00523: SSL: SSL definition acquisition failed.(%s1,%s2,%s3) [%s4]**

### Variable Information

%s1 = SSL definition name

%s2 = Function name

%s3 = Error details context

%s4 = Web Server name

### Explanation

SSL definition name (%s1) certificate information failed to be acquired.

### System Action

The Web Server start processing is canceled.

### User Action

Collect diagnostic information using the *iscollectinfo* command, and then contact your SE (systems engineer).

## 7.6.25 ihs00524

---

**IHS: ERROR: ihs00524: SSL: SSLSlotDir is not defined. [%s1]**

### Variable Information

%s1 = Web Server name

### Explanation

The SSLSlotDir directive has not been set in the environment definition file (httpd.conf).

### System Action

The Web Server start processing is canceled.

### User Action

Set the SSLSlotDir directive in the environment definition file (httpd.conf).

## 7.6.26 ihs00525

---

**IHS: ERROR: ihs00525: SSL: SSLTokenLabel is not defined. [%s1]**

### Variable Information

%s1 = Web Server name

### Explanation

The SSLTokenLabel directive has not been set in the environment definition file (httpd.conf).

### System Action

The Web Server start processing is canceled.

### User Action

Set the SSLTokenLabel directive in the environment definition file (httpd.conf).

## 7.6.27 ihs00526

---

**IHS: ERROR: ihs00526: SSL: SSLUserPINFile is not defined. [%s1]**

### Variable Information

%s1 = Web Server name

### Explanation

The SSLUserPINFile directive has not been set in the environment definition file (httpd.conf).

### System Action

The Web Server start processing is canceled.

### User Action

Set the SSLUserPINFile directive in the environment definition file (httpd.conf).

## 7.6.28 ihs00527

---

**IHS: ERROR: ihs00527: SSL: SSLVerifyClient is not defined. [%s1]**

### Variable Information

%s1 = Web Server name

### Explanation

The SSLVerifyClient directive has not been set in the environment definition file (httpd.conf).

### System Action

The Web Server start processing is canceled.

### User Action

Set the SSLVerifyClient directive in the environment definition file (httpd.conf).

## 7.6.29 ihs00528

---

**IHS: ERROR: ihs00528: SSL: SSLEnvDir is not defined. [%s1]**

### Variable Information

%s1 = Web Server name

### Explanation

The SSLEnvDir directive has not been set in the environment definition file (httpd.conf).

### System Action

The Web Server start processing is canceled.

### User Action

Set the SSLEnvDir directive in the environment definition file (httpd.conf).

## 7.6.30 ihs00529

---

**IHS: ERROR: ihs00529: SSL: SSLCertName is not defined. [%s1]**

### Variable Information

%s1 = Web Server name

### Explanation

The SSLCertName directive has not been set in the environment definition file (httpd.conf).

### System Action

The Web Server start processing is canceled.

### User Action

Set the SSLCertName directive in the environment definition file (httpd.conf).

## 7.6.31 ihs00530

---

**IHS: ERROR: ihs00530: SSL: User PIN decryption failed.(%s1,%s2) [%s3]**

### Variable Information

%s1 = Error details context 1

%s2 = Error details context 2

%s3 = Web Server name

### Explanation

The user PIN could not be decrypted.

### System Action

The Web Server start processing is canceled.

### User Action

Create the user PIN file again using the *ihsregistupin* command.

## 7.6.32 ihs00531

---

**IHS: ERROR: ihs00531: SSL: Couldn't open user pin file.(%s1) [%s2]**

### Variable Information

%s1 = User PIN file name

%s2 = Web Server name

### Explanation

The user PIN file (%s1) could not be opened.

### System Action

The Web Server start processing is canceled.

### User Action

Check whether the user PIN file (%s1) exists.

## 7.6.33 ihs00532

---

---

**IHS: ERROR: ihs00532: SSL: Couldn't read user pin file.(%s1) [%s2]****Variable Information**

%s1 = User PIN file name

%s2 = Web Server name

**Explanation**

The user PIN file (%s1) could not be read.

**System Action**

The Web Server start processing is canceled.

**User Action**

Check the user PIN file %s1 authority. If the authority has been set correctly, user PIN file %s1 may be corrupt. Create the user PIN file again using the *ihsregistupin* command.

If this error message continues to be displayed, collect diagnostic information using the *iscollectinfo* command, and then contact your SE (systems engineer).

---

**7.6.34 ihs00534**

---

**IHS: WARNING: ihs00534: SSL: The site certificate validity term has expired.(%s1,%s2) [%s3]****Variable Information**

%s1 = site certificate nickname

%s2 = site certificate validity term (Format: "YYYY/MM/DD hh:mm:ss")

%s3 = Web Server name

**Explanation**

The validity term (%s2) of the site certificate (%s1) has expired.

If a Web Server operation is continued even though the site certificate's validity term has already expired, the following problems will occur:

- Communication with the client fails.
- The Web Server cannot be restarted.

**System Action**

The processing is continued.

**User Action**

Take action according to the following procedure:

1. Make a request to the CA (certificate issuer) to issue a new site certificate.
2. Reregister a new site certificate.
3. Restart the Web Server.

---

**7.6.35 ihs00535**

---

**IHS: WARNING: ihs00535: SSL: The CA certificate validity term has expired.(%s1,%s2) [%s3]****Variable Information**

%s1 = CA certificate serial number

%s2 = CA certificate validity term (Format: "YYYY/MM/DD hh:mm:ss")

%s3 = Web Server name

### Explanation

The validity term (%s2) of the CA certificate has expired.

If a Web Server operation is continued even though the CA certificate's validity term has already expired, the following problems will occur:

- Communication with the client fails.
- The Web Server cannot be restarted.

### System Action

The processing is continued.

### User Action

Take action according to the following procedure:

1. Make a request to the CA (certificate issuer) to issue a new CA certificate.
2. Reregister a new CA certificate.
3. Restart the Web Server.

## 7.6.36 ihs00536

---

**IHS: WARNING: ihs00536: SSL: The site certificate will expire in %s1 days.(%s2,%s3) [%s4]**

### Variable Information

%s1 = Number of days left until the site certificate's validity term will expire

%s2 = site certificate nickname

%s3 = site certificate validity term (Format: "YYYY/MM/DD hh:mm:ss")

%s4 = Web Server name

### Explanation

The validity term (%s3) of the site certificate (%s2) will expire in %s1 days.

### System Action

The processing is continued.

### User Action

Before the validity term of the site certificate expires, take action according to the following procedure:

1. Make a request to the CA (certificate issuer) to issue a new site certificate.
2. Reregister a new site certificate.
3. Restart the Web Server.

## 7.6.37 ihs00537

---

**IHS: WARNING: ihs00537: SSL: The CA certificate will expire in %s1 days.(%s2,%s3) [%s4]**

### Variable Information

%s1 = Number of days left until the CA certificate's validity term will expire

%s2 = CA certificate serial number

%s3 = CA certificate validity term (Format: "YYYY/MM/DD hh:mm:ss")

%s4 = Web Server name

#### Explanation

The validity term (%s3) of the CA certificate will expire in %s1 days.

#### System Action

The processing is continued.

#### User Action

Before the validity term of the CA certificate expires, take action according to the following procedure:

1. Make a request to the CA (certificate issuer) to issue a new CA certificate.
2. Reregister a new CA certificate.
3. Restart the Web Server.

## 7.6.38 ihs00538

---

**IHS: ERROR: ihs00538: (%s1)%s2: SSL: Failed to generate the certificate monitoring daemon. func=%s3 [%s4]**

#### Variable Information

%s1 = Error details number

%s2 = Error details context

%s3 = Function name

%s4 = Web Server name

#### Explanation

Failed to generate the certificate monitoring daemon.

#### System Action

The Web Server start processing is canceled.

#### User Action

Refer to the error details content (%s2), resolve the error, and then restart the Web Server.

## 7.6.39 ihs00539

---

**IHS: ERROR: ihs00539: SSL: Not enough memory in the SCMI library. [%s1]**

#### Variable Information

%s1 = Web Server name

#### Explanation

The SCMI library memory became insufficient.

#### System Action

The Web Server start processing is canceled.

#### User Action

Check that there is enough memory. If there is not enough memory, close unnecessary programs and secure the required memory capacity for running the Web server.

## 7.6.40 ihs00540

---

**IHS: ERROR: ihs00540: SSL: An error has occurred in the SCMI library function.(%s1,%s2) [%s3]**

### Variable Information

%s1 = SCMI library function name

%s2 = Additional information

%s3 = Web Server name

### Explanation

An error occurred in the SCMI library function (%s1). The certificate/key management environment may be invalid.

### System Action

The Web Server start processing is canceled.

### User Action

Check whether the certificate/key management environment settings are valid. If the certificate/key management environment settings are valid, collect diagnostic information using the *iscollectinfo* command, and then contact your SE (systems engineer).

## 7.6.41 ihs00599

---

**IHS: ERROR: ihs00599: SSL: Unexcepected error.(%s1,%s2,%s3,%s4) [%s5]**

### Variable Information

%s1 = Error issuer function name

%s2 = Error details context 1

%s3 = Error details context 2

%s4 = SSL definition name or site certificate nickname

%s5 = Web Server name

Note: The SSL definition name or site certificate nickname (%s4) may not be output.

### Explanation

An unexcepected error was detected in the SSL function.

### System Action

The Web Server start processing is canceled.

### User Action

Collect diagnostic information using the *iscollectinfo* command, and then contact your SE (systems engineer).

## 7.7 ihs01000 to ihs01099

---

This section details the messages numbered between ihs01000 and ihs01099.

### 7.7.1 ihs01000

---

**IHS: INFO: ihs01000: The command terminated normally.**

### Explanation

The command closed normally.

## 7.7.2 ihs01001

---

**IHS: INFO: ihs01001: Web server exists already. [%s1]**

### Variable Information

%s1 = Web Server name

### Explanation

The Web Server (%s1) has already been created.

### System Action

Stops command processing.

## 7.7.3 ihs01002

---

**IHS: ERROR: ihs01002: The allowed maximum number of created Web servers has been reached. [%s1]**

### Variable Information

%s1 = Web Server name

### Explanation

The allowed maximum number of created Web servers has been reached. A maximum of 64 Web Servers can be created.

### System Action

The command returns with an error.

### User Action

Check for unnecessary Web Servers, delete them using the *ihsdelete* command and then reexecute the *ihscreate* command.

## 7.7.4 ihs01003

---

**IHS: ERROR: ihs01003: Web server creation failed. Detail=(%s1) Message=(%s2) [%s3]**

### Variable Information

%s1 = Error details context 1

%s2 = Error details context 2

%s3 = Web Server name

### Explanation

The Web Server (%s3) could not be created.

### System Action

The command returns with an error.

### User Action

Resolve the cause of the error according to the error details context 2 (%s2).

## 7.7.5 ihs01004

---

**IHS: ERROR: ihs01004: The Web server has not been created. [%s1]**

### Variable Information

%s1 = Web Server name

Note: The Web Server name (%s1) may not be output depending on the connection status with the client.

#### Explanation

The Web Server (%s1) has not been created.

#### System Action

Stops command processing.

#### User Action

Check that the Web Server name specified in the command exists, and then reexecute the command.

## 7.7.6 ihs01005

---

**IHS: ERROR: ihs01005: The Web server cannot be deleted while it is running. Detail=(%s1) [%s2]**

#### Variable Information

%s1 = Error details context

%s2 = Web Server name

#### Explanation

The Web Server (%s2) cannot be deleted because it is running.

#### System Action

The command returns with an error.

#### User Action

Stop Web Server %s2, and then reexecute the *ihsdelete* command.

## 7.7.7 ihs01006

---

**IHS: ERROR: ihs01006: Web server deletion failed. Detail=(%s1) Message=(%s2) [%s3]**

#### Variable Information

%s1 = Error details context 1

%s2 = Error details context 2

%s3 = Web Server name

#### Explanation

The Web Server (%s3) could not be deleted.

During delete processing for the operating environment of the Web Server specified using the -n option of the *ihsdelete* command, an attempt may have been made to update the Web Server environment definition file by clicking the Interstage Management Console [System] > [Services] > [Web Server] > [Web Server Name] > [Environment Settings] window [Apply] button.

#### System Action

The command returns with an error.

#### User Action

Reexecute the *ihsdelete* command.

If this message is output after the *ihsdelete* command is executed, collect diagnostic information using the *iscollectinfo* command, and then contact your SE (systems engineer).

## 7.7.8 ihs01007

---

**IHS: INFO: ihs01007: The Web server is already started. [%s1]**

### Variable Information

%s1 = Web Server name

### Explanation

The Web Server is already started.

## 7.7.9 ihs01008

---

**IHS: ERROR: ihs01008: Failed to start the Web server. Detail=(%s1) Message=(%s2) [%s3]**

### Variable Information

%s1 = Error details context 1

%s2 = Error details context 2

%s3 = Web Server name

### Explanation

The Web Server (%s3) could not be started.

### System Action

The command returns with an error.

### User Action

Resolve the cause of the error according to the error details context 2 (%s2).

## 7.7.10 ihs01009

---

**IHS: INFO: ihs01009: The Web server is already stopped. [%s1]**

### Variable Information

%s1 = Web Server name

### Explanation

The Web Server (%s1) is already stopped.

## 7.7.11 ihs01010

---

**IHS: ERROR: ihs01010: Failed to stop the Web server. Detail=(%s1) Message=(%s2) [%s3]**

### Variable Information

%s1 = Error details context 1

%s2 = Error details context 2

%s3 = Web Server name

### Explanation

The Web Server (%s3) could not be stopped.

### System Action

The command returns with an error.

## User Action

Take one of the following actions:

- If error details context 2 (%s2) is "The service cannot accept control messages at this time", the stop operation may have been performed using the *ihssstop* command while the service was stopping.

There is no need to take action if Web Server (%s3) has stopped. The Web Server status can be check using the *ihdisp* command.

If the Web Server (%s3) has not stopped, collect diagnostic information using the *iscollectinfo* command, and then contact your SE (systems engineer).

- If error details context 2 (%s2) is not "The service cannot accept control messages at this time", resolve the cause of the error according to the error details context 2 (%s2).

## 7.7.12 ihs01011

---

**IHS: ERROR: ihs01011: There is an error in the Web server environment definition file. Detail=(%s1) Message=(%s2) [%s3]**

### Variable Information

%s1 = Error details context 1

%s2 = Error details context 2

%s3 = Web Server name

### Explanation

The Web Server (%s3) environment definition file is incorrect.

### System Action

The command returns with an error.

### User Action

Take one of the following actions:

- If the error details context 2 (%s2) is "could not bind to address (IP address (variable)) port (port number (variable))" or "could not bind to port (port number (variable))", wait for a while and then reexecute processing. If the problem persists, take the following action:

- Check whether the IP address and port number specified for the Web Server are also specified for another service.

If so, terminate that service, or specify a different IP address and port number.

- Check whether the port number specified for the Web Server is also specified for another service.

If so, terminate that service, or specify a different port number.

- **Windows32/64** **Linux32/64**

If the error details context 2 (%s2) is "could not bind to address (IP address (variable)) port (port number (variable))", check whether an IPv6 address has been specified for the Listen directive. To run the server in an IPv6 environment, specify just the port number in the Listen directive. Do not specify the IP address.

If there is no problem with the IP address and port number settings, collect diagnostic information using the *iscollectinfo* command, and then contact your SE (systems engineer).

- **Solaris32/64**

The following error details indicate that the attempt to get the address information for "\_default\_" or "255.255.255.255" that is set in the <VirtualHost> section failed:

Error details context 2: (%s2) "Syntax error on line environment definition file line number (variable ) of environment definition file path (variable): Could not resolve address '255.255.255.255' -- check resolver configuration."

In this case, for Solaris 10, add "dns" to the 'hosts' line in the /etc/nsswitch.conf file and then restart the Web server, or apply the patch "124235-03" or later.

- In cases other than the above, resolve the cause of the error according to the error details context 2 (%s2)

## 7.7.13 ihs01012

---

**IHS: ERROR: ihs01012: The content of the internal management file is incorrect. Detail=(%s1)**

### Variable Information

%s1 = Error details context

### Explanation

The content of the inner management file is incorrect.

### System Action

The command returns with an error.

### User Action

Collect diagnostic information using the *iscollectinfo* command, and then contact your SE (systems engineer).

## 7.7.14 ihs01013

---

**IHS: ERROR: ihs01013: Execution permissions have not been defined. Detail=(%s1)**

### Variable Information

%s1 = Error details context

### Explanation

The user who executed the command does not have execution rights.

### System Action

The command returns with an error.

### User Action

Reexecute the command with Administrator rights.

## 7.7.15 ihs01014

---

**IHS: ERROR: ihs01014: Processing cannot be performed because another command is executing. Detail=(%s1)**

### Variable Information

%s1 = Error details context

### Explanation

Processing cannot be performed because another command has been executed.

### System Action

The command returns with an error.

### User Action

Take one of the following actions:

- Check whether the commands shown below have been executed at the same time. If they have, wait until command processing is complete, and then reexecute the command. To prevent corruption of the Interstage HTTP Server environment, the commands shown below cannot be executed at the same time.
  - *ihsconfig*
  - *ihscreate*
  - *ihsdelete*
  - *ihsstart*
  - *ihsstop*
  - *ihsbackup*
  - *ihsrestore*
  - *ijsdeployment*
  - *ijsundeployment*
- Check whether the *isstart* or *isstop* commands have been executed at the same time. If they have, wait until command processing is complete, and then reexecute the command. If Interstage HTTP Server is integrated in the Interstage application environment using the *isinit* or *ismodifyservice* commands and the *isstart* or *isstop* command has been executed, it may not be possible to execute the Interstage HTTP Server operation command.
- In the Interstage Management Console windows shown below, check whether the start/stop/create/delete/change operations have been executed. If they have, wait until processing is complete, and then reexecute the command. To prevent corruption of the Interstage HTTP Server environment, the Interstage HTTP Server operation command cannot be executed at the same time as the Interstage Management Console operation.
  - [System] > [Services] > [Web Server] > [List]
  - [System] > [Services] > [Web Server] > [Web Server name] > [Status]
  - [System] > [Services] > [Web Server] > [New]
  - [System] > [Services] > [Web Server] > [Web Server name] > [Virtual Host] > [Virtual Host name] > [Web Server Settings]

## 7.7.16 ihs01015

---

**IHS: ERROR: ihs01015: Insufficient memory. Detail=(%s1)**

### Variable Information

%s1 = Error details context

### Explanation

There is insufficient memory available.

### System Action

The command returns with an error.

### User Action

Close any unnecessary programs or check that sufficient memory is reserved for Web Server operation.

## 7.7.17 ihs01016

---

**IHS: ERROR: ihs01016: Insufficient disk space. Detail=(%s1)**

### Variable Information

%s1 = Error details context

## Explanation

There is insufficient disk space available.

## System Action

The command returns with an error.

## User Action

Close any unnecessary programs or check that sufficient disk space is reserved for Web Server operation.

## 7.7.18 ihs01017

---

**IHS: ERROR: ihs01017: There is a problem with the environment. Detail=(%s1)**

### Variable Information

%s1 = Error details context

## Explanation

The registry required for execution of the Interstage HTTP Server operation command could not be read.

One of the following causes is assumed:

- The Interstage HTTP Server is not installed.
- The Interstage HTTP Server environment has been corrupted.

## System Action

The command returns with an error.

## User Action

Reinstall the Interstage HTTP Server

## 7.7.19 ihs01018

---

**IHS: ERROR: ihs01018: Permission for a file or directory has not been set. Detail=(%s1) Path=(%s2) [%s3]**

### Variable Information

%s1 = Error details context

%s2 = File path name or directory path name

%s3 = Web Server name

## Explanation

There are no permissions for file %s2 or directory %s2.

## System Action

The command returns with an error.

## User Action

Take one of the following actions:

- If this message was output when the *ihsdelete* command was executed:  
Check whether the file under directory %s2 is open. If it is, close the file and then reexecute the command.

- If this message was output when a command other than the *ihdelete* command was executed:

Check whether file %s2 or directory %s2 exists. If it does, set the correct access authority for file %s2 or directory %s2 and then reexecute the command.

If the above case does not apply, or this message is still output after the above action is taken, collect diagnostic information using the *iscollectinfo* command, and then contact your SE (systems engineer).

## 7.7.20 ihs01019

---

**IHS: ERROR: ihs01019: A file or directory could not be accessed. Detail=(%s1) Path=(%s2) [%s3]**

### Variable Information

%s1 = Error details context

%s2 = File path name or directory path name

%s3 = Web Server name

### Explanation

There are no permissions for the file (%s2) or directory (%s2).

### System Action

The command returns with an error.

### User Action

Check whether the file (%s2) or directory (%s2) exists. If it does, set the correct access authority for the file (%s2) or directory (%s2). If it does not, or this message is still output after the correct access authority is set, collect diagnostic information using the *iscollectinfo* command, and then contact your SE (systems engineer).

## 7.7.21 ihs01020

---

**IHS: ERROR: ihs01020: Invalid parameter specification. Option=(%s1) Param=(%s2)**

### Variable Information

%s1 = Option name

%s2 = Parameter value

### Explanation

The parameter (%s2) cannot be specified in the option (%s1).

### System Action

The command returns with an error.

### User Action

Check parameter %s2 that was specified in option %s1 of the command, specify the correct parameter and then reexecute the command.

## 7.7.22 ihs01021

---

**IHS: ERROR: ihs01021: Option has already been specified. Option=(%s1) Param=(%s2)**

### Variable Information

%s1 = Option name

%s2 = Parameter value

### Explanation

The option (%s1) cannot be specified more than once.

### System Action

The command returns with an error.

### User Action

Check option %s1 that was specified in the command, specify the correct option and then reexecute the command.

## 7.7.23 ihs01022

---

**IHS: ERROR: ihs01022: Two options that cannot be specified simultaneously have both been specified. Option 1=(%s1) Option2=(%s2)**

### Variable Information

%s1 = Option name 1

%s2 = Option name 2

### Explanation

Option (%s1) and option (%s2) cannot be specified at the same time.

### System Action

The command returns with an error.

### User Action

Check the option that was specified in the command, specify the correct option and then reexecute the command.

## 7.7.24 ihs01023

---

**IHS: ERROR: ihs01023: Some Web servers failed to start. Detail=(%s1)**

### Variable Information

%s1 = Error details context

### Explanation

Some Web Servers failed to start.

### System Action

The command returns with an error.

### User Action

Refer to the message that was output after this message and the Web Server error log and fix the error. For details about the Web Server error log, refer to the "Messages Output by Interstage HTTP Server" chapter.

If this error message continues to occur, collect diagnostic information using the *iscollectinfo* command, and then contact your SE (systems engineer).

## 7.7.25 ihs01024

---

**IHS: ERROR: ihs01024: Some Web servers failed to stop. Detail=(%s1)**

### Variable Information

%s1 = Error details context

## Explanation

Some Web Servers failed to stop.

## System Action

The command returns with an error.

## User Action

Refer to the message that was output after this message and the Web Server error log and fix the error. For Web Server error log details, refer to the "Messages Output by Interstage HTTP Server" chapter.

If this error message continues to occur, collect diagnostic information using the *iscollectinfo* command, and then contact your SE (systems engineer).

## 7.7.26 ihs01025

---

**IHS: ERROR: ihs01025: Some Web servers failed to get the status. Detail=(%s1)**

### Variable Information

%s1 = Error details context

### Explanation

The status of some Web Servers could not be obtained.

### System Action

The command returns with an error.

### User Action

Check the message output before this message and the Interstage HTTP Server error log, and fix the cause of the failure. For Web Server error log details, refer to the "Messages Output by Interstage HTTP Server" chapter.

If this error message continues to occur, collect diagnostic information using the *iscollectinfo* command, and then contact your SE (systems engineer).

## 7.7.27 ihs01027

---

**IHS: ERROR: ihs01027: A timeout occurred. Detail=(%s1)**

### Variable Information

%s1 = Error details context

### Explanation

The start or stop timeout has been exceeded. Possible causes are as follows:

- The Web Server failed to start or stop.
- The timeout time was exceeded while Web Server start or stop was in progress.

### System Action

Start/stop monitoring processing is aborted.

### User Action

Check whether a message is output to the event log (Windows(R)) or system log (Solaris/Linux) before or after this message, and then take the following action:

- If an error message was output before or after this message, check the message output before this message and the Interstage HTTP Server error log, and fix the cause of the failure. For Web Server error log details, refer to the "Messages Output by Interstage HTTP Server" chapter.

- If the `ih00001` INFO message is output after this message, the Web server started after the time set for the start timeout. This can be prevented by resetting the start timeout value using the `ihconfig` command. Calculate this value using the following formula:

Start timeout value = ("ih00001" INFO message output time - "ih81001" INFO message output time) + x (seconds)

Note: x is the margin of error (a few seconds) as applicable when considering the status of the system.

For details of the `ihconfig` command, refer to the "Interstage HTTP Server Operation Commands" chapter of the Reference Manual (Command Edition).

- If the `ih00002` INFO message is output after this message, the Web server stopped after the time set for the stop timeout. This can be prevented by resetting the stop timeout value using the `ihconfig` command. Calculate this value using the following formula:

Stop timeout value = ("ih00002" INFO message output time - "ih81002" INFO message output time) + x (seconds)

Note: x is the margin of error (a few seconds) as applicable when considering the status of the system.

For details of the `ihconfig` command, refer to the "Interstage HTTP Server Operation Commands" chapter of the Reference Manual (Command Edition).

- If a message was not output before or after this message, wait for a while, and then check again whether a message was output.

**Note** Solaris32/64 Linux32/64

When a large number of role and site definitions has been registered in the SSO repository of an Interstage Single Sign-on server, the Web server may take a while to start up and this may cause the start timeout to exceed resulting in this error message.

## 7.7.28 `ih01028`

---

**IHS: ERROR: `ih01028`: The Web server is being used, so it cannot be deleted. Detail=(%s1) Func=(%s2) [%s3]**

### Variable Information

%s1 = Error details context

%s2 = Function that used the Web Server

%s3 = Web Server name

### Explanation

Web Server (%s3) is being used by function (%s2), so it cannot be deleted.

The function (%s2) types that use the Web Server are as follows:

- `servlet`: IJServer
- `ssoaz`: Single Sign-on business server
- `ssoac`: Single Sign-on authentication server
- `ssosv`: Single Sign-on repository server

### System Action

Stops command processing.

### User Action

Take the appropriate action from the list below, and then reexecute the `ihdelete` command.

- If function (%s2) is "servlet", either delete the IJServer that uses the Web Server (%s3), or delete the Web Server (%s3) from the Web Servers that are targets of requests received by IJServer.
- If function (%s2) is "ssoaz", delete the business systems that are using the Web Server (%s3).
- If function (%s2) is "ssoac", delete the authentication servers that are using the Web Server (%s3).
- If function (%s2) is "ssosv", delete the repository servers that are using the Web Server (%s3).

## 7.7.29 ihs01029

---

**IHS: ERROR: ihs01029: This operation cannot be executed on the managed server. [%s1]**

### Variable Information

%s1 = Web Server name

### Explanation

This operation cannot be executed in the Managed Server.

### System Action

Stops command processing.

### User Action

This operation cannot be executed if the server type is Managed Server. Log in to the Admin Server in the Interstage Management Console, and then execute the same operation for this server.

## 7.7.30 ihs01030

---

**IHS: ERROR: ihs01030: Since it is being interlocked with Interstage Operation Tool Commands, it cannot execute. Detail=(%s1) [%s2]**

### Variable Information

%s1 = Error details context

%s2 = Web Server name

### Explanation

Since Interstage HTTP Server is integrated into the Interstage operating environment using the *isinit* or *ismodify* service command and Interstage is running:

- If the message is output when the *ihscreate* or *ihsdelete* command is executed, the Web Server cannot be created or deleted.
- If the message is output when the *ihsstop* command is executed, the Web Server cannot be stopped.

This problem also occurs when the operating status monitoring mode of Interstage operating status is set to "mode1".

### System Action

Stops command processing.

### User Action

Take the following action:

- If this message is output when the *ihscreate* or *ihsdelete* command is executed

Stop Interstage, and then reexecute the *ihscreate* or *ihsdelete* command. Settings can be configured using the Interstage Management Console so that the Web Server can be created or deleted even while it is connected. The settings for connecting Interstage and the Web Server are configured using the Interstage Management Console as follows:

1) In the [System] > [Update System Settings] window, under [Synchronized Services], in [Web Server] select "Yes", and then click [Update].

Note: If Interstage is running while these settings are configured, it restarts.

2) In the [System] > [System:Status] window, click [Start Interstage].

- If this message is output when the *ihsstop* command is executed, stop the Web Server by stopping Interstage.

Interstage can be stopped by any of the following methods:

- On a Standalone Server, from the Interstage Management Console, under [System] > [Status], stop Interstage.

- On an Admin Server, from the Interstage Management Console, under [Application Management] > [Interstage] > [Interstage Application Server] > [System] > [FJapache(Server Group Name or Server Name)] > [Status], stop Interstage.
- Using the *isstop* command.

## 7.7.31 ihs01099

---

**IHS: ERROR: ihs01099: Internal error. Detail=(%s1)**

### Variable Information

%s1 = Error details context

### Explanation

An internal error occurred.

### System Action

Stops command processing.

### User Action

Collect diagnostic information using the *iscollectinfo* command, and then contact your SE (systems engineer).

## 7.8 ihs69000 to ihs69099

---

This section details the messages numbered between ihs69000 and ihs69099.

### 7.8.1 ihs69000

---

**IHS: ERROR: ihs69000: There is no permission to execute ihsregistupin.**

### Explanation

The execution of the *ihsregistupin* command is not permitted.

### User Action

Execute the *ihsregistupin* command with administrator authority.

### 7.8.2 ihs69001

---

**IHS: ERROR: ihs69001: The path name of the user PIN control file is too long.**

### Explanation

The pathname of the user PIN management file exceeds its maximum length.

### User Action

Change the filename of the user PIN management file.

### 7.8.3 ihs69002

---

**IHS: ERROR: ihs69002: The path name of the slot information directory is too long.**

### Explanation

The pathname of the slot information directory exceeds its maximum length.

### User Action

Change the slot information directory name.

## 7.8.4 ihs69003

---

**IHS: ERROR: ihs69003: The slot information directory (%s1) does not exist.**

### Variable Information

%s1 = Directory name

### Explanation

Slot information directory (%s1) does not exist.

### User Action

Verify that slot information directory (%s1) exists.

## 7.8.5 ihs69004

---

**IHS: ERROR: ihs69004: Unable to check user PIN.**

### Explanation

The user PIN (UserPIN: xxx) does not match the user PIN (Retype UserPIN: xxx) that was entered for verification.

### User Action

Reenter the character string.

## 7.8.6 ihs69005

---

**IHS: ERROR: ihs69005: The user PIN control file (%s1) cannot be opened.**

### Variable Information

%s1 = File name

### Explanation

Access to user PIN management file (%s1) is not permitted.

### User Action

Verify the access authority for the user PIN management file (%s1).

## 7.8.7 ihs69006

---

**IHS: ERROR: ihs69006: Registration of user PIN (%s1) failed.**

### Variable Information

%s1 = File name

### Explanation

Writing to the user PIN management file (%s1) failed. A system failure may have occurred.

### User Action

Collect diagnostic information with the *iscollectinfo* command, and then contact your SE (systems engineer).

## 7.8.8 ihs69007

---

**IHS: ERROR: ihs69007: Unable to close the user PIN control file (%s1).**

## Variable Information

%s1 = File name

## Explanation

The user PIN management file (%s1) cannot be closed. A system failure may have occurred.

## User Action

Collect diagnostic information with the *iscollectinfo* command, and then contact your SE (systems engineer).

---

## 7.8.9 ihs69008

---

**IHS: ERROR: ihs69008: Unable to change the permission for the user PIN control file (%s1).**

## Variable Information

%s1 = File name

## Explanation

Access to the user PIN management file (%s1) is not permitted.

## User Action

Verify the access authority for the user PIN management file (%s1).

---

## 7.8.10 ihs69009

---

**IHS: ERROR: ihs69009: Memory is insufficient.**

## Explanation

Memory is insufficient.

## User Action

Quit unnecessary programs, or verify that sufficient memory is reserved for web server operation.

---

## 7.8.11 ihs69010

---

**IHS: ERROR: ihs69010: The disk capacity is insufficient.**

## Explanation

The write operation cannot be performed because disk capacity is insufficient.

## User Action

Delete unnecessary files, or reserve more disk capacity.

---

## 7.8.12 ihs69011

---

**IHS: ERROR: ihs69011: There is an error in the user PIN.**

## Explanation

An incorrect character is included in the characters specified for the user PIN.

## User Action

Enter the user PIN with up to 128 alphanumeric characters.

---

## 7.8.13 ihs69013

---

---

**IHS: ERROR: ihs69013: Encryption of user PIN failed.(%s1:%s2)****Variable Information**

%s1 = Function name

%s2 = Error code

**Explanation**

An error occurred in encryption function (%s1).

**User Action**

Collect diagnostic information with the *iscollectinfo* command, and then contact your SE (systems engineer).

---

**7.8.14 ihs69014**

---

**IHS: ERROR: ihs69014: No slot exists.****Explanation**

A slot has not been generated.

**User Action**

Generate a slot by using the *create* and *set* commands of the private key management environment. Then, reexecute the command.

---

**7.8.15 ihs69015**

---

**IHS: ERROR: ihs69015: No token exists.****Explanation**

A token has not been generated.

**User Action**

Generate a token by using the *create* and *set* commands of the private key management environment. Then, reexecute the command.

---

**7.8.16 ihs69016**

---

**IHS: ERROR: ihs69016: Failed to load at SCTL-Library.****Explanation**

An error occurred in the library load processing for operating SSL. A system error may have occurred.

**User Action**

Collect diagnostic information with the *iscollectinfo* command, and then contact your SE (systems engineer).

---

**7.8.17 ihs69017**

---

**IHS: ERROR: ihs69017: Failed to symget at SCTL-Library.****Explanation**

An error occurred in the library symbol extraction for operating SSL. A system error may have occurred.

**User Action**

Collect diagnostic information with the *iscollectinfo* command, and then contact your SE (systems engineer).

---

**7.8.18 ihs69018**

---

---

**IHS: ERROR: ihs69018: Failed to load at SCL-Library.****Explanation**

An error occurred in the library load processing for operating SSL. A system error may have occurred.

**User Action**

Collect diagnostic information with the *iscollectinfo* command, and then contact your SE (systems engineer).

---

**7.8.19 ihs69019**

---

**IHS: ERROR: ihs69019: Failed to symget at SCL-Library.****Explanation**

An error occurred in the library symbol extraction for operating SSL. A system error may have occurred.

**User Action**

Collect diagnostic information with the *iscollectinfo* command, and then contact your SE (systems engineer).

---

**7.9 ihs70000 to ihs70099**

---

This section details the messages numbered between ihs70000 and ihs70099.

---

**7.9.1 ihs70004**

---

**IHS: ERROR: ihs70004: (%s1)%s2:Cannot get enough memory****Variable Information**

%s1 = Error details number

%s2 = Error details content

**Explanation**

Failed to acquire work memory.

**User Action**

Close unnecessary programs.

---

**7.9.2 ihs70005**

---

**Windows32/64**

**IHS: ERROR: ihs70005: Error writing to log file. %s1 messages lost.****Variable Information**

%s1 = Message management number in log file (Internal code)

**Explanation**

Failed to write to the log file. There might not be enough space on the disk that stores the log files.

**User Action**

Make sure that there is enough space on the disk of the log file directory specified in the log rotation command (*ihsrlog*) in the environment definition file (httpd.conf).

**Solaris32/64 Linux32/64**

**IHS: ERROR: ihs70005: (%s1)%s2:Error writing to log file. %s3 messages lost.**

## Variable Information

%s1 = Error details number

%s2 = Error details content

%s3 = Message management number in log file (Internal code)

## Explanation

Failed to write to the log file. There might not be enough space on the disk that stores the log files.

## User Action

Make sure that there is enough space on the disk of the log file directory specified in the log rotation command (*ihstrlog*) in the environment definition file (*httpd.conf*).

If disk space is not the problem, remove the cause of error by referring to the error details content (%s2).

## 7.9.3 ihs70007

---

**IHS: INFO: ihs70007: Log can now be output to the log file(%s1). (%s2)**

## Variable Information

%s1 = File name

%s2 = Number of messages failed to be output.

## Explanation

Log can now be output to the log file (%s1).

## 7.9.4 ihs70008

---

**IHS: INFO: ihs70008: The file was rotated because the file size of the log file(%s1) reached the upper limit of the system.**

## Variable Information

%s1 = File name

## Explanation

The file was rotated because the file size of the log file (%s1), reached the system's upper limit.

## 7.9.5 ihs70009

---

**IHS: ERROR: ihs70009: The log could not be output because the file size of the log file reached the upper limit of the system.**

## Explanation

The log could not be output because the log file size reached the system's upper limit.

## System Action

Processing stopped.

## User Action

Stop the Web Server, back up the log file that reached the file size upper limit for the system, and then restart the Web Server.

Change the file size upper limit of the system using the *ulimit* command (for Bourne shell types) or the *limit* command (for C shell types). Restart the Web Server in the relevant shell to use the updated values.

It is also possible to perform log rotation in the Interstage HTTP Server.

## 7.10 ihs81000 to ihs81099

---

This section details the messages numbered between ihs81000 and ihs81099.

### 7.10.1 ihs81001

---

**IHS: INFO: ihs81001: HTTP Server is starting. [%s1]**

#### Variable Information

%s1 = Web Server name

#### Explanation

The Web Server (%s1) is starting.

### 7.10.2 ihs81002

---

**IHS: INFO: ihs81002: HTTP Server is stopping. [%s1]**

#### Variable Information

%s1 = Web Server name

#### Explanation

The Web Server (%s1) is stopping.

## 7.11 ihs81100 to ihs81199

---

This section details the messages numbered between ihs81100 and ihs81199.

### 7.11.1 ihs81101

---

**IHS: ERROR: ihs81101: Failed to start Interstage HTTP Server. Detail:%s1 [%s2]**

#### Variable Information

%s1 = Error details content

%s2 = Web Server name

#### Explanation

The Web Server (%s2) failed to start.

#### System Action

The Web Server (%s2) start processing is canceled.

#### User Action

Take the following action:

- **Windows32/64**

If Error details content (%s1) is "(82-xxx:0:11:0:0:128-0-0)" or "(82-xxx:0:11:0:0:3221225794-0-0)", the desktop heap may be depleted. If the desktop heap is depleted, extend the desktop heap.

- Inspect the previous message details and the Interstage HTTP Server error log then correct the problem. For details about the Interstage HTTP Server error log, refer to the "Messages Output by Interstage HTTP Server" chapter.

If this error message continues to occur, collect diagnostic information with the *iscollectinfo* command, and then contact your SE (systems engineer).

## 7.11.2 ihs81102

---

**IHS: ERROR: ihs81102: Failed to stop Interstage HTTP Server. Detail:%s1 [%s2]**

### Variable Information

%s1 = Error details content

%s2 = Web Server name

### Explanation

Stopping of the Web Server (%s2) failed.

### User Action

Take the following action:

- 

If Error details content (%s1) is "xx-xxx:10029:10:0:1061:0-0-0", the Interstage stop operation may have been performed using the *isstop* command or Interstage Management Console when the Web Server (%s2) service was not running.

Check the Web Server (%s2) status using the *ihsdisp* command.

If the Web Server (%s2) is not running, there is no need to take action. If the Web Server (%s2) is running, collect diagnostic information with the *iscollectinfo* command, and then contact your SE (systems engineer).

- If Error details content (%s1) is not "xx-xxx:10029:10:0:1061:0-0-0", inspect the previous message details and the Interstage HTTP Server error log and correct the problem. For details about the Interstage HTTP Server error log, refer to the "[Chapter 37 Messages Output by Interstage HTTP Server](#)" chapter.

If this error message continues to be displayed, collect diagnostic information with the *iscollectinfo* command, and then contact your SE (systems engineer).

## 7.11.3 ihs81103

---

**IHS: ERROR: ihs81103: Timeout (%s1) occurred. Detail:%s2**

### Variable Information

%s1 = Waiting content

%s2 = Error Details content

### Explanation

The start or stop timeout has been exceeded. Possible causes are as follows:

- The Web Server failed to start or stop.
- The timeout time was exceeded while Web Server start or stop was in progress.

### System Action

Start/stop monitoring processing is aborted.

### User Action

Check whether a message is output to the event log (Windows(R)) or system log (Solaris/Linux) before or after this message, and then take the following action:

- If an error message was output before or after this message, check the message output before this message and the Interstage HTTP Server error log, and fix the cause of the failure. For Web Server error log details, refer to the "Messages Output by Interstage HTTP Server" chapter.

- If the ihs00001 INFO message is output after this message, the Web server started after the time set for the start timeout. This can be prevented by resetting the start timeout value using the *ihsconfig* command. Calculate this value using the following formula:

Start timeout value = ("ihs00001" INFO message output time - "ihs81001" INFO message output time) + x (seconds)

Note: x is the margin of error (a few seconds) as applicable when considering the status of the system.

For details of the *ihconfig* command, refer to the "Interstage HTTP Server Operation Commands" chapter of the Reference Manual (Command Edition).

- If the ihs00002 INFO message is output after this message, the Web server stopped after the time set for the stop timeout. This can be prevented by resetting the stop timeout value using the *ihconfig* command. Calculate this value using the following formula:

Stop timeout time = ("ihs00002" INFO message output time - "ihs81002" INFO message output time) + x (seconds)

Note: x is the margin of error (a few seconds) as applicable when considering the status of the system.

For details of the *ihconfig* command, refer to the "Interstage HTTP Server Operation Commands" chapter of the Reference Manual (Command Edition).

- If an error message was not output before or after this message, wait for a while, and then check again whether a message was output.

**Note** Solaris32/64 Linux32/64

When a large number of role and site definitions has been registered in the SSO repository of an Interstage Single Sign-on server, the Web server may take longer than normal to start up and this may cause the start timeout to exceed resulting in this error message.

## 7.11.4 ihs81104

---

**IHS: ERROR: ihs81104: Interstage HTTP Server is not installed.**

### Explanation

Either the Interstage HTTP Server has not been installed properly or the Web Server environment is incorrect.

### User Action

Reinstall the Interstage HTTP Server.

## 7.11.5 ihs81105

---

**IHS: ERROR: ihs81105: The system call error (%s1) occurred. Detail:%s2**

### Variable Information

%s1 = Function name

%s2 = Error Details content

### Explanation

Windows32/64

A Win32API error occurred.

Solaris32/64 Linux32/64

A system call error occurred.

### User Action

Collect diagnostic information with the *iscollectinfo* command, and then contact your SE (systems engineer).

## 7.11.6 ihs81106

---

**IHS: ERROR: ihs81106: Internal error occurred. Detail:%s1**

### Variable Information

%s1 = Error details content

## Explanation

An internal error occurred.

## User Action

Collect diagnostic information with the *iscollectinfo* command, and then contact your SE (systems engineer).

## 7.11.7 ihs81107

---

**IHS: ERROR: ihs81107: fopen: Could not log pid to file %s1.**

## Variable Information

%s1 = Process ID management file name

## Explanation

Opening of process ID management file (%s1) failed.

## User Action

Collect diagnostic information with the *iscollectinfo* command, and then contact your SE (systems engineer).

## 7.11.8 ihs81108

---

**IHS: ERROR: ihs81108: fgets: Could not read pid from file %s1.**

## Variable Information

%s1 = Process ID management file name

## Explanation

Reading of process ID management file (%s1) failed.

## User Action

Collect diagnostic information with the *iscollectinfo* command, and then contact your SE (systems engineer).

## 7.11.9 ihs81109

---

**IHS: ERROR: ihs81109: Insufficient memory. Detail:(%s1)**

## Variable Information

%s1 = Error details content

## Explanation

There is insufficient memory available.

## System Action

The command returns with an error.

## User Action

Close any unnecessary programs or check that sufficient memory is reserved for Web Server operation.

## 7.12 ihs81200 to ihs81299

---

This section details the messages numbered between ihs81200 and ihs81299.

## 7.12.1 ihs81206

---

**IHS: ERROR: ihs81206: The definition has already existed. Detail:%s1, Web server name:%s2**

### Variable Information

%s1 = Definition content

%s2 = Web Server name

Note: Web Server name (%s2) may not be output.

### Explanation

The specified definition (%s1) already exists in the Web Server (%s2).

### System Action

Processing stopped.

### User Action

Specify a definition different from the specified definition (%s1).

If this message is output when the *ischangesiteinfo* command is executed, the site information definition (described in the specified site information definition file) following the change may be the same as the existing definition for Business Configuration Management.

The Business Configuration Management definition is not updated.

Refer to the definition contents (%s1), check the contents of the site information definition file, and reexecute the command.

## 7.12.2 ihs81207

---

**IHS: ERROR: ihs81207: A configuration file does not exist. Detail:%s1, Web server name:%s2**

### Variable Information

%s1 = Environment definition file name

%s2 = Web Server name

### Explanation

Environment definition (%s1) does not exist in the Web Server (%s2).

### User Action

If environment definition file (%s1) was backed up, restore the environment definition file.

If you have not backed up the environment definition file (%s1) in the Interstage Management Console, click [System] > [Services] > [Web Server] > [List], delete the Web Server (%s2), and then create the Web Server again.

## 7.12.3 ihs81208

---

**IHS: ERROR: ihs81208: The error occurred in instance registration processing. Detail:%s1, Web server name:%s2**

### Variable Information

%s1 = Error Details content

%s2 = Web Server name

Note: Web Server name (%s2) may not be output.

### Explanation

An error occurred during instance registration in the Web Server (%s2).

## User Action

Collect diagnostic information with the *iscollectinfo* command, and then contact your SE (systems engineer).

## 7.12.4 ihs81209

---

**IHS: ERROR: ihs81209: The error occurred in instance deletion processing. Detail:%s1, Web server name:%s2**

### Variable Information

%s1 = Error Details content

%s2 = Web Server name

Note: Web Server name (%s2) may not be output.

### Explanation

An error occurred during instance registration cancellation in the Web Server (%s2).

## User Action

Collect diagnostic information with the *iscollectinfo* command, and then contact your SE (systems engineer).

## 7.12.5 ihs81210

---

**IHS: ERROR: ihs81210: Interstage HTTP Server is not installed. Detail:%s1**

### Variable Information

%s1 = Error Details content

### Explanation

One of the following causes is assumed:

- The Interstage HTTP Server is not installed.
- Environment variable CLASSPATH is incorrect.
- The required libraries do not exist.

## User Action

Take one of the following actions:

- If the Interstage HTTP Server is not installed, reinstall it.
- If environment variable CLASSPATH is incorrect, check its settings.
- If the required libraries do not exist, reinstall the Interstage HTTP Server.

If none of the above actions applies, collect diagnostic information with the *iscollectinfo* command, and then contact your SE (systems engineer).

## 7.12.6 ihs81211

---

**IHS: ERROR: ihs81211: The error occurred in a system. Detail:%s1, Web server name:%s2**

### Variable Information

%s1 = Error Details content

%s2 = Web Server name

Note: Web Server name (%s2) may not be output.

## Explanation

A system error occurred.

## User Action

When the following information is output to error details content (%s1), remove the cause of the error by referring to the error messages output previous to this message for the Managed Server.

- One or more servers failed to get the Web Server status.
- All the servers failed to get the Web Server status.

In other than the above cases, collect diagnostic information with the *iscollectinfo* command, and then contact your SE (systems engineer).

## 7.12.7 ihs81213

---

**IHS: ERROR: ihs81213: Definition information is wrong. Detail:%s1, Web server name:%s2**

### Variable Information

%s1 = Definition information or error message

%s2 = Web Server name

### Explanation

Definition information (%s1) is incorrect, or error (%s1) occurred.

### System Action

Processing stopped.

### User Action

Take one of the following actions:

- If the error message (%s1) is "The specified definition does not exist. [Virtual Host Name]", the virtual host may have been changed or renamed by another user.

Follow this procedure then reexecute processing.

- When setting a virtual host with the Standalone Server of the Interstage Management Console

- 1) Click [System] > [Services] > [Web Server] > [Web Server name] > [Virtual Hosts] from Interstage Management Console.
- 2) Redisplay the virtual host list

- When setting a virtual host with the Admin Server of the Interstage Management Console

- 1) Click [Application Management] > [Interstage] > [Interstage Application Server] > [Services] > [Web Server] > [Virtual Hosts] from Interstage Management Console.
- 2) Redisplay the virtual host list

- If the error message (%s1) is "[Web Server Name] > [Environment Settings] > [Port Number] or virtual host [IP Address] cannot be used. (Host name (Variable))", the IP address which corresponds to the host name may not be able to be resolved.

Follow this procedure then reexecute processing.

- When not setting a virtual host with the Standalone Server of the Interstage Management Console

- 1) Check the [Port Number] settings in the [System] > [Services] > [Web Server] > [Web Server name] > [Web Server Settings] window from the Interstage Management Console.

- When not setting a virtual host with the Admin Server of the Interstage Management Console

- 1) Check the [Port Number] settings in the [Application Management] > [Interstage] > [Interstage Application Server] > [Services] > [Web Server] > [FJapache(Server Group name or Server name)] > [Web Server Settings] from the Interstage Management Console.

- When setting a virtual host with the Standalone Server of the Interstage Management Console
  - 1) Click [System] > [Services] > [Web Server] > [Web Server name] > [Virtual Hosts] > [Virtual Host Name (the virtual host name including the host name)] from Interstage Management Console.
  - 2) Check the [IP Address] settings in the [Virtual Host Name: Configuration] window.
- When setting a virtual host with the Admin Server of the Interstage Management Console
  - 1) Click [Application Management] > [Interstage] > [Interstage Application Server] > [Services] > [Web Server] > [FJapache(Server Group name or Server name)] > [Virtual Hosts] > [Virtual Host Name (the virtual host name including the host name)] from Interstage Management Console.
  - 2) Check the [IP Address] settings in the [Virtual Host Name: Configuration] window.
- When you set a virtual host with the environment definition file (httpd.conf)
  - 1) Check the settings of the Listen directive in the environment definition file (httpd.conf).
- If the error message (%s1) is "could not bind to address (IP address (variable)) port (port number (variable))", wait for a while and then reexecute processing. If the problem still occurs, take one of the following actions:
  - Check the network environment settings are correct.
  - Ensure the IP address and port number specified for the Web Server are not being used by another service. If they are, either terminate that service, or specify a different IP address and/or port number.
  - **Windows32/64** **Linux32/64**

If an IPv6 address is specified in [IP Address] of the virtual host, check whether the port numbers that were specified in [Port Number] of the virtual host and [Port Number] of the [Web Server Settings] window for setting the Web server environment definition are different. To run the server in an IPv6 environment, specify the same port number and then restart the Web server.

If the settings are okay, collect diagnostic information using the *iscollectinfo* command, and then contact your SE (systems engineer).

- **Solaris32/64**

The following error message (%s1) indicates that the attempt to get the address information for "\_default\_" or "255.255.255.255" that is set in the <VirtualHost> section failed:

"Syntax error on line environment definition file line number (variable) of environment definition file path (variable): Could not resolve address '255.255.255.255' -- check resolver configuration."

In this case, for Solaris 10, add "dns" to the 'hosts' line in the /etc/nsswitch.conf file and then restart the Web server, or apply the patch "124235-03" or later.
- In other than the above cases, check the following set content referring to the definition information (%s1) or the error message (%s1), and remove the cause of the error.
  - When setting the environment with the Standalone Server of the Interstage Management Console
 

[System] > [Services] > [Web Server] > [Web Server name] > [Web Server Settings] tab of the Interstage Management Console.

Note: Check the following set content when setting a virtual host:

[System] > [Services] > [Web Server] > [Web Server name] > [Virtual Hosts] > [Virtual Host Name] of the Interstage Management Console.
  - When setting a virtual host with the Admin Server of the Interstage Management Console
 

[Application Management] > [Interstage] > [Interstage Application Server] > [Services] > [Web Server] > [FJapache(Server Group name or Server name)] > [Web Server Settings] tab of the Interstage Management Console.

Note: Check the following set content when setting a virtual host:

[Application Management] > [Interstage] > [Interstage Application Server] > [Services] > [Web Server] > [FJapache(Server Group name or Server name)] > [Virtual Hosts] > [Virtual Host Name] of the Interstage Management Console.

- When setting a virtual host with the environment definition file (httpd.conf)

The directive in the environment definition file (httpd.conf).

## 7.12.8 ihs81214

---

**IHS: ERROR: ihs81214: The error occurred in operation processing of definition information. Detail:%s1, Web server name:%s2**

### Variable Information

%s1 = Error Details content

%s2 = Web Server name

### Explanation

An error occurred during definition information processing.

If the following error details content (%s1) is displayed, there might be no permission for writing to the environment definition file (httpd.conf). Alternatively, there might not be an environment definition file (httpd.conf).

**Windows32/64**

```
cannot access C:\Interstage\F3FMihs\servers\(Web Server name)\conf\httpd.conf
```

**Solaris32/64 Linux32/64**

```
cannot access /opt/FJSVihs/servers/(Web Server name)/conf/httpd.conf
```

### User Action

Take one of the following actions:

- If there is no permission for writing to the environment definition file (httpd.conf), set the permission for writing to the environment definition file (httpd.conf).
- If there is no the environment definition file (httpd.conf), take the following actions.
  - Restore the environment definition file (httpd.conf) when you back up the environment definition file (httpd.conf).
  - If you have not backed up the environment definition file (httpd.conf) in the Interstage Management Console, click [System] > [Services] > [Web Server] > [List], delete Web Server %s2, and then create the Web Server again.
- In other than the above cases, collect diagnostic information with the *iscollectinfo* command, and then contact your SE (systems engineer).

## 7.12.9 ihs81215

---

**IHS: ERROR: ihs81215: The error occurred in start processing of Interstage HTTP Server. Detail:%s1, Web server name:%s2**

### Variable Information

%s1 = Error Details content

%s2 = Web Server name

Note: Web Server name (%s2) may not be output.

### Explanation

An error occurred when the Web Server started up.

### System Action

The Web Server start processing is canceled.

## User Action

Take the action described in table below, according to Error Details content (%s1).

Error Details content (%s1)	Meaning/Required Action
lhs_start()=15	Close any unnecessary programs and check that sufficient memory is reserved for Web Server operation.
retcode=15	
All other cases	Check the message displayed before this one, remove the cause of the startup failure, and then reboot the Web Server.  If this message is displayed even after the Web Server is started up, collect diagnostic information with the <i>iscollectinfo</i> command, and then contact your SE (systems engineer).

## 7.12.10 ihs81216

**IHS: ERROR: ihs81216: The error occurred in stop processing of Interstage HTTP Server. Detail:%s1, Web server name:%s2**

### Variable Information

%s1 = Error Details content

%s2 = Web Server name

Note: Web Server name (%s2) may not be output.

### Explanation

An error occurred when the Web Server was shut down.

### System Action

The Web Server start processing is canceled.

### User Action

Take the action described in table below, according to Error Details content (%s1).

Error Details content (%s1)	Meaning/Required Action
The service cannot accept control messages at this time.	The stop operation may have been performed from the Interstage Management Console while the service was stopping.  In the Interstage Management Console, click [System] > [Services] > [Web Server] > [List] to check the status. There is no need to take action if the Web Server (%s2) has stopped.  If the Web Server (%s2) has not stopped, collect diagnostic information using the <i>iscollectinfo</i> command, and then contact your SE (systems engineer).
lhs_start()=15	Close any unnecessary programs and check that sufficient memory is reserved for Web Server operation.
retcode=15	
<b>Linux32/64</b>  retcode=10, /bin/sh: line 0: kill: (%s3) - Permission denied (*1)	In an environment in which SELinux is enabled, the Web Server (%s2) that was started using the <i>ihsstart/ isstart/ apachectl</i> commands may have been stopped in the following Interstage Management Console windows:  - [System] > [Services] > [Web Server] > [Web Server name] > [Status] ,or - [System] > [Services] > [Web Server] > [List]  If this message is output in an environment in which SELinux is enabled, use one of the following methods to stop the Web Server (%s2):  - Use the <i>ihsstop</i> command.
<b>Linux32/64</b>  /bin/sh: line 0: kill: (%s3) - Permission denied (*1)	

Error Details content (%s1)	Meaning/Required Action
	- Use the <i>ismngconsolestop</i> command to stop the Interstage Management Console, use the <i>ismngconsolestart</i> command to start the Interstage Management Console, and then stop the Web Server (%s2) in the Interstage Management Console.
All other cases	Check the message displayed before this one (in Windows(R) in an event log message, and in Solaris/Linux in a system log message), remove the cause, and then stop the Web Server again.  If this message is still displayed, collect diagnostic information using the <i>iscollectinfo</i> command, and then contact your SE (systems engineer).

\*1 %s3 = Process ID

## 7.12.11 ihs81217

**IHS: INFO: ihs81217: Interstage HTTP Server is already started. Web server name:%s1**

### Variable Information

%s1 = Web Server name

### Explanation

The Web Server has already been started.

## 7.12.12 ihs81218

**IHS: INFO: ihs81218: Interstage HTTP Server is already stopped. Web server name:%s1**

### Variable Information

%s1 = Web Server name

### Explanation

The Web Server has already been shut down.

## 7.12.13 ihs81221

**IHS: ERROR: ihs81221: Since it is being interlocked with Interstage Operation Tool Commands, it cannot stop.**

### Explanation

The Web Server cannot be stopped because it is built into the Interstage operation environment by the *isinit* or *ismodifyservice* command.

This problem also occurs when the operating status monitoring mode of Interstage operating status is set to "mode1".

### User Action

Stop the Web Server by stopping Interstage.

Interstage can be stopped in any of the following methods:

- When running Interstage with the Standalone Server of the Interstage Management Console, stop Interstage from the window displayed by clicking [System] > [Status].
- When running Interstage with the Admin Server of the Interstage Management Console, stop Interstage from the window displayed by clicking [Application Management] > [Interstage] > [Interstage Application Server] > [System] > [FJapache(Server Group name or Server name)] > [Status].
- When running Interstage with the *isstop* command, stop Interstage with the *isstop* command.

## 7.12.14 ihs81222

---

**IHS: ERROR: ihs81222: Since it is set up by the Interstage Setup Commands, the linkage cannot be canceled.**

### Explanation

The linkage between the Interstage HTTP Server and Interstage cannot be canceled because it is built into the Interstage operating environment by the *isinit* or *ismodifyservice* command.

### User Action

To cancel the linkage between the Interstage HTTP Server and Interstage, you must delete the Interstage HTTP Server from the Interstage operating environment with the *ismodifyservice* command.

Cancel this linkage in the following procedure:

1. Stop Interstage.

```
isstop -f
```

2. Delete the service "FJapache" from the Interstage operating environment.

```
ismodifyservice -d FJapache
```

## 7.12.15 ihs81223

---

**IHS: INFO: ihs81223: The log has been rotated. Update to the latest information. Web server name:%s1**

### Variable Information

%s1 = Web Server name

### Explanation

Select the [Refresh] button to display the latest log file information in the Web Server (%s1).

## 7.12.16 ihs81224

---

**IHS: ERROR: ihs81224: The log file could not be obtained. Web server name:%s1**

### Variable Information

%s1 = Web Server name

### Explanation

The log file could not be obtained in the Web Server (%s1).

### System Action

The Web Server (%s1) continues to operate.

### User Action

Select the [Refresh] button to display the latest log file information. If the message continues to be output, collect diagnostic information with the *iscollectinfo* command, and then contact your SE (systems engineer).

## 7.12.17 ihs81299

---

**IHS: ERROR: ihs81299: The error occurred in allocate processing of a message. Detail:%s1**

### Variable Information

%s1 = Error Details content

## Explanation

An error occurred during message acquisition processing.

## User Action

Collect diagnostic information with the *iscollectinfo* command, and then contact your SE (systems engineer).

## 7.13 ihs81300 to ihs81399

---

This section details the messages numbered between ihs81300 and ihs81399.

### 7.13.1 ihs81301

---

**IHS: INFO: ihs81301: Interstage HTTP Server started successfully. Web server name:%s1**

#### Variable Information

%s1 = Web Server name

#### Explanation

The Web Server (%s1) was started up.

### 7.13.2 ihs81302

---

**IHS: INFO: ihs81302: Interstage HTTP Server was stopped. Web server name:%s1**

#### Variable Information

%s1 = Web Server name

#### Explanation

The Web Server (%s1) was shut down.

### 7.13.3 ihs81304

---

**IHS: INFO: ihs81304: Interstage HTTP Server configuration was updated. The server must be restarted for the new settings to take effect. Web server name:%s1**

#### Variable Information

%s1 = Web Server name

#### Explanation

An environment definition was set in the environment definition file. The Web Server (%s1) must be restarted for the new settings to take effect.

### 7.13.4 ihs81305

---

**IHS: INFO: ihs81305: %s1 was deleted successfully. Web server name:%s2**

#### Variable Information

%s1 = Definition information

%s2 = Web Server name

#### Explanation

Definition information (%s1) was deleted normally in the Web Server (%s2).

## 7.13.5 ihs81306

---

**IHS: INFO: ihs81306: No items to display in selected list.**

### Explanation

There is no list that can be displayed. No definition information is set.

## 7.13.6 ihs81308

---

**IHS: INFO: ihs81308: Configuration file was successfully re-read. Web server name:%s1**

### Variable Information

%s1 = Web Server name

### Explanation

The environment definition file was reread in the Web Server (%s1).

## 7.13.7 ihs81313

---

**IHS: INFO: ihs81313: Virtual Host (%s1) was updated successfully. The server must be restarted for the new settings to take effect. Web server name:%s2**

### Variable Information

%s1 = Virtual host name

%s2 = Web Server name

### Explanation

Virtual host (%s1) was updated in the Web Server (%s2). The Web Server (%s2) must be restarted for the new settings to take effect.

## 7.13.8 ihs81314

---

**IHS: INFO: ihs81314: Virtual Host (%s1) was created. The server must be restarted for the new settings to take effect. Web server name:%s2**

### Variable Information

%s1 = Virtual host name

%s2 = Web Server name

### Explanation

Virtual host (%s1) was created in the Web Server (%s2). The Web Server (%s2) must be restarted for the new settings to take effect.

## 7.13.9 ihs81315

---

**IHS: INFO: ihs81315: Virtual Host (%s1) was deleted. The server must be restarted for the new settings to take effect. Web server name:%s2**

### Variable Information

%s1 = Virtual host name

%s2 = Web Server name

### Explanation

The selected virtual host was deleted in the Web Server (%s2). The Web Server (%s2) must be restarted for the new settings to take effect.

## 7.13.10 ihs81316

---

**IHS: ERROR: ihs81316: Selected SSL configuration '%s1' doesn't exist.**

### Variable Information

%s1 = SSL definition name

### Explanation

The selected SSL definition (%s1) does not exist.

### User Action

If another SSL definition exists, select that SSL definition.

If the SSL definition does not exist, use the Interstage management console [Security] > [SSL] to create an SSL definition, and execute the processing.

## 7.13.11 ihs81317

---

**IHS: ERROR: ihs81317: An SSL configuration has not been selected.**

### Explanation

The SSL definition is not selected.

### User Action

Select another SSL definition.

## 7.13.12 ihs81318

---

**IHS: ERROR: ihs81318: An SSL configuration has not been created. Please try again after creating an SSL configuration.**

### Explanation

The SSL definition has not been created.

### User Action

Use the Interstage management console [Security] > [SSL] to create an SSL definition, and reexecute the processing.

## 7.13.13 ihs81320

---

**IHS: ERROR: ihs81320: Error creating new Virtual Host. Detail:%s1, Web server name:%s2**

### Variable Information

%s1 = Error Details content

%s2 = Web Server name

### Explanation

A Virtual Host could not be created.

### User Action

If the detailed error code (%s1) is "Setting has been modified by another user", the environment definition file (httpd.conf) of the Web Server (%s2) may have already been updated by another user (creating, changing, or deleting the Virtual Host updates the environment definition file).

Do the following operations and then rerun the process.

- When running Interstage with the Standalone Server of the Interstage Management Console

Redisplay the virtual host list by clicking [System] > [Services] > [Web Server] > [Web Server name] > [Virtual Hosts] from the Interstage Management Console.

- When running Interstage with the Admin Server of the Interstage Management Console

Redisplay the virtual host list by clicking [Application Management] > [Interstage] > [Interstage Application Server] > [Services] > [Web Server] > [FJapache(Server Group name or Server name)] > [Virtual Hosts] from the Interstage Management Console.

In other than the above cases, correct the cause of the unsuccessful virtual host creation by referencing the detailed error code (%s1) and rerun the process.

## 7.13.14 ihs81321

### IHS: ERROR: ihs81321: Error deleting Virtual Host. Detail:%s1, Web server name:%s2

#### Variable Information

%s1 = Error Details content

%s2 = Web Server name

#### Explanation

The virtual host could not be deleted.

#### User Action

If the detailed error code (%s1) is "Setting has been modified by another user", the environment definition file (httpd.conf) of the Web Server (%s2) may have already been updated by another user (creating, changing, or deleting the Virtual Host updates the environment definition file).

Redisplay the virtual host list by clicking [System] > [Services] > [Web Server] > [Virtual Hosts] from Interstage Management Console and then rerun the process.

In other than the above cases, correct the cause of the unsuccessful virtual host deletion by referencing the detailed error code (%s1) and rerun the process.

## 7.13.15 ihs81322

### IHS: ERROR: ihs81322: SSL configuration is required for setup. Please install the necessary components.

#### Explanation

The SSL-related packages may have been uninstalled when operation was being performed using SSL for the Interstage certificate environment in the Web Server.

#### User Action

Install the following functions (packages).

Platform	Functions	Package name
Windows32/64	Secure Communication Service package	-
Solaris32	Interstage Secure Communication Service	FJSVisscs
	CA/EE common certificate management function, key management function	FJSVsmee
	Securecrypto Library RunTime	FJSVslcr
	Secure Socket Option	FSUNsslI
Solaris64	Interstage Secure Communication Service	FJSVisscs
	CA/EE common certificate management function, key management function	FJSVsm64

Platform	Functions	Package name
	Securecrypto Library RunTime	FJSVsc164
Linux32	Interstage Secure Communication Service	FJSVsmee
	CA/EE common certificate management function, key management function	FJSVisscs
	Securecrypto Library RunTime	FJSVsc1r
Linux64	Interstage Secure Communication Service	FJSVisscs
	CA/EE common certificate management function, key management function	FJSVsmee64
	Securecrypto Library RunTime	FJSVsc1r64

### 7.13.16 ihs81323

**IHS: INFO: ihs81323: Virtual Host '%s1' has been updated to '%s2'. Interstage HTTP Server must be restarted for the settings to take effect. Web server name:%s3**

#### Variable Information

%s1 = Virtual host name before update

%s2 = Virtual host name after update

%s3 = Web Server name

#### Explanation

The virtual host (%s1) has been updated to the virtual host (%s2).

For the settings to take effect, you must restart the Web Server (%s3).

### 7.13.17 ihs81324

**IHS: INFO: ihs81324: Cannot be referenced because the log file name has not been set. Web server name: %s1**

#### Variable Information

%s1 = Web Server name

#### Explanation

Cannot be referenced because the log file name has not been set in the Web Server (%s1).

### 7.13.18 ihs81325

**IHS: INFO: ihs81325: Cannot be referenced because the log file name has not been set. Reference from the [Web server] > [%s1] > [Log reference].**

#### Variable Information

%s1 = Web Server name

#### Explanation

Cannot be referenced because the log file name has not been set.

Refer to the log information on the [Web Server: Refer to Log] screen by clicking the following:

- When running Interstage with the Standalone Server of the Interstage Management Console  
[System] > [Services] > [Web Server] > [Web Server name] > [Refer to Log] tab

- When running Interstage with the Admin Server of the Interstage Management Console

[Integrated Control] > [Interstage] > [Interstage Application Server] > [Server Group name] > [Server name] > [System] > [Services] > [Web Server] > [FJapache] > [Refer to Log] tab

## 7.13.19 ihs81326

---

**IHS: INFO: ihs81326: Cannot be referenced because the log file cannot be found. Web server name:%s1**

### Variable Information

%s1 = Web Server name

### Explanation

Cannot be referenced because the log file cannot be found in the Web Server (%s1).

## 7.13.20 ihs81327

---

**IHS: ERROR: ihs81327: The specified server group or server is incorrect. (%s1)(%s2)**

### Variable Information

%s1 = Web Server name

%s2 = Name of a server group or a server

### Explanation

The specified name of a server group or a server (%s2) is incorrect.

### System Action

Terminates the processing

### User Action

Specify the correct name of a server group or a server.

## 7.13.21 ihs81328

---

**IHS: ERROR: ihs81328: The Web server definition for the specified server group or server cannot be located. (%s1(%s2))**

### Variable Information

%s1 = Web Server name

%s2 = Name of a server group or a server

### Explanation

The Web Server (%s1) definition for the server group or server (%s2) cannot be located.

Other users may have modified the site composition.

### System Action

Terminates the processing

### User Action

Take one of the following actions:

1. Click [Application Management] > [Interstage] > [Interstage Application Server] > [Services] > [Web Server] on the Interstage Management Console.
2. Check the site composition from the displayed list of Web Servers.

## 7.13.22 ihs81329

**IHS: ERROR: ihs81329: The environment definition obtained cannot be used. Server name=%s1, Detail: %s2**

### Variable Information

%s1 = Server name

%s2 = Error Details content

### Explanation

As the following settings do not correspond, the environment definition file (httpd.conf) for the Admin Server cannot be used.

- The host name and the virtual host name of the Web Server managed with the Admin Server.
- The host name and the virtual host name set to the environment definition file (httpd.conf) for the Managed Server.

The reason why the host name and the virtual host name are not corresponding is output to the error details content (%s2). The cause is shown as a content description of how the environment definition file (httpd.conf) of the Managed Server was updated to the host name and the virtual host of the Web Server is managed with the Admin Server.

### System Action

Terminates the processing

### User Action

Obtain the environment definition again after taking the action described in the following procedures.

1. Refer to the error details content (%s2), and check the reason the host name and virtual host name are not corresponding.
2. The same host name and virtual host name set to the environment definition file (httpd.conf) of the Managed Server is also set with the Web Server that is managed with the Admin Server.
  - When the host name is different, the host name is changed by using the [Application Management] > [Interstage] > [Interstage Application Server] > [Services] > [Web Server] > [FJapache(Server Group name or Server name)] > [Web Server Settings] tab on the Interstage Management Console of the Admin Server.
  - When the virtual host name is different, the host name is added/changed/deleted by using the [Application Management] > [Interstage] > [Interstage Application Server] > [Services] > [Web Server] > [FJapache(Server Group name or Server name)] > [Virtual Host] on the Interstage Management Console of the Admin Server.

The item on the Interstage Management Console and the directive value of the environment definition file (httpd.conf) corresponds as described in the table below.

The item on the Interstage Management Console (See Note)	The directive of the environment definition file (httpd.conf)
[Web Server] > [FJapache(Server Group name or Server name)] > [Web Server Settings] tab > [Server Hostname or IP Address]	ServerName directive
[Web Server] > [FJapache(Server Group name or Server name)] > [Virtual Host] > [The virtual host name] > [IP Address],[Port Number]	<VirtualHost> directive
[Web Server] > [FJapache(Server Group name or Server name)] > [Virtual Host] > [The virtual host name] > [Server Hostname]	ServerName directive in <VirtualHost> section

Note) This item shows the following tree from [Application Management] > [Interstage] > [Interstage Application Server] > [Services].

## 7.13.23 ihs81330

**IHS: ERROR: ihs81330: This operation cannot be executed because an error is contained in the environment setting. Detail:%s1**

## Variable Information

%s1 = Error Details content

## Explanation

The Web Server cannot be activated when the environment setting contains an error in the Web Server.

## System Action

Terminates the processing

## User Action

Refer to the error details content (%s1), resolve the error in the environment setting, and reexecute the processing.

## 7.13.24 ihs81331

---

**IHS: ERROR: ihs81331: This operation cannot be executed because another operation contains an error. Detail:%s1**

## Variable Information

%s1 = Error Details content

## Explanation

The [Application Management] of the Interstage Management Console cannot be executed because another operation output to the error details content (%s1) contains an error. The following operations might fail:

- Update of the [Server Hostname or IP Address] by clicking the [Update] button on the screen [FJapache(Server group name or Server name): Web Server Settings]. This screen is accessed by selecting [Application Management] > [Interstage] > [Interstage Application Server] > [Services] > [Web Server] > [FJapache(Server group name or Server name)] > [Web Server Settings].
- The virtual host is selected, and the [Delete] button is clicked on the [Virtual Host: View list of the Virtual Hosts] screen. This screen is accessed by selecting [Application Management] > [Interstage] > [Interstage Application Server] > [Services] > [Web Server] > [FJapache(Server group name or Server name)] > [Virtual Host].
- A new virtual host is specified, and the [Create] button is clicked on the [Virtual Host: Create a new Virtual Host] screen. This screen is accessed by selecting [Application Management] > [Interstage] > [Interstage Application Server] > [Services] > [Web Server] > [FJapache(Server group name or Server name)] > [Virtual Host] > [Create a new Virtual Host].
- The following items are updated, by clicking the [Update] button on the [Virtual Host name: Configuration] screen.
  - [Server Hostname or IP Address]
  - [Port Number]
  - [Hostname]

The [Virtual Host name: Configuration] screen is accessed by selecting [Application Management] > [Interstage] > [Interstage Application Server] > [Services] > [Web Server] > [FJapache(Server group name or Server name)] > [Virtual Host] > [Virtual Host name].

## System Action

Terminates the processing

## User Action

Remove the cause of the error, complete the operation specified in the error details content (%s1) and reexecute the processing. Do not execute the next operation until the processing of the operation is completed successfully.

## 7.13.25 ihs81332

---

**IHS: ERROR: ihs81332: One or more servers failed to activate the Interstage HTTP server. Web server name:%s1(%s2)**

#### Variable Information

%s1 = Web Server name

%s2 = Server group name

#### Explanation

One or more servers in the server group failed to activate the Web Server (%s1).

#### System Action

Terminates the processing

#### User Action

Refer to the error message output simultaneously to each server, remove the cause of the error from each server as required, and reexecute the processing.

### 7.13.26 ihs81333

---

**IHS: ERROR: ihs81333: The Interstage HTTP server could not be activated. Web server name:%s1(%s2)**

#### Variable Information

%s1 = Web Server name

%s2 = Server group name

#### Explanation

All the servers in the server group failed to activate the Web Server (%s1).

#### System Action

Terminates the processing

#### User Action

Refer to the error message output simultaneously to each server, remove the cause of the error from each server where required and reexecute the processing.

### 7.13.27 ihs81334

---

**IHS: ERROR: ihs81334: One or more servers failed to terminate the Interstage HTTP server. Web server name:%s1(%s2)**

#### Variable Information

%s1 = Web Server name

%s2 = Server group name

#### Explanation

One or more servers in the server group failed to terminate the Web Server (%s1).

#### System Action

Terminates the processing

#### User Action

Refer to the error message output simultaneously to each server, remove the cause of the error from each server where required and reexecute the processing.

## 7.13.28 ihs81335

---

**IHS: ERROR: ihs81335: The Interstage HTTP server could not be terminated. Web server name:%s1(%s2)**

### Variable Information

%s1 = Web Server name

%s2 = Server group name

### Explanation

All the servers in the server group failed to terminate the Web Server (%s1).

### System Action

Terminates the processing

### User Action

Refer to the error message output simultaneously to each server, remove the cause of the error from each server where required and reexecute the processing.

## 7.13.29 ihs81336

---

**IHS: ERROR: ihs81336: One or more servers failed to set the environment. Web server name:%s1(%s2)**

### Variable Information

%s1 = Web Server name

%s2 = Server group name

### Explanation

One or more servers in the server group failed to set the environment for the Web Server (%s1).

### System Action

Terminates the processing

### User Action

Refer to the error message output simultaneously to each server, remove the cause of the error from each server where required, and reexecute the processing.

## 7.13.30 ihs81337

---

**IHS: ERROR: ihs81337: The environment setting has failed. Web server name:%s1(%s2)**

### Variable Information

%s1 = Web Server name (not always output)

%s2 = Server group name

### Explanation

All the servers in the server group failed to set the environment for the Web Server (%s1).

### System Action

Terminates the processing

### User Action

Refer to the error message output simultaneously to each server, remove the cause of the error from each server where required and reexecute the processing.

### 7.13.31 ihs81338

---

**IHS: ERROR: ihs81338: One or more servers failed to operate the virtual host. Web server name=%s1(%s2) Detail:%s3**

#### Variable Information

%s1 = Web Server name  
%s2 = Server group name  
%s3 = Error Details content

#### Explanation

One or more servers in the server group failed to operate the virtual host.

#### System Action

Terminates the processing

#### User Action

Refer to the error message output simultaneously to each server, remove the cause of the error from each server where required and reexecute the processing.

Do not execute the next operation until this operation is complete.

### 7.13.32 ihs81339

---

**IHS: ERROR: ihs81339: Operation of the virtual host has failed. Web server name=%s1(%s2) Detail:%s3**

#### Variable Information

%s1 = Web Server name  
%s2 = Server group name  
%s3 = Error Details content

#### Explanation

Operation of the virtual host definition information failed in all servers belonging to the server group.

#### System Action

Terminates the processing

#### User Action

Refer to the error message output simultaneously to each server, remove the cause of the error from each server where required and reexecute the processing.

Do not execute the next operation until this operation is complete.

### 7.13.33 ihs81340

---

**IHS: ERROR: ihs81340: Failed to add the Managed Server to Server Group because Registered the Web server definition is different to the other. Detail=%s1**

#### Variable Information

%s1 = Error Details content

#### Explanation

The Managed Server cannot be added to the server group because there is a difference in definition information on the Web Server.

## System Action

Terminates the processing.

## User Action

Take the following actions:

- When the error details content (%s1) is "Definition is not in agreement", take the following action:

### Windows32/64

- The installation directory in the Multi Server Environment may have been set incorrectly. Check the installation directory. For details about the installation directory, refer to "Pre-Installation Preparations", "Notes about using the multiserver management function" in the Installation information.
- If the installation directory was correct and you used the editor to edit the environment definition file (httpd.conf) of the Web Server in the Managed Server, configure the definition again. On the Interstage Management Console, click the tab [Application Management] > [Interstage] > [Interstage Application Server] > [Services] > [Web Server] > [FJapache(Server group name or Server name)] > [Get Definition] and add it to the server group again.

If the message continues to be output, take the following action:

- If the installation directory was correct and you did not use the editor to edit the environment definition file (httpd.conf) of the Web Server in the Managed Server, match the Web Server definition in the Managed Servers that already belong to the Server Group with that in the Reserve Server you attempted to add to the Server Group.

After the following operation, reexecute the operation to add the server to the Server Group.

1. Back up all of the Interstage services used by the Managed Servers that already belong to the Server Group, and then create backup resources.
2. Restore any Reserve Servers you want to add to the Server Group.

### Solaris32/64 Linux32/64

- If you used the editor to edit the environment definition file (httpd.conf) of the Web Server in the Managed Server, configure the definition again. On the Interstage Management Console, click the tab [Application Management] > [Interstage] > [Interstage Application Server] > [Services] > [Web Server] > [FJapache(Server group name or Server name)] > [Get Definition] and add it to the server group again.

If the message continues to be output, take the following action:

- If you did not use the editor to edit the environment definition file (httpd.conf) of the Web Server in the Managed Server, match the Web Server definition in the Managed Servers that already belong to the Server Group with that of the Reserve Server you attempted to add to the Server Group.

After the following operation, reexecute the operation to add the server to the Server Group.

1. Back up all of the Interstage services used by the Managed Servers that already belong to the Server Group, and then create backup resources.
  2. Restore any Reserve Servers you want to add to the Server Group.
- When the error details content (%s1) is "Not exist on admin server", the Interstage HTTP Server is installed in added Managed Server. This occurs even though Interstage HTTP Server is not installed in Managed Server which has already been added to the Server Group. Therefore, there is a problem in the composition of the installation package. Ensure that the installation package is the same composition in the server group.
  - When the error details content (%s1) is "Not exist on managed server", the Interstage HTTP Server is not installed in added Managed Server. This occurs even though Interstage HTTP Server is installed in Managed Server which has already been added to the Server Group. Therefore, there is a problem in the composition of the installation package. Ensure that the installation package is the same composition in the server group.

## 7.13.34 ihs81341

---

**IHS: ERROR: ihs81341: Setting has been modified by another user.**

## Explanation

The definition could not be updated because it had been updated by another user.

## System Action

Terminates updating the definition.

## User Action

Update the definition information by using the following procedures, and then reexecute processing.

- When setting the environment of the Web Server

Click the [Update] button on [Application Management] > [Interstage] > [Interstage Application Server] > [Services] > [Web Server] > [FJapache(Server group name or Server name)] of the Interstage Management Console, and redisplay the definition information.

- When setting a virtual host

Click [Application Management] > [Interstage] > [Interstage Application Server] > [Services] > [Web Server] > [FJapache(Server group name or Server name)] > [Virtual Hosts] of the Interstage Management Console, and redisplay the virtual host list.

## 7.13.35 ihs81342

---

**IHS: ERROR: ihs81342: Could not add the Managed Server because the Interstage and Web server linkage settings in it are different. Server group=%s1 Detail:%s2**

### Variable Information

%s1 = Server Group Name

%s2 = Status of the Interstage and Web server linkage settings in each Managed Server

### Explanation

One of the following causes is assumed:

- The Interstage and Interstage HTTP Server linkage settings of the Managed Server you attempted to add to the Server Group are different to the settings of the Managed Servers that already belong to the Server Group.
- The Interstage and Interstage HTTP Server linkage settings of the Managed Servers that you attempted to add to the Server Group simultaneously are different.

The explanation of state (%s2) is as follows:

**LINK\_COMMAND=(Managed Server name(Variable))**

The Managed Server sets the Interstage and Interstage HTTP Server linkage by using the Interstage Setup Commands.

**LINK\_SYSTEM=(Managed Server name(Variable))**

The Managed Server sets the Interstage and Interstage HTTP Server linkage by using the Interstage Management Console as follows:

- When running Interstage with the Standalone Server

[Synchronized Services] displayed on [System] > [Update System Settings] tab

- When running Interstage with the Admin Server

[Synchronized Services] displayed on [Application Management] > [Interstage] > [Interstage Application Server] > [Server group name or Server name] > [Update System Settings] tab

**LINK\_NONE=(Managed Server name(Variable))**

The Managed Server does not set Interstage and Web Server linkage.

**GROUP=(Either LINK\_COMMAND, LINK\_SYSTEM or LINK\_NONE)**

The Interstage and Web Server linkage settings of the server group are either the LINK\_COMMAND, LINK\_SYSTEM or LINK\_NONE states.

## System Action

Terminates the processing.

## User Action

The Interstage definition of the Managed Servers that already belong to the Server Group and of the Reserve Server you attempted to add to the Server Group must match.

After the following operation, reexecute the operation to add the server to the Server Group.

1. Back up all of the Interstage services used by the Managed Servers that already belong to the Server Group, and then create backup resources.
2. Restore any Reserve Servers you want to add to the Server Group.

## 7.13.36 ihs81343

---

**IHS: ERROR: ihs81343: Could not add the Reserve Server because the Interstage and Web server linkage settings in the Managed Servers that already belong to the Server Group are different. Server group=%s1 Detail:%s2**

### Variable Information

%s1 = Server Group Name

%s2 = Status of the Interstage and Web server linkage settings in each Managed Server belonging to the server group

### Explanation

Could not add the Reserve Server because the Interstage and Interstage HTTP Server linkage settings in the Managed Servers that already belong to the Server Group are different.

The explanation of the (%s2) state is as follows:

LINK\_COMMAND=(Managed Server name(Variable))

The Managed Server sets the Interstage and Interstage HTTP Server linkage by using the Interstage Setup Commands.

LINK\_SYSTEM=(Managed Server name(Variable))

The Managed Server sets the Interstage and Interstage HTTP Server linkage using the Interstage Management Console as follows:

- When running Interstage with the Standalone Server

[Synchronized Services] displayed on [System] > [Update System Settings] tab

- When running Interstage with the Admin Server

[Synchronized Services] displayed on [Application Management] > [Interstage] > [Interstage Application Server] > [Server group name or Server name] > [Update System Settings] tab

LINK\_NONE=(Managed Server name(Variable))

The Managed Server does not set Interstage and Web Server linkage.

## System Action

Terminates the processing.

## User Action

When the operation for Interstage and Web Server linkage settings in the Server Group was executed, some of the Managed Servers may have failed.

Implement the linkage settings again by using [Synchronized Services] displayed on the [Application Management] > [Interstage] > [Interstage Application Server] > [Server group name or Server name] > [Update System Settings] tab of the Interstage Management Console. If an error occurs, take the action indicated by the displayed error message.

## 7.13.37 ihs81351

---

**IHS: INFO: ihs81351: Interstage HTTP Server was created. Web server name:%s1**

### Variable Information

%s1 = Web Server name

### Explanation

The Web Server (%s1) was created.

## 7.13.38 ihs81352

---

**IHS: INFO: ihs81352: Interstage HTTP Server was deleted. Web server name:%s1**

### Variable Information

%s1 = Web Server name

### Explanation

The Web Server (%s1) was deleted.

## 7.13.39 ihs81353

---

**IHS: INFO: ihs81353: Interstage HTTP Server has already been created. Web server name:%s1**

### Variable Information

%s1 = Web Server name

### Explanation

The Web Server (%s1) has already been created.

### System Action

Terminates the processing.

## 7.13.40 ihs81354

---

**IHS: ERROR: ihs81354: The allowed maximum number of created Interstage HTTP Server has been reached. Detail:%s1, Web server name:%s2**

### Variable Information

%s1 = Error details

%s2 = Web Server name

### Explanation

The allowed maximum number of created Web servers has been reached. A maximum of 64 Web servers can be created.

### System Action

Terminates the processing.

### User Action

Web Server (%s2) could not be created because the maximum number of Web Servers has been reached. Delete any unnecessary Web Servers from [System] > [Services] > [Web Server] > [List], and then reexecute create processing.

## 7.13.41 ihs81355

---

---

**IHS: ERROR: ihs81355: A problem occurred when Interstage HTTP Server was created. Detail:%s1, Web server name:%s2**

**Variable Information**

%s1 = Error details content

%s2 = Web Server name

**Explanation**

A problem occurred when the Web Server (%s2) was created.

**System Action**

Terminates the processing.

**User Action**

One of the following causes is assumed:

- If error details content (%s1) is "invalid parameter(Web Server name)", it means the [Web Server Name] settings are incorrect. Check the settings, and then reexecute create processing.
- If error details content (%s1) is "invalid parameter(Listen)", it means the [Port Number] settings are incorrect. Check the settings, and then reexecute create processing.
- If error details content (%s1) is "invalid parameter(ServerName)", it means the [Server Hostname or IP Address] settings are incorrect. Check the settings, and then reexecute create processing.

In all other cases, check error details content (%s1), fix the cause of the failure, and then reexecute processing.

If this message is still output after the Web Server is created again, collect diagnostic information using the *iscollectinfo* command, and then contact your SE (systems engineer).

---

## 7.13.42 ihs81356

---

**IHS: ERROR: ihs81356: Interstage HTTP Server has not been created. Web server name:%s1**

**Variable Information**

%s1 = Web Server name

**Explanation**

The specified operation could not be performed because the Web Server (%s1) has not been created.

**System Action**

Terminates the processing.

**User Action**

In the Interstage Management Console, click [System] > [Services] > [Web Server], refresh the list of Web Servers, and then perform the operation.

---

## 7.13.43 ihs81357

---

**IHS: ERROR: ihs81357: Interstage HTTP Server cannot be deleted because it is running. Web server name:%s1**

**Variable Information**

%s1 = Web Server name

**Explanation**

The Web Server (%s1) cannot be deleted because it is running.

## System Action

Terminates the processing.

## User Action

Stop the Web Server (%s1), and then reexecute delete processing.

## 7.13.44 ihs81358

---

**IHS: ERROR: ihs81358: A problem occurred while the Interstage HTTP Server was being deleted. Detail: %s1, Web server name:%s2**

### Variable Information

%s1 = Error details content

%s2 = Web Server name

### Explanation

A problem occurred while the Web Server (%s2) was being deleted.

### System Action

Terminates the processing.

### User Action

If error details content (%s1) is "invalid parameter(Web Server name)", it means the [Web Server Name] settings are incorrect. Check the settings, and then reexecute create processing.

In all other cases, check error details content (%s1), fix the cause of the failure, and then reexecute processing.

If this message is still output after the Web Server is deleted again, collect diagnostic information using the *iscollectinfo* command, and then contact your SE (systems engineer).

## 7.13.45 ihs81359

---

**IHS: ERROR: ihs81359: Failed to create the settings for using Interstage HTTP Server. Web server name=%s1, Hostname=%s2, Detail=%s3**

### Variable Information

%s1 = Web Server name

%s2 = Host name

%s3 = Error details content

Note: Host name (%s2) is "#MainHost" for the main host, and the virtual host name for the virtual host.

### Explanation

The settings for using the Web Server (%s1) could not be created.

### System Action

Terminates the processing.

### User Action

One of the following causes is assumed:

- If error details content (%s3) is "does not exist web server", it means the Web Server (%s1) does not exist. Either select a Web Server that exists, or in the Interstage Management Console click [System] > [Services] > [Web Servers] > [New], create the Web Server (%s1), and then reexecute processing.

- If error details content (%s3) is "retcode=14", processing cannot be performed because another operation has been executed. Wait for a short period and then reexecute processing.
- If Host name (%s2) is "#MainHost" and error details content (%s3) is "already used this host", it means the Web Server (%s1) was already locked.
- If Host name (%s2) is "#MainHost" and error details content (%s3) is "already unused this host", it means the Web Server (%s1) was already unlocked.
- If Host name (%s2) is a virtual hostname and error details content (%s3) is "already used this host", it means the virtual host (%s2) of the Web Server (%s1) was already locked.
- If Host name (%s2) is a virtual hostname and error details content (%s3) is "already unused this host", it means the Web Server (%s1) was already unlocked.

In all other cases, check error details content (%s3), fix the cause of the failure, and then reexecute processing.

## 7.13.46 ihs81360

---

**IHS: ERROR: ihs81360: The specified virtual host cannot be deleted because it is being used. Web server name=%s1, Hostname=%s2, Function name=%s3**

### Variable Information

%s1 = Web Server name

%s2 = Virtual host name

%s3 = Function that is using the virtual host

### Explanation

The Web Server (%s1) is being used by function (%s3), so it cannot be deleted.

The following function (%s3) types use the virtual host:

- servlet: IJServer
- ssoaz: Single Sign-on business server
- ssoac: Single Sign-on authentication server
- ssoav: Single Sign-on repository server

### System Action

Terminates the processing.

### User Action

Take the appropriate action from the list below, and then reexecute the delete operation.

- If function name (%s3) is "servlet", either delete the IJServer that uses the Web Server (%s1), or delete Web Server %s1 from the Web Servers that are targets of requests received by IJServer.
- If function name (%s3) is "ssiaz", delete the business systems that are using the Web Server (%s1).
- If function name (%s3) is "ssoac", delete the authentication servers that are using the Web Server (%s1).
- If function name (%s3) is "ssosv", delete the repository servers that are using the Web Server (%s1).

## 7.13.47 ihs81361

---

**IHS: ERROR: ihs81361: The specified Web server is being used, so it cannot be deleted. Web server name=%s1, Function name=%s2**

### Variable Information

%s1 = Web Server name

%s2 = Function that is using the virtual host

### Explanation

The Web Server (%s1) is being used by function (%s3), so it cannot be deleted.

The following function (%s3) types use the Web Server:

- servlet: IJServer
- ssoaz: Single Sign-on business server
- ssoac: Single Sign-on authentication server
- ssosv: Single Sign-on repository server

### System Action

Terminates the processing.

### User Action

Take the appropriate action from the list below, and then reexecute the delete operation.

- If function name (%s3) is "servlet", either delete the IJServer that uses the Web Server (%s1), or delete Web Server %s1 from the Web Servers that are targets of requests received by IJServer.
- If function name (%s3) is "ssiaz", delete the business systems that are using the Web Server (%s1).
- If function name (%s3) is "ssoac", delete the authentication servers that are using the Web Server (%s1).
- If function name (%s3) is "ssosv", delete the repository servers that are using the Web Server (%s1).

## 7.13.48 ihs81362

---

**IHS: ERROR: ihs81362: Since it is being interlocked with Interstage Operation Tool Commands, it cannot execute.**

### Explanation

The Web Server cannot be created or deleted because it is built into the Interstage operation environment by the *isinit* or *ismodify* service command.

### System Action

Terminates the processing.

### User Action

Stop Interstage, and then reexecute the Web Server create or delete operation. Settings can be configured using the Interstage Management Console so that the Web Server can be created or deleted even while it is connected. The settings for connecting Interstage and the Web Server are configured using the Interstage Management Console as follows:

1. In the [System] > [Update System Settings] window, under [Synchronized Services], in [Web Server] select "Yes", and then click [Update]

Note: If Interstage is running while these settings are configured, it restarts.

2. In the [System] > [System:Status] window, click [Start Interstage].

## 7.13.49 ihs81363

---

**IHS: ERROR: ihs81363: Processing cannot be performed because another operation is executing. Detail=%s1, Web server name:%s2**

### Variable Information

%s1 = Error details content

%s2 = Web Server name

Note: Web Server name (%s2) may not be output.

### Explanation

Processing cannot be performed because another operation has been executed.

### System Action

Terminates the processing.

### User Action

Take one of the following actions:

- Check whether the commands shown below have been executed at the same time. If they have, wait until command processing is complete, and then reexecute the command. To prevent corruption of the Interstage HTTP Server environment, the commands shown below cannot be executed at the same time.
  - *ihconfig*
  - *ihcreate*
  - *ihdelete*
  - *ihstart*
  - *ihstop*
  - *ihbackup*
  - *ihrestore*
  - *ijsdeployment*
  - *ijsundeployment*
- Check whether the *isstart* or *isstop* commands have been executed at the same time. If they have, wait until command processing is complete, and then reexecute the command. If Interstage HTTP Server is integrated in the Interstage application environment using the *isinit* or *ismodify* service commands and the *isstart* or *isstop* command has been executed, it may not be possible to execute the Interstage HTTP Server operation command.
- In the Interstage Management Console windows shown below, check whether the start/stop/create/delete/change operations have been executed. If they have, wait until processing is complete, and then reexecute the command. To prevent corruption of the Interstage HTTP Server environment, the Interstage HTTP Server operation command cannot be executed at the same time as the Interstage Management Console operation.
  - [System] > [Services] > [Web Server] > [List]
  - [System] > [Services] > [Web Server] > [Web Server name] > [Status]
  - [System] > [Services] > [Web Server] > [New]
  - [System] > [Services] > [Web Server] > [Web Server name] > [Virtual Host] > [Virtual Host name] > [Web Server Settings]

## 7.13.50 ihs81364

---

**IHS: ERROR: ihs81364: A timeout occurred. Detail:%s1**

### Variable Information

%s1 = Error details content

### Explanation

The start or stop timeout has been exceeded. Possible causes are as follows:

- Failed to start or stop the Web Server.
- The timeout time was exceeded while Web Server start or stop was in progress.

## System Action

Terminates the processing.

## User Action

Check whether a message is output to the event log (Windows(R)) or system log (Solaris/Linux) before or after this message, and then take the following action:

- If an error message was output before or after this message, check the message output before this message and the Interstage HTTP Server error log, and fix the cause of the failure. For Web Server error log details, refer to the "Messages Output by Interstage HTTP Server" chapter.

- If the `ih00001` INFO message is output after this message, that the Web server started after the time set for the start timeout. This can be prevented by resetting the start timeout value using the `ihconfig` command. Calculate this value using the following formula:

Start timeout value = ("ih00001" INFO message output time - "ih81001" INFO message output time) + x (seconds)

Note: x is the margin of error (a few seconds) as applicable when considering the status of the system.

For details of the `ihconfig` command, refer to the "Interstage HTTP Server Operation Commands" chapter of the Reference Manual (Command Edition).

- If the `ih00002` INFO message is output after this message, the Web server stopped after the time set for the stop timeout. This can be prevented by resetting the stop timeout value using the `ihconfig` command. Calculate this value using the following formula:

Stop timeout time = ("ih00002" INFO message output time - "ih81002" INFO message output time) + x (seconds)

Note: x is the margin of error (a few seconds) as applicable when considering the status of the system.

For details of the `ihconfig` command, refer to the "Interstage HTTP Server Operation Commands" chapter of the Reference Manual (Command Edition).

- If an error message was not output before or after this message, wait for a while, and then check again whether a message was output.

**Note** Solaris32/64 Linux32/64

When a large number of role and site definitions has been registered in the SSO repository of an Interstage Single Sign-on server, the Web server may take longer than normal to start up and this may cause the start timeout to exceed resulting in this error message.

## 7.13.51 `ih81373`

---

**IHS: ERROR: `ih81373`: The server cannot be added because the Web server configuration of a Managed Server in the server group is different. Web server name=%s1(%s2), Detail=%s3**

### Variable Information

`%s1` = Web Server name

`%s2` = Server Group name

`%s3` = Information on the Web Server with a different configuration

### Explanation

Possible causes are as follows:

- The Web Server configuration of the Managed Server added to the server group differs from a Managed Server already in the server group.
- The Web Server configurations in the added Managed Servers are different.

## System Action

Terminates the processing.

## User Action

The configuration of the Web Server in the server group and those on the server to be added to the group must be the same.

Back up and restore the server, and retry adding the server to the server group.

## 7.13.52 ihs81374

---

**IHS: ERROR: ihs81374: Cannot add Managed Server because the configuration of its Web server is different. Server group=%s1, Detail=%s2**

### Variable Information

%s1 = Server Group name

%s2 = Information on the Web Server with a different configuration

### Explanation

The Reserved Server cannot be added because its Web Server configuration differs from that of the Managed Servers in the server group.

### System Action

Terminates the processing.

### User Action

Take the following action and then reexecute the operation.

1. Check the server you attempted to add to the site or the reserve Web server you attempted to add to the server group.
2. If there is more than one "FJapache" Web server in the configuration that was confirmed in step 1 above, remove it from the site, and then change the configuration so that there is only one.

## 7.13.53 ihs81376

---

**IHS: ERROR: ihs81376: An attempt was made to execute processes that cannot be executed at the same time.**

### Explanation

The process cannot be executed because the Web Server update processing has already been executed.

### System Action

Terminates the processing.

### User Action

Wait for a short period and then reexecute processing.

## 7.13.54 ihs81377

---

**IHS: ERROR: ihs81377: The specified Web server is illegal. Web server name:%s1(%s2)**

### Variable Information

%s1 = Web Server name

%s2 = Server Group name

### Explanation

The process cannot be executed because the specified Web Server (%s1) is illegal.

### System Action

Terminates the processing.

## User Action

Specify the correct Web Server name.

In the Interstage Management Console, click [Application Management] > [Interstage] > [Interstage Application Server] > [Services] > [Web Servers], refresh the list of Web Servers, and then check the site configuration.

## 7.13.55 ihs81378

---

**IHS: ERROR: ihs81378: The specified Web server definition does not exist. Web server name=%s1(%s2)**

### Variable Information

%s1 = Web Server name

%s2 = Server Group name

### Explanation

The definition for the specified the Web Server (%s1) does not exist.

### System Action

Terminates the processing.

### User Action

In the Interstage Management Console, click [Application Management] > [Interstage] > [Interstage Application Server] > [Services] > [Web Servers], refresh the list of Web Servers, and then check the site configuration.

## 7.13.56 ihs81382

---

**IHS: ERROR: ihs81382: The specified virtual host cannot be deleted because it is being used. Web server name=%s1(%s2) Host name=%s3 Function name=%s4**

### Variable Information

%s1 = Web Server name

%s2 = Server Group name

%s3 = Virtual host name

%s4 = Name of the function that is being used

### Explanation

The specified virtual host (%s3) cannot be deleted because it is being used. If function name (%s4) is "servlet", IJServer is shown.

### System Action

Terminates the processing.

### User Action

Cancel the association with the virtual host in function (%s4) and then reexecute processing. If function name (%s4) is "servlet", either delete the IJServer that uses the Web Server (%s1), or delete Web Server %s1 from the Web Servers that are targets of requests received by IJServer.

## 7.13.57 ihs81383

---

**IHS: ERROR: ihs81383: More than one Web server was created. Server name=%s1**

### Variable Information

%s1 = Server name

## Explanation

More than one Web Server was created for the Independent Server or server that you attempted to add to the server group.

## System Action

Terminates the processing.

## User Action

Take the following action and then reexecute the operation.

1. Check the Web Server you attempted to add to the site or the reserve server you attempted to add to the server group.
2. If more than one Web Server was created, delete all Web Servers except for "FJapache" Web Servers.

## 7.13.58 ihs81384

---

**IHS: ERROR: ihs81384: Illegal Web server name. Server name:%s1**

## Variable Information

%s1 = Server name

## Explanation

An attempt was made to add a Web Server that is not an "FJapache" Web Server to the site or server group. The Web Servers that are not "FJapache" Web Servers cannot be added to the site.

## System Action

Terminates the processing.

## User Action

Take the following action and then reexecute the operation.

1. Check the Web Server that you attempted to add to the site or the reserve server that you attempted to add to the server group.
2. If a Web Server that is not an "FJapache" Web Server was created, delete it and create an "FJapache" Web Server.

## 7.13.59 ihs81385

---

**IHS: ERROR: ihs81385: The Web server does not exist in the specified server group or server. Server name:%s1**

## Variable Information

%s1 = Server group name or Server name

## Explanation

The Web Server does not exist in the specified server group or server.

## System Action

Terminates the processing.

## User Action

Take the following action and reexecute.

1. Check the server that you attempted to add to the site, or the Web server on the reserve server that you attempted to add to the server group.
2. If the Web Server in step 1 does not exist, create a Web Server using the name "FJapache".

## 7.14 ihs81400 to ihs81499

---

This section details the messages numbered between ihs81400 and ihs81499.

### 7.14.1 ihs81400

---

**IHS: ERROR: ihs81400: The file could not be opened. file=%s1, errno=%s2, %s3**

#### Variable Information

%s1 = File name

%s2 = System call error number

%s3 = Error Details information

#### Explanation

The file could not be opened.

#### System Action

The command returns with an error.

#### User Action

Refer to the error number (%s2), and remove the cause of the failure to open the file (%s1).

### 7.14.2 ihs81401

---

**IHS: ERROR: ihs81401: The file could not be read. file=%s1, errno=%s2, %s3**

#### Variable Information

%s1 = File name

%s2 = System call error number

%s3 = Error Details information

#### Explanation

The file could not be read.

#### System Action

The command returns with an error.

#### User Action

Refer to the error number (%s2), and remove the cause of the failure to read the file (%s1).

### 7.14.3 ihs81402

---

**IHS: ERROR: ihs81402: The environment definition contains an error. %s1**

#### Variable Information

%s1 = Error Details information

#### Explanation

The environment definition file contains an error.

#### System Action

The command returns with an error.

#### User Action

Refer to the error details information (%s1) and check for syntax errors.

### 7.14.4 ihs81403

---

**IHS: ERROR: ihs81403: Memory could not be obtained. func=%s1, errno=%s2, %s3**

#### Variable Information

%s1 = Function name

%s2 = System call error number

%s3 = Error Details information

#### Explanation

Memory could not be obtained.

#### System Action

The command returns with an error.

#### User Action

Terminate any unnecessary programs that have been activated.

### 7.14.5 ihs81404

---

**IHS: INFO: ihs81404: The backup processing has commenced.**

#### Explanation

The backup process has commenced.

### 7.14.6 ihs81405

---

**IHS: INFO: ihs81405: The backup processing has been completed normally.**

#### Explanation

The backup process has been completed normally.

### 7.14.7 ihs81406

---

**IHS: ERROR: ihs81406: An error has been generated in the backup processing.**

#### Explanation

An error was generated during the backup process.

#### System Action

The command returns with an error.

#### User Action

Refer to the message output immediately before this message, and remove the cause of the error.

### 7.14.8 ihs81407

---

**IHS: INFO: ihs81407: The restore processing has commenced.**

## Explanation

The restore process has commenced.

### 7.14.9 ihs81408

---

**IHS: INFO: ihs81408: The restore processing has been completed normally.**

## Explanation

The restore process has been completed normally.

### 7.14.10 ihs81409

---

**IHS: ERROR: ihs81409: An error has been generated in the restore processing.**

## Explanation

An error was generated during the restore process.

## System Action

The command returns with an error.

## User Action

Refer to the message output immediately before this message, and remove the cause of the error.

### 7.14.11 ihs81410

---

**IHS: ERROR: ihs81410: The specification method of the option is incorrect.**

**Usage: ihsbackup -d directory [-t pass|all]**

## Explanation

The specification method of the option in the *ihsbackup* command is incorrect.

## System Action

The command returns with an error.

## User Action

Specify the option in the following syntax and reexecute the command.

```
ihsbackup -d directory [-t pass|all]
```

### 7.14.12 ihs81411

---

**IHS: ERROR: ihs81411: The specification method of the option is incorrect.**

**Usage: ihsrestore -d directory [-t pass|all] [-h host\_table]**

## Explanation

The specification method of the option in the *ihsrestore* command is incorrect.

## System Action

The command returns with an error.

## User Action

Specify the option in the following syntax and reexecute the command.

```
ihsrestore -d directory [-t pass|all] [-h host_table]
```

## 7.14.13 ihs81412

---

**IHS: ERROR: ihs81412: The user who executed the command does not have execution rights.**

### Explanation

The user who executed the command does not have execution rights.

### System Action

The command returns with an error.

### User Action

Reexecute the command with Administrator rights.

## 7.14.14 ihs81413

---

**IHS: ERROR: ihs81413: The environment definition file cannot be located. file=%s1, errno=%s2, %s3**

### Variable Information

%s1 = File name

%s2 = Error detail number

%s3 = Error details content

### Explanation

The environment definition file (%s1) cannot be located.

### System Action

The command returns with an error.

### User Action

Locate the environment definition file (%s1) and reexecute the command.

## 7.14.15 ihs81414

---

**IHS: ERROR: ihs81414: The specified storage directory cannot be located. dir=%s1, errno=%s2, %s3**

### Variable Information

%s1 = Directory name

%s2 = Error detail number

%s3 = Error details content

### Explanation

The storage directory (%s1) specified in the -d option cannot be located.

### System Action

The command returns with an error.

### User Action

Specify the correct storage directory in the -d option, and reexecute the command.

## 7.14.16 ihs81415

---

**IHS: ERROR: ihs81415: The path name of the directory to be created is too long. dir=%s1**

## Variable Information

%s1 = Directory name

## Explanation

The path name of the directory to be created is too long. The work directory (%s1) could not be created during the backup/export process under the storage directory because the directory path name was too long.

## System Action

The command returns with an error.

## User Action

Shorten the path name of the storage directory specified in the -d option and reexecute the command.

## 7.14.17 ihs81416

---

**IHS: ERROR: ihs81416: The directory could not be created. dir=%s1, errno=%s2, %s3**

## Variable Information

%s1 = Directory name

%s2 = Error detail number

%s3 = Error details content

## Explanation

The directory (%s1) could not be created.

## System Action

The command returns with an error.

## User Action

Refer to the error details content (%s3), and remove the cause of the error.

## 7.14.18 ihs81417

---

**IHS: ERROR: ihs81417: The backup resource management file cannot be located. file=%s1, errno=%s2, %s3**

## Variable Information

%s1 = File name

%s2 = Error detail number

%s3 = Error details content

## Explanation

The backup resource management file (%s1) cannot be located.

## System Action

The command returns with an error.

## User Action

Specify the directory containing the backup resource management file (%s1) in the -d option and reexecute the command.

## 7.14.19 ihs81418

---

---

**IHS: ERROR: ihs81418: Information on the backup resource management file has been destroyed. %s1****Variable Information**

%s1 = Error details information

**Explanation**

Information on the backup resource management file (*ihs\_info.ihs*) has been destroyed.

**System Action**

The command returns with an error.

**User Action**

Collect the backup resource file (*ihs\_info.ihs*) and diagnostic information with the *iscollectinfo* command, and then contact your SE (systems engineer).

---

**7.14.20 ihs81419**

---

**IHS: ERROR: ihs81419: The backup resource management file could not be created. file=%s1, errno=%s2, %s3****Variable Information**

%s1 = File name

%s2 = Error detail number

%s3 = Error details content

**Explanation**

The backup resource management file (%s1) could not be created. The path name of the backup resource management file may be too long.

**System Action**

The command returns with an error.

**User Action**

Shorten the path name of the storage directory specified in the -d option and reexecute the command.

If the message continues to be output, refer to the error details content (%s3), and remove the cause of the error.

---

**7.14.21 ihs81420**

---

**IHS: ERROR: ihs81420: The backup resource management file could not be written to. file=%s1, errno=%s2, %s3****Variable Information**

%s1 = File name

%s2 = Error detail number

%s3 = Error details content

**Explanation**

The backup resource management file (%s1) could not be written to.

**System Action**

The command returns with an error.

## User Action

Refer to the error details content (%s3), and remove the cause of the error.

### 7.14.22 ihs81421

---

**IHS: ERROR: ihs81421: The type of the destination drive for copying is not supported. drive=%s1, type=%s2**

#### Variable Information

%s1 = Drive name

%s2 = Drive type

#### Explanation

The type (%s2) of the destination drive (%s1) for copying is not supported in the resource restore/import process.

#### System Action

The command returns with an error.

#### User Action

Allocate the drive specified in the drive name (%s1) to the system's fixed drive, network drive, or REMOVABLE drive and reexecute the command.

### 7.14.23 ihs81422

---

**IHS: ERROR: ihs81422: The original file for copying cannot be located. file=%s1, errno=%s2, %s3**

#### Variable Information

%s1 = File name

%s2 = Error detail number

%s3 = Error details content

#### Explanation

The original file (%s1) for copying could not be located during the resource restore/import process.

#### System Action

The command returns with an error.

#### User Action

If the file specified in the file name (%s1) was deleted, locate the file manually and reexecute the command.

### 7.14.24 ihs81423

---

**IHS: ERROR: ihs81423: The required drive cannot be located at the destination for copying. drive=%s1**

#### Variable Information

%s1 = Drive name

#### Explanation

The drive (%s1) required for the resource restore/import process cannot be located.

#### System Action

The command returns with an error.

## User Action

Create the drive specified in the drive name (%s1) in the system and reexecute the command.

## 7.14.25 ihs81424

---

**IHS: ERROR: ihs81424: The file could not be copied. from=%s1, to=%s2, errno=%s3, %s4**

### Variable Information

%s1 = Name of the original file for copying

%s2 = Name of the destination file for copying

%s3 = Error detail number

%s4 = Error details content

### Explanation

The file could not be copied. The destination disk for copying may be full.

### System Action

The command returns with an error.

### User Action

Check that there is sufficient space in the destination disk for copying. Allocate sufficient space and reexecute the command.

If the message continues to be output, refer to the error details content (%s4), and remove the cause of the error.

## 7.14.26 ihs81425

---

**IHS: ERROR: ihs81425: Specification of the resource storage directory contains an error. dir=%s1**

### Variable Information

%s1 = Directory name

### Explanation

The error may be caused by one of the following:

- The resource storage directory (%s1) specified in the -d option contains an error.
- Files required for restore/import processing in the following directories in the resource storage directory (%s1) specified in the -d option do not exist.

**Windows32/64**

IHS

**Solaris32/64 Linux32/64**

FJSVihs

### System Action

The command returns with an error.

### User Action

Take one of the following actions:

- **Solaris32/64 Linux32/64**

Ensure the directory specified in the -d option does not contain the following errors:

- A relative path has been specified.

- A directory immediately below the root directory has been specified.

Specify the correct absolute path and reexecute the command.

- If there are no files in the directory (%s1) which was specified in the -d option, perform the backup and export processing again, and then reexecute the restoration and import process.

Note: Check whether there are differences between the export resources on the server originating the import and the resources copied to the destination server when importing with a V9 or later server. All resources, including files starting with a period (.) must be consistent so that all resources can be the target for operations such as compression and copy.

## 7.14.27 ihs81426

---

**IHS: ERROR: ihs81426: The resource storage directory could not be created. dir=%s1, errno=%s2, %s3**

### Variable Information

%s1 = Directory name

%s2 = Error detail number

%s3 = Error details content

### Explanation

The resource storage directory (%s1) could not be created.

### System Action

The command returns with an error.

### User Action

Move the resource storage directory to a disk with sufficient space and reexecute the command.

If the message continues to be output, refer to the error details content (%s3), and remove the cause of the error.

## 7.14.28 ihs81427

---

**IHS: ERROR: ihs81427: The resource storage directory has already been located. dir=%s1**

### Variable Information

%s1 = Directory name

### Explanation

The following directory is already located under the directory specified in the -d option.

**Windows32/64**

IHS

**Solaris32/64 Linux32/64**

FJSVihs

### System Action

The command returns with an error.

### User Action

The above directory is automatically created under the directory specified in the -d option during the resource backup process.

If the above directory is not required, delete it and reexecute the command.

If the above directory is required, move it to a storage medium, or change the directory specified in the -d option and reexecute the command

## 7.14.29 ihs81428

---

**IHS: ERROR: ihs81428: The directory under the resource storage directory cannot be located. dir=%s1, errno=%s2, %s3**

### Variable Information

%s1 = Directory name  
%s2 = Error detail number  
%s3 = Error details content

### Explanation

The following directory is not located under the directory specified in the -d option.

 Windows32/64

IHS

 Solaris32/64  Linux32/64

FJSVihs

### System Action

The command returns with an error.

### User Action

Specify the upper directory in the -d option and reexecute the command.

## 7.14.30 ihs81429

---

**IHS: ERROR: ihs81429: The saved resource could not be deleted due to a backup processing error. func=%s1, errno=%s2, %s3**

### Variable Information

%s1 = Function name  
%s2 = Error detail number  
%s3 = Error details content

### Explanation

An attempt was made to delete the saved resource due to a resource backup/export processing error, but an error occurred during the delete.

### System Action

The command returns with an error.

### User Action

The following directory has remained under the directory specified in the -d option. Delete the following directory and all sub directories.

 Windows32/64

IHS

 Solaris32/64  Linux32/64

FJSVihs

## 7.14.31 ihs81430

---

**IHS: ERROR: ihs81430: An internal error has been generated. %s1**

### Variable Information

%s1 = Error details information

### Explanation

An internal error has been generated.

### System Action

The command returns with an error.

### User Action

Refer to the error details information (%s1), and remove the cause of the error.

If the message continues to be output, collect diagnostic information with the *iscollectinfo* command, and then contact your SE (systems engineer).

## 7.14.32 ihs81431

---

**IHS: ERROR: ihs81431: Specification in the host convertible file contains an error. %s1**

### Variable Information

%s1 = Error details information

### Explanation

There is an error in the specification in the host covert file specified in the -h option.

### System Action

The command returns with an error.

### User Action

Refer to the error details information (%s1), and review the specification in the host convertible file.

## 7.14.33 ihs81432

---

**IHS: ERROR: ihs81432: The environment definition temporary file could not be written to. file=%s1, errno=%s2, %s3**

### Variable Information

%s1 = File name

%s2 = Error detail number

%s3 = Error details content

### Explanation

The environment definition temporary file (%s1) could not be written to.

### System Action

The command returns with an error.

### User Action

Refer to the error details content (%s3), and remove the cause of the error.

## 7.14.34 ihs81433

---

**IHS: ERROR: ihs81433: The name of the environment definition temporary file could not be changed. file=%s1, errno=%s2, %s3**

### Variable Information

- %s1 = File name
- %s2 = Error detail number
- %s3 = Error details content

### Explanation

The name of the environment definition temporary file (%s1) could not be changed.

### System Action

The command returns with an error.

### User Action

Refer to the error details content (%s3), and remove the cause of the error.

## 7.14.35 ihs81435

---

**IHS: ERROR: ihs81435: Processing cannot be performed because the Web server configuration is different.**

### Explanation

The error may be caused by one of the following:

- In stand-alone servers, the Interstage Single Sign-on repository server, authentication server, or business server environment was set up in the "FJapache" Web server.
- In Managed Servers, resources that are not "FJapache" Web server resources were included in the operating environment that was backed up or exported.

**Windows32/64**

- The restore or import destination installation directory for the Interstage HTTP Server may be different to the backup or export source directory configuration. Even if the directory configurations are the same, the installation directory short paths may be different.

### System Action

The command returns with an error.

### User Action

Take one of the following actions:

- In stand-alone servers, delete the Interstage Single Sign-on repository server, authentication sever, or business server environment of the "FJapache" Web server and then restore or import it again.
- In Managed Servers, restore or import the operating environment that was backed up or exported when there is just one "FJapache" Web server.

**Windows32/64**

- Check whether the restore or import destination installation directory of the Interstage HTTP Server is different to the backup or export source directory configuration according to the procedure shown below, and then perform the restore or import again.
  1. Check whether the ServerRoot directive value (the server root directory path) set in the backup or export source and the restore or import destination environment definition file (httpd.conf) is the same.

2. If the values in step 1 above are different, reinstall so that they match, making sure the short paths also match.

## 7.14.36 ihs81436

---

**IHS: ERROR: ihs81436: Failed to set up the Web server environment. : %s1**

### Variable Information

%s1 = Error details

### Explanation

Failed to create the Web Server in the restore/import target system.

### System Action

The command returns with an error.

### User Action

Collect diagnostic information using the *iscollectinfo* command, and then contact your SE (systems engineer).

## 7.14.37 ihs81437

---

**IHS: WARNING: ihs81437: A directive that cannot be converted was specified in the environment definition file : %s1**

### Variable Information

%s1 = Directive name

### Explanation

A directive (%s1) that cannot be converted was defined in the environment definition file for the backed up/exported resources.

### System Action

Continues processing.

### User Action

Check the definition of directive (%s1) in the environment definition file (httpd.conf) for the restore/import target system.

If the directive (%s1) is "Include", check the contents of the file that is set.

## 7.14.38 ihs81438

---

**IHS: ERROR: ihs81438: Failed to get the installation directory. : %s1**

### Variable Information

%s1 = Error details content

### Explanation

The installation directory could not be obtained. Either the Interstage HTTP Server is not installed, or the Web Server environment is incorrect.

### System Action

The command returns with an error.

### User Action

Reinstall Interstage HTTP Server.

## 7.14.39 ihs81439

---

**IHS: ERROR: ihs81439: Failed to write the file. : file=%s1, errno=%s2, %s3**

### Variable Information

%s1 = File name

%s2 = System call error number

%s3 = Error details content

### Explanation

The file (%s1) could not be written.

### System Action

The command returns with an error.

### User Action

Refer to the error number (%s2), resolve the cause of the failure to write file (%s1), and then reexecute the command.

## 7.14.40 ihs81440

---

**IHS: ERROR: ihs81440: Failed to close the file. : file=%s1, errno=%s2, %s3**

### Variable Information

%s1 = File name

%s2 = System call error number

%s3 = Error details content

### Explanation

The file (%s1) could not be closed.

### System Action

The command returns with an error.

### User Action

Refer to the error number (%s2), resolve the cause of the failure to close file (%s1), and then reexecute the command.

## 7.14.41 ihs81444

---

**IHS: INFO: ihs81444: Conversion processing for the environment definition file has started.**

### Explanation

Restore processing for resources in Interstage HTTP Server V6.0 or earlier has started.

## 7.14.42 ihs81445

---

**IHS: INFO: ihs81445: Conversion processing for the environment definition file was completed normally.**

### Explanation

Restore processing for resources in Interstage HTTP Server V6.0 or earlier was completed normally.

## 7.14.43 ihs81446

---

---

**IHS: ERROR: ihs81446: A problem occurred during conversion processing for the environment definition file.****Explanation**

A problem occurred during restore processing for resources in Interstage HTTP Server V6.0 or earlier.

**System Action**

The command returns with an error.

**User Action**

Refer to the message output before this message, fix the cause of the problem, and then reexecute the command.

---

**7.14.44 ihs81447**

---

**IHS: ERROR: ihs81447: Processing cannot be performed because another command is executing.****Explanation**

Processing cannot be performed because another command is executing.

**System Action**

The command returns with an error.

**User Action**

Check that the commands shown below have not been executed at the same time, wait until command processing is complete, and then reexecute the command.

- *ihscreate*
- *ihsconfig*
- *ihsdelete*
- *ihsstart*
- *ihsstop*
- *ihsbackup*
- *ihsrestore*
- *ijsdeployment*
- *ijsundeployment*

To prevent corruption of the Web Server environment, the above commands cannot be executed at the same time.

---

**7.14.45 ihs81448**

---

**IHS: ERROR: ihs81448: The Web server cannot be restored because Interstage HTTP Server is running. Web server name: %s1****Variable Information**

%s1 = Web Server name

**Explanation**

The Web Server (%s1) cannot be restored because the Web Server is running.

**System Action**

Stops command processing.

## User Action

The Web Server (%s1) is running. Stop the Web Server (%s1) and repeat the restore process.

## 7.14.46 ihs81449

---

**IHS: ERROR: ihs81449: The backup target Interstage HTTP Server resource file does not exist.: file=%s1, %s2**

### Variable Information

%s1 = File name

%s2 = Error details content

### Explanation

The backup target file %s1 does not exist.

### System Action

The command returns with an error.

### User Action

Check whether file (%s1) exists, and reexecute the command.

## 7.14.47 ihs81450

---

**IHS: ERROR: ihs81450: Failed to delete the Web server environment. %s1 %s2**

### Variable Information

%s1 = Error details content

%s2 = File path name or directory path name

Note: File path name or directory path name (%s2) may not be output.

### Explanation

Failed to delete the Web server "FJapache" in the restore or import target system.

If the error details content (%s1) is "Permission for a file or directory has not been set.", there are no permissions for the file or directory.

### System Action

The command returns with an error.

### User Action

If the error details content (%s1) is "Permission for a file or directory has not been set.", check whether the file (%s2) or a file in the directory (%s2) is open. Close the file if necessary, and then reexecute the command.

In all other cases, or if this message is still output after the above action is taken, collect diagnostic information using the *iscollectinfo* command, and then contact your SE (systems engineer).

## 7.15 ihs81500 to ihs81599

---

This section details the messages numbered between ihs81500 and ihs81599.

### 7.15.1 ihs81501

---

**IHS: ERROR: ihs81501: There is already a path with the same name as the named pipe. path=%s1 [%s2]**

## Variable Information

%s1 = Path name

%s2 = Web Server name

## Explanation

There is already a path with the same name as the named pipe.

## System Action

The Web Server start processing is canceled.

## User Action

Change the name of the file or directory in path (%s1) or delete it, and then restart the Web Server.

## 7.15.2 ihs81502

---

**IHS: ERROR: ihs81502: (%s1)%s2: Failed to create the named pipe. pipe=%s3 [%s4]**

## Variable Information

%s1 = Error detail number

%s2 = Error details content

%s3 = Named pipe

%s4 = Web Server name

## Explanation

Failed to create the named pipe (%s3).

## System Action

**Windows32/64**

The status display daemon closes.

The Web Server continues to operate.

**Solaris32/64 Linux32/64**

The Web Server start processing is canceled.

## User Action

Refer to the error details content (%s2), resolve the error, and then restart the Web Server.

## 7.15.3 ihs81503

---

**IHS: ERROR: ihs81503: (%s1)%s2: Failed to create the status display daemon. func=%s3 [%s4]**

## Variable Information

%s1 = Error detail number

%s2 = Error details content

%s3 = Function name

%s4 = Web Server name

## Explanation

Failed to create the status display daemon.

## System Action

The Web Server start processing is canceled.

## User Action

Refer to the error details content (%s2), resolve the error, and then restart the Web Server.

## 7.15.4 ihs81504

---

**IHS: ERROR: ihs81504: (%s1)%s2: Failed to open the named pipe. pipe=%s3 [%s4]**

### Variable Information

%s1 = Error detail number

%s2 = Error details content

%s3 = Named pipe

%s4 = Web Server name

### Explanation

Failed to open the named pipe (%s3).

### System Action

The status display daemon closes.

The Web Server continues to operate.

### User Action

Refer to the error details content (%s2), resolve the error, and then restart the Web Server.

## 7.15.5 ihs81505

---

**IHS: ERROR: ihs81505: An error occurred in status display processing. detail=%s1 [%s2]**

### Variable Information

%s1 = Detail information

%s2 = Web Server name

### Explanation

An error occurred in status display processing.

### System Action

The status display daemon closes.

The Web Server continues to operate.

### User Action

Reexecute the status display command (*ihsdisp*).

## 7.15.6 ihs81506

---

**IHS: ERROR: ihs81506: An internal error occurred during status display daemon initialization processing. detail=%s1**

### Variable Information

%s1 = Detail information

## Explanation

An internal error occurred during status indicator daemon initialization processing.

## System Action

The Web Server start processing is canceled.

## User Action

Collect diagnostic information using the *iscollectinfo* command, and then contact your SE (systems engineer).

## 7.15.7 ihs81511

---

**IHS: ERROR: ihs81511: The user that executed the command does not have the authority to execute it.**

## Explanation

The user who executed the command does not have execution rights.

## System Action

The command returns with an error.

## User Action

Reexecute the command with Administrator rights.

## 7.15.8 ihs81512

---

**IHS: ERROR: ihs81512: The Web Server (Interstage HTTP Server) was not installed normally.**

## Explanation

The Interstage HTTP Server has not been installed correctly.

## System Action

The command returns with an error.

## User Action

Reinstall the Interstage HTTP Server.

## 7.15.9 ihs81513

---

**IHS: ERROR: ihs81513: The "ihdisp" command option was specified incorrectly.  
Usage: ihdisp [-n WebServerName[,...]] [-a]**

## Explanation

The method used to specify the option in the *ihdisp* command is incorrect.

## System Action

The command returns with an error.

## User Action

Specify the option in the following syntax and reexecute the command.

```
ihdisp [-n WebServerName[,...]] [-a]
```

## 7.15.10 ihs81514

---

**IHS: ERROR: ihs81514: (%s1)%s2: Failed to open the lock file. file=%s3**

#### Variable Information

%s1 = Error detail number

%s2 = Error details content

%s3 = File name

#### Explanation

Failed to open the lock file.

#### System Action

The command returns with an error.

#### User Action

Refer to the error details content (%s2), resolve the error, and then restart the Web Server.

### 7.15.11 ihs81515

---

**IHS: ERROR: ihs81515: The "ihsdisp" command cannot be processed now because it is being processed for something else.**

#### Explanation

*ihsdisp* has already been executed by another process, and therefore, cannot be executed now.

#### System Action

The command returns with an error.

#### User Action

After the execution of *ihsdisp* terminates, reexecute the command.

### 7.15.12 ihs81516

---

**IHS: ERROR: ihs81516: There is already a file or directory with the same name as the named pipe. path=%s1**

#### Variable Information

%s1 = Path name

#### Explanation

There is already a file or directory with the same name as the named pipe.

#### System Action

The command returns with an error.

#### User Action

Change the name of the file or directory in the path (%s1) or delete it, start the Web Server, and then reexecute the command.

### 7.15.13 ihs81517

---

**IHS: ERROR: ihs81517: The Web Server (Interstage HTTP Server) did not start. [%s1]**

#### Variable Information

%s1 = Web Server name

## Explanation

The Web Server did not start.

## System Action

The command returns with an error.

## User Action

Start the Web Server, and then reexecute the command.

## 7.15.14 ihs81518

---

**IHS: ERROR: ihs81518: (%s1)%s2: An error occurred in the named pipe operation. func=%s3, pipe=%s4**

### Variable Information

%s1 = Error detail number

%s2 = Error details content

%s3 = File name

%s4 = Named pipe

Note: Error detail number (%s1) and Error details content (%s2) may not be output.

## Explanation

An error occurred in the named pipe operation.

## System Action

The command returns with an error.

## User Action

Take the following action.

- If a message numbered between ihs81500 and ihs81599 was output to the event log in Windows(R) (or the system log in Solaris/Linux), take the action indicated by the error, and then reexecute the command.
- If this message is output when the *ihsdisp* command is executed continuously, execute the *ihsdisp* command at intervals of at least 1 second. Note that there will be no impact on the Web Server operation even if this problem does occur, therefore it is not necessary to restart the Web Server.
- If error detail number %s1 and error details content %s2 are not output, reexecute the command.
- In cases other than those detailed above, refer to the error details content (%s2), resolve the error, and then reexecute the command.

If this message is still output after the above action is taken, collect diagnostic information using the *iscollectinfo* command, and then contact your SE (systems engineer).

## 7.15.15 ihs81519

---

**IHS: ERROR: ihs81519: Failed to get memory.**

### Explanation

Memory could not be acquired.

### System Action

The command returns with an error.

### User Action

Close unnecessary programs and then reexecute the command.

## 7.15.16 ihs81520

---

**IHS: ERROR: ihs81520: The Web server operating environment has not been created.**

### Explanation

The Web Server operating environment has not been created.

### System Action

The command returns with an error.

### User Action

Create the Web Server operating environment using the *ihscreate* command or the Interstage Management Console.

## 7.15.17 ihs81521

---

**IHS: ERROR: ihs81521: The specified Web server does not exist. [%s1]**

### Variable Information

%s1 = Web Server name

### Explanation

The specified Web Server %s1 does not exist.

### System Action

The command returns with an error.

### User Action

In the -n option, specify a name for the Web Server that identifies its operating status, and then reexecute the command.

## 7.15.18 ihs81522

---

**IHS: ERROR: ihs81522: Internal error. detail=%s1**

### Variable Information

%s1 = Details information

### Explanation

Internal error.

### System Action

The command returns with an error.

### User Action

Reexecute the command.

If this message is still output, collect diagnostic information using the *iscollectinfo* command, and then contact your SE (systems engineer).

# Chapter 8 Messages Beginning with 'IJSERVER1'

This chapter explains the messages starting with 'IJSERVER1'.

## 8.1 IJSERVER10000 to IJSERVER10099

---

### 8.1.1 IJSERVER10001

---

**INFO: IJSERVER10001: The backup is started.**

Explanation

IJSERVER resource backup processing has started.

### 8.1.2 IJSERVER10002

---

**INFO: IJSERVER10002: The backup was processed normally.**

Explanation

IJSERVER resource backup processing has completed successfully.

### 8.1.3 IJSERVER10003

---

**ERROR: IJSERVER10003: Failed to back up.**

Explanation

IJSERVER resource backup processing failed.

User Action

Take action according to the message output immediately before this message.

### 8.1.4 IJSERVER10004

---

**INFO: IJSERVER10004: The restoration is started.**

Explanation

IJSERVER resource restore processing has started.

### 8.1.5 IJSERVER10005

---

**INFO: IJSERVER10005: The restoration was processed normally.**

Explanation

IJSERVER resource restore processing has completed successfully.

### 8.1.6 IJSERVER10006

---

**ERROR: IJSERVER10006: Failed to restore.**

Explanation

IJSERVER resource restore processing failed.

User Action

Take action according to the message output immediately before this message.

## 8.1.7 IJServer10007

---

**INFO: IJServer10007: Servlet service materials picking command started.**

### Explanation

Extraction of the material for investigation of IJServer resources is started.

## 8.1.8 IJServer10008

---

**INFO: IJServer10008: Servlet service materials picking command stopped.**

### Explanation

Extraction of the material for investigation of IJServer resources was performed normally.

## 8.1.9 IJServer10009

---

**ERROR: IJServer10009: Failed in the acquisition of the investigation materials.**

### Explanation

Failed in the acquisition of the investigation materials.

### User Action

Take action according to the message output immediately prior to this message.

## 8.2 IJServer10100 to IJServer10199

---

### 8.2.1 IJServer10106

---

**ERROR: IJServer10106: No such file or directory. (%s)**

### Variable Information

%s = File or directory name

### Explanation

The file or directory indicated by %s is not found.

### Cause

The possible causes are:

- A nonexistent file or directory was specified in the argument.
- The essential file or essential directory required for processing does not exist.

### User Action

Ensure that the target file or directory exists.

### 8.2.2 IJServer10107

---

**ERROR: IJServer10107: Not enough memory.**

### Explanation

A memory shortage occurred.

#### User Action

Terminate all unnecessary applications. Also, by referring to the 'Tuning Guide', check whether the memory has enough capacity. If the memory capacity is too small, expand it.

### 8.2.3 IJServer10111

---

#### **ERROR: IJServer10111: Permission denied.**

#### Explanation

Execution authority is not granted.

#### User Action

Execute with administrator authority.

### 8.2.4 IJServer10112

---

#### **ERROR: IJServer10112: J2EE package has not been installed.**

#### Explanation

The J2EE package is not installed.

#### User Action

Install the J2EE package.

### 8.2.5 IJServer10113

---

#### **ERROR: IJServer10113: Failed to make the directory. (%s1) errno=%s2**

#### Variable Information

%s1 = Directory name

%s2 = Error number

#### Explanation

The directory indicated by %s could not be allocated.

#### Cause

1. Directory name is too long.
2. An I/O error occurred in the system.

#### User Action

1. Change the directory to which the IJServer resources are to be backed up.
2. Check the system for errors.

### 8.2.6 IJServer10114

---

#### **ERROR: IJServer10114: The path name is too long. (%s)**

#### Variable Information

%s = path name

#### Explanation

The length of the path indicated by %s exceeds the limit.

#### User Action

Change the path specified in the command argument and re-execute.

### 8.2.7 IJServer10115

---

#### **INFO: IJServer10115: Usage: ijsbackup -d Directory**

#### Explanation

The usage of the resource backup command is invalid.

#### User Action

Refer to the "Reference Manual (Command Edition)".

### 8.2.8 IJServer10116

---

#### **INFO: IJServer10116: Usage: ijsrestore -d Directory [-h host\_table]**

#### Explanation

The usage of the resource restore command is invalid.

#### User Action

Refer to the 'Reference Manual (Command Edition)'.

### 8.2.9 IJServer10122

---

#### **ERROR: IJServer10122: It failed in the set of the owner and group ID. (%s)**

#### Variable Information

%s = File name

#### Explanation

The file (%s) owner ID and group ID cannot be changed.

#### Cause

A file system error may have occurred.

#### System Action

Processing stops.

#### User Action

Check the file system for errors.

If the problem cannot be solved, contact a service engineer.

### 8.2.10 IJServer10124

---

#### **ERROR: IJServer10124: Failed to remove the backup resources. (%s)**

#### Variable Information

%s = Name of restore destination directory

#### Explanation

The IJServer resource indicted by %s that was previously restored could not be deleted.

## Cause

An I/O error occurred in the system.

## User Action

When Interstage is operating, stop Interstage and then execute this command.

Check the system for errors.

Delete the directory indicated by %s.

## 8.2.11 IJServer10125

---

**ERROR: IJServer10125: The resources of the IJServer have already exist. (%s)**

### Variable Information

%s = Name of the directory to which the resource is to be backed up or restored

### Explanation

The IJServer resource already exists in the directory indicated by %s.

### User Action

Change the directory to which the IJServer resource is to be backed up.

## 8.2.12 IJServer10126

---

**ERROR: IJServer10126: Failed to open the directory. (%s) errno=%d**

### Variable Information

%s = Directory name

%d = Error number

### Explanation

The directory indicated by %s could not be opened. (Error number: %d)

### Cause

An I/O error occurred in the system.

### User Action

Check the system for errors.

## 8.2.13 IJServer10127

---

**ERROR: IJServer10127: Failed to close the directory. (%s) errno=%d**

### Variable Information

%s = Directory name

%d = Error number

### Explanation

The directory indicated by %s could not be closed. (Error number: %d)

### Cause

An I/O error occurred in the system.

#### User Action

Check the system for errors.

### 8.2.14 IJServer10129

---

**ERROR: IJServer10129: The resources of the IJServer don't exist. (%s)**

#### Variable Information

%s = Directory name

#### Explanation

No IJServer resource exists in the directory indicated by %s.

#### User Action

Specify the directory to which the IJServer resource was backed up.

### 8.2.15 IJServer10131

---

**ERROR: IJServer10131: Failed to copy the file. (%s) errno=%d**

#### Variable Information

%s = File name

%d = Error number

#### Explanation

The file indicated by %s could not be copied.

#### Cause

An I/O error occurred in the system.

#### User Action

Check that there is sufficient empty space on the disk.

Check whether there is an error with the specification of the copy destination.

Check the system for errors.

### 8.2.16 IJServer10132

---

**ERROR: IJServer10132: Interstage package has not been installed.**

#### Explanation

The Interstage package is not installed.

#### User Action

Install the Interstage package.

### 8.2.17 IJServer10133

---

**ERROR: IJServer10133: Interstage HTTP Server has not been installed.**

#### Explanation

Interstage HTTP Server has not been installed.

#### User Action

Install the Interstage HTTP Server.

### 8.2.18 IJServer10134

---

**WARNING: IJServer10134: Cannot find (%s). This resource is not backed up or restored.**

#### Variable Information

%s = File name, Directory name

#### Explanation

The file or directory indicated by %s is not found. The file cannot be extracted, backed up or restored.

#### Cause

The file or directory indicated by %s does not exist at the specified location.

#### User Action

If the file or directory indicated by %s needs to be backed up or restored, place the file or directory at the specified location.

There is no need to take action if this message is output when resources are extracted.

### 8.2.19 IJServer10135

---

**ERROR: IJServer10135: The error occurred in IP address conversion processing.**

#### Explanation

The error occurred in IP address conversion processing.

#### Cause

Possible causes are as follows:

- There is not enough memory.

#### System Action

Processing stops.

#### User Action

- Close unnecessary applications and re-execute. If the error is still not resolved, increase the main memory or extend the swap area.
- If another message was output directly before this message, take action according to that message.

If the error is still not resolved, collect diagnostic information using the *iscollectinfo* command, and contact a service engineer.

### 8.2.20 IJServer10136

---

**ERROR: IJServer10136: JDK/JRE package has not been installed.**

#### Explanation

JDK/JRE package has not been installed.

#### System Action

Processing stops.

#### User Action

Perform again after installing JDK/JRE package.

## 8.2.21 IJServer10137

---

### **WARNING: IJServer10137: The timeout occurred.**

#### Explanation

A timeout occurred in IP address conversion processing.

#### Cause

The following causes can be considered.

- The shortage of a memory has occurred.
- The machine is overloaded.

#### User Action

Check whether IP address conversion was performed normally.

- When the IP address conversion did operate normally, user action is unnecessary.
- When the IP address conversion did not operate normally, re-execute IP address conversion processing after performing the following:
  - Stop other applications and decrease machine load.
  - Wait a short time before canceling a fault load state.

## 8.2.22 IJServer10138

---

### **ERROR: IJServer10138: System error. %s**

#### Variable Information

%s = Error information

#### Explanation

An error has occurred in the system.

#### System Action

Processing stops.

#### User Action

Re-execute the command.

If a message is output in the event log (system log), investigate the cause and re-execute the command.

If the above action does not solve the problem, collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

## 8.2.23 IJServer10139

---

### **ERROR: IJServer10139: Syntax error on line %d of (%s1) : %s2**

#### Variable Information

%d = The line in which the error was generated

%s1 = The definition file name specified by -h

%s2 = The contents of the corresponding line

#### Explanation

An error is in description of the definition file specified by -h.

## System Action

Processing stops.

## User Action

Refer to the Reference manual (command edition), and correctly describe the definition file specified by -h.

## 8.2.24 IJServer10140

---

**WARNING: IJServer10140: Description is not found. (%s)**

### Variable Information

%s = The definition file name specified by -h

### Explanation

There is no description in the definition file specified by -h.

### System Action

It is assumed that the description is not in the definition file, and processing is continued.

### User Action

Refer to the Reference manual (command edition), and correctly describe the definition file specified by -h.

## 8.2.25 IJServer10141

---

**INFO: IJServer10141: %s1 : before=%s2 after=%s3 server=%s4**

### Variable Information

%s1 = Type of the updated information

"IP address of IJServer": Updates to the IP address of a Servlet container

"IP address of WebServer": Updates to the IP address of a Web Server

"IP address that allows connection to the control port": Updates to the Access permission IP address of the Control Port

%s2 = The IP address before conversion

%s3 = The IP address after conversion

%s4 = IJServer WorkUnit name

### Explanation

The information about s was updated.

## 8.2.26 IJServer10142

---

**IJServer: ERROR: IJServer10142: Failed to get the common Java information. func=%s errno=%d**

### Variable Information

%s = Internal information

%d = Deatil code

### Explanation

Failed to get the common Java information.

### System Action

Processing stops.

## User Action

Take action according to the detail code.

Detail code	Action
1	Reinstall Interstage.
2	There was not enough memory. Re-execute the command.
3 to 5	Reinstall Interstage.
10	Collect diagnostic information using the <i>iscollectinfo</i> command, then contact a service engineer.iscollectinfo

## 8.3 IJServer10200 to IJServer10299

---

### 8.3.1 IJServer10201

---

**IJServer: INFO: IJServer10201: Starting a request distribution processing to a container**

#### Explanation

Starting a request distribution processing to a container.

### 8.3.2 IJServer10202

---

**IJServer: INFO: IJServer10202: Stopping a request distribution processing to a container**

#### Explanation

Stopping a request distribution processing to a container.

### 8.3.3 IJServer10203

---

**IJServer: INFO: IJServer10203: <IPaddress>:<Port>:<WebServerName> distribution was disabled**

#### Variable Information

<IPaddress> = IP address

<Port> = Port number

<WebServerName> = Web server name

#### Explanation

<IPaddress>:<Port>:<WebServerName> distribution was disabled

### 8.3.4 IJServer10204

---

**IJServer: INFO: IJServer10204: <IPaddress>:<Port>:<WebServerName> distribution was enabled**

#### Variable Information

<IPaddress> = IP address

<Port> = Port number

<WebServerName> = Web server name

#### Explanation

<IPaddress>:<Port>:<WebServerName> distribution was enabled.

## 8.3.5 IJServer10205

---

### IJServer: ERROR: IJServer10205: Specified <IPaddress>[:<Port>] does not exist

#### Variable Information

<IPaddress> = IP address

<Port> = Port number

#### Explanation

Specified <IPaddress>[:<Port>] does not exist.

#### User Action

Check whether the specified value is correct.

A valid IP address or ip-address:port-number can be confirmed with the distribution status display command (*ijsprintdispatchcont*). For details of the distribution status display command, see the "Reference Manual (Command Edition)".

## 8.3.6 IJServer10206

---

### IJServer: ERROR: IJServer10206: Process failed

#### Explanation

Process failed.

#### System Action

Processing stops.

#### User Action

Refer to the message that the command output to the Console to establish the cause of the error together with this message. Remove the cause of the error by referring to the message output together with this message.

## 8.3.7 IJServer10207

---

### IJServer: ERROR: IJServer10207: An error is in a parameter

#### Explanation

An error is in a parameter.

#### Cause

The possible causes are:

- Necessary parameters are insufficient or an invalid parameter is specified.
- The IP address format is incorrect.
- The port number is outside the range of 5001-65535.

#### System Action

Processing stops.

#### User Action

Specify the correct parameters and re-execute the command.

For details on the *ijsdispatchcont* command, refer to the Reference Manual (Command Edition).

## 8.3.8 IJServer10208

---

---

**IJServer: ERROR: IJServer10208: Required packages ( %s ) was not installed: Please perform again after installing a required package.**

Variable Information

%s = Name of the package not installed

Explanation

Required packages were not installed.

System Action

Processing stops.

User Action

Perform again after installing a required package.

This command requires the following packages: FJSVisjmx, FJSVihs, FJSVjs5, and FJSVj2ee.

---

### 8.3.9 IJServer10209

---

**IJServer: ERROR: IJServer10209: FJSVawjdk(JDK/JRE) was not installed: Please perform again after installing FJSVawjdk(JDK/JRE)**

Explanation

FJSVawjdk(JDK/JRE) was not installed.

System Action

Processing stops.

User Action

Perform again after installing FJSVawjdk(JDK/JRE).

---

### 8.3.10 IJServer10211

---

**IJServer: INFO: IJServer10211: WorkUnit for a display does not exist**

Explanation

WorkUnit for a display does not exist.

---

### 8.3.11 IJServer10212

---

**IJServer: ERROR: IJServer10212: JMX Management server connection failed**

Explanation

The Interstage JMX service connection failed.

System Action

Processing stops.

User Action

Remove the cause of the error by referring to the message output together with this message.

---

### 8.3.12 IJServer10213

---

**IJServer: ERROR: IJServer10213: Permission denied.**

#### Explanation

Permission denied.

#### User Action

Perform the process by a user who has administrator authority.

### 8.3.13 IJServer10214

---

#### **IJServer: ERROR: IJServer10214: Interstage package has not been installed.**

#### Explanation

Interstage package has not been installed.

#### User Action

Install Interstage.

### 8.3.14 IJServer10215

---

#### **IJServer: WARNING: IJServer10215: The timeout occurred.**

#### Explanation

The timeout was detected in distribution control, or display processing of a distribution state.

#### Cause

The following causes can be considered.

- The shortage of a memory has occurred.
- The machine is overloaded.

#### User Action

When this message is output by the *ijdispatchcont* command, check a distribution state by the *ijsprintdispatchcont* command.

- When the distribution state is operated normally, user action is unnecessary.
- When the distribution state is not operated normally, execute a *ijdispatchcont* command again after performing the following "Solution".

When this message is output by the *ijsprintdispatchcont* command, execute the distribution state display command again.

- When a state is displayed correctly, user action is unnecessary.
- When a state is not displayed, execute the *ijsprintdispatchcont* command again after performing the following "Solution".

#### Solution

1. Stop other applications and decrease machine load.
2. Wait to cancel a fault load state.

### 8.3.15 IJServer10216

---

#### **IJServer: ERROR: IJServer10216: The error occurred in timeout processing. errno=%d**

#### Variable Information

%d = Error number

#### Explanation

The error occurred in timeout processing.

#### System Action

Processing stops.

#### User Action

Collect the investigation information using the *iscollectinfo* command, then contact a service engineer.

### 8.3.16 IJServer10218

---

**IJServer: ERROR: IJServer10218: The error occurred in check processing of execution authority. errno=%d**

#### Variable Information

%s = Error number

#### Explanation

The error occurred in check processing of execution authority.

#### System Action

Processing stops. Distribution control, or presenting of distribution information, is not performed.

#### User Action

Collect the investigation information using the *iscollectinfo* command, then contact a service engineer.

### 8.3.17 IJServer10219

---

**IJServer: ERROR: IJServer10219: The command name to perform is different.**

#### Explanation

The command name to perform is changed.

#### User Action

Check a command name and perform by the right command name (*ijsdispatchcont*/*ijsprintdispatchcont*).

### 8.3.18 IJServer10220

---

**IJServer: ERROR: IJServer10220: The error occurred in distribution control or display processing of a distribution state. errno=%d**

#### Variable Information

%d = Error number

#### Explanation

The error occurred in distribution control or display processing of a distribution state.

#### System Action

Processing stops.

#### User Action

Collect the investigation information using the *iscollectinfo* command, then contact a service engineer.

### 8.3.19 IJServer10221

---

**IJServer: ERROR: IJServer10221: Failed to output log message. Memory is insufficient.**

## Explanation

Memory failed to be allocated during log message output.

## User Action

1. Check whether an unnecessary application is active. If one is active, stop it.
2. [Windows32/64](#)

Extend the main memory, or add the virtual memory (paging file).

[Solaris32/64](#) [Linux32/64](#)

Extend the main memory, or add the swap area.

If the problem is not solved after the above actions are taken, collect the investigation information using the *iscollectinfo* command, then contact a service engineer.

## 8.3.20 IJServer10222

---

**IJServer: INFO: IJServer10222: Pre-compile is complete: JSP File Number=%s1, Error File Number=%s2**

### Variable Information

%s1 = JSP File Number

%s2 = Error File Number

### Explanation

Pre-compile is complete.

### System Action

Processing stops.

### User Action

If an error occurs in a JSP, fix the error and then re-execute the command.

## 8.3.21 IJServer10223

---

**IJServer: ERROR: IJServer10223: An error occurred in pre-compile**

### Explanation

Processing stopped because an error occurred in pre-compile.

### System Action

Processing stops.

### User Action

Fix the error and then re-execute the command.

## 8.3.22 IJServer10224

---

**IJServer: ERROR: IJServer10224: Error in usage of command**

### Explanation

The command was used incorrectly.

### System Action

Processing stops.

#### User Action

Specify the correct option and then re-execute the command.

### 8.3.23 IJServer10225

---

**IJServer: ERROR: IJServer10225: The specified application was not deployed: Details=%s1**

#### Variable Information

%s1 = Specified application name

#### Explanation

Pre-compile cannot be performed because the specified application was not deployed.

#### System Action

Processing stops.

#### User Action

Specify the correct application, and then re-execute the command.

### 8.3.24 IJServer10226

---

**IJServer: ERROR: IJServer10226: The specified IJServer type cannot run Web applications: Details=%s1**

#### Variable Information

%s1 = Specified IJServer name

#### Explanation

The specified IJServer type cannot be used to run Web applications.

#### System Action

Processing stops.

#### User Action

Specify a valid IJServer type, and then re-execute the command.

### 8.3.25 IJServer10227

---

**IJServer: INFO: IJServer10227: The JSP file does not exist**

#### Explanation

The JSP file does not exist.

#### System Action

Processing stops.

#### User Action

Specify an application containing JSP files, and then re-execute the command.

### 8.3.26 IJServer10228

---

**IJServer: ERROR: IJServer10228: The specified IJServer does not exist: Details=%s1**

#### Variable Information

%s1 = Specified IJServer name

#### Explanation

The specified IJServer does not exist.

#### System Action

Processing stops.

#### User Action

Specify an existing IJServer, and then re-execute the command.

### 8.3.27 IJServer10229

---

**IJServer: INFO: IJServer10229: No applications have been deployed to the specified IJServer: Details=%s1**

#### Variable Information

%s1 = Specified IJServer name

#### Explanation

No applications have been deployed to the specified IJServer.

#### System Action

Processing stops.

#### User Action

Specify an IJServer containing applications, and then re-execute the command.

### 8.3.28 IJServer10230

---

**IJServer: INFO: IJServer10230: Pre-compile has started**

#### Explanation

Pre-compile has started.

#### System Action

Processing stops.

#### User Action

None.

### 8.3.29 IJServer10231

---

**IJServer: ERROR: IJServer10231: An error occurred in the executed command build processing.**

#### Explanation

An internal error occurred in command build.

#### System Action

Processing stops.

#### User Action

Collect diagnostic information using the *iscollectinfo* command and then contact a service engineer.

### 8.3.30 IJServer10232

---

**IJServer: ERROR: IJServer10232: No web applications have been deployed to the specified application: Details=%s1**

#### Variable Information

%s1 = Specified application name

#### Explanation

The specified application does not contain any Web applications.

#### System Action

Processing stops.

#### User Action

Specify a valid application and then re-execute the command.

### 8.3.31 IJServer10233

---

**IJServer: ERROR: IJServer10233: The specified IJServer has been created in V6.0: The function range of this IJServer is that of V6.0: Details=%s1**

#### Variable Information

%s1 = Specified IJServer

#### Explanation

The function you tried to execute is not available for IJServers created in V6.0.

#### System Action

Processing stops.

#### User Action

To use this function, migrate to a new IJServer environment.

### 8.3.32 IJServer10234

---

**IJServer: ERROR: IJServer10234: WebServer does not exist**

#### Explanation

WebServer does not exist

#### System Action

Processing stops.

#### User Action

Check whether the Web server exists.

### 8.3.33 IJServer10235

---

**IJServer: ERROR: IJServer10235: Failed to get the common Java information. func=%s errno=%d**

#### Variable Information

%s = Internal information

%d = Detail code

### Explanation

Failed to get the common Java information.

### System Action

Processing stops.

### User Action

Take action according to the detail code.

Detail code	Action
1	Reinstall Interstage.
2	There was not enough memory. Re-execute the command.
3 to 5	Reinstall Interstage.
10	Collect diagnostic information using the <i>iscollectinfo</i> command, then contact a service engineer.iscollectinfo

## 8.3.34 IJServer10236

---

**IJServer: ERROR: IJServer10236: WebServer <%s1> does not exist**

### Variable Information

%s1 = Web server name

### Explanation

The specified Web server does not exist.

### System Action

Processing stops.

### User Action

Check whether the specified Web server exists.

## 8.3.35 IJServer10237

---

**IJServer: ERROR: IJServer10237: Not enough memory.**

### Explanation

Not enough memory.

### System Action

Processing stops.

### User Action

Close all unnecessary applications. Additionally, refer to the "Tuning Guide" and check whether enough required memory has been reserved. If there is not enough memory, increase it.

## 8.4 IJServer11000 to IJServer11099

---

### 8.4.1 IJServer11001

---

**ERROR: IJServer11001: Initialization of a file went wrong. (%s) errno=%d**

#### Variable Information

%s = File name

%d = Error number

#### Explanation

The file indicated by %s could not be opened. (Error number: %d)

#### Cause

An I/O error occurred in the system.

#### User Action

Check the system for errors.

### 8.4.2 IJServer11002

---

**ERROR: IJServer11002: A package was not able to be found.**

#### Explanation

The Interstage package is not installed.

#### User Action

Install the Interstage package.

### 8.4.3 IJServer11003

---

**ERROR: IJServer11003: Memories are insufficient.**

#### Explanation

A memory shortage occurred.

#### User Action

Terminate all unnecessary applications. Also, by referring to the "Tuning Guide", check whether the memory has enough capacity. If the memory capacity is too small, expand it.

### 8.4.4 IJServer11004

---

**ERROR: IJServer11004: The copy of a file went wrong. (%s) errno=%d**

#### Variable Information

%s = File name

%d = Error number

#### Explanation

The system failed to copy the file indicated by %s. (Error number: %d)

#### Cause

An I/O error occurred in the system.

#### User Action

Check the system for errors.

### 8.4.5 IJServer11005

---

---

**ERROR: IJServer11005: The renewal of the time of a file went wrong. (%s) errno=%d****Variable Information**

%s = File name

%d = Error number

**Explanation**

An error occurred during setting the update time of the file indicated by %s. (Error number: %d)

**Cause**

Too many files are open.

**User Action**

Close unnecessary files.

---

**8.4.6 IJServer11006**

---

**ERROR: IJServer11006: The properties file contains invalid data. (%s) Line=%d****Variable Information**

%s = File name

%d = Line number

**Explanation**

The file (%s) contains data that is not "key = value".

**System Action**

Processing stops.

**User Action**

Collect the error log using the *iscollectinfo* command, and contact a systems engineer.

---

**8.4.7 IJServer11007**

---

**ERROR: IJServer11007: An #IFDEF or #IFNDEF block has not been closed. Line=%d****Variable Information**

%d = Line number(s)

**Explanation**

No "#ENDIF" is specified for "#IFDEF" or "#IFNDEF".

**System Action**

Processing stops.

**User Action**

Collect the error log using the *iscollectinfo* command, and contact a systems engineer.

---

**8.4.8 IJServer11008**

---

**ERROR: IJServer11008: Specify "#IFDEF" or "#IFNDEF" before "#ELSE". Line=%d****Variable Information**

%d = Line number

#### Explanation

Specify "#IFDEF" or "#IFDEF" before "#ELSE".

#### System Action

Processing stops.

#### User Action

Collect the error log using the *iscollectinfo* command, and contact a systems engineer.

### 8.4.9 IJServer11009

---

**ERROR: IJServer11009: Specify "#IFDEF" or "#IFDEF" before "#ENDIF". Line=%d**

#### Variable Information

%d : Error line number

#### Explanation

Neither "#IFDEF" nor "#IFDEF" is specified before "#ENDIF".

#### System Action

Processing stops.

#### User Action

Collect the error log using the *iscollectinfo* command, and contact a systems engineer.

### 8.4.10 IJServer11010

---

**ERROR: IJServer11010: The file could not be opened. (%s) errno=%d**

#### Variable Information

%s = File name

%d = Error number

#### Explanation

The specified file could not be opened.

#### Cause

An I/O error may have been generated by the system.

#### System Action

Processing stops.

#### User Action

Check if the file exists. If it does, check that a system error did not occur.

### 8.4.11 IJServer11011

---

**ERROR: IJServer11011: The file could not be read. (%s) errno=%d**

#### Variable Information

%s = File name

%d = Error number

#### Explanation

Data in the file could not be read.

#### Cause

An I/O error may have occurred.

#### System Action

Processing stops.

#### User Action

Check that a system error has not occurred.

### 8.4.12 IJServer11012

---

**ERROR: IJServer11012: .The file could not be written to. (%s) errno=%d**

#### Variable Information

%s = File name

%d = Error number

#### Explanation

Data could not be written to the file.

#### Cause

An I/O error has been generated in the system.

#### System Action

Processing stops.

#### User Action

Check that there is no system error.

### 8.4.13 IJServer11013

---

**ERROR: IJServer11013: A required definition doesn't exist. "%s1" of "%s2"**

#### Variable Information

%s1 = Definition name

%s2 = Definition file name

#### Explanation

Required data "%s1" is not contained in file "%s2".

#### System Action

Processing stops.

#### User Action

Collect the error log using the *iscollectinfo* command, and contact a systems engineer.

### 8.4.14 IJServer11014

---

**ERROR: IJServer11014: The value specified of definition (%s1) is too long. "file=%s2" "maximum length=%s3"**

### Variable Information

%s1 = Definition name

%s2 = Definition file name

%s3 = Maximum length that can be specified for the definition

### Explanation

The value specified for the definition (%s1) exceeded the maximum length that can be specified for the definition (%s3).

### System Action

Processing stops.

### User Action

Specify a value that is within the maximum length that can be specified for the definition.

## 8.4.15 IJServer11015

---

### **ERROR: IJServer11015: System error. %s**

### Variable Information

%s = Error information

### Explanation

An error occurred in the system.

### System Action

Processing stops.

### User Action

If a message is output in the event log (system log), investigate the cause and re-execute the command.

If the above action does not solve the problem, collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

## 8.4.16 IJServer11016

---

### **ERROR: IJServer11016: It failed in the set of the owner and group ID. (%s) errno=%d**

### Variable Information

%s = File name

%d = Error number

### Explanation

The owner ID and group ID of the file (%s) cannot be changed.

### Cause

An error may have occurred in the file system.

### System Action

Processing stops.

### User Action

Check the file system.

If the above action does not solve the problem, collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

## 8.4.17 IJServer11017

---

**ERROR: IJServer11017: Failed to change the mode of a file. (%s) errno=%d**

### Variable Information

%s = File name

%d = Error number

### Explanation

Failed to change the file (%s) authority.

### Cause

An error may have occurred in the file system.

### System Action

Processing stops.

### User Action

Check the file system.

If the above action does not solve the problem, collect diagnostic information using the *iscollectinfo* command, then contact a service engineer.

## 8.5 IJServer11100 to IJServer11199

---

### 8.5.1 IJServer11101

---

**IJServer: IJServer11101: thdump command(thdump.exe) does not exist,FullThreadDump is not outputted. Please check whether FJVM is used.**

### Explanation

A thread dump could not be output.

### System Action

The system continues processing.

### User Action

Check whether FJVM is used. If FJVM is not used, the above message is output.

### 8.5.2 IJServer11102

---

**IJServer: IJServer11102: Output of FullThreadDump may have gone wrong.**

### Explanation

A thread dump could not be output.

### Cause

Memory consumption may exceed the system limit or the system may be in high load state.

### System Action

The system continues processing.

## User Action

Do as follows:

- Decrease the value specified for the process multiplicity of IJServer WorkUnits, or decrease the number of IJServer WorkUnits that are active.
- Terminate unnecessary applications other than the IJServer used.
- By referring to "When Application Server is Used" in the "Tuning Guide," check whether a necessary size of free memory space is available.

If the size of free memory space is too small, expand the main memory capacity or swap area.

## 8.5.3 IJServer11103

### IJServer: IJServer11103: change owner failed. code=%d

#### Variable Information

%d = Error number

Error number	Cause
1	There was no authority to reference the IJServer resources.
2	The user name for starting IJServer was incorrect.
3	Failed to read the IJServer resources.
4	The path for the IJServer resources was too long. It is possible that an absolute path for application resources in the IJServer resources has exceeded the maximum length for the OS.
9	An internal error occurred.

#### Explanation

Failed to change the owner information for the IJServer resources The IJServer resources are stored in the following directory.

**Windows32/64**

```
J2EE common directory\ijserver\IJServer WorkUnit name
```

**Solaris32/64** **Linux32/64**

```
J2EE common directory/ijserver/IJServer WorkUnit name
```

#### Cause

Possible causes are shown below:

- There was no authority to reference the IJServer resources.
- There are no IJServer resources.
- The path indicating the IJServer resources was too long.
- An internal error occurred.

#### System Action

Processing stops.

#### User Action

Refer to the variable information to establish the problem, and restart the IJServer If the problem still cannot be resolved, use the *iscollectinfo* command to collect investigation information. Send the error information to a Systems Engineer.

## 8.6 IJServer12000 to IJServer12099

---

The messages with IJServer12000s are output by the Web server connector.

The log of a Web server connector can be referred by selecting [Services] > [Web Server] > "Web server name" > [Web Server Connector] > [View Log] tab on the Interstage Management Console.

Messages preceded by "(debug)" are debug information of the Web server connector. Debug information is output when "Yes" is selected for "Write debugging info to log" on the [Log Settings] tab, which can be displayed by selecting [Services] > [Web Server] > "Web server name" > [Web Server Connector] on the Interstage Management Console.

Unless stated otherwise, the "WorkUnit (IJServer)" in this section refers to both IJServer(J2EE) and IJServer cluster.

### 8.6.1 IJServer12001

---

**(error) IJServer12001: CA certificate has expired. Please get a new certificate. definitionName=<name> error=<error> details=<details> pid=<pid> tid=<tid>**

#### Variable Information

<name> = SSL definition name

<error> = Error number

<details> = Error detail number

<pid> = Web server process ID

<tid> = Web server thread ID

#### Explanation

The CA certificate registered in the certificate/key management environment has expired.

#### User Action

Obtain a new certificate and register it in the certificate/key management environment. Select the new CA Certificate Nickname on the [SSL Detailed Settings], which can be displayed by selecting [System] > [Security] > [SSL] > [SSL Configuration Name] on the Interstage Management Console.

Use the certificate/CRL registration command (scscenter) to register the certificate.

### 8.6.2 IJServer12002

---

**(error) IJServer12002: CA certificate revoked by Certificate Revocation List(CRL). Please check the certificate. definitionName=<name> error=<error> details=<details> pid=<pid> tid=<tid>**

#### Variable Information

<name> = SSL definition name

<error> = Error number

<details> = Error detail number

<pid> = Web server process ID

<tid> = Web server thread ID

#### Explanation

The CA certificate environment of the authority that issued the site certificate has been revoked by the certification authority.

#### User Action

Obtain a new CA certificate and register it in the certificate/key management environment. Select the new CA Certificate Nickname on the [SSL Detailed Settings], which can be displayed by selecting [System] > [Security] > [SSL] > [SSL Configuration Name] on the Interstage Management Console.

Use the certificate/CRL registration command (scscenter) to register the certificate.

### 8.6.3 IJServer12003

---

**(warn) IJServer12003: Cannot clean old log files. You must remove the old log file manually. pid=<pid> tid=<tid>**

#### Variable Information

<pid> = Web server process ID

<tid> = Web server thread ID

#### Explanation

Old log files cannot be deleted.

#### User Action

Because old log files may exhaust the free disk space, manually delete old log files beyond the specified number of generations. The setting of the number of generations can be checked on the [Log Settings] tab, which can be displayed by selecting [Services] > [Web Server] > "Web server name" > [Web Server Connector] on the Interstage Management Console.

### 8.6.4 IJServer12004

---

**(error) IJServer12004: Cannot connect to IJServer. The following are the most common causes of this error: IJServer stops or overloaded, Wrong IP address or port. serverName=<serverName> serverPort=<serverPort> host=<host> port=<port> uri=<uri> errno=<errno> pid=<pid> tid=<tid>**

#### Variable Information

<serverName> = Server name of Web server

<serverPort> = Port number of Web server

<host> = Host name of IJServer WorkUnit

<port> = Port number of IJServer WorkUnit

<uri> = Web browser request URL

<errno> = Error number

<pid> = Web server process ID

<tid> = Web server thread ID

#### Explanation

The Web server connector cannot be connected to the WorkUnit (IJServer).

#### Cause

Possible causes are as follows:

1. The WorkUnit (IJServer) is stopped.

This message is also output if a request is issued by the Web browser before the WorkUnit (IJServer) start sequence is completed.

When the process multiplicity of the WorkUnit (IJServer) is 2 or more, even if this message is output, no problem occurs because the request from the Web browser is processed by a process of another active WorkUnit (IJServer).

2. The WorkUnit (IJServer) is temporarily stopped because an error occurred in the Web application.

When this message is produced by abnormalities of a Web application, the message of EXTP4371 is outputted to an event log (system log). Moreover, in the case of Solaris and Linux, a core image file (core) is outputted to the current directory of a workunit (IJServer). However, when there is a factor which checks the output of core image files, such as a shortage of a disk domain, a core image file may not be outputted.

3. The WorkUnit process is forcibly stopped because of an application timeout.

4. When the Web server and WorkUnit (IJSERVER) run on different server machines, the IP address and port number of the Servlet container do not match those of the WorkUnit (IJSERVER).
5. **Windows32/64 Solaris32/64**  
A TCP/IP resource shortage occurred.
6. The WorkUnit (IJSERVER) is overloaded. A memory shortage may have occurred in the Java VM.
7. The number of requests that was received exceeded the maximum number of connections to the Servlet container.
8. The WorkUnit is in diminished operation.
9. When load distribution is being performed using IPCOM, IPCOM has stopped or the IPCOM setup is incorrect.
10. In other cases, an error may have occurred in the WorkUnit (IJSERVER).

### System Action

- If the Work Unit (IJSERVER) process concurrency is 1, the Web server connector interrupts connection to the WorkUnit (IJSERVER), and posts a message containing status code 500 (Internal Server Error) to the web browser.
- If the Work Unit (IJSERVER) process concurrency is 2 or more, the Web server connector ends connection to the Work Unit (IJSERVER) and attempts to connect to another Work Unit (IJSERVER).

If connection to all Work Units (IJSERVERs) fails, the Web server connector posts a message containing status code 500 (Internal Server Error) to the Web browser.

### User Action

1. If the WorkUnit (IJSERVER) is stopped, start it.
2. If the WorkUnit (IJSERVER) is stopped because of an error in a Web application, check Web applications for abnormalities. In particular, a Web application using the Java Native Interface (JNI) may have an abnormality. Moreover, when the core image file (core) outputs to the current directory of a WorkUnit (IJSERVER), investigate a core image file using a debugger.
3. Tune the Web server connector and Servlet container.
  - For IJSERVER(J2EE), refer to the "Tuning Guide", section "Tuning J2EE Applications" > "Tuning Servlet Containers"
  - For IJSERVER cluster, refer to the "Java EE Operation Guide", section "Java EE Function Tuning" > "Web Container Tuning".
4. If you are not using the multiserver management function, and the Web server and WorkUnit (IJSERVER) run on different server machines, check that the IP address and port number of the Servlet container are specified correctly. They can be checked at [Services] > [Web Server] > "Web server name" > [Web Server Connector] > [WorkUnit Name] > [Settings] on the Interstage Management Console.

The IP address and port number of the WorkUnit (IJSERVER) can be checked in the following pages:

- For IJSERVER(J2EE), in the Interstage Management Console [Servlet Container Settings], which can be displayed by selecting [WorkUnit] > [IJSERVER WorkUnit Name] > [Settings] > [Servlet Container Settings [Show]]
- For JSERVER cluster, HTTP\_LISTENER\_PORT of system property

5. **Windows32/64 Solaris32/64**  
Tune the TCP/IP parameters. For information on the tuning, refer to the "Tuning TCP/IP Parameters" in the "Tuning Guide".
6. If this error message is output frequently, increase the process multiplicity of the WorkUnit (IJSERVER) or check the system configuration (hardware and software) and reconfigure an overload-resistant system. Consider upgrading the CPU as needed.  
Check the event log (system log) or container log of IJSERVER. If there is insufficient Java VM memory ('OutOfMemoryError' is output), refer to "JDK/JRE Tuning" in the "Tuning Guide".
7. Tune the Web server connector and Servlet container.
  - For IJSERVER(J2EE), refer to the "Tuning Guide", section "Tuning J2EE Applications" > "Tuning Servlet Containers"
  - For IJSERVER cluster, refer to the "Java EE Operation Guide", section "Java EE Function Tuning" > "Web Container Tuning".

8. When the WorkUnit (IJServer) is in diminished operation, restore the WorkUnit (IJServer) according to the following procedure:
  - For IJServer(J2EE), in the Interstage Management Console select [WorkUnit] > [IJServer WorkUnit Name] > [Operation] tab to restore the WorkUnit (IJServer)
  - For IJServer cluster, stop the cluster, establish the cause of the automatic restart failure, then restart the cluster.
9. If IPCOM is not running, start IPCOM. If IPCOM is running, check whether the IPCOM and Web server connector setup are correct.
10. Check the WorkUnit (IJServer) log. If an error has occurred, take action according to the message.

## 8.6.5 IJServer12005

---

**(error) IJServer12005: Cannot connect to IJServer. IJServer stops or overloaded. SSL definition may differ from IJServer. definitionName=<name> serverName=<serverName> serverPort=<serverPort> host=<host> port=<port> uri=<uri> errno=<errno> pid=<pid> tid=<tid>**

### Variable Information

- <name> = SSL definition name
- <serverName> = Server name of Web server
- <serverPort> = Port number of Web server
- <host> = Host name of IJServer workunit
- <port> = Port number of IJServer workunit
- <uri> = Web browser request URL
- <errno> = Error number
- <pid> = Web server process ID
- <tid> = Web server thread ID

### Explanation

The Web server connector cannot be connected to the WorkUnit (IJServer).

### Cause

Possible causes are as follows:

1. The WorkUnit (IJServer) does not accept a connection request because the SSL definition differs from that on the WorkUnit (IJServer) or the certificate/key management environment contains an error. The required CA certificate may be invalid.
2. The WorkUnit (IJServer) is stopped.

This message is also output if a request is issued by the Web browser before the WorkUnit (IJServer) start sequence is completed.

- When the process multiplicity of WorkUnit (IJServer) is 2 or more

Even if this message is output, no problem occurs because the request from the Web browser is processed by a process of another active WorkUnit (IJServer).

3. The WorkUnit (IJServer) is temporarily stopped because an error occurred in the Web application.

When this message is output by the abnormalities of a Web application, the message of EXTP4371 is output to an event log (system log). Moreover, in the case of Solaris and Linux, a core image file (core) is output to the current directory of a WorkUnit (IJServer). However, when there is a factor which checks the output of core image files, such as a shortage of a disk domain, a core image file may not be output.

4. The WorkUnit process is forcibly stopped because of an application timeout.

5. **Windows32/64 Solaris32/64**

A TCP/IP resource shortage occurred.

6. The WorkUnit (IJServer) is overloaded. A memory shortage may have occurred in the Java VM.

7. The number of requests that was received exceeded the maximum number of connections to the Servlet container.
8. The WorkUnit is in diminished operation.
9. When load distribution is being performed using IPCOM, IPCOM has stopped or the IPCOM setup is incorrect.

### System Action

- If the Work Unit (IJSERVER) process concurrency is 1, the Web server connector interrupts connection to the workunit (IJSERVER), and posts a error message containing status code 500 (Internal Server Error) to the web browser.
- If the Work Unit (IJSERVER) process concurrency is 2 or more, the Web server connector ends connection to the Work Unit (IJSERVER) and attempts to connect to another Work Unit (IJSERVER).

If connection to all Work Units (IJSERVERs) fails, the Web server connector posts a message containing status code 500 (Internal Server Error) to the Web browser.

### User Action

1. Determine whether the SSL definitions of a Web server connector and a workunit (IJSERVER) differ, or the required certificate is effective, by the Interstage Management Console.
2. If the WorkUnit (IJSERVER) is stopped, start it.
3. If the WorkUnit (IJSERVER) is stopped because of an error in a Web application, check Web applications for abnormalities. In particular, a Web application using the Java Native Interface (JNI) may have an abnormality. Moreover, when the core image file (core) outputs to the current directory of a WorkUnit (IJSERVER), investigate a core image file using a debugger.
4. Tune the Web server connector and Servlet container.
  - For IJSERVER(J2EE), refer to the "Tuning Guide", section "Tuning J2EE Applications" > "Tuning Servlet Containers".
  - For IJSERVER cluster, refer to the "Java EE Operation Guide", section "Java EE Function Tuning" > "Web Container Tuning".
5. **Windows32/64** **Solaris32/64**  
Tune the TCP/IP parameters. For information on the tuning, refer to the "Tuning TCP/IP Parameters" in the "Tuning Guide".
6. If this error message is output frequently, increase the process multiplicity of the WorkUnit (IJSERVER) or check the system configuration (hardware and software) and reconfigure an overload-resistant system. Consider upgrading the CPU as needed.  
Check the event log (system log) or container log of IJSERVER. If there is insufficient Java VM memory ('OutOfMemoryError' is output), refer to "JDK/JRE Tuning" in the "Tuning Guide".
7. Tune the Web server connector and Servlet container.
  - For IJSERVER(J2EE), refer to the "Tuning Guide", section "Tuning J2EE Applications" > "Tuning Servlet Containers".
  - For IJSERVER cluster, refer to the "Java EE Operation Guide", section "Java EE Function Tuning" > "Web Container Tuning".
8. When the WorkUnit (IJSERVER) is in the diminished operation, restore the WorkUnit (IJSERVER) according to the following procedure:
  - For IJSERVER(J2EE), in the Interstage Management Console select [WorkUnit] > [IJSERVER WorkUnit Name] > [Operation] tab and restore the WorkUnit (IJSERVER)
  - For IJSERVER cluster, stop the cluster, establish the cause of the automatic restart failure, then restart the cluster.
9. If IPCOM is not running, start IPCOM. If IPCOM is running, check whether the IPCOM and Web server connector setup are correct.

## 8.6.6 IJSERVER12006

---

**(error) IJSERVER12006: Cannot connect to IJSERVER. Web Server Connector did a timeout. SSL definition may differ from IJSERVER. definitionName=<name> serverName=<serverName> serverPort=<serverPort> host=<host> port=<port> uri=<uri> errno=<errno> pid=<pid> tid=<tid>**

## Variable Information

<name> = SSL definition name

<serverName> = Server name of Web server

<serverPort> = Port number of Web server

<host> = Host name of IJServer workunit

<port> = Port number of IJServer workunit

<uri> = Web browser request URI

<errno> = Error number

<pid> = Web server process ID

<tid> = Web server thread ID

## Explanation

The Web server connector caused a timeout, and a connection could not be set up with the WorkUnit (IJServer).

## Cause

SSL may not be defined on the WorkUnit (IJServer).

## System Action

The Web server connector interrupted its attempt to connect to the WorkUnit (IJServer), and sent the error message status code 500 (Internal Server Error) to the web browser.

## User Action

Check whether the WorkUnit (IJServer) started in SSL mode. If not, restart the WorkUnit (IJServer) in SSL mode or disable the SSL definition in the Web server connector.

## 8.6.7 IJServer12007

---

**(error) IJServer12007: Cannot create socket. The per-process descriptor table is full or out of streams resources. errno=<errno> pid=<pid> tid=<tid>**

### Variable Information

<errno> = Error number

<pid> = Web server process ID

<tid> = Web server thread ID

### Explanation

A socket cannot be created because of a resource shortage.

### System Action

The Web server connector interrupted its attempt to connect to the WorkUnit (IJServer), and sent the error message status code 500 (Internal Server Error) to the web browser.

### User Action

Terminate other applications or increase the number of files that can be opened in the system.

## 8.6.8 IJServer12008

---

**(error) IJServer12008: Cannot load SSL library. lib="<filename>" func=<func> pid=<pid> tid=<tid>**

### Variable Information

- <filename> = SSL library path
- <func> = Name of the function in which an error occurred
- <pid> = Web server process ID
- <tid> = Web server thread ID

### Explanation

SSL library loading failed.

### Cause

Possible causes are as follows:

- The SSL library exists.
- An SSL library file contains an error.
- Permission to access the SSL library is not granted.

### User Action

Re-install Interstage.

## 8.6.9 IJServer12009

---

**(error) IJServer12009: Certificate has expired. Please get a new certificate. nickname=<nickname> definitionName=<name> error=<error> details=<details> pid=<pid> tid=<tid>**

### Variable Information

- <nickname> = Nickname of site certificate
- <name> = SSL definition name
- <error> = Error number
- <details> = Error detail number
- <pid> = Web server process ID
- <tid> = Web server thread ID

### Explanation

The site certificate specified in the SSL definition has expired.

### User Action

Obtain a new site certificate and register it in the certificate/key management environment. Select the new site Certificate Nickname on the [SSL Detailed Settings], which can be displayed by selecting [System] > [Security] > [SSL] > [SSL Configuration Name] on the Interstage Management Console.

Use the certificate/CRL registration command (scscenter) to register the certificate.

## 8.6.10 IJServer12010

---

**(error) IJServer12010: Certificate revoked by Certificate Revocation List(CRL). Please check the certificate. nickname =<nickname> definitionName=<name> error=<error> details=<details> pid=<pid> tid=<tid>**

### Variable Information

- <nickname> = Nickname of site certificate
- <name> = SSL definition name

<error> = Error number

<details> = Error detail number

<pid> = Web server process ID

<tid> = Web server thread ID

### Explanation

The site certificate specified in the SSL definition has been revoked by the certification authority

### User Action

Obtain a new site certificate and register it in the certificate/key management environment. Select the new site Certificate Nickname on the [SSL Detailed Settings], which can be displayed by selecting [System] > [Security] > [SSL] > [SSL Configuration Name] on the Interstage Management Console.

Use the certificate/CRL registration command (scsenter) to register the certificate.

## 8.6.11 IJServer12011

---

**(info) IJServer12011: Cleaning up the old log files. file="<filename>" pid=<pid> tid=<tid>**

### Variable Information

<filename> = Old log file name

<pid> = Web server process ID

<tid> = Web server thread ID

### Explanation

Cleaning up the old log files.

## 8.6.12 IJServer12012

---

**(error) IJServer12012: Internal error in SSL library. Please inform an engineer. definitionName=<name> error=<error> details=<details> pid=<pid> tid=<tid>**

### Variable Information

<name> = SSL definition name

<error> = Error number

<details> = Error detail number

<pid> = Web server process ID

<tid> = Web server thread ID

### Explanation

An error occurred in the SSL library.

### Cause

Possible causes are as follows:

1. Access to the Interstage certificate environment has not been authorised.
2. An internal error occurred in the SSL library.

### User Action

Perform the following tasks:

1. Assign "Full Control" permission for access to the Interstage certificate environment and permission to execute the Web Server.

2. Collect the check information using the *iscollectinfo* command, then contact a service engineer.

## 8.6.13 IJServer12013

---

**(error) IJServer12013: Invalid a CA certificate environment. definitionName=<name> error=<error> details=<details> pid=<pid> tid=<tid>**

### Variable Information

<name> = SSL definition name

<error> = Error number

<details> = Error detail number

<pid> = Web server process ID

<tid> = Web server thread ID

### Explanation

The CA certificate environment of the authority that issued the site certificate is invalid.

### Cause

Possible causes are as follows:

1. When <error> is 0x100047, the certificate route of the CA certificate could not be established.
2. When <error> is 0x100049, CA certificate verification failed.
3. In other cases, the CA certificate or certificate environment may contain an abnormality.

### User Action

In the case of 1 or 2, register the CA certificate of the certification authority which issued the site certificate, in the certificate/key management environment. If it does not solve the problem or if other causes are assumed, collect check information using the *iscollectinfo* command, and contact a service engineer.

Use the certificate/CRL registration command (scscenter) to register the certificate.

## 8.6.14 IJServer12014

---

**(error) IJServer12014: Invalid a certificate environment. nickname=<nickname> definitionName=<name> error=<error> details=<details> pid=<pid> tid=<tid>**

### Variable Information

<nickname> = Nickname of site certificate

<name> = SSL definition name

<error> = Error number

<details> = Error detail number

<pid> = Web server process ID

<tid> = Web server thread ID

### Explanation

The environment of the site certificate specified in the SSL definition is invalid.

### Cause

Possible causes are as follows:

1. When <error> is 0x100046, the certificate route of the site certificate could not be established.

2. When <error> is 0x10000C, verification of the site certificate and the CA certificate registered in the certificate/key management environment failed.
3. In other cases, the site certificate or certificate environment may contain an abnormality.

#### User Action

In the case of 1 or 2, register the CA certificate of the certification authority which issued the site certificate, in the certificate/key management environment. If it does not solve the problem or if other causes are assumed, collect check information using the *iscollectinfo* command, and contact a service engineer.

Use the certificate/CRL registration command (*scscenter*) to register the certificate.

## 8.6.15 IJServer12015

---

**(error) IJServer12015: Invalid a server certificate environment. definitionName=<name> error=<error> details=<details> pid=<pid> tid=<tid>**

#### Variable Information

<name> = SSL definition name

<error> = Error number

<details> = Error detail number

<pid> = Web server process ID

<tid> = Web server thread ID

#### Explanation

The site certificate environment on the WorkUnit (IJServer) is invalid.

#### Cause

Possible causes are as follows:

1. When <error> is 0x100045, the certificate route of the site certificate on the WorkUnit (IJServer) could not be established.
2. When <error> is 0x10001A, verification of the site certificate on the WorkUnit (IJServer) failed.
3. In other cases, the site certificate or certificate environment on the WorkUnit (IJServer) may contain an abnormality.

#### User Action

In the case of 1 or 2, register the CA certificate of the certification authority which issued the site certificate on the WorkUnit (IJServer), in the certificate/key management environment on the Web server connector.

If it does not solve the problem or if other causes are assumed, collect check information using the *iscollectinfo* command, and contact a service engineer.

Use the certificate/CRL registration command (*scscenter*) to register the certificate.

## 8.6.16 IJServer12016

---

**(info) IJServer12016: Loading of the Web Server Connector properties. conf="<filename>" pid=<pid> tid=<tid>**

#### Variable Information

<filename> = Property file of Web server connector

<pid> = Web server process ID

<tid> = Web server thread ID

#### Explanation

The property file of the Web server connector is loaded.

## 8.6.17 IJServer12017

---

**(error) IJServer12017: No space left on device. directory= "<dir>" pid=<pid> tid=<tid>**

### Variable Information

<dir> = Directory name

<pid> = Web server process ID

<tid> = Web server thread ID

### Explanation

The disk is short of free space.

### User Action

Check whether sufficient free disk space required for logging Web server connector messages has been prepared. The required size can be calculated from the log size and the number of log generations.

If the free disk space is insufficient, decrease the log size or the number of log generations.

## 8.6.18 IJServer12018

---

**(error) IJServer12018: Out of memory. pid=<pid> tid=<tid>**

### Variable Information

<pid> = Web server process ID

<tid> = Web server thread ID

### Explanation

Out of memory.

### User Action
