IJServer must have been created in Interstage version V7.0 or later for it to be operated in the site. If Interstage V6.0 or earlier was installed in the server you tried to add to the site is, this caused the failure.

### System Action

Terminates the processing

### User Action

Recreate IJServer in version V7.0 and add the server to the site again.

## 12.11.6 is21205

---

**IS: WARNING: is21205: The configuration setting could not be updated**

### Explanation

There is no definition item to change the contents.

### System Action

Terminates the processing

## 12.11.7 is21206

---

**IS: WARNING: is21206: There is no Managed Server to redeploy IJServer=%s1 Module=%s2**

### Variable Information

%s1: IJServer name

%s2: Module name

### Explanation

The retry process could not be executed because there is no Managed Server for the process that previously failed.

## System Action

Terminates the processing

## 12.11.8 is21207

---

**IS: ERROR: is21207: The client distribution data could not be downloaded IJServer=%s1 Module=%s2**

### Variable Information

%s1: IJServer name

%s2: Module name

### Explanation

Failed to process the EJB client distribution data download.

### System Action

Terminates the processing

### User Action

A message indicating the cause of the failure is output at the same time. Take the action indicated by the message.

## 12.11.9 is21208

---

**IS: ERROR: is21208: Failed to add the Managed Server to Server Group because Registered IJServer definition is different to the other IJServer=%s1 Managed Server=%s2**

### Variable Information

%s1 = IJServer name

%s2 = Managed Server name

### Explanation

The Managed Server cannot be added to the Server Group because the IJServer definition of the Server Group and the IJServer definition of the Managed Server to be added to the Server Group are not the same.

### System Action

Stops the processing.

### User Action

Check the IJServer definition of the Managed Server to be added to the Server Group.

## 12.11.10 is21209

---

**IS: ERROR: is21209: Failed to delete Web server connector log file because Web server does not stop. Web server=%s**

### Variable Information

%s = Web server name

### Explanation

Deletion of the log file failed because the Web server had not stopped

### System Action

Stops the processing.

## User Action

Reexecute processing after stopping the Web server.

## 12.11.11 is21210

---

### **IS: ERROR: is21210: The activation processing has failed IJServer=%s**

#### Variable Information

%s = IJServer name

#### Explanation

Activation processing failed in all Managed Servers.

#### System Action

Stops the processing.

#### User Action

A message indicating the cause of the error is output at the same time. Take the action shown in the message, and reexecute activation processing.

## 12.11.12 is21211

---

### **IS: ERROR: is21211: The activation processing has failed in some parts IJServer=%s**

#### Variable Information

%s = IJServer name

#### Explanation

Activation processing failed in some of the Managed Servers.

#### System Action

Stops the processing.

#### User Action

A message indicating the cause of the error is output at the same time. Take the action shown in the message, and reexecute activation processing.

## 12.11.13 is21212

---

### **IS: WARNING: is21212: The Managed Server for the line could not be found Managed Server=%s1 No=%s2**

#### Variable Information

%s1 = Managed Server name

%s2 = Sequence number in the Server Group

#### Explanation

Since the line between the Servlet and the EJB container was not connected among some Managed Servers, it was not able to process.

## System Action

Processing is continued by other Managed Servers.

## 12.11.14 is21214

---

**IS: ERROR: is21214:Failed to rollback Web server connector after failed process of being added the Managed Server to the Server Group Server Group IJServer=%s1 Server=%s2 information=%s3**

### Variable Information

%s1 = IJServer name

%s2 = Managed Server name

%s3 = Error information

### Explanation

Web server connector definition rollback processing failed after the attempt to add the Managed Server to the Server Group failed.

### System Action

Stops the processing.

### User Action

Refer to the error information, and establish the cause of the failure.

## 12.11.15 is21215

---

**IS: ERROR: is21215:Failed to rollback Web server connector after failed process of being deleted the Managed Server to the Server Group Server Group IJServer=%s1 Server=%s2 information=%s3**

### Variable Information

%s1 = IJServer name

%s2 = Managed Server name

%s3 = Error information

### Explanation

Web server connector definition rollback processing failed after the attempt to delete the Managed Server from the Server Group failed.

### System Action

Stops the processing.

### User Action

Refer to the error information, and establish the cause of the failure.

## 12.11.16 is21216

---

**IS: ERROR: is21216:The IJServer definitions on the server are not located on the Server Group Server=%s**

### Variable Information

%s = Managed Server name

## Explanation

The attempt to add the server to the Server Group failed because the IJServer definitions on the server are not in the Server Group.

## System Action

Stops the processing.

## User Action

Backup/restore the Managed Server to be added to the Server Group, and then reexecute.

## 12.11.17 is21217

---

**IS: ERROR: is21217:Can not delete all Managed Server from the ServerGroup because IJServer extends Allocation destination Server Group=%s1 IJServer=%s2**

## Variable Information

%s1 = Server Group name

%s2 = IJServer name over two or more allocation destinations

## Explanation

This message displays when:

- A Managed Server in a Server Group is being deleted
- The Server Group to which the Managed Server belongs is the allocation destination for the IJServer, and
- The IJServer extends across more than allocation destination.

In this case, all Managed Servers cannot be deleted from the Server Group.

## System Action

Stops the processing.

## User Action

Delete the IJServer displayed in variable information %s2, and perform the processing again.

## 12.11.18 is21218

---

**IS: ERROR: is21218:Can not delete the Managed Server from the Site because IJServer extends Allocation destination Server=%s1 IJServer=%s2**

## Variable Information

%s1 = Server Group name

%s2 = IJServer name over two or more allocation destinations

## Explanation

This message displays when:

- A Managed Server in a Server Group is being deleted
- The Server Group to which the Managed Server belongs is the allocation destination for the IJServer, and
- The IJServer extends across more than allocation destination.

In this case, all Managed Servers cannot be deleted from the Server Group.

## System Action

Stops the processing.

## User Action

Delete the IJServer displayed in variable information %s2, and perform the processing again.

## 12.11.19 is21219

---

**IS: ERROR: is21219: The specified execution class has been deleted IJServer=%s1 Executionclass=%s2**

### Variable Information

%s1 = IJServer name

%s2 = Executionclass

### Explanation

Processing failed because delete processing for the specified executable class was already executed.

## System Action

Stops the processing.

## User Action

Check the executable class name and then reexecute.

If the executable class name is correct, delete the target executable class, recreate the executable class, and then reexecute processing.

## 12.11.20 is21220

---

**IS: ERROR: is21220: The processing cannot be executed because environment setup for the other execution class has failed IJServer=%s1 Execution class1=%s2 Execution class=%s3**

### Variable Information

%s1 = IJServer name

%s2 = Name of the execution class in which the configuration change previously failed

%s3 = Name of the execution class for which processing according to this operation could not be executed

### Explanation

Processing could not be executed because the configuration change of another execution class (add execution class, change execution class, or delete or execution class) failed.

## System Action

Stops the processing.

## User Action

Establish the cause of the failure that occurred in the configuration change of the other execution class. Make sure that the configuration change is correct, and then reexecute processing.

## 12.11.21 is21221

---

**IS: ERROR: is21221: Failed to refresh the module information IJServer=%s**

## Variable Information

%s = IIServer

## Explanation

Failed to refresh the module information.

## System Action

Stops processing.

## User Action

Refer to the message output in the Interstage Management Console message window to establish the cause of the failure to refresh the module information, and then execute again.

## 12.11.22 is21222

---

### **IS: ERROR: is21222: Cannot process because there is a Managed Server in for which the Site environment settings failed**

## Explanation

The operation failed because the Application Management tab of the Managed Server Interstage Management Console was clicked for an application on the IIServer deployed to the Managed Server for which the Site environment settings failed.

## System Action

Stops processing.

## User Action

Determine why the Site environment settings could not be made, check that the application operation type was changed correctly, and then reexecute.

## 12.11.23 is21223

---

### **IS: INFO: is21223: Site information change processing has started**

## Explanation

Site information change processing has started.

## 12.11.24 is21224

---

### **IS: INFO: is21224: Site information change processing completed normally**

## Explanation

Site information change processing completed normally.

## 12.11.25 is21225

---

### **IS: ERROR: is21225: An error occurred in Site information change processing**

## Explanation

Site information change processing failed.

### System Action

The command exits abnormally.

### User Action

Refer to the message output before this message to establish the cause of the error, and then execute the command again.

## 12.11.26 is21226

---

**IS: ERROR: is21226: There is no section FILE=%s1 SECTION=%s2**

### Variable Information

%s1 = Site information configuration file

%s2 = Section

### Explanation

Section (%s2) is not specified in the Site information configuration file (%s1).

### System Action

Stops processing.

### User Action

At least one section must be specified in the Site information configuration file. The following sections can be specified:

- [ManageIp]
- [BusinessIp]
- [BusinessHost]

Specify the section in the Site information configuration file, and then execute processing again.

## 12.11.27 is21227

---

**IS: ERROR: is21227: The section was repeated FILE=%s1 LINE=%s2**

### Variable Information

%s1 = Site information configuration file

%s2 = Line

### Explanation

The section specified at line (%s2) of the Site information configuration file (%s1) is repeated at least twice.

### System Action

Stops processing.

### User Action

Delete sections that are repeated, and reexecute processing.

## 12.11.28 is21228

---

**IS: ERROR: is21228: There was a section that cannot be configured FILE=%s1 LINE=%s2**

## Variable Information

%s1 = Site information configuration file

%s2 = Line

## Explanation

The section at line (%s2) of the Site information configuration file (%s1) cannot be configured. Specify the [ManageIP], [BusinessIP], and [BusinessHost] sections.

## System Action

Stops processing.

## User Action

Modify the sections in the Site information configuration file as appropriate, and reexecute processing.

## 12.11.29 is21229

---

**IS: ERROR: is21229: The format of the specified file is incorrect FILE=%s1 LINE=%s2**

## Variable Information

%s1 = Site information configuration file

%s2 = Line

## Explanation

The contents at line (%s2) of the Site information configuration file are incorrect.

## System Action

Stops processing.

## User Action

Check the contents at line (%s2) of the Site information configuration file. Possible causes are as follows:

- The IP address was entered in a non-IPv4 format
- '>' was omitted
- 256 or more characters were specified in the Hostname

Correct line (%s2) of the Site information configuration file, and then execute processing again.

## 12.11.30 is21230

---

**IS: ERROR: is21230: The format of the specified file is incorrect FILE=%s1 LINE=%s2**

## Variable Information

%s1 = Site information configuration file

%s2 = Line

## Explanation

The IP address or Hostname in the Site information configuration file is repeated:

1. A prechange IP address or Hostname cannot be changed to two post-change IP addresses or Hostnames in the same section.
2. Multiple prechange IP addresses or Hostnames cannot be changed to one post-change IP address or Hostname in the same section.

Possible causes are as follows:

- The IP address was entered in a non-IPv4 format
- '>' was omitted
- 256 or more characters were specified in the Hostname

#### System Action

Stops processing.

#### User Action

Check the information at line(%s2) of the Site information configuration file, make necessary corrections and reexecute.

## 12.11.31 is21231

---

**IS: ERROR: is21231: The IP address/Hostname before the change is not in the Site information FILE=%s1 VALUE=%s2**

#### Variable Information

%s1 = Site information configuration file

%s2 = Section, and IP address or Hostname before the change

#### Explanation

The prechange IP address or Hostname is not in the Site information file.

#### System Action

Stops processing.

#### User Action

Specify the prechange IP address or Hostname of the Managed Server in the Site information file, and then execute processing again.

## 12.11.32 is21232

---

**IS: ERROR: is21232: The Server Group specified on the server used to deploy the IJServer could not be operated IJServer=%s1 Server Group=%s2**

#### Variable Information

%s1 = IJServer

%s2 = Server Group

#### Explanation

The Server Group specified from the server used to deploy the IJServer does not contain Managed Servers, so the Server Group can not be operated.

#### System Action

Stops processing.

#### User Action

Use repurposing to add the Managed Server to the Server Group, and then execute processing again.

## 12.11.33 is21233

---

**IS: ERROR: is21233: Cannot process because the function is unsupported IJServer=%s**

### Variable Information

%s = IJServer

### Explanation

The function used is not supported in the installed Interstage version.

### System Action

Stops processing.

### User Action

Check that the function is supported in the installed Interstage version.

## 12.11.34 is21234

---

**IS: ERROR: is21234: Cannot process because the application operation type is management operation mode**

### Explanation

This function cannot be used because the application operation type is management operation mode. Application operation type stand-alone operation mode is required

### System Action

Stops processing.

### User Action

Change the application operation type to stand-alone operation mode, and then execute processing again.

## 12.11.35 is21235

---

**IS: ERROR: is21235: Cannot process because of a Site environment settings error**

### Explanation

The attempt to change the Site environment settings of the Managed Server specified for deployment failed. As a result, the attempt to operate the J2EE application from the Admin Server failed.

### System Action

Stops processing.

### User Action

Determine why the application operation type could not be changed, fix the problem, and then execute processing again.

## 12.11.36 is21236

---

**IS: ERROR: is21236: The module configuration in the Server Group does not match Server Group=%s1 Managed Server=%s2 IJServer=%s3 Module configuration=%s4**

### Variable Information

%s1: Server Group  
%s2: Managed Server  
%s3: IJServer  
%s4: Module configuration

### Explanation

The module configuration of one Managed Server (%s2) does not match with some of other Managed Servers in same Server Group (%s1). .

### System Action

Stops processing.

### User Action

Correct to ensure the configuration (%s4) matches, and then execute processing again.

## 12.11.37 is21238

---

**IS: ERROR: is21238: The Web Server connector configuration in the Server Group does not match Server Group=%s1 Managed Server=%s2 IJServer=%s3**

### Variable Information

%s1: Server Group  
%s2: Managed Server  
%s3: IJServer

### Explanation

The Web Server connector configuration of one Managed Server does not match with some other Managed Servers in same Server Group

### System Action

Stops processing.

### User Action

Make sure that the Web Server connector configuration of the Managed Server matches with other Managed Servers in same Server Group, and then execute processing again.

## 12.11.38 is21240

---

**IS: ERROR: is21240: The Web Server connector configuration is invalid IJServer=%s**

### Variable Information

%s = IJServer

### Explanation

The operation failed because the Web Server connector configuration is invalid.

### System Action

Stops processing.

## User Action

Check the Web Server connector configuration, take either of the following actions described below, and then execute processing again:

- Register the Web Server connector Web application as the Web application deployed to the Servlet container again.
- Deploy the same Web application to the Servlet container as for the Web Server connector.

## 12.11.39 is21241

---

**IS: ERROR: Could not be deployed by the specified directory: Directory=%s**

### Variable Information

%s = Directory

### Explanation

The application could not be deployed to the specified directory.

### System Action

Stops processing.

### User Action

Check the specified directory, and then execute processing again.

## 12.11.40 is21242

---

**IS: ERROR: is21242: Cannot process because the application operation type is a stand-alone operation mode**

### Explanation

The function cannot be used because the application operation type is a stand-alone operation mode.

### System Action

Stops processing.

### User Action

If the application operation type is set for stand-alone operation mode, use the Managed Server Interstage Management Console or commands to execute processing. Alternatively, change the application operation type to management operation mode, and then execute processing again.

## 12.11.41 is21243

---

**IS: ERROR: is21243: The number of modules in the servers in the Server Group does not match Server Group=%s1 Managed Server=%s2 IJServer=%s3**

### Variable Information

%s1: Server Group

%s2: Managed Server

%s3: IJServer

## Explanation

The operation failed because the number of modules in the servers in one Server Group does not match with the other Server Group.

## System Action

Stops processing.

## User Action

Make sure that the number of modules in the servers in the Server Group match, and then execute processing again.

## 12.11.42 is21244

---

**IS: ERROR: is21244: The module configuration does not match Server Group=%s1 IJServer=%s2 Module configuration=%s3**

## Variable Information

%s1: Server Group

%s2: IJServer

%s3: Module configuration

## Explanation

The operation failed because the module configurations in one ServerGroup of a multilevel IJServer does not match with another ServerGroup of the same multilevel IJServer .

## System Action

Stops processing.

## User Action

Make sure that the number of modules in the servers in the Server Group match, and then execute processing again.

## 12.11.43 is21245

---

**IS: ERROR: The Server Group specified on the server used to deploy the IJServer could not be operated Server Group=%s**

## Variable Information

%s = Server Group

## Explanation

The Server Group specified on some of the servers used to deploy the IJServer does not contain a Managed Server, so the Server Group could not be operated.

## System Action

Stops processing.

## User Action

Use repurposing to add the Managed Server to the Server Group, and then execute processing again.

## 12.11.44 is21246

---

---

**IS: ERROR: The versions in the servers used to deploy IIServers do not match****Explanation**

The Interstage versions of the servers used to which the IIServer is deployed do not match.

**System Action**

Stops processing.

**User Action**

Make the version of Interstage all the same among servers to which the IIServer is deployed.

## 12.11.45 is21247

---

**IS: ERROR: The value specified for the control port is already being used: Specify a port number that is not being used: Specified Value=%s****Variable Information**

%s = Specified port number

**Explanation**

The value specified for the control port is already being used.

**System Action**

Processing stops.

**User Action**

Specify a port number that is not being used.

## 12.11.46 is21248

---

**IS: ERROR: Deletion of pre-migration Web server connector definitions failed. IIServer=%s1 Deployment destination =%s2****Variable Information**

%s1: IIServer name

%s2: Deployment destination name

**Explanation**

Deletion of the pre-migration Web server connector definitions failed at all Managed Servers.

**System Action**

Processing stops.

**User Action**

A message indicating the cause of this failure is displayed. Take the action described in the message.

## 12.11.47 is21249

---

**IS: ERROR: Deletion of some pre-migration Web server connector definitions failed. IIServer=%s1 Deployment destination =%s2**

#### Variable Information

%s1: IIServer name

%s2: Deployment destination name

#### Explanation

Deletion of the pre-migration Web server connector definitions failed at some Managed Servers.

#### System Action

Processing stops.

#### User Action

A message indicating the cause of this failure is displayed. Take the action described in the message.

## 12.11.48 is21250

---

**IS: ERROR: Creation of migration destination Web server connector definitions failed. IIServer=%s1  
Deployment destination=%s2**

#### Variable Information

%s1: IIServer name

%s2: Deployment destination name

#### Explanation

Definitions for migration destination Web server connectors failed to be created on all Managed Servers.

#### System Action

Processing stops.

#### User Action

A message indicating the cause of this failure is displayed. Take the action described in the message.

## 12.11.49 is21251

---

**IS: ERROR: Creation of some migration destination Web server connector definitions failed. IIServer=  
%s1 Deployment destination=%s2**

#### Variable Information

%s1: IIServer name

%s2: Deployment destination name

#### Explanation

Definitions for migration destination Web server connectors failed to be created on some Managed Servers.

#### System Action

Processing stops.

#### User Action

A message indicating the cause of this failure is displayed. Take the action described in the message.

## 12.11.50 is21253

---

**IS: ERROR: The operation is not possible because migration processing failed for the specified IJServer Web server connector. IJServer=%s**

### Variable Information

%s = IJServer name

### Explanation

The processing failed because the Web server connector migration processing performed for the specified IJServer failed.

### System Action

Processing stops.

### User Action

A message indicating the cause of this failure is displayed. Take the action described in the message.

## 12.11.51 is21254

---

**IS: ERROR: Servlet container and EJB container definitions do not match. Servlet container=%s1 EJB container=%s2 Definition type=%s3 Definition name=%s4 Details=%s5**

### Variable Information

%s1: Servlet container IJServer name

%s2: EJB container IJServer name

%s3: Type of definition that does not match

%s4: Name of definition that does not match

%s5: Attribute name that does not match

### Explanation

The processing failed because the Servlet container and EJB container definitions do not match.

The character strings displayed for "Definition type" in the variable information have the following meanings:

Definition type	Meaning
J2EEServerConfiguration	IJServer environment settings
J2EEServerLogConfiguration	Log definitions
J2EEApplicationConfiguration	J2EE application environment settings
J2EEServerExecApplicationConfiguration	Execution class environment settings

The character strings displayed for "Attribute name" in the variable information have the following meanings:

Definition type	Attribute name	Meaning
J2EEServerConfiguration	WorkUnitAutomaticStartMode	WorkUnit automatic startup
	AbnormalTerminationCounts	Retry count
	StartupMonitorTime	WorkUnit startup wait time

Definition type	Attribute name	Meaning
	ShutdownMonitorTime	Process forced termination time
	JavaDebugStart	Debug startup
	WorkUnitAutomaticStartUserName	WorkUnit automatic startup user
	ProcessDegeneracy	Control when application automatic restart fails
	NumberOfRevisionDirectories	Number of generations of current directories saved
	HotDeploy	Common definition - HotDeploy use
	XMLParser	Common definition - Type of XML server used
	XMLParserDirectory	Common definition - Type of XML server used - Directory
	UseWebServiceContainer	Common definition - Container Web service function
	ClassLoaderSeparationKind	Common definition - Class loader separation
	ClassLoaderSearchOrder	Common definition - Class loader search sequence
	ClassLoaderTrace	Common definition - Class loader trace information output
	AutoReload	Common definition - Automatic reload
	AutoReloadInterval	Common definition - Automatic reload- Change confirmation interval
ApplicationFileProtectionLevel	Common definition - Application protection level	
J2EEServerLogConfiguration	LogSize	Log file rollover log size
	StartTime	Log file rollover start time
	Interval	Log file rollover repeat
	HistoryNum	Number of generations
J2EEApplicationConfiguration	Reloadable	Automatic reload

Definition type	Attribute name	Meaning
	CheckInterval	Automatic reload- Change confirmation interval
J2EEServerExecApplicationConfiguration	ClassName	Execution class name
	RelationalApplicationName	Execution sequence- Execution class name
	FailureOption	WorkUnit startup when exception issued
	DisregardConcurrency	Calling when concurrent WorkUnits

#### System Action

Processing stops.

#### User Action

A message indicating the cause of this failure is displayed. Take the action described in the message.

### 12.11.52 is21255

**IS: ERROR: Specified Web server does not exist. Web server=%s**

#### Variable Information

%s = Web server name

#### Explanation

Processing failed because the specified Web server does not exist.

#### System Action

Processing stops.

#### User Action

A message indicating the cause of this failure is displayed. Take the action described in the message.

### 12.11.53 is21256

**IS: ERROR: The operation is not possible because deletion processing failed for the specified Web server. Web server =%s**

#### Variable Information

%s = Web server name

#### Explanation

Processing failed because deletion processing was performed for the specified Web server.

#### System Action

Processing stops.

#### User Action

Check the Web server connector name, and execute again. If the Web server connector name is correct, delete the targeted Web server, then recreate the Web server and execute processing again.

### 12.11.54 is21257

---

**IS: ERROR: The Web server cannot be deleted because an IJServer is using the specified Web server. Web server=%s1 IJServer=%s2**

#### Variable Information

%s1: Web server name

%s2: IJServer name

#### Explanation

Processing failed because the Web server targeted for deletion is being used by an IJServer.

#### System Action

Processing stops.

#### User Action

Change the Web server used by the IJServer, then execute again.

### 12.11.55 is21258

---

**IS: ERROR: The Web server linked to IJServer should not be changed in this operation. IJServer=%s**

#### Variable Information

%s1: IJServer name

#### Explanation

Processing failed because the Web server linked to IJServer was changed.

#### System Action

Processing stops.

#### User Action

Use the Web server connector migration function to change the Web server linked to the IJServer.

### 12.11.56 is21259

---

**IS: ERROR: The Web application names of Web server connectors do not match. Managed Server=%s1 IJServer=%s2**

#### Variable Information

%s1: Managed Server name

%s2: IJServer name

## Explanation

Processing failed because different Web application names are being used for the Web server connectors defined at the Managed Server.

## System Action

Processing stops.

## User Action

Ensure that the Web application name definitions are the same for the Web server connectors connected to the same IJServer, and then execute again.

## 12.11.57 is21260

---

**IS: ERROR: Cannot process because specified IJServer environment settings contain an error. IJServer= %s**

## Variable Information

%s = IJServer name

## Explanation

Processing failed because the environment settings for the specified IJServer contain an error.

## System Action

Processing stops.

## User Action

Resolve the cause of the error and then execute the operation again.

## 12.11.58 is21261

---

**IS: ERROR: Processing failed because of an IJServer environment settings error.**

## Explanation

Processing failed because of an IJServer environment setting error.

## System Action

Processing is stopped.

## User Action

Fix the environment setting error, and then reexecute processing.

## 12.11.59 is21262

---

**IS: ERROR: Processing failed because the Web server connector could not be moved.**

## Explanation

Processing is not possible because the attempt to move the Web server connector failed.

## System Action

Processing is stopped.

## User Action

Fix the environment setting error, and then reexecute processing.

# 12.12 is21300 to is21399

---

This section details messages numbered between is21300 and is21399.

## 12.12.1 is21300

---

### IS: ERROR: is21300: Failed to create JDBC Data Source Definition=%s

#### Variable Information

%s = Definition name

#### Explanation

Failed to create JDBC data source.

#### System Action

Terminates the processing

#### User Action

A message indicating the cause of the failure is output at the same time. Take the action indicated by the message.

## 12.12.2 is21301

---

### IS: ERROR: is21301: Failed to update JDBC Data Source Definition=%s

#### Variable Information

%s = Definition name

#### Explanation

Failed to update the JDBC data source.

#### System Action

Terminates the processing

#### User Action

A message indicating the cause of the failure is output at the same time. Take the action indicated by the message.

## 12.12.3 is21302

---

### IS: ERROR: is21302: Failed to acquire list of JDBC Data Source

#### Explanation

Failed to acquire list of JDBC data source.

#### System Action

Terminates the processing

#### User Action

A message indicating the cause of the failure is output at the same time. Take the action indicated by the message.

## 12.12.4 is21303

---

**IS: ERROR: is21303: Failed to acquire information for JDBC Data Source Definition=%s**

### Variable Information

%s = Definition name

### Explanation

Failed to acquire information for JDBC data source.

### System Action

Terminates the processing

### User Action

A message indicating the cause of the failure is output at the same time. Take the action indicated by the message.

## 12.12.5 is21304

---

**IS: ERROR: is21304: Failed to delete JDBC Data Source Definition=%s**

### Variable Information

%s = Definition name

### Explanation

Failed to delete JDBC data source.

### System Action

Terminates the processing

### User Action

A message indicating the cause of the failure is output at the same time. Take the action indicated by the message.

## 12.12.6 is21305

---

**IS: ERROR: is21305: Failed to JDBC Data Source Connection Test Definition=%s**

### Variable Information

%s = Definition name

### Explanation

Failed to JDBC data source connection test.

### System Action

Terminates the processing

### User Action

A message indicating the cause of the failure is output at the same time. Take the action indicated by the message.

## 12.12.7 is21306

---

**IS: ERROR: is21306: A JDBC Data Source Connection Test error occurred Error information=%s**

### Variable Information

%s = Error information

### Explanation

An error was detected in the JDBC data source connection test.

### System Action

Terminates the processing

### User Action

For details on the action to be taken for each item of error information shown in the messages variable information, refer to the User Action section of message is40304.

## 12.12.8 is21307

---

**IS: ERROR: is21307: Failed to create JavaMail resource access configuration Definition=%s**

### Variable Information

%s = Definition name

### Explanation

Failed to create JavaMail resource access configuration.

### System Action

Terminates the processing

### User Action

A message indicating the cause of the failure is output at the same time. Take the action indicated by the message.

## 12.12.9 is21308

---

**IS: ERROR: is21308: Failed to update JavaMail resource access configuration Definition=%s**

### Variable Information

%s = Definition name

### Explanation

Failed to update JavaMail resource access configuration.

### System Action

Terminates the processing

### User Action

A message indicating the cause of the failure is output at the same time. Take the action indicated by the message.

## 12.12.10 is21309

---

**IS: ERROR: is21309: Failed to acquire list of JavaMail resource access configurations**

### Explanation

Failed to acquire list of JavaMail resource access configurations.

### System Action

Terminates the processing

## User Action

A message indicating the cause of the failure is output at the same time. Take the action indicated by the message.

## 12.12.11 is21310

---

**IS: ERROR: is21310: Failed to acquire information for JavaMail resource access configuration Definition=%s**

### Variable Information

%s = Definition name

### Explanation

Failed to acquire information for JavaMail resource access configuration.

### System Action

Terminates the processing

### User Action

A message indicating the cause of the failure is output at the same time. Take the action indicated by the message.

## 12.12.12 is21311

---

**IS: ERROR: is21311: Failed to delete JavaMail resource access configuration Definition=%s**

### Variable Information

%s = Definition name

### Explanation

Failed to delete the JavaMail resource access configuration.

### System Action

Terminates the processing

### User Action

A message indicating the cause of the failure is output at the same time. Take the action indicated by the message.

## 12.12.13 is21312

---

**IS: ERROR: is21312: Failed to deploy Resource Adapter Definition=%s**

### Variable Information

%s = Definition name

### Explanation

Failed to deploy the Resource adapter.

### System Action

Terminates the processing

## User Action

A message indicating the cause of the failure is output at the same time. Take the action indicated by the message.

## 12.12.14 is21313

---

### IS: ERROR: is21313: Failed to update Resource Adapter Definition=%s

#### Variable Information

%s = Definition name

#### Explanation

Failed to update Resource adapter.

#### System Action

Terminates the processing

#### User Action

A message indicating the cause of the failure is output at the same time. Take the action indicated by the message.

## 12.12.15 is21314

---

### IS: ERROR: is21314: Failed to acquire list of Resource Adapter

#### Explanation

Failed to acquire list of Resource adapter.

#### System Action

Terminates the processing

#### User Action

A message indicating the cause of the failure is output at the same time. Take the action indicated by the message.

## 12.12.16 is21315

---

### IS: ERROR: is21315: Failed to acquire information for Resource Adapter Definition=%s

#### Variable Information

%s = Definition name

#### Explanation

Failed to acquire information for Resource adapter.

#### System Action

Terminates the processing

#### User Action

A message indicating the cause of the failure is output at the same time. Take the action indicated by the message.

## 12.12.17 is21316

---

**IS: ERROR: is21316: Failed to undeploy Resource Adapter Definition=%s**

### Variable Information

%s = Definition name

### Explanation

Failed to undeploy Resource adapter.

### System Action

Terminates the processing

### User Action

A message indicating the cause of the failure is output at the same time. Take the action indicated by the message.

## 12.12.18 is21317

---

**IS: ERROR: is21317: The processing could not be executed because another user was using the same Resource for their processing**

### Explanation

The processing could not be executed because another user was using the same Resource for their processing.

### System Action

Terminates the processing

### User Action

Reexecute processing after the processing of other users has completed.

## 12.12.19 is21318

---

**IS: ERROR: is21318: A server in which Interstage Java EE is installed cannot be added to the site or a server group as a stand-alone Managed Server.**

### Explanation

An attempt was made to add a server in which Interstage Java EE is installed to the site or a server group as a stand-alone Managed Server.

### System Action

Terminates processing

### User Action

Uninstall Interstage Java EE from the server to be added to the site or server group, and then reexecute.

## 12.13 is30100 to is30199

---

This section details the messages with message numbers between is30100 and is30199.

## 12.13.1 is30140

---

**Command name: INFO: is30140:INTERSTAGE started normally**

### Explanation

Interstage was started successfully.

## 12.13.2 is30141

---

**Command name: ERROR: is30141:INTERSTAGE unable to start (SERVICE=%s)**

### Variable Information

%s = Service name

### Explanation

An error occurred in the Interstage starting process.

### System Action

Stops processing. The service for which start was successful is changed to start status.

### User Action

Refer to the event log and error messages of the service shown in Variable Information, carry out the User Action for the respective message, then reexecute the command.

**Windows32/64**

It may be that possible that the machine used for running Interstage in a Windows(R) environment was disconnected from the network. Reconnect the machine to the network and then start Interstage.

**Solaris32/64 Linux32/64**

If the 'Daemon start fails message is output, reexecute the *isstart* command.

If the event log and error messages of the service shown in Variable Information have not been output, execute the *isstop -f* command after a few moments. Then, execute the command again.

If the problem persists, collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

## 12.13.3 is30142

---

**Command name: ERROR: is30142:An error when starting INTERSTAGE is not recovered (SERVICE=%s)**

### Variable Information

%s = Service name

### Explanation

An error occurred retrieving the errors for the Interstage starting process.

### System Action

Stops the retrieve process.

### User Action

Refer to the event log and error messages of the service shown in Variable Information, and carry out the User Action for the respective message, then reexecute the command.

## 12.13.4 is30143

---

**Command name: ERROR: is30143: Does not have the authority to execute a command**

## Explanation

The user does not have permission to execute the command.

## System Action

Command processing stops.

## User Action

Execute the command with the correct permissions.

## 12.13.5 is30144

---

### Command name: ERROR: is30144: There is an error in the operand

## Explanation

The command cannot be executed due to an invalid operand specification. Alternatively, the command could not be executed because the operand that was specified for the command cannot be specified.

## System Action

Command processing stops.

## User Action

Specify a correct operand. Alternatively, if the operand that was specified for the command cannot be specified, reexecute the command without specifying an operand.

## 12.13.6 is30145

---

### Command name: INFO: is30145:INTERSTAGE is already started

## Explanation

Interstage is already activated.

## User Action

**Solaris32/64**

Interstage may be running, or the values defined in the IPC key value definition file may be duplicated across systems.

Change the IPC key values so that they are not duplicated across systems. For more information, refer to "Other Customization Items" in the "System Tuning" chapter of the Tuning Guide.

## 12.13.7 is30146

---

### Command name:ERROR: is30146: An internal error was detected Error information(%d)

## Variable Information

%d = Error information

## Explanation

A contradiction was found in the Interstage system.

## System Action

Command processing stops.

## User Action

Check whether another message was output simultaneously to the system log. If it was output, take action according to the message.

If no other message was output, collect diagnostic information using the *iscollectinfo* command, record the error information, and then contact your systems engineer.

## 12.13.8 is30147

---

**Command name:** ERROR: is30147:A shortage of memory

### Explanation

Insufficient memory.

### System Action

Command processing stops.

### User Action

Execute the process again later. If this message is generated frequently, refer to the Tuning Guide, reestimate the memory that is needed to run Interstage, and confirm that there is enough memory.

If there is enough memory to run Interstage, there may be inadequate memory to run other applications. Reestimate the amount of memory needed for the other applications running on the same machine to determine if there is an appropriate amount of memory.

Contact your system administrator if the reestimation indicates that the memory is insufficient. Ask the system administrator to either increase the size of the main memory or to increase the size of the page file.

**Solaris32/64** **Linux32/64**

Alternately, refer to the system log. If a message indicates insufficient memory or swap area, wait a moment, and then reexecute the process.

## 12.13.9 is30148

---

**Command name:** ERROR: is30148: A condition exists that the command cannot be executed

### Explanation

This command failed to be executed because one of the following commands is being executed:

- *isgendef*
- *isregistdef*
- *isinit*
- *ismodifyservice*
- *isstart*
- *isstop*
- *isstat*

This error may also occur while Interstage is being started or stopped by using a service under the Control Panel, or by using the *net start* or *net stop* command.

### System Action

Command processing stops.

### User Action

Take one of the following actions:

- If this message is output while Interstage is being installed, finish the installation and then initialize Interstage.
- Do not execute any of the commands described in [Explanation] above at the same time.

Check the status of Interstage, and then reexecute the command (if necessary).

If the problem persists even when you execute the command again, collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

## 12.13.10 is30149

---

**Command name:** ERROR: is30149:INTERSTAGE is not initialized

### Explanation

Failed to execute the command. Interstage did not initialize.

### System Action

Command processing stops.

### User Action

Initialize Interstage.

## 12.13.11 is30150

---

**Command name:** ERROR: is30150:INTERSTAGE initializing is not completed

### Explanation

Since the Interstage initialization process failed, the command cannot be executed.

### System Action

Command processing stops.

### User Action

Reexecute the Interstage initialization process.

## 12.13.12 is30151

---

**Command name:** ERROR: is30151:A system error occurred Error information(%d)

### Variable Information

%d = Error information

### Explanation

A system error has occurred.

### System Action

Command processing stops.

### User Action

**Windows32/64**

Collect diagnostic information using the *iscollectinfo* command, record the error information, and then contact your systems engineer.

**Solaris32/64**

When using the multi-system function, the *isdeletesys* or *iscreatesys* command may have been executed concurrently with the command being executed when the error occurred. In this case, delete the system with the *isdeletesys* command.

Solaris32/64 Linux32/64

If another message was output at the same time, take action accordingly. When no other message is output, collect diagnostic information using the *iscollectinfo* command, record the error information, and then contact your systems engineer.

Alternately, refer to the system log. If a message indicates insufficient memory or swap area, wait a moment, and then reexecute the process.

### 12.13.13 is30152

---

**Command name: ERROR: is30152:Processing is interrupted by signal**

#### Explanation

A signal was raised during the command execution.

#### System Action

Command processing stops.

#### User Action

Terminate Interstage with the *isstop* command, and then reexecute the command.

### 12.13.14 is30153

---

**Command name: ERROR: is30153:A system resource shortage occurred**

#### Explanation

Insufficient resources.

#### System Action

Command processing stops.

#### User Action

Wait for a moment, and then reexecute the command. If this error appears frequently, collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

Solaris32/64 Linux32/64

A user not assigned as a special user or superuser may have attempted to execute the command. Reexecute the command as a special user or superuser.

### 12.13.15 is30154

---

**Command name: ERROR: is30154:The definition of INTERSTAGE is not created**

#### Explanation

Since the Interstage definition was not generated, the command failed to execute.

#### System Action

Command processing stops.

#### User Action

Generate the Interstage definition, and then reexecute the command.

## 12.13.16 is30155

---

**Command name:** ERROR: is30155:An error when starting INTERSTAGE is not recovered

### Explanation

Failed in retrieve the Interstage process.

### System Action

Stops the retrieve process.

### User Action

Refer to the event log and carry out the User Action for the respective message, then reexecute the command.

## 12.13.17 is30156

---

**Command name:** ERROR: is30156:INTERSTAGE unable to start

### Explanation

Failed to start Interstage.

### System Action

Command processing stops.

### User Action

Refer to the event log and carry out the User Action for the respective message, then reexecute the command.

## 12.13.18 is30158

---

**Command name:** ERROR: is30158:I/O error occurred in system file

### Explanation

An I/O error has occurred in the system file.

### System Action

Command processing stops.

### User Action

Resolve the I/O error, and then reconstruct the system.

## 12.13.19 is30159

---

**Command name:** ERROR: is30159:INTERSTAGE is not licensed Error information(%s)

### Variable Information

%s = Error information

### Explanation

An error occurred during Interstage license processing.

### System Action

Command processing stops.

### User Action

Record the error information, collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

## 12.13.20 is30160

---

**Command name: INFO: is30160:INTERSTAGE terminated normally**

### Explanation

Interstage has stopped successfully.

## 12.13.21 is30161

---

**Command name: ERROR: is30161:INTERSTAGE unable to terminate (SERVICE=%s)**

### Variable Information

%s = Service name

### Explanation

An error has occurred in the Interstage termination process.

### System Action

Command processing stops.

### User Action

Refer to the event log and error messages of the service shown in Variable Information, and carry out the User Action for the respective message, then reexecute the command.

## 12.13.22 is30162

---

**Command name: ERROR: is30162: Does not have the authority to execute a command**

### Explanation

The user does not have permission to execute the command.

### System Action

Command processing stops.

### User Action

Execute the command with the correct permissions.

## 12.13.23 is30163

---

**Command name: ERROR: is30163: There is an error in the option**

### Explanation

An invalid option has been specified.

## System Action

Command processing stops.

## User Action

Specify the correct option, and then reexecute the command.

## 12.13.24 is30164

---

**Command name: INFO: is30164:INTERSTAGE is not started**

### Explanation

Interstage is not activated.

## 12.13.25 is30165

---

**Command name: ERROR: is30165: An internal error was detected Error information(%d)**

### Variable Information

%d = Error information

### Explanation

A contradiction was found in the Interstage system, or there is a memory shortage.

### System Action

Command processing stops.

### User Action

If the value indicated by %d (error information) is xxx:8:xxx, xxx:14:xxx, xxx:1455:xxx, xxx:10008:xxx, xxx:10014:xxx, or xxx:11455:xxx, there is a memory shortage. After a few moments, execute the *isstop -f* command and then reexecute the process. If executing the *isstop -f* command results in an error, restart the machine. If this message is generated frequently, refer to the Tuning Guide, reestimate the memory required to run Interstage, and check whether there is enough memory.

If there is enough memory to run Interstage, there may be inadequate memory to run other applications. Reestimate the amount of memory required for the other applications running on the same machine to determine if there is an appropriate amount of memory.

Contact your system administrator if the reestimation indicates that the memory is insufficient. Ask the system administrator to either increase the size of the main memory or to increase the size of the page file.

If the value indicated by %d (error information) is not xxx:8:xxx, xxx:14:xxx, xxx:1455:xxx, xxx:10008:xxx, xxx:10014:xxx, or xxx:11455:xxx, record the error information, collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

## 12.13.26 is30166

---

**Command name: ERROR: is30166: Memory allocation failure**

### Explanation

Insufficient memory.

### System Action

Command processing stops.

## User Action

Execute the process again later. If this message is generated frequently, refer to the Tuning Guide, reestimate the memory that is needed to run Interstage, and confirm that there is enough memory.

If there is enough memory to run Interstage, there may be inadequate memory to run other applications. Reestimate the amount of memory needed for the other applications running on the same machine to determine if there is an appropriate amount of memory.

Contact your system administrator if the reestimation indicates that the memory is insufficient. Ask the system administrator to either increase the size of the main memory or to increase the size of the page file.

**Solaris32/64** **Linux32/64**

Alternately, refer to the system log. If a message indicates insufficient memory or swap area, wait a moment, and then reexecute the process.

## 12.13.27 is30167

---

**Command name: ERROR: is30167: A condition exists that the command cannot be executed**

### Explanation

Interstage is collecting resources or one of the following commands is being executed:

- *isgendef*
- *isregistdef*
- *isinit*
- *ismodifyservice*
- *isstart*
- *isstop*
- *isstat*

This error may also occur while Interstage is being started or stopped by using a service under the Control Panel, or by using the *net start* or *net stop* command.

### System Action

Command processing stops.

### User Action

Check the status of Interstage and, then reexecute the command (if necessary).

If the error persists, collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

## 12.13.28 is30168

---

**Command name: ERROR: is30168:A system error occurred Error information(%d)**

### Variable Information

%d = Error information

### Explanation

A system error has occurred.

### System Action

Command processing stops.

## User Action

**Windows32/64**

Record the error information, collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

**Solaris32/64**

When using the multi-system function, the *isdeletesys* or *iscreatesys* command may have been executed concurrently with the command being executed when the error occurred. In this case, delete the system with the *isdeletesys* command.

**Solaris32/64** **Linux32/64**

If another message was output at the same time, take the action recommended in the other message.

When no other message is output, collect diagnostic information using the *iscollectinfo* command, record the error information, and then contact your systems engineer.

Alternately, refer to the system log. If a message indicates insufficient memory or swap area, wait a moment, and then reexecute the process.

## 12.13.29 is30169

---

**Command name: ERROR: is30169:Processing is interrupted by signal**

### Explanation

A signal was raised during the command processing.

### System Action

Command processing stops.

### User Action

Reexecute the command

## 12.13.30 is30170

---

**Command name: ERROR: is30170:A system resource shortage occurred**

### Explanation

Insufficient system resources.

### System Action

Command processing stops.

### User Action

Wait for a moment, and then reexecute the command. If this error appears frequently, collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

## 12.13.31 is30171

---

**Command name: ERROR: is30171:The definition of INTERSTAGE is not created**

### Explanation

Since the Interstage definition was not generated, the command failed to execute.

### System Action

Command processing stops.

### User Action

Generate the Interstage definition, and then reexecute the command.

## 12.13.32 is30172

---

**Command name: ERROR: is30172:A Resource of ObjectTransactionService unable to terminate**

### Explanation

Failed to stop the OTS resource manager.

### System Action

Command processing stops.

### User Action

Resolve the error, by referring to the message output by OTS, and then reexecute the command.

## 12.13.33 is30173

---

**Command name: ERROR: is30173:INTERSTAGE unable to terminate**

### Explanation

Failed to stop Interstage.

### System Action

Processing stops.

### User Action

Resolve the error by referring to the output message, and execute a forced stop using the Interstage Management Console or the *isstop* command with the *-f* option.

## 12.13.34 is30174

---

**Command name: ERROR: is30174:I/O error occurred in system file**

### Explanation

An I/O error has occurred in the system file.

### System Action

Command processing stops.

### User Action

Resolve the I/O error, and then reconstruct the system.

## 12.13.35 is30175

---

---

**Command name: ERROR: is30175: A Work Unit is active****Explanation**

Since the WorkUnit being operated exists, Interstage failed to stop.

**System Action**

Processing stops.

**User Action**

Perform either of the following actions:

- Terminate the WorkUnit being operated, and terminate Interstage again using the Interstage Management Console or the *isstop* command.
- Execute the forcible stop of the starting service using the Interstage Management Console, or execute a forced stop using the *isstop* command with the *-c* option.

## 12.13.36 is30176

---

**Command name: WARNING: is30176: Failure to stop service due to it being in use by another service (SERVICE=%s)****Variable Information**

%s = Service name

**Explanation**

Another service mentioned in the Variable Information is in operation, and has the service in use.

**System Action**

Command processing stops.

**User Action**

Execute the forcible termination by specifying the *isstop* command with the *-f* option after terminating the service mentioned in Variable Information.

## 12.13.37 is30177

---

**Command name: ERROR: is30177:%s is not active****Variable Information**

%s = Service name

**Explanation**

Failed to execute the command since the service shown in [Variable Information] has stopped.

**System Action**

Command processing stops.

**User Action**

Start the service shown in [Variable Information] and then execute the command again.

## 12.13.38 is30178

---

**Command name:** ERROR: is30178:Cannot be stopped, because %s is active

### Variable Information

%s = Service name

### Explanation

The command failed to execute because the service shown in [Variable Information] is running.

### System Action

Command processing stops.

### User Action

Stop the service shown in [Variable Information], and then execute the command again.

## 12.13.39 is30180

---

**Command name:** ERROR: is30180:INTERSTAGE is not initialized

### Explanation

Failed to execute the command. Interstage did not initialize.

### System Action

Command processing stops.

### User Action

Initialize Interstage.

## 12.13.40 is30181

---

**Command name:** ERROR: is30181: Does not have the authority to execute a command

### Explanation

The user does not have permission to execute the command.

### System Action

Command processing stops.

### User Action

Execute the command with the correct permissions.

## 12.13.41 is30182

---

**Command name:** ERROR: is30182: There is an error in the operand

### Explanation

The command cannot execute because too many operands are specified.

## System Action

Command processing stops.

## User Action

Specify the correct number of operands, and then reexecute the command.

## 12.13.42 is30183

---

### Command name: ERROR: is30183: Memory allocation failure

#### Explanation

Insufficient memory.

#### System Action

Command processing stops.

#### User Action

Execute the process again later. If this message is generated frequently, refer to the Tuning Guide, reestimate the memory that is needed to run Interstage, and confirm that there is enough memory.

If there is enough memory to run Interstage, there may be inadequate memory to run other applications. Reestimate the amount of memory needed for the other applications running on the same machine to determine if there is an appropriate amount of memory.

Contact your system administrator if the reestimation indicates that the memory is insufficient. Ask the system administrator to either increase the size of the main memory or to increase the size of the page file.

**Solaris32/64** **Linux32/64**

Alternately, refer to the system log. If a message indicates insufficient memory or swap area, wait a moment, then reexecute the process.

## 12.13.43 is30184

---

### Command name: ERROR: is30184: A condition exists that the command cannot be executed

#### Explanation

This command failed to be executed because one of the following commands is being executed:

- *isgendef*
- *isregistdef*
- *isinit*
- *ismodifyservice*
- *isstart*
- *isstop*
- *isstat*

This error may also occur while Interstage is being started or stopped by using a service under the Control Panel, or by using the *net start* or *net stop* command.

#### System Action

Command processing stops.

## User Action

Reexecute the command. If the error persists, collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

## 12.13.44 is30185

---

**Command name:** ERROR: is30185:A system error occurred Error information(%d)

### Variable Information

%d = Error information

### Explanation

A system error has occurred.

### System Action

Command processing stops.

### User Action

Record the error information, collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

**Solaris32/64** **Linux32/64**

Alternately, refer to the system log. If a message indicates insufficient memory or swap area, wait a moment, and then reexecute the process.

## 12.13.45 is30186

---

**Command name:** ERROR: is30186:Processing is interrupted by signal

### Explanation

A signal was raised during the command processing.

### System Action

Command processing stops.

### User Action

Reexecute the command.

## 12.13.46 is30187

---

**Command name:** ERROR: is30187:A system resource shortage occurred

### Explanation

Insufficient resources.

### System Action

Command processing stops.

### User Action

Wait for a moment, and then reexecute the command. If this error appears frequently, collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

## 12.13.47 is30188

---

**Command name:** ERROR: is30188: An internal error was detected Error information(%d)

### Variable Information

%d = Error information

### Explanation

A contradiction was found in the Interstage system.

### System Action

Command processing stops.

### User Action

If another message was output at the same time, take action accordingly.

When no other message is output, collect diagnostic information using the *iscollectinfo* command, record the error information, and then contact your systems engineer.

## 12.13.48 is30190

---

**Command name:** ERROR: is30190:The definition of INTERSTAGE is not created

### Explanation

Since the Interstage definition of was not generated, the command failed to execute.

### System Action

Command processing stops.

### User Action

Generate the Interstage definition, and then reexecute the command.

## 12.13.49 is30191

---

**Command name:** ERROR: is30191:INTERSTAGE initializing is not completed

### Explanation

Since the Interstage initialization process failed, the command cannot be executed.

### System Action

Command processing stops.

### User Action

Reinitialize Interstage.

## 12.13.50 is30192

---

**Command name:** ERROR: is30192: An error occurred to get status of service SERVICE=%s Error infomation(%d)

## Variable Information

%s = Service Name

%d = Error Information

## Explanation

The service status failed to be obtained.

## System Action

Command processing stops.

## User Action

Refer to the event log. If there is a message for the service indicated by %s (variable information), take the action indicated by that message.

If there is no message for the service indicated by %s (variable information), collect diagnostic information using the *iscollectinfo* command, record the error information, and then contact your systems engineer.

## 12.13.51 is30193

---

**Command name: ERROR: is30193:%s is specified to be an environment variable LD\_LIBRARY\_PATH**

## Variable Information

%s = value specified for the environmental variable LD\_LIBRARY\_PATH

## Explanation

An invalid value was specified for the environmental variable LD\_LIBRARY\_PATH.

## System Action

Command processing stops.

## User Action

Change the environmental variable setting of LD\_LIBRARY\_PATH to a valid path, and then reexecute the command.

## 12.13.52 is30194

---

**Command name: ERROR: is30194:Command execution failed because server is too busy**

## Explanation

Command execution failed because server is too busy.

## System Action

Command processing stops.

## User Action

Wait a moment, and then reexecute the command.

## 12.13.53 is30198

---

**Command Name: ERROR: is30198: The function cannot be used FUNCTION NAME(%S)**

## Variable Information

%s = Function Name

## Explanation

An attempt was made to use an unusable function.

Table 12.29 is30198 Function Name/Variable Information

Name of Function indicated by Variable Information	Variable Information Function Name and Corresponding Function
Database Linkage Service	Database link service
Load Balancing	Load balancing
Activation modification	Active modification of WorkUnit
Active concurrency modification	Dynamic modification of number of processes
Closure of object	Closure of object
Cancel closure of object	Cancel closure of object
Cancel queuing of request	Cancel queuing of request

## System Action

Command processing stops.

## User Action

Execute the command again after installing an edition or package that supports the desired function.

## 12.13.54 is30199

---

**Command name: INFO: is30199: The command was processed normally**

## Explanation

The command terminated normally.

## 12.14 is30200 to is30299

---

This section details the messages with message numbers between is30200 and is30299.

### 12.14.1 is30201

---

**Command name: INFO: is30201: The command was processed normally**

## Explanation

The command executed successfully.

### 12.14.2 is30202

---

**Command name: ERROR: is30202: An abnormality occurred in the command Error information(%d-%s1-%s2)**

## Variable Information

%d = Error information1

%s1 = Error information2

%s2 = Error information3

## Explanation

The command terminated abnormally due to the reasons described in the following table.

Table 12.30 is30202 Error Information and Required Action

Error Information 1	Cause	Countermeasures
1000	The number of file descriptors used in the process has reached the maximum value.	Collect diagnostic information using the <i>iscollectinfo</i> command, record the error information, and then contact your systems engineer.
1001	Insufficient memory.	Execute the process again later. If this message is generated frequently, refer to the Tuning Guide, reestimate the memory required to run Interstage, and check whether there is enough memory.  If there is enough memory to run Interstage, there may be inadequate memory to run other applications. Reestimate the amount of memory required for the other applications running on the same machine to determine if there is an appropriate amount of memory.  Contact your system administrator if the reestimation indicates that the memory is insufficient. Ask the system administrator to either increase the size of the main memory or to increase the size of the page file.
1002	The number of processes to be generated has exceeded the maximum limit.	Correct the system tuning parameter
1003	The user does not have permission to access the file or folder.	Check the file or folder access permissions, or execute the process with the correct access permissions.
1004	The specified file or folder may have been modified.	Check if the file or folder has been modified.
1005	The OD reported an abnormality.	Check that the OD, Naming Service, and Interface Repository have started.  If the error persists, collect diagnostic information using the <i>iscollectinfo</i> command, and then contact your systems engineer.
1006	Processing cannot continue, as another command is being executed.	Wait for a moment, and then reexecute the command.
1007	An I/O error has occurred.	Check that TD_HOME\sys\smm or TD_HOME(Note)\sys\smm exists, or if the access permissions have changed.  If there is no problem with the above files, there may be a memory shortage. In this case, execute the processing again later. If this message is generated

Error Information 1	Cause	Countermeasures
		<p>frequently, refer to the Tuning Guide, reestimate the memory required to run Interstage, and check whether there is enough memory.</p> <p>If there is enough memory to run Interstage, there may be inadequate memory to run other applications. Reestimate the amount of memory required for the other applications running on the same machine to determine if there is an appropriate amount of memory.</p> <p>Contact your system administrator if the reestimation indicates that the memory is insufficient. Ask the system administrator to either increase the size of the main memory or to increase the size of the page file.</p>
1008	The Naming Service or Load Balancing function has not started.	Start the Naming service or Load Balancing function.
1101	The TD is not installed.	Install TD, and then reexecute the command.
1102	A user, other than an administrator in the local group, attempted to execute the command.	Reexecute the command as an administrator in the local group.
9000	Failed to execute the command due to an unknown reason.	<p><b>Windows32/64</b></p> <p>If %s1 (error information 2) is 'Not enough storage is available to process this command', 'Not enough storage is available to complete this operation', or 'The paging file is too small for this operation to complete', there is a memory shortage. In this situation, execute the processing again later. If this message is generated frequently, refer to the Tuning Guide, reestimate the memory required to run Interstage, and check whether there is enough memory.</p> <p>If there is enough memory to run Interstage, there may be inadequate memory to run other applications. Reestimate the amount of memory required for the other applications running on the same machine to determine if there is an appropriate amount of memory.</p> <p>Contact your system administrator if the reestimation indicates that the memory is insufficient. Ask the system administrator to either increase the size of the main memory or to increase the size of the page file.</p> <p>In other situations, collect diagnostic information using the <i>iscollectinfo</i> command, and then contact your systems engineer.</p> <p><b>Solaris32/64 Linux32/64</b></p> <p>Collect diagnostic information using the <i>iscollectinfo</i> command, and then contact your systems engineer.</p>

**Note**

TD\_HOME: Interstage installation folder

**System Action**

Command processing stops.

## User Action

Carry out the countermeasures as per Error information1, and reexecute the command.

For other reason codes, carry out the actions described in messages displayed at the same time. If no other messages are displayed, or if the error cannot be resolved, record Error Information 2 and 3 and collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

### 12.14.3 is30203

---

#### Command name:ERROR:is30203: SMM is already started

#### Explanation

The command cannot be executed because the SMM has already been started.

#### System Action

Command processing stops.

#### User Action

Since the SMM is already started, countermeasures are not required.

### 12.14.4 is30204

---

#### Command name:ERROR:is30204: SMM is not started

#### Explanation

The SMM is not started.

#### System Action

Command processing stops.

#### User Action

Start the SMM, and then execute the *isdisplaysmm* command.

### 12.14.5 is30205

---

#### Command name:ERROR:is30205: SMMA is already started

#### Explanation

The SMMA is already started. Cannot execute the command.

#### System Action

Command processing stops.

#### User Action

Since the SMMA is already started, countermeasures are not required.

### 12.14.6 is30206

---

#### Command name:ERROR:is30206: SMMA is not started

#### Explanation

The SMMA is not started.

#### System Action

Command processing stops.

## User Action

Since the SMMA is already terminated, countermeasures are not required. If you want to execute *isaddtarget* command or *isdeletetarget* command, start the SMMA, then reexecute the command.

## 12.14.7 is30207

---

**Command name:ERROR:is30207: There is no -%s option**

### Variable Information

%s = Option

### Explanation

There is no option.

### System Action

For Windows failed to register the SMM or SMMA.

For Solaris, failed to start the SMM or SMMA.

### User Action

Enter the correct option, and then reexecute the command.

## 12.14.8 is30208

---

**Command name:ERROR:is30208: The operand specification contains an error Reason code(%d)**

### Variable Information

%d = Reason Code

### Explanation

The command cannot be executed due to an invalid operand specification, as shown in the following table.

Table 12.31 is30208 Reason Codes and Required Action

Reason Code	Cause	Countermeasures
1	The IP address is invalid. <b>Solaris32/64</b> The specification of IPv6 address is invalid.	Specify the correct IP address. <b>Solaris32/64</b> Specify an IPv4 address.
2	The operand is invalid.	Specify the correct operand.
3	There are too many operands.	Specify the correct number of operands.

### System Action

Command processing stops.

### User Action

Specify the correct operands, and then reexecute the command.

## 12.14.9 is30209

---

**Command name:ERROR:is30209: The option specification is incorrect Reason code(%d)**

## Variable Information

%d = Reason Code

## Explanation

The command cannot be executed due to an invalid option specification, as shown in the following table.

Table 12.32 is30209 Reason Codes and Required Action

Reason Code	Cause	Countermeasures
1	The down or recover shell name is not specified.	Specify the down shell name or recover shell name.
5	The HBI value is not specified.	Specify the HBI value.
6	The HBI value is out of range (1 to 3599 seconds).	Specify a valid HBI value.
7	The DT value is not specified.	Specify the DT value.
8	The DT value is not within the correct range (2 to 3600 seconds).	Specify a valid DT value.
12	The HBI value is greater than the DT value.	Specify a DT value greater than the HBI value.
13	The -D option cannot be specified with -d option.	Specify only one of these options at a time.
14	The -R option cannot be specified with -r option.	Specify only one of these options at a time.
15	The -D option is specified, but the down shell name is not specified.	Specify the down shell name.
16	The down shell name has exceeded 255 bytes.	Specify a down shell name within 255 bytes.
17	The -R option is specified, but the recover shell name is not specified.	Specify the recover shell name.
18	The recover shell name has exceeded 255 bytes.	Specify a recover shell name within 255 bytes.

## System Action

Command processing stops.

## User Action

Specify the correct option, and then reexecute the command.

## 12.14.10 is30210

---

**Command name:ERROR:is30210: IP address is not specified**

## Explanation

The IP address is not specified.

## System Action

Monitor list cannot be recognized.

## User Action

Enter the IP address, and then reexecute the command.

## 12.14.11 is30211

---

**Command name:ERROR:is30211: IP address(%s) is already registered**

#### Variable Information

%s = IP address

#### Explanation

Since the monitor list is already registered, the command cannot be executed.

#### System Action

Command processing stops.

#### User Action

Since the monitor list is already registered, countermeasures are not required.

### 12.14.12 is30212

---

#### **Command name:ERROR:is30212: IP address(%s) is not registered**

#### Variable Information

%s = IP address

#### Explanation

Since the monitor list is not registered, the command cannot be executed.

#### System Action

Command processing stops.

#### User Action

Since the monitor list has already been deleted, countermeasures are not required.

### 12.14.13 is30213

---

#### **Command name:ERROR:is30213: OD did not start**

#### Explanation

Either the OD is not started, or the OD reported insufficient resources.

#### System Action

Invocation, termination of SMM or SMMA, and other process failed.

#### User Action

If the OD is already started, verify operating resources, otherwise, start the OD, and then reexecute the command.

### 12.14.14 is30251

---

#### **Command name:ERROR:is30251:Registering service is failed Error information(%d1-%d2-%s)**

#### Variable Information

%d1 = Reason code

%d2 = Error information 1

%s = Error information 2

## Explanation

Failed to register service as per explanation given at reason code.

## System Action

Command processing stops.

## User Action

Execute the process according to the reason code as shown in the following table and reregister the Windows® service.

If another message is output at the same time, execute that process.

When no other message is output, or the cause of the error cannot be removed, collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

Table 12.33 is30251 Reason Codes and Required Action

Reason code	Explanation	Action
1000	SMM or SMMA is registered to the Windows® service.	If necessary, stop the Windows® service of SMM or SMMA, delete the SMM or SMMA from the Windows® service and register SMM or SMMA to the Windows® service.
9000	Failed to execute the command due to an unknown reason.	<p>If the value indicated in %d2 (error information 1) is 8, 14, or 1455, there is a memory shortage. In this situation, execute the processing again later. If this message is generated frequently, refer to the Tuning Guide, reestimate the memory required to run Interstage, and check whether there is enough memory.</p> <p>If there is enough memory to run Interstage, there may be inadequate memory to run other applications. Reestimate the amount of memory required for the other applications running on the same machine to determine if there is an appropriate amount of memory.</p> <p>Contact your system administrator if the reestimation indicates that the memory is insufficient. Ask the system administrator to either increase the size of the main memory or to increase the size of the page file.</p> <p>In other cases, check whether the service of Windows® operating correctly.</p> <p>If the error persists, collect diagnostic information using the <i>iscollectinfo</i> command, and then contact your systems engineer.</p>

## 12.14.15 is30252

---

### Command name:ERROR:is30252:Removing service is failed Error information(%d1- %d2-%s)

#### Variable Information

%d1 = Reason code

%d2 = Error information 1

%s = Error information 2

## Explanation

Failed to delete the service as per explanation given at reason code.

## System Action

Command processing stops.

## User Action

Perform the process indicated by the reason code shown in the following table and delete the Windows® service again.

If the reason code is not listed, execute the process of any other messages output at the same time.

When no other message is output, or the cause of the error cannot be removed, collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

Table 12.34 is30252 Reason Codes and Required Action

Reason code	Explanation	Action
1000	SMM or SMMA is not registered to the Windows® service.	Since SMM or SMMA is not registered to the Windows® service, countermeasures are not required.
1001	SMM or SMMA is not started.	Stop, (if necessary), the SMM or SMMA service and delete SMM or SMMA from the Windows® service.
9000	Failed to execute the command for an unknown reason.	Collect diagnostic information using the <i>iscollectinfo</i> command, record the error information, and then contact your systems engineer.
9003	Cannot be processed because another command is being executed.	Wait for a moment, and reexecute the command. If the error persists, collect diagnostic information using the <i>iscollectinfo</i> command, and then contact your systems engineer.

## 12.15 is30300 to is30399

---

This section details the messages with message numbers between is30300 and is30399.

### 12.15.1 is30301

---

**Command name: ERROR: is30301: Does not have the authority to execute a command**

#### Explanation

The user does not have permission to execute the command.

#### System Action

Command processing stops.

#### User Action

Execute the command with the correct permissions.

### 12.15.2 is30302

---

**Command name: ERROR: is30302: There is an error in the operand**

#### Explanation

The operand is not specified, an operand other than default operand is specified, or too many arguments are specified in the operand.

#### System Action

Command processing stops.

#### User Action

Specify the correct operand, and then reexecute the command.

### 12.15.3 is30303

---

**Command name: ERROR: is30303: A condition exists that the command cannot be executed**

## Explanation

This command failed to be executed because one of the following commands is being executed:

- *isgendef*
- *isregistdef*
- *isinit*
- *ismodifyservice*
- *isstart*
- *isstop*
- *isstat*

This error may also occur while Interstage is being started or stopped by using a service under the Control Panel, or by using the *net start* or *net stop* command.

## System Action

Command processing stops.

## User Action

Check the status of Interstage, and then reexecute the command (if necessary).

## 12.15.4 is30304

---

**Command name: ERROR: is30304: A failure occurred in the making of the system definition of INTERSTAGE(%d)**

## Variable Information

%d = Reason code

## Explanation

Failed to generate the Interstage system definition.

## System Action

Command processing stops.

## User Action

Carry out the actions described in the following table, according to the reason code, then reexecute the command.

Carry out the actions described in any other messages displayed at the same time.

If no other messages are displayed, or if the error cannot be resolved, record the reason code, and collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

Table 12.35 is30304 Reason Codes and Required Action

Reason Code	Explanation	Action
21	Insufficient resources.	Wait for a moment, and then reexecute the command. If this error appears frequently, contact your system administrator to expand main memory or increase the page file.
22	Insufficient disk space.	Check that sufficient disk space exists in TD_HOME\etc\isdef or TD_HOME\var\iscom. (TD_HOME: Interstage installation folder)
23	A signal was raised during command execution.	Reexecute the command.

Reason Code	Explanation	Action
24,25	The number of processes to be generated has exceeded the maximum limit.	Correct the system tuning parameter.
26	An I/O error has occurred.	Check that TD_HOME\etc\isdef or TD_HOME\var\iscom is installed correctly.(TD_HOME: Interstage installation folder)

## 12.15.5 is30305

---

**Command name: ERROR: is30305: Memory allocation failure**

### Explanation

Insufficient memory.

### System Action

Command processing stops.

### User Action

Execute the process again later. If this message is generated frequently, refer to the Tuning Guide, reestimate the memory that is needed to run Interstage, and confirm that there is enough memory.

If there is enough memory to run Interstage, there may be inadequate memory to run other applications. Reestimate the amount of memory needed for the other applications running on the same machine to determine if there is an appropriate amount of memory.

Contact your system administrator if the reestimation indicates that the memory is insufficient. Ask the system administrator to either increase the size of the main memory or to increase the size of the page file.

**Solaris32/64** **Linux32/64**

Alternately, refer to the system log. If a message indicates insufficient memory or swap area, wait a moment, and then reexecute the process.

## 12.15.6 is30306

---

**Command name: ERROR: is30306: An internal error was detected inside the system Error information(%s)**

### Variable Information

%s = Error information

### Explanation

A contradiction was found in Interstage, or there is a memory shortage.

### System Action

Command processing stops.

### User Action

**Windows32/64**

If the value indicated by %s (error information) is 8, 14, 1455, 10008, 10014, or 11455, there is a memory shortage.

**Solaris32/64** **Linux32/64**

If the value indicated by %s (error information) is 12, there is a memory shortage.

After a few moments, execute the *isstop -f* command, and then reexecute the process. If executing the *isstop -f* command results in an error, restart the machine. If this message is generated frequently, refer to the Tuning Guide, reestimate the memory required to run Interstage, and check whether there is enough memory.

If there is enough memory to run Interstage, there may be inadequate memory to run other applications. Reestimate the amount of memory required for the other applications running on the same machine to determine if there is an appropriate amount of memory.

Contact your system administrator if the reestimation indicates that the memory is insufficient. Ask the system administrator to either increase the size of the main memory or to increase the size of the page file.

**Solaris32/64**

If the value that is indicated in the error information is '200', it may be possible that the FSUNtd package has not been installed correctly. If the FSUNtd package has not been installed in /opt, check that there is a symbolic link from /opt/FSUNtd to the FSUNtd package installation directory. If there is no symbolic link, reinstall the FSUNtd package.

**Linux32/64**

If the value that is indicated in the error information is '200', it may be that the FJSVtd package has not been installed correctly. If the FJSVtd package has not been installed in /opt, check that there is a symbolic link from /opt/FJSVtd to the FSUNtd package installation directory. If there is no symbolic link, reinstall the FJSVtd package.

If the value indicated by %s (error information) is not above, record the error information, collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

**Solaris32/64** **Linux32/64**

Alternately, refer to the system log. If a message indicates insufficient memory or swap area, wait a moment, and then reexecute the process.

## 12.15.7 is30320

---

**Command name: WARNING: is30320:The %s isn't being installed**

### Variable Information

%s = Service name

### Explanation

The service shown in Variable Information is not installed.

### System Action

The definition file of the service shown at Variable Information is not registered.

### User Action

Install the service, and then reexecute the command.

## 12.15.8 is30330

---

**Command name: ERROR: is30330:There is an error in the operand**

### Explanation

**Windows32/64**

An operand is specified.

**Solaris32/64** **Linux32/64**

An illegal value has been specified in the operand.

### System Action

Command processing stops.

## User Action

Windows32/64

Must not specify an operand.

Solaris32/64 Linux32/64

Specify a valid operand and then reexecute the command.

## 12.15.9 is30331

---

**Command name: ERROR: is30331:The indispensable service %s isn't being installed**

### Variable Information

%s = Service name

### Explanation

The service shown at Variable Information is not installed.

### System Action

Command processing stops.

### User Action

Install the service, and then reexecute the command.

## 12.15.10 is30332

---

**Command name: ERROR: is30332:INTERSTAGE is starting**

### Explanation

Interstage is starting.

### System Action

Command processing stops.

### User Action

Windows32/64 Linux32/64

Stop Interstage with the *isstop* command, and then reexecute the command.

Solaris32/64

Interstage may be running, or the values defined in the IPC key value definition file may be duplicated across systems.

Change the IPC key values so that they are not duplicated across systems. For more information, refer to "Other Customization Items" in the "System Tuning" chapter of the Tuning Guide.

If the value is not duplicated, stop Interstage with the *isstop* command, then reexecute the command.

## 12.15.11 is30333

---

**Command name: ERROR: is30333: An error occurred in the registration of the definition file(%d)**

### Variable Information

%d = Reason code

## Explanation

Failed to register the definition.

## System Action

Command processing stops.

## User Action

Carry out the actions described in the following table, according to the reason code.

Carry out the actions described in any other messages displayed at the same time.

Table 12.36 is30333 Reason Codes and Required Action

Reason Code	Explanation	Action
10	Insufficient memory.	Wait for a moment, and then reexecute the command. If this error appears frequently, contact your system administrator to expand main memory or increase the page file.
11	Temporarily insufficient resources.	Wait for a moment, and then reexecute the command. If this error appears frequently, contact your system administrator to expand main memory or increase the page file.
12	A signal was raised during command execution.	Reexecute the command.
13,14	The number of processes to be generated has exceeded the maximum limit.	Correct the system tuning parameter.
15	Insufficient disk space.	Check that sufficient disk space exists in TD_HOME\etc\isdef or TD_HOME\var\iscom. (See note below.)
16	An I/O error has occurred.	Check that TD_HOME\etc\isdef or TD_HOME\var\iscom is installed correctly. (See note below.)
21	CORBA service environment definition failed to be registered.	Take the action indicated by the preceding output message, and then reexecute the command.

Reexecute the command.

If no other messages are displayed, or if the error cannot be resolved, record the reason code, and collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

### Note

TD\_HOME: Interstage installation folder

## 12.15.12 is30334

---

### Command name: **ERROR: is30334: Does not have the authority to execute a command**

## Explanation

The user does not have permission to execute the command.

## System Action

Command processing stops.

## User Action

Execute the command with the correct permissions.

## 12.15.13 is30335

---

**Command name: ERROR: is30335: A condition exists that the command cannot be executed**

### Explanation

This command failed to be executed because one of the following commands is being executed:

- *isgendef*
- *isregistdef*
- *isinit*
- *ismodifyservice*
- *isstart*
- *isstop*
- *isstat*

This error may also occur while Interstage is being started or stopped by using a service under the Control Panel, or by using the *net start* or *net stop* command.

### System Action

Command processing stops.

### User Action

Check the status of Interstage, and then reexecute the command (if necessary).

## 12.15.14 is30336

---

**Command name: ERROR: is30336: An internal error was detected inside the system Error information(%s)**

### Variable Information

%s = Error information

### Explanation

A contradiction was found in the Interstage system, or there is a memory shortage.

### System Action

Command processing stops.

### User Action

**Windows32/64**

If the value indicated by %s (error information) is xxx:8:xxx, xxx:14:xxx, xxx:1455:xxx, xxx:10008:xxx, xxx:10014:xxx, or xxx:11455:xxx, there is a memory shortage.

**Solaris32/64 Linux32/64**

If the value indicated by %s (error information) is xxx:12:xxx, there is a memory shortage.

After a few moments, execute the *isstop -f* command and then restart the process. If executing the *isstop -f* command results in an error, restart the machine. If this message is generated frequently, refer to the Tuning Guide, reestimate the memory required to run Interstage, and check whether there is enough memory.

If there is enough memory to run Interstage, there may be inadequate memory to run other applications. Reestimate the amount of memory required for the other applications running on the same machine to determine if there is an appropriate amount of memory.

Contact your system administrator if the reestimation indicates that the memory is insufficient. Ask the system administrator to either increase the size of the main memory or to increase the size of the page file.

#### Windows32/64

If the value that is indicated in the error information is '0051:0019:2', it means that the FSUNtd package has not been installed correctly. Reinstall the FSUNtd package.

#### Solaris32/64 Linux32/64

If the value that is indicated in the error information is '0051:0019:2', it means that the FJSVtd package has not been installed correctly. Reinstall the FJSVtd package.

#### Windows32/64

If the value indicated by %s (error information) is not above, record the error information, collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

#### Solaris32/64 Linux32/64

If the value that is indicated in the error information is not the one shown above, refer to the system log. If there is another message output at the same time, take action according to the message. If there is not another message output at the same time, record the error information, collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

## 12.15.15 is30337

---

**Command name: ERROR: is30337:definition file isn't formed**

### Explanation

Since the Interstage system definition generation process was not performed, the definition file cannot be registered.

### System Action

Command processing stops.

### User Action

Execute the *isgendef* command, and then reexecute the command.

## 12.15.16 is30338

---

**Command name: ERROR: is30338: There is an error in the system definition of INTERSTAGE FILE=%s**

### Variable Information

%s = Interstage System Definition filename

### Explanation

The contents of the Interstage system definition are invalid.

### System Action

Command processing stops.

### User Action

Carry out the actions described in the previous message, then reexecute the command.

## 12.15.17 is30339

---

---

**Command name: ERROR: is30339:%s is starting****Variable Information**

%s = Service name

**Explanation**

The service shown at Variable Information was started by a command other than *isstart*.

**System Action**

Command processing stops.

**User Action**

Stop the service shown at Variable Information, then reexecute the command. If this message appears frequently, stop all services.

## 12.15.18 is30350

---

**Command name: ERROR: is30350:Line %d: There is an error in the value specified in the %s statement****Variable Information**

%d = Line No.

%s = Statement

**Explanation**

Value specified in the Interstage system definition statement is invalid.

**System Action**

Command processing stops.

**User Action**

Correct the value of the statement specified in Variable Information, and then reexecute the command.

## 12.15.19 is30351

---

**Command name: ERROR: is30351:Line %d: The %s statement can't be specified in the plural****Variable Information**

%d = Line No.

%s = Statement

**Explanation**

Multiple statements cannot be specified in the Interstage system definition.

**System Action**

Command processing stops.

**User Action**

Correct the statement specified in Variable Information, and then reexecute the command.

## 12.15.20 is30352

---

**Command name: ERROR: is30352:Line %d: There is an error in the description form of the statement**

### Variable Information

%d = Line No.

### Explanation

Either the specified statement does not exist in the Interstage system definition, or the statement syntax is invalid.

### Explanation

Command processing stops.

### User Action

Correct the statement, and then reexecute the command.

## 12.15.21 is30353

---

**Command name: ERROR: is30353:The %s statement isn't specified**

### Variable Information

%s = Statement

### Explanation

A required Interstage system definition statement is not specified.

### System Action

Command processing stops.

### User Action

Add the statement specified in Variable Information, and then reexecute the command.

## 12.15.22 is30354

---

**Command name: ERROR: is30354:Line %d: Value of %s statement isn't specified**

### Variable Information

%d = Line No.

%s = Statement

### Explanation

A value for the statement shown at Variable Information is not set.

### System Action

Command processing stops.

### User Action

Specify the value in the statement, and then reexecute the command.

## 12.15.23 is30360

---

**Command name: ERROR: is30360: Does not have the authority to execute a command**

### Explanation

The user does not have permission to execute the command.

### System Action

Command processing stops.

### User Action

Execute the command with the correct permissions.

## 12.15.24 is30361

---

**Command name: ERROR: is30361:Option is invalid**

### Explanation

An invalid option is specified.

### System Action

Command processing stops.

### User Action

Specify the correct option, and then reexecute the command.

## 12.15.25 is30362

---

**Command name: ERROR: is30362:Operand isn't specified**

### Explanation

An operand is not specified.

### System Action

Command processing stops.

### User Action

Specify the correct operand, and then reexecute the command.

## 12.15.26 is30363

---

**Command name: ERROR: is30363:Operand is invalid**

### Explanation

An invalid operand value is specified.

### System Action

Command processing stops.

## User Action

Specify a valid operand value, and then reexecute the command.

## 12.15.27 is30364

---

**Command name:** ERROR: is30364:%s is starting

### Variable Information

%s = Service Name

### Explanation

The service shown at Variable Information is started.

### System Action

Command processing stops.

### User Action

**Windows32/64** **Linux32/64**

Stop the service, then reexecute the command.

**Solaris32/64**

Interstage may be running, or the values defined in the IPC key value definition file may be duplicated across systems

Change the values so that they are not duplicated across systems. For more information, refer to "Other Customization Items" in the "System Tuning" chapter of the Tuning Guide.

If the value is not duplicated, stop Interstage with the *isstop* command, then reexecute the command.

## 12.15.28 is30365

---

**Command name:** ERROR: is30365: An internal error was detected inside the system ERROR-  
INFORMATION(%s:%d1:%d2)

### Variable Information

%s = Error information1

%d1 = Error information2

%d2 = Error information3

### Explanation

A contradiction was found in the Interstage system, or there is a memory shortage.

### System Action

Command processing stops.

### User Action

**Windows32/64**

If the value indicated by %s (error information) is xxx:8:xxx, xxx:14:xxx, xxx:1455:xxx, xxx:10008:xxx, xxx:10014:xxx, or xxx:11455:xxx, there is a memory shortage.

**Solaris32/64** **Linux32/64**

If the value indicated by %s (error information) is xxx:12:xxx, there is a memory shortage.

After a few moments, execute the *isstop -f* command and then reexecute the process. If executing the *isstop -f* command results in an error, restart the machine. If this message is generated frequently, refer to the Tuning Guide, reestimate the memory required to run Interstage, and check whether there is enough memory.

If there is enough memory to run Interstage, there may be inadequate memory to run other applications. Reestimate the amount of memory required for the other applications running on the same machine to determine if there is an appropriate amount of memory.

Contact your system administrator if the reestimation indicates that the memory is insufficient. Ask the system administrator to either increase the size of the main memory or to increase the size of the page file.

If this message appears immediately after installation of Interstage and the value indicated by the error information contains the string 'iseitool.c', this error is probably because the resource used during the previous installation remains. In this case, uninstall Interstage and then install it again (refer to the Quickstart Guide). During uninstallation, remove the unnecessary directories and files.

#### Windows32/64

If the value indicated by %s (error information) is not above, record the error information and collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

#### Solaris32/64 Linux32/64

If the value that is indicated in the error information is not the one shown above, refer to the system log. If there is another message output at the same time, take action according to the message. If there is not another message output at the same time, record the error information, collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

If a message indicates insufficient memory or swap area, wait a moment, and then reexecute the process.

## 12.15.29 is30366

---

### Command name: ERROR: is30366: Memory allocation failure

#### Explanation

Failed to retrieve the memory required for the operation.

#### System Action

Command processing stops.

#### User Action

Execute the process again later. If this message is generated frequently, refer to the Tuning Guide, reestimate the memory that is required to run Interstage, and confirm that there is enough memory.

If there is enough memory to run Interstage, there may be inadequate memory to run other applications. Reestimate the amount of memory needed for the other applications running on the same machine to determine if there is an appropriate amount of memory.

Contact your system administrator if the reestimation indicates that the memory is insufficient. Ask the system administrator to either increase the size of the main memory or to increase the size of the page file.

#### Solaris32/64 Linux32/64

Alternately, refer to the system log. If a message indicates insufficient memory or swap area, wait a moment, and then reexecute the process.

## 12.15.30 is30367

---

### Command name: ERROR: is30367: A condition exists that the command cannot be executed

#### Explanation

This command failed to be executed because one of the following commands is being executed:

- *isgendef*

- *isregistdef*
- *isinit*
- *ismodifyservice*
- *isstart*
- *isstop*
- *isstat*

This error may also occur while Interstage is being started or stopped by using a service under the Control Panel, or by using the *net start* or *net stop* command.

#### System Action

Command processing stops.

#### User Action

Check the status of Interstage, and then reexecute the command (if necessary).

## 12.15.31 is30368

---

**Command name: ERROR: is30368:%s is not installed**

#### Variable Information

%s = Service Name

#### Explanation

The service shown at Variable Information is not installed.

#### System Action

Command processing stops.

#### User Action

Install the service, and then reexecute the command.

## 12.15.32 is30369

---

**Command name: ERROR: is30369:INTERSTAGE initializing failure SERVICE=%s**

#### Variable Information

%s = Service name

#### Explanation

Failed to initialize Interstage.

#### System Action

Processing stops.

#### User Action

If this message is output when the Interstage management command is executed, check the action method based on the following information.

 Windows 32/64

- Message output by the command
- Message output to the event log

**Solaris32/64** **Linux32/64**

- Message output by the command
- Message output to the system log

If this message is output when the Interstage Management Console is used to set the system environment, also check the action method based on the following information:

**Windows32/64**

- Message output by the Interstage Management Console
- Message output to the event log
- Log file ([Interstage install folder]\td\log\isinit\_resultlog.txt)

**Solaris32/64**

- Message output by the Interstage Management Console
- Message output to the system log
- Log file (/var/opt/FSUNtd/log/isinit\_resultlog.txt)

**Linux32/64**

- Message output by the Interstage Management Console
- Message output to the system log
- Log file (/var/opt/FJSVtd/log/isinit\_resultlog.txt)

Multiple operation information is logged in the log file.

Log information for one operation starts on the line containing the string '----- logging start -----'. Because the date of execution of the operation is output after this string, this information can be used to identify the log information for the operation.

According to the above information, take one of the following actions for the service in which the initialization failed.

1) The service for which initialization failed is the CORBA service

If 'ObjectDirector' is displayed in the variable information, it means that the initialization of the CORBA service failed.

If this message is output when the Interstage management command is executed, refer to output message of command. If this message is output when the Interstage Management Console was used to update the system environment settings, refer to the log file.

If a message indicated in the table below is output before this message is output, take action according to the message. If this problem reoccurs, use the *iscollectinfo* command to collect investigation information. Send the error information to a Systems Engineer.

If a message indicated in the table below is not output, take action according to 2) that follows the table.

**Table 12.37 Messages and Required Action**

Message	Cause	Countermeasures
Error : database already create	The database has already been created.	Change the folder name specified at IR path for DB file Statement of Interstage Operating Environment Definition, or delete the folder after taking a backup of the source.
Error : disk no area for Inter Database	Insufficient disk space to create the database.	Change the folder name specified at IR path for DB file Statement of Interstage Operating Environment Definition, or create sufficient space on the disk.
Error : admin_synch	Insufficient disk space.	Create sufficient space in the ObjectDirector installation folder.

Message	Cause	Countermeasures
Error : FJ_Implementation Rep_synch	Insufficient disk space.	Create sufficient space in the ObjectDirector installation folder.
Sufficient memory is not available	Insufficient memory.	Insufficient memory occurred during the command practice. Reexecute the command.
Cannot execute command : %1	Failed to start the command : %1	Restart after you remove the reason why the command indicated by %1 failed.
ObjectDirector start failed	Failed to start the ObjectDirector.	A message indicating the cause of failure to start the CORBA Service was output. Take action according to the message and then restart the CORBA Service.
ObjectDirector stop failed	Failed to stop the ObjectDirector.	A message indicating the cause of failure to start the CORBA Service was output. Take action according to the message and then restart the CORBA Service.
NamingService start failed	Failed to start the Naming Service.	A message indicating the cause of failure to start the Naming Service was output. Take action according to the message and restart the Naming Service.
LoadBalancingOption start failed	Failed to start the Load Balancing Option.	A message indicating the cause of failure to start the Load Balance Option was output. Take action according to the message and restart the Load Balance Option.
InterfaceRepository invocation failed	Failed to start the Interface Repository service.	A message indicating the cause of failure to start the Interface Repository was output. Take action according to the message and restart the Interface Repository.
Inter Database already create	Database files already exist in the database storage folder.    Alternatively, it may be that the previous Interstage uninstallation was not performed correctly.	 Remove the existing database by hand, or change the database storage location.   Delete databases that already exist manually, or change the directory name specified in the Interstage operating environment definition IR path for DB file statement. Alternatively, if the previous Interstage uninstallation was not performed correctly, reinstall Interstage according to the correct procedure. For details about this procedure, refer to the Installation manuals.
Invalid setting in the environment setting file : Invalid user-name is specified	Invalid setting in the environment setting file. Invalid user name is specified.	Specify an existing user name.
parameter not exist. %s	Conflict is detected inside the Interstage system.	Take a note of the message output during this operation and collect diagnostic information using the <i>iscollectinfo</i> command, and then contact your systems engineer.
cannot open config file	Operation environment file (config file) of the CORBA service could not be opened.	Remove the cause of prevention in opening the operation environment file (config file) of the CORBA service.
cannot open new config file	Shortage of disk resources has occurred.	Increase the free space of the Interstage installation folder and reexecute the command again.
Fail to rename (%s1 to %s2 file)	Conflict is detected inside the Interstage system.	Take a note of the message output during this operation and collect diagnostic information using the <i>iscollectinfo</i> command, and then contact your systems engineer.

Message	Cause	Countermeasures
<span style="border: 1px solid black; padding: 2px;">Solaris32/64</span> <span style="border: 1px solid black; padding: 2px;">Linux32/64</span> Daemon start fails	Failed to start the CORBA service.	Reexecute the isinit command.

2) In all other cases

Windows32/64

Take action according to the service message that was output immediately before, or according to the service message that was output in the event log or log file and then reexecute the command.

Solaris32/64 Linux32/64

Take action according to the service message that was output immediately before, or according to the service message that was output in the system log or log file and reexecute the command.

## 12.15.33 is30370

**Command name: ERROR: is30370:INTERSTAGE initializing is not completed**

### Explanation

An attempt was made to display the operation status before the Interstage initialization process completed.

### System Action

Command processing stops.

### User Action

After the Interstage initialization process completes, specify the -l option, and then reexecute the command.

## 12.15.34 is30371

**Command name: ERROR: is30371:Operand must not be specified in case of -l option**

### Explanation

The -l option and the operand cannot be specified together.

### System Action

Command processing stops.

### User Action

Do not specify the -l option with the operand. Reexecute the command.

## 12.15.35 is30372

**Command name: ERROR: is30372:System file access failure FILE=%s ERROR- INFORMATION(%d)**

### Variable Information

%s = Filename

%d = Error information

### Explanation

An abnormality occurred while accessing the system file.

### System Action

Command processing stops.

### User Action

Record the filename and error information, and collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

## 12.15.36 is30373

---

**Command name: ERROR: is30373:INTERSTAGE operation environment definition is not found**

### Explanation

The Interstage operating environment definition file was not saved.

### System Action

Command processing stops.

### User Action

Register the definition file with the *isregistdef* command, and then reexecute the command.

## 12.15.37 is30374

---

**Command name: ERROR: is30374: A condition exists that INTERSTAGE cannot initialize**

### Explanation

Interstage definition generation and registration has not been done, so Interstage cannot be initialized.

### System Action

Command processing stops.

### User Action

Generate the Interstage system definition with the *isgendef* command, register it with the *isregistdef* command, and then reexecute the command.

## 12.15.38 is30375

---

**Command name: ERROR: is30375:There is not space in the disk PATH=%s**

### Variable Information

%s = Path name

### Explanation

The disk is full.

### System Action

Command processing stops.

### User Action

Increase the disk space for the displayed path, and then reexecute the command.

## 12.15.39 is30376

---

**Command name: ERROR: is30376:A system resource shortage occurred**

### Explanation

Insufficient system resources to execute the command.

### System Action

Command processing stops.

### User Action

Wait for a moment, and then reexecute the command. If this error appears frequently, collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

## 12.15.40 is30377

---

**Command name: ERROR: is30377: There is an error in the INTERSTAGE operation environment definition FILE=%s**

### Variable Information

%s = Interstage Operating Environment Definition filename

### Explanation

Since the Interstage operating environment definition is invalid, the Interstage initialization process cannot be executed.

### System Action

Command processing stops.

### User Action

Carry out the action described in the previous syntax error message, then reexecute the command.

## 12.15.41 is30378

---

**Command name: ERROR: is30378:Starting of %s failure**

### Variable Information

%s = Service Name

### Explanation

The service shown at Variable Information cannot be started.

### System Action

Command processing stops.

### User Action

Carry out the actions relating to the messages of each service output to the event log, and then reexecute the command.

## 12.15.42 is30379

---

---

**Command name: WARNING: is30379:Stopping of %s failure****Variable Information**

%s = Service Name

**Explanation**

The service shown at Variable Information cannot be stopped, however, Interstage initialization is continuing.

**System Action**

Processing continues.

**User Action**

Before starting Interstage, carry out the actions described in the previous service messages, or those of each service output to the event log.

## 12.15.43 is30380

---

**Command name: ERROR: is30380:Line %d: There is an error in the value specified in the %s1 statement ERRORKIND(%s2)****Variable Information**

%d = Line No.

%s1 = Statement

%s2 = Error kind

**Explanation**

The value in the Interstage operating environment definition statement, described in the following table, is invalid:

Table 12.38 Error Type Explanations

Error type	Explanation
PATH_TOOLONG	The specified path has exceeded the maximum length.
PATH_INVALID	Either the specified path is invalid, or is not an absolute path. It is not the absolute path which begins from a drive name.
PATH_NOTUSECHR	An illegal string used in the path.
PATH_NOTDIRECTORY	The specified folder does not exist.
OVER_RANGE	An unsupported numeric or character value or value is specified.
TYPE_INVALID	An invalid string is specified.
PORT_UNMATCH	The value specified in the IR PORT NUMBER statement does not match the value specified in the NS PORT NUMBER statement.
FILE_NOTFOUND	The specified file does not exist.

**System Action**

Command processing stops.

**User Action**

Specify the correct statement value, and then reexecute the command.

## 12.15.44 is30381

---

**Command name: ERROR: is30381:Line %d: The %s statement can't be specified in the plural**

### Variable Information

%d = Line No.

%s = Statement

### Explanation

Multiple statements cannot be specified in the Interstage operating environment definition.

### System Action

Command processing stops.

### User Action

Correct the statement specified in Variable Information, and then reexecute the command.

## 12.15.45 is30382

---

**Command name: ERROR: is30382:Line %d: There is an error in the description form of the statement**

### Variable Information

%d = Line No.

### Explanation

Either the specified statement does not exist in the Interstage operating environment definition, or the statement syntax is invalid.

### System Action

Command processing stops.

### User Action

Correct the statement, and then reexecute the command.

## 12.15.46 is30383

---

**Command name: ERROR: is30383:The %s statement isn't specified**

### Variable Information

%s = Statement

### Explanation

A required Interstage operating environment definition statement is not specified.

### System Action

Command processing stops.

### User Action

Add the statement specified in Variable Information, and then reexecute the command.

## 12.15.47 is30384

---

**Command name: ERROR: is30384:Line %d: Value of %s statement isn't specified**

### Variable Information

%d = Line No.

%s = Statement

### Explanation

The value is not set in the statement shown at Variable Information.

### System Action

Command processing stops.

### User Action

Specify the value in the statement shown at Variable Information, and then reexecute the command.

## 12.15.48 is30386

---

**Command name: ERROR: is30386: In case of remote specified in the IR USE statement, EJB option can not be specified**

### Explanation

The EJB option cannot be specified when remote is specified in the IR USE statement of the Interstage operational environment definition.

### System Action

Command processing stops.

### User Action

When using the remote host Interface Repository, reexecute the command without the EJB option specified.

To use the EJB service, specify local in the IR USE statement and reexecute the command.

## 12.15.49 is30387

---

**Command name: ERROR: is30387:In case of no specified in the SSL USE statement.yes can not be specified in the Event SSL statement**

### Explanation

When no is specified in the SSL USE statement of the Interstage operating environment definition, yes cannot be specified in the Event SSL statement.

### System Action

Command processing stops.

### User Action

Specify yes in the SSL USE statement when specifying yes in the Event SSL statement.

## 12.15.50 is30388

---

**Command name: ERROR: is30388: An error is found in the combination of specified values of the Corba Host Name statement and the Corba Port Number statement**

### Explanation

There was an error in the combined value specified for the Corba Host Name statement and the Corba Port Number statement.

Possible causes are described below:

- The value specified for both statements conflicts with the value specified for another system.
- The value specified for both statements conflicts with the value specified for another system, and the Corba Host Name statement for the default or the extended system has been omitted.

### System Action

Command processing stops.

### User Action

Correct the statement containing the error and reexecute the command.

## 12.15.51 is30390

---

**Command name: ERROR: is30390:Processing is interrupted by signal**

### Explanation

A signal was raised during program execution.

### System Action

Command processing stops.

### User Action

Reexecute the command.

## 12.15.52 is30391

---

**Command name: WARNING: is30391: Failure to stop service due to it being in use by another service (SERVICE=%s)**

### Variable Information

%s = Service name

### Explanation

The service described in Variable Information is a prerequisite of another service.

### System Action

Processing continues.

### User Action

Terminate the service described in Variable Information, and then forcibly terminate the prerequisite service with the *isstop* command -f option.

## 12.15.53 is30392

---

**Command Name: ERROR: is30392: Setup of ObjectTransactionService failure MESSAGE (%s1) VARIABLE-INFORMATION(%s2)**

### Variable Information

%s1 = Message ID

%s2 = Message Variable Information

### System Action

Command processing stops.

### User Action

Execute the command again after referencing the message ID shown in the variable information of the error message and after taking appropriate action.

## 12.15.54 is30393

---

**Command Name: WARNING: is30393: Warning is notified on setup ObjectTransactionService MESSAGE(%s1) VARIABLE-INFORMATION(%s2)**

### Variable Information

%s1 = Message ID

%s2 = Message Variable Information

### System Action

Command processing continues.

### User Action

Execute the command again after referencing the message ID shown in the variable information of the error message and after taking appropriate action.

## 12.16 is30400 to is30499

---

This section details the messages with message numbers between is30400 and is30499.

### 12.16.1 is30401

---

**Command Name: ERROR: is30401: Option '%s' is not found**

### Variable Information

%s = Option Character

### Explanation

An illegal option character was specified in the command

### System Action

Processing stops.

### User Action

Specify a correct option and execute the command again.

## 12.16.2 is30402

---

**Command Name:** ERROR: is30402: The argument for '%s' option is not specified

### Variable Information

%s = Option Character

### Explanation

Argument not defined for option requiring an option argument.

### System Action

Processing stops.

### User Action

Specify the option argument and execute the command again.

## 12.16.3 is30403

---

**Command Name:** ERROR: is30403: More than one option cannot be specified

### Explanation

Multiple options cannot be specified.

### System Action

Processing stops.

### User Action

Specify the correction option and execute the command again.

## 12.16.4 is30404

---

**Command Name:** ERROR: is30404: An indispensable option is not specified

### Explanation

A required option is not specified.

### System Action

Processing stops.

### User Action

Specify the required option and execute the command again.

## 12.16.5 is30405

---

**Command Name:** ERROR: is30405: The argument of the '%s' option is outside the specified range

### Variable Information

%s = Option Character

### Explanation

An out-of-range argument was specified.

### System Action

Processing stops.

## User Action

Specify the argument correctly and execute the command again.

## 12.16.6 is30406

---

**Command Name:** ERROR: is30406: An operand cannot be specified

### Variable Information

%s = Command Name

### Explanation

Operand cannot be specified

### System Action

Processing stops.

### User Action

Execute the command again without specifying an operand.

## 12.16.7 is30407

---

**Command Name:** ERROR: is30407: More than one '%s' option is specified

### Variable Information

%s = option Character

### Explanation

The option is specified redundantly.

### System Action

Processing stops.

### User Action

Specify the option correctly and execute the command again.

## 12.16.8 is30408

---

**Command Name:** ERROR: is30408: Memory is insufficient

### Explanation

There is not enough system memory.

### System Action

Processing stops.

### User Action

Execute the process again later. If this message is generated frequently, refer to the Tuning Guide, reestimate the memory that is needed to run Interstage, and confirm that there is enough memory.

If there is enough memory to run Interstage, there may be inadequate memory to run other applications. Reestimate the amount of memory needed for the other applications running on the same machine to determine if there is an appropriate amount of memory.

Contact your system administrator if the reestimation indicates that the memory is insufficient. Ask the system administrator to either increase the size of the main memory or to increase the size of page file.

**Solaris32/64** **Linux32/64**

Alternately, refer to the system log. If a message indicates insufficient memory or swap area, wait a moment, and then reexecute the process.

## 12.16.9 is30409

---

**Command Name:** ERROR: is30409: Could not get IPC resource due to duplicated key(key=%x path=%s)

### Variable Information

%x = Key value

%s = path name

### Explanation

IPC resource retrieval failed because the IPC resource required for operating the performance monitoring tool is in use.

### System Action

Processing stops.

### User Action

The IPC key value is duplicated and must be customized. For more information, refer to "Other Customization Items" in the "System Tuning" chapter of the Tuning Guide.

## 12.16.10 is30410

---

**Command Name:** ERROR: is30410: The operand '%s ' is incorrect

### Variable Information

%s = Operand Character

### Explanation

An illegal operand has been specified.

### System Action

Processing stops.

### User Action

Specify the operand (%s) correctly and execute the command again.

## 12.16.11 is30411

---

**Command Name:** ERROR: is30411: It is unqualified of the execution of this command

### Explanation

Inadequate authority to run this command.

### System Action

Processing stops.

### User Action

Run this command with sufficient authority.

## 12.16.12 is30412

---

**Command Name:** ERROR: is30412: Performance tool environment is not created

### Explanation

The environment required for the performance tool has not been created.

### System Action

Processing stops.

### User Action

Execute the command again after using the *ispmakeenv* command to create the performance tool environment.

## 12.16.13 is30413

---

**Command Name:** ERROR: is30413: File '%s' is not found

### Variable Information

%s = File path name

### Explanation

A nonexistent file was specified.

### System Action

Processing stops.

### User Action

Specify the correct file name and execute the command again.

## 12.16.14 is30414

---

**Command Name:** ERROR: is30414: A resource shortage for file access occurred(Pathname '%s ')

### Variable Information

%s = File Path Name

### Explanation

There is not enough space to create or expand the file.

### System Action

Processing stops.

### User Action

Secure adequate space by deleting unnecessary files, for example, and execute the command again.

## 12.16.15 is30415

---

**Command Name:** ERROR: is30415: The pathname for the specified file is invalid(Pathname '%s ')

## Variable Information

%s = File Path Name

## Explanation

An invalid file path name has been specified.

## System Action

Processing stops.

## User Action

Specify the correct file path name and execute the command again.

## 12.16.16 is30416

---

**Command Name:** ERROR: is30416: An I/O error occurred(Pathname '%s ')

## Variable Information

%s = File path name

## Explanation

An I/O error occurred during file access.

## System Action

Processing stops.

## User Action

Restore the disk where the I/O error occurred and execute the command again.

## 12.16.17 is30417

---

**Command Name:** ERROR: is30417: File '%s' is in use

## Variable Information

%s = File Path Name

## Explanation

The specified file cannot be accessed because it is being used by another user.

## System Action

Processing stops.

## User Action

Execute the command again later.

## 12.16.18 is30418

---

**Command Name:** ERROR: is30418: A necessary file does not exist

## Explanation

A file required by the performance monitoring tool does not exist.

#### System Action

Processing stops.

#### User Action

Reinstall Interstage.

### 12.16.19 is30419

---

#### Command Name: ERROR: is30419: Internal inconsistency occurred

#### Explanation

An internal conflict occurred in the presence and absence of a performance monitoring environment and a performance monitoring logger.

#### System Action

Processing stops.

#### User Action

Stop performance monitoring with the *ispstop* command, then delete the performance monitoring environment with the *ispdeleteenv* command.

If this error occurs in the *ispdeleteenv* command, execute this command again.

### 12.16.20 is30421

---

#### Command Name: ERROR: is30421: Specified pathname '%s' is not a folder

#### Variable Information

%s = Path Name

#### Explanation

A path name that is not a folder has been specified.

#### System Action

Processing stops.

#### User Action

Correct the path name and execute the command again.

### 12.16.21 is30422

---

#### Command Name: WARNING: is30422: Please perform after stopping all the work units under performance measurement

#### Explanation

Although the performance monitoring environment has been deleted by the *ispdeleteenv* command, a new performance monitoring environment cannot be created because the WorkUnit under performance measurement has not been stopped.

#### System Action

Processing stops.

#### User Action

Stop the WorkUnit under performance measurement, and then execute the command again.

### 12.16.22 is30424

---

#### Command Name: ERROR: is30424: TD\_HOME is not specified

#### Explanation

Because the TD\_HOME environment variable is not specified, the folder in which the performance log file is to be created cannot be determined.

#### System Action

Processing stops.

#### User Action

Access the System Properties window under the Control Panel and specify the TD\_HOME environment variable. Alternatively, reinstall Interstage.

### 12.16.23 is30425

---

#### Command Name: WARNING: is30425: Performance tool environment has already been created

#### Explanation

The environment required for the performance tool has already been generated.

#### System Action

Processing stops.

#### User Action

Use the *ispstatus* command to check the status of the performance tool.

### 12.16.24 is30426

---

#### Command Name: ERROR: is30426: ISP\_LOG is not specified by absolute path name

#### Explanation

The full pathname of the performance monitoring log file is not specified in the ISP\_LOG environment variable.

#### System Action

Processing stops.

#### User Action

Specify the full pathname in the ISP\_LOG environment variable or in the *ispmakeenv* command argument.

### 12.16.25 is30427

---

#### Command Name: INFO: is30427: Performance tool environment was created normally

## Explanation

The performance monitoring environment has been created normally and the performance monitoring logger has been started normally.

## System Action

Processing continues.

## 12.16.26 is30428

---

### **Command name: ERROR: is30428: System composition information(seminf.semmnu) is wrong**

## Explanation

The exclusive lock of Performance Monitoring Tool could not be applied because there was an error in the system composition information settings (seminf.semmnu).

## System Action

Processing stops.

## User Action

Make sure the system composition information settings (seminf.semmnu) are correct and then create the performance monitoring environment.

## 12.16.27 is30429

---

### **Command Name: WARNING: is30429: Performance log file is damaged. It is evacuated as file %s**

## Variable Information

%s = File Path Name

## Explanation

Because the performance log file is damaged, it has been saved with a different name.

## System Action

Processing continues.

## User Action

Create a report about the damaged files and delete these files. This report provides information obtained until the damage was detected.

## 12.16.28 is30430

---

### **Command name: ERROR: is30430: Memory shortage occurred (code=%s)**

## Variable Information

%s = Function code

## Explanation

System memory shortage occurred, and the processing shown in the function code table failed.

## System Action

Processing stops.

## User Action

Reexecute the process after a few moments. If this message is generated frequently, refer to the Tuning Guide, reestimate the memory required to run Interstage, and check that there is sufficient memory.

If there is sufficient memory to run Interstage, there may be inadequate memory to run other applications. Reestimate the amount of memory required for other applications running on the same machine to determine if there is an appropriate amount of memory.

Contact your system administrator if the reestimation indicates that the memory is insufficient. Ask the system administrator to either increase the size of the main memory or to increase the size of the swap region.

**Solaris32/64** **Linux32/64**

Alternately, refer to the system log. If a message indicates insufficient memory or swap area, wait a moment, and then reexecute the process.

## 12.16.29 is30431

---

**Command name: ERROR: is30431: I/O error occurred(Path name'%s')**

### Variable Information

%s = Path name

### Explanation

An input/output error occurred when accessing the folder or the file specified in the path name and backup or restoring of the performance monitoring tool resource failed.

### System Action

Processing stops.

### User Action

Recover the disk that caused an input/output error and reexecute the command.

## 12.16.30 is30432

---

**Command name: ERROR: is30432: Disk capacity is insufficient(Path name'%s')**

### Variable Information

%s = Path name

### Explanation

Backup or restoration of the performance monitoring tool resource failed due to the disk capacity shortage.

### System Action

Processing stops.

### User Action

Increase the capacity of the disk specified in the path name, or specify the disk with adequate capacity and, reexecute the command.

## 12.16.31 is30433

---

**Command name: ERROR: is30433: There is no right of access(Path name'%s')**

## Variable Information

%s = Path name

## Explanation

Backup or restoration of the performance monitoring tool resource failed because the access permission to the file or the folder specified in the path name is not set.

## System Action

Processing stops.

## User Action

Carry out either one of the following countermeasures:

- Set the access permission to the file or to the folder specified in the path name, and reexecute the command.
- Specify the folder with the access permission, and reexecute the command.
- Reexecute the command as a user with access permission.

## 12.16.32 is30434

---

**Command name: ERROR: is30434: System error occurred(code=%s, errno=%d)**

## Variable Information

%s = Reason code

%d = Error information

## Explanation

System error occurred.

## System Action

Processing stops.

## User Action

Record the reason code and the error information, and collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

## 12.16.33 is30440

---

**Command name: ERROR: is30440: Performance Tool has already been started**

## Explanation

Command processing failed because the performance monitoring tool had already started.

## System Action

Command processing stops.

## User Action

Reexecute the command that stopped command processing.

## 12.16.34 is30443

---

**Command Name: ERROR: is30443: Performance tool system error happened (errno=%d)**

### Variable Information

%d = Error Information

### Explanation

System error occurred.

### System Action

Processing stops.

### User Action

Take the action for message is20316 displayed on the event viewer.

## 12.16.35 is30444

---

**Command name: ERROR: is30444:Failed in deleting performance tool environment**

### Explanation

The system could not stop the performance monitoring tool because it failed to delete the performance monitoring environment.

### System Action

Command processing stops.

### User Action

**Windows32/64**

Take any action indicated by the message in the event log, and then reexecute the command.

**Solaris32/64** **Linux32/64**

Take any action indicated by the message in the console message, and then reexecute the command.

## 12.16.36 is30445

---

**Command name: ERROR: is30445: Can not execute this command because Performance tool automatic start definition is registered**

### Explanation

A command to start or stop the performance monitoring tool failed because the auto-start definition for the performance monitoring tool was already registered.

### System Action

Command processing stops.

### User Action

If you have started the performance monitoring tool with the *ispmakeenv* command, stop it with the *ispdeleteenv* command. Wait until Interstage stops completely before issuing the *ispunsetautostart* command. Then reexecute the command.

## 12.16.37 is30450

---

**Command name: ERROR: is30450: Permission to access the file or parent directory is not granted: FILE=%**

### Variable Information

%s = File name

### Explanation

This user does not have permission to access either the file or the parent directory.

### System Action

Processing stops.

### User Action

The user who checks and changes a parent directory or the right to access to a file, or has the right to access needs to process.

## 12.16.38 is30451

---

**Command name: ERROR: is30451: Specified file or directory does not exist: FILE=%s**

### Variable Information

%s = File name

### Explanation

The specified file or directory does not exist.

### System Action

Processing stops.

### User Action

Specify a valid file name and directory, and then execute the command again

## 12.16.39 is30452

---

**Command name: ERROR: is30452: A directory cannot be specified for the control document file: FILE=%s**

### Variable Information

%s = File name

### Explanation

A directory has been defined for performance surveillance definition.

### System Action

Command processing stops.

### User Action

Specify the definition for performance surveillance correctly.

## 12.16.40 is30453

---

**Command name: ERROR: is30453: Line %d: Syntax error: FILE=%s**

### Variable Information

%d = Line number

%s = File name

### Explanation

There is a syntax error in the control file.

### System Action

Command processing stops.

### User Action

Correct the syntax in the control file, and reexecute command.

## 12.16.41 is30454

---

**Command name: ERROR: is30454: Line %d: Section duplicated: FILE=%s SECTION=%s**

### Variable Information

%d = Line number

%s = File name

%s = Section name (TD-OBJECT, EJB-APPLICATION or CORBA-IMPLID)

### Explanation

The section is specified twice or more.

### System Action

Command processing stops.

### User Action

Correct the syntax in the control file, and then reexecute command.

## 12.16.42 is30455

---

**Command name: ERROR: is30455: Line %d: Number of statements that may be specified has been exceeded: FILE=%s**

### Variable Information

%d = Line number

%s = File name

### Explanation

Too many statements have been specified.

### System Action

Command processing stops.

#### User Action

Decrease the number of statements that can be specified, and then reexecute the command.

### 12.16.43 is30456

---

**Command name: ERROR: is30456: Line %d: The object name is duplicated: FILE=%s**

#### Variable Information

%d = Line number

%s = File name

#### Explanation

The object name has been duplicated.

#### System Action

Command processing stops.

#### User Action

Remove the duplicate object name, and then reexecute the command.

### 12.16.44 is30457

---

**Command name: ERROR:is30457: The specified parameter by -%s option contains an error**

#### Variable Information

%s = Option name

#### Explanation

There is an error is in the argument of the specified option.

#### System Action

Command processing stops.

#### User Action

Correct the argument, and then reexecute the command.

### 12.16.45 is30460

---

**Command name: ERROR: is30460: Command parameter contains an error**

#### Explanation

An invalid parameter was specified in the command.

#### System Action

Command processing stops.

#### User Action

Specify the correct parameter, and then reexecute the command.

## 12.16.46 is30461

---

**Command name: INFO: is30461: Performance tool automatic start definition has been registered**

### Explanation

The auto-start definition for the performance monitoring tool has been registered.

## 12.16.47 is30462

---

**Command name: INFO: is30462: Performance tool automatic start definition has been deleted**

### Explanation

The auto-start definition for the performance monitoring tool has been deleted.

## 12.16.48 is30463

---

**Command name: ERROR: is30463: Performance tool automatic start definition is not registered**

### Explanation

The auto-start definition for the performance monitoring tool is not registered.

### System Action

Command processing stops.

### User Action

Use the *ispstatus* command to confirm whether the performance monitoring tool has been started. If so, it most likely was started using the *ispmakeenv* command. However, this command is no longer available.

To register the auto-start definition for the performance monitoring tool, stop the performance monitoring tool with the *ispdeleteenv* command. After Interstage stops completely, use the *ispsetautostart* command to register the auto-start definition.

## 12.16.49 is30480

---

**Command name: ERROR:is30480: Failed in the opening of the library: PACKAGE='%s1'  
ERRORSTRING='%s2'**

### Variable Information

%s1 = Package name

%s = Error information

### Explanation

Failed to open the library

### System Action

Command processing stops.

### User Action

Check that the package specified in the error message is installed, and reexecute the command.

## 12.16.50 is30481

---

**Command name: ERROR:is30481: Failed in the reading the function: PACKAGE='%s' ERRORSTRING='%s'**

### Variable Information

%s = Package name  
% = Error information

### Explanation

Failed to read the function

### System Action

Command processing stops.

### User Action

Check the version of the package specified in the error message. When the correct version of the package is installed, after carrying out management to error information, reexecute the command.

## 12.16.51 is30482

---

**Command Name: WARNING: is30482: Performance superintendence is already started**

### Explanation

Performance monitoring has already been started.

### System Action

Processing stops.

### User Action

Use the *ispstatus* command to check the performance monitoring status.

## 12.16.52 is30483

---

**Command Name: INFO: is30483: Performance superintendence was started**

### Explanation

Performance measurement has been started without errors.

### System Action

Starts performance measurements.

## 12.16.53 is30484

---

**Command name: ERROR: is30484:Object(%s) is not defined**

### Variable Information

%s = Object Name

#### Explanation

The specified object has not been registered.

#### System Action

Processing stops.

#### User Action

Specify an object that has been registered, and reexecute the command.

### 12.16.54 is30485

---

**Command name: ERROR: is30485:Internal inconsistency occurred in Performance superintendence process : error information=%d**

#### Variable Information

%d = Error Information

#### Explanation

An internal conflict was detected by the performance monitoring tool.

#### System Action

Processing stops.

#### User Action

Record the error information, collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

### 12.16.55 is30486

---

**Command name: ERROR: is30486:An I/O error occurred in Performance superintendence process**

#### Explanation

An I/O error occurred in the performance superintendence start process.

#### System Action

Processing stops.

#### User Action

Restore the disk device that generated the I/O error, and reexecute the command.

### 12.16.56 is30488

---

**Command name: ERROR: is30488:The length of file name is too long**

#### Explanation

Command process failed as the file name was too long.

#### System Action

Command processing stops.

## User Action

Specify a valid file name, and reexecute the command.

## 12.16.57 is30489

---

**Command name:** ERROR:is30489: -%s1 and -%s2 option cannot be specified at once

### Variable Information

%s1 = Option name

%s2 = Option name

### Explanation

These options cannot be specified simultaneously.

### System Action

Command processing stops.

### User Action

Specify the right option, and reexecute the command.

## 12.16.58 is30490

---

**Command name:** ERROR: is30490:File access failure FILE=%s ERROR-INFORMATION(%d)

### Variable Information

%s = File name

%d = Error information

### Explanation

An error occurred while a file was being accessed.

### System Action

Command processing stops.

### User Action

**Windows32/64**

Rectify as indicated by any error message recorded in the event log, and then reexecute the command.

**Solaris32/64 Linux32/64**

Rectify as indicated by any error message recorded in the console message, and then reexecute the command.

## 12.16.59 is30491

---

**IS: ERROR: is30491: The system name is invalid**

### Explanation

The command processing failed because an invalid system name was specified.

### System Action

Processing stops.

### User Action

Specify a valid system name, and then restart processing.

## 12.16.60 is30492

---

### **IS: ERROR: is30492: The length of system name is too long**

#### Explanation

Command processing failed because the system name specified was too long.

#### System Action

Processing stops.

#### User Action

Specify a valid system name, and then restart processing.

## 12.16.61 is30493

---

### **IS: ERROR: is30493: The indispensable package is not installed Package name=%s**

#### Variable Information

%s = Package name

#### Explanation

The package required for using the performance monitoring tool may not be installed, or the version of the installed package may be invalid.

#### System Action

Processing stops.

#### User Action

Install the package of version given in Variable Information, and reexecute the command.

## 12.16.62 is30494

---

### **Command name: ERROR: is30494:The application for performance superintendence is not specified**

#### Explanation

The system failed to execute the command because an application was not specified to be performance-monitored.

#### System Action

Command processing stops.

#### User Action

Specify an application to be performance-monitored, and then reexecute the command.

## 12.16.63 is30495

---

**Command name:** ERROR: is30495:Failed in starting of Performance superintendence

### Explanation

The system failed to start performance monitoring.

### System Action

Command processing stops.

### User Action

**Windows32/64**

Rectify as indicated by any error message recorded in the event log, and then reexecute the command.

**Solaris32/64** **Linux32/64**

Rectify as indicated by any error message recorded in the console message, and then reexecute the command.

## 12.17 is30500 to is30599

---

This section details the messages with message numbers between is30500 and is30599.

### 12.17.1 is30502

---

**Command Name:** WARNING: is30502: Specified item is being already stopped

### Explanation

An item has been specified for which the measurement has already been stopped.

### System Action

Processing stops.

### User Action

Not applicable.

### 12.17.2 is30503

---

**Command Name:** INFO: is30503: Performance superintendence was stopped

### Explanation

Performance monitoring was terminated without error.

### System Action

Stops the performance monitoring.

### 12.17.3 is30504

---

**Command name:** ERROR: is30504:Failed in stopping of Performance superintendence

### Explanation

The system failed to stop performance monitoring.

### System Action

Command processing stops.

## User Action

**Windows32/64**

Rectify as indicated by any error message recorded in the event log, and then reexecute the command.

**Solaris32/64** **Linux32/64**

Rectify as indicated by any error message recorded in the console message, and then reexecute the command.

## 12.17.4 is30541

---

**Command Name: ERROR: is30541: An invalid data was found**

### Explanation

Invalid data was detected when reading performance data

### System Action

Processing stops.

### User Action

Create a report, and then delete the files containing the invalid data.

## 12.17.5 is30542

---

**Command Name: ERROR: is30542: Data start time is specified incorrectly**

### Explanation

There was an error in the time setting method.

### System Action

Processing stops.

### User Action

Set the correct start time and execute the command again.

## 12.17.6 is30543

---

**Command Name: ERROR: is30543: Data termination time is specified incorrectly**

### Explanation

There was an error in the time setting method.

### System Action

Processing stops.

### User Action

Set the correct end time and execute the command again.

## 12.17.7 is30544

---

**Command Name: ERROR: is30544: Please specify early time at the time specified at end time (-e) at beginning time (-b)**

### Explanation

The end time specified by the -e option is either before or the same as the start time specified by the -b option.

#### System Action

Processing stops.

#### User Action

Set the start time to a time earlier than the time specified for the end time and execute the command again.

### 12.17.8 is30545

---

**Command Name: ERROR: is30545: No input file is specified**

#### Explanation

The file in which to store the performance data is not specified.

#### System Action

Processing stops.

#### User Action

Specify the file name and execute the command again.

### 12.17.9 is30564

---

**Command Name: INFO: is30564: Performance tool environment was deleted**

#### Explanation

The performance monitoring environment has been deleted normally.

#### System Action

Terminates processing normally.

### 12.17.10 is30570

---

**Command Name: INFO: is30570: Sub Agent is registered normally into SNMP service**

#### Explanation

The performance monitoring tool has been registered in the SNMP service as a subagent.

#### System Action

Terminates processing normally.

### 12.17.11 is30571

---

**Command Name: INFO: is30571: Sub Agent is deleted normally from SNMP service**

#### Explanation

The subagent (performance monitoring tool) has been deleted from the SNMP service.

#### System Action

Terminates processing normally.

## 12.17.12 is30572

---

### **Command Name: INFO: is30572: Sub Agent is already registered into SNMP service**

#### Explanation

Because the performance monitoring tool has already been registered in the SNMP service as a subagent, there is no need to execute the registration command.

#### System Action

Processing stops.

## 12.17.13 is30573

---

### **Command Name: INFO: is30573: Sub Agent is not registered into SNMP service**

#### Explanation

Because the performance monitoring tool has not been registered in the SNMP service as a subagent, there is no need to execute the deletion command.

#### System Action

Processing stops.

## 12.17.14 is30574

---

### **Command Name: INFO: is30574: SNMP service is not installed**

#### Explanation

Because the SNMP service has not been installed, the performance monitoring tool cannot be registered as a subagent.

#### System Action

Processing stops.

#### User Action

Install the SNMP service, and then execute the command again.

## 12.17.15 is30575

---

### **Command Name: ERROR: is30575: Registry data base is destroyed**

#### Explanation

Because the registry database has been destroyed, the performance monitoring tool cannot be registered in or deleted from the SNMP service.

#### System Action

Processing stops.

#### User Action

Recover the registry database, and then execute the command again.

## 12.17.16 is30576

---

### Command Name: **ERROR: is30576: Failed in access to registry**

#### Explanation

Because access to the registry database has failed, the performance monitoring tool cannot be registered in or deleted from the SNMP service.

#### System Action

Processing stops.

#### User Action

Restart the machine, and then execute the command again. If the same error occurs, check the registry and try again. If it still does not work, execute the *ispunsetagt* command and try again.

## 12.17.17 is30577

---

### Command Name: **ERROR: is30577: Registry area is insufficient**

#### Explanation

Because the registry area contains too little space to write data, the performance monitoring tool cannot be registered in or deleted from the SNMP service.

#### System Action

Processing stops.

#### User Action

Activate 'System' from the Control Panel to display the System Properties window. Select the 'Performance' tab and then increase the maximum registry size in the 'Virtual Memory' section. Restart the machine, and then execute the command again. If this error occurs when the *ispsetagt* command is executed, take action after executing the *ispunsetagt* command.

## 12.18 is30600 to is30699

---

This section details the messages with message numbers between is30600 and is30699.

### 12.18.1 is30601

---

#### command name: **INFO: is30601:Collecting resources for the following products**

#### Explanation

The resources for the products displayed under this message are being collected.

#### Message Type

INFO

### 12.18.2 is30602

---

#### command name: **INFO: is30602:Collecting resources for %s**

#### Variable Information

%s = Product abbreviation

#### Explanation

Collection of the product resources will start.

#### Message Type

INFO

### 12.18.3 is30603

---

**command name: INFO: is30603:Resources for %s collected**

#### Variable Information

%s = Product abbreviation

#### Explanation

Collection of the product resources has finished.

#### Message Type

INFO

### 12.18.4 is30604

---

**command name: ERROR: is30604:Insufficient disk space (%s)**

#### Variable Information

%s = Collection target directory

#### Explanation

Resources cannot be collected because the specified directory does not have sufficient space.

#### Message Type

ERROR

#### System Action

Processing is cancelled.

#### User Action

Either specify a different directory or make space available in the specified directory.

### 12.18.5 is30605

---

**command name: WARNING: is30605:The disk space might be insufficient (%s) (%dKB)**

#### Variable Information

%s = Collection target directory

%d = Available disk space (KB)

#### Explanation

Some resources might not be collected because the specified directory does not have sufficient space.

#### Message Type

WARNING

## System Action

Processing is continued.

## User Action

Either specify a different directory or make space available in the specified directory.

## 12.18.6 is30606

---

**command name: WARNING: is30606:The filesystem can not be accessed (%s) Error information(%d)**

### Variable Information

%s = Collection target directory

%d = Error detail

### Explanation

Some resources might not be collected because could not access the specified directory's file system.

### Message Type

WARNING

### System Action

Processing is continued.

### User Action

Either specify a different directory or ensure that the specified directory's file system can be accessed.

## 12.18.7 is30607

---

**command name: ERROR: is30607:Resources for %s failed in collection**

### Variable Information

%s = Product abbreviation

### Explanation

An error occurred during resource collection for the specified product.

### Message Type

ERROR

### System Action

Processing is cancelled.

### User Action

If a message is output informing that there is insufficient disk space, make space available on the disk.

If another error message is output, follow the action advised.

If the cause of the error cannot be removed, send the command output results and collected resources to Fujitsu technical support.

## 12.19 is30800 to is30899

---

This section details the messages with message numbers between is30800 and is30899.

## 12.19.1 is30801

---

**Command name:** ERROR: is30801: An I/O error occurred

### Explanation

An I/O error occurred.

### System Action

Command processing stops.

### User Action

If the Interstage system is running, stop Interstage and restore the disk device that generated the I/O error.

## 12.19.2 is30802

---

**Command name:** ERROR: is30802: A system error occurred: CODE=%s

### Variable Information

%s = Error Information

### Explanation

A system error has occurred.

### System Action

Command processing stops.

### User Action

Take one of the following actions:

#### Windows32/64

- If the error information is 'xxx:xxx:13', the Interstage system file could fail in an editing operation. In this case, close the file that is being edited, and reexecute the command.
- In all other cases, record the error information, collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

#### Solaris32/64 Linux32/64

- If the error information is 'xxx:xxx:13', an Interstage system file is being edited by another process. Close the file that is being edited, and reexecute the command.
- If the error information is '582:1:5:5439488', and secure mode is active, the group nominated for secure mode may have been deleted, or its name may have been changed. Either recreate the group using same group ID, or change the nominated group to an existing group using the *issetsecuritymode* command.
- If the error information is 'CMD 1001 2 91', ensure that when secure mode is active, operations and commands are performed by a super user or by users nominated for secure mode
- In all other cases, if the value that is indicated in the error information is not the one shown above, refer to the system log. If there is another message output at the same time, take action according to the message. If there is not another message output at the same time, record the error information, collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.
- If a message indicates insufficient memory or swap area, wait a moment, and then reexecute the process.

## 12.19.3 is30803

---

**Command name:** ERROR: is30803: TD did not start

#### Explanation

TD did not start.

#### System Action

Command processing stops.

#### User Action

Start TD, and reexecute the command.

### 12.19.4 is30804

---

#### Command name: ERROR: is30804: Setup was not done

#### Explanation

Setup was not done.

#### System Action

Command processing stops.

#### User Action

Perform setup, and reexecute the command.

### 12.19.5 is30805

---

#### Command name: ERROR: is30805: The work unit name is not specified

#### Explanation

The WorkUnit name is not specified so the command cannot be executed.

#### System Action

Command processing stops.

#### User Action

Specify the WorkUnit name, and reexecute the command.

### 12.19.6 is30806

---

#### Command name: ERROR: is30806: An abnormality occurred in the command Reason code(%x)

#### Variable Information

%x = Reason Code

#### Explanation

An error occurred in the command for the reason corresponding to the Reason Code in the following table.

Table 12.39 is30806 Reason Code Causes

Reason Code	Cause
2	The specified WorkUnit is being started.
3	The specified WorkUnit is either stopped or has an invalid name.
4	The definition for the specified WorkUnit name is invalid.
5	The specified WorkUnit is already started.
6	The specified WorkUnit is stopped or does not exist.

Reason Code	Cause
9	The specified WorkUnit is currently being started.
a	The specified WorkUnit is being started.
b	The specified WorkUnit is being stopped.
c	A different user started the WorkUnit.
e	The number of concurrent processes is being changed for the specified WorkUnit.
f	The WorkUnit definitions are being changed for the specified WorkUnit.
10	The specified WorkUnit is performing WorkUnit activation processing.
11	The object that was designated does not exist
12	The TD cannot perform processing because it is currently being started.
13	The component transaction service is not already being started.
14	<b>Windows32/64</b> <b>Solaris32/64</b> The designated DPCF communication path does not exist.
15	<b>Solaris32/64</b> <b>Linux32/64</b> The command must be executed by a user whose login name is no more than 8 bytes.
20	There is a system resource shortage.
21	An I/O error has occurred.
22	A system error has occurred.
28	<b>Solaris32/64</b> <b>Linux32/64</b> An access permission error occurred. When the security control has been reinforced, check whether an appropriate permission is given to the user who executes the command.
30	Failed to execute the system function.
31	The EXTP is not installed properly.
32	The component transaction service is not installed properly.
33	On of the following occurred: <ul style="list-style-type: none"> <li>- An invalid WorkUnit name was specified.</li> <li>- The activation change of the WorkUnit was not executed.</li> <li>- The previous environment of the WorkUnit was already restored during the WorkUnit activation change</li> <li>- The previous environment of the WorkUnit was already deleted during the WorkUnit activation change</li> <li>- The WorkUnit was stopped during activation change processing before the switch to new environment (change) phase.</li> </ul>
34	During WorkUnit activation change, a statement that cannot be changed was changed, and an application was added or deleted. Correct the WorkUnit configuration, and process it again.
35	WorkUnit configuration does not exist. Check the WorkUnit status. Register the WorkUnit configuration for activation change using the following command: <ul style="list-style-type: none"> <li>- ischangewudef</li> </ul>
36	The preparation (prepare) phase of the WorkUnit activation change is not complete. Check the WorkUnit status. The following commands cannot be executed while the WorkUnit is in this state: <ul style="list-style-type: none"> <li>- ischangewu</li> </ul>

Reason Code	Cause
	- iscommitwu
37	<p>The preparation (prepare) phase of the WorkUnit activation change is being processed. Check the WorkUnit status.</p> <p>The following commands cannot be executed while the WorkUnit is in this state:</p> <ul style="list-style-type: none"> <li>- ispreparewu</li> <li>- ischangewu</li> <li>- iscommitwu</li> <li>- isrollbackwu</li> </ul>
38	<p>The preparation (prepare) phase of the WorkUnit activation change is complete. Check the WorkUnit status.</p> <p>The following commands cannot be executed while the WorkUnit is in this state:</p> <ul style="list-style-type: none"> <li>- ispreparewu</li> <li>- iscommitwu</li> </ul>
39	<p>The switch to new environment (change) phase of the WorkUnit activation change is complete. Check the WorkUnit status.</p> <p>The following commands cannot be executed while the WorkUnit is in this state:</p> <ul style="list-style-type: none"> <li>- ispreparewu</li> <li>- ischangewu</li> </ul>
3a	<p>The old environment deletion phase of the WorkUnit activation change is being processed. Check the WorkUnit status.</p> <p>The following commands cannot be executed while the WorkUnit is in this state:</p> <ul style="list-style-type: none"> <li>- ispreparewu</li> <li>- ischangewu</li> <li>- iscommitwu</li> <li>- isrollbackwu</li> </ul>
3b	<p>The old environment restoration (commit or rollback) phase of the WorkUnit activation change is being processed. Check the WorkUnit status.</p> <p>The following commands cannot be executed while the WorkUnit is in this state:</p> <ul style="list-style-type: none"> <li>- ispreparewu</li> <li>- ischangewu</li> <li>- iscommitwu</li> <li>- isrollbackwu</li> </ul>
40	The user ID for the person entering commands has not been correctly registered in the system.
41	<p>Either:</p> <p>the CORBA WorkUnit to which the specified Implementation Repository ID or the interface name in the Implementation Repository ID belongs is stopped or not defined.</p> <p>the EJB WorkUnit to which the specified EJB application belongs is stopped or not defined.</p> <p>the transaction application or wrapper WorkUnit to which the specified object belongs is stopped or not defined.</p>
42	Either:

Reason Code	Cause
	(for CORBA WorkUnits) the specified Implementation Repository ID or the interface name in the Implementation Repository ID is in cancel closure state. (for EJB WorkUnits) the specified EJB application is in cancel closure state. (for transaction application or wrapper WorkUnits) the specified object is in cancel closure state.
43	Either: (for CORBA WorkUnits) the specified Implementation Repository ID or the interface name in the Implementation Repository ID is in closure state. (for EJB WorkUnits) the specified EJB application is in closure state. (for transaction application or wrapper WorkUnits) the specified object is in closure state.
44	The specified WorkUnit or object type cannot be used with this function.
45	Processing is terminated because the specified WorkUnit is forcibly stopped.
46	The startup process of the specified WorkUnit is not completed. Or The specified WorkUnit is being recovered.
47	The specified WorkUnit is being degenerated.
48	The specified WorkUnit has not been degenerated.
49	The specified application maintains instances.
50	A resource shortage occurred during command initialization.
51 to ff	<b>Windows32/64</b> The command execution failed for some reason. Refer to the event log for the cause of the error. <b>Solaris32/64</b> <b>Linux32/64</b> The command execution failed for some reason. Refer to the console message for the cause of the error.

### System Action

Command processing stops.

### User Action

Carry out the countermeasures indicated by the reason code, and reexecute the command.

If other reason codes or messages are displayed at the same time, carry out the appropriate countermeasures. If there are no other messages (or if the error continues), collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

## 12.19.7 is30807

**Command name: ERROR: is30807: The command execution failed Reason code(%x)**

### Variable Information

%x = Reason Code

### Explanation

An error occurred in the command for the reason shown in the Reason Code in the following table.

Table 12.40 is30807 Reason Code Causes

Reason Code	Cause
2	The specified WorkUnit is being processed. Check the status of the WorkUnit and take action according to [User Action] as described in the EXTP4406 message.

Reason Code	Cause
3	The specified WorkUnit has stopped, or there was an error in the WorkUnit name. Check the status of the WorkUnit and take the appropriate action.
4	There was an error in the specified WorkUnit definition. Check the registration status of the WorkUnit using the <i>islistwundef</i> and <i>isinfwundef</i> commands and take the appropriate action.
5	The specified WorkUnit has already started. Check the runtime status of the WorkUnit and take the appropriate action.
6	The specified WorkUnit has stopped, or does not exist. Check the status of the WorkUnit and take the appropriate action.
9	The specified WorkUnit is starting up. Activate or stop the WorkUnit.
a	The specified WorkUnit is in the process of being started. Check the status of the WorkUnit and take the appropriate action.
b	The specified WorkUnit is in the process of being stopped. Check the status of the WorkUnit and take appropriate action.
c	This is not the user who started the WorkUnit. Stop the WorkUnit as the user who started it.
e	The specified WorkUnit process concurrency is being changed. Check the status of the WorkUnit and take the appropriate action.
f	The specified WorkUnit definition is being changed. Check the status of the WorkUnit and take the appropriate action.
10	The specified WorkUnit is being activated. Check the status of the WorkUnit and take the appropriate action.
11	The specified object does not exist. Check the status of the object and take the appropriate action.
12	Could not process because the component transaction service is starting up. Check the status of the component transaction service and take the appropriate action.
13	The component transaction service has not started. Check the status of the component transaction service and take the appropriate action.
14	 The specified DPCF communication path does not exist. Check the status of the DPCF communication path and take appropriate action.
15	 The user name of the user who executed the command exceeds 8 characters. Login with a user name of 8 characters or less.
20	There are not enough system resources. Refer to the Tuning Guide, reestimate the IPC resources and memory that are needed to run Interstage, and confirm that there is enough.
21	An I/O error occurred.
22	A system error occurred. Use the <i>iscollectinfo</i> command to collect investigation information. Send the error information to a Systems Engineer.
28	 An access authority error occurred. If secure mode is active, check that the authority of the user who executed the command is sufficient.
30	Failed to execute the system function. Reexecute processing. If this trouble still happens, use the <i>iscollectinfo</i> command to collect investigation information. Send the error information to a Systems Engineer.
31	EXTP has not been installed correctly. Reinstall Interstage Application Server.
32	The component transaction service has not been installed correctly. Reinstall Interstage Application Server.

Reason Code	Cause
33	<p>On of the following occurred:</p> <ul style="list-style-type: none"> <li>- An invalid WorkUnit name was specified.</li> <li>- The activation change of the WorkUnit was not executed.</li> <li>- The previous environment of the WorkUnit was already restored during the WorkUnit activation change</li> <li>- The previous environment of the WorkUnit was already deleted during the WorkUnit activation change</li> <li>- The WorkUnit was stopped during activation change processing before the switch to new environment (change) phase.</li> </ul>
34	<p>During WorkUnit activation change, a statement that cannot be changed was changed, and an application was added or deleted. Correct the WorkUnit configuration, and process it again.</p>
35	<p>WorkUnit configuration does not exist. Check the WorkUnit status.</p> <p>Register the WorkUnit configuration for activation change using the following command:</p> <ul style="list-style-type: none"> <li>- ischangewudef</li> </ul>
36	<p>The preparation (prepare) phase of the WorkUnit activation change is not complete. Check the WorkUnit status.</p> <p>The following commands cannot be executed while the WorkUnit is in this state:</p> <ul style="list-style-type: none"> <li>- ischangewu</li> <li>- iscommitwu</li> </ul>
37	<p>The preparation (prepare) phase of the WorkUnit activation change is being processed. Check the WorkUnit status.</p> <p>The following commands cannot be executed while the WorkUnit is in this state:</p> <ul style="list-style-type: none"> <li>- ispreparewu</li> <li>- ischangewu</li> <li>- iscommitwu</li> <li>- isrollbackwu</li> </ul>
38	<p>The preparation (prepare) phase of the WorkUnit activation change is complete. Check the WorkUnit status.</p> <p>The following commands cannot be executed while the WorkUnit is in this state:</p> <ul style="list-style-type: none"> <li>- ispreparewu</li> <li>- iscommitwu</li> </ul>
39	<p>The switch to new environment (change) phase of the WorkUnit activation change is complete. Check the WorkUnit status.</p> <p>The following commands cannot be executed while the WorkUnit is in this state:</p> <ul style="list-style-type: none"> <li>- ispreparewu</li> <li>- ischangewu</li> </ul>
3a	<p>The old environment deletion phase of the WorkUnit activation change is being processed. Check the WorkUnit status.</p> <p>The following commands cannot be executed while the WorkUnit is in this state:</p> <ul style="list-style-type: none"> <li>- ispreparewu</li> <li>- ischangewu</li> </ul>

Reason Code	Cause
	<ul style="list-style-type: none"> <li>- iscommitwu</li> <li>- isrollbackwu</li> </ul>
3b	<p>The old environment restoration (commit or rollback) phase of the WorkUnit activation change is being processed. Check the WorkUnit status.</p> <p>The following commands cannot be executed while the WorkUnit is in this state:</p> <ul style="list-style-type: none"> <li>- ispreparewu</li> <li>- ischangewu</li> <li>- iscommitwu</li> <li>- isrollbackwu</li> </ul>
40	<p>The user ID of the user who executed the command has not been registered in the system correctly. Check the registration status of the user who executed the command.</p>
41	<p>The WorkUnit has a stop status, or the WorkUnit has not been defined.</p> <p>WorkUnits are shown below by component.</p> <p>In CORBA, the WorkUnit that belongs to the specified implementation repository ID or the interface name in the implementation repository ID.</p> <p>In EJB, the WorkUnit that belongs to the specified EJB application.</p> <p>If the WorkUnit is a transaction application WorkUnit or a wrapper WorkUnit, the WorkUnit belongs to the specified object.</p>
42	<p>The following have unblocked status.</p> <p>WorkUnits are shown below by component.</p> <p>In CORBA, the specified implementation repository ID or the interface name in the implementation repository ID.</p> <p>In EJB, the specified EJB application.</p> <p>If the WorkUnit is a transaction application WorkUnit or a wrapper WorkUnit, the specified object.</p>
43	<p>The following have blocked status.</p> <p>WorkUnits are shown below by component.</p> <p>In CORBA, the specified implementation repository ID or the interface name in the implementation repository ID.</p> <p>In EJB, the specified EJB application.</p> <p>In a transaction application WorkUnit or a wrapper WorkUnit, the specified object.</p>
44	<p>The specified WorkUnit or object type cannot be used in this function.</p>
45	<p>Processing was interrupted because the specified WorkUnit was stopped by force. Check the status of the WorkUnit and take the appropriate action.</p>
45	<p>The stop process was restored by a timeout. The stop process is continued. Processing was interrupted because the specified WorkUnit was stopped by force. Check the status of the WorkUnit and take the appropriate action.</p>
46	<p>The specified WorkUnit does not have completed start status. Alternatively, the specified WorkUnit is being recovered. Check the status of the WorkUnit and take the appropriate action.</p>
47	<p>The specified WorkUnit is being degenerated. Check the status of the WorkUnit and take the appropriate action.</p>
48	<p>The specified WorkUnit has not been degenerated. Check the status of the WorkUnit and take appropriate action.</p>

Reason Code	Cause
49	The specified application maintains instances.
50	There were not enough resources for initialization of the command. Wait for a while and reexecute processing.
51 to fe	The command execution failed. Refer to the following for the cause of the error. <a href="#">Windows32/64</a> Event log. <a href="#">Solaris32/64</a> <a href="#">Linux32/64</a> System log
ff	There may be a problem with the application on the WorkUnit. Take one of the following actions: <ul style="list-style-type: none"> <li>- Check whether there is a problem with the application.</li> <li>- If the WorkUnit is IJServer, check the container log (container.log) and startup information file (info.log).</li> </ul> If there is no problem with the above, refer to the following for the cause of the error. <a href="#">Windows32/64</a> Event log <a href="#">Solaris32/64</a> <a href="#">Linux32/64</a> System log

#### System Action

Command processing stops.

#### User Action

Carry out the countermeasures indicated by the reason code, and reexecute the command. If other reason codes or messages are displayed at the same time, carry out the appropriate countermeasures. If there are no other messages (or if the error continues), collect diagnostic information using the *iscollectinfo* command, contact your systems engineer.

## 12.19.8 is30808

**Command name: ERROR: is30808: The work unit name is too long**

#### Explanation

The WorkUnit name is too long.

#### System Action

Command processing stops.

#### User Action

Check the WorkUnit name, and reexecute the command.

## 12.19.9 is30810

**Command name: INFO: is30810: No supported WorkUnits are running**

#### Explanation

The function executed only supports CORBA WorkUnits but there are no CORBA WorkUnits currently running.

## 12.19.10 is30811

---

**Command name: ERROR: is30811: The WorkUnit that was specified is not a supported type**

### Explanation

The function executed only supports CORBA WorkUnits, but the WorkUnit specified is not a CORBA WorkUnit.

### System Action

Stops processing of the command.

### User Action

Check the type of the specified WorkUnit. If the WorkUnit name is incorrect, change it and reexecute the command.

## 12.19.11 is30812

---

**Command name: ERROR: is30812: The WorkUnit has stopped, or the WorkUnit name is incorrect**

### Explanation

The WorkUnit that was specified has stopped, or the WorkUnit name is incorrect.

### System Action

Stops processing of the command.

### User Action

Use the *islistwu* command to check the status of the specified WorkUnit. Also, check the WorkUnit name. If it is incorrect, change it and reexecute the command.

## 12.19.12 is30821

---

**Command name: ERROR: is30821: No parameter for the -%s option**

### Variable Information

%s = Option Name

### Explanation

The argument for the option shown in the Variable Information has not been specified.

### System Action

Command processing stops.

### User Action

Specify the option argument, and reexecute the command.

## 12.19.13 is30822

---

**Command name: ERROR: is30822: Work unit of %s classification cannot be specified in case of -s option**

### Variable Information

%s = WorkUnit Kind

#### Explanation

The '-s' option is not valid for WorkUnits of the classification given in the variable information.

#### System Action

Command processing stops.

#### User Action

Specify valid options (not '-s'), and then reexecute the command.

### 12.19.14 is30831

---

#### **Command name: INFO: is30831: There are no work units in use**

#### Explanation

There are no active WorkUnits.

#### System Action

Command processing stops.

### 12.19.15 is30832

---

#### **Command name: INFO: is30832: The work unit in use and registered does not exist**

#### Explanation

There is no active WorkUnit that has been registered.

#### System Action

Command processing stops.

### 12.19.16 is30841

---

#### **Command name: ERROR: is30841: The object or application in use does not exist**

#### Explanation

There is no active object or application.

#### System Action

Command processing stops.

#### User Action

Specify the right object or application name, and reexecute the command.

### 12.19.17 is30851

---

#### **Command name: ERROR: is30851: The object or application name is not specified**

#### Explanation

The object or application name is not specified.

### System Action

Command processing stops.

### User Action

Specify the object or application name, and reexecute the command.

## 12.19.18 is30852

---

**Command name: ERROR: is30852: The object or application name is too long**

### Explanation

The object or application name is too long.

### System Action

Command processing stops.

### User Action

Check the object and application name, and reexecute the command.

## 12.19.19 is30853

---

**Command name: ERROR: is30853: The specified object or application does not exist**

### Explanation

The specified object or application does not exist.

### System Action

Command processing stops.

### User Action

Check the object and application name, and reexecute the command.

## 12.19.20 is30861

---

**Command name: ERROR: is30861: The work unit name or the que name is not specified**

### Explanation

The WorkUnit name or the queue name has not been specified.

### System Action

Command processing stops.

### User Action

Specify a WorkUnit or a queue name, and reexecute the command.

## 12.19.21 is30862

---

**Command name: ERROR: is30862: The work unit name or the que name is too long**

### Explanation

A WorkUnit name or a queue name is too long.

### System Action

Command processing stops.

### User Action

Enter a valid WorkUnit name or a queue name, and then reexecute the command.

## 12.19.22 is30863

---

**Command name: ERROR: is30863:Operand '%s' can be specified only when pplication type is 'CORBA'**

### Variable Information

%s = Operand

### Explanation

There is an error in the operand.

### System Action

Command processing stops.

### User Action

Enter a valid operand, and then reexecute the command.

## 12.19.23 is30864

---

**Command name: ERROR: is30864:Specified quename (%s) is not exist**

### Variable Information

%s = Queue name

### Explanation

The specified queue does not exist.

### System Action

Command processing stops.

### User Action

Enter a valid queue name, and then reexecute the command.

## 12.19.24 is30865

---

**Command name: ERROR: is30865:The object name is not specified**

### Explanation

The object name is not specified.

### System Action

Command processing stops.

#### User Action

Specify an object name, and then reexecute the command.

### 12.19.25 is30866

---

**Command name: ERROR: is30866:Work unit kind contains an error: WU=%s**

#### Variable Information

%s = WorkUnit name

#### Explanation

There is an error in the WorkUnit classification.

#### System Action

Command processing stops.

#### User Action

This function cannot be used about the WorkUnit classification.

### 12.19.26 is30867

---

**Command name: ERROR: is30867:The specified que is already inhibited**

#### Explanation

The specified queue is already inhibited.

#### System Action

Command processing stops.

#### User Action

When an error is in a WorkUnit name or a queue name, please process at a right WorkUnit name or right queue again.

### 12.19.27 is30868

---

**Command name: ERROR: is30868:The specified que is already permitted**

#### Explanation

The specified queue has already permitted.

#### System Action

Command processing stops.

#### User Action

When there is an error in a WorkUnit or queue name, correct the name, and reexecute the command.

### 12.19.28 is30890

---

**Command name: INFO: is30890:Collecting information in %s started**

## Variable Information

%s = Directory in which information is to be stored

## Explanation

Information collection for the directory indicated by %s has started.

## 12.19.29 is30891

---

**Command name: INFO: is30891:Collecting information in %s finished**

## Variable Information

%s = Directory in which information is to be stored

## Explanation

Information collection for the directory indicated by %s has ended.

## 12.19.30 is30892

---

**Command name: ERROR: is30892:Creating a directory for collecting information failed**

## Explanation

The directory in which information was to be stored could not be allocated.

## System Action

Command processing stops.

## User Action

The information storage destination may be in one of the following states.

- The information storage destination is a read-only medium.
- Write authority to the information storage destination has not been granted.
- A non-existent drive was specified (for Windows).
- The information storage destination has no free space.
- The data store destination is a file instead of a directory.

Specify a valid information storage destination.

There is a possibility that the maximum path length supported by the OS was exceeded when the directory was created. Shorten the path of the directory for storing the resources.

When the Command name is *iscollectinfo*, a directory may already exist storing information of the following format:

**Windows32/64**

<specified directory>\collect\<YYYYMMDDHHMMSS>

**Solaris32/64**

<specified directory>/collect/<YYYYMMDDHHMMSS>/<system>

**Linux32/64**

<specified directory>/collect/<YYYYMMDDHHMMSS>/default

After checking the following, execute the command again.

Do not execute the *iscollectinfo* command simultaneously at another terminal.

The time shown by the operating system clock is correct.

Refer to "iscollectinfo" in the "Maintenance Commands" chapter of the Reference Manual (Command Edition) about the details of the format of the information storing directory of the *iscollectinfo* command.

### 12.19.31 is30893

---

**Command name: ERROR: is30893:Path length is too long**

#### Explanation

The path name of the information storage directory is too long.

#### System Action

Command processing stops.

#### User Action

The total length of the information storage directory path name must not exceed 1024 bytes. Store information in a directory with a shorter path name.

### 12.19.32 is30894

---

**Command name: ERROR: is30894:Creating a process failed**

#### Explanation

A process for collecting information could not be created.

#### System Action

Command processing stops.

#### User Action

Terminate unnecessary applications to increase the free memory space in the system.

### 12.19.33 is30895

---

**Command name: ERROR: is30895:Getting Interstage installation path failed**

#### Explanation

The Interstage installation path could not be obtained.

#### System Action

Command processing stops.

#### User Action

Interstage is not installed correctly. Enter the command in an environment in which Interstage is installed correctly.

### 12.19.34 is30896

---

**Command name: ERROR: is30896:The Interstage installation path is specified to storage path**

## Explanation

### Solaris32/64

The data store destination of the batch information collection tool is specified to be allocated to the Interstage installation destination. Alternatively, the path specified as the data store destination of the batch information collection tool contains the string '/FSUN' or '/FJSV'.

### Linux32/64

The data store destination of the batch information collection tool is specified to be allocated to the Interstage installation destination. Alternatively, the path specified as the data store destination of the batch information collection tool contains the string '/FJSV'.

## System Action

Command processing stops.

## User Action

Check the data store destination of the batch information collection tool.

### Solaris32/64

If the path specified as the data store destination of the batch information collection tool contains the string '/FSUN' or '/FJSV', specify a data store destination that does not contain '/FSUN' and '/FJSV'.

### Linux32/64

If the path specified as the data store destination of the batch information collection tool contains the string '/FJSV', specify a data store destination that does not contain '/FJSV'.

## 12.20 is30900 to is30999

---

This section details the messages with message numbers between is30900 and is30999.

### 12.20.1 is30901

---

**Command name:** ERROR: is30901:Creating INTERSTAGE system resources is failed SERVICE=%s

#### Variable Information

%s = Service Name

#### Explanation

System resource creation failed.

#### System Action

Command processing stops.

#### User Action

If an extended system resource with the same name still exists, delete the corresponding system using the *isdeletesys* command, and then reexecute the command.

### 12.20.2 is30902

---

**Command name:** ERROR: is30902:Specified system name is already exist

#### Explanation

The specified system already exists.

### System Action

Command processing stops.

### User Action

Specify a different system name, or delete the corresponding system, and then reexecute the command.

## 12.20.3 is30903

---

**Command name: ERROR: is30903:Specified directory is not exist PATH=%s**

### Variable Information

%s = Path Name

### Explanation

The specified directory does not exist.

### System Action

Command processing stops.

### User Action

Create the specified directory, and then reexecute the command.

## 12.20.4 is30904

---

**Command name: ERROR: is30904: Exceed the maximum number of system**

### Explanation

The maximum number of the systems has been exceeded.

### System Action

Command processing stops.

### User Action

If necessary, delete an existing system, and then reexecute the command.

## 12.20.5 is30905

---

**Command name: ERROR: is30905:It can not be able to specify a reserved word for system name**

### Explanation

'td001', 'ec001', or 'default' is specified as the system name.

### System Action

Command processing stops.

### User Action

Respecify the system name using only non-reserved words, and then reexecute the command.

## 12.20.6 is30906

---

**Command name: ERROR: is30906: Specified directory is already exist PATH=%s**

### Variable Information

%s = Path Name

### Explanation

The directory shown in the variable information already exists.

### System Action

Command processing stops.

### User Action

Specify a different directory from the one shown in the variable information, and then reexecute the command.

## 12.20.7 is30907

---

**Command name: ERROR: is30907:Deleting INTERSTAGE system resources is failed SERVICE=%s**

### Variable Information

%s = Service Name

### Explanation

Interstage system resource could not be deleted.

### System Action

Command processing stops.

### User Action

Refer to the message output before this message, and take action according to the message. Also, verify that the directory the command was executed from is not the directory to be deleted:

```
var/opt/FJSVisas/system/ System name
```

If command processing failed because CORBA Service or Event Service was running, take the following action.

- Stop Event Service, by executing the following command.  
> esstop -o off -M system-name
- Stop CORBA Service, by executing the following command.  
> OD\_stop -M system-name

## 12.20.8 is30908

---

**Command name: ERROR: is30908: Deleting system directory is failed PATH=%s**

### Variable Information

%s = Service Name

### Explanation

The specified system directory could not be deleted.

### System Action

Command processing stops.

### User Action

Verify that the directory the command was executed from is not the target deletion directory. Also, check the message and system log output before this message.

## 12.20.9 is30909

---

---

**Command name: ERROR: is30909:There is not such a system**

Explanation

The specified system does not exist.

System Action

Command processing stops.

User Action

Specify a correct system name, and then reexecute the command.

## 12.20.10 is30911

---

**Command name: ERROR: is30911:The indispensable package is not installed Package name=%s**

Variable Information

%s = Package name

Explanation

The mandatory package is not installed.

System Action

Command processing stops.

User Action

Install the mandatory package shown in the variable information, and then reexecute the command.

**Solaris32/64** **Linux32/64**

Alternately, refer to the system log. If a message indicates insufficient memory or swap area, wait a moment, and then reexecute the process.

## 12.20.11 is30912

---

**Command name: ERROR: is30912:The system name is invalid**

Explanation

The specified system name is invalid.

System Action

Command processing stops.

User Action

Correct the system name, and then reexecute the command.

## 12.20.12 is30913

---

**Command name: ERROR: is30913:The length of system name is too long**

Explanation

The specified system name exceeds eight bytes.

## System Action

Command processing stops.

## User Action

After correcting the system name, reexecute the command.

## 12.20.13 is30914

---

**Command name: ERROR: is30914:I/O error occurred in system file FILE=%s**

## Variable Information

%s = File name

## Explanation

An I/O error occurred in the system file.

## System Action

Command processing stops.

## User Action

Clear the problem in the file shown in the variable information, and then reexecute the command.

## 12.20.14 is30915

---

**Command name: ERROR: is30915:There is not space in the disk**

## Explanation

There is insufficient free disk space.

## System Action

Command processing stops.

## User Action

Secure sufficient free disk space, and then reexecute the command.

## 12.20.15 is30916

---

**Command name: ERROR: is30916:A system environment error was occurred**

## Explanation

An error was detected in the system environment.

## System Action

Command processing stops.

## User Action

The system information for this system may have been deleted with the *isdeletesys* command. If so, delete this system using the *isdeletesys* command, recreate the system using the *iscreatesys* command, and then restart processing.

## 12.20.16 is30917

---

**Command name: ERROR: is30917:The specified path is too long**

### Explanation

The specified path exceeds 512 bytes.

### System Action

Command processing stops.

### User Action

Specify a path of fewer than 512 bytes, and reexecute the command.

## 12.20.17 is30930

---

**Command name: ERROR: is30930:It failed in backup processing FILE=%s Error information=%d**

### Variable Information

%s = Filename

%d = Error Information

### Explanation

The backup processing of the file indicated by variables information failed.

### System Action

Terminates the command processing.

### User Action

If the filename indicated by the variables information is `isc`, change the path that stores the backup resources that are designated by the command parameter, and reexecute the command.

In all other cases, note the filename and the error information indicted by the variable information and collect diagnostic information using the `iscollectinfo` command, and then contact your systems engineer.

## 12.20.18 is30931

---

**Command name: ERROR: is30931:It failed in backup processing PATH=%s Error information=%d**

### Variable Information

%s = Path name

%d = Error Information

### Explanation

The backup processing of the path indicated by variables information failed.

### System Action

Terminates the command processing.

## User Action

If the path name indicated by the variable information is located under the backup resource storage path designated by the command parameter, change the path that stores the backup resource and is designated by the command parameter. Then reexecute the command.

In all other cases, note the path name and the error information indicated by the variables information, and collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

## 12.20.19 is30932

---

**Command name: ERROR: is30932:The path which stores backup resources does not exist PATH=%s**

### Variable Information

%s = Path name

%d = Error Information

### Explanation

Failed to execute the command because the path in which the backup resources are to be stored does not exist.

### System Action

Terminates the command processing.

### User Action

After creating a path that stores the backup resources, reexecute the command.

## 12.20.20 is30933

---

**Command name: ERROR: is30933:It failed in restoration processing FILE=%s Error information=%d**

### Variable Information

%s = Filename

%d = Error Information

### Explanation

Failed in the backup processing of the file (%s). If the file (%s) is located under the path of the backup resources specified in the argument, possible causes are as follows:

- The backup resources may have been corrupted.
- Interstage setup resources backed up using the *isbackup* command may have been overwritten by Interstage setup resources backed up using the *isbackupsys* command.

### System Action

Command processing stops.

### User Action

If the file (%s) is located under the backup resource storage path designated by the command parameter, change the path that stores the backup resource and is designated by the command parameter. Then reexecute the command.

In all other cases, note the path name and the error information indicated by the variables information, and collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

## 12.20.21 is30934

---

**Command name: ERROR: is30934:It failed in restoration processing PATH=%s Error information=%d**

### Variable Information

%s = Path name

%d = Error Information

### Explanation

The backup processing of the path indicated by variable information failed.

### System Action

Terminates the command processing.

### User Action

If the path name that is indicated by the variable information is located under the backup resource storage path designated by the command parameter, change the path that stores the backup resource and is designated by the command parameter. Then reexecute the command.

In all other cases, note the path name and the error information indicated by the variables information, and collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

## 12.20.22 is30935

---

**Command name: ERROR: is30935: Backup resources already exist in the specified path PATH=%s**

### Variable Information

%s = Path name

### Explanation

Backup resource already exists in the path indicated by the variable information.

### System Action

Command processing stops.

### User Action

Specify a path other than that storing the backup resource (currently designated by the command parameter), and reexecute the command.

## 12.20.23 is30936

---

**Command name: ERROR: is30936:The service under operation exists SERVICE=%s**

### Variable Information

%s = Service Name

### Explanation

Failed to execute the command because the service indicated by the variable information is already started.

### System Action

Command processing stops.

## User Action

After stopping the service indicated by the variable information, reexecute the command.

## 12.20.24 is30937

---

**Command name: ERROR: is30937:A system error occurred Error information=%d**

### Variable Information

%d = Error Information

### Explanation

System error has occurred.

### System Action

Command processing stops.

### User Action

Record the error information, collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

## 12.20.25 is30938

---

**Command name: ERROR: is30938:Required component is not installed Error Information=%s**

### Variable Information

%d = Error Information

### Explanation

Failed to execute the command because an error was detected in the service, or in the library indicated by the variable information.

### System Action

Terminates the command processing.

### User Action

Either install the necessary components or reinstall Interstage because the file is damaged.

## 12.20.26 is30939

---

**Command name: ERROR: is30939:System file access failure FILE=%s Error information=%d**

### Variable Information

%s = Filename

%d = Error Information

### Explanation

An error has occurred at the access to the system file.

### System Action

Terminates the command processing.

## User Action

Record the filename and error information, collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

## 12.20.27 is30940

---

**Command name: ERROR: is30940: Backup resources do not exist in the specified path PATH=%s**

### Variable Information

%s = Path name

### Explanation

Backup resource does not exist in the path indicated by variable information.

### System Action

Command processing stops.

### User Action

Specify the path in which the backup resource exists, and reexecute the command.

## 12.20.28 is30941

---

**Command name: ERROR: is30941: Permission to access the file or directory is not granted PATH=%s**

### Variable Information

%s = Filename or path name

### Explanation

The file or the path indicated by the variable information does not have access rights.

### System Action

Terminates the command processing.

### User Action

Confirm the access rights of the file and path. Either change the access rights or have a user who has the access rights execute the processing.

## 12.20.29 is30942

---

**Command name: ERROR: is30942: An I/O error occurred PATH=%s**

### Variable Information

%s = Filename or path name

### Explanation

Input/output error has occurred.

### System Action

Command processing stops.

## User Action

Restore the disk device that has caused the input/output error.

### 12.20.30 is30943

---

**Command name: ERROR: is30943: The specified path does not exist PATH=%s**

#### Variable Information

%s = Path name

#### Explanation

The path indicated by the variable information does not exist.

#### System Action

Command processing stops.

#### User Action

Designate the correct path name, and reexecute the command.

### 12.20.31 is30944

---

**Command name: ERROR: is30944:Line %d: The %s statement can't be specified in the plural**

#### Variable Information

%d = Line No.

%s = Statement

#### Explanation

More than one statement cannot be specified to be shown in the variable information.

#### System Action

Command processing stops.

#### User Action

Specify a statement to be shown in the variable information correctly, and then execute the command again.

### 12.20.32 is30945

---

**Command name: ERROR: is30945: The %s statement isn't specified**

#### Variable Information

%s = Statement

#### Explanation

The mandatory statement for the restoration definition was not specified.

#### System Action

Command processing stops.

### User Action

Add the statement from in variable information, and then reexecute the command.

## 12.20.33 is30946

---

**Command name: ERROR: is30946:Line %d: There is an error in the value specified in the %s1 statement Error information (%s2)**

### Variable Information

%d = Line No

%s1 = Statement

%s2 = Error information

### Explanation

The value in the statement specified in the restoration definition has an error as described in the following table.

Table 12.41 is30946 Error Information Explanations

Error information	Cause
PATH_TOOLONG	The specified path name is longer than the limit.
PATH_INVALID	The specified path name is not the name of an absolute path, or is invalid.
PATH_NOTUSECHR	An invalid character was used in the path name.
PATH_NOTDIRECTORY	The specified directory does not exist.
OVER_RANGE	The specified numeric value or the number of the specified characters is out of the range.
TYPE_INVALID	The specified character string is invalid.
FILE_NOTFOUND	The specified file does not exist.

### System Action

Command processing stops.

### User Action

Correct the statement to be shown in the variable information, and then reexecute the command.

## 12.20.34 is30947

---

**Command name: ERROR: is30947:Line %d: There is an error in the description from of the statement**

### Variable Information

%d = Line No

### Explanation

The specified statement does not exist in the restoration definition. Or the coding format of the statement is incorrect.

### System Action

Command processing stops.

### User Action

Correct the statement from variable information, and then reexecute the command.

## 12.20.35 is30948

---

**Command name:** ERROR: is30948: There is an error in the restore definition FILE=%s

### Variable Information

%s = Restore definition file

### Explanation

Restoration cannot be processed due to an error in the restoration definition file.

### System Action

Command processing stops.

### User Action

Correct the statement from the variable information, and then reexecute the command.

## 12.20.36 is30949

---

**Command name:** ERROR: is30949:It failed in restoration processing Error information =%d

### Variable Information

%d = Error information

### Explanation

Restoration cannot be processed due to an error in the restoration definition file.

### System Action

Command processing stops.

### User Action

Take action to rectify the error as described in the table below:

Table 12.42 is30949 Error Information Code Explanations

Error information	Cause	Action
<b>Solaris32/64</b> 2	If the backup source system is different from the restore destination system (the system names are different), it is necessary to specify the restore definition for the argument in the command.	Specify the restore definition, and reexecute the command.
<b>Solaris32/64</b> 3	The backup source system is different from the restore destination system (the system names are different), but the system directories are the same.	Change the restore destination system, and reexecute the command.
<b>Solaris32/64</b> 4	The backup source system is the same as the restore destination system, but the system directories are different.	Change the restore destination system, and reexecute the command.
<b>Solaris32/64</b> 5	The backup resource of the environment initialized in TYPE2 cannot be restored to the extended system.	Change the restore destination system, and reexecute the command.
8	Resources of V9.3 or earlier cannot be restored to systems in which the features below have not been installed. - Multilanguage service	Change the restore destination system, and reexecute the command.

Error information	Cause	Action
	- J2EE compatibility	
9	Resources backed up in systems in which the features below have not been installed cannot be restored to systems in which they have been installed: - Multilanguage service - J2EE compatibility	Change the restore destination system, and reexecute the command.
10	Resources backed up in systems in which the features below have not been installed cannot be restored to systems in which they have been installed: - Multilanguage service - J2EE compatibility	Change the restore destination system, and reexecute the command.
Other	An internal conflict has occurred.	Record the error information, collect diagnostic information using the <i>iscollectinfo</i> command, and then contact your systems engineer.

**Note**

This message is also output if the backed up resources are restored/imported to a different platform. The backed resources can not be restored/imported to a different platform. Restore/import backed up resources collected from the same platform.

## 12.20.37 is30950

**Command name:** ERROR: is30950:An abnormality occurred in the command

**Explanation**

An abnormality occurred in the command.

**System Action**

Command processing stops.

**User Action**

Refer to User Action in the message output in the event log, and reexecute the command.

## 12.20.38 is30952

**Command name:** ERROR: is30952: The machine is not rebooted after package installation

**Explanation**

The machine was not rebooted after the package was installed.

**System Action**

Command processing stops.

**User Action**

Reboot the machine and reexecute the command.

## 12.20.39 is30953

---

**Command name: ERROR: is30953: A restoration definition can not be specified**

### Explanation

The restore definition cannot be specified.

### System Action

Command processing stops.

### User Action

If the system names of the backup source and the restore destination are the same, the restore definition cannot be specified.

The restore definition can be used in multi system applications if export resources are imported to a separate system in the same or another server.

Avoid specifying the restore definition or change the restore destination system, and then reexecute the command.

## 12.20.40 is30954

---

**Command name: ERROR: is30954: The specified host name is too long**

### Explanation

A specified host name exceeds 64 bytes.

### System Action

Command processing stops.

### User Action

Specify a host name of fewer than 64 bytes, and reexecute the command.

## 12.20.41 is30955

---

**Command name:ERROR:is30955:It failed in change processing of service SERVICE=%s Error information=%d**

### Variable Information

%s = Service Name

%d = Error information

### Explanation

Change processing of the service failed.

### System Action

Processing stops.

### User Action

Take action to rectify the error as described in the following table:

Table 12.43 is30955 Error Information Code Explanations

Error information	Cause	Action
1	Attempting to add the service in variable information failed, as the service already existed.  Reference location change processing of the service failed. When the service shown in variable information is 'NamingService' or 'InterfaceRepositoryCacheService', the service already exists in the reference location it was going to change.	Verify that the service being added does not exist already. Verify that the service does not exist at the reference location change does not exist.  Then reexecute the command.
2	Attempting to delete the service in variable information failed, as the service does not exist.	Verify that the service to delete exists, and then reexecute the command.
3	The setup processing of the service shown in variable information failed.	Handle the problem based on any other messages that were output at the same time. (Note)  If there were no other messages, or when a cause cannot be removed, note the error information and collect diagnostic information using the <i>iscollectinfo</i> command, and then contact your systems engineer.
4	Command execution is not possible because an employment form is TYPE2,	Change the employment form to TYPE1 or TYPE3, and then reexecute the command.
5	Command execution is not possible because load balancing is used.	Change without load balance and execute the command again.
Other	An internal conflict has occurred.	Record the error information, collect diagnostic information using the <i>iscollectinfo</i> command, and then contact your systems engineer.

**Note**

If this message is output when the Interstage Management Console is used to configure the system environment settings, it may be output in the following log file:

**Windows32/64**

[Interstage install folder]\td\log\ismodifyservice\_resultlog.txt

**Solaris32/64**

/var/opt/FSUNtd/log/ismodifyservice\_resultlog.txt

**Linux32/64**

/var/opt/FJSVtd/log/ismodifyservice\_resultlog.txt

Multiple operation information is logged in the log file.

Log information for one operation starts on the line containing the string '----- logging start -----'. Because the date of execution of the operation is output after this string, this information can be used to identify the log information for the operation.

## 12.20.42 is30956

---

**Command name:ERROR:is30956:Operand is invalid Error information=%d**

Variable Information

%d = Error information

## Explanation

An operand is invalid.

## System Action

Command processing stops.

## User Action

Take appropriate action according to the error information in the following table:

Table 12.44 is30956 Reason Code Explanations

Reason code	Cause
1	The specified path name is over the maximum length.
2	The path specified in path name does not exist. Or an invalid path was specified.
3	An invalid character was used in the path name.
4	The specified directory does not exist.
5	The numerical value or the number of characters specified is out of range.
6	An invalid character sequence was specified.
7	The value specified in the IR PORT NUMBER statement does not match that of the NS PORT NUMBER.
8	The file specified does not exist.
9	The identifier of the Web server is duplicated.
10	The Interstage HTTP Server cannot be added to, or deleted from, an extended system.
Other	An internal conflict has occurred.

## 12.20.43 is30957

---

### Command name:ERROR:is30957:There is an error in the specified port number

## Explanation

There is an error in the specified port number.

## System Action

Command processing stops.

## User Action

Specify an integer value between 1 and 65535 for the port number, and reexecute the command.

## 12.20.44 is30958

---

### Command name:ERROR:is30958: The command execution failed

## Explanation

Command execution failed.

## System Action

Command processing stops.

## User Action

**Windows32/64**

When other messages are outputted simultaneously, or when the message is outputted to the event log, execute a command again after copying with it with reference to [User Action] of each message.

**Solaris32/64 Linux32/64**

When other messages are outputted simultaneously, or when the message is outputted to the console message, execute a command again after copying with it with reference to [User Action] of each message.

## 12.20.45 is30959

---

**Command name:ERROR:is30959: A remote host(%s) can not use the specified port number Port number =%d**

### Variable Information

%s = Host Name

%d = Port Number

### Explanation

The remote host (Host Name) cannot use the port number (Port Number).

### System Action

Command processing stops.

### User Action

If output by the *ismodifyservice* command, the port number of the reference location for the naming service and that for the interface Repository service may not be the same. Please specify a valid port number, and reexecute the command.

## 12.20.46 is30960

---

**Command name:ERROR: is30960:An error occurred to get state of INTERSTAGE SERVICE=%s**

### Variable Information

%s = Service name

### Explanation

Status information could not be obtained for the service indicated in Variable Information.

### System Action

Command processing stops.

### User Action

**Windows32/64**

If another message was output or if a message was output to the event log, take the action indicated by the User Action for that message then reenter the command.

**Solaris32/64 Linux32/64**

If another message was output or if a message was output to the console message, take the action indicated by the User Action for that message then reenter the command.

In other cases, reenter the command later.

If this message is output frequently, collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

## 12.20.47 is30961

---

**Command name: WARNING: is30961:Failed in starting Interstage Performance Tool or starting Performance superintendence**

### Explanation

The system failed to start the Performance Monitoring Tool or performance monitoring because an error occurred during Performance Monitoring Tool startup or during performance monitoring.

### System Action

Cancels the starting of the Performance Monitoring Tool or performance monitoring.

### User Action

**Windows32/64**

Rectify as indicated by the error message recorded in the event log, and then reexecute the command.

**Solaris32/64 Linux32/64**

Rectify as indicated by the error message recorded in the console message, and then reexecute the command.

## 12.20.48 is30962

---

**Command name: WARNING: is30962:Failed in stopping Interstage Performance Tool**

### Explanation

The system failed to stop the Performance Monitoring Tool because an error occurred during the stopping process.

### System Action

Cancels the stopping of the Performance Monitoring Tool.

### User Action

Rectify as indicated by the error message recorded in the event log, and then reexecute the command.

## 12.20.49 is30963

---

**Command name: WARNING: is30963:The automatic setup of Interstage Application Server went wrong**

### Explanation

The system failed in the automatic setup of the Interstage Application Server.

### System Action

Processing continues.

### User Action

Rectify as indicated by the error message recorded in the event log, and then reexecute the command.

## 12.20.50 is30965

---

**Command name: ERROR: is30965:The error of syntax is in a definition file FILE=%s1 Error information=%s2**

### Variable Information

%s1 = File name

%s2 = Error information

### Explanation

The file indicated in Variable Information contains a syntax error.

### System Action

Command processing stops.

### User Action

Correct the syntax error in the file indicated by Variable Information %s1, and reexecute processing. If the indicated file name is *isconfig.xml*, refer to the Operator's Guide.

If this message appears immediately after installation of Interstage, this error may be caused because the resource used during the previous installation remains. In this case, uninstall Interstage and then install it again, (refer to the Quickstart Guide). During uninstallation, remove the unnecessary directories and files.

## 12.20.51 is30966

---

**Command name: WARNING: is30966:Correlation of the resource modules of Workload Organizer went wrong Module=%s1 Error information=%s2**

### Variable Information

%s1 = Resource module name

%s2 = Error information

### Explanation

Failed to make association with the resource module of Workload Organizer, indicated by [Variable Information].

### System Action

Processing continues.

However, the linkage function to Workload Organizer cannot be used.

### User Action

Take one of the following actions depending on the error information indicated by Variable Information.

## 12.20.52 is30967

---

**Command name:ERROR: is30967: This operation cannot be executed on the Managed Server**

### Explanation

Processing failed because this operation cannot be executed on the Managed Server and the Admin Server.

## System Action

Command processing stops.

## User Action

Login to the Interstage Management Console of the Admin Server and execute the same operation for this server.

Table 12.45 is30966 Error, Cause, Action Table

Error information	Cause	Action
ENAMETOOLONG	The resource module name specified in isconfig.xml is too long.	The maximum length of the resource module name is 63 bytes. Check the resource module name specified in isconfig.xml, and then specify the correct module name.
ENOENT	No resource module is defined.	Check the resource module name defined in Workload Organizer, and then specify the correct module name.
ENXIO	Workload Organizer is not running.	Start Workload Organizer. For details, see the Workload Organizer manual.
ECOMM	Linkage to Workload Organizer failed.	First stop Workload Organizer and then restart it again. For instructions on restarting it, see the Workload Organizer manual. If this message often appears, record the resource module name and error information indicated in [Variable Information], collect diagnostic information using the <i>iscollectinfo</i> command, and then contact your systems engineer.
EIO	A file access error occurred.	Follow another message displayed at the same time by Workload Organizer.
EOTHER	An error occurred.	Follow another message displayed at the same time by Workload Organizer.

## 12.21 is31100 to is31199

---

This section details the messages with message numbers between is31100 and is31199.

### 12.21.1 is31101

---

**Command name:** **ERROR: is31101: Command parameter contains an error**

#### Explanation

There is an error in the parameter of the command.

#### System Action

Command processing stops.

#### User Action

Specify the correct parameter, and reexecute the command.

### 12.21.2 is31102

---

**Command name:** **ERROR: is31102: System does not exist**

#### Explanation

Initialization of the Interstage has not been executed.

## System Action

Command processing stops.

## User Action

Initialize the Interstage, and reexecute.

## 12.21.3 is31103

---

**Command name: ERROR: is31103: System resource shortage occurred: CODE='%s1'**

### Variable Information

%s1 = Error information

### Explanation

Insufficient memory.

### System Action

Command processing stops.

### User Action

Reexecute the process later. If this message is generated frequently, reestimate the memory that is needed to run Interstage (refer to the Tuning Guide), and confirm that there is enough memory.

If there is enough memory to run Interstage, there may be inadequate memory to run other applications. Reestimate the amount of memory needed for the other applications running on the same machine to determine if there is an appropriate amount of memory.

Contact your system administrator if the reestimation indicates that the memory is insufficient. Ask the system administrator to either increase the size of the main memory or to increase the size of the page file.

If the error persists, collect diagnostic information using the *iscollectinfo* command, record the error information, and then contact your systems engineer.

## 12.21.4 is31104

---

**Command name: ERROR: is31104: The work unit is not starting: WU=%s1**

### Variable Information

%s1 = WorkUnit name

### Explanation

The WorkUnit is not starting.

### System Action

Command processing stops.

### User Action

If there is an error in the WorkUnit, reexecute the processing with the correct WorkUnit name.

If there is no problem in the estimated value of the system, collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

## 12.21.5 is31105

---

**Command name: ERROR: is31105: Work unit kind contains an error: WU=%s1**

### Variable Information

%s1 = WorkUnit name

### Explanation

There is an error in the WorkUnit kind.

### System Action

Command processing stops.

### User Action

This function cannot be used for the specified WorkUnit kind.

## 12.21.6 is31106

---

**Command name: ERROR: is31106: Executable file does not exist: WU=%s1 FILE=%s2**

### Variable Information

%s1 = WorkUnit name

%s2 = Executable file name

### Explanation

The executable file does not exist.

### System Action

Command processing stops.

### User Action

If there is an error in the executable file name, restart the processing with a correct executable file name.

## 12.21.7 is31107

---

**Command name: INFO: is31107: The execution of the command was normally completed: WU=%s1 FILE=%s2**

### Variable Information

%s1 = WorkUnit name

%s2 = Executable file name

### Explanation

The command was executed normally.

## 12.21.8 is31108

---

**Command name: ERROR: is31108: A memory shortage occurred: CODE='%s1'**

### Variable Information

%s1 = Error information

### Explanation

A memory shortage occurred.

### System Action

Command processing stops.

## User Action

After a few moments, restart the process. If this message is generated frequently, refer to the Tuning Guide, reestimate the memory required to run Interstage, and check that there is sufficient memory.

If there is sufficient memory to run Interstage, there may be inadequate memory to run other applications. Reestimate the amount of memory required for the other applications running on the same machine to determine if there is an appropriate amount of memory.

Contact your system administrator if the reestimation indicates that memory is insufficient. Ask the system administrator to either increase the size of the main memory or to increase the size of the swap region.

## 12.21.9 is31109

---

**Command name:** ERROR: is31109: A system error occurred: CODE='%s1' INFO='%s2'

### Variable Information

%s1 = Error information 1

%s2 = Error information 2

### Explanation

A system error occurred. Alternatively, there is a memory shortage.

### System Action

Command processing stops.

### User Action

If there is a possibility of memory shortage, refer to the Tuning Guide. Reestimate the memory required to run Interstage and check that there is sufficient memory.

If there is sufficient memory to run Interstage, there may be inadequate memory to run other applications. Reestimate the amount of memory required for the other applications running on the same machine to determine if there is an appropriate amount of memory.

Contact your system administrator if the reestimation indicates that the memory is insufficient. Ask the system administrator to either increase the size of the main memory or to increase the size of the swap region.

If there is no problem in the estimated value of the system, collect diagnostic information using the *iscollectinfo* command, and then contact your systems engineer.

## 12.21.10 is31110

---

**Command name:** ERROR: is31110: This is not the user who started the work unit: WU='%s1' USER1='%s2' USER2='%s3'

### Variable Information

%s1 = WorkUnit name

%s2 = User name

%s3 = WorkUnit activation user name

### Explanation

Stops processing for the WorkUnit because this is not the user who started the processing.

### System Action

Command processing stops.

### User Action

Execute processing for the WorkUnit by the user who started the processing.

## 12.21.11 is31111

---

**Command name: ERROR: is31111: The system name is too long**

### Explanation

The designated system name is too long.

### System Action

Terminates the command processing.

### User Action

Check the system name, and reexecute the command.

## 12.21.12 is31112

---

**Command name: ERROR: is31112: The work unit name is too long**

### Explanation

The specified WorkUnit name is too long.

### System Action

Command processing stops.

### User Action

Check the WorkUnit name, and reexecute the command.

## 12.21.13 is31113

---

**Command name: ERROR: is31113: The executable file name is too long**

### Explanation

The specified executable file name is too long.

### System Action

Command processing stops.

### User Action

Check the executable file name, and reexecute the command.

## 12.22 is31200 to is31299

---

This section details the messages with message numbers between is31200 and is31299.

### 12.22.1 is31201

---

**Command name: ERROR: is31201: A parameter in the command contains an error.**

### Explanation

There is an error in the parameter of the command.

## System Action

Terminates the processing

## User Action

Specify the correct parameter and reexecute the command.

## 12.22.2 is31202

---

**Command name: INFO: is31202: The command processing has been completed.**

### Explanation

The command processing has been completed.

### System Action

The command processing was completed normally.

## 12.22.3 is31203

---

**Command name: ERROR: is31203: One or more file could not be copied.**

### Explanation

One or more file could not be copied.

### System Action

After attempting to copy all the files to be copied, information for the failed file and the cause of the failure is output.

### User Action

The command log is output to the <Interstage installation folder> \var\issetcompatiblepath.log file.

The log file is output in the following format:

[File] <<file-name>> [Target folder] <<folder-name-to-copy-to>> [result] <<copy-result>> [detail] <<(if copying failed) Detail information>>

Refer to the log file and check the following items, remove the cause of the error and reexecute the command.

- If the access right has not been set properly, change the access right so that files and folders to be copied can be accessed.
- If an I/O error was generated, check if the disk device where Interstage has been installed is operating normally.
- Terminate if Interstage is being activated.
- Terminate other software that uses the file to be copied.
- Check if there is sufficient capacity for the copied files

## 12.22.4 is31204

---

**Command name: ERROR: is31204: Some paths could not be added because the environment variable, PATH, exceeded 1023 bytes.**

### Explanation

Some paths could not be added because the environment variable, PATH, exceeded 1023 bytes.

### System Action

Adds the paths that are less than 1023 bytes to the environment variables, PATH, and outputs to the file the path names that could not be added.

## User Action

Paths that could not be added to the environmental variable, PATH, are output to <Interstage installation folder> \path2.txt. Delete the unnecessary paths from the environment variables, then add manually the paths from 'path2.txt' or execute the command again.

## 12.22.5 is31205

---

**Command name: ERROR: is31205: The command is being executed.**

### Explanation

The command is being executed.

### System Action

Terminates the processing.

### User Action

If the command being executed is terminated normally by another process, there is no need to reexecute this command.

## 12.22.6 is31210

---

**Command name: ERROR: is31210: An internal error has been generated. Error information=%s**

### Variable Information

%s = error information

### Explanation

An internal error has been generated.

### System Action

Terminates the processing.

### User Action

Collect error data using the *iscollectinfo* command, and contact the engineer in charge.

## 12.22.7 is31211

---

**Command name: ERROR: is31211: The user does not have the execution rights for the command.**

### Explanation

The user does not have the execution rights for the command.

### System Action

Terminates the processing.

### User Action

Arrange for the user who has the execution rights to execute the command.

## 12.22.8 is31212

---

**Command name: ERROR: is31212: The memory is insufficient.**

### Explanation

The memory is insufficient.

### System Action

Terminates the processing.

### User Action

Terminate unnecessary programs.

## 12.22.9 is31215

---

**Command name: ERROR: is31215: The file cannot be written to file=%s**

### Variable Information

%s = File name

### Explanation

The file cannot be written to file

### System Action

Terminates the processing.

### User Action

Check the following items:

- If the access right has not been set properly, change the access right so that the files and directories specified can be accessed.
- When an I/O error was generated, check if the disk device where Interstage has been installed is operating normally.
- Terminate other applications that use the file

## 12.22.10 is31216

---

**Command name: ERROR: is31216: The file cannot be read file=%s**

### Variable Information

%s = File name

### Explanation

The file cannot be read file.

### System Action

Terminates the processing.

### User Action

Check the following items:

- If the access right has not been set properly, change the access right so that the files and directories specified can be accessed.
- When an I/O error was generated, check if the disk device where Interstage has been installed is operating normally.
- Terminate other applications that use the file

## 12.22.11 is31217

---

**Command name: ERROR: is31217: The folder could not be created Folder=%s1 Error information=%s2**

## Variable Information

%s1 = File name

%s2 = Error information

## Explanation

The folder could not be created Folder.

## System Action

Terminates the processing.

## User Action

Check the following items:

- If the access right has not been set properly, change the access right so that the folders specified can be accessed.
- When an I/O error was generated, check if the disk device where Interstage has been installed is operating normally.

## 12.23 is31300 to is31399

---

This section details the messages with message numbers between is31300 and is31399.

### 12.23.1 is31321

---

**Command name: INFO: is31321: Forced deletion from the Site was successful**

#### Explanation

Forced deletion from the site was successful.

### 12.23.2 is31322

---

**Command name: ERROR: is31322: Forced deletion from the Site failed**

#### Explanation

Forced deletion from the site failed.

#### System Action

Stops processing of the command.

#### User Action

**Windows32/64**

Refer to the event log. If another message was output at the same time, take the action indicated by that message.

**Solaris32/64** **Linux32/64**

Refer to the system log. If another message was output at the same time, take the action indicated by that message.

### 12.23.3 is31323

---

**Command name: ERROR: is31323: There is an error in the option**

#### Explanation

There was an error in the specified option.

#### System Action

Stops processing of the command.

#### User Action

Specify a correct option and reexecute the command.

---

### 12.23.4 is31324

---

**Command name: ERROR: is31324: Does not have the authority to execute a command**

#### Explanation

Failed to process because there was no authority to execute the command.

#### System Action

Stops processing of the command.

#### User Action

Execute the command as a user with the required authority.

---

### 12.23.5 is31325

---

**Command name: WARNING: is31325: This command cannot execute except on the Managed Server**

#### Explanation

Processing failed because this type of processing cannot be executed on the Managed Server.

#### System Action

Stops processing of the command.

#### User Action

Execute processing on the Managed Server.

When this message is output during execution of the *isleavesite* command, since the resources of the server can be normally deleted, there is no necessity for action.

---

### 12.23.6 is31326

---

**Command name: ERROR: is31326: A timeout occurred**

#### Explanation

A timeout occurred during execution of the Site information conversion command *ischangesiteinfo*.

#### System Action

The requested processing continues in Interstage even if a communication timeout occurs.

#### User Action

Increase the Interstage JMX service communication timeout.

---

### 12.23.7 is31327

---

**Command name: ERROR: is31327: Java runtime environment contains an error**

#### Explanation

The Java runtime environment contains an error.

#### System Action

Command processing stops.

## User Action

Set the correct installation path for the JDK/JRE used by the Interstage JMX service.

### 12.23.8 is31328

---

**Command name: ERROR: is31328: The specified backup resources are not combined server backup resources**

#### Explanation

The specified backup resources are not combined server backup resources.

#### System Action

Command processing stops.

#### User Action

Specify the backup resources obtained by the combined server and execute the command again. If the backup resources obtained by the combined server are already specified, confirm that they are stored in the correct directory structure.

### 12.23.9 is31329

---

**Command name: ERROR: is31329: Required backup resources do not exist**

#### Explanation

A required backup resource does not exist. Check for errors in the storage directory specified for backup resources, and confirm that the resource backup task was performed correctly.

#### System Action

Command processing stops.

#### User Action

If the backup resource storage directory is incorrect, specify the correct directory, and execute the command again. If the resource backup task was not performed correctly, perform it correctly and then execute the command again.

### 12.23.10 is31330

---

**Command name: INFO: is31330: Backup resource separation succeeded**

#### Explanation

The backup resource separation succeeded.

### 12.23.11 is31331

---

**Command name: ERROR: is31331: Backup resource separation failed**

#### Explanation

The backup resource separation succeeded.

#### System Action

Command processing stops.

#### User Action

Another message indicating the cause of this failure is displayed. Refer to the message and take the described action.

## 12.23.12 is31332

---

**Command name: ERROR: is31332: The specified parameter contains an error**

### Explanation

The command parameters contain a specification error.

### System Action

Command processing stops.

### User Action

Specify the parameter correctly, and then execute the command again.

## 12.23.13 is31333

---

**Command name: ERROR: is31333: No authority to execute command**

### Explanation

The user does not have authority to execute this command.

### System Action

Command processing stops.

### User Action

Ask a user who has Administrator authority to execute the command again.

## 12.23.14 is31334

---

**Command name: ERROR: is31334: Specified path does not exist**

### Explanation

The specified path does not exist.

### System Action

Command processing stops.

### User Action

Specify the path name correctly, and then execute the command again.

## 12.23.15 is31336

---

**Command name: ERROR: is31336: Backup resources already exist in specified directory**

### Explanation

The specified directory already contains backup resources.

### System Action

Command processing stops.

## User Action

Specify a different storage path for the backup resources specified in the command parameters, and then execute the command again.

## 12.24 is31600 to is31699

---

This section details the messages with message numbers between is31600 and is31699.

### 12.24.1 is31601

---

**Command name: ERROR: is31601: Does not have the authority to execute a command.**

#### Explanation

There is no authority to execute the command.

#### System Action

Processing stops.

#### User Action

Execute the command as a user with root authority.

### 12.24.2 is31602

---

**Command name: ERROR: is31602: A condition exists preventing the command from being executed. (SERVICE=%s)**

#### Variable Information

%s = Service name

#### Explanation

Execution of the command failed because Interstage is running.

#### User Action

Stop the service shown in the variable information and reexecute the command. For details about the stop information for each service, refer to the following manuals:

Service name	Reference
OD (CORBA Service)	" <i>isstop</i> " in the Reference Manual (Command Edition)
JMX (JMX Service)	" <i>isjmxstop</i> " in the Reference Manual (Command Edition)
DAS (Interstage Java EE DAS Service)	" <i>ijdasstop</i> " in the Java EE Operator's Guide
NA (Interstage Java EE Node Agent Service)	" <i>ijnastop</i> " in the Java EE Operator's Guide
IJMQ (Interstage Java EE Message Broker)	" <i>imqcmd</i> " in the Java EE Operator's Guide

### 12.24.3 is31603

---

**Command name: INFO: is31604: The command was processed normally**

#### Explanation

The command was processed normally.

### 12.24.4 is31605

---

**Command name: ERROR: is31605: Operand isn't specified**

#### Explanation

A required operand isn't specified.

#### System Action

Processing stops.

#### User Action

Specify the missing operand.

### 12.24.5 is31606

---

**Command name: ERROR: is31606: Operand is invalid**

#### Explanation

The specified operand is invalid.

#### System Action

Processing stops.

#### User Action

Specify a valid operand.

### 12.24.6 is31607

---

**Command name: ERROR: is31607: The command execution failed**

#### Explanation

The command execution failed.

#### System Action

Processing stops.

#### User Action

Check the component error displayed immediately before.

### 12.24.7 is31608

---

**Command name: ERROR: is31608: The command is being executed.**

#### Explanation

The command has already been executed.

#### System Action

Processing stops.

#### User Action

Check whether more than one command has been executed. If no other command has been executed, delete the "/tmp/issetsecuritymode-key" directory.

### 12.24.8 is31609

---

**Command name: ERROR: is31609: An internal error was detected Error information(%d).**

## Variable Information

%d = Error code

## Explanation

An error occurred in the command for the reason shown in the following error information.

Error Code	Description
01	There is no security information file.
02	The contents of the security information file are invalid.
03	The security information file group name is invalid.
04	An essential component has not been installed.
05	An executable command file is still on the disk.

## System Action

Processing stops.

## User Action

Record the error information, use the *iscollectinfo* command to collect the diagnostic information, and then contact your systems engineer.

## 12.24.9 is31610

---

**Command name: ERROR: is31610: The file authority cannot be changed because either user group %s does not exist or it has not been set appropriately.**

## Variable Information

%s = User group name

## Explanation

The file privileges cannot be changed because either the specified user group "\${IS\_USER\_GROUP}" does not exist or is invalid.

## System Action

Processing stops.

## User Action

Specify a valid user group, and then execute the command again.

## 12.25 is31700 to is31799

---

### 12.25.1 is31702

---

**IS: ERROR: is31702: The specified WorkUnit is busy: WU=%s**

## Variable Information

%s = WorkUnit name

## Explanation

The operation could not be performed because the WorkUnit is processing.

## System Action

Processing stops.

#### User Action

Wait until processing of the WorkUnit is complete, and then execute the command again. Alternatively, stop the WorkUnit by force.

### 12.25.2 is31703

---

**IS: ERROR: is31703: The specified WorkUnit is not registered or not running: WU=%s**

#### Variable Information

%s = WorkUnit name

#### Explanation

The specified WorkUnit has not been defined or has not been started.

#### System Action

Processing stops.

#### User Action

If the WorkUnit name is invalid, then specify a valid WorkUnit name and execute the command again.

If the WorkUnit name is valid, then check its operational status and definition status and perform the correct operation.

If the problem persists, then an error might have occurred in the environment - in this case, reinitialize or reinstall Interstage.

### 12.25.3 is31704

---

**IS: ERROR: is31704: There was an error in the specified WorkUnit definition: WU=%s**

#### Variable Information

%s = WorkUnit name

#### Explanation

The operation failed because the specified WorkUnit definition is invalid.

#### System Action

Processing stops.

#### User Action

Correct the specified WorkUnit definition, and then execute the command again.

### 12.25.4 is31705

---

**IS: ERROR: is31705: The specified WorkUnit has already started: WU=%s**

#### Variable Information

%s = WorkUnit name

#### Explanation

The specified WorkUnit has already started.

#### System Action

Processing stops.

#### User Action

The operation is unnecessary. If an invalid WorkUnit name was specified, then specify a valid one and execute the command again.

## 12.25.5 is31706

---

**IS: ERROR: is31706: The specified WorkUnit is not running : WU=%s**

### Variable Information

%s = WorkUnit name

### Explanation

The specified WorkUnit has stopped.

### System Action

Processing stops.

### User Action

If an invalid WorkUnit name was specified, then specify a valid one and execute the command again. Otherwise, the WorkUnit has already stopped and the operation is unnecessary.

## 12.25.6 is31709

---

**IS: ERROR: is31709: The specified WorkUnit is starting up: WU=%s**

### Variable Information

%s = WorkUnit name

### Explanation

Could not operate the specified WorkUnit because it is preparing to start up or is already starting up.

### System Action

Processing stops.

### User Action

Check the operational status of the WorkUnit, and then perform the operation.

## 12.25.7 is31710

---

**IS: ERROR: is31710: The specified WorkUnit is in the process of being started: WU=%s**

### Variable Information

%s = WorkUnit name

### Explanation

Could not operate the specified WorkUnit because it is preparing to start up.

### System Action

Processing stops.

### User Action

Wait until the startup process is complete to perform the operation.

## 12.25.8 is31711

---

**IS: ERROR: is31711: The specified WorkUnit is in the process of being stopped: WU=%s**

## Variable Information

%s = WorkUnit name

## Explanation

Could not operate the specified WorkUnit because it is preparing to stop.

## System Action

Processing stops.

## User Action

Wait until the stop process is complete to perform the operation.

## 12.25.9 is31712

---

**IS: ERROR: is31712: This is not the user who started the WorkUnit: WU=%s**

## Variable Information

%s = WorkUnit name

## Explanation

The operation cannot be performed because the user that executed this command is different from the user that performed the WorkUnit startup operation.

## System Action

Processing stops.

## User Action

Execute the command again as the user that performed the WorkUnit startup operation.

## 12.25.10 is31714

---

**IS: ERROR: is31714: The specified WorkUnit process concurrency is being changed: WU=%s**

## Variable Information

%s = WorkUnit name

## Explanation

Could not operate the specified WorkUnit because it is preparing to change the process concurrency level.

## System Action

Processing stops.

## User Action

Wait until process concurrency level change is complete to perform the operation.

## 12.25.11 is31715

---

**IS: ERROR: is31715: The specified WorkUnit definition is being changed: WU=%s**

## Variable Information

%s = WorkUnit name

### Explanation

Could not operate the specified WorkUnit because it is changing its own definition.

### System Action

Processing stops.

### User Action

Wait until WorkUnit definition change is complete to perform the operation.

## 12.25.12 is31716

---

### IS: ERROR: is31716: The specified WorkUnit is being activated: WU=%s

#### Variable Information

%s = WorkUnit name

### Explanation

Could not operate the specified WorkUnit because it is being activated.

### System Action

Processing stops.

### User Action

Wait until WorkUnit activation is complete to perform the operation.

## 12.25.13 is31718

---

### IS: ERROR: is31718: Could not process because the component transaction service is starting up: WU=%s

#### Variable Information

%s = WorkUnit name

### Explanation

Could not operate the specified WorkUnit because the component transaction service is starting up.

### System Action

Processing stops.

### User Action

Wait until component transaction service startup is complete to perform the operation.

## 12.26 is31800 to is31899

---

### 12.26.1 is31801

---

### IS: ERROR: is31801: Making the directory was failed(path=%s)

#### Variable Information

%s = Directory

### Explanation

Failed to create the directory.

### System Action

Processing stops.

### User Action

If a file with the same name as the specified directory already exists, then delete it and execute the command again. Additionally, make sure that the parent directory has write authority.

---

## 12.26.2 is31802

---

### **IS: ERROR: is31802: Required command argument is missing**

#### Explanation

A required argument was not specified.

#### System Action

Processing stops.

#### User Action

Make sure that all required arguments are specified.

---

## 12.26.3 is31803

---

### **IS: ERROR: is31803: Command argument was invalid (%s)**

#### Variable Information

%s = Argument

#### Explanation

The specified argument is invalid.

#### System Action

Processing stops.

#### User Action

Make sure that a valid argument is specified. Additionally, if an error message was output before or after this one, take action according it.

---

## 12.26.4 is31804

---

### **IS: ERROR: is31804: There was not authority**

#### Explanation

There are no privileges to execute the command.

#### System Action

Processing stops.

#### User Action

Execute the command as the administrator user. Additionally, if this message was output when Systemwalker Software Configuration Manager linkage was used, take action according to the message that was output before or after.

## 12.26.5 is31805

---

**IS: INFO: is31805: %s has been started**

### Variable Information

%s = Command name

### Explanation

The command has started.

## 12.26.6 is31806

---

**IS: INFO: is31806: %s has been finished normally**

### Variable Information

%s = Command name

### Explanation

The command has successfully finished.

## 12.26.7 is31807

---

**IS: ERROR: is31807: An Error has occurred while processing %s**

### Variable Information

%s = Command name

### Explanation

The command failed.

### System Action

Processing stops.

### User Action

Remove the cause of the error indicated in the message output before this one, and then execute the command again.

If the problem persists, collect diagnostic information using the *iscollectinfo* command, record the error information, and then contact your systems engineer.

## 12.26.8 is31808

---

**IS: INFO: is31808: [%s] is started**

### Variable Information

%s = Service name

### Explanation

The service is started.

Service name	Service resource name
ISCOM	Interstage Setup Resources
OD	CORBA Service Resources
ISJEE	Common JavaEE Resources

## 12.26.9 is31809

---

### IS: INFO: is31809: [%s] was successful

#### Variable Information

%s = Service name

#### Explanation

The service has successfully finished.

## 12.26.10 is31810

---

### IS: ERROR: is31810: [%s] was failed

#### Variable Information

%s = Service name

#### Explanation

The service failed.

#### System Action

The linkage script processing stops.

#### User Action

Take action according to the error message and system log message output before this error message.

## 12.26.11 is31811

---

### IS: ERROR: is31811: A system error occurred(%s)

#### Variable Information

%s = Detail information

#### Explanation

A system error occurred.

#### System Action

Processing stops.

#### User Action

If an error message was output before this one, then check the content of both. Take action according to the detail information as described below (if the detail information is not listed below, collect diagnostic information using the *iscollectinfo* command, record the error information, and then contact your systems engineer):

Detail information	Action
Environment variable IS_HOME is not set	Ensure that the command was executed in an environment in which Interstage Application Server has been installed.
Command name cannot execute on this environment Command name: <i>isgethostinfo</i> or <i>issethostinfo</i>	The command might have been executed in an environment in which Admin Server has been installed. Check the server type for the environment in which the command was executed.

Detail information	Action
	Note that the command cannot be used with the following server types: <ul style="list-style-type: none"> <li>- Admin Server</li> <li>- Web Package</li> </ul>
Directory does not exist(path={0}) path: Directory path in which the required resources are stored when the template is deployed	isgethostinfo might not have been executed when the template was created. Check the procedure that was used to create the template.

## 12.26.12 is31812

### IS: ERROR: is31812: Other process is also executing %s

#### Variable Information

%s = Command name

#### Explanation

Another process is executing this command.

#### System Action

Processing stops.

#### User Action

Wait until the other process finishes, then execute the command again if necessary.

If this message is output repeatedly, then the lock file might still remain - in this case, delete it and execute the command again. Note the lock file cannot be deleted if another process is executing this command.

**Windows32/64**

The name and location of the lock file are displayed below (%IS\_HOME% is the Interstage installation folder):

```
%IS_HOME%\var\<<command_name>.lck
```

## 12.27 is40000 to is40099

This section details the messages with message numbers between is40000 and is40099.

### 12.27.1 is40001

#### IS: ERROR: is40001: Could not acquire system information

#### Explanation

Information on the Interstage system could not be obtained.

#### System Action

Processing stops.

#### User Action

- The Interstage JMX service may have stopped. If this is the case, take the following action, and then reexecute the processing.

**Windows32/64**

Start the Interstage Operation Tool service.

**Solaris32/64** **Linux32/64**

Start the Interstage JMX service using the *isjmxstart* command.

- Alternatively, it may be that the machine used for running Interstage Application Server was disconnected from the network, or that the IP address was changed because the network was changed. When this happens, take the following action, and log in to the Interstage Management Console again.

**Windows32/64**

Restart the Interstage JServlet (OperationManagement) service.

At this time, the Interstage Operation Tool service is restarted.

**Solaris32/64** **Linux32/64**

Restart the Interstage Servlet service for the Interstage Management Console using the */opt/FJSVjs2su/bin/jssvstop* and */opt/FJSVjs2su/bin/jssvstart* commands.

Restart the Interstage JMX service using the *isjmxstop* and *isjmxstart* commands.

**Solaris32/64** **Linux32/64**

If the Interstage JMX Service is active, a temporary system resource shortage may have occurred. Reexecute processing later.

**Windows32/64**

In Windows Server(R) 2003, if your own host name is defined in the hosts file, when logging into the Interstage Management Console, the message "is40001: Could not acquire system information." may be output, and it may not be possible to perform Interstage administration operations.

If this happens, install Windows Server(R) 2003 SP1 or later.

- If this message is output while executing an operation from the Interstage Management Console Site Management tab, refer to the message output at the same time to establish the cause of the failure. This will also enable you to obtain system information and reexecute processing.

**Solaris32/64**

- The FJSVisgui package may not be installed correctly. Reinstall the package ensuring that the packages below are installed prior to reinstallation of the FJSVisgui package:
  - FJSVihs, FJSVjs2su, FJSVawjdk, and FJSVisjmx.

## 12.27.2 is40002

---

### IS: ERROR: is40002: Error in Interstage JMX service(Error=%s)

#### Variable Information

%s = Error information

#### Explanation

An error occurred in the Interstage JMX service.

#### System Action

Processing stops.

#### User Action

It is possible that the LAN was disconnected after login to the Interstage Management Console. If the LAN was disconnected, reconnect it, open the Relogin window, and login again.

When the character sequence 'It's failed in the output of XML file' is contained in the detailed information and this message is output at the time of IJServer creation, there are the following possibilities:

- The specified J2EE common directory does not exist.

- The directory cannot be accessed.

In this case, specify either of the following and reinstall:

- The J2EE common directory which exists in a J2EE common directory and which can be accessed.
- Default value.

If "Invalid value (empty)" is output in the detail information, then an inconsistency might have occurred in the folder in which IJServer is stored (/opt/FJSVj2ee/var/deployment/ijserver). Either reinstall Interstage, or initialize Interstage using the *isinit* or *isinit* service commands to rebuild the system.

There may have been insufficient memory when a request was processed by the Interstage JMX service. Expand the heap and Perm for java processes used by the Interstage JMX service. For details on options available for java processes used by the Interstage JMX service, refer to "Environment Files used by the Interstage Management Console", "isjmx.xml" in the "Configuring the Interstage Management Console" chapter of the Operator's Guide.

## 12.27.3 is40003

---

### IS: ERROR: is40003: Could not connect to Interstage JMX service

#### Explanation

Failed to connect to the Interstage JMX service.

#### System Action

Processing stops.

#### User Action

- If this error occurs after login to the Interstage Management Console, it is possible that the LAN has been disconnected. Connect the LAN, and then login again.
- The Interstage JMX service may have stopped. If this is the case, take the following action, and then reexecute the processing.

**Windows32/64**

Start the Interstage Operation Tool service.

**Solaris32/64** **Linux32/64**

Start the Interstage JMX service using the *isjmxstart* command.

- Alternatively, it may be that the machine used for running Interstage Application Server was disconnected from the network, that the IP address was changed because the network was changed, or that the changes made to the Interstage JMX service *isjmx.xml* file are not effective. When this happens, take the following action, and log in to the Interstage Management Console again.

**Windows32/64**

Restart the Interstage JServlet (OperationManagement) service.

At this time, the Interstage Operation Tool service is restarted.

**Solaris32/64** **Linux32/64**

Restart the Servlet service for the Interstage Management Console using the */opt/FJSVjs2su/bin/jssvstop* and */opt/FJSVjs2su/bin/jssvstart* commands.

Restart the Interstage JMX service using the *isjmxstop* and *isjmxstart* commands.

**Solaris32/64** **Linux32/64**

If the Interstage JMX Service is active, a temporary system resource shortage may have occurred. Reexecute processing later.

- If this message is output when executing an operation on the Interstage Management Console Site Management tab, refer to the message output at the same time to establish the cause of the failure. This will also enable you to obtain system information and reexecute processing.

## 12.27.4 is40004

---

### IS: ERROR: is40004: Login failed, incorrect login or password

#### Explanation

The Interstage Management Console could not be logged in.

#### System Action

Processing stops.

#### User Action

Take the action suggested by the message indicating the cause of login failure that was output simultaneously.

## 12.27.5 is40005

---

### IS: ERROR: is40005: Package is not installed(Package Name=%s)

#### Variable Information

%s = Package name

#### Explanation

The package (%s) required for the operation has not been installed.

#### System Action

Processing stops.

#### User Action

After installing the package shown in Variable Information (%s), perform the operation again.

## 12.27.6 is40006

---

### IS: INFO: is40006: Package is not installed(Package Name=%s)

#### Variable Information

%s = Package name

#### Explanation

Package is not installed.

#### User Action

Take one of the following actions:

- Refer to the table below and check whether it is necessary to display/set the items of the function used in package name (%s). To display/set the items of the function used in package name (%s), install the relevant installation function that is shown in the table. For details of the installation procedure, refer to the installation. If it is not necessary to display/set the items of the function used in package name (%s), there is no need to take action.

Package name	Use function	Installation function
Interstage JServlet	Servlet Service	Web server connector
Interstage J2EE Common Resource	J2EE	Web server connector
ObjectTransactionService (Note)	Database Linkage Service	Database Linkage Service
Event Service	Event Service	Event Service
JMS	Interstage JMS	J2EE compatibility

Note) **Solaris64**

Database Linkage Service cannot be used.

- There might be a problem in the network environment when the Interstage JMX Service starts. Refer to the system log. If the 'is20712' message is output, refer to the user action in is20712.

## 12.27.7 is40010

---

### IS: ERROR: is40010: Internal logic error occurred (Error=%s)

#### Variable Information

%s = Error information

#### Explanation

An internal error occurred in the Interstage Management Console.

#### System Action

Processing stops.

#### User Action

Take one of the following actions:

- If this message is output when navigating to [System] > [Environment Setting] of the Interstage Management Console, the value that was set for the CORBA Service Environment Definition (config) may be invalid. If the CORBA Service Environment Definition was edited, review the content. For information about CORBA Service Environment Definition, refer to the "CORBA Service Environment Definition" appendix of the Tuning Guide.

#### - **Windows32/64**

If Error information (%s) is output as "1, 1385" in this message, access may not be allowed to the operating system on which Interstage is installed. To log into the Interstage Management Console, use an account that can log into the operating system.

If the above does not apply, record the error information, use the *iscollectinfo* command to collect the diagnostic information, and then contact your systems engineer.

## 12.27.8 is40011

---

### IS: ERROR: is40011: Out of memory (Error=%s)

#### Variable Information

%s = Error information

#### Explanation

A memory shortage occurred.

#### System Action

Processing stops.

#### User Action

Reexecute processing later. If this message is output frequently, reestimate the amount of memory required for Interstage operation by referring to the Tuning Guide. If there is sufficient memory for the requirements of Interstage, the memory capacity is probably insufficient for the requirements of other applications. Reestimate the memory space requirements for other applications that run on the same machine and check whether sufficient memory is available for these applications.

If the reestimation confirms a memory shortage, ask the System Administrator to expand the main memory or swap area.

## 12.27.9 is40012

---

---

**IS: ERROR: is40012: Unknown error occurred (Error=%s)****Variable Information**

%s = Error information

**Explanation**

An unexpected error occurred in the Interstage Management Console.

**System Action**

Processing stops.

**User Action**

Record the error information, use the *iscollectinfo* command to collect the diagnostic information, and then contact your systems engineer.

## 12.27.10 is40014

---

**IS: WARNING: is40014: Please wait for the current page to complete loading before attempting to click on any browser navigation buttons****Explanation**

A request was detected from a page cached by the Web browser.

This may occur when a button is pressed on the page which is displayed after the 'Back' function of the Web browser is used.

This may also occur when any button is repeatedly pressed during the processing of a previous screen change request.

**System Action**

The screen is updated in the newest state.

**User Action**

Leave it and perform the next operation.

## 12.27.11 is40015

---

**IS: ERROR: is40015: The current session is invalid. Time out may have occurred for the session or the service may have been reactivated.****Explanation**

When an active browser session is lost due to session time out or service reactivation, the log-in screen is displayed and this message is output.

**System Action**

The display changes to the Log-in screen.

**User Action**

Log in again and reexecute the processing.

## 12.27.12 is40016

---

**IS: WARNING: is40016: Logout because the server type was changed.**

## Explanation

Log-out occurred because the server type of the server the user had logged into was changed by another user.

## System Action

Terminates processing and displays the Log-In screen.

## User Action

To continue operation, log in again.

## 12.27.13 is40017

---

### IS: ERROR: is40017: Out of memory

## Explanation

Out of memory.

## System Action

Processing stops.

## User Action

Reexecute processing later. If this message is output frequently, reestimate the amount of memory required for Interstage operation by referring to the Tuning Guide. If there is sufficient memory for the requirements of Interstage, the memory capacity is probably insufficient for the requirements of other applications. Reestimate the memory space requirements for other applications that run on the same machine and check whether sufficient memory is available for these applications.

If the reestimation confirms a memory shortage, ask the System Administrator to expand the main memory or swap area.

Additionally, if this error is output for the deployment operation for an IJServer WorkUnit created in Interstage Application Server V6, take the following action.

1. Change the option information for the java process used by Interstage JMX Service.

- 1) Open the following file using an editor.

**Windows32/64**

C:\Interstage\jmx\etc\isjmx.xml

**Solaris32/64** **Linux32/64**

/etc/opt/FJSVjsjmx/isjmx.xml

- 2) Change the value specified for Java VM in the 'options' attribute of the 'server' tag in the isjmx.xml file and then save the file.

Change the value in '-Xmx' of the 'options' attribute so that is it eight times the size of the value set in the deployment file.

For example, if the value in the deployment file is 100M, change '-Xmx256m' to '-Xmx1056m'.

- 3) **Solaris32/64** **Linux32/64**

Use the *isjmxstop* and *isjmxstart* commands to restart Interstage JMX Service.

2. Change the option information for the java process used by Servlet service for the Interstage Management Console.

- 1) Open the following file using an editor.

**Windows32/64**

C:\Interstage\FJSVjs2su\conf\jswatch.conf

**Solaris32/64** **Linux32/64**

/etc/opt/FJSVjs2su/conf/jswatch.conf

2) Change the value specified for the Java VM memory in the Java VM start command parameter in the jswatch.conf file and then save the file.

Change the value in '-Xmx' of 'opmanager.bin.parameters' so that is it eight times the size of the value set in the deployment file.

For example, if the deployment file is 100M, change '-Xmx256m' to '-Xmx1056m'.

3) Restart services.

**Windows32/64**

Restart the Interstage JServlet(OperationManagement) and Interstage Operation Tool services.

**Solaris32/64 Linux32/64**

Use the `/opt/FJSVjs2su/bin/jssvstop` and `/opt/FJSVjs2su/bin/jssvstart` commands to restart Servlet service for the Interstage Management Console.

## 12.27.14 is40018

---

**IS: ERROR: is40018: The current session is invalid. Time out may have occurred for the session or the service may have been reactivated**

### Explanation

An Interstage Management Console session may have timed out during the switch to the Interstage Management Console using the integrated GUI, or the service may have been restarted. As a result, the Interstage Management Console cannot be operated in the current session.

### System Action

Processing stops.

### User Action

Take the following action:

1. Click [Return to the Interstage Java EE Admin Console.], then log out.
2. In the new session, start the Web browser and execute the operation.

## 12.27.15 is40021

---

**IS: ERROR: is40021: Login or password is incorrect**

### Explanation

An invalid user name or password was entered.

### System Action

Processing stops.

### User Action

Reenter the command with a valid user name or password specified.

If the security mode is enhancement mode, enter the user name/password of a user that has administrator authority, or enter the user name/password of a user that belongs to the Interstage operation group and reexecute.

## 12.27.16 is40022

---

---

**IS: ERROR: is40022: Login was refused due to user account security setting****Explanation**

A logon request to the Windows system was rejected because an account restriction item applied. To display the account restriction item, select [Security Setting], [Local Policy], and then [Security Option] on the local security setting tool.

Disabling of account name 'Administrator' or restriction of a user account logon without a password may be defined.

**System Action**

Processing stops.

**User Action**

Log in with a user account to which the above restrictions do not apply.

---

**12.27.17 is40023**

---

**IS: ERROR: is40023: The password has expired****Explanation**

The password has expired.

**System Action**

Processing stops.

**User Action**

Ensure that the password of the user account registered in the Windows system is valid, and reexecute processing.

---

**12.27.18 is40024**

---

**IS: ERROR: is40024: User account has been invalidated****Explanation**

The user account is invalid.

**System Action**

Processing stops.

**User Action**

Use another user account or register the user account with the server, and reexecute processing.

---

**12.27.19 is40025**

---

**IS: ERROR: is40025: Password is no longer valid****Explanation**

The password must be renewed.

**System Action**

Processing stops.

## User Action

Perform a console logon to the Windows system, and renew the password.

## 12.27.20 is40026

---

### IS: ERROR: is40026: User account is locked

#### Explanation

The user account is locked.

#### System Action

Processing stops.

#### User Action

If the lockout time is defined, wait until the appropriate time and then log in. If not, manually release the lockout.

## 12.27.21 is40027

---

### IS: ERROR: is40027: This user does not have permissions to access the Interstage Management Console

#### Explanation

The user account is not authorized to operate the Interstage Management Console.

#### System Action

Processing stops.

#### User Action

Reexecute processing as a user who is authorized to operate the Interstage Management Console.

## 12.27.22 is40028

---

### IS: ERROR: is40028: The specified login is too long

#### Explanation

The character string specified as the user name is too long.

#### System Action

Processing stops.

#### User Action

Enter a valid user name and reexecute processing.

## 12.27.23 is40029

---

### IS: ERROR: is40029: The specified password is too long

#### Explanation

The character string specified as the password is too long.

#### System Action

Processing stops.

#### User Action

Enter a valid password and reexecute processing.

### 12.27.24 is40030

---

**IS: ERROR: is40030: Invalid parameter.**

#### Explanation

An error is in the parameter specified to be a command.

#### System Action

Processing stops.

#### User Action

Specify the correct parameter and process again.

### 12.27.25 is40031

---

**IS: ERROR: is40031: Interstage JMX Service unable to start.**

#### Explanation

Starting of Interstage JMX service failed.

#### System Action

Processing stops.

#### User Action

Refer to the message currently output to the system log.

### 12.27.26 is40032

---

**IS: ERROR: is40032: Servlet service unable to start.**

#### Explanation

Starting of Interstage JServlet (OperationManagement) service failed.

#### System Action

Processing stops.

#### User Action

Refer to the message currently output to the system log.

### 12.27.27 is40033

---

**IS: ERROR: is40033: Web server unable to start.**

#### Explanation

Starting of Web server failed.

#### System Action

Processing stops.

#### User Action

Refer to the message currently output to the system log.

## 12.27.28 is40034

---

### **IS: ERROR: is40034: Interstage Operation Tool unable to start.**

#### Explanation

Starting of the Interstage Operation Tool failed.

#### System Action

Processing stops.

#### User Action

Refer to the message currently output to the system log.

## 12.27.29 is40040

---

### **IS: ERROR: is40040: There is an error in installed resource.**

#### Explanation

There is an error in the installed resource.

#### System Action

Processing stops.

#### User Action

Reinstall the Interstage Management Console, and reexecute.

## 12.27.30 is40041

---

### **IS: INFO: is40041: The service has been activated normally.**

#### Explanation

This message is output when the activation process for FJSVihs, FJSVisgui, FJSVisjmx, and FJSVjs2su was completed normally.

## 12.27.31 is40042

---

### **IS: INFO: is40042: The service has been terminated normally.**

#### Explanation

This message is output when the termination process for FJSVihs, FJSVisgui, FJSVisjmx, and FJSVjs2su was completed normally.

## 12.27.32 is40043

---

**IS: ERROR: is40043: The required package has not been installed. (package=%s)**

### Variable Information

%s = Package name

### Explanation

This message is output when the package required by the control console for its operation has not been installed.

### System Action

Terminates the command processing.

### User Action

Install the required package and reexecute processing.

## 12.27.33 is40044

---

**IS: ERROR: is40044: Interstage JMX Service unable to stop.**

### Explanation

Stopping of the Interstage JMX service failed.

### System Action

Processing stops.

### User Action

Refer to the message currently output to the system log.

## 12.27.34 is40045

---

**IS: ERROR: is40045: Servlet service unable to stop.**

### Explanation

Stopping of the Interstage JServlet (OperationManagement) service failed.

### System Action

Processing stops.

### User Action

Refer to the message currently output to the system log.

## 12.27.35 is40046

---

**IS: ERROR: is40046: Web server unable to stop.**

### Explanation

Stopping of the Web server failed.

#### System Action

Processing stops.

#### User Action

Refer to the message currently output to the system log.

### 12.27.36 is40047

---

**IS: ERROR: is40047: Interstage Operation Tool unable to stop.**

#### Explanation

Stopping of the Interstage Operation Tool failed.

#### System Action

Processing stops.

#### User Action

Refer to the message currently output to the system log.

### 12.27.37 is40051

---

**IS: INFO: is40051: Interstage started successfully**

#### Explanation

Interstage has started normally.

### 12.27.38 is40052

---

**IS: INFO: is40052: Interstage stopped**

#### Explanation

Interstage has stopped normally.

### 12.27.39 is40053

---

**IS: INFO: is40053: Configuration was updated successfully**

#### Explanation

The Interstage configuration has been updated.

### 12.27.40 is40054

---

**IS: WARNING: is40054: Configuration setting could not be updated**

#### Explanation

System tuning or reconfiguration was executed but no settings have been changed.

## System Action

Processing stops.

## User Action

Change the settings, and then reexecute processing. If no reconfiguration is required, continue operation.

## 12.27.41 is40055

---

**IS: INFO: is40055: The resource management program has been activated.**

### Explanation

This message is output when the transaction service (JTSRMP) was activated.

## 12.27.42 is40056

---

**IS: INFO: is40056: The resource management program has been terminated.**

### Explanation

This message is output when the transaction service (JTSRMP) was terminated.

## 12.27.43 is40057

---

**IS: ERROR: is40057: Error occured when collecting information (Information=%s1 Error Information=%s2)**

### Variable Information

%s1 = The item name of the information which failed in acquisition.

%s2 = The message indicating the reason information acquisition failed.

### Explanation

Acquisition of the information displayed on a screen failed. When this message is displayed on a [System] > [Environment Setting] screen, the information which failed in acquisition cannot be updated.

When is20767 is output to error information, there is no authority to refer to the item shown in information.

### System Action

The information which failed in acquisition is disregarded, and the remaining information is acquired and displayed.

### User Action

When is20767 is output to error information, log in again as the user with required authority, and process again.

When messages other than is20767 are output on error information, follow the displayed message.

## 12.27.44 is40058

---

**IS: INFO: is40058: Transaction service (OTS) has been started.**

### Explanation

This message is output when the transaction service (OTS) was activated.

## 12.27.45 is40059

---

**IS: INFO: is40059: Transaction service (OTS) has been stopped.**

### Explanation

This message is output when the transaction service (OTS) was terminated.

## 12.27.46 is40060

---

**IS: INFO: is40060: The environment of transaction service (OTS) of operation has been created.**

### Explanation

This message is output when the operating environment of the transaction service (OTS) was created.

## 12.27.47 is40061

---

**IS: INFO: is40061: The environment of transaction service (OTS) of operation has been changed.**

### Explanation

This message is output when the operating environment of the transaction service (OTS) was changed.

## 12.27.48 is40062

---

**IS: INFO: is40062: The environment of transaction service (OTS) of operation has been deleted.**

### Explanation

This message is output when the operating environment of the transaction service (OTS) was deleted.

## 12.27.49 is40063

---

**IS: INFO: is40063: The environment of transaction service (JTSRMP) of operation has been created.**

### Explanation

This message is output when the operating environment of the transaction service (JTSRMP) was created.

## 12.27.50 is40064

---

**IS: INFO: is40064: The environment of transaction service (JTSRMP) of operation has been changed.**

### Explanation

This message is output when the operating environment of the transaction service (JTSRMP) was changed.

## 12.27.51 is40065

---

**IS: INFO: is40065: The environment of transaction service (JTSRMP) of operation has been deleted.**

## Explanation

This message is output when the operating environment of the transaction service (JTSRMP) was deleted.

## 12.27.52 is40070

---

**IS: ERROR: is40070: SSL configuration has not been setup. Please setup SSL configuration before attempting to use SSL**

## Explanation

No SSL definition has been set up.

## System Action

Processing stops.

## User Action

Set up an SSL configuration and then reexecute processing.

## 12.27.53 is40080

---

**IS: WARNING: is40080: Logged out because the application operation type was changed.**

## Explanation

Logged out because the server application operation type was changed by another user.

## System Action

Stops processing and opens the login page.

## User Action

To continue the operation, log in again.

## 12.28 is40100 to is40199

---

This section details the messages with message numbers between is40100 and is40199.

### 12.28.1 is40101

---

**IS: INFO: is40101: IJServer '%s' created successfully**

## Variable Information

%s = IJServer name

## Explanation

IJServer has been created.

### 12.28.2 is40102

---

**IS: ERROR: is40102: Could not create IJServer '%s'**

## Variable Information

%s = IJServer name

## Explanation

IJServer could not be created.

## System Action

Processing stops.

## User Action

By referring to the message displayed in the message window of the Interstage Management Console and the event log, remove the cause of the failure to create the IJServer then reexecute processing.

---

## 12.28.3 is40103

---

### IS: INFO: is40103: IJServer '%s' started successfully

#### Variable Information

%s = IJServer name

#### Explanation

IJServer has started normally.

---

## 12.28.4 is40104

---

### IS: ERROR: is40104: Failed to start IJServer '%s1' (Error =%s2)

#### Variable Information

%s1 = IJServer name

%s2 = Error Information

#### Explanation

IJServer has failed to start.

#### System Action

Processing stops.

#### User Action

By referring to the message displayed in the message window of the Interstage Management Console and the event log, remove the cause of the failure to start the IJServer then reexecute processing.

---

## 12.28.5 is40105

---

### IS: INFO: is40105: IJServer '%s' stopped successfully

#### Variable Information

%s = IJServer name

#### Explanation

IJServer has stopped normally.

---

## 12.28.6 is40106

---

### IS: ERROR: is40106: Failed to stop IJServer '%s1' (Error=%s2)

#### Variable Information

%s1 = IJServer name

%s2 = Error information

#### Explanation

IJServer failed to stop.

#### System Action

Processing stops.

#### User Action

By referring to the message displayed in the message window of the Interstage Management Console and the event log, remove the cause of the failure to stop the IJServer then reexecute processing.

## 12.28.7 is40107

---

### IS: INFO: is40107: IJServer '%s' deleted successfully

#### Variable Information

%s = IJServer name

#### Explanation

IJServer has been deleted normally.

## 12.28.8 is40108

---

### IS: ERROR: is40108: Failed to delete IJServer '%s1' (Error=%s2)

#### Variable Information

%s1 = IJServer name

%s2 = Error information

#### Explanation

IJServer could not be deleted.

#### System Action

Processing stops.

#### User Action

By referring to the message displayed in the message window of the Interstage Management Console and the event log, remove the cause of the failure to delete the IJServer then reexecute processing.

## 12.28.9 is40109

---

### IS: INFO: is40109: IJServer '%s' state information acquired successfully

#### Variable Information

%s = IJServer name

#### Explanation

IJServer status information has been obtained normally.

## 12.28.10 is40110

---

---

**IS: ERROR: is40110: Failed to acquire IJServer '%s1' state information (Error=%s2)****Variable Information**

%s1 = IJServer name

%s2 = Error information

**Explanation**

IJServer status information could not be obtained.

**System Action**

Processing stops.

**User Action**

By referring to the message displayed in the message window of the Interstage Management Console and the event log, remove the cause of the failure to obtain IJServer status information then reexecute processing.

## 12.28.11 is40111

---

**IS: INFO: is40111: IJServer '%s' updated successfully****Variable Information**

%s = IJServer name

**Explanation**

The IJServer definition has been updated normally.

## 12.28.12 is40112

---

**IS: ERROR: is40112: Failed to update IJServer '%s1' (Error=%s2)****Variable Information**

%s1 = IJServer name

%s2 = Error information

**Explanation**

IJServer could not be updated.

**System Action**

Processing stops.

**User Action**

By referring to the message displayed in the message window of the Interstage Management Console and the event log, remove the cause of the failure to update the IJServer then reexecute processing.

## 12.28.13 is40113

---

**IS: ERROR: is40113: Unable to acquire JDBC Data Source information****Explanation**

A list of JDBC data sources could not be obtained.

### System Action

Processing stops.

### User Action

By referring to the message displayed in the message window of the Interstage Management Console, remove the cause of the failure to obtain a list of JDBC data sources then reexecute processing.

## 12.28.14 is40114

---

### IS: ERROR: is40114: IJServer name has not been specified

#### Explanation

No IJServer name was specified.

#### System Action

Processing stops.

#### User Action

Enter an IJServer name and reexecute processing.

## 12.28.15 is40115

---

### IS: ERROR: is40115: IJServer %s is still running

#### Variable Information

%s = IJServer name

#### Explanation

IJServer has not been stopped.

#### System Action

Processing stops.

#### User Action

Stop the IJServer and then reexecute processing.

## 12.28.16 is40116

---

### IS: INFO: is40116: New configuration setup for application %s

#### Variable Information

%s = Application name

#### Explanation

The settings have been updated normally.

#### System Action

Processing stops.

## 12.28.17 is40117

---

**IS: ERROR: is40117: The specified application does not exist (Application name=%s)**

### Variable Information

%s = Application name

### Explanation

The specified application could not be found.

### System Action

Processing stops.

### User Action

Deploy the specified application and then reexecute processing.

## 12.28.18 is40118

---

**IS: INFO: is40118: Interstage Management Console configuration has been setup**

### Explanation

The configuration of the Interstage Management Console has been defined normally.

## 12.28.19 is40119

---

**IS: ERROR: is40119: Interstage Management Console setup failed (Error=%s)**

### Variable Information

%s = Error information

### Explanation

The configuration of the Interstage Management Console could not be defined.

### System Action

Processing stops.

### User Action

**Windows32/64**

Check whether the [Interstage installation folder]\gui\etc folder exists. If not, reinstall Interstage. If the folder exists, check whether the read-only attribute is assigned to the isadminenv.xml file located under the etc folder. If the read-only attribute is assigned to isadminenv.xml, delete the attribute. After taking the above action, reexecute processing.

**Solaris32/64 Linux32/64**

Check whether the /opt/FJSVisgui/etc directory exists.

When the directory does not exist, reinstall Interstage.

When the directory exists, check whether the write authority is added to isadminenv.xml under the etc directory.

When no write authority is added, use the *chmod* command to add the write authority.

After taking the action above, perform the operation again.

## 12.28.20 is40120

---

### IS: ERROR: is40120: Selected IJServer has already been deleted

#### Explanation

The IJServer to be operated was already deleted.

#### System Action

Processing stops.

#### User Action

The IJServer to be operated may already have been deleted. Update the IJServer information, and reexecute processing.

## 12.28.21 is40121

---

### IS: INFO: is40121: Succeeded in blocking message queue (IJServer name=%s)

#### Variable Information

%s = IJServer name

#### Explanation

The message queue has been blocked successfully.

## 12.28.22 is40122

---

### IS: ERROR: is40122: Failed to block message queue for IJServer %s1 (Error=%s2)

#### Variable Information

%s1 = IJServer name

%s2 = Error information

#### Explanation

The message queue could not be blocked.

#### System Action

Processing stops.

#### User Action

By referring to the message displayed in the message window of the Interstage Management Console, remove the cause of the failure to block the message queue then reexecute processing.

## 12.28.23 is40123

---

### IS: INFO: is40123: Released message queue block for IJServer %s

#### Variable Information

%s = IJServer name

## Explanation

The message queue has been unblocked successfully.

## 12.28.24 is40124

---

### IS: ERROR: is40124: Failed to release message queue block for IJServer %s1 (Error=%s2)

#### Variable Information

%s1 = IJServer name

%s2 = Error information

#### Explanation

The message queue could not be unblocked.

#### System Action

Processing stops.

#### User Action

By referring to the message displayed in the message window of the Interstage Management Console, remove the cause of the failure to unblock the message queue then reexecute processing.

## 12.28.25 is40125

---

### IS: ERROR: is40125: Failed to read log file %s1 (Error=%s2)

#### Variable Information

%s1 = IJServer name

%s2 = Error information

#### Explanation

The log file could not be referenced.

#### System Action

Processing stops.

#### User Action

By referring to the message displayed in the message window of the Interstage Management Console, remove the cause of the failure to reference the log file then reexecute processing.

## 12.28.26 is40126

---

### IS: ERROR: is40126: Selected log file does not exist for IJServer %s

#### Variable Information

%s = IJServer name

#### Explanation

The log file could not be referenced because it did not exist.

## System Action

Processing stops.

## User Action

The IJServer may have never been started after it was created. Start the IJServer and reexecute processing.

## 12.28.27 is40127

---

**IS: INFO: is40127: Log file settings were updated for IJServer %s**

### Variable Information

%s = File name

### Explanation

Deployment has been completed normally.

## 12.28.28 is40128

---

**IS: ERROR: is40128: Failed to update log file settings for IJServer %s1 (Error=%s2)**

### Variable Information

%s1 = IJServer name

%s2 = Error information

### Explanation

The log definition could not be updated.

## System Action

Processing stops.

## User Action

By referring to the message displayed in the message window of the Interstage Management Console, remove the cause of the failure to update the log definition then reexecute processing.

## 12.28.29 is40129

---

**IS: ERROR: is40129: Selected WorkUnit has been deleted (WorkUnit name=%s)**

### Variable Information

%s = WorkUnit name

### Explanation

The WorkUnit to be accessed has been deleted.

## System Action

Processing stops.

## User Action

The WorkUnit to be accessed may have been deleted.

Update the WorkUnit information to the latest information, and then reexecute the processing.

## 12.28.30 is40130

---

**IS: ERROR: is40130: Selected WorkUnit has been deleted or does not contain any applications (WorkUnit name=%s)**

### Variable Information

%s = WorkUnit name

### Explanation

The WorkUnit to be accessed has been deleted or the application is not deployed.

### System Action

Processing stops.

### User Action

The WorkUnit to be accessed may have been deleted or the application may not be deployed. After updating the WorkUnit or application information to the latest information, reexecute the processing.

## 12.28.31 is40131

---

**IS: ERROR: is40131: The IJServer is stopped. (IJServer name = %s)**

### Variable Information

%s = IJServer name

### Explanation

Processing could not be executed because access could not be gained to IJServer.

### System Action

Terminates the processing

### User Action

Start IJServer and then reexecute processing. When IJServer is started, it may cause Interstage JMX Service to restart. In this case, restart IJServer and then reexecute processing.

## 12.28.32 is40132

---

**IS: INFO: is40132: The module has been reactivated. (Module name = %s)**

### Variable Information

%s = Module name

### Explanation

The module was reactivated normally.

## 12.28.33 is40133

---

---

**IS: ERROR: is40133: The module could not be reactivated. (Module name = %s1, Error information = %s2)**

Variable Information

%s1 = Module name

%s2 = Error information

Explanation

The module could not be reactivated.

System Action

Terminates the processing.

User Action

Refer to the message output previously to the Interstage Management Console, remove the cause of the failure, and then reexecute processing.

## 12.28.34 is40134

---

**IS: ERROR: is40134: The J2EE application configuration information could not be obtained. (Module name = %s1, Error information = %s2)**

Variable Information

%s1 = Module name

%s2 = Error information

Explanation

The J2EE application definition information could not be obtained.

System Action

Terminates the processing

User Action

Refer to the message output previously to the Interstage Management Console, remove the cause of the failure, and then reexecute processing.

## 12.28.35 is40135

---

**IS: ERROR: is40135: The name conversion definition information could not be obtained. (Module name = %s1, Error information = %s2)**

Variable Information

%s1 = Module name

%s2 = Error information

Explanation

The name conversion definition information could not be obtained.

System Action

Terminates the processing

### User Action

Refer to the message output previously to the Interstage Management Console, remove the cause of the failure, and then reexecute processing.

## 12.28.36 is40136

---

**IS: INFO: is40136: The J2EE application definition has been updated. (Module name = %s1)**

### Variable Information

%s1 = Module name

### Explanation

The J2EE application definition was updated normally.

## 12.28.37 is40137

---

**IS: ERROR: is40137: The J2EE application definition could not be updated. (Module name = %s1, Error information = %s2)**

### Variable Information

%s1 = Module name

%s2 = Error information

### Explanation

The J2EE application definition could not be updated.

### System Action

Terminates the processing

### User Action

Refer to the message output previously to the Interstage Management Console, remove the cause of the failure, and then reexecute processing.

## 12.28.38 is40138

---

**IS: INFO: is40138: The name conversion definition has been updated. (Module name = %s1)**

### Variable Information

%s1 = Module name

### Explanation

The name conversion definition was updated normally.

## 12.28.39 is40139

---

**IS: ERROR: is40139: The name conversion definition information could not be updated. (Module name = %s1, Error information = %s2)**

## Variable Information

%s1 = Module name

%s2 = Error information

## Explanation

The name conversion definition information could not be updated.

## System Action

Terminates the processing

## User Action

Refer to the message output previously to the Interstage Management Console, remove the cause of the failure, and then reexecute processing.

## 12.28.40 is40140

---

**IS: INFO: is40140: The WorkUnit under the degradation operation has been restored. (WorkUnit name = %s)**

## Variable Information

%s1 = WorkUnit name

## Explanation

This message is output when the WorkUnit has been restored normally.

## 12.28.41 is40141

---

**IS: ERROR: is40141: The WorkUnit under the degeneracy operation could not be restored. (WorkUnit name = %s1, Error information = %s2)**

## Variable Information

%s1 = WorkUnit name

%s2 = Error information

## Explanation

The WorkUnit could not be restored.

## System Action

Terminates the processing

## User Action

Refer to the message output previously to the Interstage Management Console and the event log, remove the cause of the failure, and then reexecute processing.

## 12.28.42 is40142

---

**IS: ERROR: is40142: The name conversion definition information could not be obtained. (Application name = %s1, Error information = %s2)**

### Variable Information

%s1 = Application name

%s2 = Error information

### Explanation

The name conversion definition information could not be obtained.

### System Action

Terminates the processing

### User Action

Refer to the message output previously to the Interstage Management Console, remove the cause of the failure, and then reexecute processing.

## 12.28.43 is40143

---

**IS: INFO: is40143: The name conversion definition has been updated. (Application name = %s1)**

### Variable Information

%s1 = Application name

### Explanation

The name conversion definition was updated normally.

## 12.28.44 is40144

---

**IS: ERROR: is40144: The name conversion definition information could not be updated. (Application name = %s1, Error information = %s2)**

### Variable Information

%s1 = Application name

%s2 = Error information

### Explanation

The name conversion definition information could not be updated.

### System Action

Terminates the processing

### User Action

Refer to the message output previously to the Interstage Management Console, remove the cause of the failure, and then reexecute processing.

## 12.28.45 is40145

---

**IS: INFO: is40145: The set-up information has been updated. (module name = %s1)**

### Variable Information

%s1 = Module name

## Explanation

This message is output when the definition of the 'ejb-jar' file was updated normally.

### 12.28.46 is40146

---

**IS: INFO: is40146: WSDL download complete (Filename: %s1)**

#### Variable Information

%s1 = Downloaded file

#### Explanation

WSDL download is complete.

### 12.28.47 is40147

---

**IS: INFO: is40147: IJServer was combined (IJServer name=%s1)**

#### Variable Information

%s1 = IJServer name

#### Explanation

A Web-Only IJServer and an EJB-Only IJServer were combined to create one IJServer.

### 12.28.48 is40149

---

**IS: INFO: is40149: The Web server connector was moved.**

#### Explanation

The Web server connector was moved.

## 12.29 is40200 to is40299

---

This section details the messages with message numbers between is40200 and is40299.

### 12.29.1 is40201

---

**IS: INFO: is40201: Deployment was completed for file '%s'**

#### Variable Information

%s = File name

If 'Deploy the Web application anywhere on the Managed Server' or 'Deploy the Web application anywhere on the server' are selected, the directory name is output.

#### Explanation

Deployment processing completed.

### 12.29.2 is40202

---

**IS: ERROR: is40202: Error occurred during deployment of file '%s'**

## Variable Information

%s = File name

If 'Deploy the Web application anywhere on the Managed Server' or 'Deploy the Web application anywhere on the server' are selected, the directory name is output.

## Explanation

Deployment failed.

## System Action

Processing stops.

## User Action

Refer to the message displayed in the message window of the Interstage Management Console, remove the cause of the deployment failure, and then execute processing again.

## 12.29.3 is40203

---

**IS: INFO: is40203: Undeployment was completed successfully**

## Explanation

Undeployment has been completed normally.

## 12.29.4 is40204

---

**IS: ERROR: is40204: Undeployment failed**

## Variable Information

%s = File name

## Explanation

Undeployment failed.

## System Action

Processing stops.

## User Action

By referring to the message displayed in the message window of the Interstage Management Console, remove the cause of the undeployment failure then reexecute processing.

## 12.29.5 is40205

---

**IS: ERROR: is40205: Invalid file was specified (Filename: %s)**

## Variable Information

%s = File name

## Explanation

An invalid file was specified.

## System Action

Processing stops.

## User Action

Specify a valid file then reexecute processing.

## 12.29.6 is40206

---

**IS: ERROR: is40206: File transfer failed. Filename: %s1 (Error=%s2)**

### Variable Information

%s1 = File name

%s2 = Error information

### Explanation

The file could not be transferred.

### System Action

Processing stops.

### User Action

By referring to the message displayed in the message window of the Interstage Management Console, remove the cause of the file transfer failure then reexecute processing.

## 12.29.7 is40207

---

**IS: ERROR: is40207: Unable to acquire application summary information**

### Explanation

A list of applications could not be obtained.

### System Action

Processing stops.

### User Action

By referring to the message displayed in the message window of the Interstage Management Console, remove the cause of the failure to obtain a list of applications then reexecute processing.

## 12.29.8 is40209

---

**IS: ERROR: is40209: Filename was not specified**

### Explanation

No file name was specified.

### System Action

Processing stops.

### User Action

Reenter the command with a file name specified.

## 12.29.9 is40210

---

**IS: ERROR: is40210: File not found (Filename=%s)**

### Variable Information

%s = File name

### Explanation

The specified file could not be found.

### System Action

Processing stops.

### User Action

Reenter the command with a valid file name specified.

## 12.29.10 is40211

---

**IS: ERROR: is40211: Could not acquire application information for IJServer %s1 (Error=%s2)**

### Variable Information

%s1 = IJServer name

%s2 = Error information

### Explanation

A list of applications could not be obtained.

### System Action

Processing stops.

### User Action

By referring to the message displayed in the message window of the Interstage Management Console, remove the cause of the failure to obtain a list of applications then reexecute processing.

## 12.29.11 is40212

---

**IS: ERROR: is40212: The value of Stateful Bean Concurrency must be between 1 and 2147483647**

### Explanation

The value set for the specified item is invalid.

### System Action

Processing stops.

### User Action

Set a value within the range and reexecute processing.

## 12.29.12 is40213

---

**IS: ERROR: is40213: The value of Session Idle Timeout must be between 1 and 2147483647**

### Explanation

The value set for the specified item is invalid.

### System Action

Processing stops.

### User Action

Set a value within the range and reexecute processing.

## 12.29.13 is40214

---

**IS: INFO: is40214: Redeployment was completed successfully (Module Name=%s1)**

### Variable Information

%s1 = Module name

### Explanation

Redeployment was completed successfully.

## 12.29.14 is40215

---

**IS: ERROR: is40215: Redeployment failed (Module Name=%s1)**

### Variable Information

%s1 = Module name

### Explanation

Redeployment failed.

### System Action

Processing stops.

### User Action

Remove the cause of the error by referring to the message output on the message window of the Interstage Management Console, and then reexecute the processing.

## 12.29.15 is40216

---

**IS: INFO: is40216: Undeployment completed successfully. (Module name = %s1)**

### Variable Information

%s1 = Module name

### Explanation

The undeployment processing ended normally.

## 12.29.16 is40217

---

**IS: INFO: is40217: The deactivation processing for the module has been completed. (Module name = %s1)**

### Variable Information

%s1 = Module name

### Explanation

The deactivation processing for the module has been completed.

## 12.29.17 is40218

---

**IS: ERROR: is40218: The deactivation processing for the module has failed. (Module name = %s1)**

### Variable Information

%s1 = Module name

### Explanation

The deactivation processing for the module has failed.

### System Action

Stops processing the module. Undeploys the modules that follow if the message was output when multiple modules were selected and undeployed.

### User Action

Remove the cause of the error by referring to the message output on the message window of the Interstage Management Console, and then reexecute the processing.

## 12.29.18 is40219

---

**IS: INFO: is40219: The activation processing for the module has been completed. (Module name = %s1)**

### Variable Information

%s1 = Module name

### Explanation

The activation processing for the module has been completed.

## 12.29.19 is40220

---

**IS: ERROR: is40220: The activation processing for the module has failed. (Module name = %s1)**

### Variable Information

%s1 = Module name

### Explanation

The activation processing for the module has failed.

### System Action

Stops processing the module. Undeploys the modules that follow if the message was output when multiple modules were selected and undeployed.

### User Action

Remove the cause of the error by referring to the message output on the message window of the Interstage Management Console, and then reload the module.

## 12.29.20 is40221

---

**IS: ERROR: is40221: The module could not be undeployed. (Module name = %s1)**

## Variable Information

%s1 = Module name

## Explanation

The module could not be undeployed.

## System Action

Stops processing the module. Undeploys the modules that follow if multiple modules have been selected and undeployed.

## User Action

Remove the cause of the error by referring to the message output on the message window of the Interstage Management Console, and then undeploy the same module again.

## 12.29.21 is40222

---

**IS: INFO: is40222: Deployment completed successfully. (Application name = %s1)**

## Variable Information

%s1 = Application name

## Explanation

Deployment completed successfully.

## 12.29.22 is40223

---

**IS: ERROR: is40223: Undeployment failed. (Application name = %s1)**

## Variable Information

%s1 = Application name

## Explanation

Undeployment failed.

## System Action

Processing stops.

## User Action

By referring to the message displayed in the message window of the Interstage Management Console, remove the cause of the undeployment failure then reexecute processing.

## 12.30 is40300 to is40399

---

This section details the messages with message numbers between is40300 and is40399.

### 12.30.1 is40301

---

**IS: INFO: is40301: JDBC Data Source %s was created**

## Variable Information

%s = Definition name

## Explanation

A JDBC data source has been generated.

## 12.30.2 is40302

---

### IS: ERROR: is40302: Failed to create JDBC Data Source %s1 (Error=%s2)

#### Variable Information

%s1 = Definition name

%s2 = Error information

#### Explanation

A JDBC data source could not be generated.

#### System Action

Processing stops.

#### User Action

By referring to the message displayed in the message window of the Interstage Management Console, remove the cause of the failure to generate a JDBC data source then reexecute processing.

## 12.30.3 is40303

---

### IS: INFO: is40303: JDBC Data Source Connection Test was completed successfully(name=%s1)

#### Variable Information

%s1 = Definition name

#### Explanation

A JDBC data source connection test was completed successfully.

## 12.30.4 is40304

---

### IS: ERROR: is40304: Failed to JDBC Data Source Connection Test (name=%s1, Error=%s2)

#### Variable Information

%s1 = Definition name

%s2 = Error information

Note: A maximum of 256 bytes is output for the error information.

#### Explanation

A JDBC data source connection test failed.

#### System Action

Processing stops.

#### User Action

Refer to the message that is output in the variable information error information, fix the error and reexecute. Examples are shown in the table shown below.

Refer to the database manual and JDBC driver manual, fix the cause of the error and reexecute.

#### Note

The class path, library path, or environment variable defined in the IJServer environment settings is not effective when the connection test is executed. Set the class path/library path in the J2EE properties. For the environment variable, refer to "How to set the environment variable" below and set it before starting the Interstage JMX Service.

**When the database type is Symfoware:**

Error information	Cause and solution
Failed in lookup from Provider URL : javax.naming.CommunicationException: Unknown host name : ****	The host name is invalid, or the specified host name cannot be resolved. Correct/update and reexecute.
Failed in lookup from Provider URL : javax.naming.CommunicationException: SYMNameServer isn't being started. HostName : localhost Exception:connect: Address is invalid on local machine, or port is not valid on remote machine	The host name or port number specified for "Naming Service Host Name" or "Naming Service Port Number" may be invalid. Check/correct and reexecute.
Failed in lookup from Provider URL : javax.naming.CommunicationException: I/O Error occurs when sending the command. :Read timed out	The Symfoware Naming Service may not be running. Check whether the Symfoware Naming Service in the server specified for "Naming Service Host Name" or "Naming Service Port Number" is running.  The host name specified for "Naming Service Host Name" or the port number specified for "Naming Service Port Number" may also be invalid. Check/correct and reexecute.
Failed in lookup from Provider URL : javax.naming.CommunicationException: SYMNameServer isn't being started. HostName : **** Exception:Connection refused: connect	The Symfoware Naming Service may not be running. Check whether the Symfoware Naming Service in the server specified for "Naming Service Host Name" or "Naming Service Port Number" is running.  The host name specified for "Naming Service Host Name" or the port number specified for "Naming Service Port Number" may also be invalid. Check/correct and reexecute.
Failed in lookup from Provider URL : javax.naming.NameNotFoundException: Look up *** not found.	The entered "Datasource Name", "Connection Host Name", and "Connection Port Number" may be invalid. Check the settings information and correct it if it is invalid. Also check whether the Symfoware Server server or client package is installed.  <b>Windows32/64</b>  Add the path described in 'Environment Settings for Symfoware' of the 'J2EE User's Guide' to the path of the J2EE property or PATH environment variable.  <b>Solaris32/64 Linux32/64</b>  Add the library path described in 'Environment Settings for Symfoware' of the 'J2EE User's Guide' to the library path of the J2EE property or LD_LIBRARY_PATH environment variable.
Failed in calling setter method: PROPERTY=SYMOption DETAILS=java.lang.reflect.InvocationTargetException	The description format entered for "Other parameters" is invalid. Refer to the Symfoware manual, specify the correct option and reexecute.
Failed in calling setter method: PROPERTY=SYMOption DETAILS=*****	The ctuneparam that is specified in "Other parameters" is invalid. Refer to the Symfoware manual, specify the correct option and reexecute.

Error information	Cause and solution
JYP9038E Keyword ***** specified in connection function is incorrect. item no.="*"	The value specified for the keyword of ctuneparam in "Other parameters" is invalid. Refer to the Symfoware manual, specify the correct option and reexecute.
Other errors	Refer to the error that was output (regardless of database type).  If the error cannot be resolved, refer to the Symfoware manual, fix the error and reexecute.

**When the type of a database is Oracle:**

Error information	Cause and solution
java.lang.UnsatisfiedLinkError	<p>The Oracle library path settings may be invalid (for example, a 64-bit library path may have been set instead of a 32-bit library path).</p> <p>If OCI is specified as the driver type, the Oracle client package environment is required. Verify that the client package has been installed.</p> <p><b>Windows32/64</b></p> <p>When using OCI, add the path described in 'Environment Settings for Oracle' of the 'J2EE User's Guide' to the path of the J2EE property or PATH environment variable.</p> <p><b>Solaris32/64 Linux32/64</b></p> <p>When using OCI, add the path described in 'Environment Setup when JDBC (Database) is Referenced' of the 'J2EE User's Guide' to the library path of the J2EE property or LIBRARY PATH environment variable.</p>
no *** in java.library.path	<p>Check that the Oracle server or client package is installed.</p> <p><b>Windows32/64</b></p> <p>When using OCI, add the path described in 'Environment Settings for Oracle' of the 'J2EE User's Guide' to the path of the J2EE property or PATH environment variable.</p> <p><b>Solaris32/64 Linux32/64</b></p> <p>When using OCI, add the library path described in 'Environment Setup when JDBC (Database) is Referenced' of the 'J2EE User's Guide' to the library path of the J2EE property or LIBRARY PATH environment variable.</p>
ORA-01017: invalid username/password; logon denied	There is an error in the 'user ID' and 'password' which were input. Reexecute processing after correction / updating.
ORA-12154: TNS: ***	<p>There may be an error in the 'SID/Net service name' that was entered, correct or update the error, and then reexecute.</p> <p>Since the 'tnsnames.ora' reference may have failed or the 'tnsnames.ora' definition may be incorrect, establish the cause of the error.</p>

Error information	Cause and solution
ORA-12505: TNS: ***	There is an error in the 'SID/Net service name' that was entered. Correct or update it, and then reexecute.
ORA-12541: TNS: ***	<p>There may be an error in the 'Port Number' that was entered. If there is, correct or update it, and then reexecute.</p> <p>If the TNS listener is not running, start it. If the 'tnsnames.ora' reference failed or the 'tnsnames.ora' definition is incorrect, establish the cause of the failure.</p>
ORA-12545: The target host or object does not exist, therefore the connection failed.	There may be an error in the 'host name' that was entered, or it cannot be referenced on the network. Establish the cause of the failure.
OracleDataSource is supported from Oracle 10g	<p>Oracle connection pooling cannot be used in Oracle 9i or earlier. Use Interstage connection pooling instead. If this message is output when a JDBC driver module of Oracle10g or later is already set, a JDBC driver module of Oracle9i or earlier may be loaded. Check that a JDBC driver module of Oracle9i or earlier is not set for the following definitions:</p> <ul style="list-style-type: none"> <li>- J2EE property class paths</li> <li>- System environment variables</li> </ul>
<p>Listener refused the connection with the following error: ORA-12504, TNS:listener was not given the SID in CONNECT_DATA The Connection descriptor used by the client was: (DESCRIPTION=(ADDRESS=(PROTOCOL=tcp)(PORT=1521)(HOST=****))(CONNECT_DATA=(SID=)))</p>	The "SID/Net service name" has not been entered. Enter the "SID/Net service name" and reexecute.
<p>Listener refused the connection with the following error: ORA-12505, TNS:listener does not currently know of SID given in connect descriptor. The Connection descriptor used by the client was: (DESCRIPTION=(ADDRESS=(PROTOCOL=tcp)(PORT=1521)(HOST=****))(CONNECT_DATA=(SID=****)))</p>	<p>The "SID/Net service name" that was entered is incorrect. Enter the correct "SID/Net service name" and reexecute.</p> <p>The Oracle database may also not be running. Check whether the Oracle database is running and reexecute.</p>
ORA-12560: TNS:protocol adapter error	The tnsnames.ora settings are invalid. Refer to the Oracle manual, correct tnsnames.ora and reexecute.
java.lang.NoSuchMethodException: Not exists setter method: PROPERTY=connectionProperties	Connection properties cannot be used in Oracle9i JDBC drivers. Delete the connection property settings, or set a JDBC driver of Oracle11g or later in the class path and reexecute.
<p>oracle.ons.ONSEException oracle.ons.SubscriptionException</p>	The Oracle Notification Service settings are invalid. To perform DB connection testing using Oracle RAC, the Oracle Notification Service settings must be correct. Refer to "Interstage Settings" in the "Linkage with Oracle Real Application Clusters" appendix of the J2EE User's Guide, configure the settings, and perform DB connection testing again.
If error information containing oracle/ons/ONSEException is output	The Oracle Notification Service settings are invalid. To perform DB connection testing using Oracle RAC, the Oracle Notification Service settings must be correct.

Error information	Cause and solution
	Refer to "Interstage Settings" in the "Linkage with Oracle Real Application Clusters" appendix of the J2EE User's Guide and configure the settings, or refer to the Oracle manual and configure the Oracle Notification Service settings, and perform DB connection testing again.
java.lang.NoSuchMethodException: Not exists setter method: PROPERTY=****	The property name that was entered for "Other Datasource/Property Information" - "Property Name" is invalid. Refer to the JDBC driver manual, correct/update and reexecute.
Other errors	Refer to the error that was output regardless of the database type.  If the error cannot be resolved, refer to the Oracle manual, fix the error and reexecute.

**When the database type is SQLServer:**

Error Information	Cause and Solution
java.lang.NoSuchMethodException: Not exists setter method: PROPERTY=****	The property name that was entered for "Other Datasource/Property Information" - "Property Name" is invalid. Refer to the JDBC driver manual, correct/update and reexecute.
Other errors	Refer to the error that was output regardless of the database type.  If the error cannot be resolved, refer to the SQL Server manual, fix the error and reexecute.

**When the database type is general-purpose definition:**

Error information	Cause and Solution
java.lang.ClassNotFoundException: ****	The "Datasource Class Name" class that was entered was not set in the class path, or the name that was entered for "Datasource Class Name" is invalid. If the value that was entered is invalid, correct/update and reexecute. If the value that was entered is correct, set the JDBC driver with the corresponding class in the system environment settings class path.
Other errors	Refer to the error that was output regardless of the database type.  If the error cannot be resolved, refer to the database manual to identify the cause of the error from the error information, fix the error and reexecute.

**Errors that are output regardless of database type:**

Error information	Cause and Solution
Occurred an error in a java process. Error Code=****	The method set for escaping the double quotation mark (") character in the J2EE properties JavaVM option may be incorrect. Check the J2EE properties JavaVM option settings, correct/update and reexecute.  If Oracle is used and the driver type is oci, the ORACLE_HOME environment variable may not be set. Refer to "How to set the environment variable" below and

Error information	Cause and Solution
	set ORACLE_HOME before starting the Interstage JMX Service.
java.lang.NoClassDefFoundError: ***** java.lang.ClassNotFoundException: *****	A class that is required to perform DB connection testing has not been set in the J2EE properties class path.  Refer to "Environment Setup when JDBC (Database) is Referenced" in the "JNDI" chapter of the J2EE User's Guide, and either configure the environment settings for each database. Alternatively, if you are using Oracle RAC, refer to the "Linkage with Oracle Real Application Clusters" appendix of the J2EE User's Guide, configure the environment settings, and perform DB connection testing again.
Invalid DataSource object: Class=javax.naming.Reference	A datasource class registered in the .bindings file has not been set in the class path. Check the class path settings of the J2EE property in the system environment settings, make the required corrections and reexecute.
Invalid DataSource object: Class=com.sun.jndi.fscontext.RefFSContext	"PROVIDER_URL" has not been specified. Refer to "isj2eadmin", "Resource Definition Files" in the "J2EE Operation Commands" chapter of the Reference Manual (Command Edition), make the required corrections and reexecute.
Failed in lookup from Provider URL : javax.naming.InvalidNameException: *****	The entered "PROVIDER_URL" is invalid. Correct/update and reexecute.
Failed in lookup from Provider URL : javax.naming.NameNotFoundException: *****	The datasource definition specified for "Datasource Name" in the .bindings file has not been registered, or "PROVIDER_URL" or "Datasource Name" is invalid. Check/correct and reexecute.  The environment settings may be invalid. Refer to "Environment Setup when JDBC (Database) is Referenced" in the "JNDI" chapter of the J2EE User's Guide, and check the environment settings used in each database.
java.lang.NoSuchMethodException: Not exists setter method: PROPERTY=*****	The property name that was entered for "Other Datasource/Property Information" - "Property Name" is invalid. Refer to the JDBC driver manual, correct/update and reexecute.
Failed in calling setter method: PROPERTY=***** DETAILS=java.lang.IllegalArgumentException: argument type mismatch	The data type that was entered for "Other Datasource/Property Information" - "Data Type" does not match the JDBC driver property that was specified for "Property Name". Refer to the JDBC driver manual, correct/update and reexecute.
Failed in calling setter method: PROPERTY=***** DETAILS=*****	"Property Name", "Data Type", and "Property Value" that were entered for "Other Datasource/Property Information" are invalid. Refer to the JDBC driver manual, correct/update and reexecute.

### How to set the environment variable

The settings for the environment variable depend on the method that is used to start the Interstage JMX Service.

- Starting the Interstage JMX Service using the *isjmxstart* command

After the environment variable has been set, stop the Interstage JMX Service using the *isjmxstop* command, and then start it again using the *isjmxstart* command. This will activate the environment variable that was set.

- Starting the Interstage JMX Service using the 'S95isjmxstart' system initialization script

After the environment variable has been set, to ensure that it is activated when the OS starts up, add the environment variable to the 'S95isjmxstart' system initialization script. This will ensure that the environment variable is activated the next time the OS starts up. For details on subjects such as the S95isjmxstart storage directory, refer to "S95isjmxstart" in the "Interstage JMX Service Operation Commands" chapter of the Reference Manual (Command Edition).

## 12.30.5 is40311

---

### IS: INFO: is40311: JDBC Data Source %s was updated

#### Variable Information

%s = Definition name

#### Explanation

The JDBC data source has been updated.

## 12.30.6 is40312

---

### IS: ERROR: is40312: Failed to update JDBC Data Source %s1 (Error=%s2)

#### Variable Information

%s1 = Definition name

%s2 = Error information

#### Explanation

The JDBC data source could not be updated.

#### System Action

Processing stops.

#### User Action

By referring to the message displayed in the message window of the Interstage Management Console, remove the cause of the failure to update the JDBC data source then reexecute processing.

## 12.30.7 is40322

---

### IS: ERROR: is40322: Failed to acquire JDBC Data Source information (Error=%s)

#### Variable Information

%s = Error information

#### Explanation

A list of JDBC resources could not be obtained.

#### System Action

Processing stops.

#### User Action

By referring to the message displayed in the message window of the Interstage Management Console, remove the cause of the failure to obtain a list of JDBC resources then reexecute processing.

## 12.30.8 is40332

---

---

**IS: ERROR: is40332: Failed to acquire information for JDBC Data Source %s1 (Error=%s2)****Variable Information**

%s1 = Definition name

%s2 = Error information

**Explanation**

The definition information for the JDBC data source could not be obtained.

**System Action**

Processing stops.

**User Action**

By referring to the message displayed in the message window of the Interstage Management Console, remove the cause of the failure to obtain definition information for the JDBC data source then reexecute processing.

---

**12.30.9 is40341**

---

**IS: INFO: is40341: JDBC Data Source %s was deleted****Variable Information**

%s = Definition name

**Explanation**

The JDBC data source has been deleted.

---

**12.30.10 is40342**

---

**IS: ERROR: is40342: Failed to delete JDBC Data Source %s1 (Error=%s2)****Variable Information**

%s1 = Definition name

%s2 = Error information

**Explanation**

The JDBC data source could not be deleted.

**System Action**

Processing stops.

**User Action**

By referring to the message displayed in the message window of the Interstage Management Console, remove the cause of the failure to delete the JDBC data source then reexecute processing.

---

**12.31 is40400 to is40499**

This section details the messages with message numbers between is40400 and is40499.

---

**12.31.1 is40401**

---

**IS: INFO: is40401: Retrieved status information for web application %s**

## Variable Information

%s = Application name

## Explanation

Web application status information has been obtained successfully.

## 12.31.2 is40402

---

### **IS: ERROR: is40402: Failed to acquire status information for web application %s1 (Error=%s2)**

## Variable Information

%s1 = Application name

%s2 = Error information

## Explanation

Web application status information could not be obtained.

## System Action

Processing stops.

## User Action

By referring to the message displayed in the message window of the Interstage Management Console, remove the cause of the failure to obtain Web application status information then reexecute processing.

## 12.31.3 is40412

---

### **IS: ERROR: is40412: Failed to acquire performance information for web application (Error=%s)**

## Variable Information

%s = Error information

## Explanation

Web application performance information could not be obtained.

## System Action

Processing stops.

## User Action

By referring to the message displayed in the message window of the Interstage Management Console, remove the cause of the failure to obtain Web application performance information then reexecute processing.

## 12.31.4 is40422

---

### **IS: ERROR: is40422: Failed to update settings for web application %s1 (Error=%s2)**

## Variable Information

%s1 = Application name

%s2 = Error information

## Explanation

The Web application environment definition could not be set up.

## System Action

Processing stops.

## User Action

By referring to the message displayed in the message window of the Interstage Management Console, remove the cause of the failure to set up the Web application environment definition then reexecute processing.

## 12.31.5 is40452

---

**IS: ERROR: is40452: Failed to acquire definition information for EJB application %s1 (Error=%s2)**

### Variable Information

%s1 = Module name

%s2 = Error information

### Explanation

Failed to obtain EJB application definition information.

### System Action

Processing stops.

### User Action

Refer to the message that is displayed in the Interstage Management Console message window, establish the cause of the failure, and then reexecute.

## 12.32 is40500 to is40599

---

This section details the messages with message numbers between is40500 and is40599.

### 12.32.1 is40501

---

**IS: ERROR: is40501: Setting has been modified by another user**

### Explanation

The definition could not be updated because it had been updated by another user.

### System Action

Stops updating the definition.

### User Action

By referring to the message displayed in the message window of the Interstage Management Console, remove the cause of the failure then reexecute processing.

The Managed Server or Server Group which manages the definition information which carried out the updating request may have been deleted by another user. Reexecute processing after acquiring the most recent site information.

The Managed Server may have been added or deleted from the Server Group which manages the definition information which carried out the updating request by another user. Reexecute processing after acquiring the most recent site information.

### 12.32.2 is40502

---

**IS: ERROR: is40502: Failed to update settings for web application %s1 (Error=%s2)**

### Variable Information

%s1 = Definition name

%s2 = Error information

#### Explanation

A JavaMail resource access definition could not be created.

#### System Action

Stops updating the definition.

#### User Action

By referring to the message displayed in the message window of the Interstage Management Console, remove the cause of the failure to create a JavaMail resource access definition then reexecute processing.

### 12.32.3 is40503

---

**IS: INFO: is40503: JavaMail resource access configuration %s was created**

#### Variable Information

%s = Definition name

#### Explanation

A JavaMail resource access definition has been created.

### 12.32.4 is40511

---

**IS: INFO: is40511: JavaMail resource access configuration %s was updated**

#### Variable Information

%s = Definition name

#### Explanation

The JavaMail resource access definition has been updated.

### 12.32.5 is40512

---

**IS: ERROR: is40512: Failed to update JavaMail resource access configuration %s1 (Error=%s2)**

#### Variable Information

%s1 = Definition name

%s2 = Error information

#### Explanation

The JavaMail resource access definition could not be updated.

#### System Action

Processing stops.

#### User Action

By referring to the message displayed in the message window of the Interstage Management Console, remove the cause of the failure to update the JavaMail resource access definition then reexecute processing.

### 12.32.6 is40522

---

**IS: ERROR: is40522: Failed to acquire list of JavaMail resource access configurations (Error=%s)**

## Variable Information

%s = Error information

## Explanation

A list of JavaMail resource access names could not be obtained.

## System Action

Processing stops.

## User Action

By referring to the message displayed in the message window of the Interstage Management Console, remove the cause of the failure to obtain a list of JavaMail resource access names then reexecute processing.

## 12.32.7 is40532

---

**IS: ERROR: is40532: Failed to acquire JavaMail resource access configuration information for configuration %s1 (Error=%s2)**

## Variable Information

%s1 = Definition name

%s2 = Error information

## Explanation

The definition information for the JavaMail resource access definition could not be obtained.

## System Action

Processing stops.

## User Action

By referring to the message displayed in the message window of the Interstage Management Console, remove the cause of the failure to obtain definition information for the JavaMail resource access definition then reexecute processing.

## 12.32.8 is40541

---

**IS: INFO: is40541: JavaMail resource access configuration %s was deleted**

## Variable Information

%s = Definition name

## Explanation

The JavaMail resource access definition has been deleted.

## 12.32.9 is40542

---

**IS: ERROR: is40542: Failed to delete JavaMail resource access configuration %s1 (Error=%s2)**

## Variable Information

%s1 = Definition name

%s2 = Error information

## Explanation

The JavaMail resource access definition could not be deleted.

## System Action

Processing stops.

## User Action

By referring to the message displayed in the message window of the Interstage Management Console, remove the cause of the failure to delete the JavaMail resource access definition then reexecute processing.

## 12.33 is40600 to is40699

---

This section details the messages with message numbers between is40600 and is40699.

### 12.33.1 is40601

---

**IS: INFO: is40601: Resource adapter %s was deployed**

#### Variable Information

%s = Definition name

#### Explanation

The resource adapter has been deployed.

### 12.33.2 is40602

---

**IS: ERROR: is40602: Failed to deploy resource adapter %s1 (Error=%s2)**

#### Variable Information

%s1 = Definition name

%s2 = Error information

#### Explanation

The resource adapter could not be deployed.

#### System Action

Processing stops.

#### User Action

By referring to the message displayed in the message window of the Interstage Management Console, remove the cause of the failure to deploy a resource adapter then reexecute processing.

### 12.33.3 is40611

---

**IS: INFO: is40611: Resource adapter %s was updated**

#### Variable Information

%s = Definition name

#### Explanation

The resource adapter has been updated.

### 12.33.4 is40612

---

**IS: ERROR: is40612: Failed to update resource adapter %s1 (Error=%s2)**

### Variable Information

%s1 = Definition name  
%s2 = Error information

### Explanation

The resource adapter could not be updated.

### System Action

Processing stops.

### User Action

By referring to the message displayed in the message window of the Interstage Management Console, remove the cause of the failure to update the resource adapter then reexecute processing.

## 12.33.5 is40622

---

### IS: ERROR: is40622: Failed to acquire list of resource adapters (Error=%s )

### Variable Information

%s = Error information

### Explanation

A list of resource adapters could not be obtained.

### System Action

Processing stops.

### User Action

By referring to the message displayed in the message window of the Interstage Management Console, remove the cause of the failure to obtain a list of resource adapters then reexecute processing.

## 12.33.6 is40632

---

### IS: ERROR: is40632: Failed to acquire resource adapter %s1 configuration information (Error=%s2)

### Variable Information

%s1 = Definition name  
%s2 = Error information

### Explanation

The resource adapter definition could not be obtained.

### System Action

Processing stops.

### User Action

By referring to the message displayed in the message window of the Interstage Management Console, remove the cause of the failure to obtain the resource adapter definition then reexecute processing.

## 12.33.7 is40641

---

### IS: INFO: is40641: Resource adapter %s was undeployed

## Variable Information

%s = Definition name

## Explanation

The resource adapter has been undeployed.

## 12.33.8 is40642

---

### **IS: ERROR: is40642: Failed to undeploy resource adapter %s1 (Error=%s2)**

## Variable Information

%s1 = Definition name

%s2 = Error information

## Explanation

The resource adapter could not be undeployed.

## System Action

Processing stops.

## User Action

By referring to the message displayed in the message window of the Interstage Management Console, remove the cause of the failure to undeploy the resource adapter then reexecute processing.

## 12.33.9 is40651

---

### **IS: INFO: is40651: JTS resource configuration %s was setup**

## Variable Information

%s = Definition name

## Explanation

The JTS resource definition has been registered normally.

## 12.33.10 is40652

---

### **IS: ERROR: is40652: Failed to setup JTS resource configuration %s1 (Error=%s2)**

## Variable Information

%s1 = Definition name

%s2 = Error information

## Explanation

The JTS resource definition could not be registered.

## System Action

Processing stops.

## User Action

By referring to the message displayed in the message window of the Interstage Management Console, remove the cause of the failure to register the JTS resource definition then reexecute processing.

## 12.33.11 is40654

---

### IS: WARNING: is40654: Failed to setup JTS resource configuration %s1

#### Variable Information

%s1 = Definition name

#### Explanation

The JTS resource definition could not be registered.

#### System Action

Processing stops.

#### User Action

By referring to the event log, remove the cause of the failure to register the JTS resource definition. Once this has been done, reexecute processing from the JDBC environment setting screen or connector environment setting screen.

## 12.33.12 is40655

---

### IS: ERROR: is40655: Failed to setup JTS resource configuration %s1

#### Variable Information

%s1 = Definition name

#### Explanation

Failed to register the JTS resource definition.

#### System Action

Processing stops.

#### User Action

Refer to the event log, establish the cause of the failure to register the JTS resource definition, and reexecute from the JDBC environment settings window and connector environment settings window.

## 12.33.13 is40661

---

### IS: INFO: is40661: JTS resource configuration %s was updated

#### Variable Information

%s = Definition name

#### Explanation

The JTS resource definition has been reregistered normally.

## 12.33.14 is40662

---

### IS: ERROR: is40662: Failed to update JTS resource configuration %s1 (Error=%s2)

### Variable Information

%s1 = Definition name  
%s2 = Error information

### Explanation

The JTS resource definition could not be reregistered.

### System Action

Processing stops.

### User Action

By referring to the message displayed in the message window of the Interstage Management Console, remove the cause of the failure to reregister the JTS resource definition then reexecute processing.

## 12.33.15 is40663

---

### **IS: ERROR: is40663: Failed to update JTS resource configuration %s**

#### Variable Information

%s = Definition name

#### Explanation

The JTS resource definition could not be reregistered.

#### System Action

Processing stops.

#### User Action

By referring to the message displayed in the message window of the Interstage Management Console, remove the cause of the failure to reregister the JTS resource definition then reexecute processing.

## 12.33.16 is40665

---

### **IS: WARNING: is40665: Failed to update JTS resource configuration %s**

#### Variable Information

%s = Definition name

#### Explanation

The JTS resource definition could not be reregistered.

#### System Action

Processing stops.

#### User Action

By referring to the event log, remove the cause of the failure to reregister the JTS resource definition then reexecute processing.

## 12.33.17 is40666

---

---

**IS: ERROR: is40666: Failed to update JTS resource configuration %s****Variable Information**

%s = Definition name

**Explanation**

Failed to reregister the JTS resource definition.

**System Action**

Processing stops.

**User Action**

Refer to the event log, establish the cause of the failure to reregister the JTS resource definition and reexecute.

---

**12.33.18 is40671**

---

**IS: INFO: is40671: JTS resource configuration %s was deleted****Variable Information**

%s = Definition name

**Explanation**

The JTS resource definition has been deleted normally.

---

**12.33.19 is40672**

---

**IS: ERROR: is40672: Failed to delete JTS resource configuration %s1 (Error=%s2)****Variable Information**

%s1 = Definition name

%s2 = Error information

**Explanation**

The JTS resource definition could not be deleted.

**System Action**

Processing stops.

**User Action**

By referring to the message displayed in the message window of the Interstage Management Console, remove the cause of the failure to delete the JTS resource definition then reexecute processing.

---

**12.33.20 is40674**

---

**IS: ERROR: is40674: Failed to acquire JTS resource information (Error=%s)****Variable Information**

%s = Error information

## Explanation

A list of the JTS resource definitions could not be obtained.

## System Action

Processing stops.

## User Action

By referring to the message displayed in the message window of the Interstage Management Console, remove the cause of the failure to obtain a list of the JTS resource definitions then reexecute processing.

## 12.33.21 is40683

---

### **IS: ERROR: is40683: Failed to acquire configuration information for JTS resource %s**

## Variable Information

%s = Definition name

## Explanation

The JTS resource definition could not be obtained.

## System Action

Processing stops.

## User Action

By referring to the message displayed in the message window of the Interstage Management Console, remove the cause of the failure to obtain the JTS resource definition then reexecute processing.

## 12.33.22 is40684

---

### **IS: ERROR: is40684: Transaction service (OTS) has not been not setup**

## Explanation

The Transaction Service (OTS) has not been set up.

## System Action

Processing stops.

## User Action

The Transaction Service (OTS) may not have been set up. Reconfigure the system and set up the Transaction Service (OTS).

## 12.33.23 is40685

---

### **IS: WARNING: is40685: Global transactions cannot be used because the Transaction service (OTS) has not been setup**

## Explanation

A global transaction could not be used because the Transaction Service (OTS) has not been set up.

## System Action

Processing continues.

## User Action

The Transaction Service (OTS) must be set up to use a global transaction. Reconfigure the system and set up the Transaction Service (OTS). To set up the Transaction Service (OTS), use the Interstage Management Console. Select [System] then [Environment Setup] and specify 'Enable' for Transaction Service (OTS).

To set up the Transaction Service (OTS), specify [Use Transaction Service] on 'System' > 'Environment Setup' from the Interstage Management Console.

## 12.34 is40700 to is40799

---

This section details the messages with message numbers between is40700 and is40799.

### 12.34.1 is40701

---

**IS: INFO: is40701: Startup/Shutdown class %s was created**

#### Variable Information

%s = Class name

#### Explanation

The start/stop class has been created.

### 12.34.2 is40702

---

**IS: ERROR: is40702: Failed to create Startup/Shutdown class %s1 (Error=%s2)**

#### Variable Information

%s1 = Class name

%s2 = Error information

#### Explanation

The start/stop class could not be created.

#### System Action

Processing stops.

#### User Action

By referring to the message displayed in the message window of the Interstage Management Console, remove the cause of the failure to create the start/stop class then reexecute processing.

### 12.34.3 is40711

---

**IS: INFO: is40711: Startup/Shutdown class %s was updated**

#### Variable Information

%s = Class name

#### Explanation

The start/stop class definition has been updated.

### 12.34.4 is40712

---

**IS: ERROR: is40712: Failed to update Startup/Shutdown class %s1 (Error=%s2)**

## Variable Information

%s1 = Class name

%s2 = Error information

## Explanation

The start/stop class definition could not be updated.

## System Action

Processing stops.

## User Action

By referring to the message displayed in the message window of the Interstage Management Console, remove the cause of the failure to update the start/stop class then reexecute processing.

## 12.34.5 is40722

---

**IS: ERROR: is40722: Failed to acquire information for Startup/Shutdown classes (Error=%s)**

## Variable Information

%s = Error information

## Explanation

A list of start/stop classes could not be obtained.

## System Action

Processing stops.

## User Action

By referring to the message displayed in the message window of the Interstage Management Console, remove the cause of the failure to obtain a list of start/stop classes then reexecute processing.

## 12.34.6 is40732

---

**IS: ERROR: is40732: Failed to acquire configuration information for Startup/Shutdown class %s1 (Error=%s2)**

## Variable Information

%s1 = Class name

%s2 = Error information

## Explanation

The definition information for the start/stop class could not be obtained.

## System Action

Processing stops.

## User Action

By referring to the message displayed in the message window of the Interstage Management Console, remove the cause of the failure to obtain the definition information of the start/stop class then reexecute processing.

## 12.34.7 is40733

---

**IS: ERROR: is40733: Failed to acquire configuration information for Startup/Shutdown class %s**

## Variable Information

%s = Class name

## Explanation

The definition information for the start/stop class could not be obtained.

## System Action

Processing stops.

## User Action

By referring to the message displayed in the message window of the Interstage Management Console, remove the cause of the failure to obtain the definition information for the start/stop class then reexecute processing.

## 12.34.8 is40741

---

**IS: INFO: is40741: Startup/Shutdown class was deleted**

## Explanation

The start/stop class has been deleted.

## 12.34.9 is40742

---

**IS: ERROR: is40742: Failed to delete Startup/Shutdown class %s1 (Error=%s2)**

## Variable Information

%s1 = Class name

%s2 = Error information

## Explanation

The start/stop class could not be deleted.

## System Action

Processing stops.

## User Action

By referring to the message displayed in the message window of the Interstage Management Console, remove the cause of the failure to delete the start/stop class then reexecute processing.

## 12.34.10 is40751

---

**IS: INFO: is40751: Web Server Connector was created for WorkUnit %s**

## Variable Information

%s = WorkUnit name

## Explanation

A Web server connector has been created normally.

## 12.34.11 is40752

---

**IS: ERROR: is40752: Failed to create Web Server Connector for WorkUnit %s**

#### Variable Information

%s = WorkUnit name

#### Explanation

The Web server connector could not be created.

#### System Action

Processing stops.

#### User Action

By referring to the message displayed in the message window of the Interstage Management Console, remove the cause of the failure to create the Web server connector then reexecute processing.

### 12.34.12 is40753

---

#### **IS: INFO: is40753: Web Server Connector was updated (WorkUnit=%s)**

#### Variable Information

%s = WorkUnit name

#### Explanation

The Web server connector has been updated normally.

### 12.34.13 is40754

---

#### **IS: ERROR: is40754: Failed to update Web Server Connector on WorkUnit %s**

#### Variable Information

%s = WorkUnit name

#### Explanation

The Web server connector could not be updated.

#### System Action

Processing stops.

#### User Action

By referring to the message displayed in the message window of the Interstage Management Console, remove the cause of the failure to update the Web server connector then reexecute processing.

### 12.34.14 is40755

---

#### **IS: ERROR: is40755: Failed to acquire list of Web Server Connectors (Error=%s)**

#### Variable Information

%s = Error information

#### Explanation

A list of Web server connectors could not be obtained.

## System Action

Processing stops.

## User Action

By referring to the message displayed in the message window of the Interstage Management Console, remove the cause of the failure to obtain a list of Web server connectors then reexecute processing.

## 12.34.15 is40756

---

**IS: ERROR: is40756: Failed to acquire configuration information for Web Server Connector on WorkUnit %s**

### Variable Information

%s = WorkUnit name

### Explanation

The definition information for the Web server connector could not be obtained.

### System Action

Processing stops.

### User Action

By referring to the message displayed in the message window of the Interstage Management Console, remove the cause of the failure to obtain definition information for the Web server connector then reexecute processing.

## 12.34.16 is40757

---

**IS: INFO: is40757: Web server connector was deleted (WorkUnit=%s)**

### Variable Information

%s = WorkUnit name

### Explanation

Web server connector was deleted.

## 12.34.17 is40758

---

**IS: ERROR: is40758: Failed to delete Web Server Connector on WorkUnit %s**

### Variable Information

%s = WorkUnit name

### Explanation

The Web server connector could not be deleted.

### System Action

Processing stops.

#### User Action

By referring to the message displayed in the message window of the Interstage Management Console, remove the cause of the failure to delete the Web server connector then reexecute processing.

### 12.34.18 is40759

---

#### IS: INFO: is40759: Web server connector log configuration was updated

##### Explanation

The log settings of the Web server connector have been updated normally.

### 12.34.19 is40760

---

#### IS: ERROR: is40760: Failed to update the log setup of the Web server connector

##### Explanation

The log settings of the Web server connector could not be updated.

##### System Action

Processing stops.

##### User Action

By referring to the message displayed in the message window of the Interstage Management Console, remove the cause of the failure to update the log settings of the Web server connector then reexecute processing.

### 12.34.20 is40761

---

#### IS: ERROR: is40761: Failed to acquire Web server connector log configuration information

##### Explanation

The definition information for the log settings of the Web server connector could not be obtained.

##### System Action

Processing stops.

##### User Action

By referring to the message displayed in the message window of the Interstage Management Console, remove the cause of the failure to obtain definition information for the log settings of the Web server connector then reexecute processing.

### 12.34.21 is40762

---

#### IS: ERROR: is40762: The selected WorkUnit has already been deleted

##### Explanation

The WorkUnit to be operated has already been deleted.

##### System Action

Processing stops.

## User Action

The WorkUnit to be operated has probably already been deleted. Update the WorkUnit information, and reexecute processing.

### 12.34.22 is40763

---

**IS: ERROR: is40763: "Run Web server and WorkUnit on the same machine?" option has been changed by another user.**

#### Explanation

Another user changed the servlet detail setting item 'Run the Web server and WorkUnit on the same machine' on the system environment setting screen.

#### System Action

Processing stops.

#### User Action

Update the system status information.

If the servlet detail setting item 'Run the Web server and WorkUnit on the same machine' on the system environment setting screen is set to 'Yes', the 'List' tab and 'New' tab are not displayed on the Web server connector screen. To display the 'List' tab and 'New' tab, set 'Run the Web server and WorkUnit on the same machine' to 'No'.

### 12.34.23 is40764

---

**IS: ERROR: is40764: Failed to get the type of the Web server and the WorkUnit**

#### Explanation

The Web server and WorkUnit run mode could not be obtained.

#### System Action

Continues processing assuming that the Web server and WorkUnit run on the same machine.

#### User Action

Refer to the message displayed in the message window of the Interstage Management Console, remove the cause of the failure to obtain the Web server and WorkUnit run mode, and then reexecute processing.

If the message immediately preceding the message was 'is40006', and if you want to obtain information about the operation status of the Web server and WorkUnit, install the necessary packages identified in the is40006 message and rerun the process.

In other cases, view the message output in the message window on the Interstage Management Console.

Use that information to remove the cause of the failure, and rerun the process.

### 12.34.24 is40765

---

**IS: ERROR: is40765: Failed to update the type of the Web server and the WorkUnit**

#### Explanation

The Web server and WorkUnit run mode could not be updated.

#### System Action

Processing stops.

## User Action

View the Interstage Management Console's message window, follow the message's recommendations to remove the cause of the failure to update the Web server and WorkUnit run mode, and then reexecute processing.

## 12.34.25 is40766

---

### IS: ERROR: is40766: The selected application has already been undeployed

#### Explanation

The application which the user has tried to operate has already been undeployed.

#### System Action

Processing stops.

#### User Action

Update the application information, and reexecute processing.

If the monitor information is used, the IJServer to be monitored may have stopped. If the IJServer has stopped, the monitor information cannot be referenced. Check whether IJServer has stopped.

If the IJServer has started, there is a possibility that activation for the reference target module failed. Establish the cause of the error, and change the status of the module to activation status.

## 12.34.26 is40767

---

### IS: ERROR: is40767: Failed to read log file (Error=%s)

#### Variable Information

%s = Error information

#### Explanation

Failed to see the log file.

#### System Action

Processing stops.

#### User Action

View the Interstage Management Console's message window, and follow the message's recommendations to remove the cause of the failure.

## 12.34.27 is40768

---

### IS: ERROR: is40768: Selected log file does not exist for IJServer

#### Explanation

The log file cannot be referenced because the log file does not exist.

#### System Action

Processing stops.

## User Action

The Web server may not have been started at all. Start the Web server, and then rerun the process.

## 12.34.28 is40769

---

### IS: ERROR: is40769: Failed to download log file (Error=%s)

#### Variable Information

%s = Error information

#### Explanation

Failed to execute the download processing.

#### System Action

Processing stops.

#### User Action

Remove the cause shown in error information (%s), and rerun the process.

When the log file size to download is too large, disk capacity may be insufficient, generation of a temporary file may fail, and this message output. When the log file size is large, download using FTP etc. If this message is output frequently, refer to the Tuning Guide, reestimate the disk capacity needed to operate an Interstage Management Console, and check whether disk capacity is sufficient.

## 12.34.29 is40770

---

### IS: INFO: is40770: Web Server Connector log file was deleted

#### Explanation

The log file of Web server connector was deleted.

## 12.34.30 is40771

---

### IS: ERROR: is40771: Failed to acquire Web server state information (Error=%s)

#### Variable Information

%s = Error information

#### Explanation

Failed to obtain information about the Web server status.

#### System Action

Processing stops.

#### User Action

View the Interstage Management Console's message window, follow the message's recommendations to remove the cause of the failure in obtaining information about the Web server status, and then rerun the process.

## 12.34.31 is40772

---

---

**IS: ERROR: is40772: The module to be manipulated has been undeployed.****Explanation**

This message is output when the J2EE application and the 'ejb-jar' file to be manipulated were undeployed.

**System Action**

Terminates the processing

**User Action**

The module to be manipulated may have already been undeployed. Update the module information, and reexecute the processing.

---

**12.34.32 is40773**

---

**IS: INFO: is40773: Fault monitoring settings of the Web server connector has been updated****Explanation**

The setting for the error monitor of the Web server connector was updated normally.

---

**12.34.33 is40774**

---

**IS: ERROR: is40774: Definition information for the error monitor setting of the Web server connector could not be obtained.****Explanation**

Definition information for the error monitor setting of the Web server connector could not be obtained.

**System Action**

Terminates the processing

**User Action**

Refer to the message displayed on the message window of the Interstage Management Console. Correct the error to obtain the definition information for the error monitor setting of the Web server connector, then reexecute processing.

---

**12.35 is40800 to is40899**

This section details the messages with message numbers between is40800 and is40899.

---

**12.35.1 is40801**

---

**IS: ERROR: is40801: Failed to acquire list of transaction resources (Error=%s)****Variable Information**

%s = Error information

**Explanation**

A list of transaction resources could not be displayed.

**System Action**

Processing stops.

## User Action

View the Interstage Management Console's message window, follow the message's recommendations to remove the cause of the failure to display a list of transaction resources, and then rerun the process.

---

## 12.35.2 is40802

---

### IS: ERROR: is40802: Classpath is too long

#### Explanation

The character string specified for the classpath is too long.

#### System Action

Processing stops.

#### User Action

Specify a valid character string for the classpath, and reexecute processing.

---

## 12.35.3 is40803

---

### IS: ERROR: is40803: Classpath contains invalid information

#### Explanation

An invalid value was specified for the classpath.

#### System Action

Processing stops.

#### User Action

Specify a valid value for the classpath, and reexecute processing.

---

## 12.35.4 is40804

---

### IS: ERROR: is40804: Failed to update Classpath (Error=%s)

#### Variable Information

%s = Error information

#### Explanation

The classpath could not be updated.

#### System Action

Processing stops.

#### User Action

View the message displayed in the message window of the Interstage Management Console, follow the message's recommendations to remove the cause of the failure to update the classpath, and then reexecute processing.

---

## 12.35.5 is40805

---

### IS: ERROR: is40805: Path is too long

#### Explanation

The character string specified for the path is too long.

#### System Action

Processing stops.

#### User Action

Specify a valid character string for the path, and reexecute processing.

### 12.35.6 is40806

---

#### **IS: ERROR: is40806: Path contains invalid information**

#### Explanation

The path is invalid.

#### System Action

Processing stops.

#### User Action

Specify a valid character string for the path and reexecute processing.

### 12.35.7 is40807

---

#### **IS: ERROR: is40807: Failed to update Path (Error=%s)**

#### Explanation

The path could not be updated.

#### System Action

Processing stops.

#### User Action

View the message displayed in the message window of the Interstage Management Console, follow the message's recommendations to remove the cause of the failure to update the path, and then reexecute processing.

### 12.35.8 is40808

---

#### **IS: ERROR: is40808: The value entered for the library path is too long.**

#### Explanation

The value entered for the library path is too long.

#### System Action

Processing stops.

#### User Action

Set a value that does not exceed the maximum number of characters for the library path, and then reexecute processing.

### 12.35.9 is40809

---

#### **IS: ERROR: is40809: The library path contents are illegal.**

#### Explanation

The library path contents are illegal.

#### System Action

Processing stops.

#### User Action

Set a value for the library path that is correct, and then reexecute processing.

## 12.35.10 is40810

---

**IS: ERROR: is40810: The value entered for the JVM option is too long.**

#### Explanation

The value entered for the JVM option is too long.

#### System Action

Processing stops.

#### User Action

Set a value that does not exceed the maximum number of characters for the JVM option, and then reexecute processing.

## 12.36 is40900 to is40999

---

This section details the messages with message numbers between is40900 and is40999.

### 12.36.1 is40901

---

**IS: ERROR: is40901: Failed to acquire Name Conversion information**

#### Explanation

The name conversion definition could not be obtained.

#### System Action

Processing stops.

#### User Action

The name conversion definition may be being modified by another operation. Reexecute processing later.

Alternatively, the name conversion definition may contain an error. Correct it.

### 12.36.2 is40902

---

**IS: INFO: is40902: Name Conversion configuration was updated**

#### Explanation

The name conversion definition has been updated.

### 12.36.3 is40903

---

**IS: ERROR: is40903: Failed to update Name Conversion configuration**

#### Explanation

The name conversion definition could not be updated.

## System Action

Processing stops.

## User Action

Possible causes and required actions are as follows:

- The name conversion definition is being modified by another operation.

Reexecute processing later.

- The name conversion definition contains an error.

Correct the error.

- An I/O error occurred.

Check whether the file system size is too small or the file system has not been granted access authority.

## 12.36.4 is40904

---

### IS: ERROR: is40904: Name Conversion configuration to update was not specified

#### Explanation

No name conversion was specified for modification.

#### System Action

Processing stops.

#### User Action

Select the item for which name conversion is to be performed, and reexecute processing.

## 12.36.5 is40905

---

### IS: ERROR: is40905: Error in file I/O

#### Explanation

A file I/O error occurred.

#### System Action

Processing stops.

#### User Action

Check whether the file system has enough free space. Alternatively, the application to be deployed may be damaged. Check the archive file.

## 12.36.6 is40906

---

### IS: ERROR: is40906: Deployment file configuration is invalid

#### Explanation

The definition in a deployment file is invalid.

#### System Action

Processing stops.

#### User Action

Check whether the definition file application.xml or interstage.xml in the application to be deployed contains an error.

## 12.37 is41000 to is41099

---

This section details the messages with message numbers between is41000 and is41099.

### 12.37.1 is41001

---

**IS: INFO: is41001: CORBA Application %s created successfully**

Variable Information

%s = WorkUnit name

Explanation

A new CORBA application was created.

### 12.37.2 is41002

---

**IS: ERROR: is41002: Could not create CORBA Application %s**

Variable Information

%s = WorkUnit name

Explanation

Failed to create the CORBA application.

System Action

Processing stops.

User Action

View the Interstage Management Console's message window, follow the message's recommendations to remove the cause of the failure in creating the CORBA application and the event log, and then rerun the process.

### 12.37.3 is41003

---

**IS: INFO: is41003: CORBA Application %s started successfully**

Variable Information

%s = WorkUnit name

Explanation

The CORBA application was started successfully.

### 12.37.4 is41004

---

**IS: ERROR: is41004: Failed to start CORBA Application %s1 (Error =%s2)**

Variable Information

%s = WorkUnit name

Explanation

Failed to start the CORBA application.

System Action

Processing stops.

## User Action

View the Interstage Management Console's message window and the event log, follow the messages' recommendations to remove the cause of the failure to start the CORBA application, and then rerun the process.

---

## 12.37.5 is41005

---

### IS: INFO: is41005: CORBA Application %s stopped successfully

#### Variable Information

%s = WorkUnit name

#### Explanation

The CORBA application was specified successfully.

---

## 12.37.6 is41006

---

### IS: ERROR: is41006: Failed to stop CORBA Application %s1 (Error=%s2)

#### Variable Information

%s1 = WorkUnit name

%s2 = Error information

#### Explanation

Failed to stop the CORBA application.

#### System Action

Processing stops.

#### User Action

View the Interstage Management Console's message window and the event log, follow the messages' recommendations to remove the cause of the failure to stop the CORBA application, and then rerun the process.

---

## 12.37.7 is41007

---

### IS: INFO: is41007: CORBA Application %s deleted successfully

#### Variable Information

%s = WorkUnit name

#### Explanation

The CORBA application was deleted successfully.

---

## 12.37.8 is41008

---

### IS: ERROR: is41008: Failed to delete CORBA Application %s1 (Error=%s2)

#### Variable Information

%s1 = WorkUnit name

%s2 = Error information

#### Explanation

Failed to delete the CORBA application.

## System Action

Processing stops.

## User Action

View the Interstage Management Console's message window and the event log, follow the messages' recommendations to remove the cause of the failure to delete the CORBA application, and then rerun the process.

## 12.37.9 is41009

---

**IS: INFO: is41009: CORBA Application %s state information acquired successfully**

### Variable Information

%s = WorkUnit name

### Explanation

Information about the CORBA application status was obtained successfully.

## 12.37.10 is41010

---

**IS: ERROR: is41010: Failed to acquire CORBA Application %s1 state information (Error=%s2)**

### Variable Information

%s1 = WorkUnit name

%s2 = Error information

### Explanation

Failed to obtain information about the CORBA application status.

### System Action

Processing stops.

### User Action

View the Interstage Management Console's message window and the event log, follow the messages' recommendations to remove the cause of the failure to obtain information about the CORBA application status, and then rerun the process.

## 12.37.11 is41011

---

**IS: INFO: is41011: CORBA Application %s updated successfully**

### Variable Information

%s = WorkUnit name

### Explanation

The CORBA application definition was updated successfully.

## 12.37.12 is41012

---

**IS: ERROR: is41012: Failed to update CORBA Application %s**

## Variable Information

%s = WorkUnit name

## Explanation

Failed to update the CORBA application.

## System Action

Processing stops.

## User Action

View the Interstage Management Console's message window and the event log, follow the messages' recommendations to remove the cause of the failure to update the CORBA application, and then rerun the process.

## 12.37.13 is41013

---

### **IS: ERROR: is41013: Selected WorkUnit or application has been deleted**

## Explanation

The WorkUnit or application to be accessed has been deleted.

## System Action

Processing stops.

## User Action

Update the WorkUnit or application information, and then rerun the process.

## 12.37.14 is41014

---

### **IS: ERROR: is41014: WorkUnit name has not been specified**

## Explanation

The WorkUnit name is not specified.

## System Action

Processing stops.

## User Action

Enter the WorkUnit name, and then rerun the process.

## 12.37.15 is41015

---

### **IS: ERROR: is41015: CORBA Application %s is still running**

## Variable Information

%s = WorkUnit name

## Explanation

The CORBA application has not been stopped.

#### System Action

Processing stops.

#### User Action

Stop the CORBA application, and then rerun the process.

### 12.37.16 is41016

---

**IS: INFO: is41016: New configuration setup for application has been completed %s**

#### Variable Information

%s = Application name

#### Explanation

The setting information was updated successfully.

### 12.37.17 is41017

---

**IS: ERROR: is41017: The specified application does not exist %s**

#### Variable Information

%s = Application name

#### Explanation

The specified application does not exist.

#### System Action

Processing stops.

#### User Action

Deploy the specified application, and then rerun the process.

### 12.37.18 is41020

---

**IS: ERROR: is41020: Selected WorkUnit has been deleted**

#### Explanation

The specified WorkUnit does not exist.

#### System Action

Processing stops.

#### User Action

Create the WorkUnit, and then rerun the process.

### 12.37.19 is41021

---

**IS: INFO: is41021: Succeeded in blocking application queue %s**

#### Variable Information

%s = Application name

#### Explanation

The application was blocked successfully.

### 12.37.20 is41022

---

#### **IS: ERROR: is41022: Failed to block application queue %s1 (Error=%s2)**

#### Variable Information

%s1 = Application name

%s2 = Error information

#### Explanation

Failed to block the application.

#### System Action

Processing stops.

#### User Action

View the Interstage Management Console's message window, follow the message's recommendations to remove the cause of the failure to block the application, and then rerun the process.

### 12.37.21 is41023

---

#### **IS: INFO: is41023: Succeeded in releasing application queue block %s**

#### Variable Information

%s = Application name

#### Explanation

The application was unblocked successfully.

### 12.37.22 is41024

---

#### **IS: ERROR: is41024: Failed to release application queue block %s1 (Error=%s2)**

#### Variable Information

%s1 = Application name

%s2 = Error information

#### Explanation

Failed to unblock the application.

#### System Action

Processing stops.

## User Action

View the Interstage Management Console's message window, follow the message's recommendations to remove the cause of the failure to unblock the application, and then rerun the process.

### 12.37.23 is41041

---

#### IS: INFO: is41041: Succeeded in application deployment %s

##### Variable Information

%s = Application name

##### Explanation

The application was deployed successfully.

### 12.37.24 is41042

---

#### IS: ERROR: is41042: Application deployment failed %s1 (Error=%s2)

##### Variable Information

%s1 = Application name

%s2 = Error information

##### Explanation

Failed to deploy the application.

##### System Action

Processing stops.

##### User Action

View the Interstage Management Console's message window, follow the message's recommendations to remove the cause of the failure to deploy the application, and then rerun the process.

### 12.37.25 is41043

---

#### IS: INFO: is41043: Application deleted successfully %s

##### Variable Information

%s = Application name

##### Explanation

The application was undeployed successfully.

### 12.37.26 is41044

---

#### IS: ERROR: is41044: Failed to delete application %s1 (Error=%s2)

##### Variable Information

%s1 = Application name

%s2 = Error information

#### Explanation

Failed to undeploy the application.

#### System Action

Processing stops.

#### User Action

View the Interstage Management Console's message window, follow the message's recommendations to remove the cause of the failure to undeploy the application, and then rerun the process.

## 12.37.27 is41046

---

**IS: INFO: is41046: Succeeded in state acquisition of application %s**

#### Variable Information

%s = Application name

#### Explanation

Information about the application status was obtained successfully.

## 12.37.28 is41047

---

**IS: ERROR: is41047: Failed in state acquisition of application %s1 (Error=%s2)**

#### Variable Information

%s1 = Application name

%s2 = Error information

#### Explanation

Failed to obtain information about the application status.

#### System Action

Processing stops.

#### User Action

View the Interstage Management Console's message window, follow the message's recommendations to remove the cause of the failure to obtain information about the application status, and then rerun the process.

## 12.37.29 is41048

---

**IS: INFO: is41048: Application refreshed successfully %s**

#### Variable Information

%s = Application name

#### Explanation

The application was updated successfully.

## 12.37.30 is41049

---

### IS: ERROR: is41049: Application refresh failed %s1 (Error=%s2)

#### Variable Information

%s1 = Application name

%s2 = Error information

#### Explanation

Failed to update the application.

#### System Action

Processing stops.

#### User Action

View the Interstage Management Console's message window, follow the message's recommendations to remove the cause of the failure update the application, and then rerun the process.

## 12.37.31 is41051

---

### IS: ERROR: is41051: Unable to acquire application list (WorkUnit name=%s1, Error=%s2)

#### Variable Information

%s1 = WorkUnit name

%s2 = Error information

#### Explanation

Failed to obtain the list of the deployed applications.

#### System Action

Processing stops.

#### User Action

View the Interstage Management Console's message window, follow the message's recommendations to remove the cause of the failure to obtain the list of the deployed applications, and then rerun the process.

## 12.37.32 is41061

---

### IS: INFO: is41061: Succeeded in blocking interface %s

#### Variable Information

%s = Interface name

#### Explanation

The interface was blocked successfully.

## 12.37.33 is41062

---

---

**IS: ERROR: is41062: Failed to block interface %s1 (Error=%s2)****Variable Information**

%s1 = Interface name

%s2 = Error information

**Explanation**

Failed to block the interface.

**System Action**

Processing stops.

**User Action**

View the Interstage Management Console's message window, follow the message's recommendations to remove the cause of the failure to block the interface, and then rerun the process.

## 12.37.34 is41063

---

**IS: INFO: is41063: Succeeded in releasing interface block %s****Variable Information**

%s = Interface name

**Explanation**

The interface was unblocked successfully.

## 12.37.35 is41064

---

**IS: ERROR: is41064: Failed to release interface block %s1 (Error=%s2)****Variable Information**

%s1 = Interface name

%s2 = Error information

**Explanation**

Failed to unblock the interface.

**System Action**

Processing stops.

**User Action**

View the Interstage Management Console's message window, follow the message's recommendations to remove the cause of the failure to unblock the interface, and then rerun the process.

## 12.37.36 is41065

---

**IS: INFO: is41065: The WorkUnit process concurrency has been changed. (WorkUnit name = %s1, Process concurrency = %s2)**

## Variable Information

%s1 = WorkUnit name

%s2 = Process concurrency after the change

## Explanation

The process concurrency was changed normally.

## 12.37.37 is41066

---

**IS: ERROR: is41066: The WorkUnit process concurrency could not be changed. (WorkUnit name = %s1, Error information = %s2)**

## Variable Information

%s1 = WorkUnit name

%s2 = Error information

## Explanation

The process concurrency could not be changed.

## System Action

Terminates the processing

## User Action

Refer to the message output previously in the Interstage Management Console and the event log, remove the cause of the failure, and then reexecute processing.

## 12.38 is41100 to is41199

---

This section details the messages with message numbers between is41100 and is41199.

### 12.38.1 is41100

---

**IS: INFO: is41100: A server has been added to the site (server name=%s)**

## Variable Information

%s = Server name

## Explanation

A server has been added to the site.

### 12.38.2 is41101

---

**IS: INFO: is41101: A Managed Server has been deleted from the site (server name=%s)**

## Variable Information

%s = A managed server name

## Explanation

A managed server has been deleted from the site.

### 12.38.3 is41102

---

---

**IS: INFO: is41102: A Server Group has been created (Server Group name=%s)**

Variable Information

%s = Server Group name

Explanation

A Server Group has been created.

## 12.38.4 is41103

---

**IS: INFO: is41103: A Server Group has been deleted (Server Group name=%s)**

Variable Information

%s = Server Group name

Explanation

A Server Group has been deleted.

## 12.38.5 is41104

---

**IS: INFO: is41104: A managed server has been added to the Server Group (Server Group name=%s1, server name=%s2)**

Variable Information

%s1 = Server Group name

%s2 = A Managed Server name

Explanation

A Managed Server has been added to the Server Group.

## 12.38.6 is41105

---

**IS: INFO: is41105: A Managed Server has been deleted from the Server Group (Server Group name=%s1, server name=%s2)**

Variable Information

%s1 = Server Group name

%s2 = A Managed Server name

Explanation

A Managed Server has been deleted from the Server Group.

## 12.38.7 is41106

---

**IS: INFO: is41106: The environment setting for the business configuration management has been updated**

Explanation

The environment setting for the business configuration management has been updated.

## 12.38.8 is41107

---

**IS: INFO: is41107: The environment setting for the business configuration management has been updated (destination=%s)**

#### Variable Information

%s = Destination (Server Group name or agent control server name)

#### Explanation

The environment setting for the business configuration management has been updated .

### 12.38.9 is41108

---

**IS: INFO: is41108: The environment setting for the user repository has been updated**

#### Explanation

The environment setting for the user repository has been updated.

### 12.38.10 is41109

---

**IS: ERROR: is41109: A Managed Server for operation is not found (server name=%s)**

#### Variable Information

%s = A Managed Server name

#### Explanation

A Managed Server for operation is not found.

#### System Action

Processing stops.

#### User Action

A Managed Server for operation may have been deleted, or may have been added to the Server Group. Update the screen to display the newest information and perform processing again.

### 12.38.11 is41110

---

**IS: INFO: is41110: The Site environment settings were updated**

#### Explanation

The Site environment settings were updated.

# Chapter 13 Messages Beginning with 'isj2ee'

This chapter explains the messages starting with 'isj2ee'.

## 13.1 isj2ee0010 to isj2ee0099

This section details messages numbered between isj2ee0011 and isjee0099.

### 13.1.1 isj2ee0011

**Command name: ERROR: isj2ee0011: Could not create directory: DIRECTORY='%s' CODE='%d1 %d2'**

#### Variable Information

%s = Name of the directory that you could not create

%d1 = System code1

%d2 = System code2

#### Explanation

An attempt to create a directory failed when constructing a multi-system environment.

#### System Action

Processing stops.

#### User Action

Probable causes and actions required are shown below:

- There may not be enough disk space. Check that there is enough disk space and re-execute processing.
- If the access right is not set properly, change the access right so that you can access the specified file or directory.
- If an I/O error has occurred, check that the disk unit containing INTERSTAGE is running properly.

If the cause is other than one of the above, collect the diagnostic information using the *iscollectinfo* command, record the message and contact your systems engineer.

### 13.1.2 isj2ee0012

**Command name: ERROR: isj2ee0012: Could not change directory access mode: DIRECTORY='%s' CODE='%d1 %d2'**

#### Variable Information

%s = Name of the directory that you failed in changing the access mode

%d1 = System code1

%d2 = System code2

#### Explanation

An attempt to change the access mode of the directory failed when constructing a multi-system environment.

#### System Action

Processing stops.

#### User Action

Probable causes and actions required are shown below:

- If the access right is not set properly, change the access right so that you can access the specified file or directory.

- If an I/O error has occurred, check that the disk unit containing Interstage is running properly.

If the cause is other than one of the above, collect the diagnostic information using the *iscollectinfo* command, record the message and contact your systems engineer.

### 13.1.3 isj2ee0013

---

**Command name: ERROR: isj2ee0013: Could not delete directory: DIRECTORY='%s' CODE='%d1 %d2'**

#### Variable Information

%s = Name of the directory that you could not delete

%d1 = System code1

%d2 = System code2

#### Explanation

An attempt to delete the directory failed when constructing a multi-system environment.

#### System Action

Processing stops.

#### User Action

Probable causes and actions required are shown below:

- If the access right is not set properly, change the access right so that you can access the specified file or directory.
- If an I/O error has occurred, check that the disk unit containing Interstage is running properly.

If the cause is other than one of the above, collect the diagnostic information using the *iscollectinfo* command, record the message and contact your systems engineer.

### 13.1.4 isj2ee0021

---

**Command name: ERROR: isj2ee0021: Could not copy file: FILE='%s' CODE='%d1 %d2'**

#### Variable Information

%s = Name of the file that you could not copy

%d1 = System code1

%d2 = System code2

#### Explanation

An attempt to copy the file failed when constructing a multi-system environment.

#### System Action

Processing stops.

#### User Action

Probable causes and actions required are shown below:

- If *isj2ee.properties* and *security.properties* do not exist under */etc/opt/FJSVj2ee/etc*, restore the environment and re-execute the processing.
- There may not be enough disk space. Check that there is enough disk space and re-execute processing.
- If the access right is not set properly, change the access right so that you can access the specified file or directory.
- If an I/O error has occurred, check that the disk unit containing Interstage is running properly.

If the cause is other than one of the above, collect the diagnostic information using the *iscollectinfo* command, record the message and contact your systems engineer.

## 13.1.5 isj2ee0022

---

**Command name:** ERROR: isj2ee0022: Could not copy file: FILE='%s' CODE='%d1 %d2'

### Variable Information

%s = Name of the file that could not be copied

%d1 = System code1

%d2 = System code2

### Explanation

File %s could not be saved during restore operation.

### System Action

Processing stops.

### User Action

Probable causes are shown below. The countermeasures to be taken against individual probable causes are also given.

- Check that the J2EE common resources are installed, by adding them if necessary, and re-execute the backup/restore command.
- If the file shown in the variable information does not exist, it is possible that the environment is broken. If the environment is broken, re-install Interstage.
- If access is not correctly set, change the access rights to permit access to the specified file or directory.
- If an I/O error occurred, check that the disk unit containing Interstage is running properly.

If the cause is not covered in the above, collect the diagnostic information using the *iscollectinfo* command, record the message and contact your systems engineer.

## 13.1.6 isj2ee0023

---

**Command name:** ERROR: isj2ee0023: Could not restore file: FILE='%s' CODE='%d1 %d2'

### Variable Information

%s = File for which restore processing failed

%d1 = System code1

%d2 = System code2

### Explanation

File %s could not be restored.

### System Action

Processing stops.

### User Action

Probable causes and actions required are shown below:

- If the access right is not set properly, change the access right so that you can access the specified file or directory.
- If an I/O error has occurred, check that the disk unit containing Interstage is running properly.

If the cause is other than one of the above, collect the diagnostic information using the *iscollectinfo* command, record the message and contact your systems engineer.

## 13.1.7 isj2ee0031

---

**Command name:** ERROR: isj2ee0031: Could not delete file: FILE='%s' CODE='%d1 %d2'

### Variable Information

%s = Name of the file that you could not delete

%d1 = System code1

%d2 = System code2

### Explanation

An attempt to delete the file failed when constructing a multi-system environment.

### System Action

Processing stops.

### User Action

Probable causes and actions required are shown below:

- If the access right is not set properly, change the access right so that you can access the specified file or directory.
- If an I/O error has occurred, check that the disk unit containing Interstage is running properly.

If the cause is other than one of the above, collect the diagnostic information using the *iscollectinfo* command, record the message and contact your systems engineer.

## 13.1.8 isj2ee0049

---

**Command name:** ERROR: isj2ee0049: Internal error occurred: CODE='%d'

### Variable Information

%d: System code

### Explanation

An internal conflict was detected when processing a multi-system environment.

### System Action

Processing stops.

### User Action

Collect the diagnostic information using the *iscollectinfo* command, record the message and contact your systems engineer.

## 13.2 isj2ee0100 to isj2ee0199

---

This section details messages numbered between isj2ee0100 and isj2ee0199.

### 13.2.1 isj2ee0101

---

**Command name:** INFO: isj2ee0101: Back up operation normally terminated

### Explanation

The J2EE environment definition was saved.

### System Action

Terminate processing.

## 13.2.2 isj2ee0103

---

**Command name: INFO: isj2ee0103: The backup resource already exists in the specified directory**

### Explanation

The J2EE environment definition has been saved.

### System Action

Terminate processing.

### User Action

The J2EE environment definition has already been saved in the specified directory. If necessary, specify another directory and execute the processing again.

## 13.2.3 isj2ee0104

---

**Command name: INFO: isj2ee0104: Restore operation normally terminated**

### Explanation

The J2EE environment definition has been restored.

### System Action

Terminate processing.

## 13.2.4 isj2ee0111

---

**Command name: ERROR: isj2ee0111: Invalid parameter**

### Explanation

The parameter specified in the command is incorrect.

### System Action

Processing stops.

### User Action

Check the use method and the parameter required for the command, and then specify the correct parameter.

## 13.2.5 isj2ee0112

---

**Command name: ERROR: isj2ee0112: -M option is not supported in this system**

### Explanation

An unsupported option is specified.

### System Action

Processing stops.

### User Action

Check the use method and the parameter required for the command, and then specify the correct parameter.

## 13.2.6 isj2ee0113

---

**Command name: ERROR: isj2ee0113: Specified system does not exist: SYSTEM='%s'**

### Variable Information

%s = Extended system name specified

### Explanation

Specified system does not exist.

### System Action

Processing stops.

### User Action

Specify the correct extended system name and re-execute processing.

## 13.2.7 isj2ee0114

---

**Command name: ERROR: isj2ee0114: Specified directory does not exist: DIRECTORY='%s'**

### Variable Information

%s = Directory name specified

### Explanation

The specified backup directory does not exist.

### System Action

Processing stops.

### User Action

Specify the correct backup directory and re-execute processing.

## 13.2.8 isj2ee0115

---

**Command name: ERROR: isj2ee0115: Not specified system name**

### Explanation

No extended system name is specified.

### System Action

Processing stops.

### User Action

Check the use method and the parameter required for the command, and then specify the correct parameter.

## 13.2.9 isj2ee0116

---

**Command name: ERROR: isj2ee0116: Not specified directory name**

### Explanation

No directory name is specified.

### System Action

Processing stops.

### User Action

Check the use method and the parameter required for the command, and then specify the correct parameter.

## 13.2.10 isj2ee0117

---

**Command name:** ERROR: isj2ee0117: The path name is too long: Directory='%s'

### Variable Information

%s = Path name

### Explanation

The path name is too long.

### System Action

Processing stops.

### User Action

Shorten the path name to be the argument of a command, and execute a command again.

If the problem persists, collect the check information using the *iscollectinfo* command, and contact your systems engineer.

## 13.2.11 isj2ee0118

---

**Command name:** ERROR: isj2ee0118: Permission denied

### Explanation

Permission denied.

### System Action

Processing stops.

### User Action

Perform the process by a user who has administrator authority.

## 13.2.12 isj2ee0121

---

**Command name:** ERROR: isj2ee0121: Could not create directory for back up data: DIRECTORY='%s' CODE='%d1 %d2'

### Variable Information

%s = Name of the directory that you could not create

%d1 = System code1

%d2 = System code2

### Explanation

An attempt to create a directory failed when performing backup of the J2EE environment definition.

### System Action

Processing stops.

### User Action

Probable causes and actions required are shown below:

- The FJSVj2ee file may exist under the backup directory. If it is an unnecessary file, delete it and execute the processing again.
- There may not be enough disk space. Check that there is enough disk space, and then execute processing again.
- If the access right is not set properly, change the access right so that you can access the specified file or directory.

- If an I/O error has occurred, check that the disk unit containing Interstage is running properly.

If the cause is other than one of the above, collect the diagnostic information using the *iscollectinfo* command, record the message and contact your systems engineer.

## 13.2.13 isj2ee0131

---

**Command name: ERROR: isj2ee0131: Could not copy file for etc directory: FILE='%s' CODE='%d1 %d2'**

### Variable Information

%s = Name of the file that could not be copied

%d1 = System code1

%d2 = System code2

### Explanation

An attempt to copy the file failed when performing the backup of the J2EE environment definition.

### System Action

Processing stops.

### User Action

Probable causes and actions required are shown below:

- There may not be enough disk space. Check that there is enough disk space and re-execute processing.
- If the access right is not set properly, change the access right so that you can access the specified file or directory.
- If an I/O error has occurred, check that the disk unit containing Interstage is running properly.

If the cause is other than one of the above, collect the diagnostic information using the *iscollectinfo* command, record the message and contact your systems engineer.

## 13.2.14 isj2ee0132

---

**Command name: ERROR: isj2ee0132: Could not copy file for def directory: FILE='%s' CODE='%d1 %d2'**

### Variable Information

%s = Name of the file that could not be copied

%d1 = System code1

%d2 = System code2

### Explanation

An attempt to copy the file failed when performing the backup of the J2EE environment definition.

### System Action

Processing stops.

### User Action

Probable causes and actions required are shown below:

- There may not be enough disk space. Check that there is enough disk space, and then execute processing again.
- If the access right is not set properly, change the access right so that you can access the specified file or directory.
- If an I/O error has occurred, check that the disk unit containing Interstage is running properly.

If the cause is other than one of the above, collect the diagnostic information using the *iscollectinfo* command, record the message and contact your systems engineer.

## 13.2.15 isj2ee0141

---

**Command name: ERROR: isj2ee0141: There is no backed up data: DIRECTORY='%s'**

### Variable Information

%s = Name of the backup directory

### Explanation

No backup data exists under the specified directory.

### System Action

Processing stops.

### User Action

Check that the name of the directory that was backed up is correct. Specify the correct directory name and re-execute the processing.

## 13.2.16 isj2ee0151

---

**Command name: ERROR: isj2ee0151: Could not get system data: Data name='%s'**

### Variable Information

%s = Data name which cannot be obtained

### Explanation

Could not obtain system data.

### System Action

Processing stops.

### User Action

Check that J2EE common resources are installed and execute a backup/restore command again.

## 13.2.17 isj2ee0152

---

**Command name: ERROR: isj2ee0152: There is no indispensable file: FILE='%s'**

### Variable Information

%s = Essential file

### Explanation

A file required for IJServer processing is missing.

### System Action

Processing stops.

### User Action

Probable causes and actions required are shown below:

- Check that the J2EE common resources are installed. Add them if necessary, and re-execute the backup/restore command.
- If the file shown in the variable information does not exist, there is a possibility that the environment is broken. If the environment is broken, re-install Interstage.
- If an I/O error has occurred, check that the disk unit containing Interstage is running properly.

If the cause is other than one of the above, collect the diagnostic information using the *iscollectinfo* command, record the message and contact your systems engineer.

## 13.2.18 isj2ee0161

---

**Command name:** ERROR: isj2ee0161: Could not execute jar command

### Explanation

Could not execute *jar* command.

### System Action

Processing stops.

### User Action

**Windows32/64 Linux32/64**

Check that the directory containing the *jar* command is set in the PATH environment variable.

- When the directory is not set

Set the directory containing the *jar* command in the PATH environment variable, and then execute processing again.

- When the directory is set

Check that the *jar* command operates correctly.

**Solaris32/64**

Check that the *jar* command (/usr/bin/jar) provided by the system is installed correctly.

- If the *jar* command is installed

Check that the *jar* command operates correctly.

- If the *jar* command is not installed

Check that the directory containing the *jar* command is set in the PATH environment variable.

- When the directory is not set

Set the directory containing the *jar* command in the PATH environment variable, and then execute processing again.

- When the directory is set

Check that the *jar* command operates correctly.

If the problem still cannot be resolved, use the *iscollectinfo* command to collect diagnostic information, and send the error information to your systems engineer.

## 13.2.19 isj2ee0171

---

**Command name:** ERROR: isj2ee0171: Not enough memory

### Explanation

Not enough memory.

### System Action

Processing stops.

### User Action

Terminate all unnecessary applications.

Refer to the Tuning Guide and check whether the memory has enough capacity. If the memory capacity is too small, expand it.

## 13.2.20 isj2ee0199

---

**Command name:** ERROR: isj2ee0199: System error occurred

## Explanation

A system error has occurred during the execution of a command.

Alternatively, check whether the required package, the FJSVisas package (Interstage management function), is installed. If it is not installed, "is20159" is output to the system log.

## System Action

Processing stops.

## User Action

The required component FJSVisas is not installed. Install the required component and execute the processing again.

If the cause is other than one of the above, collect the diagnostic information using the *iscollectinfo* command, record the message and contact your systems engineer.

# 13.3 isj2ee0200 to isj2ee0299

---

## 13.3.1 isj2ee0201

---

**ISJ2EE: ERROR: isj2ee0201: Wrong [Database type] is specified: Database type='%s'**

### Variable Information

%s = Database type

### Explanation

The process failed because the database type was invalid.

### System Action

Processing stops.

### User Action

Specify the correct value and rerun the process. For details, refer to "isj2eeadmin" in the Reference Manual (Command Edition).

## 13.3.2 isj2ee0202

---

**ISJ2EE: ERROR: isj2ee0202: The specified [Name of a definition] contains an unallowable character: Name of a definition='%s'**

### Variable Information

%s = Name of definition

### Explanation

The JDBC database definition could not be registered because the specified definition name contained an illegal character.

### System Action

Processing stops.

### User Action

If the specified definition name contains an illegal character ("), delete it then re-execute processing.

## 13.3.3 isj2ee0203

---

**ISJ2EE: ERROR: isj2ee0203: The specified [Name of a definition] has not been defined: Name of a definition='%s'**

## Variable Information

%s = Name of definition

## Explanation

Acquisition of detailed information (or definition updating or deletion) failed because the specified definition name was not registered.

## System Action

Processing stops.

## User Action

Obtain a list of registered definitions and check that the specified definition name is registered, and then re-execute processing.

### 13.3.4 isj2ee0204

---

#### **ISJ2EE: ERROR: isj2ee0204: [Name of a definition] is not defined**

## Explanation

Definition registration failed because no definition name was specified.

## System Action

Processing stops.

## User Action

Ensure that a definition name is specified, and re-execute processing.

### 13.3.5 isj2ee0205

---

#### **ISJ2EE: ERROR: isj2ee0205: [Name of a datasource] is not defined**

## Explanation

Definition registration or updating failed because no data source name was specified.

## System Action

Processing stops.

## User Action

Ensure that a data source name is specified, and re-execute processing.

### 13.3.6 isj2ee0206

---

#### **ISJ2EE: ERROR: isj2ee0206: [User ID] is not defined**

## Explanation

Definition registration or updating failed because no user id was specified.

## System Action

Processing stops.

## User Action

Ensure that a user id is specified, and re-execute processing.

### 13.3.7 isj2ee0207

---

---

**ISJ2EE: ERROR: isj2ee0207: [Password] is not defined****Explanation**

Definition registration or updating failed because no password was specified.

**System Action**

Processing stops.

**User Action**

Ensure that a password is specified, and re-execute processing.

---

**13.3.8 isj2ee0208**

---

**ISJ2EE: ERROR: isj2ee0208: Wrong [Name of a class] is specified: Name of a class='%s'****Variable Information**

%s = Name of class

**Explanation**

The process failed because an invalid class name was specified.

**System Action**

Processing stops.

**User Action**

Specify the correct value and rerun the process. For details, refer to "isj2eeadmin" in the Reference Manual (Command Edition).

---

**13.3.9 isj2ee0209**

---

**ISJ2EE: ERROR: isj2ee0209: [Name of a class] is not defined****Explanation**

The JDBC data source definition could not be registered or updated because no class name was specified.

**System Action**

Processing stops.

**User Action**

Ensure that a class name is specified, and re-execute processing.

---

**13.3.10 isj2ee0210**

---

**ISJ2EE: ERROR: isj2ee0210: [Driver type] is not defined****Explanation**

The JDBC data source definition could not be registered or updated because no driver type was specified.

**System Action**

Processing stops.

**User Action**

Ensure that a driver type is specified, and re-execute processing.

### 13.3.11 isj2ee0211

---

#### **ISJ2EE: ERROR: isj2ee0211: [Network protocol] is not defined**

##### Explanation

The JDBC data source definition could not be registered or updated because no network protocol was specified.

##### System Action

Processing stops.

##### User Action

Ensure that a network protocol is specified, and re-execute processing.

### 13.3.12 isj2ee0212

---

#### **ISJ2EE: ERROR: isj2ee0212: [Server URL] is not defined**

##### Explanation

The JDBC data source definition could not be registered or updated because no server URL was specified.

##### System Action

Processing stops.

##### User Action

Ensure that a server URL is specified, and re-execute processing.

### 13.3.13 isj2ee0213

---

#### **ISJ2EE: ERROR: isj2ee0213: The specified [Connection port number] contains an unallowable non-numeric character: Connection port number='%s'**

##### Variable Information

%s = Connection port number

##### Explanation

The JDBC data source definition could not be registered or updated because the specified connection port number included a nonnumeric character.

##### System Action

Processing stops.

##### User Action

Ensure that the connection port number is specified correctly, and re-execute processing.

### 13.3.14 isj2ee0214

---

#### **ISJ2EE: ERROR: isj2ee0214: [Connection host name] is not defined**

##### Explanation

The JDBC data source definition could not be registered or updated because no connection host name was specified.

##### System Action

Processing stops.

#### User Action

Ensure that a connection host name is specified, and re-execute processing.

### 13.3.15 isj2ee0215

---

#### **ISJ2EE: ERROR: isj2ee0215: [SID/Net Service Name] is not defined**

#### Explanation

The JDBC data source definition could not be registered or updated because the SID or Net Service Name was not specified.

#### System Action

Processing stops.

#### User Action

Ensure that a SID or Net Service Name is specified, and re-execute processing.

### 13.3.16 isj2ee0216

---

#### **ISJ2EE: ERROR: isj2ee0216: [.bindings File] is not defined**

#### Explanation

The JDBC data source definition could not be registered or updated because creation/non-creation of a .bindings file was not specified.

#### System Action

Processing stops.

#### User Action

Ensure that creation/non-creation of a .bindings file is specified, and re-execute processing.

### 13.3.17 isj2ee0217

---

#### **ISJ2EE: ERROR: isj2ee0217: The specified [POP3 server port number] contains an unallowable non-numeric character. POP3 server port number='%s'**

#### Variable Information

%s = POP3 server port number

#### Explanation

The JavaMail definition could not be registered or updated because the specified POP3 server port number included a nonnumeric character.

#### System Action

Processing stops.

#### User Action

Ensure that the POP3 server port number is specified correctly, and re-execute processing.

### 13.3.18 isj2ee0218

---

#### **ISJ2EE: ERROR: isj2ee0218: The specified [SMTP server port number] contains an unallowable non-numeric character: SMTP server port number='%s'**

#### Variable Information

%s = SMTP server port number

### Explanation

The JavaMail definition could not be registered or updated because the specified SMTP server port number included a nonnumeric character.

### System Action

Processing stops.

### User Action

Ensure that the SMTP server port number is specified correctly, and re-execute processing.

## 13.3.19 isj2ee0219

---

**ISJ2EE: ERROR: isj2ee0219: The specified [IMAP server port number] contains an unallowable non-numeric character: IMAP server port number='%s'**

### Variable Information

%s = IMAP server port number

### Explanation

The JavaMail definition could not be registered or updated because the specified IMAP server port number included a nonnumeric character.

### System Action

Processing stops.

### User Action

Ensure that the IMAP server port number is specified correctly, and re-execute processing.

## 13.3.20 isj2ee0220

---

**ISJ2EE: ERROR: isj2ee0220: [Sender of mail] is not defined**

### Explanation

The JavaMail definition could not be registered or updated because no sender of mail was specified.

### System Action

Processing stops.

### User Action

Ensure that the sender of mail is specified, and re-execute processing.

## 13.3.21 isj2ee0221

---

**ISJ2EE: ERROR: isj2ee0221: Address of mail server for receiving of [Mail server type for receiving/port number] is not defined**

### Explanation

The JavaMail definition could not be registered or updated because no mail server type for receiving was specified.

### System Action

Processing stops.

### User Action

Ensure that a mail server type for receiving is specified, and re-execute processing.

## 13.3.22 isj2ee0222

---

**ISJ2EE: ERROR: isj2ee0222: [Address of SMTP server] is not defined**

### Explanation

The JavaMail definition could not be registered or updated because the address of SMTP server was not specified.

### System Action

Processing stops.

### User Action

Ensure that the address of SMTP server is specified, and re-execute processing.

## 13.3.23 isj2ee0223

---

**ISJ2EE: ERROR: isj2ee0223: [Deploy file] is not defined**

### Explanation

The connector definition could not be registered or updated because no deploy file was specified.

### System Action

Processing stops.

### User Action

Ensure that a deploy file is specified, and re-execute processing.

## 13.3.24 isj2ee0230

---

**ISJ2EE: ERROR: isj2ee0230: The specified name of a definition has been already registered. Specify another name: Name of a definition='%s'**

### Variable Information

%s = Name of definition

### Explanation

Processing to register the specified definition name failed because the definition name had already been registered.

### System Action

Processing stops.

### User Action

Specify a definition name that has not been registered, and re-execute processing.

## 13.3.25 isj2ee0231

---

**ISJ2EE: ERROR: isj2ee0231: The specified name of a definition has been already registered. Specify another name: Name of a datasource='%s'**

### Variable Information

%s = Name of datasource

### Explanation

Processing to register the specified definition name failed because the definition name had already been registered.

## System Action

Processing stops.

## User Action

Specify a definition name that has not been registered, and re-execute processing.

### 13.3.26 isj2ee0232

---

**ISJ2EE: ERROR: isj2ee0232: Failed to make .bindings file: details='%s'**

#### Variable Information

%s = Details

#### Explanation

Processing to register or update the .bindings file failed because an environment variable required for registering the file was invalid.

#### System Action

Processing stops.

#### User Action

Refer to "Environment Setup when JDBC (Database) is Referenced" in the J2EE User's Guide, and check that the required class path is set in the J2EE properties.

If the directory specified in PROVIDER URL does not exist, create it.

**Windows32/64**

If the DOS device name has been used for the data source name, change the data source name.

**Solaris32/64 Linux32/64**

If the data source name is jdbc/\*\*\*, create a jdbc directory inside the directory specified by Provider URL before registering the .bindings file. For details, refer to "Environment Setup when JDBC (Database) is Referenced" in the J2EE User's Guide.

### 13.3.27 isj2ee0233

---

**ISJ2EE: ERROR: isj2ee0233: An abnormality occurred in resource access definition: details='%s'**

#### Variable Information

%s = Details

#### Explanation

Processing to register the relevant definition failed for the reason indicated by the detail cause.

#### System Action

Processing stops.

#### User Action

The operation on the definition could not be performed because another user was performing an operation on it at the same time. Rerun the process. Obtain the definition list and correct any errors that are present.

There is also the possibility that the definition file is damaged. Restore a backup of the definition.

### 13.3.28 isj2ee0234

---

**ISJ2EE: ERROR: isj2ee0234: Failed to delete the definition. Maybe it was removed by another user: Name of a definition='%s'**

## Variable Information

%s = Name of definition

## Explanation

Processing to delete the specified definition failed because the definition was not registered.

## System Action

Processing stops.

## User Action

Check whether the resource to be deleted was already deleted according to a request from another user. Reacquire a list and state of a resource and check them.

## 13.3.29 isj2ee0235

---

**ISJ2EE: ERROR: isj2ee0235: Failed to update the definition. Maybe it was removed by another user: Name of a definition='%s'**

## Variable Information

%s = Name of definition

## Explanation

Processing to update the specified definition failed because the definition was not registered.

## System Action

Processing stops.

## User Action

Check whether the resource to be updated was already deleted according to a request from another user. Reacquire a list and state of a resource and check them.

## 13.3.30 isj2ee0236

---

**ISJ2EE: ERROR: isj2ee0236: [LoginID] is not defined**

## Explanation

The JavaMail definition could not be registered or updated because no login ID was specified.

## System Action

Processing stops.

## User Action

Ensure that a login ID is specified, and re-execute processing.

## 13.3.31 isj2ee0237

---

**ISJ2EE: ERROR: isj2ee0237: Failed to create the connector definition because invalid deploy option is set**

## Explanation

The connector definition cannot be registered because the value of the deployment option "DEPLOYED" key in the user application is set to FALSE.

## System Action

Processing stops.

## User Action

Set the value of the deployment option "DEPLOYED" key in the user application to TRUE, and re-execute processing. (The default is TRUE.)

### 13.3.32 isj2ee0240

---

**ISJ2EE: ERROR: isj2ee0240: Failed to get the list of JDBC definition: details='%s'**

#### Variable Information

%s = Details

#### Explanation

Processing to obtain a JDBC data source list failed for the reason indicated by the detail cause.

#### System Action

Processing stops.

#### User Action

The operation on the definition could not be performed because another user was performing an operation on it at the same time. Rerun the process. Obtain the definition list and correct any errors that are present.

There is also the possibility that the definition file is damaged. Restore a backup of the definition.

### 13.3.33 isj2ee0241

---

**ISJ2EE: ERROR: isj2ee0241: Failed to get the list of Javamail definition: details='%s'**

#### Variable Information

%s = Details

#### Explanation

Processing to obtain a JavaMail list failed for the reason indicated by the detail cause.

#### System Action

Processing stops.

#### User Action

Check the indicated detail cause, remove the error cause, and then re-execute processing.

Check whether the JavaMail resource access definition file is damaged. If the file is damaged, delete it and re-execute processing. In this case, the existing definition information that was registered previously is lost.

The JavaMail resource access definition file is stored in the following directory:

**Windows32/64**

C:\Interstage\J2EE\def\mail.ser

**Solaris32/64 Linux32/64**

/etc/opt/FJSVj2ee/def/mail.ser

### 13.3.34 isj2ee0242

---

**ISJ2EE: ERROR: isj2ee0242: Failed to get the list of connector definition: details='%s'**

## Variable Information

%s = Details

## Explanation

Processing to obtain a connector list failed for the reason indicated by the detail cause.

## System Action

Processing stops.

## User Action

The operation on the definition could not be performed because another user was performing an operation on it at the same time. Rerun the process. Obtain the definition list and correct any errors that are present.

There is also the possibility that the definition file is damaged. Restore a backup of the definition.

## 13.3.35 isj2ee0243

---

**ISJ2EE: ERROR: isj2ee0243: An illegal file type was specified: details='%s'**

## Variable Information

%s = Details

## Explanation

The specified file could not be deployed because the file was an EAR file containing two or more ears or the file format was invalid.

## System Action

Processing stops.

## User Action

The specified file is an EAR file containing two or more ears. Specify the file in a valid format and deploy it again.

## 13.3.36 isj2ee0244

---

**ISJ2EE: ERROR: isj2ee0244: The resource access definition may have been already updated: Name of a definition='%s'**

## Variable Information

%s = Name of a definition

## Explanation

Another user may have updated the definition after it was referenced.

## System Action

Processing stops.

## User Action

Obtain the latest definition information, then modify the definition and rerun the process.

## 13.3.37 isj2ee0245

---

**ISJ2EE: ERROR: isj2ee0245: Cannot omit Database Type**

## Explanation

The process failed because the database type was not specified.

#### System Action

Processing stops.

#### User Action

Specify the database type and rerun the process.

### 13.3.38 isj2ee0246

---

**ISJ2EE: ERROR: isj2ee0246: Illegal symbols in Definition Name: value=%s1 symbol(s)=%s2**

#### Variable Information

%s1 = Definition name

%s2 = Invalid character

#### Explanation

The process failed because the definition name contained an invalid character.

#### System Action

Processing stops.

#### User Action

Remove any invalid characters from the definition name, and then rerun the process.

For details on restrictions, refer to "isj2eeadmin" in the Reference Manual (Command Edition).

### 13.3.39 isj2ee0247

---

**ISJ2EE: ERROR: isj2ee0247: The length of %s1 exceeds its limit: Maximum=%s2 value=%s3**

#### Variable Information

%s1 = Definition item name

%s2 = Maximum length of character string

%s3 = Specified value

#### Explanation

The process failed because the length of the defined string exceeded the maximum limit.

#### System Action

Processing stops.

#### User Action

Change the defined value to one that does not exceed the limit, and then rerun the process.

For details on restrictions, refer to "isj2eeadmin" in the Reference Manual (Command Edition).

### 13.3.40 isj2ee0248

---

**ISJ2EE: ERROR: isj2ee0248: Cannot omit Provider URL**

#### Explanation

The process failed because Provider URL was not specified.

#### System Action

Processing stops.

## User Action

Specify Provider URL and rerun the process.

### 13.3.41 isj2ee0249

---

**ISJ2EE: ERROR: isj2ee0249: Illegal symbols in Hostname: value=%s1 symbol(s)=%s2**

#### Variable Information

%s1 = Specified value

%s2 = Invalid character

#### Explanation

The process failed because the connection host name contained an invalid character.

#### System Action

Processing stops.

#### User Action

Remove any invalid characters from the connection host name, and then rerun the process.

For details on restrictions, refer to "isj2eeadmin" in the Reference Manual (Command Edition).

### 13.3.42 isj2ee0250

---

**ISJ2EE: ERROR: isj2ee0250: Invalid value for Provider URL: value=%s**

#### Variable Information

%s = Specified value

#### Explanation

The process failed because there was an error in Provider URL.

#### System Action

Processing stops.

#### User Action

Specify a correct value for Provider URL, and rerun the process.

If a Symfoware Server database is used, check the following:

- The value must be specified using the following format:

<code>SYM: //Host-name:Port-number.</code>
--------------------------------------------

- If the isj2eeadmin command is used to specify PortNumber, and ServerName is omitted, take one of the actions shown below:
  - Specify the host name in ServerName.
  - Delete the PortNumber specification, and specify the host name and port number using ProviderUrl.

### 13.3.43 isj2ee0251

---

**ISJ2EE: ERROR: isj2ee0251: Invalid value for Port Number: value=%s1 valid range=%s2**

#### Variable Information

%s1 = Specified value

%s2 = Valid range

#### Explanation

The process failed because the connection port number was incorrect.

#### System Action

Processing stops.

#### User Action

Change the connection port number to a value that lies within the valid range and rerun the process.

### 13.3.44 isj2ee0252

---

**ISJ2EE: ERROR: isj2ee0252: Invalid value for .bindings file setting: value=%s**

#### Variable Information

%s = Specified value

#### Explanation

The process failed because the specified value was incorrect.

#### System Action

Processing stops.

#### User Action

Specify a valid value and rerun the process.

For details, refer to "isj2eeadmin" in the Reference Manual (Command Edition).

### 13.3.45 isj2ee0253

---

**ISJ2EE: ERROR: isj2ee0253: Invalid value for Driver Type: value=%s**

#### Variable Information

%s = Specified value

#### Explanation

The process failed because the driver type was incorrect.

#### System Action

Processing stops.

#### User Action

Specify the correct value and rerun the process.

For details, refer to "isj2eeadmin" in the Reference Manual (Command Edition).

### 13.3.46 isj2ee0254

---

**ISJ2EE: ERROR: isj2ee0254: Invalid value for Network Protocol: value=%s**

#### Variable Information

%s = Specified value

#### Explanation

The process failed because the network protocol was incorrect.

### System Action

Processing stops.

### User Action

Specify a valid network protocol, and rerun the process.

For details, refer to "isj2eeadmin" in the Reference Manual (Command Edition).

## 13.3.47 isj2ee0255

---

### **ISJ2EE: ERROR: isj2ee0255: Cannot specify thin driver if Network Protocol is ipc**

#### Explanation

The process failed because the specified value was incorrect.

#### System Action

Processing stops.

#### User Action

When a thin driver is used, 'ipc' cannot be specified as the network protocol.

Use an 'oci' driver or specify 'tcp' and rerun the process.

## 13.3.48 isj2ee0256

---

### **ISJ2EE: ERROR: isj2ee0256: Invalid value for Data Source Type: value=%s**

#### Variable Information

%s = Specified value

#### Explanation

The process failed because the data source type was incorrect.

#### System Action

Processing stops.

#### User Action

Specify the correct value and rerun the process.

For details, refer to "isj2eeadmin" in the Reference Manual (Command Edition).

## 13.3.49 isj2ee0257

---

### **ISJ2EE: ERROR: isj2ee0257: Illegal symbols in SID/Net Service Name value=%s1 symbol(s)=%s2**

#### Variable Information

%s1 = Specified value

%s2 = Invalid character

#### Explanation

The process failed because the SID or Net Service Name contained an invalid character.

#### System Action

Processing stops.

## User Action

Remove any invalid characters from the SID or Net Service Name, and then rerun the process.

For details on restrictions, refer to "isj2eeadmin" in the Reference Manual (Command Edition).

### 13.3.50 isj2ee0258

---

#### **ISJ2EE: ERROR: isj2ee0258: Invalid value for JDBC Version: value=%s**

##### Variable Information

%s = Specified value

##### Explanation

The process failed because the JDBC version was incorrect.

##### System Action

Processing stops.

##### User Action

Specify the correct value and rerun the process.

For details, refer to "isj2eeadmin" in the Reference Manual (Command Edition).

### 13.3.51 isj2ee0259

---

#### **ISJ2EE: ERROR: isj2ee0259: Invalid value for Property Name: value=%s**

##### Variable Information

%s = Specified value

##### Explanation

The process failed because the property name was incorrect.

##### System Action

Processing stops.

##### User Action

A value different from the property name defined in the deployment descriptor of the resource adapter was specified. Specify the correct value and rerun the process.

Correct property names can be viewed from the Interstage Management Console or the using the *isj2eeadmin* command.

### 13.3.52 isj2ee0260

---

#### **ISJ2EE: ERROR: isj2ee0260: Invalid value for Property Class Name: Property Name=%s1 Class Name=%s2**

##### Variable Information

%s1 = Property Name

%s2 = Specified class name

##### Explanation

The process failed because the class name was incorrect.

## System Action

Processing stops.

## User Action

A value different from the class name defined in the deployment descriptor of the resource adapter was specified. Specify the correct value and rerun the process.

Correct property names can be viewed from the Interstage Management Console or using the *isj2eeadmin* command.

## 13.3.53 isj2ee0261

---

### ISJ2EE: ERROR: isj2ee0261: Cannot omit Database Name

#### Explanation

The process failed because no database name was specified.

#### System Action

Processing stops.

#### User Action

Specify a database name and rerun the process.

## 13.3.54 isj2ee0262

---

### ISJ2EE: ERROR: isj2ee0262: Cannot omit Property Name

#### Explanation

The process failed because no property name was specified.

#### System Action

Processing stops.

#### User Action

Specify a property name and rerun the process.

## 13.3.55 isj2ee0263

---

### ISJ2EE: ERROR: isj2ee0263: Cannot omit Data Source Class Name

#### Explanation

Processing failed because a data resource name has not been specified.

#### System Action

Processing stops.

#### User Action

Specify the correct value and re-execute.

The *isj2eeadmin* command may have been used with an extracted resource definition in an Interstage Application Server 8.0 environment. To use the *isj2eeadmin* command with an extracted definition file in an Interstage Application Server 8.0 environment, use the compatibility option and re-execute. For details, refer to "isj2eeadmin" in the Reference Manual (Command Edition).

## 13.3.56 isj2ee0264

---

### ISJ2EE: ERROR: isj2ee0264: Cannot omit Data Resource Name

#### Explanation

Processing failed because a data resource name has not been specified.

#### System Action

Processing stops.

#### User Action

Specify the correct value and re-execute.

### 13.3.57 isj2ee0265

---

#### **ISJ2EE: ERROR: isj2ee0265: Invalid value of Output information to audit log: value=%s1**

#### Variable Information

%s1 = Specified value

#### Explanation

Processing failed because the value set for the option that outputs Web server connection information in the audit log is invalid.

#### System Action

Processing stops.

#### User Action

Specify the correct value and re-execute.

### 13.3.58 isj2ee0266

---

#### **ISJ2EE: ERROR: isj2ee0266: Invalid value for Use Oracle RAC: value=%s1**

#### Variable Information

%s1 = Specified value

#### Explanation

Processing failed because the value set for using the RAC is invalid.

#### System Action

Processing stops.

#### User Action

Specify the correct value and re-execute.

### 13.3.59 isj2ee0267

---

#### **ISJ2EE: ERROR: isj2ee0267: Cannot omit Server URL**

#### Explanation

Processing failed because a server URL has not been specified.

#### System Action

Processing stops.

#### User Action

Specify the correct value and re-execute.

### 13.3.60 isj2ee0268

---

**ISJ2EE: ERROR: isj2ee0268: Invalid value for Use File System Service Provider: value=%s1**

#### Variable Information

%s1 = Specified value

#### Explanation

Processing failed because the value set for File System Service Provider is invalid.

#### System Action

Processing stops.

#### User Action

Specify the correct value and re-execute.

### 13.3.61 isj2ee0269

---

**ISJ2EE: ERROR: isj2ee0269: Invalid value for Property: value=%s1**

#### Variable Information

%s1 = Specified value

#### Explanation

Processing failed because the value set for other data source/property data types is invalid.

#### System Action

Processing stops.

#### User Action

Specify the correct value and re-execute.

### 13.3.62 isj2ee0270

---

**ISJ2EE: ERROR: isj2ee0270: Invalid value for Protocol: value=%s1**

#### Variable Information

%s1 = Specified value

#### Explanation

Processing failed because the value set for the protocol is invalid.

#### System Action

Processing stops.

#### User Action

Specify the correct value and re-execute.

### 13.3.63 isj2ee0271

---

**ISJ2EE: ERROR: isj2ee0271: Duplicate value for Property Name: value=%s1**

#### Variable Information

%s1 = Specified value

#### Explanation

Processing failed because the value set for the property name was duplicated.

#### System Action

Processing stops.

#### User Action

Change the duplicated property name and re-execute.

### 13.3.64 isj2ee0272

---

**ISJ2EE: ERROR: isj2ee0272: Duplicate value for Property Name: value=%s1**

#### Variable Information

%s1 = Specified value

#### Explanation

Processing failed because the value set for the data source/property name was duplicated.

#### System Action

Processing stops.

#### User Action

Change the duplicated data source/property name and re-execute.

### 13.3.65 isj2ee0273

---

**ISJ2EE: ERROR: isj2ee0273: Cannot omit Hostname**

#### Explanation

Processing failed because the Naming Service host name has not been specified.

#### System Action

Processing stops.

#### User Action

Specify the correct value and re-execute.

### 13.3.66 isj2ee0274

---

**ISJ2EE: ERROR: isj2ee0274: Illegal symbols in Hostname: value=%s1 symbol(s)=%s2**

#### Variable Information

%s1 = Specified value

%s2 = Characters that cannot be used

#### Explanation

Processing failed because the Naming Service host name contains characters that cannot be used.

#### System Action

Processing stops.

## User Action

Change the host name, fix the characters that cannot be used, and then re-execute.

For details on limitations, refer to the Interstage management Console Help, or "isj2eeadmin" in the Reference Manual (Command Edition).

### 13.3.67 isj2ee0275

---

**ISJ2EE: ERROR: isj2ee0275: The specified port number contains an unallowable non-numeric character: value=%s1**

#### Variable Information

%s1 = Specified value

#### Explanation

Processing failed because the Naming Service port number has not been specified correctly.

#### System Action

Processing stops.

#### User Action

Specify the correct value and re-execute.

### 13.3.68 isj2ee0276

---

**ISJ2EE: ERROR: isj2ee0276: Invalid value for Port Number: value=%s1 valid range=%s2**

#### Variable Information

%s1 = Specified value

%s2 = Valid range

#### Explanation

Processing failed because the Naming Service port number is invalid.

#### System Action

Processing stops.

#### User Action

Change the port number, specify a correct value that is inside the valid range and re-execute.

### 13.3.69 isj2ee0277

---

**ISJ2EE: ERROR: isj2ee0277: Cannot omit Property Type**

#### Explanation

Processing failed because a data type has not been specified.

#### System Action

Processing stops.

#### User Action

Specify the correct value and re-execute.

## 13.3.70 isj2ee0278

---

**ISJ2EE: ERROR: isj2ee0278: Not supported Database is specified: Definition Name=%s1**

### Variable Information

%s1 = Specified value

### Explanation

Processing failed because a database that is not supported was specified as the database type on this platform.

### System Action

Processing stops.

### User Action

Specify the correct value and re-execute.

For details on the database support status, refer to "Database" in the Product Notes.

## 13.3.71 isj2ee0279

---

**ISJ2EE: ERROR: isj2ee0279: Cannot use this Service**

### Explanation

This function cannot be used in this edition.

### System Action

Processing stops.

### User Action

Check the edition of the package and the functions that can be used.

## 13.3.72 isj2ee0280

---

**ISJ2EE: ERROR: isj2ee0280: Cannot change Database Type: Definition Name=%s**

### Variable Information

%s = Definition name

### Explanation

Processing failed because the database type was changed when the JDBC resource definition was updated.

### System Action

Processing stops.

### User Action

If you are using the isj2eeadmin command, change to the correct database type. Alternatively, delete the <DatadaseKind> tag from the corresponding JDBC resource definition and re-execute update processing.

The database type cannot be changed during the update. To use a different database type, create a new definition.

## 13.3.73 isj2ee0281

---

**ISJ2EE: ERROR: isj2ee0281: Failed to get deployment descriptor file: File Name=%s1 Detail=%s2**

### Variable Information

%s1 = File name

%s2 = Detail information

#### Explanation

Failed to get the deployment descriptor file.

#### System Action

Processing stops.

#### User Action

Check that the deployment descriptor file definition contents are correct.

### 13.3.74 isj2ee0282

---

**ISJ2EE: ERROR: isj2ee0282: Failed to get connector resource definition: Detail=%s**

#### Variable Information

%s1 = Detail information

#### Explanation

Failed to get the resource adapter connector resource definition.

#### System Action

Processing stops.

#### User Action

The definition file may be damaged. Either restore the backed up resources, or create the IJServer again.

### 13.3.75 isj2ee0283

---

**ISJ2EE: ERROR: isj2ee0283: An unexpected error occurred on rollback of deployment for the resource adapter: Detail=%s**

#### Variable Information

%s1 = Detail information

#### Explanation

An unexpected error occurred in rollback processing when the resource adapter is deployed.

#### System Action

Processing stops.

#### User Action

Create the IJServer again and then re-execute processing.

If the problem cannot be resolved, contact your systems engineer.

### 13.3.76 isj2ee0284

---

**ISJ2EE: ERROR: isj2ee0284: Specified configuration name contains characters that can not be used: Configuration Name=%s**

#### Variable Information

%s1 = Specified configuration name

## Explanation

Characters that cannot be used were specified in the configuration name.

## System Action

Processing stops.

## User Action

The following cannot be used for or as part of the configuration name:

- Spaces only
- The following symbols: '&', '?', '"', '<', '>', '|', ':', ';', '\*', '/', '\$'
- The '\ ' file spacer

Specify the configuration name again, and then update the configuration again.

## 13.3.77 isj2ee0285

---

**ISJ2EE: ERROR: isj2ee0285: Specified configuration name is already registered: Configuration Name=%s**

### Variable Information

%s1 = Specified configuration name

### Explanation

The specified configuration name is already registered as another configuration name on the same IJServer.

### System Action

Processing stops.

### User Action

The specified configuration name is already registered as another ConnectionFactory, management target object, or 1.0 spec-compliant resource adapter configuration name on the same IJServer.

Change the configuration name, and then update the configuration again.

## 13.3.78 isj2ee0286

---

**ISJ2EE: ERROR: isj2ee0286: Failed to update connector resource definition: Detail=%s**

### Variable Information

%s1 = Detail information

### Explanation

The attempt to update the connector resource definition failed for the reason output in the detailed information.

### System Action

Processing stops.

### User Action

Possible causes are as follows:

- The definition could not be operated on because another user was operating on it at the same time. Update the definition again.
- The definition file may be damaged. Either restore the backed up resources, or create the IJServer again.

## 13.3.79 isj2ee0287

---

**ISJ2EE: ERROR: isj2ee0287: Invalid value for Client Version: value=%s**

### Variable Information

%s =Specified value

### Explanation

The client version is incorrect, therefore processing failed.

### System Action

Processing stops.

### User Action

Specify a correct value, and then re-execute.

For details, refer to the Reference Manual (Command Edition), section "J2EE Edition" > "J2EE Operation Commands" > "isj2eeadmin".

## 13.3.80 isj2ee0288

---

**ISJ2EE: ERROR: isj2ee0288: Cannot specify Client Version and JDBC Version at the same time**

### Explanation

The JDBC version and the client version were both specified, therefore processing failed.

### System Action

Processing stops.

### User Action

The JDBC version is not supported. Delete the JDBC version, and then re-execute.

For details, refer to the Reference Manual (Command Edition), section "J2EE Edition" > "J2EE Operation Commands" > "isj2eeadmin".

## 13.4 isj2ee0300 to isj2ee0399

---

### 13.4.1 isj2ee0301

---

**ISJ2EE: ERROR: isj2ee0301: [Configuration] exceeded [255] characters: Value specified=%s1**

### Variable Information

%s = Configuration

### Explanation

The value specified for the configuration name exceeded [255] characters.

### System Action

Processing stops.

### User Action

Specify a configuration name of maximum [255] characters.

### 13.4.2 isj2ee0302

---

**ISJ2EE: ERROR: isj2ee0302: [Mail Sender] exceeded [255] characters: Value specified=%s1**

#### Variable Information

%s = Mail Sender

#### Explanation

The value specified for the Mail Sender exceeded [255] characters.

#### System Action

Processing stops.

#### User Action

Specify a Mail Sender containing a maximum of [255] characters.

### 13.4.3 isj2ee0303

---

**ISJ2EE: ERROR: isj2ee0303: The server for receiving mail in [Mail Server Settings] exceeded [255] characters: Value specified=%s1**

#### Variable Information

%s = Server for receiving mail

#### Explanation

The value specified for the server for receiving mail exceeded [255] characters.

#### System Action

Processing stops.

#### User Action

Specify a server for receiving mail containing a maximum of [255] characters.

### 13.4.4 isj2ee0304

---

**ISJ2EE: ERROR: isj2ee0304: [Login ID] exceeded [255] characters: Value specified=%s1**

#### Variable Information

%s = Login ID

#### Explanation

The value specified for the Login ID exceeded [255] characters.

#### System Action

Processing stops.

#### User Action

Specify a Login ID of maximum [255] characters

### 13.4.5 isj2ee0305

---

**ISJ2EE: ERROR: isj2ee0305: [POP3 Server Port Number] is invalid: Specify a number from [1] to [65535]: Value specified=%s1**

#### Variable Information

%s = POP3 Server Port Number

#### Explanation

The value specified for the POP3 server port number is invalid.

#### System Action

Processing stops.

#### User Action

Specify a number from [1] to [65535] for the POP3 server port number.

### 13.4.6 isj2ee0306

---

**ISJ2EE: ERROR: isj2ee0306: [IMAP Server Port Number] is invalid: Specify a number from [1] to [65535]: Value specified=%s1**

#### Variable Information

%s = IMAP Server Port Number

#### Explanation

The value specified for the IMAP server port number is invalid.

#### System Action

Processing stops.

#### User Action

Specify a number from [1] to [65535] for the IMAP server port number.

### 13.4.7 isj2ee0307

---

**ISJ2EE: ERROR: isj2ee0307: [SMTP Server] exceeded [255] characters: Value specified=%s1**

#### Variable Information

%s = SMTP Server

#### Explanation

The value specified for the SMTP Server exceeded [255] characters.

#### System Action

Processing stops.

#### User Action

Specify a SMTP Server containing a maximum of [255] characters.

### 13.4.8 isj2ee0308

---

**ISJ2EE: ERROR: isj2ee0308: [SMTP Server Port Number] is invalid: Specify a number from [1] to [65535]: Value specified=%s1**

#### Variable Information

%s = SMTP Server Port Number

#### Explanation

The value specified for the SMTP server port number is invalid.

#### System Action

Processing stops.

#### User Action

Specify a number from [1] to [65535] for the SMTP server port number.

### 13.4.9 isj2ee0311

---

**ISJ2EE: ERROR: isj2ee0311: The value specified for mailTransportProtocol is invalid: Value specified=%s1**

#### Variable Information

%s = Value specified for the JavaMailDefinitionConfiguration mailTransportProtocol attribute

#### Explanation

The value specified for the mailTransportProtocol attribute is invalid.

#### System Action

Processing stops. Anything that was defined is not reflected.

#### User Action

To specify the mailTransportProtocol attribute, specify "smtp".

### 13.4.10 isj2ee0312

---

**ISJ2EE: ERROR: isj2ee0312: The value specified for mailStoreProtocol is invalid: Value specified=%s1**

#### Variable Information

%s = Value specified for the JavaMailDefinitionConfiguration mailStoreProtocol attribute

#### Explanation

The value specified for the mailStoreProtocol attribute is invalid.

#### System Action

Processing stops. Anything defined is not reflected.

#### User Action

To specify the mailStoreProtocol attribute, specify "pop3" or "imap".

### 13.4.11 isj2ee0313

---

**ISJ2EE: ERROR: isj2ee0313: The value specified for mailStoreProtocol is wrong: Confirm whether mailPop3Host or mailImapHost is set corresponding to the specified value: Value specified=%s1**

#### Variable Information

%s = Value specified for the JavaMailDefinitionConfiguration mailStoreProtocol attribute

#### Explanation

There is no mailPop3Host or mailImapHost attribute for the value that was specified for the mailStoreProtocol attribute.

#### System Action

Processing stops. Anything that was defined is not reflected.

## User Action

If "pop3" is specified for the mailStoreProtocol attribute, set the mailPop3Host attribute as well. If "imap" is specified for the mailStoreProtocol attribute, set the mailImapHost attribute as well.

# 13.5 isj2ee1000 to isj2ee1099

---

## 13.5.1 isj2ee1001

---

### ISJ2EE: ERROR: isj2ee1001: Unable to read the isj2ee.properties file. CAUSE(%s)

#### Variable Information

%s = Details

#### Explanation

The following are the likely causes:

- Another application such as an editor is using the isj2ee.properties file.
- A user has deleted the isj2ee.properties file.

Note that the isj2ee.properties file is stored in the location specified by the following path:

**Windows32/64**

Interstage install directory

**Solaris32/64**

For the default system: /etc/opt/FJSVj2ee/etc

For an expanded system: /var/opt/FJSVisas/system/<System name>/FJSVj2ee/etc

**Linux32/64**

/etc/opt/FJSVj2ee/etc

#### System Action

Processing stops.

#### User Action

Take the following action:

- If another application is using the file, perform the operation again after the application has finished using the file.
- If a user has deleted the isj2ee.properties file, reinstall Interstage.

## 13.5.2 isj2ee1002

---

### ISJ2EE: ERROR: isj2ee1002: Unable to update the isj2ee.properties file. CAUSE(%s)

#### Variable Information

%s = Details

#### Explanation

The following are the likely causes:

- Another application such as an editor uses the isj2ee.properties file.
- The amount of free disk space is insufficient.

- A user has deleted the isj2ee.properties file.

Note that the isj2ee.properties file is stored in the location specified by the following path:

**Windows32/64**

Interstage install directory

**Solaris32/64**

For the default system: /etc/opt/FJSVj2ee/etc

For an expanded system: /var/opt/FJSVisas/system/<System name>/FJSVj2ee/etc

**Linux32/64**

/etc/opt/FJSVj2ee/etc

### System Action

Processing stops.

### User Action

Take the following action:

- If another application is concerned, perform the operation again after the application that is using the file is completed.
- If the amount of free disk space is insufficient, perform the operation after acquiring sufficient disk space.
- When a user deleted the isj2ee.properties file, reinstall Interstage.

## 13.5.3 isj2ee1003

---

**ISJ2EE: ERROR: isj2ee1003: The isj2ee.properties file is locked due to a reference or update by another operation.**

### Explanation

The isj2ee.properties file is locked by another definition reference or definition update operation.

### System Action

Processing stops.

### User Action

Before performing the operation again, confirm that multiple definition reference or definition update operations will not occur at the same time for the isj2ee.properties file.

## 13.5.4 isj2ee1004

---

**ISJ2EE: ERROR: isj2ee1004: The J2EE package is not installed.**

### Explanation

The J2EE function is not installed.

### System Action

Processing stops.

### User Action

Perform the operation after installing the J2EE function.

## 13.5.5 isj2ee1005

---

**ISJ2EE: ERROR: isj2ee1005: Update of the isj2ee.properties file was stopped because it was overwritten during processing.**

### Explanation

Update processing could not be performed for the isj2ee.properties file because the contents of the definition may have been changed by the following operations:

- Definition change operation by another user
- Processing by another application

Note that the isj2ee.properties file is stored in the location specified by the following path:

**Windows32/64**

Install directory of Interstage

**Solaris32/64**

For the default system: /etc/opt/FJSVj2ee/etc

For an expanded system: /var/opt/FJSVisas/system/<System name>/FJSVj2ee/etc

**Linux32/64**

/etc/opt/FJSVj2ee/etc

### System Action

Processing stops.

### User Action

Take the following action:

- If a definition change operation has been carried out by another user, obtain the definition again then perform the operation.
- If another application is concerned, perform the operation again after the application that is using the file is completed.

## 13.5.6 isj2ee1006

---

**ISJ2EE: ERROR: isj2ee1006: The J2EE properties cannot be accessed due to a reference or update by another operation.**

### Explanation

The J2EE property definition cannot be referenced or updated because the J2EE property is being used by another operation.

### System Action

Processing stops.

### User Action

Check that no reference or update operations are being performed on the J2EE property and then rerun the process.

## 13.5.7 isj2ee1007

---

**ISJ2EE: ERROR: isj2ee1007: The number of paths set in the classpath exceeds its limit. MAX(%s)**

### Variable Information

%s = The maximum number of paths that can be set in the classpath

## Explanation

The number of paths set in the classpath exceeded the limit.

## System Action

Processing stops.

## User Action

Delete unnecessary paths from the classpath to reduce the total number of paths, and re-execute.

## 13.5.8 isj2ee1008

---

**ISJ2EE: ERROR: isj2ee1008: The length of a path set in the classpath exceeds its limit. MAX(%s1) VALUE(%s2)**

## Variable Information

%s1 = The maximum length for paths that can be set in the classpath

%s2 = Path that caused the error

## Explanation

One or more paths set in the classpath exceeded the maximum length for paths.

## System Action

Processing stops.

## User Action

Check if the path that caused the error is valid. If not, reduce the length of the path that caused the error and re-execute.

## 13.5.9 isj2ee1009

---

**ISJ2EE: ERROR: isj2ee1009: Illegal path format in classpath. VALUE(%s)**

## Variable Information

%s = Path that caused the error

## Explanation

Illegal path format was used in the classpath.

## System Action

Processing stops.

## User Action

Check if the path that caused the error is valid. The absolute path must be specified in the classpath.

## 13.5.10 isj2ee1010

---

**ISJ2EE: ERROR: isj2ee1010: A path set in the classpath includes one or more illegal character(%s2). VALUE(%s1)**

## Variable Information

%s1 = Path that caused the error

%s2 = First illegal character

## Explanation

A path set in the classpath includes one or more illegal characters.

## System Action

Processing stops.

## User Action

Delete the path that caused the error, set a valid path, and re-execute. Characters that can be used in paths in the classpath are as follows:

**Windows32/64**

Alphanumerics and "+", "-", "\_", ".", "\$", "%", "\", ":", ";", " ", "~", ":", "\r", "\n"

**Solaris32/64 Linux32/64**

Alphanumerics and "+", "-", "\_", ".", "\$", "%", "/", ":", "~", ":", "\r", "\n"

## 13.5.11 isj2ee1011

---

**ISJ2EE: ERROR: isj2ee1011: The same path is specified more than once in the classpath. VALUE(%s)**

### Variable Information

%s = Path that caused the error

### Explanation

The same path was specified more than once in the classpath.

### System Action

Processing stops.

### User Action

Delete the path that caused the error from the classpath and re-execute.

## 13.5.12 isj2ee1012

---

**ISJ2EE: ERROR: isj2ee1012: The number of values set in the path exceeds its limit. MAX(%s1)**

### Variable Information

%s1 = Maximum number of values that can be set in the path

### Explanation

The number of values set in the path exceeds the allowed limit.

### System Action

Processing stops.

### User Action

Delete unnecessary values from the path to reduce the total number of values and re-execute.

## 13.5.13 isj2ee1013

---

**ISJ2EE: ERROR: isj2ee1013: The length of a value set in the path exceeds its limit. MAX(%s1) VALUE(%s2)**

### Variable Information

%s1 = Maximum length of a value that can be set in the path

%s2 = Value in the path that caused the error

#### Explanation

There is at least one value set in the path, and the maximum length of the value that can be set in the path has been exceeded.

#### System Action

Processing stops.

#### User Action

Check whether the value that caused the error is incorrect. If it is incorrect, change it so that it does not exceed the maximum length and re-execute.

### 13.5.14 isj2ee1014

---

#### **ISJ2EE: ERROR: isj2ee1014: Illegal value format in the path. VALUE(%s1)**

#### Variable Information

%s1 = Value that caused the error

#### Explanation

There is an illegal value format in the path.

#### System Action

Processing stops.

#### User Action

Check whether the value that caused the error is incorrect and re-execute.

### 13.5.15 isj2ee1015

---

#### **ISJ2EE: ERROR: isj2ee1015: A value set in the path includes one or more illegal character. VALUE(%s1)**

#### Variable Information

%s1 = Value in the path that caused the error

#### Explanation

A value set in the path includes one or more illegal characters.

#### System Action

Processing stops.

#### User Action

Any characters other than control characters (ShiftJIS 0x00 - 0x1f,0x7f) can be set in the path . Delete illegal characters from the value in the path that caused the error, check that the path is correct and re-execute.

### 13.5.16 isj2ee1016

---

#### **ISJ2EE: ERROR: isj2ee1016: The same value is specified more than once in the path. VALUE(%s1)**

#### Variable Information

%s1 = Value in the path that caused the error

#### Explanation

The same value is specified more than once in the path.

#### System Action

Processing stops.

#### User Action

Delete the value that caused the error from the path and re-execute.

### 13.5.17 isj2ee1017

---

**ISJ2EE: ERROR: isj2ee1017: The number of paths set in the library path exceeds its limit. MAX(%s1)**

#### Variable Information

%s1 = Maximum number of paths that can be set in the library path

#### Explanation

The number of paths set in the library path exceeds the maximum limit.

#### System Action

Processing stops.

#### User Action

Delete unnecessary paths from the library path to reduce the total number of paths and re-execute.

### 13.5.18 isj2ee1018

---

**ISJ2EE: ERROR: isj2ee1018: The length of a path set in the library path exceeds its limit. MAX(%s1) VALUE(%s2)**

#### Variable Information

%s1 = Maximum length of a path that can be set in the library path

%s2 = Path that caused the error

#### Explanation

There is at least one value set in the library path, and the maximum length of the path that can be set in the library path has been exceeded.

#### System Action

Processing stops.

#### User Action

Check whether the path that caused the error is incorrect. If it is incorrect, change it so that it does not exceed the maximum length and re-execute.

### 13.5.19 isj2ee1019

---

**ISJ2EE: ERROR: isj2ee1019: Illegal path format in the library path. VALUE(%s1)**

#### Variable Information

%s1 = Path that caused the error

#### Explanation

Illegal path format in the library path.

#### System Action

Processing stops.

#### User Action

Check whether the path that caused the error is incorrect and re-execute.

### 13.5.20 isj2ee1020

---

**ISJ2EE: ERROR: isj2ee1020: A path set in the library path includes one or more illegal character. VALUE(%s1)**

#### Variable Information

%s1 = Path that caused the error

#### Explanation

A path set in the library path includes one or more illegal characters.

#### System Action

Processing stops.

#### User Action

Any characters other than control characters (ShiftJIS 0x00 - 0x1f,0x7f) can be set in the library path. Delete the illegal characters from the value in the path that caused the error, check that the path is correct and re-execute.

### 13.5.21 isj2ee1021

---

**ISJ2EE: ERROR: isj2ee1021: The same path is specified more than once in the library path. VALUE(%s1)**

#### Variable Information

%s1 = Path that caused the error

#### Explanation

The same path is specified more than once in the library path.

#### System Action

Processing stops.

#### User Action

Delete the path that caused the error from the library path and re-execute.

### 13.5.22 isj2ee1022

---

**ISJ2EE: ERROR: isj2ee1022: The length of the JavaVM options exceeds its limit. MAX(%s1) VALUE(%s2)**

#### Variable Information

%s1 = Maximum length of the string that can be set for the JavaVM option

%s2 = Illegal value

#### Explanation

The length of the JavaVM options exceeds the maximum limit.

#### System Action

Processing stops.

## User Action

Check whether an incorrect JavaVM option has been set. If the JavaVM option is incorrect, change it so that it does not exceed the maximum length that can be set and re-execute.

### 13.5.23 isj2ee1023

---

#### **ISJ2EE: ERROR: isj2ee1023: Cannot use this System**

##### Explanation

This function cannot be used in this edition.

##### System Action

Processing stops.

##### User Action

Check the edition of the package and the functions that can be used.

### 13.5.24 isj2ee1024

---

#### **ISJ2EE: ERROR: isj2ee1024: The length of the path exceeds its limit. MAX(%s1)**

##### Variable Information

%s1 = Maximum length of the string that can be set in the path

##### Explanation

The length of the path exceeds the maximum limit.

##### System Action

Processing stops.

##### User Action

Check whether an incorrect path has been set. If the path is incorrect, change it so that it does not exceed the maximum length that can be set and re-execute.

### 13.5.25 isj2ee1025

---

#### **ISJ2EE: ERROR: isj2ee1025: The length of the library path exceeds its limit. MAX(%s1)**

##### Variable Information

%s1 = Maximum length of the string that can be set in the library path

##### Explanation

The length of the library path exceeds the maximum limit.

##### System Action

Processing stops.

##### User Action

Check whether an incorrect path has been set. If the path is incorrect, change the path to reduce the total number so that it does not exceed the maximum length and re-execute.

## 13.6 isj2ee1200 to isj2ee1299

---

### 13.6.1 isj2ee1201

---

**ISJ2EE: ERROR: isj2ee1201: Java environment file not exist: PATH=%s1**

#### Variable Information

%s = File name

#### Explanation

The Java environment setup file does not exist.

#### System Action

Processing stops.

#### User Action

Create a Java environment setup file and rerun the process.

If this error occurs when a Managed Server is added to the server group using the multi-server management functionality, this may apply to a server that has already been added to the server group, a server that you are trying to add to the server group, or both.

### 13.6.2 isj2ee1202

---

**ISJ2EE: ERROR: isj2ee1202: Incorrect Java environment file: INFO=%s1: LINE=%s2**

#### Variable Information

%s1 = Type

- NOT\_FOUND\_KEY : No key in line
- NOT\_FOUND\_EQUAL : No separator (=) in line
- INVALID\_KEY : Key name is incorrect
- EMPTY\_FILE : File is empty

%s2 = Content of line containing error

"" is output if the corresponding line does not exist.

#### Explanation

The content of the Java environment setup file is incorrect.

#### System Action

Processing stops.

#### User Action

Specify the correct information in the Java environment setup file. Refer to "Checking the Operating Environment" in the J2EE User's Guide to verify the content of the Java environment setup file.

Eliminate the cause of the problem and rerun the process.

If this error occurs when a Managed Server is added to the server group using the multi-server management functionality, this may apply to a server that has already been added to the server group, a server that you are trying to add to the server group, or both.

### 13.6.3 isj2ee1203

---

**ISJ2EE: ERROR: isj2ee1203: Improper Java Execution environment: PATH=%s1**

## Variable Information

%s = File name

## Explanation

The Java installation directory in the Java environment setup file is incorrectly specified.

## System Action

Processing stops.

## User Action

Specify the Java installation directory correctly in the Java environment setup file. Refer to "Checking the Operating Environment" in the J2EE User's Guide to verify the content of the Java environment setup file.

Eliminate the cause of the problem and rerun the process.

If this error occurs when a Managed Server is added to the server group using the multi-server management functionality, this may apply to a server that has already been added to the server group, a server that you are trying to add to the server group, or both.

## 13.6.4 isj2ee1204

---

**ISJ2EE: ERROR: isj2ee1204: I/O error occurred: There is no access permission, the capacity of the filesystem is insufficient, The file has been damaged or there is a problem with the disk device: PATH=%s1**

## Variable Information

%s = File name

## Explanation

A file I/O error occurred.

## System Action

Processing stops.

## User Action

Any of the following may be causing the problem:

- The user may not have access rights. Either change the user's access rights or rerun the process with a user who has sufficient access rights.
- The capacity of the file system may be insufficient. Either delete unnecessary files or increase the file system capacity.
- File creation may have failed because the specified directory does not exist. Check that the current directory of the file name indicated by the variable information %s1 exists.
- The file may be damaged. Restore J2EE.
- The disk device may be faulty. Check the device for faults.

If this error occurs when a Managed Server is added to the server group using the multi-server management functionality, this may apply to a server that has already been added to the server group, a server that you are trying to add to the server group, or both.

## 13.6.5 isj2ee1299

---

**ISJ2EE: ERROR: isj2ee1299: An unexpected error occurred: Contact your SE: INFO=%s1**

## Variable Information

%s = Detail code

## Explanation

An unexpected error occurred.

## System Action

Processing stops.

## User Action

Make a note of the message then collect the diagnostic information using the *iscollectinfo* command, record the message and contact your systems engineer.

---

## 13.7 isj2ee1900 to isj2ee1999

---

### 13.7.1 isj2ee1999

---

**ISJ2EE: ERROR: isj2ee1999: Occurred system error.: DETAILS=%s1**

#### Variable Information

%s = System error information

#### Explanation

System error occurred.

#### System Action

Processing stops.

#### User Action

Collect the diagnostic information using the *iscollectinfo* command, record the message and contact your systems engineer.

---

## 13.8 isj2ee2000 to isj2ee2099

---

### 13.8.1 isj2ee2001

---

**Command name: ERROR: isj2ee2001:Sub command is invalid. COMMAND=%s**

#### Variable Information

%s = Sub command name

#### Explanation

The specified subcommand is incorrect.

#### System Action

Command processing is interrupted.

#### User Action

Specify the correct subcommand and re-execute the command.

---

### 13.8.2 isj2ee2002

---

**Command name: ERROR: isj2ee2002:Out of memory.**

#### Explanation

Insufficient memory.

## System Action

Command processing is interrupted.

## User Action

Wait a few moments and rerun the process. If this message appears frequently, refer to the Tuning Guide to estimate the amount of memory required to run Interstage, and verify that sufficient memory is available.

If there is sufficient memory for Interstage to run, the problem may be due to a memory shortage in another application. Check if enough memory is available by estimating the memory requirements of other applications running on the same machine.

If these investigations reveal a memory shortage, contact the system administrator to have the main memory increased or the swap area expanded.

**Solaris32/64 Linux32/64**

Alternatively, if a message indicating a shortage of memory or swap space has been output to the system log, wait a few minutes and rerun the process.

## 13.8.3 isj2ee2003

---

**Command name:** ERROR: isj2ee2003:Specified file does not exist. FILE=%s

### Variable Information

%s = File name

### Explanation

The specified file does not exist.

### System Action

Command processing is interrupted.

### User Action

Specify the file name correctly and re-execute the command.

## 13.8.4 isj2ee2004

---

**Command name:** ERROR: isj2ee2004:Specified file already exists. FILE=%s

### Variable Information

%s = File name

### Explanation

The specified file already exists.

### System Action

Command processing is interrupted.

### User Action

Specify the file name correctly and re-execute the command.

## 13.8.5 isj2ee2005

---

**Command name:** ERROR: isj2ee2005:Failed in file access. FILE=%s1 INFO=%s2

### Variable Information

%s1 = File name

%s2 = Detail information

#### Explanation

Access to the file failed.

#### System Action

Command processing is interrupted.

#### User Action

A directory name was specified as the target file name, or the file could not be accessed. Use the detailed information (%s2) to identify and eliminate the cause of the problem, and then re-execute the command.

### 13.8.6 isj2ee2007

---

**Command name: ERROR: isj2ee2007:There is an error for XML definition. FILE=%s1 INFO=%s2**

#### Variable Information

%s1 = File name

%s2 = Detail information

#### Explanation

There is an error in the definition information specified in the command.

#### System Action

Command processing is interrupted.

#### User Action

Use the detailed information (%s2) to identify and eliminate the cause of the problem, and then re-execute the command.

### 13.8.7 isj2ee2008

---

**Command name: ERROR: isj2ee2008:There is an error for XML definition. TAG=%s1 VALUE=%s2**

#### Variable Information

%s1 = Tag name

%s2 = Specified value

#### Explanation

There is an error in the definition information specified in the command.

#### System Action

Command processing is interrupted.

#### User Action

Ensure that the value specified in the tag name indicated by the variable information (%s1) is correct, and then re-execute the command.

### 13.8.8 isj2ee2009

---

**Command name: ERROR: isj2ee2009:None option has been specified.**

#### Explanation

No operand had been specified.

### System Action

Command processing is interrupted.

### User Action

Specify the correct operand and re-execute the command.

---

## 13.8.9 isj2ee2010

---

**Command name: WARNING: isj2ee2010:No resource was defined.**

### Explanation

No resource (target object) is defined in the specified definition file.

### System Action

Command processing is interrupted.

### User Action

Check if the content of the specified definition file is correct.

---

## 13.8.10 isj2ee2011

---

**Command name: ERROR: isj2ee2011:Both of definitions cannot be specified. TAG1=%s1 TAG2=%s2**

### Variable Information

%s1 = Tag name

%s2 = Tag name

### Explanation

Definitions that cannot be specified together were specified in the definition information of the command.

### System Action

Command processing is interrupted.

### User Action

Change the definition so that only one of the tag names output in the variable information is specified, and re-execute the command.

---

## 13.8.11 isj2ee2049

---

**Command name: ERROR: isj2ee2049:Option is invalid**

### Explanation

The specified option is invalid.

### System Action

Command processing is interrupted.

### User Action

Specify the correct option and re-execute the command.

---

## 13.8.12 isj2ee2050

---

**Command name: ERROR: isj2ee2050:Sub command argument is invalid. COMMAND=%s**

## Variable Information

%s = Sub command name

## Explanation

The specified subcommand option is incorrect.

## System Action

Command processing is interrupted.

## User Action

Specify the correct subcommand option and re-execute the command.

**Windows32/64**

If a file path is specified in the subcommand option, check whether the path contains spaces.

If a path containing spaces is specified, put the path string in double quotation marks (") and re-execute the command.

## 13.8.13 isj2ee2051

---

**Command name: ERROR: isj2ee2051:Could not connect to Interstage JMX Service.**

## Explanation

An attempt to connect to the Interstage JMX Service failed.

## System Action

Command processing is interrupted.

## User Action

Take one of the following actions:

- The LAN in which the machine is running may be disconnected. Connect the LAN, and then re-execute the command.
- The Interstage JMX Service may have stopped. If the service has stopped, take the following action and then re-execute the command.

**Windows32/64**

Start Interstage Operation Tool Service.

**Solaris32/64 Linux32/64**

Start Interstage JMX Service by isjmxstart command.

## 13.8.14 isj2ee2052

---

**Command name: ERROR: isj2ee2052:Error in Interstage JMX service. ERROR=%s**

## Variable Information

%s = Error information

## Explanation

An error occurred in the Interstage JMX Service.

## System Action

Command processing is interrupted.

### User Action

Examine any messages that were output at the same time as this message to identify the cause of the problem, eliminate the cause, and re-execute the command.

## 13.8.15 isj2ee2053

---

**Command name: WARNING: isj2ee2053: The operation could not be performed on Interstage JMX service. DETAIL=%s**

### Variable Information

%s = Detail information

### Explanation

Interstage JMX Service does not support the operation indicated by the variable information %s.

### System Action

Continues command processing, but may not be able to perform some processing.

### User Action

Check that the version of Interstage Application Server is V8.0 or later, and then re-execute the command.

## 13.8.16 isj2ee2054

---

**Command name: ERROR: isj2ee2054:Does not have the authority to execute this command. COMMAND=%s**

### Variable Information

%s = Contents of command line

### Explanation

The user does not have permission to execute the command.

### System Action

Command processing is interrupted.

### User Action

Use the following table to confirm that the user has permission to execute the command and then re-execute the command:

Sub command name	Operation	OS administrator authority
ijserver	Add new definition	Not required
	Update definition	Not required
	Delete definition	Not required
	Extract definition	Not required
	Get list	Not required
system	Update definition	Required
	Extract definition	Not required
resource	Add new definition	Not required
	Update definition	Not required
	Extract definition	Not required
	Get list	Not required

Sub command name	Operation	OS administrator authority
service	Add new definition	Not required
	Update definition	Not required
	Delete definition	Not required
	Extract definition	Not required
	Get list	Not required

### 13.8.17 isj2ee2055

**Command name: ERROR: isj2ee2055:This operation cannot be executed on the managed server that the application operation mode set to the management operation mode.**

#### Explanation

This operation cannot be performed on a Managed Server whose application operation type is set to batch operation mode.

#### System Action

Command processing is interrupted.

#### User Action

Web server connector definitions can be updated when the server is a Managed Server and the application operation type is set to Stand-alone Operation Mode. However, it is not possible to add new definitions or update definitions on a Managed Server. To add new definitions or update definitions, log onto the Admin Server from the Interstage Management Console and perform the same operation on that server.

### 13.8.18 isj2ee2056

**Command name: ERROR: isj2ee2056:This operation cannot be executed on the managed server.**

#### Explanation

The operation cannot be performed on a Managed Server.

#### System Action

Command processing is interrupted.

#### User Action

Definition updates cannot be performed if the server is a Managed Server. Log onto the Admin Server from the Interstage Management Console and perform the same operation there.

Note that definitions can be updated on a Managed Server if updating the application name of a Web server connector definition when the Managed Server is set to Stand-alone Operation Mode.

### 13.8.19 isj2ee2057

**Command name: ERROR: isj2ee2057:The Web server connector definition can not be updated except application name on the managed server that the application operation mode set to the standalone operation mode.**

#### Explanation

It is not possible to update definitions other than the application name of a Web server connector definition when the Managed Server is in Stand-alone Operation Mode.

#### System Action

Command processing is interrupted.

## User Action

It is not possible to update any definitions other than the application name of a Web server connector definition when the server is a Managed Server in Stand-alone Operation Mode. Log onto the Admin Server from the Interstage Management Console and perform the same operation there.

### 13.8.20 isj2ee2058

---

**Command name: INFO: isj2ee2058: The version for the compatibility option has been set. VERSION=%s**

#### Variable Information

%s = Specified version

#### Explanation

The compatibility option was set using isj2eeadmin.conf or the -v option.

Use the default value of the specified version to register the definition.

### 13.8.21 isj2ee2059

---

**Command name: ERROR: isj2ee2059: The version specified for the compatibility option is invalid. VERSION=%s**

#### Variable Information

%s = Specified version

#### Explanation

An invalid value was set for the compatibility option using isj2eeadmin.conf or the -v option. Specify a valid value in the compatibility option and re-execute the command.

#### System Action

Command processing is interrupted.

#### User Action

Specify a valid value in the compatibility option and re-execute the command.

## 13.9 isj2ee2100 to isj2ee2199

---

### 13.9.1 isj2ee2100

---

**Command name: INFO: isj2ee2100: The IJServer has been registered. NAME=%s**

#### Variable Information

%s = IJServer name

#### Explanation

The specified IJServer has been registered.

### 13.9.2 isj2ee2101

---

**Command name: ERROR: isj2ee2101: During definition update, IJServer was deleted. NAME=%s**

#### Variable Information

%s = IJServer name

#### Explanation

The IJServer was deleted while the IJServer definition was being updated.

#### User Action

Re-execute the command.

### 13.9.3 isj2ee2102

---

**Command name: INFO: isj2ee2102:IJServer has been deleted. NAME=%s**

#### Variable Information

%s = IJServer name

#### Explanation

The specified IJServer has been deleted.

### 13.9.4 isj2ee2103

---

**Command name: INFO: isj2ee2103:The IJServer setting has been updated. NAME=%s**

#### Variable Information

%s = IJServer name

#### Explanation

The specified IJServer setting has been updated.

### 13.9.5 isj2ee2104

---

**Command name: INFO: isj2ee2104:The IJServer definition has been exported.**

#### Explanation

The specified IJServer definition has been exported.

### 13.9.6 isj2ee2105

---

**Command name: INFO: isj2ee2105:The startup class has been registered. NAME=%s**

#### Variable Information

%s = Startup class name

#### Explanation

The specified startup class has been registered.

### 13.9.7 isj2ee2106

---

**Command name: INFO: isj2ee2106:The shutdown class has been registered. NAME=%s**

#### Variable Information

%s = Shutdown class name

#### Explanation

The specified shutdown class has been registered.

## 13.9.8 isj2ee2107

---

**Command name: INFO: isj2ee2107:The startup class has been updated. NAME=%s**

### Variable Information

%s = Startup class name

### Explanation

The specified startup class definition has been updated.

## 13.9.9 isj2ee2108

---

**Command name: INFO: isj2ee2108:The shutdown class has been updated. NAME=%s**

### Variable Information

%s = Shutdown class name

### Explanation

The specified shutdown class definition has been updated.

## 13.9.10 isj2ee2109

---

**Command name: INFO: isj2ee2109:The log setting has been updated. NAME=%s**

### Variable Information

%s = IJServer name

### Explanation

The specified IJServer log settings have been updated.

## 13.9.11 isj2ee2110

---

**Command name: ERROR: isj2ee2110:Failed to register the IJServer. NAME=%s1 ERROR=%s2**

### Variable Information

%s1 = IJServer name

%s2 = Detailed error information

### Explanation

The IJServer could not be registered.

### System Action

Command processing is interrupted.

### User Action

Eliminate the cause of the problem indicated by any messages immediately preceding this one, and then re-execute the command.

## 13.9.12 isj2ee2111

---

**Command name: ERROR: isj2ee2111: Failed to delete the IJServer. NAME=%s1 ERROR=%s2**

### Variable Information

%s1 = IJServer name

%s2 = Detailed error information

#### Explanation

The IJServer could not be deleted.

#### System Action

Command processing is interrupted.

#### User Action

Eliminate the cause of the problem indicated by any messages immediately preceding this one, and then re-execute the command.

### 13.9.13 isj2ee2112

---

**Command name:** ERROR: isj2ee2112: Failed to update the IJServer. NAME=%s1 ERROR =%s2

#### Variable Information

%s = IJServer name

#### Explanation

The IJServer definition could not be updated.

#### System Action

Command processing is interrupted.

#### User Action

Eliminate the cause of the problem indicated by any messages immediately preceding this one, and then re-execute the command.

### 13.9.14 isj2ee2113

---

**Command name:** ERROR: isj2ee2113:Failed to export the IJServer.

#### Explanation

The IJServer definition could not be exported.

#### System Action

Command processing is interrupted.

#### User Action

Eliminate the cause of the problem indicated by any messages immediately preceding this one and then re-execute the command.

### 13.9.15 isj2ee2114

---

**Command name:** ERROR: isj2ee2114:Failed to list the IJServer.

#### Explanation

The IJServer could not be referenced.

#### System Action

Command processing is interrupted.

#### User Action

Eliminate the cause of the problem indicated by any messages immediately preceding this one, and then re-execute the command.

### 13.9.16 isj2ee2115

---

---

**Command name: ERROR: isj2ee2115:Failed to register the startup class. NAME=%s**

Variable Information

%s = Startup class name

Explanation

The specified startup class could not be registered.

System Action

Command processing is interrupted.

User Action

Eliminate the cause of the problem indicated by any messages immediately preceding this one, and then re-execute the command.

### 13.9.17 isj2ee2116

---

**Command name: ERROR: isj2ee2116:Failed to register the shutdown class. NAME=%s**

Variable Information

%s = Shutdown class name

Explanation

The specified shutdown class could not be registered.

System Action

Command processing is interrupted.

User Action

Eliminate the cause of the problem indicated by any messages immediately preceding this one, and then re-execute the command.

### 13.9.18 isj2ee2117

---

**Command name: ERROR: isj2ee2117:Failed to update the startup class. NAME=%s**

Variable Information

%s = Shutdown class name

Explanation

The specified startup class definition could not be updated.

System Action

Command processing is interrupted.

User Action

Eliminate the cause of the problem indicated by any messages immediately preceding this one, and then re-execute the command.

### 13.9.19 isj2ee2118

---

**Command name: ERROR: isj2ee2118:Failed to update the shutdown class. NAME=%s**

Variable Information

%s = Shutdown class name

### Explanation

The specified shutdown class definition could not be updated.

### System Action

Command processing is interrupted.

### User Action

Eliminate the cause of the problem indicated by any messages immediately preceding this one, and then re-execute the command.

## 13.9.20 isj2ee2119

---

**Command name:** ERROR: isj2ee2119:Failed to update the log setting. NAME=%s

### Variable Information

%s = IJServer name

### Explanation

The log settings of the specified IJServer could not be updated.

### System Action

Command processing is interrupted.

### User Action

Eliminate the cause of the problem indicated by any messages immediately preceding this one, and then re-execute the command.

## 13.9.21 isj2ee2120

---

**Command name:** INFO: isj2ee2120:The IJServer does not exist.

### Explanation

The IJServer does not exist.

## 13.9.22 isj2ee2121

---

**Command name:** ERROR: isj2ee2121:The IJServer does not exist. NAME=%s

### Variable Information

%s = IJServer name

### Explanation

The specified IJServer does not exist.

### System Action

Command processing is interrupted.

### User Action

Specify the correct IJServer name and re-execute the command.

## 13.9.23 isj2ee2122

---

**Command name:** INFO: isj2ee2122:The startup class has been deleted. NAME=%s

### Variable Information

%s = Class name

#### Explanation

The startup class has been deleted.

### 13.9.24 isj2ee2123

---

**Command name: INFO: isj2ee2123:The shutdown class has been deleted. NAME=%s**

#### Variable Information

%s = Class name

#### Explanation

The shutdown class has been deleted.

### 13.9.25 isj2ee2124

---

**Command name: ERROR: isj2ee2124:Failed to delete the startup class. NAME=%s**

#### Variable Information

%s = Class name

#### Explanation

The startup class could not be deleted.

#### System Action

Command processing is interrupted.

#### User Action

Eliminate the cause of the problem indicated by any messages immediately preceding this one, and then re-execute the command.

### 13.9.26 isj2ee2125

---

**Command name: ERROR: isj2ee2125:Failed to delete the shutdown class. NAME=%s**

#### Variable Information

%s = Class name

#### Explanation

The shutdown class could not be deleted.

#### System Action

Command processing is interrupted.

#### User Action

Eliminate the cause of the problem indicated by any messages immediately preceding this one, and then re-execute the command.

### 13.9.27 isj2ee2126

---

**Command name: ERROR: isj2ee2126:Too long user name is specified. TAG=%s1 VALUE=%s2**

#### Variable Information

%s1 = Tag

%s2 = Specified value

## Explanation

[9] or more characters were specified for the User tag of the AutomaticStart tag of the IJServer tag.

## System Action

Command processing is interrupted.

## User Action

Specify the name of a user name that is registered in the system, and then re-execute the command. A maximum of [8] characters can be specified for the user name.

The user name that can be specified depends on the user executing the *isj2eeadmin* command:

- Setting the start user
  - If the logged in user is a super user  
Any user name registered in the system can be specified for the start user.
  - If the logged in user is not a super user  
Only the user name of the logged in user can be specified.
- Changing the registered start user
  - If the logged in user is a super user  
It can be changed to any user name.
  - If the logged in user is not a super user  
It can only be change to the name of the logged in user.

If the <User> tag is omitted when a new WorkUnit is created, or automatic start of the WorkUnit is changed from OFF to ON, then by default, the name of the user who executed the command is specified.

## 13.10 isj2ee2200 to isj2ee2299

---

### 13.10.1 isj2ee2200

---

**Command name: INFO: isj2ee2200:The JDBC DataSource has been registered. NAME=%s**

#### Variable Information

%s = JDBC DataSource name

#### Explanation

The specified JDBC data source definition has been registered.

### 13.10.2 isj2ee2201

---

**Command name: ERROR: isj2ee2201:During definition update, JDBC data source was deleted. NAME=%s**

#### Variable Information

%s = IJServer name

#### Explanation

The JDBC data source was deleted while the JDBC data source definition was being updated.

#### User Action

Re-execute the command.

### 13.10.3 isj2ee2202

---

**Command name: INFO: isj2ee2202:The JDBC DataSource has been deleted. NAME=%s**

#### Variable Information

%s = JDBC DataSource name

#### Explanation

The specified JDBC data source definition has been deleted.

### 13.10.4 isj2ee2203

---

**Command name: INFO: isj2ee2203:The JDBC DataSource has been update. NAME=%s**

#### Variable Information

%s = JDBC DataSource name

#### Explanation

The specified JDBC data source definition has been updated.

### 13.10.5 isj2ee2204

---

**Command name: INFO: isj2ee2204:The JDBC DataSource has been exported.**

#### Explanation

The specified JDBC data source definition has been exported.

### 13.10.6 isj2ee2205

---

**Command name: INFO: isj2ee2205:The JDBC DataSource does not exist.**

#### Explanation

The JDBC data source does not exist.

### 13.10.7 isj2ee2206

---

**Command name: ERROR: isj2ee2206:Failed to register the JDBC DataSource. NAME=%s**

#### Variable Information

%s = JDBC DataSource name

#### Explanation

The specified JDBC data source could not be registered.

#### System Action

Command processing is interrupted.

#### User Action

Eliminate the cause of the problem indicated by any messages immediately preceding this one, and then re-execute the command.

### 13.10.8 isj2ee2207

---

**Command name: ERROR: isj2ee2207:Failed to delete the JDBC DataSource. NAME=%s**

#### Variable Information

%s = JDBC DataSource name

#### Explanation

The specified JDBC data source could not be deleted.

#### System Action

Command processing is interrupted.

#### User Action

Eliminate the cause of the problem indicated by any messages immediately preceding this one, and then re-execute the command.

### 13.10.9 isj2ee2208

---

**Command name: ERROR: isj2ee2208:Failed to update the JDBC DataSource. NAME=%s**

#### Variable Information

%s = JDBC DataSource name

#### Explanation

The specified JDBC data source definition could not be updated.

#### System Action

Command processing is interrupted.

#### User Action

Eliminate the cause of the problem indicated by any messages immediately preceding this one, and then re-execute the command.

### 13.10.10 isj2ee2209

---

**Command name: ERROR: isj2ee2209:Failed to export the JDBC DataSource.**

#### Explanation

The specified JDBC data source definition could not be exported.

#### System Action

Command processing is interrupted.

#### User Action

Eliminate the cause of the problem indicated by any messages immediately preceding this one, and then re-execute the command.

### 13.10.11 isj2ee2210

---

**Command name: ERROR: isj2ee2210:Failed to list the JDBC DataSource.**

#### Explanation

The JDBC data source could not be referenced.

#### System Action

Command processing is interrupted.

## User Action

Eliminate the cause of the problem indicated by any messages immediately preceding this one, and then re-execute the command.

### 13.10.12 isj2ee2211

---

**Command name:** ERROR: isj2ee2211:The JDBC DataSource does not exist. NAME=%s

#### Variable Information

%s = JDBC DataSource name

#### Explanation

The specified JDBC data source does not exist.

#### System Action

Command processing is interrupted.

#### User Action

Specify the correct JDBC data source name and re-execute the command.

### 13.11 isj2ee2300 to isj2ee2399

---

#### 13.11.1 isj2ee2300

---

**Command name:** INFO: isj2ee2300:The JavaMail resource has been registered. NAME=%s

#### Variable Information

%s = Java Mail Resource name

#### Explanation

The specified JavaMail resource definition has been registered.

#### 13.11.2 isj2ee2301

---

**Command name:** ERROR: isj2ee2301:During definition update, JavaMail resource was deleted. NAME=%s

#### Variable Information

%s = Java Mail Resource name

#### Explanation

The JavaMail resource was deleted while the IJServer definition was being updated.

#### User Action

Re-execute the command.

#### 13.11.3 isj2ee2302

---

**Command name:** INFO: isj2ee2302:The JavaMail resource has been deleted. NAME=%s

#### Variable Information

%s = Java Mail Resource name

## Explanation

The specified JavaMail resource has been deleted.

### 13.11.4 isj2ee2303

---

**Command name: INFO: isj2ee2303:The JavaMail resource has been update. NAME=%s**

#### Variable Information

%s = Java Mail Resource name

## Explanation

The specified JavaMail resource definition has been updated.

### 13.11.5 isj2ee2304

---

**Command name: INFO: isj2ee2304:The JavaMail resource has been exported.**

## Explanation

The specified JavaMAIL resource definition has been exported.

### 13.11.6 isj2ee2305

---

**Command name: INFO: isj2ee2305:The JavaMail resource does not exist.**

## Explanation

The JavaMail resource does not exist.

### 13.11.7 isj2ee2306

---

**Command name: ERROR: isj2ee2306:Failed to register the JavaMail resource. NAME=%s**

#### Variable Information

%s = Java Mail Resource name

## Explanation

The specified JavaMail resource could not be registered.

## System Action

Command processing is interrupted.

## User Action

Eliminate the cause of the problem indicated by any messages immediately preceding this one, and then re-execute the command.

### 13.11.8 isj2ee2307

---

**Command name: ERROR: isj2ee2307:Failed to delete the JavaMail resource. NAME=%s**

#### Variable Information

%s = Java Mail Resource name

## Explanation

The specified JavaMail resource could not be deleted.

#### System Action

Command processing is interrupted.

#### User Action

Eliminate the cause of the problem indicated by any messages immediately preceding this one, and then re-execute the command.

### 13.11.9 isj2ee2308

---

**Command name: ERROR: isj2ee2308:Failed to export the JavaMail resource.**

#### Explanation

The specified JavaMail resource definition could not be exported.

#### System Action

Command processing is interrupted.

#### User Action

Eliminate the cause of the problem indicated by any messages immediately preceding this one, and then re-execute the command.

### 13.11.10 isj2ee2309

---

**Command name: ERROR: isj2ee2309:Failed to list the JavaMail resource.**

#### Explanation

The specified JavaMail resource could not be referenced.

#### System Action

Command processing is interrupted.

#### User Action

Eliminate the cause of the problem indicated by any messages immediately preceding this one, and then re-execute the command.

### 13.11.11 isj2ee2310

---

**Command name: ERROR: isj2ee2310:Failed to update the JavaMail resource. NAME=%s**

#### Variable Information

%s = Java Mail Resource name

#### Explanation

The specified JavaMail resource definition could not be updated.

#### System Action

Command processing is interrupted.

#### User Action

Eliminate the cause of the problem indicated by any messages immediately preceding this one, and then re-execute the command.

### 13.11.12 isj2ee2311

---

---

**Command name:** ERROR: isj2ee2311:The JavaMail resource does not exist. NAME=%s

Variable Information

%s = Java Mail Resource name

Explanation

The specified JavaMAIL resource does not exist.

System Action

Command processing is interrupted.

User Action

Verify that the specified JavaMail resource name is correct, and then re-execute the command.

---

## 13.12 isj2ee2400 to isj2ee2499

---

### 13.12.1 isj2ee2400

---

**Command name:** INFO: isj2ee2400:The JMS Destination has been registered. NAME=%s

Variable Information

%s = JMS Destination name

Explanation

The specified JMS Destination definition has been registered.

### 13.12.2 isj2ee2401

---

**Command name:** ERROR: isj2ee2401:During definition update, JMS Destination was deleted. NAME=%s

Variable Information

%s = JMS Destination name

Explanation

The JMS Destination was deleted while the JMS destination definition was being updated.

User Action

Re-execute the command.

### 13.12.3 isj2ee2402

---

**Command name:** INFO: isj2ee2402:The JMS Destination has been deleted. NAME=%s

Variable Information

%s = JMS Destination name

Explanation

The specified JMS Destination definition has been deleted.

### 13.12.4 isj2ee2403

---

**Command name:** INFO: isj2ee2403:The JMS Destination has been updated. NAME=%s

#### Variable Information

%s = JMS Destination name

#### Explanation

The specified JMS Destination definition has been updated.

### 13.12.5 isj2ee2404

---

**Command name: INFO: isj2ee2404:The JMS Destination has been exported.**

#### Explanation

The specified JMS Destination definition has been exported.

### 13.12.6 isj2ee2405

---

**Command name: INFO: isj2ee2405:The JMS Destination does not exist.**

#### Explanation

The JMS Destination does not exist.

### 13.12.7 isj2ee2406

---

**Command name: ERROR: isj2ee2406:Failed to register the JMS Destination. NAME=%s**

#### Variable Information

%s = JMS Destination name

#### Explanation

The specified JMS Destination could not be registered.

#### System Action

Command processing is interrupted.

#### User Action

Eliminate the cause of the problem indicated by any messages immediately preceding this one, and then re-execute the command.

### 13.12.8 isj2ee2407

---

**Command name: ERROR: isj2ee2407:Failed to update the JMS Destination definition. NAME=%s**

#### Variable Information

%s = JMS Destination name

#### Explanation

The specified JMS Destination definition could not be updated.

#### System Action

Command processing is interrupted.

#### User Action

Eliminate the cause of the problem indicated by any messages immediately preceding this one, and then re-execute the command.

### 13.12.9 isj2ee2408

---

---

**Command name: ERROR: isj2ee2408:Failed to delete the JMS Destination definition. NAME=%s**

Variable Information

%s = JMS Destination name

Explanation

The specified JMS Destination could not be deleted.

System Action

Command processing is interrupted.

User Action

Eliminate the cause of the problem indicated by any messages immediately preceding this one, and then re-execute the command.

## 13.12.10 isj2ee2409

---

**Command name: ERROR: isj2ee2409:Failed to export the JMS Destination definition.**

Explanation

The specified JMS Destination definition could not be exported.

System Action

Command processing is interrupted.

User Action

Eliminate the cause of the problem indicated by any messages immediately preceding this one, and then re-execute the command.

## 13.12.11 isj2ee2410

---

**Command name: ERROR: isj2ee2410:Failed to list the JMS Destination definition.**

Explanation

The specified JMS Destination could not be referenced.

System Action

Command processing is interrupted.

User Action

Eliminate the cause of the problem indicated by any messages immediately preceding this one, and then re-execute the command.

## 13.12.12 isj2ee2411

---

**Command name: ERROR: isj2ee2411:The JMS Destination does not exist. NAME=%s**

Variable Information

%s = JMS Destination name

Explanation

The specified JMS Destination does not exist.

## System Action

Command processing is interrupted.

## User Action

Verify that the specified JMS Destination name is correct, and then re-execute the command.

---

## 13.13 isj2ee2500 to isj2ee2599

---

### 13.13.1 isj2ee2500

---

**Command name: INFO: isj2ee2500:The JMS ConnectionFactory has been registered. NAME=%s**

Command processing is interrupted.

## User Action

Eliminate the cause of the problem indicated by any messages immediately preceding this one, and then re-execute the command.

## 13.14 isj2ee2600 to isj2ee2699

---

### 13.14.1 isj2ee2600

---

**Command name: INFO: isj2ee2600:The connector resource has been registered. NAME=%s**

#### Variable Information

%s = Connector resource name

#### Explanation

The specified connector resource definition has been registered.

### 13.14.2 isj2ee2601

---

**Command name: ERROR: isj2ee2601:During definition update, connector resource was deleted. NAME=%s**

#### Variable Information

%s = Connector resource name

#### Explanation

The connector resource was deleted while the connector resource definition was being updated.

#### User Action

Re-execute the command.

### 13.14.3 isj2ee2602

---

**Command name: INFO: isj2ee2602:The connector resource has been deleted. NAME=%s**

#### Variable Information

%s = Connector resource name

#### Explanation

The specified Connector resource definition has been deleted.

### 13.14.4 isj2ee2603

---

**Command name: INFO: isj2ee2603:The connector resource has been updated. NAME=%s**

#### Variable Information

%s = Connector resource name

#### Explanation

The specified Connector resource definition has been updated.

### 13.14.5 isj2ee2604

---

**Command name: INFO: isj2ee2604:The connector resource has been exported.**

## Explanation

The specified Connector resource definition has been exported.

### 13.14.6 isj2ee2605

---

**Command name: INFO: isj2ee2605:The connector resource does not exist.**

## Explanation

The Connector resource does not exist.

### 13.14.7 isj2ee2606

---

**Command name: ERROR: isj2ee2606:Failed to register the connector resource. NAME=%s**

## Variable Information

%s = Connector resource name

## Explanation

The specified Connector resource could not be registered.

## System Action

Command processing is interrupted.

## User Action

Eliminate the cause of the problem indicated by any messages immediately preceding this one, and then re-execute the command.

### 13.14.8 isj2ee2607

---

**Command name: ERROR: isj2ee2607:Failed to update the connector resource. NAME=%s**

## Variable Information

%s = Connector resource name

## Explanation

The specified Connector resource definition could not be updated.

## System Action

Command processing is interrupted.

## User Action

Eliminate the cause of the problem indicated by any messages immediately preceding this one, and then re-execute the command.

### 13.14.9 isj2ee2608

---

**Command name: ERROR: isj2ee2608:Failed to delete the connector resource. NAME=%s**

## Variable Information

%s = Connector resource name

## Explanation

The specified Connector resource could not be deleted.

## System Action

Command processing is interrupted.

#### User Action

Eliminate the cause of the problem indicated by any messages immediately preceding this one, and then re-execute the command.

### 13.14.10 isj2ee2609

---

**Command name: ERROR: isj2ee2609:Failed to export the connector resource.**

#### Explanation

The specified Connector resource definition could not be exported.

#### System Action

Command processing is interrupted.

#### User Action

Eliminate the cause of the problem indicated by any messages immediately preceding this one, and then re-execute the command.

### 13.14.11 isj2ee2610

---

**Command name: ERROR: isj2ee2610:Failed to list the connector resource.**

#### Explanation

The specified Connector resource could not be referenced.

#### System Action

Command processing is interrupted.

#### User Action

Eliminate the cause of the problem indicated by any messages immediately preceding this one, and then re-execute the command.

### 13.14.12 isj2ee2611

---

**Command name: ERROR: isj2ee2611:The connector resource does not exist. NAME=%s**

#### Variable Information

%s = Connector resource name

#### Explanation

The specified Connector resource does not exist.

#### System Action

Command processing is interrupted.

#### User Action

Verify that the specified connector resource name is correct, and then re-execute the command.

### 13.14.13 isj2ee2612

---

**Command name: ERROR: isj2ee2612:The connector resource can not be registered.**

#### Explanation

The connector resource can not be registered.

#### System Action

Command processing is interrupted.

#### User Action

Connector resources are registered by a deployment process. They cannot be registered using the *isj2eeadmin* command. The *isj2eeadmin* command can only be used to update a connector resource definition.

To update a connector resource definition, deploy the connector resource and then re-execute the command.

### 13.14.14 isj2ee2698

---

**Command name: INFO: isj2ee2698:The resources have been exported.**

#### Explanation

The resource definition has been exported.

### 13.14.15 isj2ee2699

---

**Command name: ERROR: isj2ee2699:Failed to export the resources.**

#### Explanation

The resources' definition could not be exported.

#### System Action

Command processing is interrupted.

#### User Action

Eliminate the cause of the problem indicated by any messages immediately preceding this one, and then re-execute the command.

## 13.15 isj2ee2700 to isj2ee2799

---

### 13.15.1 isj2ee2700

---

**Command name: INFO: isj2ee2700:The J2EE properties has been registered.**

#### Explanation

The specified J2EE system definition has been registered.

### 13.15.2 isj2ee2701

---

**Command name: INFO: isj2ee2701:The J2EE system definition has been exported.**

#### Explanation

The specified J2EE system definition has been exported.

### 13.15.3 isj2ee2702

---

**Command name: ERROR: isj2ee2702:Failed to update the J2EE system definition.**

#### Explanation

The J2EE system definition could not be updated.

#### System Action

Command processing is interrupted.

#### User Action

Eliminate the cause of the problem indicated by any messages immediately preceding this one, and then re-execute the command.

### 13.15.4 isj2ee2703

---

**Command name: ERROR: isj2ee2703:Failed to export the J2EE system definition.**

#### Explanation

The J2EE system definition could not be exported.

#### System Action

Command processing is interrupted.

#### User Action

Eliminate the cause of the problem indicated by any messages immediately preceding this one, and then re-execute the command.

### 13.16 isj2ee2800 to isj2ee2899

---

#### 13.16.1 isj2ee2800

---

**Command name: INFO: isj2ee2800:The Web server connector definition has been registered. WEBSERVER=%s**

#### Variable Information

%s = Web server name

#### Explanation

The specified Web server connector has been registered.

#### 13.16.2 isj2ee2801

---

**Command name: ERROR: isj2ee2801:During definition update, Web server connector was deleted. NAME=%s**

#### Variable Information

%s = Web server connector name

#### Explanation

The Web server connector was deleted while the Web server connector definition was being updated.

#### User Action

Re-execute the command.

#### 13.16.3 isj2ee2802

---

**Command name: INFO: isj2ee2802:The Web server connector definition has been deleted. NAME=%s1 WEBSERVER=%s2**

#### Variable Information

%s1 = WorkUnit name

%s2 = Web server name

#### Explanation

The Web server connector used in the specified Work Unit has been deleted.

### 13.16.4 isj2ee2803

---

**Command name: INFO: isj2ee2803:The Web server connector definition has been updated. NAME=%s1 WEBSERVER=%s2**

#### Variable Information

%s1 = WorkUnit name

%s2 = Web server name

#### Note

- Variable information is not output to the Web server connector definition file if only the log settings or fault monitoring settings are defined.

#### Explanation

The Web server connector definition used in the specified Work Unit has been updated.

### 13.16.5 isj2ee2804

---

**Command name: INFO: isj2ee2804:The Web server connector definition has been exported.**

#### Explanation

The Web server connector definition used in the specified Work Unit has been exported.

### 13.16.6 isj2ee2805

---

**Command name: INFO: isj2ee2805:The Web server connector does not exist.**

#### Explanation

The Web server connector does not exist.

### 13.16.7 isj2ee2806

---

**Command name: ERROR: isj2ee2806:Failed to register the Web server connector definition. NAME=%s1 WEBSERVER=%s2**

#### Variable Information

%s1 = WorkUnit name

%s2 = Web server name

#### Note

- Variable information is not output to the Web server connector definition file if only the log settings or fault monitoring settings are defined.

#### Explanation

The Web server connector definition used in the specified Work Unit could not be registered.

## System Action

Command processing is interrupted.

## User Action

Eliminate the cause of the problem indicated by any messages immediately preceding this one, and then re-execute the command.

### 13.16.8 isj2ee2807

---

**Command name: ERROR: isj2ee2807:Failed to update the Web server connector definition. NAME=%s1 WEBSERVER=%s2**

#### Variable Information

%s1 = WorkUnit name

%s2 = Web server name

#### Note

- Variable information is not output to the Web server connector definition file if only the log settings or fault monitoring settings are defined.

#### Explanation

The Web server connector definition used in the specified Work Unit could not be updated.

## System Action

Command processing is interrupted.

## User Action

Eliminate the cause of the problem indicated by any messages immediately preceding this one, and then re-execute the command.

### 13.16.9 isj2ee2808

---

**Command name: ERROR: isj2ee2808:Failed to delete the Web server connector definition. NAME=%s1 WEBSERVER=%s2**

#### Variable Information

%s1 = WorkUnit name

%s2 = Web server name

#### Explanation

The Web server connector definition used in the specified Work Unit could not be deleted.

## System Action

Command processing is interrupted.

## User Action

Eliminate the cause of the problem indicated by any messages immediately preceding this one, and then re-execute the command.

### 13.16.10 isj2ee2809

---

**Command name: ERROR: isj2ee2809:Failed to export the Web server connector definition.**

#### Explanation

The Web server connector definition used in the specified Work Unit could not be exported.

#### System Action

Command processing is interrupted.

#### User Action

Eliminate the cause of the problem indicated by any messages immediately preceding this one, and then re-execute the command.

### 13.16.11 isj2ee2810

---

**Command name: ERROR: isj2ee2810:Failed to list the Web server connector definition.**

#### Explanation

The Web server connector definition could not be referenced.

#### System Action

Command processing is interrupted.

#### User Action

Eliminate the cause of the problem indicated by any messages immediately preceding this one, and then re-execute the command.

### 13.16.12 isj2ee2811

---

**Command name: INFO: isj2ee2811:The Web server does not exist.**

#### Explanation

The Web server does not exist.

### 13.16.13 isj2ee2812

---

**Command name: ERROR: isj2ee2812:The Web server does not exist. WEBSERVER=%s**

#### Variable Information

%s = Web server name

#### Explanation

The Web server does not exist.

#### System Action

Command processing is interrupted.

#### User Action

Check whether the Web server for the Web server specified in the -s option exists.

### 13.16.14 isj2ee2813

---

**Command name: ERROR: isj2ee2813:The Web server name must be specified. FILE=%s**

#### Variable Information

%s = File name

## Explanation

Failed to register the Web server connector definition because the Web server name has not been specified in the Web server connector definition file.

## System Action

Command processing is interrupted.

## User Action

Add the Web server name to the Web server connector definition file and re-execute the command.

To use an 8.0 Web server connector definition file, use the isj2eeadmin command compatibility options. For details on the compatibility options, refer to "isj2eeadmin" - "Compatibility options" in the Reference Manual (Command Edition).

## 13.16.15 isj2ee2815

---

**Command name: ERROR: isj2ee2815:The Web server connector does not exist. NAME=%s**

## Variable Information

%s = WorkUnit name

## Explanation

The specified Web server connector does not exist.

## System Action

Command processing is interrupted.

## User Action

Verify that the specified Workunit name and Web server name are correct, and then re-execute the command.

## 13.16.16 isj2ee2816

---

**Command name: INFO: isj2ee2816:The Web server connector definition has been exported.**

## Explanation

The Web server connector definition has been exported. If no Web server connector has been defined, only log information or fault monitoring information is exported.

## 13.16.17 isj2ee2817

---

**Command name: ERROR: isj2ee2817:Failed to export the Web server connector definition.**

## Explanation

The Web server connector definition could not be exported.

## System Action

Command processing is interrupted.

## User Action

Eliminate the cause of the problem indicated by any messages immediately preceding this one, and then re-execute the command.

## 13.16.18 isj2ee2818

---

**Command name:** ERROR: isj2ee2818:Failed to delete the Web server connector definition. WEBSERVER=%s

### Variable Information

%s = Web server name

### Explanation

Failed to delete the Web server connector definition.

### System Action

Command processing is interrupted.

### User Action

Eliminate the cause of the problem indicated by any messages immediately preceding this one, and then re-execute the command.

## 13.16.19 isj2ee2819

---

**Command name:** ERROR: isj2ee2819:Failed to delete the Web server connector definition. NAME=%s

### Variable Information

%s = WorkUnit name

### Explanation

Failed to delete the Web server connector definition.

### System Action

Command processing is interrupted.

### User Action

Eliminate the cause of the problem indicated by any messages immediately preceding this one, and then re-execute the command.

## 13.16.20 isj2ee2820

---

**Command name:** ERROR: isj2ee2820:The information for connection to the IJServer cluster cannot be updated or deleted using the isj2eeadmin command NAME=%s1 WEBSERVER=%s2

### Variable Information

%s1 = Web server connector name

%s2 = Web server name

### Explanation

Information for connection to the IJServer cluster was updated or deleted using the isj2eeadmin command.

### System Action

Processing stops.

## User Action

Use the Interstage Java EE Management Console or the `asadmin` command to update or delete information for connection to the IJServer cluster.

## 13.16.21 isj2ee2821

---

**Command name:** ERROR: isj2ee2821:%s1 cannot be specified.

### Variable Information

%s1 = Tag name

### Explanation

A tag specified in the definition file cannot be used in the current environment. The `isj2eeadmin` command may output this message when it is used for updating the J2EE system definition.

In both the environments shown below, only the tags under the `<system><web>` tags can be specified in J2EE system definition update processing. A tag other than the `<web>` tag may have been specified under the `<system>` tag.

- An environment in which Interstage Application Server has been installed as Web Package
- An environment in which "Web Server Connector" has been installed in Interstage Application Server, and "J2EE Compatible" has not been installed in Interstage Application Server

### System Action

Processing is interrupted.

### User Action

Delete the tag that cannot be specified from the definition file, and then re-execute the `isj2eeadmin` command.

## 13.17 isj2ee2900 to isj2ee2999

---

### 13.17.1 isj2ee2994

---

**Command name:** ERROR: isj2ee2994:No message. ID=%s

### Variable Information

%s = Message number

### Explanation

The message to be output has not been defined.

### System Action

Command processing is interrupted.

### User Action

Make a note of the message then collect the diagnostic information using the `iscollectinfo` command, record the message and contact your systems engineer.

### 13.17.2 isj2ee2995

---

**Command name:** ERROR: isj2ee2995:Unexpected value was obtained during the definition. TAG=%s1 VALUE=%s2

## Variable Information

%s1 = Tag name

%s2 = Value

## Explanation

An unexpected value was obtained when the definition was exported.

## System Action

Outputs the value 'UNKNOWN' to the tag (%1) and continues the processing.

## User Action

This error may occur if a compatible function or unsupported function is being used. Check if an interchangeable function or unsupported function is being used.

If necessary, change 'UNKNOWN' to the correct value and update the definition.

## 13.17.3 isj2ee2996

---

**Command name: ERROR: isj2ee2996:Failed to read XML definition file. ERROR=%s**

## Variable Information

%s = Error information

## Explanation

The internal definition file could not be read.

## System Action

Command processing is interrupted.

## User Action

Make a note of the message, then collect the diagnostic information using the *iscollectinfo* command, record the message and contact your systems engineer.

## 13.17.4 isj2ee2997

---

**Command name: ERROR: isj2ee2997:Failed to analyze XML definition file. ERROR=%s**

## Variable Information

%s = Detail error information

## Explanation

The internal definition file could not be exported.

## System Action

Command processing is interrupted.

## User Action

Make a note of the message, then collect the diagnostic information using the *iscollectinfo* command, record the message and contact your systems engineer.

## 13.17.5 isj2ee2998

---

**Command name: ERROR: isj2ee2998:Failed to read internal file. NAME=%s1 ERROR=%s2**

### Variable Information

%s1 = Internal definition file

%s2 = Detail error information

### Explanation

The internal definition file could not be referenced.

### System Action

Command processing is interrupted.

### User Action

Make a note of the message then collect the diagnostic information using the *iscollectinfo* command, record the message and contact your systems engineer.

## 13.17.6 isj2ee2999

---

**Command name:** ERROR: isj2ee2999:Internal Error. INTERNAL MESSAGE=%s

### Variable Information

%s = Reason code

### Explanation

An internal error was caused by the problem indicated by the reason code.

### System Action

Command processing is interrupted.

### User Action

Make a note of the message then collect the diagnostic information using the *iscollectinfo* command, record the message and contact your systems engineer.

## 13.18 isj2ee3000 to isj2ee3099

---

### 13.18.1 isj2ee3001

---

**Command name:** INFO: isj2ee3001:J2EE monitor logging has been started. IJSERVER=%s

### Variable Information

%s = IJServer name

### Explanation

J2EE monitor logging has been started.

### 13.18.2 isj2ee3002

---

**Command name:** INFO: isj2ee3002:J2EE monitor logging has been stopped. IJSERVER=%s

### Variable Information

%s = IJServer name

### Explanation

J2EE monitor logging has been stopped.

### 13.18.3 isj2ee3003

---

**Command name:** ERROR: isj2ee3003: An error occurred while starting J2EE monitor logging. IJSERVER=%s

#### Variable Information

%s = IJServer name

#### Explanation

An error occurred while starting J2EE monitor logging.

#### System Action

Command processing is interrupted.

#### User Action

Eliminate the cause of the problem indicated by any messages immediately preceding this one, and then re-execute the command.

### 13.18.4 isj2ee3004

---

**Command name:** ERROR: isj2ee3004: An error occurred while stopping J2EE monitor logging. IJSERVER=%s

#### Variable Information

%s = IJServer name

#### Explanation

An error occurred while stopping J2EE monitor logging.

#### System Action

Command processing is interrupted.

#### User Action

Eliminate the cause of the problem indicated by any messages immediately preceding this one, and then re-execute the command.

### 13.18.5 isj2ee3005

---

**ISJ2EE: ERROR: isj2ee3005:J2EE monitor logging is already started. IJSERVER=%s**

#### Variable Information

%s = IJServer name

#### Explanation

J2EE monitor logging is already started.

#### System Action

Command processing is interrupted.

#### User Action

If you want to change the option during the application, stop J2EE monitor logging and re-execute the command.

### 13.18.6 isj2ee3006

---

**ISJ2EE: ERROR: isj2ee3006:J2EE monitor logging is already stopped. IJSERVER=%s**

#### Variable Information

%s = J2Server name

#### Explanation

J2EE monitor logging is already stopped.

#### System Action

Command processing is interrupted.

#### User Action

None.

### 13.18.7 isj2ee3007

---

**ISJ2EE: INFO: isj2ee3007:A log file for J2EE monitor logging has been created. FILE=%s**

#### Variable Information

%s = File name

#### Explanation

A log file for J2EE monitor logging has been created.

### 13.18.8 isj2ee3008

---

**ISJ2EE: ERROR: isj2ee3008:An error occured while creating a log file for J2EE monitor logging. FILE=%s1  
%s1  
%s2**

#### Variable Information

%s1 = File name

%s2 = Detail information

#### Explanation

An error occured while creating a log file for J2EE monitor logging.

#### System Action

J2EE monitor logging is continued.

#### User Action

Refer to the detail information (%s2) and fix the error.

### 13.18.9 isj2ee3009

---

**ISJ2EE: INFO: isj2ee3009:A log file for J2EE monitor logging has been renamed. FILE=%s1 RENAMED  
FILE=%s2**

#### Variable Information

%s1 = File name before renaming

%s2 = File name after renaming

#### Explanation

The J2EE monitor logging file was renamed because the rollover condition was satisfied.

## 13.18.10 isj2ee3010

---

**ISJ2EE: ERROR: isj2ee3010:An error occurred while changing a log file name for J2EE monitor logging. FILE=%s1 RENAMED FILE=%s2**

### Variable Information

%s1 = File name

%s2 = File name after renaming

### Explanation

An attempt was made to rename the J2EE monitor logging file because the rollover condition was satisfied, but renaming failed.

### System Action

J2EE monitor logging is continued.

### User Action

Check whether the file displayed in %s1 has been locked by a user or another process.

## 13.18.11 isj2ee3011

---

**ISJ2EE: ERROR: isj2ee3011:An error occurred while writing a log to a log file for J2EE monitor logging. FILE=%s1 INFO=%s2**

### Variable Information

%s1 = File name

%s2 = Detail information

### Explanation

An error occurred while writing a log to a log file for J2EE monitor logging.

### System Action

J2EE monitor logging is continued.

### User Action

Refer to the detail information (%s2) and fix the error.

## 13.18.12 isj2ee3012

---

**ISJ2EE: INFO: isj2ee3012:The oldest log file has been removed because the number of log files was over the specified generation. FILE=%s**

### Variable Information

%s = File name

### Explanation

The file displayed in %s has been deleted because the number of backup files has exceeded the permitted maximum.

## 13.18.13 isj2ee3013

---

**Command name: ERROR: isj2ee3013:An error occurred while obtaining the J2EE monitor logging status. IJSERVER=%s**

### Variable Information

%s = IJServer name

### Explanation

An error occurred while obtaining the J2EE monitor logging status.

### User Action

Eliminate the cause of the problem indicated by any messages immediately preceding this one, and then re-execute the command.

## 13.18.14 isj2ee3014

---

**ISJ2EE: ERROR: isj2ee3014:J2EE monitor logging is not supported in this IJServer. IJSERVER=%s**

### Variable Information

%s = IJServer name

### Explanation

J2EE monitor logging was performed for a V8.0 compatible mode IJServer or an IJServer created in version 8.0 or earlier.

J2EE monitor logging is not supported in the V8.0 compatible mode IJServer or in an IJServer created in version 8.0 or earlier.

### System Action

Command processing is interrupted.

### User Action

For performance information about the V8.0 compatible mode IJServer or an IJServer created in Version 8.0 or earlier, refer to the Interstage Management Console monitor as usual.

If you want to use J2EE monitor logging, consider upgrading to an IJServer of V9.0 or later.

## 13.18.15 isj2ee3015

---

**ISJ2EE: ERROR: isj2ee3015:No available J2EE monitor logging target is specified. IJSERVER=%s1 VALUE=%s2**

### Variable Information

%s1 = IJServer name

%s2 = Specified value

### Explanation

Logging could not start because no log information that can be collected has been specified.

### System Action

J2EE monitor logging startup is aborted.

## User Action

Specify a log type that can be collected and start logging.

### 13.18.16 isj2ee3016

---

**ISJ2EE: ERROR: isj2ee3016:J2EE monitor logging is already starting. IJSERVER=%s**

#### Variable Information

%s = IJServer name

#### Explanation

The command failed to execute because J2EE monitor logging processing has already started.

#### System Action

Command processing is interrupted.

#### User Action

Check the J2EE monitor logging status and re-execute the command if necessary.

### 13.18.17 isj2ee3017

---

**ISJ2EE: ERROR: isj2ee3017:J2EE monitor logging is already stopping. IJSERVER=%s**

#### Variable Information

%s = IJServer name

#### Explanation

The command failed to execute because J2EE monitor logging processing has already stopped.

#### System Action

Command processing is interrupted.

#### User Action

Check the J2EE monitor logging status and re-execute the command if necessary.

### 13.18.18 isj2ee3020

---

**Command name: ERROR: isj2ee3020:This is invalid as a target of J2EE monitor logging. VALUE=%s**

#### Variable Information

%s = Specified value

#### Explanation

The command failed to execute because the specified J2EE monitor logging target is invalid.

#### System Action

Command processing is interrupted.

#### User Action

Change the target of J2EE monitor logging, and then re-execute the command.

## 13.18.19 isj2ee3021

---

**ISJ2EE: ERROR: isj2ee3021:The monitoring interval for J2EE monitor logging is invalid. Specify a value between 1 and 60. VALUE=%s**

### Variable Information

%s = Specified value

### Explanation

The monitoring interval for the specified J2EE monitor logging is outside the permitted value range.

### System Action

Command processing is interrupted.

### User Action

Specify a J2EE monitor logging monitoring interval of 1 to 60.

## 13.18.20 isj2ee3022

---

**ISJ2EE: ERROR: isj2ee3022:The rollover time for J2EE monitor logging is invalid. Specify a value between 0 and 23. VALUE=%s**

### Variable Information

%s = Specified value

### Explanation

The rollover start time for the specified J2EE monitor logging is outside the permitted value range.

### System Action

Command processing is interrupted.

### User Action

Specify a J2EE monitor logging rollover start time of 0 to 23.

## 13.18.21 isj2ee3023

---

**ISJ2EE: ERROR: isj2ee3023:The generations for the log file of J2EE monitor logging are invalid. Specify a value between 1 and 64. VALUE=%s**

### Variable Information

%s = Specified value

### Explanation

The number of rollover generations for the specified J2EE monitor logging is outside the permitted value range.

### System Action

Command processing is interrupted.

### User Action

Specify a number from 1 to 64 for the number of J2EE monitor logging rollover generations.

## 13.18.22 isj2ee3024

---

**ISJ2EE: INFO: isj2ee3024:There is no IJServer that is enabled to use J2EE monitor logging.**

### Explanation

There is no IJServer that can use J2EE monitor logging.

## 13.19 isj2ee3100 to isj2ee3199

---

### 13.19.1 isj2ee3100

---

**Command name: INFO: isj2ee3100:All JDBC connections that are being pooled have been destroyed. IJSERVER=%s1 DATASOURCE=%s2**

### Variable Information

%s1 = IJServer name

%s2 = Datasource name

### Explanation

JDBC connection pool initialization was performed using the JDBC connection release command. JDBC connections that were pooled when the command was executed are destroyed. If there is a transaction that was executed, release is performed after the transaction is complete. To check whether all connections have been released, refer to the container log.

### 13.19.2 isj2ee3101

---

**Command name: ERROR: isj2ee3101:This DataSource cannot destroy the connections. IJSERVER=%s1 DATASOURCE=%s2**

### Variable Information

%s1 = IJServer name

%s2 = Datasource name

### Explanation

The target data source cannot destroy the JDBC connections from Interstage.

### System Action

Command processing is interrupted.

### User Action

The JDBC connection can only be destroyed in the following data sources:

- Data source that performs connection pooling in Interstage
- Data source that performs connection pooling in Oracle Version 10 or later

Check the target data source type.

### 13.19.3 isj2ee3102

---

**Command name: ERROR: isj2ee3102: The specified IJServer is not started. IJSERVER=%s1**

### Variable Information

%s1 = IJServer name

#### Explanation

Processing cannot be executed because IJServer is not running.

#### System Action

Command processing is interrupted.

#### User Action

Start IJServer, or re-execute the command if necessary.

### 13.19.4 isj2ee3103

---

**Command name: ERROR: isj2ee3103: The specified IJServer is not supported by the ijstune command. IJSERVER=%s1**

#### Variable Information

%s1 = IJServer name

#### Explanation

The ijstune command was executed for a V8.0 compatible mode IJServer or an IJServer created in Version 8.0 or earlier.

The ijstune command is not supported in the V8.0 compatible mode IJServer or in an IJServer created in Version 8.0 or earlier.

#### System Action

Command processing is interrupted.

#### User Action

Specify the IJServer of V9.0 or later and execute the ijstune command.

### 13.19.5 isj2ee3104

---

**Command name: ERROR: isj2ee3104: Failed to destroy the JDBC connections. IJSERVER=%s1**

#### Variable Information

%s1 = IJServer name

#### Explanation

The JDBC connections failed to be destroyed.

#### System Action

Command processing is interrupted.

#### User Action

Refer to the error message that was output immediately before this one and take the required action.

### 13.20 isj2ee3200 to isj2ee3299

---

#### 13.20.1 isj2ee3201

---

**Command name: ERROR: isj2ee3201: The specified option is incorrect: OPTION=%s1**

#### Variable Information

%s1 = Option name

#### Explanation

The specified option is incorrect.

#### System Action

Processing stops.

#### User Action

Correct the specified option, and then re-execute the command.

### 13.20.2 isj2ee3202

---

**Command name: ERROR: isj2ee3202: The command does not exist: COMMAND=%s1**

#### Variable Information

%s1 = Command name

#### Explanation

Processing to change the security mode failed because the command shown in the variable information does not exist.

#### System Action

Processing stops.

#### User Action

Confirm that the command shown in the path in the variable information exists.

### 13.20.3 isj2ee3203

---

**Command name: ERROR: isj2ee3203: Failed to get the system information.**

#### Explanation

The system information could not be obtained.

#### System Action

Processing stops.

#### User Action

Check that a system environment error has not occurred due to, for example, a memory shortage.

### 13.20.4 isj2ee3204

---

**Command name: ERROR: isj2ee3204: The target file does not exist: NAME=%s1**

#### Variable Information

%s1 = File name

#### Explanation

The target file does not exist.

#### System Action

Processing stops.

#### User Action

Check that the file or directory shown in the variable information exists.

## 13.20.5 isj2ee3205

---

**Command name: ERROR: isj2ee3205: Failed to change the group ownership: GROUP=%s1 FILE=%s2 CODE=%s3**

### Variable Information

%s1 = Group name

%s2 = File name

%s3 = Detail code

### Explanation

An attempt to change the group ownership failed.

### System Action

Processing stops.

### User Action

Check the following:

- Does the group shown in the variable information exist?
- Does the file or directory shown in the variable information exist?
- Did a system environment error occur due to, for example, a memory shortage?

## 13.20.6 isj2ee3206

---

**Command name: ERROR: isj2ee3206: Failed to change the access authority: NAME=%s1 CODE=%s2**

### Variable Information

%s1 = File name

%s2 = Detail code

### Explanation

An attempt to change the access authority failed.

### System Action

Processing stops.

### User Action

Check the following:

- Does the file or directory shown in the variable information exist?
- Did a system environment error occur due to, for example, a memory shortage?

# Chapter 14 Messages Beginning with 'isws'

This chapter describes messages beginning with "isws".

The Messages manual contains descriptions for only the main messages and those messages for which it is difficult to take action according to the contents of the message.

If a message not contained in this manual is output, take action according to the contents of the message.

## Note

- Within the tables that detail the following data types, the prefixes included in XML namespace indicate the following:
  - "xsd" represents name space "http://www.w3.org/2001/XMLSchema".
  - "soapenc" represents name space "http://schemas.xmlsoap.org/soap/encoding/".
  - "wsdl" represents name space "http://schemas.xmlsoap.org/wsdl/".
  - "soap" represents name space "http://schemas.xmlsoap.org/wsdl/soap/".
  - "mime" represents name space " http://schemas.xmlsoap.org/wsdl/mime/".
  - "wsibp" represents name space " http://ws-i.org/profiles/basic/1.1/xsd ".
- In some messages, the exception information about the cause of the error may be placed in brackets '(')' at the end of the message. Use this information to investigate the cause.
- In this chapter, messages contained in exception objects are also mentioned.

Each message has the "Label: Error type: " part in it (for example, "ISWS: ERROR: "). Messages contained in exception objects, however, do not have this part.

## 14.1 isws10000 to isws10099

This section details messages numbered between isws10000 and isws10099.

### 14.1.1 isws10047

**ISWS: WARNING: isws10047: Warning: SOAPHeaderElement.setParentElement should take a SOAPHeader parameter instead of a SOAPEnvelope (but need not be called after SOAPHeader.addHeaderElement)**

#### Explanation

SOAPEnvelope was passed to the SOAPHeaderElement setParentElement method argument.

#### System Action

SOAPHeader is set in the parent element instead of SOAPEnvelope.

### 14.1.2 isws10056

**ISWS: ERROR: isws10056: Could not convert %s1 to bean field '%s2', type %s3**

#### Variable Information

%s1 = Class name

%s2 = Field name or property

%s3 = Class name for %s2

#### Explanation

The SOAP message that was received is invalid.

## System Action

Fault is returned.

## User Action

Take the following action:

- This message is output when the Web service application is executed
  - Check that the WSDL offered to the Web service user is valid.
  - Ask the Web service user whether the URL for connection is valid.
  - Ask the Web service provider whether the SOAP message was sent according to WSDL.
- This message is output when the Web service client application is executed
  - Check whether WSDL offered by the Web service for connection was used to develop the application.
  - Check the URL for connection. If it is invalid, correct it.
  - Check the application. If the API parameters or the way in which they are used are incorrect, correct them.
  - Ask the Web service provider whether the SOAP message was sent according to WSDL.

## 14.1.3 isws10087

---

**ISWS: ERROR: isws10087: Duplicate file name: %s1 %s2**

### Variable Information

%s1 = File name

%s2 = Detail message

### Explanation

A file with the same name already exists.

### System Action

Stops processing.

### User Action

If the file already exists, delete the file manually. Alternatively, check whether there is a definition mapped to a class with the same name in WSDL.

Establish the cause of the error according to the detail message, and then re-execute the command.

## 14.1.4 isws10088

---

**ISWS: ERROR: isws10088: Emitter failure. All input parts must be listed in the parameterOrder attribute of %s1**

### Variable Information

%s1 = The "name" attribute of the <wsdl:operation> element in the <wsdl:portType> element

### Explanation

The "parameterOrder" attribute of the <wsdl:operation> element in the <wsdl:portType> element and the <wsdl:part> element in the <wsdl:message> element do not correspond.

### System Action

Stops processing.

## User Action

Specify all the "part" names under the <message> element that is referenced from the <wsdl:input> "message" attribute in the "parameterOrder" attribute.

### 14.1.5 isws10094

---

**ISWS: ERROR: isws10094: Emitter failure. The operation (%s1) from portType (%s2) in the WSDL document has no corresponding binding operation.**

**Hint: make sure that the binding has the same number of operations as its portType.**

#### Variable Information

%s1 = <wsdl:operation> element "name" attribute

%s2 = %s0 parent element <wsdl:portType> element "name" attribute

#### Explanation

The <wsdl:operation> element for the <wsdl:portType> element and the <wsdl:operation> element for the <wsdl:binding> element do not correspond.

#### System Action

Stops processing.

#### User Action

Define the same name <wsdl:operation> element for <wsdl:portType> and the corresponding <wsdl:binding>.

### 14.1.6 isws10095

---

**ISWS: ERROR: isws10095: Emitter failure. There is an undefined binding (%s1) in the WSDL document.**

**Hint: make sure <port binding=" "> is fully qualified.**

#### Variable Information

%s1 = Binding name

#### Explanation

The binding definition could not be found.

#### System Action

Stops processing.

#### User Action

Check that the specified binding namespace and the binding namespace specified for the port binding attribute are correct.

### 14.1.7 isws10098

---

**ISWS: ERROR: isws10098: Emitter failure. There is an undefined portType (%s1) in the WSDL document.**

**Hint: make sure <binding type=".."> is fully qualified.**

#### Variable Information

%s1 = <wsdl:portType> not defined in WSDL

#### Explanation

The <wsdl:portType> with the name specified for the <wsdl:binding> element "type" attribute could not be found.

#### System Action

Stops processing.

## User Action

Specify an existing <wsdl:portType> for the <wsdl:binding> element "type" attribute.

## 14.2 isws10100 to isws10199

---

This section details messages numbered between isws10100 and isws10199.

### 14.2.1 isws10100

---

**ISWS: WARNING: isws10100: Emitter Warning. Invalid endpoint address in port %s1 in service %s2: %s3**

#### Variable Information

%s1 = Port name

%s2 = QName of service

%s3 = URL of location

#### Explanation

The URL specified in the WSDL file is invalid.

#### System Action

Continues processing.

#### User Action

Correct the URL and re-execute the command if necessary.

### 14.2.2 isws10192

---

**ISWS: ERROR: isws10192: Did not understand "MustUnderstand" header(s):%s1**

#### Variable Information

%s1 = Header block name that cannot be processed. If there is more than one name, separate the names by using a comma between each one.

#### Explanation

Could not find a handler that can process the header item that has to be processed.

#### System Action

Stops processing.

#### User Action

Add the "mustUnderstand" attribute to the header for which the service cannot be processed, so that the message cannot be sent.

### 14.2.3 isws10193

---

**ISWS: ERROR: isws10193: Version Mismatch**

#### Explanation

The Web service application received a non-SOAP1.1 request.

#### System Action

Processing is interrupted and Fault is returned.

## User Action

Fix the Web service client application so that it sends SOAP1.1 requests.

## 14.2.4 isws10199

---

### **ISWS: ERROR: isws10199: null parent!**

#### Explanation

Null was specified for the parent.

#### System Action

Throws `java.lang.IllegalArgumentException`.

#### User Action

Check if null was specified.

## 14.3 isws10200 to isws10299

---

This section details messages numbered between isws10200 and isws10299.

### 14.3.1 isws10221

---

#### **ISWS: ERROR: isws10221: return code: %s1 %s2**

#### Variable Information

%s1 = Status Code

%s2 = Detail information

#### Explanation

Status Code "%s1" was returned.

#### System Action

Stops application processing.

#### User Action

Fix the problem according to the Status Code contents.

If the problem is not solved, collect the investigation information using the `iscollectinfo` command, then contact a service engineer.

### 14.3.2 isws10263

---

#### **ISWS: ERROR: isws10263: Type %s1 is referenced but not defined.**

#### Variable Information

%s1 = Type name

#### Explanation

The type was referenced but not defined.

#### System Action

Stops processing.

## User Action

Possible causes are shown below:

- There is no referenced type definition. Add the definition.
- The referenced type definition is invalid. Check the definition.
- There is a referenced type definition, but the namespace definition is invalid. Check the namespace.

Establish the cause of the error according to the message detail, and then re-execute the command.

## 14.3.3 isws10266

---

### ISWS: ERROR: isws10266: The definition of %s1 results in a loop.

#### Variable Information

%s1 = Definition that causes the loop

#### Explanation

In a part of the WSDL file as shown below, the "ref" definition is used to make a reference from an internal definition to an external definition, causing a loop in the reference.

```
<element name="RootProcesses">
  <complexType>
    <sequence>
      <element name="Process" ref="tns1:RootProcesses" />
    </sequence>
  </complexType>
</element>
```

#### System Action

Stops processing.

#### User Action

Correct WSDL so that the reference loop does not occur.

## 14.3.4 isws10297

---

### ISWS: ERROR: isws10297: Exception:

#### Explanation

An exception occurred during Web service processing.

#### System Action

Stops processing.

#### User Action

Check the contents of the message that was output immediately before or after and fix the error.

## 14.3.5 isws10298

---

### ISWS: ERROR: isws10298: Exception: %s1

#### Variable Information

%s1 = Detailed information

## Explanation

An exception occurred during Web service processing.

## System Action

Stops processing.

## User Action

Check the detailed information and fix the error.

# 14.4 isws10300 to isws10399

---

This section details messages numbered between isws10300 and isws10399.

## 14.4.1 isws10314

---

### **ISWS: ERROR: isws10314: WSDL2Java emitter timed out (this often means the WSDL at the specified URL is inaccessible)!**

## Explanation

A timeout occurred during WSDL path processing. A possible reason is that it took a long time to access the resources specified in http referenced in the WSDL and XML schema.

## System Action

Continues processing.

## User Action

Take the following action:

- Increase the timeout set using the "-timeout" option of the "iswsgen" command.
- If the proxy is used to access the resources, the proxy settings might be invalid. Check that the "-proxyHost" and "-proxyUser" option settings of the "iswsgen" command are correct. If they are invalid, correct them.
- There might be a problem in the network environment. Ask the network administrator of the environment executed using the "iswsgen" command to check whether there is a problem accessing the resources specified in http referenced in the WSDL and XML schema. If there is a problem, fix it.
- Copy the resources specified in http and correct the WSDL and XML schema so that the resources can be referenced as a local file.
- **Windows32/64**

Check that the partial strings (parts of a strings separated by '.', '/', or ':'), type name, port type, or service name of the WSDL Naming Service are not the same as the DOS device name.

If the partial strings of the WSDL Naming Service are inappropriate, specify such that the DOS device name is not included in the Java package names defined by the -PkgNSmappingFile option.

In all other cases, the WSDL cannot be used.

## 14.4.2 isws10318

---

### **ISWS: WARNING: isws10318: Unable to find required classes (javax.activation.DataHandler and javax.mail.internet.MimeMultipart). Attachment support is disabled.**

## Explanation

An error occurred loading the class.

## System Action

Continues processing.

## User Action

Refer to "Web service" - "Web service runtime environment" - "Web service client runtime environment" in the "J2EE User's Guide", and check that the class path is set correctly.

### 14.4.3 isws10368

---

#### **ISWS: ERROR: isws10368: class %s1 must implement %s2**

#### Variable Information

%s1 = class name

%s2 = interface name

#### Explanation

%s1 must implement %s2.

#### System Action

Stops application processing.

#### User Action

%s1 must implement %s2.

### 14.4.4 isws10373

---

#### **ISWS: ERROR: isws10373: No such operation '%s1'**

#### Variable Information

%s1 = Method name

#### Explanation

A method that does not exist in the service endpoint interface was called from the Web service client.

#### System Action

Stops application processing.

#### User Action

In the Web service client, check the service endpoint interface or WSDL for the called Web service, specify the method (method name, data type) that exists for the called Web service correctly, and re-execute the application.

### 14.4.5 isws10376

---

#### **ISWS: ERROR: isws10376: The value of the soapAction option must be NONE or OPERATION.**

#### Explanation

soapAction is invalid.

#### System Action

Stops processing.

#### User Action

Specify one of NONE or OPERATION.

## 14.4.6 isws10387

---

**ISWS: ERROR: isws10387: Could not find class for the service named: %s1**

### Variable Information

%s1 = Class name

### Explanation

An error occurred loading the class.

### System Action

Throws Fault.

### User Action

Possible causes are shown below:

- The class name defined in deployment descriptor is invalid.
- The class is not contained in the WAR file.
- The reference class is not set in the class path.

## 14.4.7 isws10389

---

**ISWS: ERROR: isws10389: The <class-of-portType> was not specified.**

### Explanation

The input class (service endpoint interface) was not specified.

### System Action

Stops processing.

### User Action

Specify the input class (service endpoint interface).

## 14.4.8 isws10391

---

**ISWS: ERROR: isws10391: The wsdl path was not specified.**

### Explanation

The input file (WSDL) was not specified.

### System Action

Stops processing.

### User Action

Specify the input file (WSDL).

## 14.4.9 isws10398

---

**ISWS: WARNING: isws10398: soap:body in Binding %s1 / Operation %s2 has an empty namespace**

### Variable Information

%s1 = Binding name

%s2 = Operation name

### Explanation

The operation namespace was not specified.

### System Action

Continues processing.

### User Action

The "namespace" attribute of the "soap:body" element was not specified, or is empty. Fix this, and then re-execute the command.

## 14.5 isws10400 to isws10499

---

This section details messages numbered between isws10400 and isws10499.

### 14.5.1 isws10443

---

**ISWS: ERROR: isws10443: %s1 already exists, Interstage Web Service will not overwrite it.**

#### Variable Information

%s1 = File name

#### Explanation

The created Java source already exists.

#### System Action

Stops processing.

#### User Action

Change the output directory, or specify the "-overwriteJava" option.

**Windows32/64**

Check that the partial strings (parts of a string separated by '.', '/', or ':'), type name, port type, or service name of the WSDL Naming Service are not the same as the DOS device name.

If the partial strings of the WSDL Naming Service are inappropriate, specify such that the DOS device name is not included in the Java package names defined by the -PkgNSmappingFile option.

In all other cases, the WSDL cannot be used.

### 14.5.2 isws10467

---

**ISWS: ERROR: isws10467: Element %s1 is referenced but not defined.**

#### Variable Information

%s1 = Element

#### Explanation

The element was referenced but not defined.

#### System Action

Stops processing.

#### User Action

Possible causes are shown below:

- There is no referenced element definition. Add the definition.

- The referenced element definition is invalid. Check the definition.
- Although an attempt was made to use the "element" attribute to reference "element" from <part> of <message>, only "type" is defined. Add "element" for referencing "type" as shown below.

```
<element name="ElementName" type="TypeName"/>
```

Establish the cause of the error according to the detail message, and then re-execute the command.

## 14.5.3 isws10480

---

**ISWS: ERROR: isws10480: Missing <soap:fault> element in fault "%s1" in operation "%s2", in binding "%s3"**

### Variable Information

%s1 = Fault name

%s2 = Operation name

%s3 = Binding name

### Explanation

The <wsdl:fault> element in the "binding" definition (<wsdl:binding>) does not contain the <soap:fault> element as a sub element.

### System Action

Stops processing.

### User Action

Include the <soap:fault> element as a sub element of <wsdl:fault>.

## 14.5.4 isws10495

---

**ISWS: ERROR: isws10495: Unable to open namespace-to-package mapping file %s1.**

### Variable Information

%s1 = Detail informaion

### Explanation

Failed to read the PkgNSmappingFile file (PkgNSmappingFile option).

### System Action

Stops processing.

### User Action

Take the following action:

- Check that the file path specified in the "-PkgNSmappingFile" option is correct.
- Check the access authority for the file path specified in the "-PkgNSmappingFile" option.

## 14.5.5 isws10496

---

**ISWS: INFO: isws10496: Loaded namespace-to-package mapping file %s1.**

### Variable Information

%s1 = File name

### Explanation

This is debug information used when the file specified in the NSPkgmappingFile option is read.

## System Action

Continues processing.

## 14.5.6 isws10497

---

**ISWS: INFO: isws10497: Loaded default namespace-to-package mapping file %s1 as java resource.**

### Variable Information

%s1 = File name

### Explanation

This is debug information used when the default mapping information is read when the -PkgNSmappingFile option is not specified.

## System Action

Continues processing.

## 14.6 isws10500 to isws10599

---

This section details messages numbered between isws10500 and isws10599.

### 14.6.1 isws10501

---

**ISWS: ERROR: isws10501: InputSource has neither character stream nor byte stream**

### Explanation

An invalid message was specified to the InputSource.

### System Action

SOAPException is returned.

### User Action

Check the value of specified InputSource.

### 14.6.2 isws10506

---

**ISWS: ERROR: isws10506: Unknown encoding style : %s1**

### Variable Information

%s1 = Detail information

### Explanation

The SOAP message that was received is invalid.

### System Action

Fault is returned.

### User Action

Take the following action:

- This message is output when the Web service application is executed
- Check that the WSDL offered to the Web service user is valid.
- Ask the Web service user whether the URL for connection is valid.
- Ask the Web service provider whether the SOAP message was sent according to WSDL.

- This message is output when the Web service client application is executed

Check whether WSDL offered by the Web service for connection was used to develop the application.

Check the URL for connection. If it is invalid, correct it.

Check the application. If the API parameters or the way in which they are used are incorrect, correct them.

Ask the Web service provider whether the SOAP message was sent according to WSDL.

### 14.6.3 isws10508

---

**ISWS: ERROR: isws10508: Attempted to write schema for bad QName (no namespace) : %s1**

#### Variable Information

%s1 = Namespace name

#### Explanation

The specified namespace is invalid.

#### System Action

Stops processing.

#### User Action

Specify a valid namespace.

### 14.6.4 isws10529

---

**ISWS: ERROR: isws10529: serviceInterface must not be null**

#### Explanation

Null was specified for service interface.

#### System Action

Stops application processing.

#### User Action

Do not specify null for the argument.

### 14.6.5 isws10538

---

**ISWS: ERROR: isws10538: Cannot find part [%s1] for operation [%s2] using MIMEContent type [%s3]**

#### Variable Information

%s1 = Part name

%s2 = Operation name

%s3 = MIME type

#### Explanation

Cannot find a 'wsdl:part' element of the name specified in the 'part' attribute of the 'mime:content' element.

#### System Action

Stops application processing.

## User Action

Specify a 'part' name that exists for the Variable Information operation in the 'part' attribute of the 'mime:content' element in the WSDL file.

## 14.6.6 isws10540

---

**ISWS: ERROR: isws10540: 'HandlerInfoChain' class not found: '%s1'**

### Variable Information

%s1 = class name

### Explanation

Handler class not found.

### System Action

Continues processing. The handler cannot be used.

### User Action

Check whether the class specified in <handler-class> of the deployment descriptor exists in the module or WorkUnit class path, or if illegal characters were set for the class name in <handler-class>.

## 14.7 isws10700 to isws10799

---

This section details messages numbered between isws10700 and isws10799.

### 14.7.1 isws10712

---

**ISWS: ERROR: isws10712: Unable to create handler of type %s1: falseIndex=%s2**

#### Variable Information

%s1 = class name

%s2 = internal information

#### Explanation

The handler instance cannot be created.

#### System Action

Aborts handler chain processing.

#### User Action

Check whether the class specified in <handler-class> of the deployment descriptor implements the javax.xml.rpc.handler.Handler interface, is a public class, and whether the public default constructor exists.

### 14.7.2 isws10752

---

**ISWS: ERROR: isws10752: Invalid date/time: source=%s1**

#### Variable Information

%s1 = Date or time

#### Explanation

An invalid SOAP message was received for date or time.

## System Action

Fault is returned.

## User Action

Take the following action:

- This message is output when the Web service application is executed
  - Check that the WSDL offered to the Web service user is valid.
  - Ask the Web service user whether the URL for connection is valid.
  - Ask the Web service provider whether the SOAP message was sent according to WSDL.
- This message is output when the Web service client application is executed
  - Check whether WSDL offered by the Web service for connection was used to develop the application.
  - Check the URL for connection. If it is invalid, correct it.
  - Check the application. If the API parameters or the way in which they are used are incorrect, correct them.
  - Ask the Web service provider whether the SOAP message was sent according to WSDL.

## 14.7.3 isws10757

---

**ISWS: ERROR: isws10757: Invalid element in %s1 - %s2: %s3**

### Variable Information

%s1 = The structure type or Bean type class

%s2 = The received XML structure element

%s3 = Detail information

### Explanation

An XML structure containing an element that does not match the member defined in the structure type or Bean type class was received.

## System Action

Fault is returned.

## User Action

Take the following action:

- This message is output when the Web service application is executed
  - Check that the structure type or Bean type class stored in the WAR file and the WSDL definition stored in the WAR file match.
  - Check that the WSDL offered to the Web service user is valid.
  - Ask the Web service provider whether the SOAP message was sent according to WSDL.
- This message is output when the Web service client application is executed
  - Check whether WSDL offered by the Web service for connection was used to develop the application.
  - It is possible that the structure type created using WSDL, the Bean type class, or the original WSDL definition contents were changed. In this case, change them back to their original state.

## 14.7.4 isws10787

---

**ISWS: ERROR: isws10787: Null property name specified. : %s1**

### Variable Information

%s1 = Detail information

#### Explanation

Null was specified for property name.

#### System Action

Throws javax.xml.rpc.JAXRPCException.

#### User Action

Check whether null is specified.

### 14.7.5 isws10790

---

**ISWS: ERROR: isws10790: Null property value specified. : %s1**

#### Variable Information

%s1 = Detail information

#### Explanation

Null was specified for property value.

#### System Action

Throws javax.xml.rpc.JAXRPCException.

#### User Action

Check whether null is specified.

### 14.7.6 isws10794

---

**ISWS: ERROR: isws10794: Property name null not supported.: %s1**

#### Variable Information

%s1 = Detail information

#### Explanation

Null was specified for property name.

#### System Action

Throws javax.xml.rpc.JAXRPCException.

#### User Action

Check whether null is specified.

### 14.7.7 isws10796

---

**ISWS: ERROR: isws10796: a SOAPHeader may only have SOAPHeaderElement as its immediate children: EnvelopeURI=%s1 EncodingURI=%s2 element=%s3**

#### Variable Information

%s1 = SOAP envelope URI

%s2 = SOAP encoding URI

%s3 = Name of the element you tried to add

#### Explanation

Only SOAPHeaderElement can be added to SOAPHeader.

## System Action

Throws Exception.

## User Action

The only object that can be passed to the SOAPHeader object addChild method or addChildElement method argument is the SOAPHeaderElement object. Do not pass other objects.

# 14.8 isws10800 to isws10899

---

This section details messages numbered between isws10800 and isws10899.

## 14.8.1 isws10800

---

**ISWS: ERROR: isws10800: Bad envelope tag: %s1: namespace=%s2 prefix=%s3 messageType=%s4**

### Variable Information

%s1 = Bad element

%s2 = Element namespace

%s3 = Element namespace prefix

%s4 = Internal information

### Explanation

The SOAP message "Envelope" element definition is invalid.

### System Action

Issues Fault.

### User Action

Check the SOAP message and re-send it.

## 14.8.2 isws10801

---

**ISWS: ERROR: isws10801: Invalid time: source=%s1**

### Variable Information

%s1 = Time

### Explanation

The SOAP message received for the Time format is invalid.

### System Action

Issues Fault.

### User Action

Take the following action:

- This message is output when the Web service application is executed
  - Check that the WSDL offered to the Web service user is valid.
  - Ask the Web service user whether the URL for connection is valid.
  - Ask the Web service provider whether the SOAP message was sent according to WSDL.

- This message is output when the Web service client application is executed

Check whether WSDL offered by the Web service for connection was used to develop the application.

Check the URL for connection. If it is invalid, correct it.

Check the application. If the API parameters or the way in which they are used are incorrect, correct them.

Ask the Web service provider whether the SOAP message was sent according to WSDL.

### 14.8.3 isws10812

---

**ISWS: ERROR: isws10812: Couldn't find a matching Java operation for WSDD operation "%s1" (%s2 args): implClassIn=%s3 implClass=%s4 name=%s5 documentation=%s6**

#### Variable Information

%s1 = Method

%s2 = Method argument number

%s3 = Web service implementation class

%s4 = Internal information

%s5 = webservices.xml <port-component-name> definition

%s6 = Internal information

#### Explanation

The method for the operation defined in the WSDL was not defined in the service endpoint interface or Web service implementation class.

#### System Action

Fault is returned.

#### User Action

Take the following action:

- Check that the WSDL, service endpoint interface, and Web service implementation class defined in the Web service environment definition file (deployment descriptor) are correct.
- Check that the Web service implementation class implemented the service endpoint interface.

### 14.8.4 isws10821

---

**ISWS: ERROR: isws10821: Body already present: messageType=%s1**

#### Variable Information

%s1 = Message type

#### Explanation

An attempt was made to add a "SOAPBody" element to a SOAP message for which there is already a "SOAPBody" element.

#### System Action

Stops application processing.

#### User Action

Set the number for "Body" in the SOAP message to [1], and then re-execute the application.

### 14.8.5 isws10828

---

---

**ISWS: ERROR: isws10828: %s1 encountered a child element, which is NOT expected, in something it was trying to deserialize.: %2****Variable Information**

%s1 = Internal information

%s2 = Detail information

**Explanation**

The SOAP message that was received is invalid.

**System Action**

Fault is returned.

**User Action**

Take the following action:

- This message is output when the Web service application is executed
  - Check that the WSDL offered to the Web service user is valid.
  - Ask the Web service user whether the URL for connection is valid.
  - Ask the Web service provider whether the SOAP message was sent according to WSDL.
- This message is output when the Web service client application is executed
  - Check whether WSDL offered by the Web service for connection was used to develop the application.
  - Check the URL for connection. If it is invalid, correct it.
  - Check the application. If the API parameters or the way in which they are used are incorrect, correct them.
  - Ask the Web service provider whether the SOAP message was sent according to WSDL.

---

**14.8.6 isws10835**

---

**ISWS: ERROR: isws10835: Unable to tunnel through %s1:%s2. Proxy returns "%s3": %s4****Variable Information**

%s1 = Proxy hostname or IP address

%s2 = Proxy port number

%s3 = String returned from the proxy

%s4 = Detail information

**Explanation**

Transit connection to the proxy for SSL connection using the proxy failed.

**System Action**

Stops processing.

**User Action**

Check that the connection Web service URL and proxy host/port were specified in the Web service client application. Check that connection is possible using the Web service URL and proxy host/port. If the proxy uses authentication, check that the authentication information for the proxy is correct. Check that there are no network problems.

Alternatively, refer to the string returned from the proxy to fix the problem.

---

**14.8.7 isws10840**

---

**ISWS: ERROR: isws10840: Found character data inside an array element while deserializing: %s1****Variable Information**

%s1 = Internal information

**Explanation**

An error occurred during array data analysis processing.

**System Action**

Fault is returned.

**User Action**

Take the following action:

- This message is output when the Web service application is executed
  - Check that the WSDL offered to the Web service user is valid.
  - Ask the Web service user whether the URL for connection is valid.
  - Ask the Web service provider whether the SOAP message was sent according to WSDL.
- This message is output when the Web service client application is executed
  - Check whether WSDL offered by the Web service for connection was used to develop the application.
  - Check the URL for connection. If it is invalid, correct it.
  - Check the application. If the API parameters or the way in which they are used are incorrect, correct them.
  - Ask the Web service provider whether the SOAP message was sent according to WSDL.

---

**14.8.8 isws10849**

---

**ISWS: ERROR: isws10849: End of stream encountered before final boundary marker.: %s1****Variable Information**

%s1 = Internal information

**Explanation**

Some data was truncated from the MIME message when a SOAP message containing the attachment was received.

**System Action**

Stops processing.

**User Action**

- If you are receiving the data from an attachment file, check there are no problems reading the file.
- If you are receiving the attachment from the network, check for network or sender side errors.
- If you are limiting Web server request size in the Web service, either specify an appropriate size, or check that the Web service client has not sent data that has exceeded the limit.

---

**14.8.9 isws10850**

---

**ISWS: ERROR: isws10850: End of stream encountered before final boundary marker.: %s1****Variable Information**

%s1 = Internal information

## Explanation

The end of the data stream in the attachment data was encountered before the final boundary marker.

## System Action

Stops processing.

## User Action

There may have been a disconnection while data in the attachment was being received.

Check if an error occurred with a communication partner.

Check for problems in the communication pathway.

## 14.8.10 isws10852

---

**ISWS: ERROR: isws10852: Error invoking operation: %s1: parmAndRetReq=%s2 portName=%s3 portTypeName=%s4 operationName=%s5 maintainSession=%s6 useSOAPAction=%s7 SOAPActionURI=%s8 timeout=%s9 useStreaming=%s10 operationSetManually=%s11 invokeOneWay=%s12 isMsg=%s13 transportName=%s14 msg.getClass().getName()=%s15**

## Variable Information

%s1 = Detail information

%s2 = Internal information

%s3 = Port name

%s4 = Port type name

%s5 = Operation name

%s6 = Internal information

%s7 = SOAPAction

%s8 = SOAPActionURI

%s9 = Internal information

%s10 = Internal information

%s11 = Internal information

%s12 = Internal information

%s13 = Internal information

%s14 = Internal information

%s15 = Internal information

## Explanation

An unexpected exception occurred during SOAP message processing.

## System Action

Stops processing.

## User Action

Refer to the detail information and take action.

If the problem cannot be resolved, contact the administrator of the connection destination service.

## 14.8.11 isws10858

---

**ISWS: ERROR: isws10858: Header already present: messageType=%s1**

#### Variable Information

%s1 = message type

#### Explanation

You tried to add a SOAP Header element to a SOAP message for which the SOAP Header element already exists.

#### System Action

Stops processing, and throws Exception.

#### User Action

Do not call the addHeader() method for a SOAPEnvelope for which SOAPHeader already exists.

### 14.8.12 isws10859

---

#### **ISWS: ERROR: isws10859: IllegalArgumentException: %s1**

#### Variable Information

%s1 = Internal information

#### Explanation

Failed to specify the SOAPEnvelope content.

#### System Action

Throws javax.xml.soap.SOAPException.

#### User Action

Check whether null is specified.

### 14.8.13 isws10862

---

#### **ISWS: ERROR: isws10862: IllegalArgumentException: parent=%s1**

#### Variable Information

%s1 = Class name you tried to set as the parent element

#### Explanation

An illegal object was specified as the SOAPBodyElement parent element.

#### System Action

Stops processing.

#### User Action

Only SOAPBody can be specified as the SOAPBodyElement parent element.

### 14.8.14 isws10863

---

#### **ISWS: ERROR: isws10863: IllegalArgumentException: processed=%s1 mustUnderstand=%s2 relay=%s3 parent=%s4**

#### Variable Information

%s1 = Internal information

%s2 = Internal information

%s3 = Internal information

%s4 = Internal information

#### Explanation

An illegal object was specified as the SOAPHeaderElement setParentElement method argument.

#### System Action

Throws Exception.

#### User Action

Specify the SOAPHeader object as the SOAPHeaderElement setParentElement method argument.

### 14.8.15 isws10874

---

#### **ISWS: ERROR: isws10874: Invocation arguments were modified: falseIndex=%s1**

#### Variable Information

%s1 = Internal information

#### Explanation

Information required for Web service processing was rewritten by the handler.

#### System Action

Stops processing.

#### User Action

Do not change the part under the SOAP Body section.

### 14.8.16 isws10878

---

#### **ISWS: ERROR: isws10878: Error in MIME data stream, start boundary not found, %s1**

#### Variable Information

%s1 = Internal information

#### Explanation

The start boundary of a MIME message was not found when a SOAP message containing an attachment was received.

#### System Action

Stops processing.

#### User Action

If you are reading the data from an attachment file, check that there are no problems reading the file.

If you are receiving the attachment from the network, check for network or sender side errors.

If you are limiting the Web server request size in the Web service, either specify an appropriate size, or check that the Web service client has not sent data that has exceeded the limit.

### 14.8.17 isws10891

---

#### **ISWS: ERROR: isws10891: Body not found.: Operation=%s1**

#### Variable Information

%s1 = Operation name

## Explanation

There is no "SOAPBody" element in the SOAP message.

## System Action

Stops application processing.

## User Action

Set the number for "Body" in the SOAP message to [1], and then re-execute the application.

## 14.8.18 isws10892

---

**ISWS: ERROR: isws10892: InputSource has neither character stream nor byte stream: currentForm=%s1 currentEncoding=%s2 currentMessageAsString=%s3**

## Variable Information

%s1 = Internal information

%s2 = Encoding charset

%s3 = SOAP message error contents

## Explanation

Neither character stream nor byte stream are used for InputSource.

## System Action

Stops application processing.

## User Action

Enter character stream or byte stream for InputSource, and then re-execute the application.

## 14.8.19 isws10897

---

**ISWS: ERROR: isws10897: No deserializer defined for array type %s1: %s2**

## Variable Information

%s1 = XML array, or element XML data type. Format: {namespace}Local name

%s2 = Detail information

## Explanation

The Java class for the received XML array could not be resolved.

## User Action

Check that the application contains the required classes.

Check that the service endpoint interface or parameter class Java package corresponds to the XML namespace in a 1 to 1 ratio.

## 14.9 isws10900 to isws10999

---

This section details messages numbered between isws10900 and isws10999.

### 14.9.1 isws10901

---

**ISWS: ERROR: isws10901: No custom elements allowed at top level until after the <body> tag: QName=%s1 prefix=%s2 messageType=%s3**

## Variable Information

%s1 = QName of tag

%s2 = prefix

%s3 = message type

## Explanation

An unexpected element was detected during analysis of the message.

## System Action

Stops processing, and throws Exception.

## User Action

The only element that can be contained in the SOAP Envelope child element is the SOAP Body element. Do not include other elements.

## 14.9.2 isws10902

---

### **ISWS: ERROR: isws10902: No deserializer for %s1 %s2**

## Variable Information

%s1 = Data type

## Explanation

The SOAP message that was received is invalid.

## System Action

Fault is returned.

## User Action

Take the following action:

- This message is output when the Web service application is executed
  - Check that the WSDL offered to the Web service user is valid.
  - Ask the Web service user whether the URL for connection is valid.
  - Ask the Web service provider whether the SOAP message was sent according to WSDL.
- This message is output when the Web service client application is executed
  - Check whether WSDL offered by the Web service for connection was used to develop the application.
  - Check the URL for connection. If it is invalid, correct it.
  - Check the application. If the API parameters or the way in which they are used are incorrect, correct them.
  - Ask the Web service provider whether the SOAP message was sent according to WSDL.

## 14.9.3 isws10906

---

### **ISWS: ERROR: isws10906: Deserializing parameter '%s1': could not find deserializer for type %s2: %s3**

## Variable Information

%s1 = Parameter name

%s2 = Type

%s3 = Detail information

## Explanation

The SOAP message that was received is invalid.

## System Action

Fault is returned.

## User Action

Take the following action:

- This message is output when the Web service application is executed
  - Check that the WSDL offered to the Web service user is valid.
  - Ask the Web service user whether the URL for connection is valid.
  - Ask the Web service provider whether the SOAP message was sent according to WSDL.
- This message is output when the Web service client application is executed
  - Check whether WSDL offered by the Web service for connection was used to develop the application.
  - Check the URL for connection. If it is invalid, correct it.
  - Check the application. If the API parameters or the way in which they are used are incorrect, correct them.
  - Ask the Web service provider whether the SOAP message was sent according to WSDL.

## 14.9.4 isws10911

---

**ISWS: ERROR: isws10911: File for data handler does not exist: %s1: headerLength=%s2 dataSize=%s3**

### Variable Information

%s1 = File name

%s2 = Internal information

%s3 = Internal information

## Explanation

Could not find the file used by the attachment.

## System Action

Stops processing.

## User Action

- If a file has been specified for the attachment data, check that the file path is correct, and the file can be read.
- If `javax.activation.FileDataSource` is used for the attachment data, check that the path for the file specified in the constructor is correct, and the file for that path can be read.

## 14.9.5 isws10917

---

**ISWS: ERROR: isws10917: Processing instructions are not allowed within SOAP messages: %s1**

### Variable Information

%s1 = Internal information

## Explanation

The SOAP message that was received is invalid.

## System Action

Throws exception.

## User Action

Take the following action:

- This message is output when the Web service application is executed
  - Check that the WSDL offered to the Web service user is valid.
  - Ask the Web service user whether the URL for connection is valid.
  - Ask the Web service provider whether the SOAP message was sent according to WSDL.
- This message is output when the Web service client application is executed
  - Check whether WSDL offered by the Web service for connection was used to develop the application.
  - Check the URL for connection. If it is invalid, correct it.
  - Check the application. If the API parameters or the way in which they are used are incorrect, correct them.
  - Ask the Web service provider whether the SOAP message was sent according to WSDL.

## 14.9.6 isws10942

---

**ISWS: ERROR: isws10942: No serializer found for class %s1 in registry %s2 %s3**

### Variable Information

- %s1 = Class name
- %s2 = Internal information
- %s3 = Internal information

### Explanation

Failed to create the SOAP message.

### System Action

Throws exception.

### User Action

Check the API parameters and the way in which they are used in the user application. If they are incorrect, correct them.

## 14.9.7 isws10952

---

**ISWS: ERROR: isws10952: No such operation '%s1': qname=%s2**

### Variable Information

- %s1 = Method name
- %s2 = Method namespace qualifier

### Explanation

The method specified for the service endpoint interface does not exist.

### System Action

Stops application processing.

### User Action

Specify an existing method for the service endpoint interface, and then re-execute the application.

## 14.9.8 isws10969

---

**ISWS: ERROR: isws10969: Non nillable element '%s1' is null.: xmlType=%s2 javaType=%s3 name=%s4 value=%s5**

### Variable Information

%s1 = Element

%s2 = Element type

%s3 = Java type in the field for the element

%s4 = Internal information

%s5 = Internal information

### Explanation

null was specified for an element for which null is illegal. For this reason, an abnormality was detected while the SOAP message was created, or during analysis.

### System Action

Stops application processing.

### User Action

Check whether null is specified.

## 14.9.9 isws10970

---

**ISWS: ERROR: isws10970: null parent!: name=%s1 prefix=%s2 namespaceURI=%s3**

### Variable Information

%s1 = parent name

%s2 = prefix

%s3 = name space URI

### Explanation

A child element was not specified as the replaceChild method second argument.

### System Action

Throws Exception.

### User Action

Specify the child element of the element as the replaceChild method second argument.

## 14.9.10 isws10973

---

**ISWS: ERROR: isws10973: null parent!: processed=%s1 mustUnderstand=%s2 relay=%s3**

### Variable Information

%s1 = Internal information

%s2 = Internal information

%s3 = Internal information

### Explanation

null was specified as the SOAPHeaderElement setParentElement method argument.

## System Action

Throws Exception.

## User Action

Specify the SOAPHeader object as the SOAPHeaderElement setParentElement method argument.

### 14.9.11 isws10979

---

**ISWS: ERROR: isws10979: Only one Body element allowed!: QName=%s1 prefix=%s2 messageType=%s3**

#### Variable Information

%s1 = Namespace complete qualifier

%s2 = Prefix

%s3 = Message type

#### Explanation

"Body" was set twice in the SOAP message.

#### System Action

Stops application processing.

#### User Action

Set the number for "Body" in the SOAP message to [1], and then re-execute the application.

### 14.9.12 isws10991

---

**ISWS: ERROR: isws10991: Resource has been deleted.: %s1**

#### Variable Information

%s1 = Internal information

#### Explanation

Attempted to read attachment data for which the resources have already been released.

#### System Action

Stops processing.

#### User Action

In Web service server application request processing, by default, resources for received attachment data are released after request processing completes.

If an application error occurred during data read, correct the application.

If it is essential to read past attachment data, configure the settings so that the resources are not released after request processing completes. For details on the settings and points to note, refer to "Web Service Settings File" in the "J2EE User's Guide".

## 14.10 isws11000 to isws11099

---

This section details messages numbered between isws11000 and isws11099.

### 14.10.1 isws11008

---

---

**ISWS: ERROR: isws11008: Illegal argument passed to ParameterDesc.setJavaType. The java type %s1 does not match the mode %s2: %s3**

**Variable Information**

%s1 = Java class name

%s2 = Parameter mode (in/out/inout)

%s3 = Internal information

**Explanation**

Failed to create the SOAP message.

**System Action**

Throws an exception.

**User Action**

Check the API parameters and the way in which they are used in the user application. Correct them if necessary.

---

## 14.10.2 isws11056

---

**ISWS: ERROR: isws11056: Unexpected EOF from proxy: host=%s1 port=%s2**

**Variable Information**

%s1 = Connection destination server host name

%s2 = Connection destination server port number

**Explanation**

Data from the proxy closed unexpectedly in the SSL connection to a server via a proxy.

**System Action**

Throws an exception.

**User Action**

Take the following action:

- Check whether the connection destination server host name and port number are correct.
- Check whether the connection to the server via a proxy is possible using this host name and port number.
- Check whether the specified proxy is correct.
- Check whether the network contains an error, or whether an error has occurred in the proxy or in the connection destination server.

---

## 14.10.3 isws11061

---

**ISWS: ERROR: isws11061: Missing argument to option %s1**

**Variable Information**

%s1 = Option name

**Explanation**

There is no option.

**System Action**

Stops processing.

#### User Action

Check that the option settings or order is correct.

### 14.10.4 isws11064

---

#### **ISWS: ERROR: isws11064: Unable to parse first argument for option %s1**

##### Variable Information

%s1 = Option name

##### Explanation

The argument for the option is invalid.

##### System Action

Stops processing.

##### User Action

Check that the option settings or order is correct.

### 14.10.5 isws11065

---

#### **ISWS: ERROR: isws11065: Malformed option -**

##### Explanation

The specified option is invalid.

##### System Action

Stops processing.

##### User Action

Check the specified option.

### 14.10.6 isws11070

---

#### **ISWS: ERROR: isws11070: Error parsing XML: %s1: %s2**

##### Variable Information

%s1 = WSDL file URI

%s2 = Detail message

##### Explanation

Failed to create the Web service application.

##### System Action

Stops processing.

##### User Action

Establish the cause of the error according to the message detail, and then re-execute the command.

### 14.10.7 isws11071

---

#### **ISWS: ERROR: isws11071: Fatal error parsing XML: %s1**

## Variable Information

%s1 = Detail message

## Explanation

XML analysis of the WSDL file, SOAP message or internal definition file failed.

## System Action

Stops processing.

## User Action

If the error resulted from executing the *iswsген* client or *iswsген* server commands, resolve the WSDL error according to the detailed message and then re-execute the command.

If the error occurs when the Web service application is deployed, correct the Web service environment definition file (deployment descriptor), resolve the WSDL error according to the detailed message, and then re-execute the command.

If the error occurs when the Web service application is running, the message received from the communication partner may be an incomplete XML message. Check with the communication partner.

In addition, resolve the error according to the detailed message.

## 14.10.8 isws11092

---

**ISWS: ERROR: isws11092: setValue() may not be called on a non-Text node with more than one child.: name=%s1 prefix=%s2 namespaceURI=%s3 children.size()=%s4 value=%s5**

## Variable Information

%s1 = Element local name

%s2 = Element prefix name

%s3= Element namespace URI

%s4 = Number of child nodes

%s5 = Value contents

## Explanation

The setValue() method was used on a node that has more than one child node.

## System Action

Stops application processing.

## User Action

Issue setValue() for a text node or an element that has one text node and re-execute the application.

## 14.10.9 isws11093

---

**ISWS: ERROR: isws11093: setValue() may not be called on a non-Text node with a non-Text child.: name=%s1 prefix=%s2 namespaceURI=%s3 child=%s4 value=%s5**

## Variable Information

%s1 = Element local name

%s2 = Element prefix name

%s3= Element namespace URI

%s4 = Sub element type

%s5 = Value contents

### Explanation

The setValue() method was used for a non-text mode element for the specified element or sub element.

### System Action

Stops application processing.

### User Action

Issue setValue() for a text mode element for the specified element or sub element, and then re-execute the application.

## 14.10.10 isws11094

---

### ISWS: ERROR: isws11094: Bad types (%s1): %s2

#### Variable Information

%s1 = Class name

%s2 = Internal information

### Explanation

The SOAP message that was received is invalid.

### System Action

Fault is returned.

### User Action

Take the following action:

- This message is output when the Web service application is executed
  - Check that the WSDL offered to the Web service user is valid.
  - Ask the Web service user whether the URL for connection is valid.
  - Ask the Web service provider whether the SOAP message was sent according to WSDL.
- This message is output when the Web service client application is executed
  - Check whether WSDL offered by the Web service for connection was used to develop the application.
  - Check the URL for connection. If it is invalid, correct it.
  - Check the application. If the API parameters or the way in which they are used are incorrect, correct them.
  - Ask the Web service provider whether the SOAP message was sent according to WSDL.

## 14.11 isws11100 to isws11199

---

This section details messages numbered between isws11100 and isws11199.

### 14.11.1 isws11151

---

#### ISWS: ERROR: isws11151: Exception in preInvoke: falseIndex=%s1 : %s2

#### Variable Information

%s1 = Handler index that returned false or the exception

%s2 = Exception

#### Explanation

An unexpected exception occurred during handler processing.

#### System Action

Stops processing, and throws Exception.

#### User Action

Check the contents of the exception message and take action.

### 14.11.2 isws11196

---

**ISWS: ERROR: isws11196: Duplicate options for %s1 found.**

#### Variable Information

%s1 = Option name

#### Explanation

The specified option already exists.

#### System Action

Stops command processing.

#### User Action

Check the option specified in the command, and make sure that the option does not already exist.

### 14.11.3 isws11197

---

**ISWS: WARNING: isws11197: Exception:**

#### Explanation

The exception was thrown during analysis of the SOAP message.

#### System Action

Continues processing.

#### User Action

Check the contents of the message that is output immediately before and fix the error.

### 14.11.4 isws11199

---

**ISWS: ERROR: isws11199: Internal error.: detail=%s1**

#### Variable Information

%s1 = Detail information

#### Explanation

An unexpected error occurred.

#### System Action

Stops application processing.

#### User Action

Fix the problem according to the detail information contents.

If the problem is not solved, collect the investigation information using the *iscollectinfo* command, then contact a service engineer.

## 14.12 isws11200 to isws11299

---

This section details messages numbered between isws11200 and isws11299.

### 14.12.1 isws11200

---

**ISWS: ERROR: isws11200: It failed in the acquisition of the service instance. ServiceName: [%s1]. Abnormality occurred by initialization.**

#### Variable Information

%s1 = Service instance that could not be got

#### Explanation

Failed to get the service instance.

#### System Action

Stops request processing and returns an exception.

#### User Action

Information about the abnormality that is output is not shown. Check the initialization processing contents to fix the problem.

### 14.12.2 isws11201

---

**ISWS: ERROR: isws11201: Error occurred.; nested exception is: %s1**

#### Variable Information

%s1 = Detail information

#### Explanation

An error occurred.

#### System Action

Stops application processing.

#### User Action

Fix the problem according to the detail information contents.

Check the error information in the Web server log or the communication partner.

### 14.12.3 isws11209

---

**ISWS: ERROR: isws11209: only Element Node allowed.**

#### Explanation

An attempt was made to add javax.xml.soap.SOAPHeaderElement or an option for a class not derived from org.w3c.dom.Element as the SOAPHeader sub element.

#### System Action

Throws org.w3c.dom.DOMException.

#### User Action

Check that the specified object is valid.

## 14.12.4 isws11210

---

### **ISWS: ERROR: isws11210: Null SOAPMessage specified.**

#### Explanation

Null was specified for SOAPMessage.

#### System Action

Throws javax.xml.rpc.JAXRPCException.

#### User Action

Check whether null is specified.

## 14.12.5 isws11211

---

### **ISWS: ERROR: isws11211: Null Properties specified.**

#### Explanation

Null was specified for properties.

#### System Action

Throws javax.xml.rpc.ServiceException.

#### User Action

Check whether null is specified.

## 14.12.6 isws11212

---

### **ISWS: ERROR: isws11212: Null WSDL Document location specified.**

#### Explanation

Null was specified for WSDL Document location.

#### System Action

Throws javax.xml.rpc.ServiceException.

#### User Action

Check whether null is specified.

## 14.12.7 isws11213

---

### **ISWS: ERROR: isws11213: Failed to create InputSource.**

#### Explanation

Failed to create InputSource.

#### User Action

Refer to the exception information to fix the problem.

## 14.12.8 isws11215

---

### **ISWS: ERROR: isws11215: Null portName specified.**

#### Explanation

Null was specified for portName.

#### System Action

Throws javax.xml.rpc.ServiceException.

#### User Action

Check whether null is specified.

### 14.12.9 isws11216

---

#### **ISWS: ERROR: isws11216: Null operationName specified.**

#### Explanation

Null was specified for operationName.

#### System Action

Throws javax.xml.rpc.ServiceException.

#### User Action

Check whether null is specified.

### 14.12.10 isws11217

---

#### **ISWS: ERROR: isws11217: invalid QName local part.**

#### Explanation

Null was specified for local part when QName was created.

#### System Action

Throws IllegalArgumentException.

#### User Action

Check whether null is specified.

### 14.12.11 isws11218

---

#### **ISWS: ERROR: isws11218: invalid QName prefix.**

#### Explanation

Null was specified for prefix when QName was created.

#### System Action

Throws IllegalArgumentException.

#### User Action

Check whether null is specified.

### 14.12.12 isws11219

---

---

**ISWS: ERROR: isws11219: invalid QName literal.****Explanation**

An invalid string was passed to the QName valueOf method.

**System Action**

Throws IllegalArgumentException.

**User Action**

Check whether an invalid string is specified.

## 14.12.13 isws11220

---

**ISWS: ERROR: isws11220: Null Property specified.****Explanation**

Null was specified for property name.

**System Action**

Throws IllegalArgumentException.

**User Action**

Check whether null is specified.

## 14.12.14 isws11221

---

**ISWS: WARNING: isws11221: invalid content-type received. content-type=%s1****Variable Information**

%s1 = Received content-type

**Explanation**

An invalid content-type was received. The received content-type was "%s1".

**System Action**

Continues processing, but it is possible that the attempt to analyze the received data will fail.

**User Action**

Check the sent data content-type.

## 14.12.15 isws11222

---

**ISWS: ERROR: isws11222: Failed to import file. URI="%s1" detail= %s2****Variable Information**

%s1 = Resource URI

%s2 = Detail information

## Explanation

One of the <xsd:import>, <xsd:include>, or <wsdl:import> elements in the WSDL file was used to try to obtain external resources, but the resources could not be obtained.

## System Action

Stops processing.

## User Action

Possible causes are shown below.

- The external resources could not be obtained
- The proxy settings are invalid
- Proxy authentication failed when external resources were obtained
- The attempt to analyze the external resources failed

If the above problems cannot be resolved, refer to the detail information to establish the cause and fix the problem.

## 14.12.16 isws11223

---

### **ISWS: WARNING: isws11223: Failed to load properties: filePath=%s1**

#### Variable Information

%s1 = Properties file path

#### Explanation

Failed to load the properties file specified in "%s1".

#### System Action

Continues processing.

#### User Action

Take one of the following actions:

- Check the path (%s1), and correct it if necessary.
- Check the path (%s1) access authority, and correct it if necessary.
- Refer to the stack trace output after this message and fix the problem.

## 14.12.17 isws11224

---

### **ISWS: WARNING: isws11224: Failed to load properties: resourceName=%s1**

#### Variable Information

%s1 = Resource name of properties file

#### Explanation

Failed to load the properties file.

#### System Action

Continues processing.

## User Action

Take one of the following actions:

- Check the properties file access authority, and correct it if necessary.
- Refer to the stack trace output after this message and fix the problem.

## 14.12.18 isws11225

---

**ISWS: WARNING: isws11225: Invalid property specified: key="%s1" value="%s2"**

### Variable Information

%s1 = Property name

%s2 = Property value

### Explanation

Invalid property specified.

### System Action

Ignores the invalid property and continues processing.

### User Action

Specify a valid property.

## 14.12.19 isws11226

---

**ISWS: ERROR: isws11226: Failed to parse WSDL file. detail=%s1**

### Variable Information

%s1 = Detail information

### Explanation

An error was detected during analysis of the WSDL file.

### System Action

Stops processing.

### User Action

Refer to the detail information to fix the problem.

## 14.12.20 isws11227

---

**ISWS: ERROR: isws11227: <input>,<output>, or <fault> in <operation ..> without attribute 'message' found. Attribute 'message' is required.**

### Explanation

One of the <wsdl:input>, <wsdl:output>, <wsdl:fault> elements in the <wsdl:portType> definition does not contain the essential "message" attribute.

### System Action

Stops processing.

#### User Action

Use the "message" attribute to specify the corresponding <wsdl:message>.

### 14.12.21 isws11228

---

**ISWS: ERROR: isws11228: <input ..>, <output ..> or <fault ..> in <portType> with undefined message found. message name is %s1**

#### Variable Information

%s1 = The name specified for the "message" attribute in the <wsdl:input>, <wsdl:output>, or <wsdl:fault> element

#### Explanation

The <wsdl:message> element with the name specified for the "message" attribute in the <wsdl:input>, <wsdl:output>, or <wsdl:fault> elements in the <wsdl:portType> definition could not be found.

#### System Action

Stops processing.

#### User Action

Specify an existing <wsdl:message> definition.

### 14.12.22 isws11229

---

**ISWS: ERROR: isws11229: Unable to create instance of type %s1.**

#### Variable Information

%s1 = Class name

#### Explanation

The class instance could not be created.

#### System Action

Stops processing.

#### User Action

Check the following:

- Does the class have the "public" definition?
- Is the "public" constructor defined?

### 14.12.23 isws11230

---

**ISWS: ERROR: isws11230: Exception occurred within the serialization of Fault information.**

#### Explanation

Serialization of the exception object failed.

#### System Action

Returns isws11234 to the client application after the stack trace showing the cause of the serialization processing failure is output.

## User Action

Take one of the following actions:

- If this message is output more than once, it is possible that the user exception thrown by the Web service application is invalid. Check the user exception. If it is invalid, correct it.
- Refer to the stack trace output after this message and fix the problem.

## 14.12.24 isws11231

---

**ISWS: ERROR: isws11231: Abnormalities were detected in the analysis of a SOAP message.**

### Explanation

An error was detected during analysis of the SOAP message.

### System Action

Refer to the [System action] of the message that is output immediately before.

### User Action

Check the contents of the message that is output immediately before and fix the error.

## 14.12.25 isws11232

---

**ISWS: ERROR: isws11232: "location" attribute of <wsdl:import> is omitted , or the value of "location" attribute is blank.**

### Explanation

The "location" attribute of the WSDL <wsdl:import> element is omitted, or the "location" attribute is empty.

### System Action

Stops processing.

### User Action

Specify an existing location URL.

## 14.12.26 isws11233

---

**ISWS: ERROR: isws11233: The collision of java class name occurred. class=%s1**

### Variable Information

%s1 = Intended Java class name

### Explanation

The intended Java class name already exists.

### System Action

Stops processing.

### User Action

As an example of a possible cause, there is more than one "type" definition in WSDL, as with the Java class shown below.

```
..
-----
<xsd:complexType name="Name">
  <xsd:sequence>
    <xsd:element name="param1" type="xsd:int"/>
  </xsd:sequence>
</xsd:complexType>
<xsd:complexType name="name">
  <xsd:sequence>
    <xsd:element name="param1" type="xsd:int"/>
  </xsd:sequence>
</xsd:complexType>
-----
..
```

## 14.12.27 isws11234

---

**ISWS: ERROR: isws11234: Failed in processing of Web service. Please inquire to a provider of Web service.**

### Explanation

Web service processing failed. Contact the Web service provider.

### User Action

The problem occurred when the Web service was processed. Contact the Web service provider.

Ask the Web service to refer to the message output in the log file to fix the problem.

## 14.12.28 isws11235

---

**ISWS: INFO: isws11235: Initializing Interstage Web Service version: %s1. webapp=%s2**

### Variable Information

%s1 = Interstage Web service version information

%s2 = Web application name

### Explanation

The Interstage Web service is initialized. This is output in the container log for each Web application contained in the Web service when IJServer starts up.

### System Action

Continues processing.

## 14.12.29 isws11236

---

**ISWS: INFO: isws11236: Adding servlet mapping. servlet=%s1 pattern=%s2**

### Variable Information

%s1 = Servlet name

%s2 = url pattern

## Explanation

If servlet mapping is not defined for the servlet used as the Web service, default servlet mapping is added when IIServer starts up.

## System Action

Default servlet mapping is added for the servlet used as the Web service.

## 14.12.30 isws11238

---

**ISWS: ERROR: isws11238: Exception was thrown by Web Service application. exceptionName=%s1**

### Variable Information

%s1 = Exception thrown by the Web service application

### Explanation

The Web service application throws an exception.

### System Action

Returns the exception information thrown by the Web service application.

### User Action

Check the stack trace that is output after this message to establish the cause of the exception and fix the problem.

## 14.12.31 isws11239

---

**ISWS: ERROR: isws11239: Failed to create the mapping information between the java package and the namespace. The java package related to the namespace %s1 is already exists. package=%s2 existing package=%s3**

### Variable Information

%s1 = Namespace

%s2 = Java package name

%s3 = Java package name

### Explanation

An attempt was made to associate more than one java package for the same namespace. For this reason, creation of the java package and namespace mapping information failed.

### System Action

Returns the exception information thrown by the Web service application.

### User Action

Take the following actions:

- If the "-PkgtoNS" or "-PkgNSmappingFile" option is specified when the "iswsngen wsdl" subcommand is executed, do not specify more than one java package for the namespace.
- The "iswsngen" command creates the namespace according to default rules using the package entered for the java class, and has an association with the package. If the "-PkgtoNS" or "-PkgNSmappingFile" option is specified, and the namespace is created from the java package using the "iswsngen" command, do not specify mapping from a different java package.

## 14.12.32 isws11240

---

**ISWS: ERROR: isws11240: The demanded operation was not able to be specified. SOAPActionURI=%s1. First Child Element of Body=%s2**

### Variable Information

%s1 = Value set in SOAPActionURI

%s2 = First Body subelement

### Explanation

The requested operation could not be identified.

### System Action

Stops processing and returns an error message.

### User Action

Check the value specified for SOAPActionURI.

## 14.12.33 isws11241

---

**ISWS: ERROR: isws11241: A circulation reference was detected. Sending and receiving of elements that use circulation references are supported only in RPCENC style/use services. Element of circulation reference = %s1**

### Variable Information

%s1 = Element that detected the circulation reference

### Explanation

A circulation reference was detected in the object that was about to be sent. Objects containing circulation references are only supported in RPCENC style/use services.

### User Action

Check the application to ensure that objects containing circulation references are not sent. If objects containing circulation references must be sent, change to a RPCENC style/use service.

## 14.12.34 isws11242

---

**ISWS: ERROR: isws11242: No 'message' attribute in %s1 for operation '%s2', or the set of name attributes of the <input> and <output> elements are different between the portType and the binding.**

### Variable Information

%s1 = Either <input> or <output>

%s2 = Operation name

### Explanation

The entered WSDL file is incorrect. Possible causes are as follows:

- There is no message attribute in the wsdl:input or wsdl:output element under wsdl:portType.

- For the wsdl:operation element under wsdl:portType, the following information could not be found under the wsdl:binding element in the same wsdl:operation element:
  - The name attribute
  - The number of input and output elements, and the name attribute for that number

#### System Action

Stops processing.

#### User Action

Correct the wsdl file and determine and correct the cause of the problem. If the name attribute of the input and output elements is omitted, the following name is used implicitly.

- Input element  
operation name + 'Request'
- Output element  
operation name + 'Response'

### 14.12.35 isws11243

---

**ISWS: WARNING: isws11243: The number specified is not correct, so the default value (16K) will be set for the cache used to store the attached data. Value specified=%s1**

#### Variable Information

%s1 = Memory cache size

#### Explanation

The cache size for storing attached data specified in the Web service settings file properties is incorrect, so it was set to [16KB].

#### System Action

Continues processing.

#### User Action

Specify a number from [0] to [2097152] for the memory cache size in the Web service settings file properties (com.fujitsu.interstage.isws.attachment.memory.cachesize).

### 14.12.36 isws11244

---

**ISWS: WARNING: isws11244: The value set for the buffer size of AttachmentPart#getSize() processing is invalid, so the default value (128K) will be used. value=%s1**

#### Variable Information

%s1 = Value set by the user

#### Explanation

When the getSize() method from the javax.xml.soapAttachmentPart class of the Web service settings file properties was executed, the value that was specified for the buffer size (a property of the method) was invalid, so the default value (128K) was set.

#### System Action

Continues processing.

## User Action

Specify a number from [0] to [2097152] for the buffer size in the Web service settings file properties (com.fujitsu.interstage.isws.attachment.read.bufferSize).

## 14.12.37 isws11245

---

**ISWS: WARNING: isws11245: Character encoding %s1 that was specified for the properties value is not supported, so the MIME data type text/plain attachment will be output using the default UTF-8.**

### Variable Information

%s1 = Character encoding

### Explanation

The character encoding, %1, specified in the Web service settings file properties is not supported, so the MIME data type 'text/plain' attachment is output using the default UTF-8.

### System Action

Continues processing.

### User Action

Set the correct character encoding in the Web service settings file properties (com.fujitsu.interstage.isws.attachment.plaintext.charset) so that the java.lang.String character code is attached and handled as non-UTF-8.

## 14.12.38 isws11247

---

**ISWS: WARNING: isws11247: Character encoding %s1 that was specified for the properties value is not supported, so the MIME data type text/plain attachment will be read using UTF-8.**

### Variable Information

%s1 = Character code

### Explanation

Character encoding %1 that was specified in the Web service settings file properties is not supported, so the MIME data type 'text/plain' attachment is interpreted as the default UTF-8.

### System Action

Continues processing.

### User Action

- Set the correct character encoding in the Web service settings file properties (com.fujitsu.interstage.isws.attachment.plaintext.charset) so that the java.lang.String character code is attached and handled as non-UTF-8.
- Check that the character encoding for the Content-Type charset parameter of the received attachment data is correct.

## 14.12.39 isws11248

---

**ISWS: ERROR: isws11248: The Bean instance could not be generated using the default constructor. Bean class name=[%s1] Bean XML type [%s2]**

#### Variable Information

%s1 = Target class name

%s2 = Target XML type

#### Explanation

The Bean instance in the default constructor could not be generated.

#### System Action

Stops processing.

#### User Action

Refer to the exception information, and correct the Bean class or fix the cause of the error so that the instance can be generated by the default constructor in the target Bean class.

### 14.12.40 isws11249

---

**ISWS: ERROR: isws11249: Sending of the message was aborted because an exception occurred while the attached data was being sent.**

#### Explanation

Message sending was aborted because an exception occurred while the attached data was being sent.

#### System Action

Stops message send processing at the point when the exception occurs.

#### User Action

Refer to the exception information and fix the cause of the error.

### 14.12.41 isws11250

---

**ISWS: ERROR: isws11250: The WSDL file contains unsupported content. code = %s1 %s2**

#### Variable Information

%s1 = code

%s2 = Detail information

#### Explanation

The WSDL file contains unsupported content.

#### System Action

Stops processing.

#### User Action

Refer to the error information in the table and correct the WSDL file.

Table 14.1 Error information interpretation

No	Error information	Variable Information	Explanation	User Action
1	Unsupported transport. transport=%s1	%s1: The value specified for the "transport" attribute in the <soap:binding> element	The value specified for the "transport" attribute in the <soap:binding> element is not supported.	Specify http://schemas.xmlsoap.org/soap/http for the "transport" attribute.
2	All "style" attributes in the WSDL document must have the same value.	-	Not all "style" attributes in the WSDL document have the same value.	Make the "style" specification in the <soap:binding> and <soap:operation> elements the same in WSDL.
3	All "use" attributes in the WSDL document must have the same value.	-	Not all "use" attributes in the WSDL document have the same value.	Make the "use" specification in the <soap:body> and <soap:fault> elements the same in WSDL.
4	"document"/"encoded" is not supported.	-	"document" is specified for "style", and "encoded" is specified for "use".	Specify "document" for "style", and "literal" for "use".
5	Only the REQUEST-RESPONSE operation is supported. portType=%s1 operation=%s2	%s1: Port type name %s2: Operation name	The operation used was not "request-response" type.	Use a "request-response" type operation.
6	The <wsdl:operation> element in <wsdl:binding> and its related <wsdl:portType> must have the same number of <wsdl:fault> elements. Binding=%s1 operation=%s2	%s1: Binding name %s2: Operation name	The number of <wsdl:fault> definitions in <wsdl:binding> and <wsdl:portType> is different.	Make the number of <wsdl:fault> definitions the same.
7	The first token of the "encodingStyle" attribute value must be "http://schemas.xmlsoap.org/soap/encoding/".	-	The "encodingStyle" attribute in the <soap:body> or <soap:fault> element is not http://schemas.xmlsoap.org/soap/encoding/.	Specify http://schemas.xmlsoap.org/soap/encoding/ for the "encodingStyle" attribute.
8	The "namespace" attribute of the <soap:body> and <soap:fault> elements must not be blank.	-	A string was specified for the "namespace" attribute in the <soap:body> or <soap:fault> element.	Do not use spaces in the "namespace" attribute.
9	The operation "name" must be unique within the portType. name=%s1	%s1: Operation name	The "name" attribute of the <wsdl:operation> element was duplicated within the port type.	The "name" attribute of the <wsdl:operation> element must be unique within the port type.
10	The "name" attribute of the <wsdl:input> and <wsdl:output> elements provides a unique name among all <wsdl:input> and <wsdl:output> elements within the	%s1: "name" attribute of the "input" or "output" element	The "name" attribute of the <wsdl:input> and <wsdl:output> elements was duplicated for the port type.	The "name" attribute of the <wsdl:input> and <wsdl:output> elements must be unique within the port type.

	exactly one <soap:body> element as an extensibility element. Other kinds of elements are not supported.		<wsdl:input> element under the <wsdl:binding> element is unsupported.	element must have only one <soap:body> element as an extensibility element. Other kinds of elements are not supported.
20	The <wsdl:output> element must have exactly one <soap:body> element as an extensibility element. Other kinds of elements are not supported.	-	The description for the extensibility element of the <wsdl:output> element under the <wsdl:binding> element is unsupported.	The <wsdl:output> element under the <wsdl:binding> element must have only one <soap:body> element as an extensibility element. Other kinds of elements are not supported.
21	The <wsdl:fault> element must have exactly one <soap:fault> element as an extensibility element. Other kinds of elements are not supported.	-	The description for the extensibility element of the <wsdl:fault> element under the <wsdl:binding> element is unsupported.	The <wsdl:fault> element under the <wsdl:binding> element must have only one <soap:body> element as an extensibility element. Other kinds of elements are not supported.
22	The "definition" element must not contain an extensibility element for which the "required" attribute is "true". extensibilityElement=%s1	%s1: Extensibility element	The "wsdl:required" attribute contains a "true" extensibility element as the <wsdl:definition> attribute subelement.	The "wsdl:required" attribute must not contain "true" extensibility elements as the <wsdl:definition> attribute subelement.
23	The number of operations in binding "%s1" and portType "%s2" are different.	%s1: Binding name %s2: Port type name	The number of operations defined for the <wsdl:portType> element for the <wsdl:binding> attribute and "binding" are different.	Make the number of operations for "binding" and "portType" the same.
24	The value for the "encodingStyle" attribute is blank.	-	The "encodingStyle" attribute in the <soap:body> or <soap:fault> attribute contains spaces.	Do not use spaces.

## 14.12.42 isws11251

**ISWS: ERROR: isws11251: The WSDL file contains unsupported schema content. code = %s1 %s2**

### Variable Information

%s1 = code

%s2 = Error information

### Explanation

The WSDL file XML schema definition contains unsupported content.

## System Action

Stops processing.

## User Action

Refer to the error information in the table and correct the WSDL file.

Table 14.2 Error information interpretation

No	Error information	Variable Information	Explanation	User Action
1	The child element %s1 of the element %s2 is not supported.	%s1: Element that cannot be used %s2: Parent element	An unsupported element %s1 was used as the %s2 subelement in the XML schema definition.	Do not use an unsupported element as the %s2 subelement.
2	The attribute "%s1" of the element %s2 is not supported.	%s1: Attribute %s2: Element	An unsupported attribute %s1 was used as the %s2 attribute in the XML schema definition.	Do not use an unsupported attribute as the %s2 subelement.
3	The xml data type "%s1" referenced from the "base" attribute of the <xsd:extension> element is not supported.	%s1: Referenced XML data type	An unsupported data type was referenced from the "base" attribute of the <xsd:extension> element.	Do not allow unsupported data types to be referenced.
4	The <xsd:extension> element in the <xsd:simpleContent> element must contain at least one <xsd:attribute> or <xsd:attributeGroup> element.	-	The description for the <xsd:simpleContent> element subelement is unsupported	The <xsd:simpleContent> element subelement must contain at least one "xsd:attribute" or "xsd:attributeGroup" element.
5	The xml data type "%s1" referenced from the "base" attribute of the <xsd:restriction> element is not supported.	%s1: Referenced XML data type	An unsupported data type was referenced from the "base" attribute of the <xsd:restriction> element.	Do not allow unsupported data types to be referenced.
6	The "base" attribute of the <xsd:restriction> element must reference a built-in simple xml data type.:type=%s1	%s1: Referenced XML data type	A non built-in XML data type was referenced from the "base" attribute of the <xsd:restriction> element.	The data type referenced from the "base" attribute of the <xsd:restriction> element must be built-in XML data type.
7	The xml data type "%s1" referenced from the "type" attribute of the <xsd:element> element is not supported.	%s1: Referenced XML data type	An unsupported data type was referenced from the "type" attribute of the <xsd:element> element.	Do not allow unsupported data types to be referenced.
8	The xml data type "%s1" referenced from the "type" attribute of the <xsd:attribute> element is not supported.	%s1: Referenced XML data type	An unsupported data type was referenced from the "type" attribute of the <xsd:attribute> element.	Do not allow unsupported data types to be referenced.
9	When the base attribute of <xsd:restriction> is omitted, that <xsd:restriction> must contain the	-	The <xsd:restriction> element does not contain either the "base" attribute or the <xsd:simpleType> subelement.	If the "base" attribute of the <xsd:restriction> element is omitted, the subelement of the <xsd:restriction> element

No	Error information	Variable Information	Explanation	User Action
	<xsd:simpleType> element as a child element.			must be <xsd:simpleType>.
10	When a <xsd:complexContent> element has a <xsd:restriction> child element, the "base" attribute of the <xsd:restriction> must reference the xml data type "soapenc:Array".	-	The <xsd:complexContent> element has a <xsd:restriction> child element, but the data type specified in the "base" attribute was not "soapenc:Array".	Specify the "soapenc:Array" type.
11	The value for the "mixed" attribute of the <xsd:complexType> element must be neither "true" nor "1".	-	"true" or "1" was specified for the "mixed" attribute of the <xsd:complexType> element.	Specify "false" or "0" for the "mixed" attribute of the <xsd:complexType> element, or omit the attribute.
12	The value for the "abstract" attribute of the <xsd:element> element must be neither "true" nor "1".	-	"true" or "1" was specified for the "abstract" attribute of the <xsd:element> element.	Specify "false" or "0" for the "abstract" attribute of the <xsd:element> element, or omit the attribute.
13	When a <xsd:simpleContent> element has a <xsd:extension> child element, the "base" attribute of the <xsd:extension> element must reference a built-in simple xml data type.:type=%s1	%s1: Referenced XML data type	A non built-in simple XML data type was referenced from the "base" attribute of the <xsd:extension> element in the <xsd:simpleContent> element subelement.	The data type for the "base" attribute of the <xsd:extension> element in the <xsd:simpleContent> element subelement must be built-in simple XML data type.
14	When a <xsd:complexContent> element has a <xsd:extension> child element, the "base" attribute of the <xsd:extension> element must not reference a simple xml data type.:type=%s1	%s1: Referenced XML data type	A simple XML data type was specified for the "base" attribute of the <xsd:extension> element in the <xsd:complexContent> element subelement.	Do not specify a simple XML data type for the "base" attribute of the <xsd:extension> element in the <xsd:complexContent> element subelement.
15	The <soap:fault> element and enclosing <wsdl:fault> element must have the same name. wsdl:fault=%s1 soap:fault=%s2	%s1: Name of wsdl:fault %s2: Name of soap:fault	The "name" attribute in the <wsdl:fault> element and the subelement <soap:fault> element do not match.	Make sure that the "name" attribute in the <wsdl:fault> element and the subelement <soap:fault> element match.
16	The type "%s1" and the base type have an element or attribute with the same name. : %s2	%s1: <xsd:complexType> for extending another complexType %s2: Duplicated element/attribute	The element or attribute for name %s2 were defined for the %s1 complexType and the %1 extension complexType.	The element or /attribute for complexType and the extension complexType must not be the same.
17	Both the type "%s1" and the base type have a <xsd:any> element."	%s1: <xsd:complexType> for extending another complexType	The <xsd:any> element was used in the %s1	Do not use the <xsd:any> element in the

No	Error information	Variable Information	Explanation	User Action
			complexType and the %1 extension complexType.	complexType and the extension complexType.
18	No value except "1" can be specified for the "maxOccurs" and "minOccurs" attributes of the <xsd:sequence> element.	-	A value except "1" was specified for the <xsd:sequence> "maxOccurs" or "minOccurs" attributes.	Specify "1" for the <xsd:sequence> "maxOccurs" or "minOccurs" attributes, or omit the attribute.
19	No value except "1" can be specified for the "maxOccurs" and "minOccurs" attributes of the <xsd:all> element.	-	A value except "1" was specified for the <xsd:all> "maxOccurs" or "minOccurs" attributes.	Specify "1" for the <xsd:all> "maxOccurs" or "minOccurs" attributes, or omit the attribute.
20	The xml data type "%s1" referenced from the "wsdl:arrayType" attribute is not supported.	%s1: Referenced XML data type	An unsupported data type was referenced from the "wsdl:arrayType" attribute.	Do not allow unsupported data types to be referenced.
21	"image/gif" MIME type is not supported.	-	The "image/gif" MIME type is not supported.	Do not specify "image/gif" for the "type" attribute of the <mime:content> element.
22	The <mime:multipartRelated> element must only have one root part. The root part is the <mime:part> element that holds the <soap:body> element in the sub element.	-	The <mime:multipartRelated> element must only have one root part. The root part is the <mime:part> element that holds the <soap:body> element in the sub element.	Create only one root part as the sub element of the <mime:multipartRelated> element.
23	The %s1 element must only have one %s2 element or %s3 as the extensibility element.	%s1: Element name %s2: Element name %s3: Element name	The %s1 element must only have one %s2 element or %s3 as the extensibility element.	Create only one %s2 element or %s3 as the sub element of the %s1 element.

### 14.12.43 isws11253

**ISWS: ERROR: isws11253: The WSDL file is missing required content. code = %s1 %s2**

#### Variable Information

%s1 = code

%s2 = Detail information

#### Explanation

The WSDL file is missing required information.

#### System Action

Stops processing.

#### User Action

Refer to the error information in the table and correct the WSDL file.

Table 14.3 Error information interpretation

No	Error information	Variable Information	Explanation	User Action
1	No service found in the WSDL document.	-	There is no <service> element in WSDL.	Define the <service> element in WSDL.
2	The <wsdl:input> and <wsdl:output> elements must not be omitted. binding=%s1 operation=%s2	%s1: Binding name %s2: Operation name	The <wsdl:input> or <wsdl:output> element was omitted.	Define the <wsdl:input> and <wsdl:output> elements.
3	The "use" attribute of the <soap:body> and <soap:fault> elements must not be omitted.	-	The "use" attribute of the <soap:body> or <soap:fault> elements was omitted.	The "use" attribute of the <soap:body> and <soap:fault> elements must not be omitted.
4	The "soapAction" attribute of the <soap:operation> element must not be omitted.	-	The "soapAction" attribute of the <soap:operation> element was omitted.	The "soapAction" attribute of the <soap:operation> element must not be omitted.

## 14.12.44 isws11254

**ISWS: ERROR: isws11254: The binding %s1 has multiple operations with the same soapAction which could lead to the soap message not containing enough information for the server to determine the method to invoke: soapAction="%s2"**

### Variable Information

%s1 = Binding name

%s2 = soapAction Value

### Explanation

The following conditions apply to the multiple WSDL binding operations.

- The soapAction attribute is the same, and
- In the SOAP message for WSDL, the request message <soapenv:body> element is empty or the name of the child element of the <soapenv:body> element is the same.

### System Action

Stops processing.

### User Action

Correct the WSDL (change the soapAction attribute of the operation element) so that the conditions identified in the Explanation above do not apply.

## 14.12.45 isws11255

**ISWS: ERROR: isws11255: Failed to get Content-Length because of an abnormality in the body information. : headerLength=%s1 dataSize=%s2 contentType=%s3 contnetID=%s4**

### Variable Information

%s1 = Header length

%s2 = Data length

%s3 = Internal information

%s4 = Internal information

#### Explanation

Failed to get the data size of the MIME body part.

#### System Action

Stops processing.

#### User Action

Check that the objects and data of the sent attachment are correct. Refer to the exception information and fix the error.

## 14.12.46 isws11257

---

**ISWS: ERROR: isws11257: Processing will be aborted because operation and acquisition of the attachment contained in the send data failed. : message=%s1: attachmentFile=%s2**

#### Variable Information

%s1 = Detailed information

%s2 = Attachment information

#### Explanation

Processing aborted because operations on and acquisition of the attachment contained in the send data failed.

#### System Action

Stops processing.

#### User Action

Refer to the exception information to fix the error. also, check there is no problem with the send target attachment.

## 14.12.47 isws11258

---

**ISWS: ERROR: isws11258: Processing will be aborted because operation and acquisition of the attachment contained in the send data failed. : message=%s1: name=%s2 contentType=%s3**

#### Variable Information

%s1 = Exception information

%s2 = name

%s3 = contentType

#### Explanation

Processing aborted because operations on and acquisition of the attachment contained in the send data failed.

#### System Action

Stops processing.

#### User Action

Refer to the exception information to fix the error. Also, check that there is no problem with the send target attachment.

## 14.12.48 isws11259

---

**ISWS: ERROR: isws11259: Processing will be aborted because operation and acquisition of the attachment contained in the receive data failed. : message=%s1: namespace=%s2 localName=%s3 prefix=%s4**

### Variable Information

%s1 = Exception information

%s2 = namespace

%s3 = localName

%s4 = prefix

### Explanation

Processing aborted because operation and acquisition of the attachment contained in the receive data failed.

### System Action

Stops processing.

### User Action

Refer to the exception information and fix the error. Also, check there is no problem with the send source attachment.

## 14.12.49 isws11260

---

**ISWS: ERROR: isws11260: Processing will be aborted because operation and analysis of the attachment contained in the receive data failed. : messageType=%s1 saveRequired=%s2 mAttachmentsImpIClassName=%s3**

### Variable Information

%s1 = Internal information

%s2 = Internal information

%s3 = Internal information

### Explanation

Processing aborted because operation and analysis of the attachment contained in the receive data failed.

### System Action

Stops processing.

### User Action

Refer to the exception information and fix the error. Also, check there is no problem with the send source attachment.

## 14.12.50 isws11261

---

**ISWS: ERROR: isws11261: Processing will be aborted because operation and analysis of the attachment contained in the receive data failed. : sendtype=%s1 contentLocation=%s2 \_askedForAttachments=%s3 \_askedForStreams=%s4**

### Variable Information

%s1 = Internal information

%s2 = Internal information

%s3 = Internal information

%s4 = Internal information

#### Explanation

Processing aborted because operation and analysis of the attachment contained in the receive data failed.

#### System Action

Stops processing.

#### User Action

Refer to the exception information and fix the error. Also, check there is no problem with the send source attachment.

### 14.12.51 isws11263

---

**ISWS: WARNING: isws11263: Failed in the acquisition of an attached file. There is a possibility that the attached data which are not referred to from an envelope were lost.**

#### Explanation

Failed to get the attached data.

#### System Action

Continues processing.

#### User Action

An illegal format MIME part may have been sent. Contact the connection partner to check.

### 14.12.52 isws11264

---

**ISWS: WARNING: isws11264: There is no response message.**

#### Explanation

There is no response message.

#### System Action

Continues processing.

#### User Action

If the response message is required, check the handler processing.

### 14.12.53 isws11265

---

**ISWS: WARNING: isws11265: Failed to delete the file used for processing attached data. Path=%s1 %s2**

#### Variable Information

%s1 = Path of a file used for internal processing

%s2 = Internal information

## Explanation

Failed to delete the file in %s1.

## System Action

File used for internal processing not deleted.

## User Action

Check the following, and after the application closes delete the file:

- Check that the file in %s1 is not being used by another application.
- Verify that the authorization for the path in %s1 is add/modify/delete.

## 14.12.54 isws11266

---

### **ISWS: ERROR: isws11266: Boundary not found.**

## Explanation

The MIME boundary string could not be found.

## System Action

Returns Fault to the Application.

## User Action

Take the following action:

- If this message is output when a Web service server application is executed:
  - Check that the WSDL provided to the Web service user is correct.
  - Ask the Web service user to verify the connection destination URL.
  - Ask the Web service user to verify that the SOAP message has been sent according to the WSDL provided.
- If this message is output when a Web service client application is executed:
  - Check that the WSDL (in the connection destination) provided for the Web service was used to develop the application.
  - Verify the connection destination URL. Correct it if necessary.
  - Check the application. Correct the API parameters or usage methods if necessary.
  - Ask the Web service provider to check that the SOAP message has been sent according to WSDL.

## 14.12.55 isws11267

---

### **ISWS: ERROR: isws11267: Failed to output to the attachment data temporary file. file=%s1 exception=%s2**

## Variable Information

%s1 = File name

%s2 = Exception message

## Explanation

Failed to write to the attachment data temporary file.

## System Action

Stops processing.

## User Action

Take the following action:

- Confirm that the process can access the directory used to create the temporary file, and configure appropriate authority settings for the directory or process.
- Verify that the directory in which the temporary file is created is valid.  
For details on the directory in which the temporary file is created, refer to "Web Service Settings File" in the "J2EE User's Guide".
- Refer to the exception information and resolve the error.

## 14.12.56 isws11268

---

**ISWS: ERROR: isws11268: Failed to read the attachment data from the temporary file. file=%s1 exception=%s2**

### Variable Information

%s1 = File name

%s2 = Exception message

### Explanation

Failed to read to the attachment data temporary file.

## System Action

Stops processing.

## User Action

Take the following action:

- Confirm that the process can access the directory used to create the temporary file, and configure appropriate authority settings for the directory or process.
- Verify that the directory in which the temporary file is created is valid.  
For details on the directory in which the temporary file is created, refer to "Web Service Settings File" in the "J2EE User's Guide".
- Refer to the exception information and resolve the error.

## 14.12.57 isws11269

---

**ISWS: WARNING: isws11269: The MIME part declared in the mime:content element was not sent because null was set for the corresponding parameter. operation=%s1 part=%s2 type=%s3**

### Variable Information

%s1 = Name of the operation contained in the target mime:content element

%s2 = part attribute in the mime:content element

%s3 = type attribute in the mime:content element

### Explanation

The MIME part was not sent because a parameter declared in the WSDL mime:content element was set to "null".

## System Action

MIME part for null parameters not sent.

## User Action

Correct the Web service application or Web service client so that the target parameter cannot be sent using "null" If this is not the problem, but the corresponding MIME part is not sent, change the settings in the Web service settings file.

For details, refer to "Developing Applications Based on the WS-I Basic Profile and Attachment Profile" in the "J2EE User's Guide".

## 14.12.58 isws11270

---

**ISWS: ERROR: isws11270: null was set for the parameter declared in the mime:content element. operation=%s1 part=%s2 type=%s3**

### Variable Information

%s1 = Name of the operation contained in the target mime:content element

%s2 = part attribute in the mime:content element

%s3 = type attribute in the mime:content element

### Explanation

A parameter declared in the WSDL mime:content element was set to "null".

## System Action

Stops processing.

## User Action

Correct the Web service application or Web service client so that the target parameter is not set to null. If this is not the problem, but the corresponding MIME part is not sent, change the settings in the Web service settings file.

For details, refer to "Developing Applications Based on the WS-I Basic Profile and Attachment Profile" in the "J2EE User's Guide".

## 14.12.59 isws11271

---

**ISWS: ERROR: isws11271: Processing will be aborted because operation and acquisition of the attachment contained in the receive data failed. : message=%s1: partName=%s2**

### Variable Information

%s1 = Exception message

%s2 = Internal information

### Explanation

Processing aborted because operation and analysis of the attachment contained in the receive data failed.

## System Action

Stops processing.

## User Action

Refer to the exception information and fix the error. Also, check there is no problem with the attachment source at the source.

## 14.12.60 isws11272

---

**ISWS: WARNING: isws11272: Failed to get temporary directory for attachment in %s1**

### Variable Information

%s1 = Target directory

### Explanation

Failed to get temporary directory for attachment.

### System Action

Uses an existing file directory for the attachment data temporary file directory and continues processing.

### User Action

Check that the path specified in the Web service settings file for temporary directory used to process attachment data is correct, access is possible, and there is sufficient available capacity. Refer to the exception information output and fix the error.

## 14.12.61 isws11273

---

**ISWS: ERROR: isws11273: An error occurred during attachment processing. class=%s1 method=%s2 sendtype=%s3 contentLocation=%s4 keepMode=%s5**

### Variable Information

%s1 = Class in which the error occurred

%s2 = Method in which the error occurred

%s3 = Send type

%s4 = contentLocation

%s5 = Temporary file keep mode

### Explanation

An error occurred during attachment processing.

### System Action

Stops processing.

### User Action

If you are reading the attachment data from the file, check there are no problems reading the file.

If you are receiving the attachment from the network, check there are no errors in the network or at the send source.

Check there are no errors in the SOAP message data that was received.

If you are sending the attachment data from the file, check there are no errors in the object.

Refer to the exception information and fix the error.

## 14.12.62 isws11274

---

**ISWS: ERROR: isws11274: An error occurred during attachment processing. class=%s1 method=%s2 contentId=%s3 eos=%s4 rootPartLength=%s5 closed=%s6**

## Variable Information

%s1 = Class in which the error occurred

%s2 = Method in which the error occurred

%s3 = Send type

%s4 = Indicates if the process is attached to the final boundary marker of the stream

%s5 = Length of the root part

%s6 = Indicates if the stream is closed

## Explanation

An error occurred during attachment processing.

## System Action

Stops processing.

## User Action

If you are reading the attachment data from the file, check there are no problems reading the file.

If you are receiving the attachment from the network, check there are no errors in the network or at the send source.

Check there are no errors in the SOAP message data that was received.

If you are sending the attachment data from the file, check there are no errors in the object.

Check there are no errors in the object content of the attachment you attempted to send.

Refer to the exception information and fix the error.

## 14.12.63 isws11275

---

**ISWS: ERROR: isws11275: Character encoding %s1 not supported : message=%s2 class=%s3 method=%s4**

## Variable Information

%s1 = Character code

%s2 = Exception information

%s3 = Class in which the error occurred

%s4 = Method in which the error occurred

## Explanation

URL decode processing failed because a character code that is not supported was specified.

## System Action

Stops processing.

## User Action

- Failed to decode the encoded characters contained in the received data. Specify the correct character code.
- The encoding method may not be supported for the encoded characters. Check the received data.

## 14.12.64 isws11276

---

---

**ISWS: ERROR: isws11276: Character encoding %s1 not supported : message=%s2 class=%s3 method=%s4****Variable Information**

%s1 = Encoding method

%s2 = Exception information

%s3 = Class in which the error occurred

%s4 = Method in which the error occurred

**Explanation**

URL decode processing failed because a character code that is not supported was specified.

**System Action**

Stops processing.

**User Action**

Failed to encode the encoded characters contained in the sent data. Specify the correct character code.

## 14.12.65 isws11277

---

**ISWS: ERROR: isws11277: Failed to decode %s1 : message=%s2 data=%s3****Variable Information**

%s1 = Target item

%s2 = Exception information

%s3 = Decode target characters

**Explanation**

%s1 decode processing failed.

**System Action**

Stops processing.

**User Action**

- Check whether the received data has been encoded using the correct character code.
- Refer to the exception information that was output immediately before and fix the error.

## 14.12.66 isws11278

---

**ISWS: ERROR: isws11278: An error occurred during attachment processing: detail=%s1****Variable Information**

%s1 = Detail information

**Explanation**

An error occurred during attachment processing.

**System Action**

Stops processing.

## User Action

Refer to the detail information and fix the error. If an exception stack trace that starts with javax is output for the package name, refer to the exception Javadoc.

## 14.12.67 isws11279

---

### **ISWS: ERROR: isws11279: An error occurred during attachment processing.**

#### Explanation

Attachment operation and analysis failed.

#### System Action

Stops processing.

#### User Action

Take the following action:

- If attachment data is being read from a file, check whether there is a problem reading the file.
- If the attachment is received from the network, check whether there is an error in the network or in the attachment sender.
- Check whether there is an error in the SOAP message data that was read.
- Check whether there is an error in the contents of the attachment type object that you tried to send.
- Refer to the exception information that is also output and fix the error.

## 14.12.68 isws11280

---

### **ISWS: ERROR: isws11280: %s1 is not defined.**

#### Variable Information

%s1 = Information that is not defined

#### Explanation

%s1 is not defined.

#### System Action

When IJServer is started: Processing is continued.

When an application is executed: An exception is returned.

#### User Action

Define the tag shown in %s1 in service-ref.

## 14.12.69 isws11281

---

### **ISWS: ERROR: isws11281: The getHandlerRegistry method of the Service object that was looked up using JNDI is not supported.**

#### Explanation

The getHandlerRegistry method of the Service object that was looked up using JNDI is not supported.

## System Action

Stops processing.

## User Action

Define the handler using the deployment descriptor, not the getHandlerRegistry method.

## 14.12.70 isws11282

---

**ISWS: ERROR: isws11282: Failed to create the Service object. : %s1**

### Variable Information

%s1 = Detail information

### Explanation

Failed to create the Service object.

### System Action

When IJServer is started: Processing is continued.

When an application is executed: An exception is returned.

### User Action

Check the detail information and take action.

## 14.12.71 isws11283

---

**ISWS: ERROR: isws11283: An internal exception occurred during analysis of the SOAP header block.**

### Explanation

An internal exception occurred during analysis of the SOAP header block.

### System Action

Stops processing.

### User Action

- Check the application. If there is an error in the API parameter or how it was used, correct it.
- Ask the Web service provider whether any SOAP messages that follow WSDL conventions were sent.
- Check the contents of the message output immediately before or after this one, and fix the error.

## 14.12.72 isws11284

---

**ISWS: ERROR: isws11284: %s1 that was specified in %s2 is not supported.**

### Variable Information

%s1 = Value specified in the tag

%s2 = tag name

### Explanation

%s1 that was specified in the %s2 tag is not supported.

## System Action

When IIServer is started: Processing is continued.

When an application is executed: An exception is returned.

## User Action

Do not specify %s1 in the %s2 tag.

## 14.12.73 isws11285

---

**ISWS: ERROR: isws11285: An internal exception occurred in handler instance delete processing. :%s1**

### Variable Information

%s1 = Name of the service in which delete processing was executed

### Explanation

An internal exception occurred in handler instance delete processing.

### System Action

A log is output and processing is continued.

### User Action

- Check the application. If there is an error in the API parameter or how it was used, correct it.
- Ask the Web service provider whether any SOAP messages that follow WSDL conventions were sent.
- Check the contents of the message output immediately before or after this one, and fix the error.

## 14.12.74 isws11286

---

**ISWS: ERROR: isws11286: An illegal value was specified in the %s1 element. : '%s2'**

### Variable Information

%s1 = element name

%s2 = Value that was defined

### Explanation

An illegal value was defined in the %s1 element.

### System Action

When IIServer is started: Processing is continued.

When an application is executed: An exception is returned.

### User Action

Check the %s1 element contents and correct the contents that were defined.

## 14.12.75 isws11287

---

**ISWS: ERROR: isws11287: Cannot find the implementation class of the service interface defined in the <service-interface> element. : class=%s1 service-interface=%s2 service-ref-name=%s3**

## Variable Information

%s1 = Service interface implementation class name

%s2 = Service interface name

%s3 = <service-ref-name> value

## Explanation

Cannot find the implementation class of the service interface defined in the <service-interface> element.

## System Action

When IJServer is started: Processing is continued.

When an application is executed: An exception is returned.

## User Action

Check the following and take action.

- If the Web service client application was created using the iswsgen client command or Interstage Studio, check that the classes generated in the command or Interstage Studio are all included in the application module.
- Check that the correct Service interface name has been defined in the <service-interface> element.  
The Service interface is generated by the iswsgen client command in the interface that inherits javax.xml.rpc.Service.
- Check that the interface specified in the <service-interface> element exists.
- If the application was created without using the iswsgen command and Interstage Studio, specify the correct WSDL file and JAXRPC mapping file in the <wsdl-file> and <jaxrpc-mapping-file> elements, and check that the Service interface implementation class is generated when the module is deployed.

## 14.12.76 isws11288

---

**ISWS: ERROR: isws11288: Cannot find the class defined in the <handler-class> element. : %s1**

## Variable Information

%s1 = class name

## Explanation

Cannot find the class defined in the <handler-class> element.

## System Action

When IJServer is started: Processing is continued.

When the application is executed: Returns an exception.

## User Action

Specify a class name that exists.

## 14.12.77 isws11289

---

**ISWS: ERROR: isws11289: The value specified in the %s1 element has been duplicated. : %s2**

## Variable Information

%s1 = element name

%s2 = Value that was entered

## Explanation

The value specified in the %s1 element is a duplicate.

## System Action

When IIServer is started: Processing is continued.

When an application is executed: An exception is returned.

## User Action

Specify a value that is unique in the file for the %s1 element.

## 14.12.78 isws11290

---

**ISWS: ERROR: isws11290: An error occurred during the server processing. detail=%s1**

## Variable Information

%s1 = Detail information

## Explanation

An error occurred during server processing.

## System Action

Stops processing.

## User Action

- If this message is output when the Web service application is executed  
Refer to the message in the container log that was output before this message and take action.
- If this message is output when the Web service client application is executed  
Contact the Web service administrator.

## 14.12.79 isws11291

---

**ISWS: ERROR: isws11291: Cannot set a parent element because of a circular reference. parent=%s1**

## Variable Information

%s1 = Name of the element you tried to set as the parent element

## Explanation

A circular reference occurred.

## System Action

Throw Exception.

## User Action

Do not specify the SOAPElement object that references objects that call methods as the parent element as the setParentElement method argument.

## 14.12.80 isws11292

---

---

**ISWS: ERROR: isws11292: The getTypeMappingRegistry method of the Service object that was looked up using JNDI is not supported.**

**Explanation**

The getTypeMappingRegistry method of the Service object that was looked up using JNDI is not supported.

**System Action**

Stops processing.

**User Action**

Call services using the stub created in Interstage. Do not use the getTypeMappingRegistry method.

---

## 14.13 isws11300 to isws11399

This section details messages numbered between isws11300 and isws11399.

### 14.13.1 isws11300

---

**ISWS: WARNING: isws11300: Certificate is not valid at now. Connection may be going to fail. (cert:%s1 error:%s2)**

**Variable Information**

%s1 = Certificate information

%s2 = Detail information

**Explanation**

It is possible that the connection failed because there was a problem in the specified client certificate.

**System Action**

Continues processing.

**User Action**

If the connection fails, refer to the detail information to fix the problem.

Check that there are no problems with the certificate specified in the SSL definition, or update the certificate if it has expired.

---

### 14.13.2 isws11301

---

**ISWS: WARNING: isws11301: CA certificate "%s1" is not valid at now, and removed from trusted CAs. Connection may be going to fail. (error: %s2)**

**Variable Information**

%s1 = CA certificate nickname

%s2 = Detail information

**Explanation**

The CA certificate connection cannot be used because of a problem with the specified CA certificate. Use of the connection might fail.

**System Action**

Ignores the CA certificate and continues processing.

**User Action**

If the connection fails, refer to the detail information to fix the problem.

If the certificate has expired, get a new CA certificate and specify it in the SSL definition.

### 14.13.3 isws11302

---

**ISWS: INFO: isws11302: Following cipher suites are not supported in the environment, and will not be used. : %s1**

#### Variable Information

%s1 = List of invalid encryption methods (standard notation) in the JSSE provider

#### Explanation

The encryption methods specified for the SSL definition are deemed invalid by the JSSE provider. These encryption methods are not used.

#### System Action

Ignores the encryption methods and continues processing.

### 14.13.4 isws11303

---

**ISWS: ERROR: isws11303: Failed to initialize SSL socket factory. ConfName: %s1. (%s2)**

#### Variable Information

%s1 = Specified SSL definition

%s2 = Detail information

#### Explanation

Failed to initialize SSL for the Web service client.

#### User Action

Refer to the detail information to fix the problem.

The main details of the detail information are shown below.

- Cannot get keystore accessing information from ssl definition 'SSL definition name'. : Detail information
  - It is possible that the specified SSL definition name is invalid. Check the SSL definition name.
  - It is possible that there is no authority for access to the Interstage certificate environment in the Web service client application. Refer to "Setting up and using the Interstage certificate environment" - " Setting up the environment " in the "Security System Operator's Guide", and make the appropriate authority settings.
- None of specified ciphersuites is supported in the environment.
  - The specified SSL definition does not use a single encryption method supported by the JSSE provider. Check the specified SSL definition. For details about encryption methods supported by the JSSE provider, refer to the JDK/JRE documentation.

## 14.14 isws12000 to isws12099

---

This section details messages numbered between isws12000 and isws12099.

### 14.14.1 isws12000

---

**ISWS: ERROR: isws12000: Failed to create log file.: filePath=%s1**

#### Variable Information

%s1 = Log file path

#### Explanation

Failed to create log file.

## System Action

The log was not output.

## User Action

Take one of the following actions:

- Check the path (%s1), and correct it if necessary.
- Check the path (%s1) access authority, and correct it if necessary.
- Refer to the stack trace output after this message and fix the problem.

## 14.14.2 isws12001

---

**ISWS: WARNING: isws12001: Failed to write log file.**

### Explanation

Failed to write the log file.

### System Action

Stops the log output until the problem is resolved.

### User Action

Take one of the following actions:

- Check the log file output disk space. If this is insufficient, delete unnecessary files to secure space.
- Check the log file access authority. If this is invalid, set valid access authority.
- Refer to the stack trace output after this message and fix the problem.

## 14.14.3 isws12002

---

**ISWS: WARNING: isws12002: Error is in setting of property. Default value is used.: key=%1 value=%2**

### Variable Information

%s1 = Definition

### Explanation

The property settings are invalid, so the default value is used.

### User Action

Take one of the following actions:

- Set a valid property.
- Refer to the stack trace output after this message and fix the problem.

## 14.14.4 isws12003

---

**ISWS: WARNING: isws12003: Failed to load properties.: filePath=%s1**

### Variable Information

%s1 = Properties file path

### Explanation

Failed to load the properties file specified in "%s1".

## System Action

Continues processing.

## User Action

Take one of the following actions:

- Check the path (%s1), and correct it if necessary.
- Check the path (%s1) access authority, and correct it if necessary.
- Refer to the stack trace output after this message and fix the problem.

## 14.14.5 isws12004

---

**ISWS: WARNING: isws12004: Failed to load properties.: resourceName=isws.properties**

### Explanation

Failed to load the properties file.

### System Action

Uses the default value for all the settings in the properties file.

### User Action

Take one of the following actions:

- Check the access authority for the properties file in the class path for the class loader that loaded isws.jar. If the access authority is invalid, change it.
- Refer to the stack trace output after this message and fix the problem.

## 14.14.6 isws12010

---

**ISWS: WARNING: isws12010: Failed to load properties.: resourceName=isws-version.properties**

### Explanation

Failed to load the property file.

### System Action

Default settings are used for all items in the property file.

### User Action

Take the following action:

- Check the access authorization for the property file at the class path of the class loader used to load isws.jar. Correct if necessary.
- Refer to the stack trace output following this message to resolve the problem.

If this message is still output, use the *iscollectinfo* command to collect diagnostic information. Send the error information to your Systems Engineer.

## 14.14.7 isws12011

---

**ISWS: ERROR: isws12011: Failed to load properties.: m1=%s1 m2=%s2**

### Variable Information

%s1 = Internal information

%s2 = Internal information

## Explanation

Failed to load the property file.

## System Action

Default settings are used for all items in the property file.

## User Action

Take the following action:

- If a stack trace is output after this message, refer to the stack trace to resolve the problem.

If this message is still output, use the *iscollectinfo* command to collect diagnostic information. Send the error information to your Systems Engineer.

# 14.15 isws14000 to isws14099

---

This section details messages numbered between isws14000 and isws14099.

## 14.15.1 isws14000

---

**ISWS: ERROR: isws14000: Failed to load webservicess.xml: webapp=%s1 detail=%s2**

### Variable Information

%s1 = Web application name

%s1 = Detail information

### Explanation

The Web service included in this Web application cannot be used because the reading of the webservicess.xml file failed.

### System Action

Stops the Web service registration processing.

### User Action

Refer to the detail information and fix webservicess.xml, and then re-deploy the Web application.

## 14.15.2 isws14001

---

**ISWS: ERROR: isws14001: Cannot find the interface specified in <service-endpoint-interface>: service=%s1 interface=%s2**

### Variable Information

%s1 = Web application name

%s1 = Java interface name

### Explanation

The Java interface specified in <service-endpoint-interface> of webservicess.xml is not set in the Web application class path.

### System Action

Stops Web service application processing.

### User Action

Set the Java interface specified in <service-endpoint-interface> of webservicess.xml in the Web application class path, and then re-deploy the Web application.

### 14.15.3 isws14002

---

**ISWS: ERROR: isws14002: Failed to initialize a monitor: webapp=%s1 detail=%s2**

#### Variable Information

%s1 = Web application name

%s1 = Detail information

#### Explanation

Failed to initialize Web service application statistical information.

#### System Action

The statistical information of the Web service application included among the same Web applications is not collected.

#### User Action

Refer to the detail information to establish the cause of the problem.

### 14.15.4 isws14003

---

**ISWS: ERROR: isws14003: No definition of the class could be found.: service=%s1**

#### Variable Information

%s1 = Port name

#### Explanation

The service endpoint interface or class could not be found in class path.

#### System Action

Stops Web service application processing.

#### User Action

Re-deploy the required class file in the war file, or set the class path for the class required for the IJServer settings.

### 14.15.5 isws14004

---

**ISWS: ERROR: isws14004: Web service Monitoring is stopped due to the unexpected error: webapp=%s1 detail=%s2**

#### Variable Information

%s1 = Web application name

%s1 = Detail information

#### Explanation

An unexpected error occurred while the statistical information was being collected.

#### System Action

The Web service application statistical information was not collected. Web service application processing continues.

#### User Action

Refer to the detail information to establish the cause of the error. If an isws14002 message is output before this message, refer to the isws14002 user action as well.

If the problem is not solved, collect the investigation information using the *iscollectinfo* command, then contact a service engineer.

## 14.16 isws15000 to isws15099

---

This section details messages numbered between isws15000 and isws15099.

### 14.16.1 isws15000

---

**ISWS: ERROR: isws15000: A mistake is found in the arguments.**

**Usage: iswsngen wsdl | server | client [options]**

**Detailed Usage can be referred to by specifying -help option.**

#### Explanation

The first argument is not "wsdl", "server" or "client".

#### System Action

Stops command processing.

#### User Action

Specify one of wsdl, server or client, or for the first argument.

### 14.16.2 isws15002

---

**ISWS: ERROR: isws15002: The value of the styleuse option must be DOCLITERALWRAPPED, RPCENC or RPCLITERAL.**

#### Explanation

styleuse is invalid.

#### System Action

Stops command processing.

#### User Action

Specify one of DOCLITERALWRAPPED, RPCENC, or RPCLITERAL.

### 14.16.3 isws15003

---

**ISWS: ERROR: isws15003: The value of the retrieve option must be none, local or global.**

#### Explanation

The -retrieve option is invalid.

#### System Action

Stops command processing.

#### User Action

Specify one of none, local, or global.

### 14.16.4 isws15004

---

**ISWS: ERROR: isws15004: Unknown option %s1 specified.**

#### Variable Information

%s1 = option

#### Explanation

An unknown option was specified.

#### System Action

Stops command processing.

#### User Action

Specify a valid option, and then re-execute the command.

### 14.16.5 isws15005

---

**ISWS: ERROR: isws15005: Unknown option %s1 specified.**

#### Variable Information

%s1 = option

#### Explanation

An unknown option was specified.

#### System Action

Stops command processing.

#### User Action

Specify a valid option, and then re-execute the command.

### 14.16.6 isws15006

---

**ISWS: ERROR: isws15006: There was a problem passing the class specified for the -classpath option.**

#### Explanation

The class loader could not be created because the "-classpath" option path is invalid.

#### System Action

Stops command processing.

#### User Action

Check that the file path specified is valid.

### 14.16.7 isws15007

---

**ISWS: ERROR: isws15007: Pass the path of the existing directory to the %s1 option.**

#### Variable Information

%s1 = option

#### Explanation

The specified directory path is invalid.

#### System Action

Stops command processing.

#### User Action

Check the directory path.

## 14.16.8 isws15008

---

**ISWS: ERROR: isws15008: Specify the file name for the %s1 option.**

### Variable Information

%s1 = option

### Explanation

The specified file is invalid.

### System Action

Stops command processing.

### User Action

Specify the file name. The path cannot be specified.

## 14.16.9 isws15009

---

**ISWS: ERROR: isws15009: Failed to load input class %s1.**

### Variable Information

%s1 = Class name

### Explanation

The input class (service endpoint interface) could not be found.

### System Action

Stops command processing.

### User Action

Check that the classpath contains a class.

## 14.16.10 isws15010

---

**ISWS: ERROR: isws15010: WSDL file not found.: file=%s1**

### Variable Information

%s1 = Specified file name

### Explanation

The WSDL file specified for the iswsngen command argument could not be found.

### System Action

Stops command processing.

### User Action

Specify an existing WSDL file path for the argument.

## 14.16.11 isws15011

---

**ISWS: ERROR: isws15011: Invalid package name specified for the -NStoPkg option: %s1**

## Variable Information

%s1 = Package name specified for the "-NStoPkg" option

## Explanation

The package name specified for the -NStoPkg option is invalid as a java package name.

## System Action

Stops command processing.

## User Action

Specify a string that can be used for the Java package name.

## 14.16.12 isws15012

---

**ISWS: ERROR: isws15012: Invalid package name specified in the file specified for the -PkgNSmappingFile option : %s1**

## Variable Information

%s1 = Invalid java package written in the file specified for -PkgNSmappingFile

## Explanation

The java package in the file specified for -PkgNSmappingFile is invalid.

## System Action

Stops command processing.

## User Action

Specify a string that can be used for the Java package name.

## 14.16.13 isws15013

---

**ISWS: ERROR: isws15013: Invalid class name specified. : %s1**

## Variable Information

%s1 = Java class specified for the option

## Explanation

The Java class specified for the command option is invalid.

## System Action

Stops command processing.

## User Action

Specify a string that can be used for the Java class name.

## 14.16.14 isws15014

---

**ISWS: ERROR: isws15014: Invalid location URL specified for the -l option : %s1**

## Variable Information

%s1 = URL specified for the -l option

## Explanation

The URL specified for the -l option is invalid.

## System Action

Stops command processing.

## User Action

Specify a string that can be used for the URL.

## 14.16.15 isws15015

---

**ISWS: ERROR: isws15015: Invalid binding name specified for the -bindingName option : %s1**

## Variable Information

%s1 = bindingName specified for the -bindingName option

## Explanation

A string that cannot be used with the "xsd:NCName" type was specified for the "-bindingName" option.

## System Action

Stops command processing.

## User Action

Specify a string that can be used with the "xsd:NCName" type.

## 14.16.16 isws15016

---

**ISWS: ERROR: isws15016: Invalid service name specified for the -serviceElementName option : %s1**

## Variable Information

%s1 = Name specified for the -serviceElementName option

## Explanation

A string that cannot be used with the "xsd:NCName" type was specified for the "-serviceElementName" option.

## System Action

Stops command processing.

## User Action

Specify a string that can be used with the "xsd:NCName" type.

## 14.16.17 isws15017

---

**ISWS: ERROR: isws15017: Invalid port name specified for the -servicePortName option : %s1**

## Variable Information

%s1 = Port name specified for -servicePortName

### Explanation

A string that cannot be used with the "xsd:NCName" type was specified for the "-servicePortName" option.

### System Action

Stops command processing.

### User Action

Specify a string that can be used with the "xsd:NCName" type.

## 14.16.18 isws15018

---

### **ISWS: ERROR: isws15018: Invalid parameter specified for the -timeout option : %s1**

#### Variable Information

%s1 = Value specified for the "-timeout" option

### Explanation

The value specified for the "-timeout" option is invalid.

### System Action

Stops command processing.

### User Action

Specify a number for the "-timeout" option.

## 14.16.19 isws15019

---

### **ISWS: ERROR: isws15019: The value of the attachmentsType option must be swaref, or apache.**

#### Explanation

The value of the attachmentsType option must be "swaref", or "apache".

### System Action

Stops processing.

### User Action

Set the attachmentsType option to a "swaref", or "apache".

## 14.16.20 isws15020

---

### **ISWS: ERROR: isws15020: Class %s1 that is used in the service endpoint interface cannot be mapped to XML data type "wsibp:swaRef". Either use the javax.activation.DataHandler class instead of %s1, or specify "apache" for the -attachmentsType option value.**

#### Variable Information

%s1 = Class name. This can be one of:

- java.awt.Image
- javax.xml.transform.Source

- javax.mail.internet.MimeMultipart

## Explanation

The %s1 class that is used in the service end point interface cannot be mapped to the 'wsibi:swaRef' XML data type.

## System Action

Stops processing.

## User Action

During WSDL generation (using the *iswsgen wsd* subcommand), by default the WS-I Attachments Profile 1.0-based wsibp:swaRef type is used when the Java class that indicates the attachment is mapped to the XML schema part of the WSDL.

If the %s1 class is used, the *iswsgen* command notifies an error. In this case, do one of the following:

- Use a javax.activation.DataHandler class that can be mapped to wsibp:swaRef instead of %s1.
- Reconfigure the service end point interface so that the %s1 class is mapped to the mime:content element, not to the XML schema part in the WSDL. For details, refer to "Web Service Development" in the "J2EE User's Guide".
- Specify "apache" for the -attachmentsType option, execute the command, and then specify the Java class so it is mapped to the apachesoap namespace XML data type.

In this case, note that the generated WSDL file is not WS-I Attachments Profile1.0-based. For details, refer to "Web Service Development" in the "J2EE User's Guide".

## 14.16.21 isws15021

---

**ISWS: ERROR: isws15021: Class %s1 that is used in the service endpoint interface uses class %s2, which cannot be mapped to the "wsibp:swaRef" XML data type, either directly or indirectly. Either use the javax.activation.DataHandler class instead of %s2, or specify "apache" for the "-attachmentsType" option.**

## Variable Information

%s1 = Class name used in the service end point interface

%s2 = Class name referenced either directly or indirectly from the %s1 class

## Explanation

The %s1 class used in the service end point interface references the %s2 class. %s2 cannot be mapped to the "wsibi:swaRef" XML data type, either directly or indirectly.

## System Action

Stops processing.

## User Action

During WSDL generation (using the *iswsgen wsd* subcommand), by default the wsibp:swaRef type based on WS-I Attachments Profile 1.0 is used when the Java class identifying the attachment is mapped to the XML schema part of the WSDL.

If %s2 is used, the *iswsgen* command raises an error. In this case, do one of the following:

- Use a javax.activation.DataHandler class that can be mapped to wsibp:swaRef instead of %s2.
- Reconfigure the service end point interface so that %s2 is mapped to the mime:content element, not to the XML schema part of the WSDL.

For details, refer to "Web service development" in the "J2EE User's Guide".

- Specify "apache" for the "-attachmentsType" option, execute the command, and specify the Java class explicitly so that it is mapped to the apachesoap namespace XML data type.

In this case, note that the generated WSDL file is not based on WS-I Attachments Profile1.0.

For details, refer to "Web service development" in the "J2EE User's Guide".

## 14.16.22 isws15022

---

**ISWS: ERROR: isws15022: The value of the -module option must be web or ejb.**

### Explanation

Specify "web" or "ejb" as the value of the -module option.

### System Action

Stops processing.

### User Action

Specify "web" or "ejb" as the value of the -module option.

## 14.17 isws15100 to isws15199

---

This section details messages numbered between isws15100 and isws15199.

### 14.17.1 isws15101

---

**ISWS: ERROR: isws15101: There is an import definition which cannot be referenced.:level=%s1 URL=%s2**

### Variable Information

%s1 = Reference level (none/local/global)

%s2 = URL in which the error occurred

### Explanation

The URL specified in one of <xsd:import>, <xsd:include>, or <wsdl:import> in the WSDL file could not be referenced.

### System Action

Stops command processing.

### User Action

Specify the "-retrieve" option so that the URL can be referenced.

## 14.18 isws15200 to isws15299

---

This section details messages numbered between isws15200 and isws15299.

### 14.18.1 isws15200

---

**ISWS: ERROR: isws15200: Failed to generate XML.**

### Explanation

Failed to generate the XML file.

### System Action

Stops command processing.

## User Action

Check that the following files exist:

**Windows32/64**

C:\Interstage\J2EE\lib\xerces

- xercesImpl.jar
- xml-apis.jar

**Solaris32/64** **Linux32/64**

/opt/FJSVj2ee/lib/xerces

- xercesImpl.jar
- xml-apis.jar

## 14.18.2 isws15201

---

**ISWS: ERROR: isws15201: Failed to generate XML.  
An error occurred during the creation of %s1.**

### Variable Information

%s1 = File path

### Explanation

Failed to generate the XML file.

### System Action

Stops command processing.

### User Action

Take one of the following actions:

- Check the XML file access authority.
- Refer to the exception detail message and take action.

## 14.18.3 isws15202

---

**ISWS: ERROR: isws15202: Failed to generate XML.  
Failed to read %s1.**

### Variable Information

%s1 = File path

### Explanation

Failed to generate or analyze the XML file.

### System Action

Stops command processing.

### User Action

Take one of the following actions:

- Check the XML file access authority.
- Check the XML syntax.

## 14.18.4 isws15203

---

**ISWS: ERROR: isws15203: Failed to generate XML.  
%s1 is not a file.**

### Variable Information

%s1 = File path

### Explanation

A directory with the same name as the generated XML file already exists.

### System Action

Stops command processing.

### User Action

Either delete the directory or change the output directory for the XML file.

## 14.18.5 isws15204

---

**ISWS: ERROR: isws15204: The XML library does not support JAXP 1.2.**

### Explanation

The XML parser does not support JAXP version 1.2.

### System Action

Stops Web service application initialization processing.

### User Action

Use the Interstage Management Console or the `isj2eeadmin` command to check that a JAXP1.2-compatible XML parser directory is selected for [Xerces2], [Fujitsu XML Processor], or [Other] in [Type of XML Parser to use]. Restart IJServer.

For details about the XML parser settings, refer to "Class Loaders"->"XML Parser Settings" in the "J2EE User's Guide".

## 14.18.6 isws15205

---

**ISWS: ERROR: isws15205: Generation of a directory went wrong %s1.**

### Variable Information

%s1 = Directory path

### Explanation

Failed to generate the XML file output directory.

### System Action

Stops command processing.

### User Action

Check that the output in the output directory is possible (check the disk space and write authority for the directory).

## 14.18.7 isws15206

---

**ISWS: ERROR: isws15206: Generation of a directory went wrong %s1.**

### Variable Information

%s1 = Directory path

## Explanation

Failed to generate the WSDL file output directory.

## System Action

Stops command processing.

## User Action

Check that the output in the output directory is possible (check the disk space and write authority for the directory).

## 14.18.8 isws15207

---

### ISWS: ERROR: isws15207: Failed to generate the WSDL file.%s1

#### Variable Information

%s1 = Detail message

#### Explanation

Failed to generate the WSDL file.

#### System Action

Stops command processing.

#### User Action

Refer to the exception detail message and take action.

## 14.18.9 isws15208

---

### ISWS: ERROR: isws15208: Failed to generate the web service application. %s1

#### Variable Information

%s1 = Detail message

#### Explanation

Failed to generate the Web service application.

#### System Action

Stops command processing.

#### User Action

Possibilities are as follows:

- The input WSDL file does not exist. Check the path.
- Check that the output in the output directory is possible (check the disk space and write authority for the directory).

In an environment that uses a proxy, specify the -proxyHost/-proxyPort/-proxyUser/-proxyPassword option if necessary.

Establish the cause of the error according to the detail message and re-execute the command.

#### Windows32/64

Check that the partial strings (parts of a string separated by '.', '/', or ':'), type name, port type, or service name of the WSDL Naming Service are not the same as the DOS device name.

If the partial strings of the WSDL Naming Service are inappropriate, specify such that the DOS device name is not included in the Java package names defined by the -PkgNSmappingFile option.

In all other cases, the WSDL cannot be used.

## 14.19 isws15300 to isws15399

This section details messages numbered between isws15300 and isws15399.

### 14.19.1 isws15300

**ISWS: ERROR: isws15300: The error was detected by checking the Service Endpoint Interface rule. %s1**

#### Variable Information

%s1 = Error detail information

#### Explanation

An error occurred during the service endpoint interface validity check.

#### System Action

Stops command processing.

#### User Action

Refer to the error information in the table and correct the service endpoint interface.

Table 14.4 Error information interpretation

No	Error information	Variable Information	Explanation	User Action
1	The qualifier of the service endpoint interface "%s1" is not an interface.	%s1: service endpoint interface name	A class was specified for the service endpoint interface.	Specify an interface for the service endpoint interface.
2	The service endpoint interface "%s1" must extend java.rmi.Remote (direct or indirect).	%s1: service endpoint interface name	The service endpoint interface does not extend the "java.rmi.Remote" interface.	The service endpoint interface must extend the "java.rmi.Remote" interface.
3	The interface "%s1" is an inner class. Inner classes are not supported.	%s1: service endpoint interface name or super interface name	The service endpoint interface or super interface was declared as the inner class of another class.	Do not use inner classes.
4	The unqualified name "%s1" of the service endpoint interface "%s2" starts with lower case.	%s1: Interface name except for the service endpoint interface package %s2: service endpoint interface name	The interface name except for the service endpoint interface package starts with lower case.	The interface name except for the service endpoint interface package must start with upper case.
5	The overloaded method "%s1" is not supported.	%s1: method name	There is an overloaded method in the service endpoint interface or super interface.	Do not overload methods.
6	The method name "%s1" declared in interface "%s2" starts with upper case. The method name of the service endpoint interface (and its super interface) must start with lower case.	%s1: method name %s2: service endpoint interface name or super interface name	There is a method in the service endpoint interface or super interface that starts with upper case.	The method must start with lower case.
7	The method "%s1" of interface "%s2" does not throw	%s1: method name	There is a method in the service endpoint interface or super interface that is not	Declare the method in the section that throws

No	Error information	Variable Information	Explanation	User Action
	javax.rmi.RemoteException. All methods of the service endpoint interface (and its super interface) must throw javax.rmi.RemoteException.	%s2: service endpoint interface name or super interface name	declared in the section that throws "javax.rmi.RemoteException".	"javax.rmi.RemoteException".
8	When the "-module" option is specified with the value "ejb", The method name of the service endpoint interface (and its super interface) must not start with "ejb". method=%s1 interface=%s2	%s1: method name %s2: service endpoint interface name or super interface name	When "ejb" is specified for the -module option, a method name that starts with "ejb" cannot be declared for the service endpoint interface or its parent interface.	Do not declare a method name that starts with "ejb".

## 14.19.2 isws15301

**ISWS: ERROR: isws15301: The error was detected by checking the support type.**  
%s1

### Variable Information

%s1 = Error detail information

### Explanation

This is an input class support type error.

### System Action

Stops command processing.

### User Action

Refer to the error information in the table and correct the service endpoint interface and user definition class.

Table 14.5 Error information interpretation

No	Error information	Variable Information	Explanation	User Action
1	The array of holder class "%s1" is referenced from the method "%s2" of the service endpoint interface "%s3". Array of any holder classes is not supported.	%s1: Holder class %s2: Method for referencing the Holder class %s3: Service endpoint interface that declared the method	The Holder class array was used.	Do not use Holder class arrays.
2	The class "%s1" references unsupported class "%s2" in the declaration of public (non-static) field "%s3".	%s1: Class that declared the field %s2: Unsupported class %s3: Field for referencing the unsupported class	An unsupported class was used in the user-defined class "public" field.	Use a supported class.
3	The class "%s1" inherits "%s2". User-defined classes that inherit non-user-defined classes (java.*, javax.*, except for	%s1: Class that inherited the standard Java class %s2: Inherited standard Java class	The user-defined class inherits package classes that start with java.* and javax.*.	Except for "java.lang.Object", do not inherit package classes that start with java.* and javax.*.

No	Error information	Variable Information	Explanation	User Action
	java.lang.Object ) are not supported.			
4	The service endpoint interface "%s1" references unsupported class "%s2" as a parameter of (declared or inherited) method "%s3".	%s1: Service endpoint interface %s2: Unsupported class %s3: Method for referencing the unsupported class	There is a class in the service endpoint interface or super interface method argument that is not supported.	Use a supported class.
5	The service endpoint interface "%s1" references unsupported class "%s2" as a return type of (declared or inherited) method "%s3".	%s1: Service endpoint interface %s2: Unsupported class %s3: Method for referencing the unsupported class	There is a class in the service endpoint interface or super interface method return value that is not supported.	Use a supported class.
6	The class "%s1" references unsupported class "%s2" in the declaration of setter method "%s3".	%s1: Class for referencing the supported class %s2: Unsupported class %s3: "set" method	There is a class in the user-defined class "set" method argument that is not supported.	Use a supported class.
7	The class "%s1" references unsupported class "%s2" in the declaration of getter method "%s3".	%s1: Class for referencing the supported class %s2: Unsupported class %s3: "get" method	There is a class in the user-defined class "get" method return value that is not supported.	Use a supported class.
8	The holder class "%s1" is referenced from the "%s2" setter method of the class "%s3". Holder classes can be used only as a method parameter of the service endpoint interface.	%s1: Holder class %s2: "set" method for using the Holder class as the return value %s3: Class for referencing the Holder class	The Holder class was used in the user-defined class "set" method argument.	Do not use the Holder class except for service endpoint interface method arguments.
9	The holder class "%s1" is referenced from the "%s2" getter method of the class "%s3". Holder classes can be used only as a method parameter of the service endpoint interface.	%s1: Holder class %s2: "get" method for using the Holder class as the return value %s3: Class for referencing the Holder class	The Holder class was used in the user-defined class "get" method return value.	Do not use the Holder class except for service endpoint interface method arguments.
10	The holder class "%s1" is referred to as the return type of the "%s2" method of service endpoint interface "%s3". Holder classes can be used only as a method parameter of the service endpoint interface.	%s1: Holder class %s2: Method for using the Holder class as the return value %s3: Service endpoint interface that declared the method	The Holder class was used in the service endpoint interface or super interface method return value.	Do not use the Holder class except for service endpoint interface method arguments.
11	The holder class "%s1" is referenced from the "%s2" field of class "%s3". Holder classes can be used only as a method parameter of the service endpoint interface.	%s1: Holder class %s2: Field name that declared as Holder type %s3: Class that declared the Holder type field	The Holder class was used in the user-defined class "public" field.	Do not use the Holder class except for service endpoint interface method arguments.

No	Error information	Variable Information	Explanation	User Action
12	The holder class "%s1" is referenced from the "value" field of holder class "%s2". Holder classes can be used only as a method parameter of the service endpoint interface.	%s1: Holder class %s2: Holder class when the "value" field type is Holder	The Holder class was used as the Holder class "value" field type.	Do not use the Holder class except for service endpoint interface method arguments.
13	The class "%s1" is an inner class. Inner classes are not supported.	%s1: Class declared as inner class of another class	An inner class was used.	Do not use inner classes.
14	The class "%s1" is not public. Non-public user-defined classes (classes except for java.* , javax.* ) are not supported.	%s1: Non-public class	A non-public class was used.	Use a public class.
15	The java class "%s1" mapped to the XML enumeration type is not supported.	%s1: Class mapped to the type that uses XML "xsd:enumeration"	A class mapped to the type that uses XML "xsd:enumeration" was used.	Do not use a class mapped to the type that uses XML "xsd:enumeration".
16	The user-defined class "%s1" implements (directly or indirectly) java.rmi.Remote.	%s1: Class that implemented the "java.rmi.Remote" interface	A class that implemented the "java.rmi.Remote" interface as the user-defined class was used.	Do not use the class that implemented the "java.rmi.Remote" interface as the user-defined class.
17	The unqualified name "%s1" of the class "%s2" starts with lower case.	%s1: Class except for the package	The class name, except for the user-defined class package part, starts with lower case.	The class name, except for the user-defined class package part, must start with upper case.
18	The user-defined class "%s1" has no public default constructor.	%s1: User-defined class name	A user-defined class with no "public" default constructor was used.	Use a user-defined class that has a "public" default constructor.
19	The Holder class "%s1" must have a public (and non-static) field named "value".	%s1: Holder class name	A Holder class with no "public" default constructor was used.	Use a Holder class that has a "public" default constructor.
20	The service specific exception "%s1" must not extend java.lang.RuntimeException.	%s1: User-defined exception class name	The user-defined exception that inherited "java.lang.RuntimeException" was declared in the service endpoint interface method "throws" section.	Use a user-defined exception that does not inherit "java.lang.RuntimeException".
21	The method of the service endpoint interface must not throw user-defined Error "%s1".	%s1: User-defined error class	The user-defined error class was declared in the service endpoint interface method "throws" section.	Do not use the user-defined error class.
22	"%s1" is not a concrete Holder class.	%s1: User-defined Holder class	The user-defined interface that inherited "javax.xml.rpc.holders.Holder" was used as the Holder class.	Use the class that inherited "javax.xml.rpc.holders.Holder".

No	Error information	Variable Information	Explanation	User Action
23	The service endpoint interface method "%s1" references inconcrete Holder class "%s2".	%s1: Service endpoint interface method	"javax.xml.rpc.holders.Holder" was used as the Holder class.	Use the class that implemented "javax.xml.rpc.holders.Holder".
24	The service endpoint interface method "%s1" references unsupported holder class "javax.xml.rpc.holders.ObjectHolder".	%s1: Service endpoint interface method	The unsupported "javax.xml.rpc.holders.ObjectHolder" Holder class was used.	Do not use "javax.xml.rpc.holders.ObjectHolder".

### 14.19.3 isws15302

---

#### ISWS: ERROR: isws15302: The hierarchy of the input class is too deep.

##### Explanation

Analysis processing of the input class was aborted because the hierarchy of the input class is too deep.

##### System Action

Stops command processing.

##### User Action

Wait for a while and re-execute. If this message is still output, correct the input Java class and reduce the number of classes that are referenced from the input class or that are inherited directly or indirectly.

### 14.19.4 isws15303

---

#### ISWS: ERROR: isws15303: Failed to load class %s1.

##### Variable Information

%s1 = Exception detail message

##### Explanation

There was a class that cannot be loaded in the iswsngen support type check.

##### System Action

Stops command processing.

##### User Action

Specify the "-classpath" option so that classes that cannot be loaded can be referenced.

## 14.20 isws15900 to isws15999

---

This section details messages numbered between isws15900 and isws15999.

### 14.20.1 isws15900

---

#### ISWS: ERROR: isws15900: Internal error. %s1

##### Variable Information

%s1 = Error information

1. bad subcommand type.

2. bad option description.
3. Exception detail message
4. bad directory path.

### Explanation

An internal occur occurred.

- Subcommand is invalid
- An abnormal option is defined in the "parseOption" type method.
- Argument is invalid
- An exception that could not be caught in iswsRun() was returned.
- Abnormal directory-related option.

### System Action

Stops command processing.

### User Action

Fix the problem according to the detail information contents.

Alternatively, collect the investigation information using the *iscollectinfo* command, then contact a service engineer.

## 14.21 isws16000 to isws16099

---

This section details messages numbered between isws16000 and isws16099.

### 14.21.1 isws16000

---

**ISWS: ERROR: isws16000: File input/output error: file name=%s1: Details=%s2**

#### Variable Information

%s1 = File name

%s2 = Error detail information

#### Explanation

A file input/output error occurred.

#### System Action

Stops processing.

#### User Action

Possible causes are shown below. Establish the cause of the error, and then re-execute processing.

- Check that the file exists, and the access authority for the file. This error might occur in other applications if the file or directory shown in the variable information is referenced.
- It is possible that there is insufficient file system capacity. Either delete unnecessary files, or increase the file system capacity.

### 14.21.2 isws16001

---

**ISWS: ERROR: isws16001: File input/output error: Details =%s1**

#### Variable Information

%s1 = Error detail information

## Explanation

A file input/output error occurred.

## System Action

Stops processing.

## User Action

It is possible that there is insufficient file system capacity. Either delete unnecessary files or increase the file system capacity, and then re-execute processing.

Alternatively, collect the investigation information using the *iscollectinfo* command, then contact a service engineer.

## 14.21.3 isws16004

---

**ISWS: ERROR: isws16004: An error occurred reading files contained in the deployed files: File=%s1: Details=%s2**

## Variable Information

%s1 = File name

%s2 = Error detail information

## Explanation

An error occurred reading files contained in the deployed files.

## System Action

Stops processing.

## User Action

Establish the cause of the error according to the detail message, and then re-execute the process.

If the detail message contains the string "There was a timeout during the reading of the WSDL file.", check whether other resources specified in the WSDL file and the XML schema "import" element can be referenced.

The default timeout time for read processing for the WSDL file and resources referenced from the WSDL file is [45] seconds.

If resources referenced from the WSDL file are obtained using a proxy, settings must be made for connection using a proxy.

For details about changing the default timeout time, refer to "Running the Web Service (Server Function)" in the "J2EE User's Guide".

## 14.21.4 isws16005

---

**ISWS: ERROR: isws16005: More than one <servlet-mapping> for the <servlet> WebService port**

## Explanation

<servlet-mapping> was specified more than once for the <servlet> WebService port.

## System Action

Stops processing.

## User Action

It is not possible to specify <servlet-mapping> more than once for the <servlet> WebService port. Check the Web environment definition file to establish the cause of the error, and then re-execute processing.

## 14.21.5 isws16006

---

**ISWS: ERROR: isws16006: An error occurred when the class was loaded: Details=%s1**

## Variable Information

%s1 = Class for which class load failed

## Explanation

An error occurred when the class was loaded.

## System Action

Stops processing.

## User Action

Establish the cause of the error according to the detail message, and then re-execute the process.

## 14.21.6 isws16012

---

**ISWS: ERROR: isws16012: Servlet was not configured for <servlet-link> configured in webservices.xml.**

## Explanation

Servlet was not defined for <servlet-link> defined in webservices.xml.

## System Action

Stops processing.

## User Action

Check the Web environment definition file to establish the cause of the error, and then re-execute processing.

If a tag with a namespace prefix is specified, delete the prefix from the tag.

## 14.21.7 isws16013

---

**ISWS: ERROR: isws16013: webservices.xml read error: Details=%s1**

## Variable Information

%s1 = Error detail information

## Explanation

An error occurred during the reading of webservices.xml.

## System Action

Stops processing.

## User Action

Establish the cause of the error according to the detail message, and then re-execute the process.

For details about webservices.xml, refer to "Web Service Development" - "Web service environment definition file (deployment descriptor)" in the "J2EE User's Guide".

## 14.21.8 isws16015

---

**ISWS: ERROR: isws16015: The WSDL <address> was not configured for <wsdl-port> configured in webservices.xml: Port=%s1**

## Variable Information

%s1 = Prot name

## Explanation

The WSDL file <address> was not defined for <wsdl-port> defined in webservices.xml.

## System Action

Stops processing.

## User Action

Check that <address> of the WSDL file for <wsdl-port> defined in webservices.xml actually exists.

## 14.21.9 isws16016

---

**ISWS: ERROR: isws16016: service endpoint interface could not be found: Service endpoint interface=%s1**

## Variable Information

%s1 = Service endpoint interface

## Explanation

The service endpoint interface could not be found.

## System Action

Stops processing.

## User Action

Check that the service endpoint interface for <service-endpoint-interface> in webservices.xml actually exists.

## 14.21.10 isws16017

---

**ISWS: ERROR: isws16017: The argument class specified in the service endpoint interface method could not be found: Service endpoint interface=%s1: Method=%s2: Class=%s3**

## Variable Information

%s1 = Service endpoint interface

%s2 = Method name

%s3 = Class name

## Explanation

The argument class specified for the service endpoint interface method could not be found.

## System Action

Stops processing.

## User Action

Check that the class described in the <input> sub element in <operation> of the WSDL file for the service end point interface described in <service-endpoint-interface> of webservices.xml actually exists.

## 14.21.11 isws16018

---

**ISWS: ERROR: isws16018: Invalid URL prefix: Details=%s1**

## Variable Information

%s1 = Error detail information

## Explanation

Invalid URL prefix.

## System Action

Stops processing.

## User Action

Check the detail message and specify a valid URL prefix.

## 14.21.12 isws16019

---

**ISWS: ERROR: isws16019: <servlet-link> was not configured in webservices.xml.**

## Explanation

<servlet-link> was not defined in webservices.xml.

## System Action

Stops processing.

## User Action

Check the Web environment definition file to establish the cause of the error, and then re-execute processing.

## 14.21.13 isws16020

---

**ISWS: ERROR: isws16020: The <url-pattern> value for the Servlet for <servlet-link> defined in webservices.xml was invalid: Value=%s1**

## Variable Information

%s1 = Web environment definition file <url-pattern>

## Explanation

The Servlet <url-pattern> for the <servlet-link> defined in webservices.xml is invalid.

The URL specified for the WebService port must not contain '\*'.

## System Action

Stops processing.

## User Action

Fix the Web environment definition file <url-pattern>, and then re-execute processing.

## 14.21.14 isws16021

---

**ISWS: ERROR: isws16021: The class described in the WSDL <types> sub element could not be found: Class=%s1**

## Variable Information

%s1 = Class described in the WSDL <types> sub element

### Explanation

The class described in the WSDL <types> sub element could not be found.

### System Action

Stops processing.

### User Action

Check that the class described in the WSDL <types> sub element exists.

## 14.21.15 isws16022

---

**ISWS: ERROR: isws16022: The class for the Servlet for <servlet-link> defined in webservices.xml could not be found: Class=%s1**

### Variable Information

%s1 = Servlet class for the <servlet-link> defined in webservices.xml

### Explanation

The Servlet class for the <servlet-link> defined in webservices.xml could not be found.

### System Action

Stops processing.

### User Action

Check that the class described in <servlet-class> of the Web environment definition file exists.

If a tag with a namespace prefix is specified, delete the prefix from the tag.

## 14.21.16 isws16023

---

**ISWS: ERROR: isws16023: <ejb-link> has not been defined in webservices.xml.**

### Explanation

<ejb-link> has not been defined in webservices.xml.

### System Action

Stops processing.

### User Action

Check webservices.xml to fix the error and re-execute.

## 14.21.17 isws16024

---

**ISWS: ERROR: isws16024: There is an error in the relationship between <ejb-link> in webservices.xml and <ejb-name> in ejb-jar.xml: ejb-link=%s1**

### Variable Information

%s1 = Value of <ejb-link>

## Explanation

There is an error in the relationship between <ejb-link> in webservices.xml and <ejb-name> in ejb-jar.xml.

## System Action

Stops processing.

## User Action

Check the value that is defined for <ejb-link> in webservices.xml and <ejb-name> in ejb-jar.xml to fix the error and re-execute.

## 14.21.18 isws16025

---

**ISWS: ERROR: isws16025: There is an error in the relationship between <service-endpoint-interface> in webservices.xml and <service-endpoint> in ejb-jar.xml: ejb-link=%s1**

## Variable Information

%s1 = Value of <ejb-link>

## Explanation

There is an error in the relationship between <service-endpoint-interface> in webservices.xml and <service-endpoint> in ejb-jar.xml.

## System Action

Stops processing.

## User Action

Check the value that is defined for <service-endpoint-interface> in webservices.xml and <service-endpoint> in ejb-jar.xml to fix the error and re-execute.

## 14.21.19 isws16026

---

**ISWS: ERROR: isws16026: There is an error in the relationship between <wsdl-file> and <jaxrpc-mapping-file> in the deployment descriptor: Module name=%s1: service-ref-name=%s2**

## Variable Information

%s1 = Module name

%s2 = Value of <service-ref-name>

## Explanation

There is an error in the relationship between <wsdl-file> and <jaxrpc-mapping-file> in the deployment descriptor.

## System Action

Stops processing.

## User Action

Check the value that is defined for <wsdl-file> and <jaxrpc-mapping-file> in the deployment descriptor to fix the error and re-execute.

## 14.21.20 isws16027

---

**ISWS: ERROR: isws16027: There is an error in the relationship between <wsdl-file> and <jaxrpc-mapping-file> in the deployment descriptor: Module name=%s1: ejb-name=%s2: service-ref-name=%s3**

## Variable Information

%s1 = Module name

%s2 = Value of <ejb-name>

%s3 = Value of <service-ref-name>

## Explanation

There is an error in the relationship between <wsdl-file> and <jaxrpc-mapping-file> in the deployment descriptor.

## System Action

Stops processing.

## User Action

Check the value that is defined for <wsdl-file> and <jaxrpc-mapping-file> in the deployment descriptor to fix the error and re-execute.

## 14.21.21 isws16028

---

**ISWS: ERROR: isws16028: The file specified in the deployment descriptor does not exist: Module name=%s1: service-ref-name=%s2: Tag name=%s3**

## Variable Information

%s1 = Module name

%s2 = Value of <service-ref-name>

%s3 = Error tag name

## Explanation

The file specified in the deployment descriptor does not exist.

## System Action

Stops processing.

## User Action

Check that the value and file specified in the error tag name that is output in the variable information exist to fix the error and re-execute.

## 14.21.22 isws16029

---

**ISWS: ERROR: isws16029: The file specified in the deployment descriptor does not exist: Module name=%s1: ejb-name=%s2: service-ref-name=%s3: Tag name=%s4**

## Variable Information

%s1 = Module name

%s2 = Value of <ejb-name>

%s3 = Value of <service-ref-name>

%s4 = Error tag name

## Explanation

The file specified in the deployment descriptor does not exist.

#### System Action

Stops processing.

#### User Action

Check that the value and file specified in the error tag name that is output in the variable information exist to fix the error and re-execute.

### 14.21.23 isws16030

---

**ISWS: ERROR: isws16030: No definition of Stateless Session Bean for <ejb-link> defined in webservices.xml.**

#### Explanation

No definition of Stateless Session Bean for <ejb-link> defined in webservices.xml.

#### System Action

Stops processing.

#### User Action

Check ejb-jar.xml to fix the error and re-execute.

### 14.21.24 isws16031

---

**ISWS: ERROR: isws16031: Cannot find the Stateless Session Bean class for <ejb-link> that is defined in webservices.xml: Class name=%s1**

#### Variable Information

%s1 = Stateless Session Bean class name for <ejb-link> defined in webservices.xml

#### Explanation

Cannot find the Stateless Session Bean class for <ejb-link> that is defined in webservices.xml.

#### System Action

Stops processing.

#### User Action

Check whether the class described in <ejb-class> of ejb-jar.xml exists.

### 14.21.25 isws16032

---

**ISWS: ERROR: isws16032: A compile error occurred.**

#### Explanation

A compile error occurred in Javac.

#### System Action

Stops processing.

## User Action

- Fix the error according to the Javac compile error message and re-execute. The Javac compile error is output to the following file:

**Windows32/64**

```
C:\Interstage\J2EE\var\isdeploy\wsdeploy_api.info(or, wsdeploy_api_old.info)
```

**Solaris32/64 Linux32/64**

```
/opt/FJSVj2ee/var/isdeploy/wsdeploy_api.info(or, wsdeploy_api_old.info)
```

- Javac cannot run unless the JDK environment is installed. Install the JDK environment.

## 14.21.26 isws16033

---

**ISWS: ERROR: isws16033: An error occurred in source generation processing: Module name=%s1: Details=%s2**

### Variable Information

%s1 = Module name

%s2 = Detail information

### Explanation

An error occurred in source generation processing.

### System Action

Stops processing.

### User Action

Verify the message output in the detail part of the variable information, fix the error and re-execute.

## 14.21.27 isws16034

---

**ISWS: ERROR: isws16034: The classfile generated during deployment (as specified under <service-ref> of the deployment descriptor) is duplicated: Module name=%s1: service-ref-name=%s2**

### Variable Information

%s1 = Module name

%s2 = Value of <service-ref-name>

### Explanation

The classfile generated during deployment (as specified under <service-ref> of the deployment descriptor) is duplicated

### System Action

Stops processing.

### User Action

Check the following for <wsdl-file> that is specified under <service-ref> that is defined in the deployment descriptor of the module output in the variable information.

- Is the name attribute for any of the following elements duplicated in all the WSDL files that are referenced from the deployment descriptor?
  - <portType>, <binding>, <service>, <element>, <complexType>, <simpleType>

If so, take the following action:

- Modify the value for the name attribute

## 14.21.28 isws16035

---

**ISWS: ERROR: isws16035: The classfile generated during deployment (as specified under <service-ref> of the deployment descriptor) is duplicated: Module name=%s1: ejb-name=%s2: service-ref-name=%s3**

### Variable Information

%s1 = Module name

%s2 = Value of <ejb-name>

%s3 = Value of <service-ref-name>

### Explanation

The classfile generated during deployment (as specified under <service-ref> of the deployment descriptor) is duplicated

### System Action

Stops processing.

### User Action

Check the following for <wsdl-file> that is specified under <service-ref> that is defined in the deployment descriptor of the module output in the variable information.

- Is the name attribute for any of the following elements duplicated in all the WSDL files that are referenced from the deployment descriptor?
  - <portType>, <binding>, <service>, <element>, <complexType>, <simpleType>

If so, take the following action:

- Modify the value for the name attribute

## 14.22 isws16900 to isws16999

---

This section details messages numbered between isws16900 and isws16999.

### 14.22.1 isws16999

---

**ISWS: ERROR: isws16999: Internal error: Details=%s1**

### Variable Information

%s1 = Error detail information

### Explanation

An error occurred during internal processing.

### System Action

Stops deployment processing.

### User Action

Collect the investigation information using the *iscollectinfo* command, then contact a service engineer.

# Chapter 15 Messages Beginning with 'jms'

This chapter describes the messages displayed by the JMS.

## 15.1 jms1000 to jms1099

This section details the messages numbered between jms1000 and jms1099.

### 15.1.1 jms1000

**JMS:ERROR:jms1000: Error in JMS application operating environment.**

#### Explanation

Processing failed because of an environmental abnormality or an unexpected error.

#### System Action

The processing stops.

#### User Action

The following are suspected to be causes of failure in processing. Action required for each possible cause is listed below.

- An environment variable has an error (environment variable PATH, CLASSPATH or LD\_LIBRARY\_PATH). In case an environment variable has an error, change the environment variable.
- Necessary libraries have not been set to the environment variable LD\_LIBRARY\_PATH. In case necessary libraries are absent, install the product again.
- Version of JDK/JRE in use has an error. Select a correct version.

If the cause of the failure is not the above, collect diagnostic information with the *iscollectinfo* command, and contact the service engineer (SE).

### 15.1.2 jms1001

**JMS:ERROR:jms1001: Memory shortage occurred.**

#### Explanation

Memory is insufficient in Java VM.

#### System Action

The processing stops.

#### User Action

After a while, execute the processing again. In case this message is frequently output, take the following action, then restart the processing.

- Change the size of memory of Java VM.
- Check that memory is sufficient for execution. If necessary, re-estimate the volume of memory required by another application to be executed on the same machine.

### 15.1.3 jms1002

**JMS:ERROR:jms1002: There is a possibility that disk space is full. FILE '%s'**

#### Variable Information

%s = File Name

## Explanation

Size of the file system is insufficient.

## System Action

The processing stops.

## User Action

Check that the file system has sufficient free capacity and execute the processing again.

## 15.1.4 jms1003

---

### **JMS:ERROR:jms1003: Failure in reading of the file. FILE '%s'**

#### Variable Information

%s = File Name

#### Explanation

Failed to read a file.

#### System Action

The processing stops.

#### User Action

Check information on the console and eliminate the cause. Check the following items.

- The permissions required to access the directories and files under the Interstage installation directory may not be set. In this case, set the required permissions.
- In case an I/O error has occurred, check that the disk device where Interstage JMS is installed is operating normally.

In other cases, collect diagnostic information with the *iscollectinfo* command, and contact the service engineer (SE).

## 15.1.5 jms1004

---

### **JMS:ERROR:jms1004: Failure in writing to the file. FILE '%s'**

#### Variable Information

%s = File Name

#### Explanation

Failed to write to a file.

#### System Action

The processing stops.

#### User Action

Check information on the console and eliminate the cause. Check the following items.

- In case the access right is not set properly, change the access right so that access may be enabled to a specified file or directory.
- In case an I/O error has occurred, check that the disk device where Interstage JMS is installed is operating normally.

## 15.1.6 jms1006

---

### **JMS:ERROR:jms1006: Failure in deleting the file. FILE '%s1', EXCEPTION '%s2'**

## Variable Information

%s1 = File Name

%s2 = Detailed Exception Information

## Explanation

Failed to delete a file.

## System Action

The processing stops.

## User Action

Refer to the detailed exception information, and then eliminate the cause of error. Check the following items.

- In case the access right is not set properly, change the access right so that access may be enabled to a specified file or directory.
- In case an I/O error has occurred, check that the disk device where Interstage JMS is installed is operating normally.

## 15.1.7 jms1007

---

### **JMS:ERROR:jms1007: Failure in loading the file. FILE '%s'**

## Variable Information

%s = File Name

## Explanation

Failed to load a file.

## System Action

The processing stops.

## User Action

After a while, execute the processing again. In case this message is frequently output, take the following action, then restart the processing.

- Change the size of memory allocated to Java VM.
- Check that memory is sufficient for execution. If necessary, re-estimate the volume of memory required by another application to be executed on the same machine.

Check the following items.

- The permissions required to access the directories and files under the Interstage installation directory may not be set. In this case, set the required permissions.

## 15.1.8 jms1008

---

### **JMS:ERROR:jms1008: Failure in locking the file. TYPE '%s'**

## Variable Information

%s = System Error Information

## Explanation

A system error occurred during access to a JMS environment definition file.

## System Action

The processing stops.

## User Action

Ensure the user has appropriate access to the directories and files under the Interstage installation directory.

If the cause of this error is not the above or if this message is still displayed although the above action was taken, collect diagnostic information with the *iscollectinfo* command, and contact the service engineer (SE).

## 15.1.9 jms1009

---

### **JMS:ERROR:jms1009: Failure in unlocking the file. TYPE '%s'**

#### Variable Information

%s = System Error Information

#### Explanation

A system error occurred during access to a JMS environment definition file.

#### System Action

The processing stops.

#### User Action

Collect diagnostic information with the *iscollectinfo* command, and contact the service engineer (SE).

## 15.1.10 jms1010

---

### **JMS:ERROR:jms1010: Failure in restoring the file. FILE '%s1', EXCEPTION '%s2'**

#### Variable Information

%s1 = File Name

%s2 = Detailed Exception Information

#### Explanation

Failed to restore a file.

#### System Action

The processing stops.

#### User Action

Refer to the detailed exception information, then eliminate the cause. If necessary, manually restore the file.

## 15.1.11 jms1011

---

### **JMS:WARNING:jms1011: Failure in deleting the file. FILE '%s'**

#### Variable Information

%s = File Name

#### Explanation

Failed to delete a file.

#### System Action

The processing continues.

#### User Action

None.

## 15.1.12 jms1012

---

### **JMS:ERROR:jms1012: An I/O error occurred.**

#### Explanation

An I/O error occurred.

#### System Action

The processing stops.

#### User Action

Check that the disk device where Interstage JMS is installed is operating normally.

## 15.1.13 jms1013

---

### **JMS:ERROR:jms1013: Failed to create directory. DIR '%s'**

#### Variable Information

%s = Directory Name that Could not be Created

#### Explanation

Failed to create a directory.

#### System Action

The processing stops.

#### User Action

Check whether the specified path has an error and execute the processing again.

Ensure the user has appropriate access to the specified directory path and files.

## 15.1.14 jms1014

---

### **JMS:ERROR:jms1014: Specified directory is not exist. DIR '%s'**

#### Variable Information

%s = Specified Directory Name

#### Explanation

The directory is absent.

#### System Action

The processing stops.

#### User Action

Create a directory and execute the processing again.

## 15.1.15 jms1015

---

### **JMS:ERROR:jms1015: Internal error. EXCEPTION '%s'**

#### Variable Information

%s = Detailed Exception Information as Cause of an Internal Error

## Explanation

An internal inconsistency occurred.

## System Action

The processing stops.

## User Action

Collect diagnostic information with the *iscollectinfo* command, and contact the service engineer (SE).

## 15.1.16 jms1016

---

**JMS:ERROR:jms1016: Failure in object reference acquisition of initial service. NAME '%s'**

### Variable Information

%s = Service name

## Explanation

Object with the argument name cannot be found.

## System Action

The processing stops.

## User Action

Check the following items:

- Check that the CORBA Service is operating normally.
- Check that the Event Factory is set up correctly - if it is not, then set it up by taking the following actions:
  - Execute the *isinit* command to initialize Interstage. For details about the *isinit* command, refer to the Reference Manual (Command Edition).
  - Execute the *ismodifyservice* command to add Event Service to the Interstage operating environment. For details about the *ismodifyservice* command, refer to the Reference Manual (Command Edition).
  - Use the Interstage management console to set "Event Service" to "Enable".

## 15.2 jms1100 to jms1199

---

This section details the messages numbered between jms1100 and jms1199.

### 15.2.1 jms1100

---

**JMS:WARNING:jms1100: Failure in accessing system property '%s1'. EXCEPTION '%s2'**

### Variable Information

%s1 = System Property Name

%s2 = Detailed Exception Information

## Explanation

An error occurred during access to a system property.

## System Action

The processing continues with a default value.

## User Action

Refer to the detailed exception information, then eliminate the cause.

## 15.3 jms1200 to jms1299

---

This section details the messages numbered between jms1200 and jms1299.

### 15.3.1 jms1200

---

**JMS:ERROR:jms1200: Failure in accessing CORBA service. EXCEPTION '%s'**

#### Variable Information

%s = Detailed Exception Information

#### Explanation

An error occurred during access to the CORBA Service.

#### System Action

The processing stops.

#### User Action

Refer to the detailed exception information, then eliminate the cause.

Check the following:

- Check that the CORBA Service is operating normally.
- Check the Event Service and the Event Factory are starting.
- In case the environment variables PATH, CLASSPATH or LD\_LIBRARY\_PATH have an error, set the environment variables are correct and execute the processing again.
- Check that the CORBA service (ObjectDirector) is specified in an environment setting file as an ORB to be used.
- Review the CORBA environment and execute the processing again.

## 15.4 jms1900 to jms1999

---

This section details the messages numbered between jms1900 and jms1999.

### 15.4.1 jms1998

---

**JMS:ERROR:jms1998: Operation '%s1' failed. System error occurred.**

#### Variable Information

%s1 = JMS API Method Name

#### Explanation

A system error occurred.

#### System Action

The processing stops.

#### User Action

The cause of the error may be one of the following:

- A system error occurred in Java VM.

- There is a problem in JNI.
- Memory is insufficient.

If one of the above causes applies, take the following action:

- If there is an error in the environment variable, review the configuration of the environment variable.
- If the product is not correctly installed, reinstall it.
- If the version of JDK/JRE in use has an error, select a version that is working correctly.
- Change the amount of Java VM memory.
- Check that there is sufficient memory to execute other applications. If necessary, re-estimate the volume of memory required by other applications to be executed on the same machine.

If the problem is not caused by any of the above, collect diagnostic information with the *iscollectinfo* command, and contact the service engineer (SE).

## 15.4.2 jms1999

---

**JMS:ERROR:jms1999: System error occurred. CODE '%s1', DETAIL '%s2'**

### Variable Information

%s1 = System Error Information

%s2 = System Error Information

### Explanation

A system error occurred.

The following lists possible causes:

- A system error occurred in Java VM.
- There is a problem in JNI.
- Memory is insufficient.
- If System Error Information (%s1) is "DefToolCom.openDefinitionFile:", the following operations may have been performed while the JMS operation command was running.
  - The JMS operation command is stopped because of an urgent situation.
  - A JMS operation command process is forced to shut down.
  - The terminal used to execute the JMS operation command is stopped.

### System Action

The processing stops.

### User Action

If one of the above causes applies, take the following action:

- If there is an error in the environment variable, review the configuration of the environment variable.
- If the product is not correctly installed, reinstall it.
- If the version of JDK/JRE in use has an error, select a version that is working correctly.
- Change the size of memory allocated to Java VM.
- Check that memory is sufficient for execution of another application. If necessary, re-estimate the volume of memory required by another application to be executed on the same machine.

- If System Error Information (%s1) is "DefToolCom.openDefinitionFile:", check whether Interstage JMS Resource has illegal status. If Interstage JMS Resource has illegal status, perform a recovery according to the following procedure.
  1. Stop JMS applications (including IJServer).
  2. Stop the Interstage Management Console.
  3. Back up the following files in any directory.
    - JNDI definition file (fjmsjndi.ser)
    - The JNDI definition file backup file (fjmsjndi.ser.bak) (Note: Only if this already exists)
  4. Delete the following files from the original directory.
    - JNDI definition file (fjmsjndi.ser)
    - The JNDI definition file backup file (fjmsjndi.ser.bak) (Note: Only if this already exists)
  5. Copy the default JNDI definition file (fjmsjndi.ser.default) to JNDI definition file (fjmsjndi.ser) to create a new file.

Note: For the fjmsjndi.ser file access privileges, set the same access privileges as for the fjmsjndi.ser.default file.

  6. Start the Interstage Management Console.
  7. Re-register the JMS resource definition using the Interstage Management Console, J2EE Operation Command (isj2eadmin), or JMS Operation Command.
  8. Start JMS applications (including IJServer).
  9. Delete the files that were backed up in step 3. They are not needed after recovery processing for Interstage JMS resources is complete.

If the cause of the failure is not the above, collect diagnostic information with the *iscollectinfo* command, and contact the service engineer (SE).

## 15.5 jms2000 to jms2099

---

This section details the messages numbered between jms2000 and jms2099.

### 15.5.1 jms2000

---

**JMS:ERROR:jms2000: Operation '%s' is not supported by this version of the Interstage JMS Provider.**

#### Variable Information

%s = JMS API Method Name

#### Explanation

JMS API method in use is not supported.

#### System Action

The processing stops.

#### User Action

Check specified JMS API method.

### 15.5.2 jms2010

---

**JMS:ERROR:jms2010: Operation '%s' failed. The message body is currently write-only.**

#### Variable Information

%s = JMS API Method Name

## Explanation

Message body is write only. Message body cannot be read. (When a byte message or stream message is created, the write-only mode is initially assumed.)

## System Action

The processing stops.

## User Action

Correct the application so that a message may be read after it is received. In case the application is not the cause of the error,, call reset. This places a message in the read-only mode.

## 15.5.3 jms2011

---

**JMS:ERROR:jms2011: Operation '%s' failed. The message body is currently read-only.**

### Variable Information

%s = JMS API Method Name

### Explanation

Although an attempt was made to correct the message body, the message body is read-only.

A received message defaults to read-only.

When reset of a byte message or stream message is called, the message is read-only.

### System Action

The processing stops.

### User Action

Call clearBody and correct the message.

## 15.5.4 jms2012

---

**JMS:ERROR:jms2012: Operation '%s' failed. The message properties are currently read-only.**

### Variable Information

%s = JMS API Method Name

### Explanation

Although an attempt was made to correct the message property, the message property is read-only. Message property is read-only when the message is received.

### System Action

The processing stops.

### User Action

Call clearProperties and correct the message.

## 15.5.5 jms2013

---

**JMS:ERROR:jms2013: Operation '%s' failed. The JMS Header was not set.**

### Variable Information

%s = JMS API Method Name

## Explanation

Failed to read the property.

## System Action

The processing stops.

## User Action

In JMS applications, check whether a part other than the body is obtained when a message that was sent from the CORBA application is received. Only the body can be obtained for messages that are sent from CORBA applications.

In all other cases, collect diagnostic information with the *iscollectinfo* command, and contact the service engineer (SE).

## 15.5.6 jms2014

---

**JMS:ERROR:jms2014: Operation '%s' failed. An invalid conversion was attempted.**

### Variable Information

%s = JMS API Method Name

### Explanation

Although an attempt was made to read a non-existent property..

### System Action

The processing stops.

### User Action

Check the application.

- Avoid reading a nonexistent property name.
- In case the property name is already in use, use `getPropertyNames` or `propertyExists`.

## 15.5.7 jms2015

---

**JMS:ERROR:jms2015: Operation '%s1' failed. The Message Property identified by '%s2' is null or does not exist.**

### Variable Information

%s1 = JMS API Method Name

%s2 = Property Name

### Explanation

Although an attempt was made to read a property, the property could not be converted.

### System Action

The processing stops.

### User Action

For details of the rules for converting property types, refer to the "Package `javax.jms`" in the Java docs.

Use another API method to read the message property.

## 15.5.8 jms2016

---

**JMS:ERROR:jms2016: Operation 'setObjectProperty' failed. The Object type '%s' is not supported.**

## Variable Information

%s = Class Name of Passed Object

## Explanation

Only the following object types are valid:

Byte, Short, Integer, Long, Float, Double, String

## System Action

The processing stops.

## User Action

Pass only a valid object.

## 15.5.9 jms2017

---

**JMS:ERROR:jms2017: Operation 'acknowledge' failed. Message not received or Session already closed.**

## Explanation

Message.acknowledge was called with an invalid timing. The following lists possible causes:

- No messages are received. (Only a received message can be acknowledged.)
- Related Session is no longer Open.

## System Action

The processing stops.

## User Action

Check the application.

## 15.5.10 jms2018

---

**JMS:ERROR:jms2018: Operation '%s1' failed. The name ('%s2') is not a valid JMS Property name.**

## Variable Information

%s1 = JMS API Method name

%s2 = Invalid Property Name

## Explanation

Property value that has been passed is not a valid property name.

## System Action

The processing stops.

## User Action

For the rules regarding valid message properties, refer to the "Package javax.jms" in the Java docs.

## 15.5.11 jms2019

---

**JMS:ERROR:jms2019: Operation 'setJMSPriority' failed. The priority must be in range 0-9.**

## Explanation

Priority value that has been passed is out of a valid range.

## System Action

The processing stops.

## User Action

Specify a priority value within the range of 0-9.

## 15.5.12 jms2020

---

**JMS:ERROR:jms2020: Failed to get the Destination. Operation '%s1' EXCEPTION '%s2'**

### Variable Information

%s1 = JMS API Method name

%s2 = Detailed Exception Information

### Explanation

Failed to get the Destination.

### System Action

The processing stops.

### User Action

Collect diagnostic information with the *iscollectinfo* command, and then contact the service engineer (SE).

## 15.5.13 jms2021

---

**JMS:ERROR:jms2021: Failed to set the Destination. Operation '%s1' EXCEPTION '%s2'**

### Variable Information

%s1 = JMS API Method name

%s2 = Detailed Exception Information

### Explanation

Failed to set the Destination.

### System Action

The processing stops.

### User Action

Collect diagnostic information with the *iscollectinfo* command, and then contact the service engineer (SE).

## 15.5.14 jms2040

---

**JMS:ERROR:jms2040: Operation 'writeUTF' failed. Cannot pass null.**

### Explanation

writeUTF in a byte message does not support a null string as an argument.

### System Action

The processing stops.

### User Action

You cannot pass null. Instead pass a blank string " ".

## 15.5.15 jms2041

---

**JMS:ERROR:jms2041: Operation 'writeBytes' failed. Cannot pass null byte[].**

### Explanation

*writeBytes* in a byte message does not support null byte[] as an argument.

### System Action

The processing stops.

### User Action

You cannot pass null. Instead pass byte [0].

## 15.5.16 jms2042

---

**JMS:ERROR:jms2042: Operation '%s1' failed. EOF was encountered. EXCEPTION '%s2'**

### Variable Information

%s1 = JMS API Method Name

%s2 = Detailed Exception Information

### Explanation

EOF is detected while byte message is being read.

### System Action

The processing stops.

### User Action

Check whether more messages than written in the application are being read. Refer to the detailed exception information, then eliminate the cause.

## 15.5.17 jms2043

---

**JMS:ERROR:jms2043: Operation 'writeObject' failed. The Object type '%s' is not supported.**

### Variable Information

%s = Class Name of Passed Object

### Explanation

Only the following object types are valid:

Boolean, Byte, byte[], Character, Double, Float, Integer, Long, Short, String

### System Action

The processing stops.

### User Action

Pass only a valid object.

## 15.5.18 jms2044

---

**JMS:ERROR:jms2044: Operation 'writeObject' failed. Cannot pass null.**

### Explanation

*writeObject* in a byte message does not support null.

#### System Action

The processing stops.

#### User Action

Correct the application so as not to pass null.

### 15.5.19 jms2045

---

**JMS:ERROR:jms2045: Operation 'readBytes' failed. The 'length' passed ('%s') is < 0, or > the size of the buffer.**

#### Variable Information

%s = Length of Passed Value

#### Explanation

length indicates the number of bytes to be read. The buffer must be large enough to maintain the length of byte count.

#### System Action

The processing stops.

#### User Action

Modify the passed length or increase the buffer size.

### 15.5.20 jms2047

---

**JMS:ERROR:jms2047: Operation 'setBytes' failed. Check values passed for 'offset' and 'length'. EXCEPTION '%s'**

#### Variable Information

%s = Detailed Exception Information

#### Explanation

offset+length has exceeded the buffer size.

#### System Action

The processing stops.

#### User Action

Check the following:

- Buffer size
- Offset value
- Length value
- Detailed Exception Information

### 15.5.21 jms2050

---

**JMS:ERROR:jms2050: Operation '%s1' failed. A null name was passed. The name ('%s2') is invalid.**

#### Variable Information

%s1 = JMS API Method Name

%s2 = Name that was set

## Explanation

The null name or the blank string was passed to the relevant method of the map message.

## System Action

The processing stops.

## User Action

Correct the application so as not to pass null name and the blank string to the value of map message.

## 15.5.22 jms2051

---

**JMS:ERROR:jms2051: Operation '%s' failed. An invalid conversion was attempted.**

## Variable Information

%s = JMS API Method Name

## Explanation

The value of the map message was read by the relevant method, but the value could not be converted.

## System Action

The processing stops.

## User Action

For details of the rules for converting the value of a map message, refer to the "Package javax.jms" in the Java docs.

## 15.5.23 jms2052

---

**JMS:ERROR:jms2052: Operation 'getChar' failed. The map-value was null.**

## Explanation

getChar cannot be used to read the value of a null map message.

## System Action

The processing stops.

## User Action

Use another getXXX method to trap a null value.

## 15.5.24 jms2053

---

**JMS:ERROR:jms2053: Operation 'setBytes' failed. Arguments 'offset' and 'length' must be 0 when the byte[] 'value' passed is null.**

## Explanation

'offset' and 'length' of setBytes must be zero because null was passed to the value of byte[] when setBytes of a map message is called.

## System Action

The processing stops.

## User Action

Check whether 'offset' and 'length' are 0 in case null was passed to the value of byte[]. Alternatively, use a setBytes method of another form without arguments of 'offset' or 'length'.

## 15.5.25 jms2054

---

**JMS:ERROR:jms2054: Operation 'setBytes' failed. Check values passed for 'offset' and 'length'. EXCEPTION '%s'**

### Variable Information

%s = Detailed Exception Information

### Explanation

The value of the '*offset*' or '*length*' does not agree with that of the byte [] that was passed.

### System Action

The processing stops.

### User Action

- Check the value of 'offset' or 'length'.
- Check detailed exception information.

## 15.5.26 jms2055

---

**JMS:ERROR:jms2055: Operation 'setObject' failed. The Object type '%s' is not supported.**

### Variable Information

%s = Class Name of Passed Object

### Explanation

Only the following object types are valid:

Byte, Short, Character, Integer, Long, Float, Double, String, byte[]

### System Action

The processing stops.

### User Action

Pass only a valid object.

## 15.5.27 jms2056

---

**JMS:ERROR:jms2056: Operation 'itemExists' failed. A null name was passed.**

### Explanation

The name of null was passed to see whether the map message contains map-name.

### System Action

The processing stops.

### User Action

Correct the application so as not to pass the name of null to itemExists.

## 15.5.28 jms2057

---

**JMS:ERROR:jms2057: Operation '%s1'. The map-name '%s2' already existed and was over-written!**

## Variable Information

%s1 = JMS API Method Name

%s2 = Overwritten map-name

## Explanation

The relevant method was called to assign the value of the map-name.

## System Action

The processing continues. The previous value of map-name is overwritten.

## User Action

Check the application to see whether this is an intentional feature.

## 15.5.29 jms2060

---

**JMS:ERROR:jms2060: Operation '%s' failed. An invalid conversion was attempted.**

## Variable Information

%s = JMS API Method Name

## Explanation

The stream message field was read by the relevant method, but the field-value could not be converted.

## System Action

The processing stops.

## User Action

For details of the rules for converting the value of a stream message, refer to the "Package javax.jms" in the Java docs.

## 15.5.30 jms2061

---

**JMS:ERROR:jms2061: Operation '%s1' failed. EOF was encountered. EXCEPTION '%s2'**

## Variable Information

%s1 = JMS API Method Name

%s2 = Detailed Exception Information

## Explanation

While executing the relevant method of the stream message, the stream EOF was detected.

## System Action

The processing stops.

## User Action

If this event is unexpected, confirm that the stream message field that was read, and the file that is written when the message was sent, corresponds.

## 15.5.31 jms2062

---

**JMS:ERROR:jms2062: Operation 'writeBytes' failed. Arguments 'offset' and 'length' must be 0 when the byte[] 'value' passed is null.**

## Explanation

'offset' and 'length' of *writeBytes* must be zero because null was passed to the value of byte[] when *writeBytes* of a stream message is called.

## System Action

The processing stops.

## User Action

Check the following:

- If `javax.jms.Session.createStreamMessage()` was used, check whether messages were read beyond the end of the message.
- If `javax.jms.Message` was implemented to send independent messages, then when messages are sent to the event channel from Interstage JMS, `javax.jms.StreamMessage.readObject()` is executed and the messages will be obtained until `java.io.EOFException` occurs. For this reason, when `java.io.EOFException` occurs, this message will be output to the event log (Windows(R)) or system log (Solaris/Linux). This does not pose any problems to the process to send messages, however.

To prevent the output of the above message, fix the program using the methods below, so that the generated messages are used in the application if necessary:

- `javax.jms.Session.createBytesMessage()`
- `javax.jms.Session.createMapMessage()`
- `javax.jms.Session.createMessage()`
- `javax.jms.Session.createObjectMessage()`
- `javax.jms.Session.createObjectMessage(java.io.Serializable object)`
- `javax.jms.Session.createStreamMessage()`
- `javax.jms.Session.createTextMessage()`
- `javax.jms.Session.createTextMessage(java.lang.String text)`

## 15.5.32 jms2063

---

**JMS:ERROR:jms2063: Operation 'writeBytes' failed. Check values passed for 'offset' and 'length'. EXCEPTION '%s'**

### Variable Information

%s = Detailed Exception Information

### Explanation

The value of the '*offset*' or '*length*' does not agree with that of the byte [] that was passed.

### System Action

The processing stops.

### User Action

Check the following:

- Value of 'offset' and 'length'
- Detailed exception information

## 15.5.33 jms2064

---

**JMS:ERROR:jms2064: Operation 'writeObject' failed. The Object type '%s' is not supported.**

## Variable Information

%s = Class Name of Passed Object

## Explanation

Only the following object types are valid:

Boolean, Byte, Character, Double, Float, Long, Short, String, byte[]

## System Action

The processing stops.

## User Action

Pass only a valid object.

## 15.5.34 jms2065

---

**JMS:ERROR:jms2065: Operation 'readChar' failed. The stream data value was null.**

## Explanation

readChar cannot be used to read null field-value from a stream message.

## System Action

The processing stops.

## User Action

Use another method to read the null field-value.

## 15.6 jms2100 to jms2199

---

This section details the messages numbered between jms2100 and jms2199.

### 15.6.1 jms2101

---

**JMS:ERROR:jms2101: Operation '%s1' failed. Argument '%s2' not supported by this version of the Interstage JMS Provider.**

## Variable Information

%s1 = JMS API Method Name

%s2 = Argument Name

## Explanation

Argument name is not completely supported by the specified JMS API method.

## System Action

The processing stops.

## User Action

Check specified JMS API method.

### 15.6.2 jms2102

---

**JMS:ERROR:jms2102: Operation '%s1' failed. An invalid value was specified for argument '%s2'.**

## Variable Information

%s1 = JMS API Method Name

%s2 = Argument Name

## Explanation

The value of the argument name is invalid.

## System Action

The processing stops.

## User Action

For details of the proper use of this method API, refer to the "Package javax.jms" in the Java docs.

## 15.6.3 jms2103

---

**JMS:ERROR:jms2103: Operation '%s' was invoked at an illegal or inappropriate time.**

## Variable Information

%s = JMS API Method Name

## Explanation

One of the following may have occurred:

- Although Connection.setClientID was called, it was not the first API on the connection.
- Although an attempt was made to call JMS API method, the JMS object is already closed.
- An attempt was made to call a JMS API method that cannot be used.

## System Action

The processing stops.

## User Action

Confirm the application.

- Connection.setClientID must be the first API to be called on the connection.
- You cannot call the API method for an already closed JMS object.
- The QueueConnection interface cannot call the following methods:
  - createDurableConnectionConsumer()
- The QueueSession interface cannot call the following methods:
  - createDurableSubscriber()
  - createTemporaryTopic()
  - createTopic()
  - unsubscribe()
- The TopicSession interface cannot call the following methods:
  - createBrowser()
  - createQueue()
  - createTemporaryQueue()

## 15.6.4 jms2104

---

**JMS:ERROR:jms2104: Operation '%s' was invoked on a Session that is not transacted.**

### Variable Information

%s = JMS API Method Name

### Explanation

Specified API was called in a session that was not processing a transaction. This processing is invalid.

- Session.commit can be called only in a session processing a transaction.
- Session.rollback can be called only in a session processing a transaction.

### System Action

The processing stops.

### User Action

- Avoid calling these methods in a session that is not processing a transaction.
- Check whether TopicConnection.createTopicSession has passed a correct transaction flag.

## 15.6.5 jms2105

---

**JMS:ERROR:jms2105: Operation '%s' was invoked on a transacted Session.**

### Variable Information

%s = JMS API Method Name

### Explanation

Specified API was called in a session processing a transaction. This processing is invalid.

- Session.recover can be called only in a session that is not processing a transaction.
- Message.acknowledge can be called only in a session that is not processing a transaction.

### System Action

The processing stops.

### User Action

- Avoid calling these methods in a session processing a transaction.
- Check whether TopicConnection.createTopicSession has passed a correct transaction flag.

## 15.6.6 jms2106

---

**JMS:ERROR:jms2106: Operation '%s' failed. Normal JMS clients cannot use this method.**

### Variable Information

%s = JMS API Method Name

### Explanation

Session.setMessageListener should not be called in a session that already has MessageConsumers.

### System Action

The processing stops.

## User Action

This method is part of "Application Server Facility" and not intended for use by general JMS users. For details, refer to the "Package javax.jms" in the Java docs.

## 15.6.7 jms2107

---

**JMS:ERROR:jms2107: Operation 'setClientID' failed. The specified clientID '%s' is not valid.**

### Variable Information

%s = Specified clientID

### Explanation

clientID is not valid.

### System Action

The processing stops.

### User Action

Check the validity rules for clientID.

## 15.6.8 jms2108

---

**JMS:ERROR:jms2108: Operation 'publish' failed. Invalid Message: '%s'**

### Variable Information

%s = Invalid Message

### Explanation

The message is invalid.

### System Action

The processing stops.

### User Action

Confirm that the null message will not be sent.

## 15.6.9 jms2109

---

**JMS:ERROR:jms2109: Operation '%s' failed. A MessageListener is already set. No other form of message receipt in the Session can be used.**

### Variable Information

%s = JMS API Method Name

### Explanation

It is invalid to generate the subscriber using the same session when Session.setMessageListener is already called.

### System Action

The processing stops.

### User Action

Use another session to generate the subscriber.

## 15.6.10 jms2111

---

**JMS:ERROR:jms2111: Operation '%s' failed. Session is part of distributed transaction.**

### Variable Information

%s = JMS API method name

### Explanation

JMS API method (%s) is incorrect.

### System Action

The processing stops.

### User Action

If you are not using the global transaction function, set 'Do not use the global transaction function' as the ConnectionFactory transaction type,

If you are using the global transaction function, take the following action:

- If JMS API method (%s) is 'createQueueSession' or 'createTopicSession', check that the 'transacted' parameter is "true".
- If JMS API method (%s) is 'commit', use `javax.transaction.UserTransaction.commit()`.
- If JMS API method (%s) is 'rollback', use `javax.transaction.UserTransaction.rollback()`.

## 15.6.11 jms2112

---

**JMS:ERROR:jms2112: Operation '%s' failed. ConnectionFactory Transaction type is different from Channels Transaction type.**

### Variable Information

%s = JMS API Method Name

### Explanation

The types of transaction set using the *jmsmkfact* command differ from those for channels.

### System Action

The processing stops.

### User Action

Set a type of transaction that is the same as one for channels.

## 15.6.12 jms2113

---

**JMS:ERROR:jms2113: Operation '%s' failed.**

### Variable Information

%s = JMS API Method Name

### Explanation

Failed to commit all Producers/Consumers.

### System Action

The processing stops.

### User Action

A complete state is assured in a distributed transaction only. Avoid using the following for a local transaction:

- Session in multiple consumers
- Session in multiple producers
- Producer to publish multiple topics

In all other cases, it is possible that a local transaction timeout occurred. In Windows(R), an event log message is output. In Solaris/Linux, a system log message is output. Refer to the message, and check whether the jms2551 information message is output before this message.

If jms2551 is output, it means that a local transaction timeout occurred. Check that there are no problems in the application and change the local transaction timeout time if necessary according to the following procedure.

- Environment settings using the Interstage Management Console

Change 'Local Transaction Timeout' in the following page:

- On the Standalone Server

[System] > [Resources] > [JMS] > [JMS Configuration]

[System] > [Resources] > [JMS] > [EventChannels] > [Group name::EventChannel name] > [Settings]

- On the [Operate in Batch] of the Admin Server

[Operate in Batch] > [Interstage] > [Interstage Application Server] > [Services] > [Event Service] > [Server Group Name/Server Name] > [Event Service]

[Operate in Batch] > [Interstage] > [Interstage Application Server] > [Services] > [Event Service] > [Server Group Name/Server Name] > [EventChannels] > [Group name::EventChannel name] > [Settings]

- Environment settings using the Event Service operation commands

Use the *esetcnf* or *esetcnfchnl* commands to change the local transaction timeout time. For details about the *esetcnf* and *esetcnfchnl* commands, refer to the Reference Manual (Command Edition).

If jms2551 is not output, check whether an Event Service or CORBA Service message is output before this message. If it is, take action according to the message.

If the problem is still not resolved, collect diagnostic information with the *iscollectinfo* command, and contact the service engineer (SE).

## 15.6.13 jms2114

---

**JMS:ERROR:jms2114: Operation '%s1' failed. '%s2' cannot be consumed by session of different connection.**

### Variable Information

%s1 = JMS API Method Name

%s2 = TemporaryQueue or TemporaryTopic

### Explanation

TemporaryQueue or TemporaryTopic can be consumed only by a session of the same connection.

### System Action

The processing stops.

### User Action

Check the application.

## 15.6.14 jms2115

---

**JMS:ERROR:jms2115: An invalid messageSelector was specified. MESSAGE SELECTOR '%s1', ERROR INFORMATION '%s2'**

### Variable Information

%s1 = Setup selector statement

%s2 = Error details

### Explanation

A syntax error was detected in the specified messageSelector.

### System Action

The processing stops.

### User Action

Check the application.

## 15.6.15 jms2116

---

**JMS:ERROR:jms2116: Operation '%s1' failed. The specified messageSelector ('%s2') is not valid.**

### Variable Information

%s1 = JMS API Method Name

%s2 = Argument value of messageSelector

### Explanation

The specified messageSelector is incorrect.

### System Action

The processing stops.

### User Action

Check the application.

## 15.6.16 jms2117

---

**JMS:ERROR:jms2117: Operation '%s1' failed. The specified message ('%s2') is not valid.**

### Variable Information

%s1 = JMS API Method Name

%s2 = Argument value of message

### Explanation

The specified message is incorrect.

### System Action

The processing stops.

### User Action

Check the application.

## 15.6.17 jms2118

---

**JMS:ERROR:jms2118: Operation '%s' failed. Destination is being used.**

### Variable Information

%s = JMS API Method Name

## Explanation

The Consumer attempted to delete a TemporaryQueue or TemporaryTopic that was being used.

## System Action

The processing stops.

## User Action

To delete a TemporaryQueue or TemporaryTopic in the application, check that the Consumer that is being used is closed.

# 15.7 jms2500 to jms2599

---

This section details the messages numbered between jms2500 and jms2599.

## 15.7.1 jms2500

---

### **JMS:ERROR:jms2500: UNKNOWN EXCEPTION.**

## Explanation

An internal error.

An error has occurred. The correct message could not be found because there is a problem in the message file.

## System Action

Depends upon the nature of the error.

## User Action

Collect diagnostic information with the *iscollectinfo* command, and contact the service engineer (SE).

## 15.7.2 jms2501

---

### **JMS:ERROR:jms2501: Property type not supported for object '%s'.**

## Variable Information

%s = Object Reference

## Explanation

An internal error.

## System Action

The processing stops.

## User Action

Collect diagnostic information with the *iscollectinfo* command, and contact the service engineer (SE).

## 15.7.3 jms2502

---

### **JMS:ERROR:jms2502: Property type not supported for type code '%s'.**

## Variable Information

%s = Type code

## Explanation

An internal error.

## System Action

The processing stops.

## User Action

Collect diagnostic information with the *iscollectinfo* command, and contact the service engineer (SE).

## 15.7.4 jms2503

---

**JMS:ERROR:jms2503: Unable to de-serialize StreamMessage remainder\_of\_body. EXCEPTION '%s'**

### Variable Information

%s = Detailed Exception Information

### Explanation

An error occurred while assembling the body of a stream message.

### System Action

The processing stops.

### User Action

Refer to the detailed exception information, then take proper action if possible.

If the problem cannot be rectified, collect diagnostic information with the *iscollectinfo* command, and contact the service engineer (SE).

## 15.7.5 jms2504

---

**JMS:ERROR:jms2504: read(byte[],offset,length) returned -1.**

### Explanation

An internal error occurred while reading byte[] from a stream message.

### System Action

The processing stops.

### User Action

Collect diagnostic information with the *iscollectinfo* command, and contact the service engineer (SE).

## 15.7.6 jms2505

---

**JMS:ERROR:jms2505: Unknown metadata item code '%s'.**

### Variable Information

%s = Item code

### Explanation

An unknown field was found in a stream message.

An internal error.

### System Action

The processing stops.

### User Action

Collect diagnostic information with the *iscollectinfo* command, and contact the service engineer (SE).

## 15.7.7 jms2506

---

**JMS:ERROR:jms2506: I/O exception occurred while closing streams. EXCEPTION '%s'**

### Variable Information

%s = Detailed Exception Information

### Explanation

An error occurred while the internal stream related to a stream message or byte message is closed.

### System Action

The processing stops.

### User Action

This problem is minor. Refer to the detailed exception information, then take proper action if possible.

If the problem cannot be rectified, collect diagnostic information with the *iscollectinfo* command, and contact the service engineer (SE).

## 15.7.8 jms2507

---

**JMS:ERROR:jms2507: Message has unsupported body type '%s'.**

### Variable Information

%s = Body type

### Explanation

An internal error.

### System Action

The processing stops.

### User Action

Collect diagnostic information with the *iscollectinfo* command, and contact the service engineer (SE).

## 15.7.9 jms2508

---

**JMS:ERROR:jms2508: Operation '%s1' failed because an unexpected I/O exception occurred. EXCEPTION '%s2'**

### Variable Information

%s1 = JMS API Method Name

%s2 = Detailed Exception Information

### Explanation

An I/O error occurred during execution of the following processing:

- Reading or writing a byte message value
- Creating an object message
- Setting or acquiring an object in an object message
- Reading or writing field-value of a stream message

### System Action

The processing stops.

## User Action

Refer to the detailed exception information, then take the proper action if possible.

If the problem cannot be rectified, collect diagnostic information with the *iscollectinfo* command, and contact the service engineer (SE).

## 15.7.10 jms2509

---

**JMS:ERROR:jms2509: Operation '%s' failed. Topic is not associated with a channel.**

### Variable Information

%s = JMS API Method Name

### Explanation

An internal error.

### System Action

The processing stops.

### User Action

Collect diagnostic information with the *iscollectinfo* command, and contact the service engineer (SE).

## 15.7.11 jms2510

---

**JMS:ERROR:jms2510: An exception has occurred while converting a CosNotification StructuredEvent to a JMS Message. EXCEPTION '%s'**

### Variable Information

%s = Detailed Exception Information

### Explanation

The sent message was not able to be received by this version.

### System Action

The processing stops.

### User Action

The JMS application of V6.0 or earlier cannot receive a message sent by the JMS application of V7.0 or later. To send a message from V7.0 or later to V6.0 or earlier, specify "ON" for the environment variable JMS\_RECEIVER\_VERSION\_LOWER on the sending side of the system.

In cases other than that described above, collect diagnostic information with the *iscollectinfo* command, and contact the service engineer (SE).

## 15.7.12 jms2511

---

**JMS:ERROR:jms2511: An exception has occurred while converting a JMS Message to a CosNotification StructuredEvent. EXCEPTION '%s'**

### Variable Information

%s = Detailed Exception Information

### Explanation

An internal error.

### System Action

The processing stops.

### User Action

Collect diagnostic information with the *iscollectinfo* command, and contact the service engineer (SE).

## 15.7.13 jms2512

---

**JMS:ERROR:jms2512: An exception occurred converting the data to the JMS message. EXCEPTION '%s'**

### Variable Information

%s = Detailed Exception Information

### Explanation

An internal error.

### System Action

The processing stops.

### User Action

Collect diagnostic information with the *iscollectinfo* command, and then contact the service engineer (SE).

## 15.7.14 jms2513

---

**JMS:ERROR:jms2513: An exception occurred converting the data from the JMS message. EXCEPTION '%s'**

### Variable Information

%s = Detailed Exception Information

### Explanation

An internal error.

### System Action

The processing stops.

### User Action

Collect diagnostic information with the *iscollectinfo* command, and then contact the service engineer (SE).

## 15.7.15 jms2530

---

**JMS:WARNING:jms2530: A native message was detected but its body type is not supported. ARRAY ELEMENT TYPECODE '%s'**

### Variable Information

%s = Type code of array element

### Explanation

The Structured Event of the CORBA application was found in the channel, but the message could not be received because it could not be converted to the JMS message. The Interstage JMS can process CORBA application messages only when they the message type that can be mapped to the JMS messages.

### System Action

The processing continues.

#### User Action

Examine the reason why the Structured Event of the CORBA application was sent into the channel.

When sending the CORBA application messages, use a type that can be mapped to the JMS` messages.

### 15.7.16 jms2531

---

**JMS:WARNING:jms2531: A native message was detected but its body type is not supported. TYPECODE '%s'**

#### Variable Information

%s = Type code

#### Explanation

The Structured Event of the CORBA application was found in the channel, but the message could not be received because it was the type that could not be converted to the JMS message. The Interstage JMS can process CORBA application messages only when they are the types that can be mapped to the JMS messages.

#### System Action

The processing continues.

#### User Action

Examine the cause why the Structured Event of the CORBA application was sent into the channel.

When sending the CORBA application messages, use a type that can be mapped to the JMS messages.

### 15.7.17 jms2532

---

**JMS:ERROR:jms2532: An unsupported native message was encountered.**

#### Explanation

The CORBA application message received in the channel (Example: CosNotification Event or Structured Event ) is related to the Topic, but the CORBA application message cannot be converted to the equivalent JMS message.

#### System Action

The processing for (receive, receive(timeout), receiveNoWait) stops.

Otherwise continues the processing.

#### User Action

The conversion of the supported CORBA application message is as shown below:

- wstring -> JMS text message
- string -> JMS text message
- sequence of octet -> JMS byte message
- array of octet -> JMS byte message

Possible action is as follows:

- When sending the CORBA application messages, use the type of CORBA application message that is supported.
- When an unexpected CORBA application message is received, examine the cause why the CORBA application message was sent to the channel used by the JMS.

### 15.7.18 jms2533

---

---

**JMS:WARNING:jms2533: A native message was detected but its body type is not supported. SEQUENCE ELEMENT TYPECODE '%s'****Variable Information**

%s = Type code of sequence element

**Explanation**

Though a Structured Event of a CORBA application was found in a channel, the message could not be received because it was of a type that could not be converted into a JMS message. Interstage JMS can handle messages of the CORBA application only if they are of a type that can be mapped to a JMS message.

**System Action**

The processing continues.

**User Action**

Investigate the cause why the Structured Event of a CORBA application was sent to the channel.

When sending a message of a CORBA application, use a type that can be mapped to a JMS message.

---

**15.7.19 jms2550**

---

**JMS:ERROR:jms2550: Communication Error. METHOD '%s1', EXCEPTION '%s2'****Variable Information**

%s1 = Method Name for CORBA Service or Event Service

%s2 = Detailed Exception Information

**Explanation**

A communication error occurred during access to the CORBA Service or Event Service.

**System Action**

The processing stops.

**User Action**

Take the following action, then restart processing.

- If the Detailed Exception Information (%s2) minor code is 1179254784(0x464a0000) or 1179256832(0x464a0800), a Connection object that was no longer needed while the JMS application was running might not have been closed. Check that Connection objects no longer needed by JMS have been closed.
- If the minor code is 1179255041(0x464a0101) or 1179257089(0x464a0901), a shorter time than the wait time (specified by *-wtime* of the *esetcnf* or *esetcnfchnl* command) of the event data may have been set in the parameter *period\_receive\_timeout* in the operating environment file (*config*) of the CORBA Service. Re-examine the parameter *period\_receive\_timeout* or the wait time for event data.
- If the minor code is 1179255234(0x464a01c2) or 1179257282(0x464a09c2), connection information may have been collected by the Event Channel stopping or by the Event Service *esmonitorchnl* operation command. From the Interstage Management Console pages below, or using the Event Service *esmonitor* command, check the [Start Status] and [No. of Consumer Connections] and stop the application.

If the EventChannel [Start Status] is "Stopping...", stop the EventChannel using forced stop mode, start the EventChannel, and then re-execute the application.

If the EventChannel [Start Status] is "Stopped", start the EventChannel and then re-execute the application.

- On a Standalone Server

[System] > [Resources] > [JMS] > [EventChannels] > [View Status]

- On the Admin Server from the Site Management tab  
[Interstage] > [Interstage Application Server] > [Server Name] > [System] > [Resources] > [JMS] > [EventChannels] > [View Status]
- On the Admin Server from the Application Management tab  
[Interstage] > [Interstage Application Server] > [Services] > [Event Service] > [EventChannels]  
or  
[Interstage] > [Interstage Application Server] > [Services] > [Event Service] > [Server Group Name/Server Name] > [EventChannels] > [View Status]
- The following circumstances indicate that the message reference may have failed because the event data wait time was exceeded:  
The QueueBrowser which selected the message selector is running,  
The event service method name (%s1) is "ChannelUtil.refer\_structured\_event" or "ChannelUtil.refer\_JMS\_event" and,  
The minor code (%s2) is "1179255233(0x464a01c1)" or "1179257281(0x464a09c1)".  
If this is the case follow the procedures below to change the event data wait time:
  - Environment settings using the Interstage Management Console  
Change 'Event Data Waiting Time' in the following page:  
On the Standalone Server  
[System] > [Resources] > [JMS] > [JMS Configuration]  
[System] > [Resources] > [JMS] > [EventChannels] > [Group name::EventChannel name] > [Settings]  
On the [Operate in Batch] of the Admin Server  
[Operate in Batch] > [Interstage] > [Interstage Application Server] > [Services] > [Event Service] > [Server Group Name/Server Name] > [Event Service]  
[Operate in Batch] > [Interstage] > [Interstage Application Server] > [Services] > [Event Service] > [Server Group Name/Server Name] > [EventChannels] > [Group name::EventChannel name] > [Settings]
  - Environment settings using the Event Service operation commands  
Use the *esetcnf* or *esetcnfchnl* commands to change the wait time (-wtime) for event data. For details about the *esetcnf* and *esetcnfchnl* commands, refer to the Reference Manual (Command Edition).

In other cases, refer to the detailed exception information, and eliminate the cause of the communication error. Then re-execute processing.

For more information, refer to Exception Information Minor Codes to be Reported from the CORBA Service and Exception Information Minor Codes to be Reported from the Event Service in this manual.

## 15.7.20 jms2551

---

**JMS:INFO:jms2551: Local transaction timeout has occurred. METHOD '%s1', EXCEPTION '%s2'**

### Variable Information

%s1 = Method Name for CORBA Service

%s2 = Detailed Exception Information

### Explanation

Local transaction time-out limit was exceeded for the CORBA Service.

### System Action

The processing continues.

## User Action

No action is requested. Note the following:

- Local transaction time-out can be changed using *esetcnf* or *esetcnfchnl*.
- User process may take too much time because of an error in creating the application. Check the application.

## 15.7.21 jms2552

---

**JMS:ERROR:jms2552: Message storage limit exceeded. METHOD '%s1', EXCEPTION '%s2'**

### Variable Information

%s1 = Method Name for CORBA Service

%s2 = Detailed Exception Information

### Explanation

The maximum Event Channel message storage limit has been exceeded.

### System Action

The processing stops.

### User Action

Use *esetcnf* or *esetcnfchnl* to modify the maximum values of the number of messages which can be accumulated in each Event Channel.

In case an expected message is not received, check the state of Subscriber.

## 15.7.22 jms2553

---

**JMS:ERROR:jms2553: No resource. METHOD '%s1', EXCEPTION '%s2'**

### Variable Information

%s1 = Method Name for CORBA Service or Event Service

%s2 = Detailed Exception Information

### Explanation

Processing of a request cannot be executed because resource is insufficient in the system and/or disk on the server.

### System Action

The processing stops.

### User Action

Eliminate unnecessary applications running on the server and release the resource.

For more information, refer to chapters Exception Information Minor Codes to be Reported from the CORBA Service and Exception Information Minor Codes to be Reported from the Event Service in this manual.

## 15.7.23 jms2554

---

**JMS:ERROR:jms2554: local\_begin was not invoked. METHOD '%s1', EXCEPTION '%s2'**

### Variable Information

%s1 = Method Name for CORBA Service

%s2 = Detailed Exception Information

## Explanation

Although `local_commit` or `local_rollback` was called, no transactions are in progress.

## System Action

The processing stops.

## User Action

Take the following action.

- When this message is output by the application using `TopicSession` or `QueueSession` to process a transaction, neither `commit` nor `close` of `Session` may be called after the message is sent and received. Check the application.
- In all other cases, it is possible that a local transaction timeout occurred. In Windows(R), an event log message is output. In Solaris/Linux, a system log message is output. Refer to the message, and check whether the `jms2551` information message is output before this message.

If `jms2551` is output, it means that a local transaction timeout has occurred. Check that there are no problems in the application and change the local transaction timeout time if necessary according to the following procedure.

### Environment settings using the Interstage Management Console

Change 'Local Transaction Timeout' in the following page:

- On the Standalone Server

[System] > [Resources] > [JMS] > [JMS Configuration]

[System] > [Resources] > [JMS] > [EventChannels] > [Group name::EventChannel name] > [Settings]

- On the [Operate in Batch] of the Admin Server

[Operate in Batch] > [Interstage] > [Interstage Application Server] > [Services] > [Event Service] > [Server Group Name/Server Name] > [Event Service]

[Operate in Batch] > [Interstage] > [Interstage Application Server] > [Services] > [Event Service] > [Server Group Name/Server Name] > [EventChannels] > [Group name::EventChannel name] > [Settings]

### Environment settings using the Event Service operation commands

Use the `esetcnf` or `esetcnfchnl` commands to change the local transaction timeout time. For details about the `esetcnf` and `esetcnfchnl` commands, refer to the Reference Manual (Command Edition).

If `jms2551` is not output, check whether an Event Service or CORBA Service message is output before this message. If it is, take action according to the message.

If the problem is still not resolved, collect diagnostic information with the `iscollectinfo` command, and contact the service engineer (SE).

## 15.7.24 jms2555

---

**JMS:ERROR:jms2555: EventChannel unavailable. METHOD '%s1', EXCEPTION '%s2'**

### Variable Information

%s1 = Method Name for CORBA Service

%s2 = Detailed Exception Information

### Explanation

Because the Event Channel is currently stopped (e.g. via `esstopchnl`), it cannot be used.

### System Action

The processing stops.

## User Action

Activate the Event Channel, and execute the processing again.

## 15.7.25 jms2556

---

**JMS:ERROR:jms2556: EventChannel transaction usage is invalid. METHOD '%s1', EXCEPTION '%s2'**

### Variable Information

%s1 = Method Name for CORBA Service

%s2 = Detailed Exception Information

### Explanation

Local transactions and global transactions are used in a mixed way.

### System Action

The processing stops.

### User Action

Use local transactions or global transaction in an application.

Specify 'tran' or 'ots' as a parameter then change the *esmkchnl* mode creation.

## 15.7.26 jms2557

---

**JMS:ERROR:jms2557: EventChannel proxy is not connected. METHOD '%s1', EXCEPTION '%s2'**

### Variable Information

%s1 = Method Name for CORBA Service

%s2 = Detailed Exception Information

### Explanation

Not connected to the Event Channel proxy.

The following lists possible causes:

- It is considered that mismatching has occurred between the proxy of the Event Channel and that of the JMS provider because the Event Channel was deleted by the *esrmchnl* command.
- It is considered that mismatching has occurred between the proxy of the Event Channel and that of the JMS provider because the connection information may have been collected by the *esmonitorchnl* command.
- When the durable subscription function is used, a proxy is re-generated on the server so that data for the original proxy is lost.
- The client non-communication monitoring time (`period_client_idle_con_timeout * 5` seconds specified in the config file) was exceeded, so the connection with the Event Channel was closed.

### System Action

The processing stops.

### User Action

Take the following action:

- When the Event Channel was deleted by the *esrmchnl* command, re-execute the application after the Event Channel re-creation.
- When the connection information was collected by the *esmonitorchnl* command, re-execute the application.
- When the message is output by the application using the durable subscription function, re-execute the application or re-call the `createDurableSubscriber` API after deleting the durable Subscriber being used by the *jmsrmds* command.

- When setting for the function of the automatically recover connection information (*autodiscon*) is effective when the Event Channel is created, check the client non-communication monitoring time (*period\_client\_idle\_con\_timeout* specified in the config file). For details on this setting, refer to the "Tuning Guide", section "CORBA Service Environment Definition" > "config", table "Operating Environment of Timeout Monitoring".

## 15.7.27 jms2558

---

**JMS:ERROR:jms2558: EventChannel proxy is already connected. METHOD '%s1', EXCEPTION '%s2'**

### Variable Information

%s1 = Method Name for CORBA Service

%s2 = Detailed Exception Information

### Explanation

An internal error.

### System Action

The processing stops.

### User Action

Collect diagnostic information with the *iscollectinfo* command, and contact the service engineer (SE).

## 15.7.28 jms2559

---

**JMS:ERROR:jms2559: Error accessing CORBA service. METHOD '%s1', EXCEPTION '%s2'**

### Variable Information

%s1 = Method Name for CORBA Service

%s2 = Detailed Exception Information

### Explanation

An internal error.

### System Action

The processing stops.

### User Action

Take the following action.

- When the class library (*esjava4.jar*) of the Event Service is set, change the setting order so that the class library (*esnotifyjava4.jar*) of the notification service comes first.
- If Method Name for CORBA Service (%s1) is one of those shown below, the detailed exception information (%s2) is "java.lang.NullPointerException", and this message is output when a message is sent (*send*, *publish*), it means that the Destination that was specified in the Message *setJMSReplyTo* method may be incorrect.
  - *ChannelUtil.StructuredProxyPushConsumer.push\_sturctured\_event*
  - *ChannelUtil.StructuredProxyPushConsumer.push\_JMS\_event*
  - *ChannelUtil.push\_sturctured\_eventEx*
  - *ChannelUtil.push\_JMS\_eventEx*

Check that the Destination that was specified in the *setJMSReplyTo* method in the application is correct. Destinations that can be specified in the *setJMSReplyTo* method are as follows:

- Destinations obtained using the lookup that is provided in the Interstage JNDI service provider

- Destinations created using the `createQueue`, `createTopic`, `createTemporaryQueue`, or `createTemporaryTopic` methods

If the cause of the failure is not the above, collect diagnostic information with the `iscollectinfo` command, and contact the service engineer (SE).

## 15.7.29 jms2560

---

**JMS:ERROR:jms2560: EventChannel is not running. METHOD '%s1', EXCEPTION '%s2'**

### Variable Information

%s1 = Method Name for CORBA Service

%s2 = Detailed Exception Information

### Explanation

Event Channels are halted. (For example in case `esstopchnl` is running on the server)

### System Action

The processing stops.

### User Action

Activate the Event Channel, and execute the processing again.

## 15.7.30 jms2561

---

**JMS:ERROR:jms2561: EventChannel proxy does not exist. METHOD '%s1', EXCEPTION '%s2'**

### Variable Information

%s1 = Method Name for CORBA Service

%s2 = Detailed Exception Information

### Explanation

Proxy for the Event Channel is absent.

The following lists possible causes:

- The Event Channel may have been restarted.
- It is considered that mismatching has occurred between the proxy of the Event Channel and that of the JMS provider because the Event Channel was deleted by the `esrmchnl` command.
- It is considered that mismatching has occurred between the proxy of the Event Channel and that of the JMS provider because the connection information may have been collected by the `esmonitorchnl` command.
- When the durable subscription function is used, a proxy is re-generated on the server so that data for the original proxy is lost.
- The client non-communication monitoring time (`period_client_idle_con_timeout * 5` seconds specified in the config file) was exceeded, so the connection with the Event Channel was closed.

### System Action

The processing stops.

### User Action

Take the following action:

- When the Event Channel was restarted, re-execute the application.
- When the Event Channel was deleted by the `esrmchnl` command, re-execute the application after the Event Channel re-creation.
- When the connection information was collected by the `esmonitorchnl` command, re-execute the application.

- When the message is output by the application using the durable subscription function, re-execute the application or re-call the createDurableSubscriber API after deleting the durable Subscriber being used by the *jmsrmds* command.
- When setting for the function of the automatically recover connection information (*autodiscon*) is effective when the Event Channel is created, check the client non-communication monitoring time (*period\_client\_idle\_con\_timeout* specified in the config file). For details on this setting, refer to the "Tuning Guide", section "CORBA Service Environment Definition" > "config", table "Operating Environment of Timeout Monitoring"

## 15.7.31 jms2562

---

### JMS:ERROR:jms2562: Memory shortage occurred. METHOD '%s1', EXCEPTION '%s2'

#### Variable Information

%s1 = Method Name for CORBA Service or Event Service

%s2 = Detailed Exception Information

#### Explanation

Requested processing cannot be executed because memory is insufficient.

#### System Action

The processing stops.

#### User Action

Take the following action, then restart processing.

- If the Detailed Exception Information (%s2) minor code is "1179255272(0x464a01e8)" or "1179257320 (0x464a09e8)", then the total number of connections to the EventChannel may have exceeded the maximum limit (the combined total for producers and consumers) set when the EventChannel was created.

For details on the maximum number of connections and how to perform persistent channel operations, refer to the "Tuning Guide", section "Appendix D - Event Service Environment Definition" > "Estimating the Total Number of Event Channels, Suppliers, and Consumers".

If the value is invalid, then delete the EventChannel and create it again.

- Eliminate unnecessary applications running on the server, then release the resource.

For more information, refer to chapters Exception Information Minor Codes to be Reported from the CORBA Service and Exception Information Minor Codes to be Reported from the Event Service in this manual.

## 15.7.32 jms2563

---

### JMS:ERROR:jms2563: Error accessing CORBA service. METHOD '%s1', EXCEPTION '%s2'

#### Variable Information

%s1 = Method Name for CORBA Service or Event Service

%s2 = Detailed Exception Information

#### Explanation

An unexpected error occurred during access to the CORBA Service or Event Service.

#### System Action

The processing stops.

#### User Action

Take the following action, and re-execute processing.

- If the detail exception information (%s2) minor code is '1179254801(0x464A0011)' or '1179256849(0x464A0811)', it means there is a possibility that there was an error in the creation of the Event Channel.

#### Using the Interstage Management Console to make the environment settings

1. Check the status of the Event Channel Notification Service function in the following page:

- On the Standalone Server

[System] > [Services] > [Event Service] > [EventChannels] > [Group name::EventChannel name] > [Detailed Settings]

- On the Integrated Control of the Admin Server

[Integrated Control] > [Interstage] > [Interstage Application Server] > [Server name] > [System] > [Services] > [Event Service] > [EventChannels] > [Group name::EventChannel name] > [Detailed Settings]

- On the Operate in Batch of the Admin Server

[Operate in Batch] > [Interstage] > [Interstage Application Server] > [Services] > [Event Service] > [Server Group Name/Server Name] > [EventChannels] > [Detailed Settings]

2. If 'None' is set for the Notification Service function, delete the Event Channel and then re-create it by specifying 'JMS' for 'EventChannel Type'.

- On the Standalone Server

[System] > [Resources] > [JMS] > [EventChannels] > [Create a New EventChannel]

- On the Operate in Batch of the Admin Server

[Operate in Batch] > [Interstage] > [Interstage Application Server] > [Services] > [Event Service] > [Server Group Name/Server Name] > [EventChannels] > [Create a New EventChannel]

#### Using the Event Service operation command to make the environment settings

1. Execute the *esetcnfchnl* command as shown below, and check that 'yes' is set for 'Notification channel mode'.

```
esetcnfchnl -d -g group name
```

2. If 'no' is set for 'Notification channel mode', delete the Event Channel using the *esrmchnl* command and then re-create the Event Channel by specifying the -notify option in the *esmkchnl* command.

- If the detail exception information (%s2) minor code is '1179255248(0x464a01d0)' or '1179257296(0x464a09d0)', take the following action:

- The total number of connections to the EventChannel may have exceeded the maximum limit (the combined total for producers and consumers) set when the EventChannel was created. Collect unnecessary connection information using the *esmonitorchnl* command.
- A Connection object no longer needed by the JMS application may not have been closed while it was closing or running. Check that Connection objects no longer needed by JMS have been closed.
- Refer to the event log message (Windows(R)) or system log message (Solaris/Linux) in the server system used to run the Event Channel. Check whether the es10804 error message was output at the same time as this message. If it was, take action according to the es10804 error message.

In other cases, refer to chapters Exception Information Minor Codes to be Reported from the CORBA Service and Exception Information Minor Codes to be Reported from the Event Service in this manual, and take appropriate action.

## 15.7.33 jms2564

**JMS:WARNING:jms2564: Error accessing CORBA service. METHOD '%s1', EXCEPTION '%s2'**

#### Variable Information

%s1 = Method Name for CORBA Service or Event Service

%s2 = Detailed Exception Information

## Explanation

An unexpected error occurred during access to the CORBA Service or Event Service.

## System Action

The processing continues.

## User Action

For more information, refer to chapters Exception Information Minor Codes to be Reported from the CORBA Service and Exception Information Minor Codes to be Reported from the Event Service in this manual.

While processing continues, priority feature of messages is not guaranteed.

## 15.7.34 jms2565

---

**JMS:ERROR:jms2565: Maximum proxy count exceeded. METHOD '%s1', EXCEPTION '%s2'**

### Variable Information

%s1 = Method Name for CORBA Service

%s2 = Detailed Exception Information

### Explanation

Total number of connections exceeded the limit of Event Channels.

### System Action

The processing stops.

### User Action

Eliminate unnecessary Publishers or Subscribers.

Use *esetcnf* or *esetcnfchnl* to modify the maximum values of the number of producers or the numbers of consumers that can be connected with the Event Channel.

## 15.7.35 jms2566

---

**JMS:ERROR:jms2566: A receiving application does not connect to the EventChannel. METHOD '%s1', EXCEPTION '%s2'**

### Variable Information

%s1 = Method Name for CORBA Service

%s2 = Detailed Exception Information

### Explanation

A receiving application is not connected to the Event Channel.

### System Action

The processing stops.

### User Action

This message is output when "-chkcon yes" is set in the *esetcnf* and *esetcnfchnl* commands.

Change the setting to "-chkcon no," or connect a receiving application to the Event Channel.

## 15.7.36 jms2567

---

**JMS:ERROR:jms2567: Data is not in the EventChannel. METHOD '%s1', EXCEPTION '%s2'**

## Variable Information

%s1 = Method Name for CORBA Service

%s2 = Detailed Exception Information

## Explanation

No data was found that could be received by the application.

## System Action

The processing stops.

## User Action

Failed to acquire a message.

If this message is output while there are messages stored in the EventChannel, it may mean that stop processing was performed using the normal stop mode of the EventChannel while an application was being executed.

From the Interstage Management Console pages below, or using the Event Service *esmonitor* command, check the [Start Status] and [No. of Consumer Connections] and stop the application.

If the EventChannel [Start Status] is "Stopping...", stop the EventChannel using forced stop mode, start the EventChannel, and then re-execute the application.

If the EventChannel [Start Status] is "Stopped", start the EventChannel and then re-execute the application.

- On a Standalone Server

[System] > [Resources] > [JMS] > [EventChannels] > [View Status]

- On the Admin Server from the Site Management tab

[Interstage] > [Interstage Application Server] > [Server Name] > [System] > [Resources] > [JMS] > [EventChannels] > [View Status]

- On the Admin Server from the Application Management tab

[Interstage] > [Interstage Application Server] > [Services] > [Event Service] > [EventChannels]

or

[Interstage] > [Interstage Application Server] > [Services] > [Event Service] > [Server Group Name/Server Name] > [EventChannels] > [View Status]

In other cases, check whether the sender application is operating correctly.

## 15.7.37 jms2568

---

**JMS:ERROR:jms2568: Operation '%s' failed. getEnumeration was not invoked.**

## Variable Information

%s = JMS API Method Name

## Explanation

The QueueBrowser.getEnumeration operation has not been performed.

## System Action

The processing stops.

## User Action

Take the following action:

- In the application, make sure that the QueueBrowser.getEnumeration() method was called before Enumeration.hasMoreElements() or QueueBrowse.close().

- In the application, check whether multiple queue browsers were used for one EventChannel at the same time - only one queue browser can be used for one EventChannel at the same time.

## 15.7.38 jms2570

---

**JMS:ERROR:jms2570: Operation '%s' failed. Destination is not associated with a channel.**

### Variable Information

%s = JMS API Method Name

### Explanation

An internal error.

### System Action

The processing stops.

### User Action

Collect diagnostic information with the *iscollectinfo* command, and contact the service engineer (SE).

## 15.7.39 jms2571

---

**JMS:ERROR:jms2571: The maximum of channel was exceeded. METHOD '%s1', EXCEPTION '%s2'**

### Variable Information

%s1 = Method Name for CORBA Service

%s2 = Detailed Exception Information

### Explanation

The total number of dynamically generated Event Channels exceeded the upper limit for dynamically generated Event Channels.

### System Action

The processing stops.

### User Action

Modify the maximum number of dynamically generated Event Channels using *esetconf* and restart the Event Service.

Alternatively, delete unnecessary channels that were generated dynamically.

## 15.7.40 jms2572

---

**JMS:ERROR:jms2572: Operation '%s1' failed. Specified '%s2' is deleted.**

### Variable Information

%s1 = JMS API Method Name

%s2 = TemporaryQueue or TemporaryTopic

### Explanation

A TemporaryQueue or TemporaryTopic that has been released is specified.

### System Action

The processing stops.

### User Action

Check the application.

## 15.7.41 jms2573

---

**JMS:ERROR:jms2573: The event channel is in the inhibited state and cannot be used. Method: '%s1', Exception: '%s2'**

### Variable Information

%s1 = CORBA service method name

%s2 = Detailed Exception Information

### Explanation

The event channel is in the inhibited state and cannot be used.

### System Action

The processing stops.

### User Action

Re-execute processing after cancelling the inhibited state for the event channel (or after automatic cancellation of the inhibited state).

## 15.7.42 jms2575

---

**JMS:ERROR:jms2575: Transaction timeout has occurred. METHOD '%s1'**

### Variable Information

%s1 = CORBA service method name

### Explanation

A local transaction timeout has occurred.

### System Action

The processing continues.

### User Action

Check that there are no problems in the application and change the local transaction timeout time if necessary according to the following procedure.

#### Environment settings using the Interstage Management Console

Change 'Local Transaction Timeout' in the following page:

- On the Standalone Server

[System] > [Resources] > [JMS] > [JMS Configuration]

[System] > [Resources] > [JMS] > [EventChannels] > [Group name::EventChannel name] > [Settings]

- On the [Operate in Batch] of the Admin Server

[Operate in Batch] > [Interstage] > [Interstage Application Server] > [Services] > [Event Service] > [Server Group Name/Server Name] > [Event Service]

[Operate in Batch] > [Interstage] > [Interstage Application Server] > [Services] > [Event Service] > [Server Group Name/Server Name] > [EventChannels] > [Group name::EventChannel name] > [Settings]

#### Environment settings using the Event Service operation commands

Use the *esetcnf* or *esetcnfchnl* commands to change the local transaction timeout time. For details about the *esetcnf* and *esetcnfchnl* commands, refer to the Reference Manual (Command Edition).

## 15.7.43 jms2576

---

---

**JMS:WARNING:jms2576: A Connection that has not been closed was detected.****Explanation**

A Connection object that has not been closed was detected.

**System Action**

The processing continues.

**User Action**

A Connection object no longer needed by the JMS application may not have been closed. Check that Connection objects no longer needed by JMS have been closed.

---

## 15.8 jms2700 to jms2799

---

This section details the messages numbered between jms2700 and jms2799.

### 15.8.1 jms2701

---

**JMS:ERROR:jms2701: Unable to set the MessageListener class. EXCEPTION '%s'****Variable Information**

%s = Detailed Exception Information

**Explanation**

An internal error.

**System Action**

The processing stops.

**User Action**

Collect diagnostic information with the *iscollectinfo* command, and contact the service engineer (SE).

### 15.8.2 jms2702

---

**JMS:ERROR:jms2702: Unable to return ServerSession from pool. EXCEPTION '%s'****Variable Information**

%s = Detailed Exception Information

**Explanation**

An internal error.

**System Action**

The processing stops.

**User Action**

Collect diagnostic information with the *iscollectinfo* command, and contact the service engineer (SE).

### 15.8.3 jms2703

---

**JMS:ERROR:jms2703: Unable to notify Pool about the availability of ServerSession. EXCEPTION '%s'****Variable Information**

%s = Detailed Exception Information

#### Explanation

An internal error.

#### System Action

The processing stops.

#### User Action

Collect diagnostic information with the *iscollectinfo* command, and contact the service engineer (SE).

### 15.8.4 jms2704

---

**JMS:ERROR:jms2704: Unable to start run object for message processing. EXCEPTION '%s'**

#### Variable Information

%s = Detailed Exception Information

#### Explanation

An internal error.

#### System Action

The processing stops.

#### User Action

Collect diagnostic information with the *iscollectinfo* command, and contact the service engineer (SE).

### 15.8.5 jms2711

---

**JMS:ERROR:jms2711: Operation 'CreateServerSessionPool' failed. A null connection was passed.**

#### Explanation

TopicConnection object passed during generation of ServerSessionPool is null.

#### System Action

The processing stops.

#### User Action

Check the application.

- Check that TopicConnection is properly generated and is not null.

### 15.8.6 jms2712

---

**JMS:ERROR:jms2712: Operation 'CreateServerSessionPool' failed. A null MessageListener was passed.**

#### Explanation

MessageListener object passed during generation of ServerSessionPool is null.

#### System Action

The processing stops.

#### User Action

Check the application.

- Check that MessageListener class is loaded and is not null.

## 15.8.7 jms2713

---

**JMS:ERROR:jms2713: Operation 'CreateServerSessionPool' failed. A null MessageDrivenContext was passed.**

### Explanation

MessageDrivenContext object passed during generation of ServerSessionPool is null.

### System Action

The processing stops.

### User Action

Check the application.

- Check that MessageDrivenContext class is generated and is not null.

## 15.8.8 jms2714

---

**JMS:ERROR:jms2714: Operation 'CreateConnectionConsumer' failed. A null connection was passed.**

### Explanation

ConnectionConsumer could not be generated because null was specified for the Connection object.

### System Action

The processing stops.

### User Action

Check whether null was specified for the Connection object instance in the application. To generate ConnectionConsumer, do not specify null for the Connection object instance.

## 15.8.9 jms2715

---

**JMS:ERROR:jms2715: Operation 'CreateConnectionConsumer' failed. A null topic was passed.**

### Explanation

Topic object passed during generation of ConnectionConsumer is null.

### System Action

The processing stops.

### User Action

Check the application.

- Check that the instance of Topic object has been acquired by the lookup of JNDI and is not null.

## 15.8.10 jms2716

---

**JMS:ERROR:jms2716: Operation 'CreateConnectionConsumer' failed. A null ServerSessionPool was passed.**

### Explanation

ServerSessionPool object passed during generation of ConnectionConsumer is null.

### System Action

The processing stops.

## User Action

Check the application.

- Check that the instance of ServerSessionPool object has been generated and is not null.

## 15.8.11 jms2717

---

**JMS:ERROR:jms2717: Operation 'ServerSessionPool.close' encountered exception during.ejbRemove. EXCEPTION '%s'**

### Variable Information

%s = Detailed Exception Information

### Explanation

An internal error occurred in the.ejbRemove method where Message-driven Bean registered as MessageListener becomes the cause of exception.

### System Action

The processing continues.

### User Action

Check the application that is using the.ejbRemove method for Message-driven Bean.

- Check that all the exceptions are caught and proper.ejbRemove method is processed.

## 15.8.12 jms2718

---

**JMS:ERROR:jms2718: The 'createConnectionConsumer' operation failed. A null Queue was specified.**

### Explanation

null was specified in the Queue object, so ConnectionConsumer could not be generated.

### System Action

The processing stops.

### User Action

Check whether null was specified in the Queue object instance in the application. To generate ConnectionConsumer, null must not be specified in the Queue object instance.

## 15.8.13 jms2719

---

**JMS:ERROR:jms2719: The 'createConnectionConsumer' operation failed. A null Destination was specified.**

### Explanation

null was specified in the Destination object, so ConnectionConsumer could not be generated.

### System Action

The processing stops.

### User Action

Check whether null was specified in the Destination object instance in the application. To generate ConnectionConsumer, null must not be specified in the Destination object instance.

## 15.8.14 jms2720

---

**JMS:ERROR:jms2720: Operation 'CreateDurableConnectionConsumer' failed. A null connection was passed.**

### Explanation

null was specified in the Connection object, so ConnectionConsumer could not be generated.

### System Action

The processing stops.

### User Action

Check whether null was specified in the Connection object instance in the application. To generate ConnectionConsumer, null must not be specified in the Connection object instance.

## 15.8.15 jms2721

---

**JMS:ERROR:jms2721: Operation 'CreateDurableConnectionConsumer' failed. A null topic was passed.**

### Explanation

null was specified in the Topic object, so ConnectionConsumer could not be generated.

### System Action

The processing stops.

### User Action

Check whether null was specified in the Topic object instance in the application. To generate ConnectionConsumer, null must not be specified in the Topic object instance.

## 15.8.16 jms2722

---

**JMS:ERROR:jms2722: Operation 'CreateDurableConnectionConsumer' failed. A null ServerSessionPool was passed.**

### Explanation

null was specified in the ServerSessionPool object, so ConnectionConsumer could not be generated.

### System Action

The processing stops.

### User Action

Check whether null was specified in the ServerSessionPool object instance in the application. To generate ConnectionConsumer, null must not be specified in the ServerSessionPool object instance.

## 15.9 jms2800 to jms2899

---

This section details the messages numbered between jms2800 and jms2899.

### 15.9.1 jms2801

---

**JMS:ERROR:jms2801: The JNDI definition file not found. NAME '%s'**

#### Variable Information

%s = Absolute path name of JNDI definition file

## Explanation

JNDI definition file cannot be used.

## System Action

The processing stops.

## User Action

Copy the default JNDI definition file (fjmsjndi.ser.default) which is stored in the etc directory under the JMS install directory, to the JNDI definition file (fjmsjndi.ser).

## 15.9.2 jms2802

---

### **JMS:ERROR:jms2802: Wrong number of parameters.**

## Explanation

The number of parameters passed to a definition command is erroneous.

## System Action

The processing stops.

## User Action

Check the use of parameters and the number of parameters actually required by the definition command, then pass correct parameters.

## 15.9.3 jms2803

---

### **JMS:ERROR:jms2803: Invalid ConnectionFactory type. TYPE '%d'**

## Variable Information

%d = Value of type of ConnectionFactory passed to the definition command *jmsmkfact*.

## Explanation

The integer value of the type of ConnectionFactory is invalid.

## System Action

The processing stops.

## User Action

Currently, only TopicConnectionFactory is supported. Check that the -t option of the *jmsmkfact* command is specified.

## 15.9.4 jms2804

---

### **JMS:ERROR:jms2804: Invalid switch or parameter. PARAMETER '%s'**

## Variable Information

%s = Parameter or Switch as a Cause of Exception

## Explanation

Parameter or switch passed to a definition command is invalid.

## System Action

The processing stops.

## User Action

Check how to use a definition command and check that all the parameters passed to the command are valid.

For details of the valid characters for a parameter in a definition command, refer to the JMS Operation Commands in the Reference Manual (Command Edition).

## 15.9.5 jms2805

---

### **JMS:ERROR:jms2805: JNDI registration name is not specified.**

#### Explanation

JNDI registration name is not specified in the definition command.

#### System Action

The processing stops.

#### User Action

Check how to use a definition command and pass a valid JNDL registration name.

## 15.9.6 jms2806

---

### **JMS:ERROR:jms2806: ConnectionFactory type and clientID are not specified.**

#### Explanation

The type of ConnectionFactory and clientID are not specified in the definition command *jmsmkfact*.

#### System Action

The processing stops.

#### User Action

Check how to use the definition command *jmsmkfact* and pass a valid type of ConnectionFactory and clientID.

## 15.9.7 jms2807

---

### **JMS:ERROR:jms2807: clientID is not specified.**

#### Explanation

clientID is not specified in the definition command *jmsmkfact*.

#### System Action

The processing stops.

#### User Action

Check how to use the definition command *jmsmkfact* and pass a valid clientID.

## 15.9.8 jms2808

---

### **JMS:ERROR:jms2808: Group Name and Channel Name are not specified.**

#### Explanation

A group name and a channel name are not specified in the definition command *jmsmkdst*.

#### System Action

The processing stops.

#### User Action

Check how to use the definition command *jmsmkdst* and pass a valid group name and channel name.

## 15.9.9 jms2809

---

**JMS:ERROR:jms2809: Group name must be specified.**

### Explanation

In case the `-o` option is not used, the definition command `jmsmkdst` needs specification of a group name.

### System Action

The processing stops.

### User Action

Check how to use the definition command `jmsmkdst` and pass a valid group name.

## 15.9.10 jms2810

---

**JMS:ERROR:jms2810: Channel name must be specified.**

### Explanation

In case the `-o` option is not used, the definition command `jmsmkdst` needs specification of a channel name.

### System Action

The processing stops.

### User Action

Check how to use the definition command `jmsmkdst` and pass a valid channel name.

## 15.9.11 jms2811

---

**JMS:ERROR:jms2811: Too long parameter. The length of parameter can't exceed 255 characters. PARAMETER '%s'**

### Variable Information

`%s` = Parameter as a Cause of Exception

### Explanation

The length of a parameter passed to a definition command exceeded 255 characters.

### System Action

The processing stops.

### User Action

Check that the length of all the parameters passed to a definition command does not exceed the maximum 255 characters.

## 15.9.12 jms2812

---

**JMS:ERROR:jms2812: Bad parameter. The first character of the parameter must be either a number or an alphabet. PARAMETER '%s'**

### Variable Information

`%s` = Parameter as a Cause of Exception

### Explanation

A parameter passed to a definition command must start with a numeral or an alphabetic character.

## System Action

The processing stops.

## User Action

Check that the parameter passed to a definition command starts with a numeral or an alphabetic character.

## 15.9.13 jms2813

---

**JMS:ERROR:jms2813: Bad character in the parameter. PARAMETER '%s', CHARACTER '%c'**

### Variable Information

%s = Value of parameter passed to a definition command

%c = Characters as a Cause of Exception

### Explanation

The parameter value currently passed to a definition command is an invalid or an unsupported character.

## System Action

The processing stops.

## User Action

Check that all the parameters passed to a definition command use only the characters permitted in a character set as described above.

For details of the valid characters for the parameter of a definition command, refer to JMS Operation Commands in the Reference Manual (Command Edition).

## 15.9.14 jms2814

---

**JMS:ERROR:jms2814: A NamingException occurred while reading the JNDI definition. EXCEPTION '%s'**

### Variable Information

%s = Detailed Exception Information

### Explanation

An internal error.

## System Action

The processing stops.

## User Action

Collect diagnostic information with the *iscollectinfo* command, and contact the service engineer (SE).

## 15.9.15 jms2815

---

**JMS:INFO:jms2815: Command completed successfully.**

### Explanation

JMS operational commands have been executed without error.

## System Action

The processing continues.

## User Action

None.

## 15.9.16 jms2816

---

**JMS:ERROR:jms2816: Trying to delete Destination '%s' that is not registered in the JNDI.**

### Variable Information

%s = Destination Name

### Explanation

An attempt was made to delete Destination not registered to JNDI.

### System Action

The processing stops.

### User Action

- Use the *jmsinfodst* command to check whether Destination is registered.
- Check whether Destination name is correct.

## 15.9.17 jms2817

---

**JMS:ERROR:jms2817: Trying to delete ConnectionFactory '%s' that is not registered in the JNDI.**

### Variable Information

%s = ConnectionFactory Name

### Explanation

An attempt was made to delete ConnectionFactory not registered to JNDI.

### System Action

The processing stops.

### User Action

- Use the *jmsinfofact* command to check whether ConnectionFactory is registered.
- Check whether ConnectionFactory name is correct.

## 15.9.18 jms2818

---

**JMS:ERROR:jms2818: The switch or parameter '%s' is not supported by this version of the Interstage JMS Provider.**

### Variable Information

%s = Value of ConnectionFactory Passed to the Definition Command *jmsmkfact*

### Explanation

Parameters passed to the command are not supported by the Interstage JMS provider of the current version.

### System Action

The processing stops.

### User Action

Currently, only TopicConnectionFactory is supported. Use the -t switch of the *jmsmkfact* command.

## 15.9.19 jms2819

---

---

**JMS:ERROR:jms2819: Specified parameter '%s' is duplicated.****Variable Information**

%s = Parameter specified in duplication (Ex: jmssetupcluster -w -w)

**Explanation**

The same parameter is specified in duplication.

**System Action**

The processing stops.

**User Action**

Review how to specify parameters and execute the processing again.

---

**15.9.20 jms2820**

---

**JMS:ERROR:jms2820: Please restore the definition file by hand.****Explanation**

Definition files must be restored in the order they are backed up.

**System Action**

The processing stops.

**User Action**

Restore the backed-up definition file (fjmsjndi.ser.bak) which is stored in the etc directory under the JMS install directory, as the definition file (fjmsjndi.ser).

---

**15.9.21 jms2821**

---

**JMS:ERROR:jms2821: JNDI object identified by '%s' is not a Destination.****Variable Information**

%s = Destination Name

**Explanation**

An attempt was made to overwrite Destination not registered to JNDI.

**System Action**

The processing stops.

**User Action**

- Use the *jmsinfodst* command to check whether Destination is registered.
- Check whether Destination name is correct.

---

**15.9.22 jms2822**

---

**JMS:ERROR:jms2822: JNDI object identified by '%s' is not a ConnectionFactory.****Variable Information**

%s = ConnectionFactory Name

**Explanation**

An attempt was made to overwrite ConnectionFactory not registered to JNDI.

### System Action

The processing stops.

### User Action

- Use the *jmsinfofact* command to check whether ConnectionFactory is registered.
- Check whether ConnectionFactory name is correct.

## 15.9.23 jms2823

---

**JMS:ERROR:jms2823: Parameter -t and -q cannot be specified simultaneously.**

### Explanation

-t and -q are specified simultaneously in the definition command.

### System Action

The processing stops.

### User Action

Specify -t or -q in the definition command and re-execute.

## 15.9.24 jms2824

---

**JMS:ERROR:jms2824: The parameter is too long. The parameter length must not exceed 64 characters. PARAMETER '%s'**

### Variable Information

%s = Parameter that caused the exception

### Explanation

The maximum length for the parameter (%s) passed to the definition command exceeded 64 characters.

### System Action

The processing stops.

### User Action

Correct the parameter (%s) passed to the definition command and check that its length does not exceed 64 characters.

## 15.9.25 jms2825

---

**JMS:ERROR:jms2825: The parameter contains characters that cannot be used. PARAMETER '%s', CHARACTER '%c'**

### Variable Information

%s = Parameter that caused the exception

%c = Character that caused the exception

### Explanation

The parameter passed to the definition command contains invalid characters.

### System Action

The processing stops.

## User Action

Check that the definition command parameter does not contain invalid characters.

For details of characters that can be used in definition command parameters, refer to 'JMS Operation Commands' in the Reference Manual (Command Edition).

## 15.9.26 jms2826

---

**JMS:ERROR:jms2826: The specified Host '%s' could not be found.**

### Variable Information

%s = Host IP address, or Host name that caused the exception

### Explanation

The specified Host could not be found.

Possible causes are as follows:

- If an IP address was specified, the IP address format may be incorrect.
- The specified Host name may not exist. Alternatively, the IP address could not be resolved from the specified host name.

### System Action

The processing stops.

### User Action

Take the following actions:

- Check the specified IP address and, if necessary, correct the IP address format.
- Check whether the specified host name exists.

If it does not, specify a correct host name or IP address.

If it does exist, it is possible that the IP address could not be resolved from the host name. If the application is running using DNS, check the DNS settings. If the application is not running using DNS, check that the content defined in the hosts file is correct. For details on entering information in the hosts file, refer to "Entering Information in the Hosts File" in the "Common Notes for Interstage" chapter of the Product Notes.

## 15.9.27 jms2827

---

**JMS:ERROR:jms2827: Specify the port number using half-width numerics.**

### Explanation

The port number was specified using multi-byte characters.

### System Action

The processing stops.

### User Action

Specify the port number using half-width numerics.

## 15.9.28 jms2828

---

**JMS:ERROR:jms2828: Specify an integer from [0] to [65535] for the port number.**

### Explanation

The value that was specified for the port number is outside the range.

#### System Action

The processing stops.

#### User Action

Specify an integer from 0 to 65535 for the port number.

### 15.9.29 jms2829

---

**JMS:ERROR:jms2829: Specify the IP address (Hostname) and the port number at the same time.**

#### Explanation

Either the IP address (Host name) or the port number was not specified.

#### System Action

The processing stops.

#### User Action

Specify both the IP address (Host name) and the port number.

For details about definition command parameters, refer to 'JMS Operation Commands' in the Reference Manual (Command Edition).

### 15.9.30 jms2880

---

**JMS:ERROR:jms2880: Argument '%s' is not specified.**

#### Variable Information

%s = Argument name

#### Explanation

Invoked without specifying the argument '%s'.

#### System Action

The processing stops.

#### User Action

Internal error.

Collect diagnostic information with the *iscollectinfo* command, and contact the service engineer (SE).

### 15.9.31 jms2881

---

**JMS:ERROR:jms2881: ConnectionFactory type '%s' is not supported by this version of the Interstage JMS Provider.**

#### Variable Information

%s = ConnectionFactory type

#### Explanation

The ConnectionFactory type (%s) is not supported in the Interstage JMS provider of the current version.

#### System Action

The processing stops.

#### User Action

Internal error.

Collect diagnostic information with the *iscollectinfo* command, and contact the service engineer (SE).

## 15.9.32 jms2882

---

**JMS:ERROR:jms2882: It cannot delete of a default definition. NAME '%s'**

### Variable Information

%s = JNDI name

### Explanation

The specified JNDI name cannot be deleted because it is a default definition.

### System Action

The processing stops.

### User Action

None.

## 15.9.33 jms2883

---

**JMS:ERROR:jms2883: It cannot change the type of a default definition. NAME '%s'**

### Variable Information

%s = JNDI name

### Explanation

The specified JNDI is a default definition type, so it cannot be changed.

Only the following settings can be changed:

- Client identifier (client ID)
- Global Transactions

### System Action

The processing stops.

### User Action

None.

## 15.10 jms3000 to jms3099

---

This section details the messages numbered between jms3000 and jms3099.

### 15.10.1 jms3003

---

**JMS:ERROR:jms3003: Unable to create Structured Event from the Message. EXCEPTION '%s'**

### Variable Information

%s = Detailed Exception Information

### Explanation

An internal error.

It is impossible to convert a JMS message to a Structured Event during publishing.

## System Action

The processing stops.

## User Action

Collect diagnostic information with the *iscollectinfo* command, and contact the service engineer (SE).

### 15.10.2 jms3007

---

**JMS:ERROR:jms3007: Internal Error. Current thread is not the owner. EXCEPTION '%s'**

## Variable Information

%s = Detailed Exception Information

## Explanation

An internal error.

## System Action

The processing stops.

## User Action

Collect diagnostic information with the *iscollectinfo* command, and contact the service engineer (SE).

### 15.10.3 jms3008

---

**JMS:ERROR:jms3008: The message cannot be converted. EXCEPTION '%s'**

## Variable Information

%s = Detailed Exception Information

## Explanation

An internal error.

JMS messages cannot be converted during send.

## System Action

The processing stops.

## User Action

Collect diagnostic information with the *iscollectinfo* command, and contact the service engineer (SE).

### 15.10.4 jms3020

---

**JMS:ERROR:jms3020: Operation '%s' failed. An invalid priority was set. Priority range 0-9.**

## Variable Information

%s = JMS API Method Name

## Explanation

Priority is specified in the range 0-9.

## System Action

The processing stops.

## User Action

Set the priority within the range 0-9.

### 15.10.5 jms3021

---

**JMS:ERROR:jms3021: Operation '%s' failed. A value >= 0ms must be set.**

#### Variable Information

%s = JMS API Method Name

#### Explanation

A value below the default was set.

#### System Action

The processing stops.

#### User Action

Set the default value or a bigger value.

### 15.10.6 jms3022

---

**JMS:ERROR:jms3022: Operation '%s' failed. Method not called by a transacted Session.**

#### Variable Information

%s = JMS API Method Name

#### Explanation

A method was called in a session that was not processing a transaction.

#### System Action

The processing stops.

#### User Action

Avoid calling a method in a session that is not processing a transaction.

### 15.10.7 jms3024

---

**JMS:ERROR:jms3024: Operation '%s' failed. This method can be used only when the TopicPublisher's Topic is null.**

#### Variable Information

%s = JMS API Method Name

#### Explanation

A method was called When Topic of TopicPublisher was not null. (Ex: createPublisher(topic))

#### System Action

The processing stops.

#### User Action

It is possible to call a method only for a createPublisher whose Topic is null.

(Example: createPublisher(null))

## 15.10.8 jms3027

---

**JMS:ERROR:jms3027: Error. Another thread has interrupted this thread when it is waiting. EXCEPTION '%s'**

### Variable Information

%s = Detailed Exception Information

### Explanation

An internal error.

### System Action

The processing stops.

### User Action

Collect diagnostic information with the *iscollectinfo* command, and contact the service engineer (SE).

## 15.10.9 jms3028

---

**JMS:ERROR:jms3028: Operation '%s' failed. This method cannot be used when the TopicPublisher's Topic is null.**

### Variable Information

%s = JMS API Method Name

### Explanation

A method was called When Topic of TopicPublisher was null. (Ex: createPublisher(null))

### System Action

The processing stops.

### User Action

It is possible to call a method only for a createPublisher whose Topic is not null.

(Example: createPublisher(topic))

## 15.10.10 jms3031

---

**JMS:ERROR:jms3031: Operation '%s' failed. Invalid Delivery Mode.**

### Variable Information

%s = JMS API Method Name

### Explanation

An invalid delivery mode (mode other than PERSISTENT or NON\_PERSISTENT) is set.

Delivery mode different from channel delivery mode is set.

### System Action

The processing stops.

### User Action

Set a valid deliver mode (PERSISTENT or NON\_PERSISTENT) and check the setting of the delivery mode is the same as setting of channels.

## 15.10.11 jms3033

---

**JMS:ERROR:jms3033: Operation '%s' failed. The delivery mode cannot be set if the Topic is null.**

### Variable Information

%s = JMS API Method Name

### Explanation

It is impossible to call the delivery mode for a null Topic.

### System Action

The processing stops.

### User Action

Avoid calling this method before setting Topic.

## 15.10.12 jms3034

---

**JMS:ERROR:jms3034: Operation '%s' failed. Cannot call this method when the MessageListener is set.**

### Variable Information

%s = JMS API Method Name

### Explanation

It is impossible to call this method when MessageListener is set.

### System Action

The processing stops.

### User Action

Avoid calling this method when MessageListener is set.

## 15.10.13 jms3036

---

**JMS:ERROR:jms3036: Operation '%s' failed. The MessageListener is null.**

### Variable Information

%s = JMS API Method Name

### Explanation

Setting of MessageListener is null.

### System Action

The processing stops.

### User Action

Set a valid MessageListener.

## 15.10.14 jms3037

---

**JMS:ERROR:jms3037: Operation '%s1' failed. The Topic ('%s2') is invalid.**

### Variable Information

%s1 = JMS API Method Name

%s2 = Set Topic Name

### Explanation

An invalid Topic was set.

### System Action

The processing stops.

### User Action

Set an invalid Topic.

## 15.10.15 jms3038

---

**JMS:ERROR:jms3038: Operation '%s' failed. Messages discarded.**

### Variable Information

%s = JMS API Method Name

### Explanation

Failed to deliver a message due to some internal error.

### System Action

The processing stops.

### User Action

Re-send the message.

## 15.10.16 jms3039

---

**JMS:ERROR:jms3039: Operation '%s' failed. The delivery mode cannot be set if the Destination is null.**

### Variable Information

%s = JMS API Method Name

### Explanation

If Destination is null, the delivery mode cannot be invoked.

### System Action

The processing stops.

### User Action

Do not invoke this method before making a Destination setting.

## 15.10.17 jms3051

---

**JMS:ERROR:jms3051: A RuntimeException occurred within the MessageListener. EXCEPTION '%s'**

### Variable Information

%s = Detailed Exception Information

### Explanation

RuntimeException occurred.

### System Action

The processing continues.

### User Action

Correct RuntimeException in the client application.

## 15.10.18 jms3059

---

**JMS:ERROR:jms3059: Operation '%s' failed. Cannot be called from an Applet.**

### Variable Information

%s = JMS API Method Name

### Explanation

It is impossible to call this method from an applet.

### System Action

The processing stops.

### User Action

Avoid calling this method from an applet.

## 15.10.19 jms3060

---

**JMS:ERROR:jms3060: Autodiscon should be off for durable subscription.**

### Explanation

The automatic collection mode of the Event Channel must be disabled in the durable subscription.

### System Action

The processing stops.

### User Action

Avoid setting parameters for the automatic collection mode when an Event Service is set or Event Channel is generated.

## 15.10.20 jms3061

---

**JMS:ERROR:jms3061: Channel has to be Persistent for durable subscription.**

### Explanation

An Event Channel must be non-volatile in the durable subscription.

### System Action

The processing stops.

### User Action

Generate an Event Channel that is non-volatile in the durable subscription.

## 15.10.21 jms3062

---

**JMS:INFO:jms3062: Durable subscription (name '%s1') was using Topic '%s2'. Now using Topic '%s3'.**

### Variable Information

%s1 = durable subscription Name

%s2 = Old Topic Name

%s3 = New Topic Name

### Explanation

The durable subscription generated in a new Topic uses the same subscription name and clientID as an existing durable subscription. First, unregister the old subscription.

### System Action

The processing stops.

### User Action

Check whether the same subscription name and client ID were intentionally used for different Topics.

## 15.10.22 jms3063

---

**JMS:ERROR:jms3063: Operation 'unsubscribe' failed. The durable subscription still has an active TopicSubscriber.**

### Explanation

The client inadvertently made an attempt to delete a durable subscription having an activated TopicSubscriber.

### System Action

The processing stops.

### User Action

Close TopicSubscriber before calling Session.unsubscribe.

## 15.10.23 jms3064

---

**JMS:ERROR:jms3064: Operation 'unsubscribe' failed. The durable subscription still has unacknowledged messages.**

### Explanation

The client inadvertently made an attempt to delete a durable subscription while receiving a message not acknowledged by part of a transaction or a session.

### System Action

The processing stops.

### User Action

Perform commit/rollback/acknowledge/recover on any message received via TopicSubscriber before calling Session.unsubscribe.

## 15.10.24 jms3065

---

**JMS:ERROR:jms3065: The specified durable Subscriber does not exist. NAME '%s1', CLIENT ID '%s2'**

### Variable Information

%s1 = durable subscription name

%s2 = clientID

### Explanation

The *jmsrmds* command was used in the non-existent durable Subscriber, or Session.unsubscribe was called.

### System Action

The processing stops.

### User Action

Check the durable subscription name and clientID.

## 15.10.25 jms3066

---

**JMS:ERROR:jms3066: Operation '%s' failed. TemporaryTopic cannot be specified to be Topic.**

### Variable Information

%s = JMS API Method Name

### Explanation

A temporary topic is specified for Topic in createDurableSubscriber.

### System Action

The processing stops.

### User Action

Check the application.

## 15.10.26 jms3067

---

**JMS:ERROR:jms3067: The 'unsubscribe' operation failed. Durable subscription contains a MessageConsumer that is not running yet.**

### Explanation

The client mistakenly attempted to delete a durable subscription from a MessageConsumer that is running.

#### System Action

The processing stops.

#### User Action

Close the MessageConsumer before calling Session.unsubscribe.

### 15.10.27 jms3070

---

**JMS:ERROR:jms3070: Specified durable Subscriber is active.**

#### Explanation

Specified durable Subscriber is already activated.

#### System Action

The processing stops.

#### User Action

Stop the specified durable Subscriber, then call it again.

### 15.10.28 jms3071

---

**JMS:INFO:jms3071: There is no durable Subscriber. FILE '%s'**

#### Variable Information

%s = durable Subscriber Management File Name

#### Explanation

durable Subscribers are not registered.

#### System Action

The processing stops.

#### User Action

None.

### 15.10.29 jms3072

---

**JMS:ERROR:jms3072: Exceed max number of durable Subscriber. MAX NUMBER '%s'**

#### Variable Information

%s = Maximum number of durable Subscribers that can be registered

#### Explanation

Too many durable Subscribers are registered.

#### System Action

The processing stops.

#### User Action

Delete unnecessary durable Subscribers and execute the processing again.

## 15.10.30 jms3073

---

**JMS:INFO:jms3073: The file is not found. NAME '%s1', CLIENT ID '%s2'**

### Variable Information

%s1 = durable subscription name

%s2 = clientID

### Explanation

The specified durable Subscriber information file cannot be found.

### System Action

The processing continues.

### User Action

None.

## 15.10.31 jms3074

---

**JMS:ERROR:jms3074: Failure in converting String to Object.**

### Explanation

An error occurred while restoring durable Subscriber information in the durable Subscriber information file.

### System Action

The processing stops.

### User Action

Check information in the console log and eliminate the cause.

## 15.10.32 jms3075

---

**JMS:ERROR:jms3075: Failure in converting Object to String.**

### Explanation

An error occurred while recording durable Subscriber information in the durable Subscriber information file.

### System Action

The processing stops.

### User Action

Check information in the console log and eliminate the cause.

## 15.10.33 jms3076

---

**JMS:ERROR:jms3076: Failure in reading of the file. NAME '%s1', CLIENT ID '%s2'**

### Variable Information

%s1 = durable subscription name

%s2 = clientID

#### Explanation

An error occurred while reading a durable Subscriber information file.

#### System Action

The processing stops.

#### User Action

Check information in the console log and eliminate the cause.

### 15.10.34 jms3077

---

**JMS:ERROR:jms3077: Specified durable Subscriber is active. NAME '%s1', CLIENT ID '%s2'**

#### Variable Information

%s1 = durable subscription name

%s2 = clientID

#### Explanation

Specified durable Subscriber is already activated.

#### System Action

The processing stops.

#### User Action

Stop the specified durable Subscriber, and execute the processing again.

### 15.10.35 jms3078

---

**JMS:ERROR:jms3078: Failure in accessing to the file. FILE '%s'**

#### Variable Information

%s = File name

#### Explanation

An error has occurred while accessing the file.

#### System Action

The processing stops.

#### User Action

Confirm the following.

- The durable Subscriber being used by other users cannot be started.
- Processing cannot be executed without access permission to the file or the directory.

If the cause of the failure is not the above, collect diagnostic information with the *iscollectinfo* command, and contact the service engineer (SE).

## 15.11 jms4000 to jms4099

---

This section details the messages numbered between jms4000 and jms4099.

### 15.11.1 jms4000

---

**JMS:ERROR:jms4000: Operation '%s1' failed. The Queue ('%s2') is invalid.**

#### Variable Information

%s1 = JMS API Method Name

%s2 = Setup Queue name

#### Explanation

An invalid Queue is set.

#### System Action

The processing stops.

#### User Action

Set a valid Queue.

## 15.12 jms4500 to jms4599

---

This section details the messages numbered between jms4500 and jms4599.

### 15.12.1 jms4500

---

**JMS:ERROR:jms4500: Operation '%s' failed. This method cannot be used when the QueueSender's Queue is null.**

#### Variable Information

%s = JMS API Method Name

#### Explanation

This method was invoked when Queue of QueueSender was null (Example: createSender(null)).

#### System Action

The processing stops.

#### User Action

This method can be invoked only for a createSender whose Queue is not null (Example: createSender(queue)).

### 15.12.2 jms4501

---

**JMS:ERROR:jms4501: Operation '%s' failed. This method can be used only when the QueueSender's Queue is null.**

#### Variable Information

%s = JMS API Method Name

#### Explanation

This method was invoked when Queue of QueueSender was not null (Example: createSender(queue)).

## System Action

The processing stops.

## User Action

This method can be invoked only for a createSender whose Queue is null (Example: createSender(null)).

## 15.13 jms4600 to jms4699

---

This section details the messages numbered between jms4600 and jms4699.

### 15.13.1 jms4600

---

**JMS:ERROR:jms4600: Operation '%s' failed. There is no acquirable element.**

#### Variable Information

%s = JMS API Method Name

#### Explanation

No result data of nextElements exists.

#### System Action

The processing stops.

#### User Action

hasMoreElements may not have been performed. Check the application.

## 15.14 jms4700 to jms4799

---

This section details the messages numbered between jms4700 and jms4799.

### 15.14.1 jms4700

---

**JMS:ERROR:jms4700: Operation '%s1' failed. Destination ('%s2') is incorrect.**

#### Variable Information

%s1 = JMS API Method Name

%s2 = Destination name that was set

#### Explanation

An invalid Destination was set.

#### System Action

The processing stops.

#### User Action

Set a valid Destination.

### 15.14.2 jms4701

---

**JMS:ERROR:jms4701: Operation '%s' failed. This method cannot be used when the MessageProducer Destination is null.**

## Variable Information

%s = JMS API Method Name

## Explanation

null was specified in the MessageProducer destination and the method was called. (Example: createProducer(null))

## System Action

The processing stops.

## User Action

Check the createProducer() destination parameter.

Do not specify null in the createProducer destination parameter when JMS API method name (%s) is "send" and the destination parameter is not specified. (Example: createProducer(destination))

## 15.14.3 jms4702

---

**JMS:ERROR:jms4702: Operation '%s' failed. This method can only be used when the MessageProducer Destination is null.**

## Variable Information

%s = JMS API Method Name

## Explanation

null was not specified in the MessageProducer destination and the method was called. (Example: createProducer(destination))

## System Action

The processing stops.

## User Action

Check the createProducer() destination parameter.

Specify null in the createProducer destination parameter when JMS API method name (%s) is "send" and the destination parameter is specified. (Example:createProducer(null))

## 15.15 jms4800 to jms4899

---

This section details the messages numbered between jms4800 and jms4899.

### 15.15.1 jms4800

---

**JMS:ERROR:jms4800: Failed to get the transactionID. value = '%s'**

## Variable Information

%s = Property value for the transaction ID.

## Explanation

Failed to get the transaction ID for the application specified in the 'com.fujitsu.interstage.jms.TransactionBetweenMultipleChannels' system property.

## System Action

The processing stops.

## User Action

Confirm the following:

- The 'com.fujitsu.interstage.jms.TransactionBetweenMultipleChannels' system property is set to "ON".
- The transaction ID is set for the message that is sent. If it is not, set it.

## 15.15.2 jms4801

---

### **JMS:ERROR:jms4801: Failed to set the Property name('%s').**

#### Variable Information

%s = Property name

#### Explanation

Failed to set the property (%s). The property (%s) already exists.

#### System Action

The processing stops.

#### User Action

Check whether the property (%s) is set for the message that is sent. If it is, make sure that it is not set.

## 15.15.3 jms4802

---

### **JMS:ERROR:jms4802: Failed to get the Property name('%s').**

#### Variable Information

%s = Property name

#### Explanation

Failed to set the property (%s). More than one property (%s) already exists.

#### System Action

The processing stops.

#### User Action

Check whether the property (%s) is set for the message that is sent. If it is, make sure that it is not set.

## 15.16 jms5000 to jms5099

---

This section details the messages numbered between jms5000 and jms5099.

### 15.16.1 jms5000

---

#### **JMS:WARNING:jms5000: An invalid value was specified for snap file name.**

#### Explanation

An invalid value was specified to a snap file name.

#### System Action

The processing continues without outputting snap logs.

#### User Action

Check the following:

- In case the specified snap file name is not an absolute path (including the drive name), specify the snap file name with an absolute path.

- In case the specified snap file name contains invalid characters defined in a file system, correct the snap file name.
- In case the specified snap file name is over 260 bytes, shorten the snap file name.
- In case an access right is not set to the specified snap file name, change the access right so as to access the snap file.

In case snap logs must be acquired, specify a valid snap file name and execute the processing again.

## 15.16.2 jms5001

---

**JMS:WARNING:jms5001: An invalid value was specified for snap level.**

### Explanation

An invalid value was specified to the snap level.

### System Action

The processing continues without outputting snap logs.

### User Action

In case snap logs must be acquired, specify a valid snap file name and execute the processing again.

- Valid level is 1 or 2.

## 15.16.3 jms5002

---

**JMS:WARNING:jms5002: Failure in writing to snap file. REASON '%s'**

### Variable Information

%s = Detailed Message

### Explanation

An error occurred while writing to a snap file.

### System Action

The processing continues without outputting snap logs.

### User Action

Check the following:

- In case the directory for the specified snap file does not exist, change the snap file name or create a directory.
- In case the size of the file system is insufficient, increase the free capacity of the file system.
- In case an access right is not set to the specified snap file name, change the access right so as to access the snap file.
- In case an I/O error occurred, check that the disk device storing the snap file is operating normally.

## 15.16.4 jms5003

---

**JMS:WARNING:jms5003: Failure in writing to console file. REASON '%s'**

### Variable Information

%s = Detailed Message

### Explanation

An error occurred while writing to a console file.

### System Action

The processing continues without outputting snap logs.

## User Action

Check the following:

- In case the size of the file system is insufficient, increase the free capacity of the file system.
- In case an access right is not set to the directory for console files or to the console file, change the access right so as to access the console file.
- In case an I/O error occurred, check that the disk device storing the console file is operating normally.
- If the file system size is insufficient, increase the available capacity of the file system.

**Solaris32/64** **Linux32/64**

- The security enhancement command may have been changed. Execute the `jmssetsecmode` command (with the `-l` option) to check the security mode, and then re-execute the JMS application as a user with security authority.

## 15.16.5 jms5004

---

**JMS:WARNING:jms5004: An invalid value was specified for console size.**

### Explanation

An invalid value was specified to the size of the console file.

### System Action

The processing continues with the default console file size.

### User Action

In case it is necessary to change the maximum size of the console file, specify the valid console file size and execute the processing again.

## 15.16.6 jms5005

---

**JMS:WARNING:jms5005: Snap file name is not specified.**

### Explanation

Snap file name is not specified.

### System Action

The processing continues without outputting snap logs.

### User Action

In case it is necessary to acquire snap logs, specify a valid snap file name and execute the processing again.

In case it is not necessary to acquire snap logs, avoid specifying the snap level.

## 15.16.7 jms5006

---

**JMS:WARNING:jms5006: An invalid value was specified for console directory.**

### Explanation

An invalid value was specified to the directory for console files.

### System Action

The processing continues without outputting console logs.

### User Action

In case it is necessary to acquire console logs, specify a valid directory for console files and execute the processing again.

## 15.17 jms6000 to jms6099

---

This section details the messages numbered between jms6000 and jms6099.

### 15.17.1 jms6005

---

**JMS:ERROR:jms6005: The context is not empty. NAME '%s'**

#### Variable Information

%s = JNDI Name

#### Explanation

Processing failed because the specified Context is not empty.

#### System Action

The processing stops.

#### User Action

Check whether the specified Context can be deleted, specify an empty Context and execute the processing again.

### 15.17.2 jms6013

---

**JMS:ERROR:jms6013: The name is already binding. NAME '%s'**

#### Variable Information

%s = JNDI Name

#### Explanation

Processing failed because the specified JNDI name is already registered.

#### System Action

The processing stops.

#### User Action

Specify another JNDI name and execute the processing again.

### 15.17.3 jms6014

---

**JMS:ERROR:jms6014: The name is not found. NAME '%s'**

#### Variable Information

%s = JNDI Name

#### Explanation

Processing failed because the specified JNDI name was not found.

#### System Action

The processing stops.

#### User Action

If this message is output when the Interstage management console is used to delete the ConnectionFactory or Destination, it may be deleted by a request from another user or the Interstage JMX service may be restarted. Recollect the ConnectionFactory or Destination list, and if the targeted JNDI name exists, re-execute the processing.

In cases other than that described above, specify the correct JNDI name and re-execute the processing.

If a JMS application is started for an extended system during multisystem operation, the extended system name may not have been specified for system property "com.fujitsu.interstage.isas.SystemName" of the Java (TM) VM. Use the java command -D option to specify the extended system name.

## 15.17.4 jms6019

---

### **JMS:ERROR:jms6019: The name is not Context. NAME '%s'**

#### Variable Information

%s = JNDI Name

#### Explanation

Processing failed because the specified JNDI name was not a Context object.

#### System Action

The processing stops.

#### User Action

Specify a correct JNDI name and execute the processing again.

## 15.17.5 jms6053

---

### **JMS:ERROR:jms6053: Invalid attribute is specified. NAME '%s1', OBJECT '%s2'**

#### Variable Information

%s1 = JNDI Name

%s2 = Object Registered to the JNDI Name Space

#### Explanation

Processing failed because the specified object was invalid.

#### System Action

The processing stops.

#### User Action

Collect diagnostic information with the *iscollectinfo* command, and contact the service engineer (SE).

## 15.18 jms6100 to jms6199

---

This section details the messages numbered between jms6100 and jms6199.

### 15.18.1 jms6100

---

#### **JMS:ERROR:jms6100: Failure in accessing the CORBA service. NAME '%s1', EXCEPTION '%s2'**

#### Variable Information

%s1 = Event Channel Name

%s2 = Detailed Exception Information

#### Explanation

An error occurred during access to the CORBA Service.

## System Action

The processing stops.

## User Action

If the detail exception information (%s2) minor code is '1179254801(0x464A0011)' or '1179256849(0x464A0811)', it means there is a possibility that there was an error in the creation of the Event Channel. Take the following action, and re-execute processing.

### Using the Interstage Management Console to make the environment settings

1. Check the status of the Event Channel Notification Service function in the following page:

- On the Standalone Server

[System] > [Services] > [Event Service] > [EventChannels] > [Group name::EventChannel name] > [Detailed Settings]

- On the Integrated Control of the Admin Server

[Integrated Control] > [Interstage] > [Interstage Application Server] > [Server name] > [System] > [Services] > [Event Service] > [EventChannels] > [Group name::EventChannel name] > [Detailed Settings]

- On the Operate in Batch of the Admin Server

[Operate in Batch] > [Interstage] > [Interstage Application Server] > [Services] > [Event Service] > [Server Group Name/Server Name] > [EventChannels] > [Detailed Settings]

2. If 'None' is set for the Notification Service function, delete the Event Channel and then re-create it by specifying 'JMS' for 'EventChannel Type'.

- On the Standalone Server

[System] > [Resources] > [JMS] > [EventChannels] > [Create a New EventChannel]

- On the Operate in Batch of the Admin Server

[Operate in Batch] > [Interstage] > [Interstage Application Server] > [Services] > [Event Service] > [Server Group Name/Server Name] > [EventChannels] > [Create a New EventChannel]

### Using the Event Service operation command to make the environment settings

1. Execute the *esstcfnchnl* command as shown below, and check that "yes" is set for "Notification channel mode".

```
esstcfnchnl -d -g group name
```

2. If 'no' is set for 'Notification channel mode', delete the Event Channel using the *esrmchnl* command and then re-create the Event Channel by specifying the *-notify* option in the *esmkchnl* command.

In other cases, refer to the detailed exception information, and then eliminate the cause.

Check the following:

- Check that CORBA Service is operating normally.
- In case the environment variables PATH or CLASSPATH contain an error, ensure that the environment variables are set correctly and execute the processing again.
- Review the CORBA environment and execute the processing again.
- If the host name or the IP address was specified in the Destination definition, it is possible that the IP address could not be resolved from the host name or that the host name could not be resolved from the IP address. If the application is running using DNS, check the DNS settings. If the application is not running using DNS, check that the content defined in the hosts file is correct. For details on entering information in the hosts file, refer to "Entering Information in the Hosts File" in the "Common Notes for Interstage" chapter of the Product Notes.
- Check the host name and port number that are set in the files below: If the settings contain any errors, set the correct values, and re-execute processing.
  - The host information definition file of the CORBA service client (C:\Interstage\ODWIN\etc\inithost)
  - The operating environment file of Portable-ORB

## Note

Use the *porbeditenv* command for confirmation.

## 15.18.2 jms6101

---

**JMS:ERROR:jms6101: EventChannel is not found. NAME '%s1', EXCEPTION '%s2'**

### Variable Information

%s1 = Event Channel Name

%s2 = Detailed Exception Information

### Explanation

Processing failed because the specified Event Channel was not found.

### System Action

The processing stops.

### User Action

Refer to the detailed exception information, and then eliminate the cause. Check the following:

- Check that CORBA Service is operating normally.
- Check that the specified Event Channel has been created. In case the Event Channel is not generated or is deleted, create the specified Event Channel.
- Check whether an IPv6 format address was specified for the Destination definition. If the host that is used for running the Naming Service is run in an IPv6 environment, specify the host name.
- If import and export of the event channel object reference has occurred, check whether they were correctly performed.

## 15.18.3 jms6102

---

**JMS:ERROR:jms6102: Invalid name is specified. NAME '%s1', EXCEPTION '%s2'**

### Variable Information

%s1 = Event Channel Name

%s2 = Detailed Exception Information

### Explanation

Processing failed because the specified Event Channel name was invalid.

### System Action

The processing stops.

### User Action

Refer to the detailed exception information, then eliminate the cause.

Check the following:

- Check that CORBA Service is operating normally.
- In case the Event Channel is registered with an invalid name by the *jmsmkdst* command, specify and register a valid Event Channel name.

## 15.18.4 jms6104

---

**JMS:INFO:jms6104: Refer to the local Host Naming Service. Destination '%s'**

## Variable Information

%s = Destination Name

## Explanation

Failed to access the CORBA Service that was running using the IP address (host name) set for the Destination definition (%s). Refer to the local Host Naming Service.

## System Action

The processing continues.

## User Action

Take the following actions:

- In Windows(R), refer to the message on the event log and check whether error message od10937 was output at the same time as this message. In Solaris/Linux, refer to the message on the system log and check whether error message od10937 was output at the same time as this message.

If od10937 was output, check whether the host name was set as "Corba Host Name" of the Interstage operating environment definition or "IOP\_hostname" of the CORBA Service config file. If the host name was set, specify the same host name as the Destination definition IP address (host name) to update the Destination definition, and then re-execute processing.

- If the host name or the IP address was specified in the Destination definition, it is possible that the IP address could not be resolved from the host name or that the host name could not be resolved from the IP address. If the application is running using DNS, check the DNS settings. If the application is not running using DNS, check that the content defined in the hosts file is correct. For details on entering information in the hosts file, refer to "Entering Information in the Hosts File" in the "Common Notes for Interstage" chapter of the Product Notes.
- Check whether an IPv6 format address was specified for the Destination definition. If the host that is used for running the Naming Service is run in an IPv6 environment, specify the host name.
- In all other cases, check the Destination definition IP address (host name) and check that the CORBA Service running using the corresponding host name is running normally.

## 15.18.5 jms6150

---

### **JMS:ERROR:jms6150: Other process is writing in JNDI definition file.**

## Explanation

Processing failed because another process was writing to the JNDI definition file.

## System Action

The processing stops.

## User Action

After the other process has completed access to the JNDI definition file, execute the processing again.

## 15.19 jms6200 to jms6299

---

This section details the messages numbered between jms6200 and jms6299.

### 15.19.1 jms6200

---

#### **JMS:ERROR:jms6200: Failure in reading the cluster information. EXCEPTION '%s'**

## Variable Information

%s = Detailed Exception Information

#### Explanation

Failed to read the cluster environment.

#### System Action

The processing stops.

#### User Action

Refer to the exception information output as variable information to eliminate the cause of exception, and execute the processing again.

### 15.19.2 jms6201

---

#### **JMS:ERROR:jms6201: Failure in reading the cluster environment.**

#### Explanation

Failed to read the cluster environment because information on the cluster environment has been corrupted.

#### System Action

The processing stops.

#### User Action

Information on the cluster environment is corrupt. Implement the cluster environment again, or restore the backed-up environment.

### 15.19.3 jms6202

---

#### **JMS:ERROR:jms6202: Failure in writing the cluster environment. EXCEPTION '%s'**

#### Variable Information

%s = Detailed Exception Information

#### Explanation

Failed to write to the cluster environment.

#### System Action

The processing stops.

#### User Action

Refer to the exception information output as variable information to eliminate the cause of exception, and execute the processing again.

Ensure the user has appropriate access to the directories and files under the Interstage installation directory.

### 15.19.4 jms6203

---

#### **JMS:ERROR:jms6203: Cluster environment has not setup.**

#### Explanation

Cluster environment is not set up.

#### System Action

The processing stops.

#### User Action

The cluster environment is already deleted. It is not necessary to execute *jmssetupcluster*.

## 15.19.5 jms6204

---

**JMS:ERROR:jms6204: Failed to setup cluster environment because durable Subscriber is running.**

### Explanation

It is impossible to set up the cluster environment because durable Subscriber is in operation.

### System Action

The processing stops.

### User Action

Delete the durable Subscriber in operation and execute the processing again.

## 15.19.6 jms6205

---

**JMS:INFO:jms6205: Cluster environment has already setup.**

### Explanation

Cluster environment is already set up.

### System Action

The processing stops.

### User Action

The cluster environment is already set up. It is not necessary to execute *jmssetupcluster*.

## 15.19.7 jms6206

---

**JMS:ERROR:jms6206: Invalid path is specified for the shared disk.**

### Explanation

Specification of a path to a shared disk is wrong.

### System Action

The processing stops.

### User Action

Change the path specification to a full-path specification and execute the processing again.

## 15.19.8 jms6207

---

**JMS:INFO:jms6207: Cluster environment setup is completed.**

### Explanation

Setup of the cluster environment is complete.

### System Action

The processing stops.

### User Action

None.

## 15.19.9 jms6208

---

---

**JMS:ERROR:jms6208: The maximum length of path can be specified for the shared disk exceeded.**

Explanation

Maximum length of a path that can be specified to a shared disk has been exceeded.

System Action

The processing stops.

User Action

Review the path specification and execute the processing again.

## 15.19.10 jms6209

---

**JMS:ERROR:jms6209: There is no durable Subscriber information for the specified shared disk.**

Explanation

Specified shared disk does not contain information on the durable Subscriber.

System Action

The processing stops.

User Action

Review the path specification of the shared disk and execute the processing again.

## 15.19.11 jms6210

---

**JMS:INFO:jms6210: Setup information of cluster environment is deleted.**

Explanation

Setup information on cluster environment is deleted.

System Action

The processing stops.

User Action

None.

## 15.20 jms6300 to jms6399

---

This section details the messages numbered between jms6300 and jms6399.

### 15.20.1 jms6300

---

**JMS:ERROR:jms6300: System name is invalid. SYSTEM=%s**

Variable Information

%s = System name

Explanation

The system name is not correct.

### System Action

Stops command processing.

### User Action

Specify the correct system name, and re-execute processing.

## 15.20.2 jms6301

---

**JMS:ERROR:jms6301: Specified system does not exist. SYSTEM=%s**

### Variable Information

%s = System name

### Explanation

The specified system does not exist.

### System Action

Stops command processing.

### User Action

Specify the system name that exists, and re-execute processing.

## 15.20.3 jms6302

---

**JMS:ERROR:jms6302: System name is too long.**

### Explanation

The system name is too long.

### System Action

Stops command processing.

### User Action

The maximum length of the system name is 8 characters. Specify the system name of not more than 8 characters, and re-execute processing.

## 15.21 jms6400 to jms6499

---

This section details the messages numbered between jms6400 and jms6499.

### 15.21.1 jms6400

---

**JMS:INFO:jms6400: The backup resource already exists in the specified directory.**

### Explanation

JMS environment definition is already saved.

### System Action

The processing stops.

### User Action

JMS environment definition is saved in the specified directory. If necessary, specify another directory and execute the processing again.

## 15.21.2 jms6401

---

**JMS:INFO:jms6401: Backup process is starting. DIR '%s'**

### Variable Information

%s = Path to the Directory

### Explanation

JMS environment definition is being saved.

### System Action

The processing continues.

### User Action

None.

## 15.21.3 jms6402

---

**JMS:INFO:jms6402: Backup process ended normally. DIR '%s'**

### Variable Information

%s = Path to the Directory

### Explanation

JMS environment definition is saved.

### System Action

The processing terminates.

### User Action

None.

## 15.21.4 jms6403

---

**JMS:ERROR:jms6403: There is no JMS environment definition to restore for the specified directory.**

### Explanation

The specified directory does not contain JMS environment definition to be restored.

### System Action

The processing stops.

### User Action

The specified directory does not contain JMS environment definition. Specify another directory and execute the processing again.

## 15.21.5 jms6404

---

**JMS:INFO:jms6404: Restore process is starting. DIR '%s'**

### Variable Information

%s = Path to the Directory

### Explanation

JMS environment definition is being restored.

#### System Action

The processing continues.

#### User Action

None

### 15.21.6 jms6405

---

**JMS:INFO:jms6405: Restore process ended normally. DIR '%s'**

#### Variable Information

%s = Path to the Directory

#### Explanation

JMS environment definition is restored..

#### System Action

The processing terminates.

#### User Action

None.

### 15.22 jms6500 to jms6599

---

This section details the messages numbered between jms6500 and jms6599.

#### 15.22.1 jms6500

---

**JMS:ERROR:jms6500: An application don't have executive right because security strengthening is being done.**

#### Explanation

There is no execution permission for the application under the present strengthened security control.

#### System Action

The processing stops.

#### User Action

Check the user that executed the application and the effective group for the user.

If the following conditions are true, execute the application as a user who belongs to the group set for secure mode, or as the root.

- If this product was installed in secure mode, or set to use secure mode with the *issetsecuritymode* or *jmssetsecmode* command, and
- If the name of the effective group to which the user who executed the application belongs differs from the group name (and user name) set for secure mode,

For details on secure mode for Interstage resources, refer to the "Security System Guide".

#### 15.22.2 jms6501

---

**JMS:ERROR:jms6501: Operation '%s' failed. Null cannot be specified to be user name.**

#### Variable Information

%s = JMS API Method Name

### Explanation

An invalid username is specified.

### System Action

The processing stops.

### User Action

Set a valid username and re-execute.

## 15.22.3 jms6502

---

**JMS:ERROR:jms6502: Operation '%s' failed. Null cannot be specified to be password.**

### Variable Information

%s = JMS API Method Name

### Explanation

An invalid password is specified.

### System Action

The processing stops.

### User Action

Set a valid password and re-execute.

## 15.22.4 jms6503

---

**JMS:ERROR:jms6503: Security control environment definition file does not exist. EXCEPTION '%s'**

### Variable Information

%s = Detailed Exception Information

### Explanation

No security management environment definition file exists.

### System Action

The processing stops.

### User Action

Check that the security.properties file exists in the following directory (default installation path). If the file does not exist, create it.

**Windows32/64**

C:\Interstage\J2EE\etc

**Solaris32/64** **Linux32/64**

/opt/FJSVj2ee/etc

## 15.22.5 jms6504

---

**JMS:ERROR:jms6504: Failure in processing input/output of security control environment definition file. EXCEPTION '%s'**

## Variable Information

%s = Detailed Exception Information

## Explanation

Failed to input or output the security management environment definition file.

## System Action

The processing stops.

## User Action

Check whether read authority is granted for the security.properties file.

## 15.22.6 jms6505

---

**JMS:ERROR:jms6505: The information of security control environment definition file is invalid. EXCEPTION '%s'**

## Variable Information

%s = Detailed Exception Information

## Explanation

Information contained in the security management environment definition file is incorrect.

## System Action

The processing stops.

## User Action

Check the definitions in the security.properties file.

## 15.22.7 jms6506

---

**JMS:ERROR:jms6506: Failure in authenticating specified user id/password. USERID '%s1' , PASSWORD '%s2'**

## Variable Information

%s1 = User name

%s2 = Password

## Explanation

Failed to authenticate the specified user ID/password.

## System Action

The processing stops.

## User Action

The specified user ID and password are not registered in the Interstage Directory Service.

Check the user ID or password.

## 15.22.8 jms6508

---

**JMS:ERROR:jms6508: Failure in accessing directory service. EXCEPTION '%s'**

## Variable Information

%s = Detailed Exception Information

## Explanation

The directory service could not be accessed.

## System Action

The processing stops.

## User Action

Check if the Interstage Directory Service is usable.

## 15.22.9 jms6512

---

**JMS:ERROR:jms6512: User is not found. UserID '%s'**

## Variable Information

%s = User ID

## Explanation

The user ID cannot be found.

## System Action

Cancels switching of the specific user permission operation mode.

## User Action

Specify a valid user ID for the machine, then re-execute the process.

## 15.22.10 jms6513

---

**JMS:ERROR:jms6513: Specified system does not exist. SYSTEM=%s**

## Variable Information

%s = Name of the system specified using option -M

## Explanation

An incorrect system name was specified.

## System Action

Cancels switching of the specific user permission operation mode.

## User Action

Consider which of the following actions apply, then re-execute:

- Execute the *islistsys* command, then specify the system name obtained from the displayed list of systems.
- If an extended system has not been constructed, do not specify option -M.

## 15.22.11 jms6514

---

**JMS:ERROR:jms6514: Directory is not found. DIR '%s'**

## Variable Information

%s = Name of the directory used for switching specific user permission operation mode

## Explanation

The following may have occurred:

- The Interstage JMS has not been installed correctly.
- The extended system environment has not been constructed correctly.

## System Action

Cancels switching of the specific user permission operation mode.

## User Action

Consider which of the following actions apply, then re-execute:

- Correctly install the Interstage JMS.
- Correctly construct the extended system environment.

## 15.22.12 jms6515

---

**JMS:INFO:jms6515: jmssetsecmode command ended.**

## Explanation

Secure mode was set successfully.

## System Action

Secure mode was set successfully.

## 15.22.13 jms6516

---

**JMS:ERROR:jms6516: Only Super Users can execute jmssetsecmode.**

## Explanation

Only Super Users can execute this command.

## System Action

Stops attempting to switch to secure mode.

## User Action

Ask a Super User to execute the command again.

## 15.22.14 jms6517

---

**JMS:ERROR:jms6517: Group not found. GroupID '%s'**

## Variable Information

%s = Group ID

## Explanation

The group ID (%s) cannot be found.

### System Action

Stops attempting to switch to secure mode.

### User Action

Specify a group ID that exists on this machine, then execute the command again.

## 15.22.15 jms6518

---

**JMS:ERROR:jms6518: Failed to get the secure mode.**

### Explanation

Failed to obtain secure mode information.

### System Action

Stops attempting to switch to secure mode.

### User Action

Configure the secure mode settings again.

## 15.23 jms7000 to jms7099

---

This section details the messages numbered between jms7000 and jms7099.

### 15.23.1 jms7000

---

**JMS:ERROR:jms7000: Memory shortage occurred.**

### Explanation

Memory is insufficient in the system.

### System Action

The processing stops.

### User Action

After a brief period, execute the processing again. In case this message is frequently output, take the following action, then restart the processing.

- Change the size of memory of Java VM.
- Check that memory is sufficient for execution. If necessary, re-estimate the volume of memory required by another application to be executed on the same machine.

### 15.23.2 jms7001

---

**JMS:WARNING:jms7001: Failure in deleting the directory. DIR '%s'**

### Variable Information

%s = Directory Name that Could not be Deleted

### Explanation

Failed to delete a directory.

### System Action

The processing continues.

### User Action

Delete the displayed directory.

## 15.23.3 jms7002

---

**JMS:WARNING:jms7002: Failure in deleting the file. FILE '%s'**

### Variable Information

%s = File Name that Could not be Deleted

### Explanation

Failed to delete a file.

### System Action

The processing continues.

### User Action

Delete the displayed file.

## 15.23.4 jms7003

---

**JMS:ERROR:jms7003: Failure in system call. FUNCTION '%s', CODE '%d'**

### Variable Information

%s = Error Function Name

%d = Error Code

### Explanation

Failed in a system call.

### System Action

The processing stops.

### User Action

Collect diagnostic information with the *iscollectinfo* command, and contact the service engineer (SE).

## 15.23.5 jms7004

---

**JMS:ERROR:jms7004: Required component is not installed. Error Information=%s**

### Variable Information

%s = Error information

### Explanation

Failed to load a library.

### System Action

The processing stops.

## User Action

Check the installation environment of Interstage seeing to component name (%s). If the problem cannot be rectified, collect diagnostic information with the *iscollectinfo* command, and contact the service engineer (SE).

## 15.23.6 jms7005

---

### **JMS:ERROR:jms7005: Failure in starting the program. CODE '%d'**

#### Variable Information

%d = Error Code

#### Explanation

Failed to activate a program.

#### System Action

The processing stops.

#### User Action

- Check that the JDK path is properly defined in the environment variable PATH.
- If the error persists, collect diagnostic information with the *iscollectinfo* command, and contact the service engineer (SE).

## 15.23.7 jms7006

---

### **JMS:ERROR:jms7006: Internal error. CODE '%d'**

#### Variable Information

%d = Error Code

#### Explanation

An internal inconsistency occurred.

#### System Action

The processing stops.

#### User Action

Collect diagnostic information with the *iscollectinfo* command, and contact the service engineer (SE).

## 15.23.8 jms7007

---

### **JMS:ERROR:jms7007: Failure in creating of the directory. DIR '%s', CODE '%d'**

#### Variable Information

%s = Directory Name that Could not be Created

%d = Failure information

#### Explanation

Failed to create a directory.

#### System Action

The processing stops.

#### User Action

The disk device may be faulty. Check that disk device is operating correctly.

In case the error persists, collect diagnostic information with the *iscollectinfo* command, and contact the service engineer (SE).

## 15.23.9 jms7008

---

**JMS:ERROR:jms7008: Failure in reading of the file. FILE '%s', CODE '%d'**

### Variable Information

%s = File Name that Could not be Read

%d = Failure information

### Explanation

Failed to read a file.

### System Action

The processing stops.

### User Action

Some error occurred while reading a file. A system error is suspected.

Collect diagnostic information with the *iscollectinfo* command, and contact the service engineer (SE).

## 15.23.10 jms7009

---

**JMS:ERROR:jms7009: Failure in writing of the file. FILE '%s', CODE '%d'**

### Variable Information

%s = File Name that Could not be Written

%d = Failure information

### Explanation

Failed to write to a file.

### System Action

The processing stops.

### User Action

Some error occurred while writing to a file. A system error is suspected.

Collect diagnostic information with the *iscollectinfo* command, and contact the service engineer (SE).

## 15.23.11 jms7010

---

**JMS:ERROR:jms7010: Failure in opening of the file. FILE '%s', CODE '%d'**

### Variable Information

%s = File Name that Could not be Opened

%d = Failure information

### Explanation

Failed to open a file.

### System Action

The processing stops.

### User Action

Some error occurred while opening a file. A system error is suspected.

Collect diagnostic information with the *iscollectinfo* command, and contact the service engineer (SE).

## 15.23.12 jms7011

---

**JMS:ERROR:jms7011: This operation cannot be executed on the managed server.**

### Explanation

JMS operation commands for registering or deleting the definition were executed on the managed server.

### System Action

The command processing stops.

### User Action

Log in to the managed server with the Interstage Management Console, and re-execute the operation for this server.

## 15.23.13 jms7012

---

**JMS:ERROR:jms7012: Internal error. CODE '%s1' 'DETAIL '%s2'**

### Variable Information

%s1 = Error Code

%s2 = Detailed Code

### Explanation

An internal error occurred.

### System Action

The processing stops.

### User Action

Collect diagnostic information with the *iscollectinfo* command, and contact the service engineer (SE).

## 15.23.14 jms7013

---

**JMS:ERROR:jms7013: This command can only be executed by the administrator.**

### Explanation

The user that executed this command does not have "Administrators" authority.

### System Action

The processing stops.

### User Action

Execute this command as a user with "Administrators" authority.

## 15.24 jms8000 to jms8099

---

This section details the messages numbered between jms8000 and jms8099.

### 15.24.1 jms8000

---

**JMS:ERROR:jms8000: EventChannel cannot be performed because of a Publish/Subscribe model.**

#### Explanation

The Event Channel specified as the communication destination is an Event Channel for Publish/Subscribe.

#### System Action

The processing stops.

#### User Action

Check the following items:

- Check whether any application using the Queue interface was started.
- Check whether the Event Channel was created in the correct manner. For Point-To-Point operation, the `-ptp` option must be specified when executing `esmkchnl`.

### 15.24.2 jms8001

---

**JMS:ERROR:jms8001: EventChannel cannot be performed because of a Point-To-Point model.**

#### Explanation

The Event Channel specified as the communication destination is an Event Channel for Point-To-Point operation.

#### System Action

The processing stops.

#### User Action

Check the following items:

- Check whether any application using the Topic interface was started.
- Check whether the Event Channel was created in the correct manner. For Publish/Subscribe operation, do not specify the `-ptp` option when executing `esmkchnl`.

### 15.24.3 jms8002

---

**JMS:ERROR:jms8002: Could not be executed because it is not a Notification Service EventChannel ('%s').**

#### Variable Information

%s = Event Channel Name

#### Explanation

The Event Channel specified in the other server cannot use the Notification Service.

#### System Action

The processing stops.

#### User Action

Take the following action.

**Using the Interstage Management Console to make the environment settings**

1. Check the status of the Event Channel Notification Service function in the following page:
  - On the Standalone Server  
[System] > [Services] > [Event Service] > [EventChannels] > [Group name::EventChannel name] > [Detailed Settings]
  - On the Integrated Control of the Admin Server  
[Integrated Control] > [Interstage] > [Interstage Application Server] > [Server name] > [System] > [Services] > [Event Service] > [EventChannels] > [Group name::EventChannel name] > [Detailed Settings]
  - On the Operate in Batch of the Admin Server  
[Operate in Batch] > [Interstage] > [Interstage Application Server] > [Services] > [Event Service] > [Server Group Name/Server Name] > [EventChannels] > [Detailed Settings]
2. If 'None' is set for the Notification Service function, delete the Event Channel and then re-create it by specifying 'JMS' for 'EventChannel Type'.
  - On the Standalone Server  
[System] > [Resources] > [JMS] > [EventChannels] > [Create a New EventChannel]
  - On the Operate in Batch of the Admin Server  
[Operate in Batch] > [Interstage] > [Interstage Application Server] > [Services] > [Event Service] > [Server Group Name/Server Name] > [EventChannels] > [Create a New EventChannel]

**Using the Event Service operation command to make the environment settings**

1. Execute the *esstcfnchnl* command as shown below, and check that 'yes' is set for 'Notification channel mode'.  
`esstcfnchnl -d -g group name`
2. If 'no' is set for 'Notification channel mode', delete the Event Channel using the *esrmchnl* command and then re-create the Event Channel by specifying the -notify option in the *esmkchnl* command.

## 15.24.4 jms8003

---

**JMS:ERROR:jms8003: Error in localtransaction operating environment. CHANNEL='%s'**

**Variable Information**

%s = Event Channel Name

**Explanation**

The Event Channel (%s) cannot perform the local transaction application that was specified in the "com.fujitsu.interstage.jms.TransactionBetweenMultipleChannels" system property. Event Channels that can be used are Point-To-Point model local transaction applications.

**System Action**

The processing stops.

**User Action**

Use an Event Channel that can perform the local transaction application that was specified in the "com.fujitsu.interstage.jms.TransactionBetweenMultipleChannels" system property.

## 15.25 jms9000 to jms9099

---

This section details the messages numbered between jms9000 and jms9099.

### 15.25.1 jms9000

---

**JMS:ERROR:jms9000: Error in JMS application operating environment.**

## Explanation

Processing failed due to an operating environment abnormality or unexpected error.

## System Action

The processing stops.

## User Action

The possible causes of the processing failure are as follows. Take the required action for each of these causes.

- If an environment variable (PATH, CLASSPATH, or LD\_LIBRARY\_PATH) is incorrect, check the environment variable settings.
- If the library set in environment variable LD\_LIBRARY\_PATH does not exist, install the product correctly.
- If an incorrect JDK/JRE version was used, replace it with the correct version.
- The Interstage JMS has not been installed correctly. Correctly install the Interstage JMS.

If the cause of the failure is not the above, collect diagnostic information with the *iscollectinfo* command, and contact the service engineer (SE).

## 15.25.2 jms9001

---

### **JMS:ERROR:jms9001: Memory shortage occurred.**

## Explanation

A memory shortage occurred.

## System Action

The processing stops.

## User Action

Wait a while and re-execute the processing. If this message is output frequently, take the following action and re-execute the processing.

- Change the JavaVM memory size.
- Check whether sufficient memory capacity is available and stop any unnecessary applications.

## 15.25.3 jms9003

---

### **JMS:ERROR:jms9003: Argument '%s' is not specified.**

## Variable Information

%s = Argument Name

## Explanation

Argument (%s) is not specified.

## System Action

The processing stops.

## User Action

Check whether argument (%s) is specified correctly.

## 15.25.4 jms9004

---

### **JMS:ERROR:jms9004: An invalid value was specified for Definition information(%s1). VALUE '%s2'**

## Variable Information

%s1 = Definition item name

%s2 = Value specified for definition item

## Explanation

The specified definition information (%s1) is incorrect.

## System Action

The processing stops.

## User Action

Check whether definition information (%s1) is specified correctly.

## 15.25.5 jms9005

---

**JMS:ERROR:jms9005: The value for Definition information(%s1) is exceeded maximum length(%s2)byte.**

## Variable Information

%s1 = Definition item name

%s2 = Maximum length which can be specified for definition item

## Explanation

The specified definition information (%s1) exceeded maximum length (%s2) bytes.

## System Action

The processing stops.

## User Action

Check the maximum length for the specified definition information (%s1) and specify the information within the maximum length.

## 15.25.6 jms9006

---

**JMS:ERROR:jms9006: The first character of Definition information(%s1) must be either a number or an alphabet. VALUE '%s2'**

## Variable Information

%s1 = Definition item name

%s2 = Value specified for definition item

## Explanation

A non-alphanumeric character was specified at the beginning of the specified definition information (%s1).

## System Action

The processing stops.

## User Action

Specify an alphanumeric character at the beginning of the specified definition information (%s1) and re-execute the processing.

## 15.25.7 jms9007

---

**JMS:ERROR:jms9007: The value for Definition information(%s1) is illegal character. VALUE '%s2' CHARACTER '%s3'**

## Variable Information

%s1 = Definition item name

%s2 = Value specified for definition item

%s3 = Illegal character

## Explanation

The specified definition information (%s1) includes an invalid code.

## System Action

The processing stops.

## User Action

Specify a valid character in the specified definition information (%s1).

## 15.25.8 jms9008

---

**JMS:ERROR:jms9008: The value for Definition information(%s1) is Illegal string literal. VALUE '%s2'**

## Variable Information

%s1 = Definition item name

%s2 = Value specified for definition item

## Explanation

The specified string literal is invalid in the specified definition information (%s1).

## System Action

The processing stops.

## User Action

Specify a valid string literal in the specified definition information (%s1).

## 15.25.9 jms9009

---

**JMS:ERROR:jms9009: Since the transaction service (OTS) is not set up, a global transaction cannot be used.**

## Explanation

The transaction service (OTS) is not set up, so the global transaction cannot be used.

## System Action

The processing stops.

## User Action

When using the global transaction, you must set up the transaction service (OTS). To set up the transaction service (OTS), change [Transaction Service (OTS)] selected by clicking [System] > [Update System Settings] from Interstage Management Console to "Yes". This changes the system configuration.

## 15.25.10 jms9010

---

**JMS:ERROR:jms9010: Configuration is currently being updated by another user.**

## Explanation

The definition could not be updated because it is already updated by another user.

## System Action

The processing stops.

## User Action

The definition requested to be updated is already updated by another user. Update the latest definition information and rerun the process. To update the definition information maintained in the Interstage Management Console, a user with Administrators authority must display the list of definition information.

## 15.25.11 jms9011

---

**JMS:ERROR:jms9011: The name is not found. NAME '%s'**

## Variable Information

%s = JNDI name

## Explanation

The process failed because the specified JNDI name could not be found.

## System Action

The processing stops.

## User Action

If this message is displayed when *ConnectionFactory* or *Destination* definition information is reacquired with Interstage Management Console, the JNDI name may have been deleted by a request from another user. Reacquire the *ConnectionFactory* or *Destination* list and then rerun the process.

## 15.25.12 jms9012

---

**JMS:ERROR:jms9012: Type is currently being updated by another user. Please perform re-acquisition of a list. NAME '%s'**

## Variable Information

%s = JNDI name

## Explanation

The process failed because the type of the specified JNDI name was changed by another user.

## System Action

The processing stops.

## User Action

If this message is displayed when *ConnectionFactory* or *Destination* definition that uses Interstage Management Console is changed or definition information is displayed, the type may have been changed by a request from another user. Reacquire the *ConnectionFactory* or *Destination* list and then rerun the process.

## 15.25.13 jms9013

---

---

**JMS:ERROR:jms9013: EventService is not setup.****Explanation**

The Event Service is not set up.

**System Action**

The processing stops.

**User Action**

If "Event Service" is not registered in [Interstage Component Services] selected by clicking [System] > [View System Status] from Interstage Management Console, change [Event Service Settings] or [JMS Settings] selected by clicking [System] > [Update System Settings] to "Yes". This changes the system configuration.

## 15.25.14 jms9014

---

**JMS:ERROR:jms9014: A package has not been installed.****Explanation**

The Interstage JMS has not been installed.

**System Action**

The processing stops.

**User Action**

The JMS installation state of the Managed Servers that already belong to the Server Group and of the Reserve Server you attempted to add to the Server Group must match.

Match the JMS installation state of the Managed Servers that already belong to the Server Group and of the Reserve Server you attempted to add to the Server Group. Once this has been done, re-execute the operation to add the server to the Server Group.

## 15.25.15 jms9015

---

**JMS:ERROR:jms9015: The specified host '%s' could not be found.****Variable Information**

%s = IP address or hostname of the host that caused the exception

**Explanation**

The specified host (%s) could not be found.

Possible causes are as follows:

- If an IP address was specified, the IP address format may be incorrect.
- If a Host name was specified, it is possible that the specified Host name does not exist. Alternatively, the IP address could not be resolved from the specified host name.

**System Action**

The processing stops.

**User Action**

Take the following action.

- Check the IP address that was specified. If the IP address format is incorrect, set a correct IP address.

- Check whether the specified host name exists.

If it does not, specify a correct host name or IP address.

If it does exist, it is possible that the IP address could not be resolved from the host name. If the application is running using DNS, check the DNS settings. If the application is not running using DNS, check that the content defined in the hosts file is correct. For details on entering information in the hosts file, refer to "Entering Information in the Hosts File" in the "Common Notes for Interstage" chapter of the Product Notes.

## 15.25.16 jms9016

---

**JMS:ERROR:jms9016: Specify a number from [0] to [65535] for the port number.**

### Explanation

An illegal value was specified for the port number.

### System Action

The processing stops.

### User Action

Specify a number from [0] to [65535] for the port number.

## 15.25.17 jms9017

---

**JMS:ERROR:jms9017: Specify the hostname and IP address at the same time.**

### Explanation

Either the [Hostname or IP address] or [Port Number] was not specified.

### System Action

The processing stops.

### User Action

Values for [Hostname or IP address] and [Port Number] should be set at the same time.

## 15.25.18 jms9018

---

**JMS:ERROR:jms9018: The specified definition information ('%s1') contains illegal characters. VALUE '%s2', CHARACTER '%s3'**

### Variable Information

%s1 = Definition item name

%s2 = Value specified for the definition item name

%s3 = Illegal characters

### Explanation

The specified definition information (%s1) contains illegal characters (%s3).

### System Action

The processing stops.

## User Action

Correct the illegal characters in the specified definition information (%s1).

## 15.26 jms9100 to jms9199

---

This section details the messages numbered between jms9100 and jms9199.

### 15.26.1 jms9100

---

#### **JMS:INFO:jms9100: New ConnectionFactory '%s' was created**

##### Variable Information

%s = JNDI name

##### Explanation

ConnectionFactory (JNDI%s) was registered successfully.

##### System Action

The processing continues.

##### User Action

None.

### 15.26.2 jms9101

---

#### **JMS:INFO:jms9101: ConnectionFactory '%s' was deleted**

##### Variable Information

%s = JNDI name

##### Explanation

ConnectionFactory (JNDI%s) was deleted.

##### System Action

The processing continues.

##### User Action

None.

### 15.26.3 jms9102

---

#### **JMS:INFO:jms9102: New Destination '%s' was created**

##### Variable Information

%s = JNDI name

##### Explanation

Destination (JNDI%s) was registered successfully.

##### System Action

The processing continues.

##### User Action

None.

## 15.26.4 jms9103

---

### JMS:INFO:jms9103: Destination '%s' was deleted

#### Variable Information

%s = JNDI name

#### Explanation

Destination (JNDI%s) was deleted.

#### System Action

The processing continues.

#### User Action

None.

## 15.26.5 jms9104

---

### JMS:INFO:jms9104: ConnectionFactory '%s' was updated successfully

#### Variable Information

%s = JNDI name

#### Explanation

Updating of ConnectionFactory (JNDI%s) succeeded.

#### System Action

The processing continues.

#### User Action

None.

## 15.26.6 jms9105

---

### JMS:INFO: jms9105: Destination was updated successfully

#### Explanation

Destination was updated successfully.

#### System Action

The processing continues.

#### User Action

None.

## 15.26.7 jms9106

---

### JMS:ERROR: jms9106: Could not find NAME '%s'

#### Variable Information

%s = JNDI name

#### Explanation

The process failed because the operation target JNDI name could not be found.

## System Action

The processing stops.

## User Action

Destination may have been deleted by a request from another user. Reacquire the Event Channel list and then rerun the process.

# 15.27 jms9200 to jms9299

---

This section details the messages numbered between jms9200 and jms9299.

## 15.27.1 jms9201

---

### **JMS:ERROR: jms9201: The ConnectionFactory could not be created.**

#### Explanation

An error occurred and the ConnectionFactory could not be created.

#### System Action

The processing stops.

#### User Action

Refer to the previous message and identify the cause of the failure. Correct the problem preventing the creation of the ConnectionFactory, and re-execute the creation process.

## 15.27.2 jms9202

---

### **JMS:ERROR: jms9202: The ConnectionFactory could not be created. EXCEPTION '%s'**

#### Variable Information

%s = Detailed exception information

#### Explanation

An error occurred and the ConnectionFactory could not be created.

#### System Action

The processing stops.

#### User Action

Refer to the exception information (%s), and identify the cause of the failure. Correct the problem preventing the creation of the ConnectionFactory, and re-execute the creation process.

## 15.27.3 jms9203

---

### **JMS:ERROR: jms9203: The ConnectionFactory could not be deleted.**

#### Explanation

An error occurred and the ConnectionFactory could not be deleted.

#### System Action

The processing stops.

#### User Action

Refer to the previous message, and identify the cause of the failure. Correct the problem preventing the deletion of the ConnectionFactory, and re-execute the deletion process.

### 15.27.4 jms9204

---

**JMS:ERROR: jms9204: The ConnectionFactory could not be updated.**

#### Explanation

An error occurred and the ConnectionFactory could not be updated.

#### System Action

The processing stops.

#### User Action

Refer to the previous message, and identify the cause of the failure. Correct the problem preventing the update, and re-execute the update process.

### 15.27.5 jms9205

---

**JMS:ERROR: jms9205: The Destination could not be created.**

#### Explanation

An error occurred and the Destination could not be created.

#### System Action

The processing stops.

#### User Action

Refer to the previous message, and identify the cause of the failure. Correct the problem preventing the creation of the Destination, and re-execute the creation process.

### 15.27.6 jms9206

---

**JMS:ERROR: jms9206: The Destination could not be created. EXCEPTION '%s'**

#### Variable Information

%s = Detailed exception information

#### Explanation

An error occurred and the Destination could not be created.

#### System Action

The processing stops.

#### User Action

Refer to the exception information (%s), and identify the cause of the failure. Correct the problem preventing the creation of the Destination, and re-execute the creation process.

### 15.27.7 jms9207

---

**JMS:ERROR: jms9207: The Destination could not be deleted.**

## Explanation

An error was generated and the Destination could not be deleted.

## System Action

The processing stops.

## User Action

Refer to the previous message, and identify the cause of the failure. Correct the problem preventing the delete, and re-execute the deletion process.

## 15.27.8 jms9208

---

### **JMS:ERROR: jms9208: The Destination could not be updated.**

## Explanation

An error occurred and the Destination could not be updated.

## System Action

The processing stops.

## User Action

Refer to the previous message, and identify the cause of the failure. Correct the problem preventing the update, and re-execute the update process.

## 15.28 jms9300 to jms9399

---

This section details the messages numbered between jms9300 and jms9399.

### 15.28.1 jms9300

---

#### **JMS:ERROR: jms9300: A system error has been generated. DETAIL '%s'**

## Variable Information

%s = Detailed information

## Explanation

A system error has occurred.

## System Action

The processing stops.

## User Action

Refer to the previous error message output and correct the cause of the error.

### 15.28.2 jms9301

---

#### **JMS:ERROR: jms9301: Memory is insufficient.**

## Explanation

Memory is insufficient.

## System Action

The processing stops.

## User Action

Wait a short while, and then re-execute the processing. If this message is output frequently, take the following action, and then restart the processing.

- Change the size of the Java VM memory.
- Check that memory is sufficient for execution. If necessary, re-estimate the volume of memory required by another application to be executed on the same machine.

## 15.28.3 jms9302

---

**JMS:ERROR: jms9302: The argument '%s' has not been specified.**

### Variable Information

%s = Argument name

### Explanation

The argument (%s) has not been specified.

### System Action

The processing stops.

### User Action

Specify the argument (%s).

## 15.28.4 jms9303

---

**JMS:ERROR: jms9303: The specified argument '%s1' contains an error. VALUE '%s2'**

### Variable Information

%s1 = Argument name

%s2 = Value

### Explanation

The value (%s2) of the specified argument (%s1) contains an error.

### System Action

The processing stops.

### User Action

Review the value (%s2) of the specified argument (%s1), assign a new value, and re-execute processing.

## 15.28.5 jms9304

---

**JMS:ERROR: jms9304: The specified definition information '%s1' contains an error. VALUE '%s2'**

### Variable Information

%s1 = Definition information name

%s2 = Value

### Explanation

The value (%s2) of the definition information (%s1) contains an error.

### System Action

The processing stops.

### User Action

Review the value (%s2) of the definition information (%s1), assign a new value, and re-execute processing.

## 15.28.6 jms9305

---

**JMS:ERROR: jms9305: The specified server cannot be found on the site. SERVER '%s'**

### Variable Information

%s = Server name

### Explanation

The specified server (%s) cannot be found on the site.

### System Action

The processing stops.

### User Action

Specify a server that is found on the site and re-execute processing.

## 15.28.7 jms9306

---

**JMS:ERROR: jms9306: The specified server group cannot be found on the site. SERVERGROUP '%s'**

### Variable Information

%s = Server group name

### Explanation

The specified server group (%s) cannot be found on the site.

### System Action

The processing stops.

### User Action

Specify a server group that is found on the site, and re-execute processing.

## 15.28.8 jms9307

---

**JMS:ERROR: jms9307: The specified server has been registered with the server group. SERVER '%s'**

### Variable Information

%s = Server name

### Explanation

The specified server (%s) has been registered with the server group.

### System Action

The processing stops.

### User Action

Specify a server that has not been registered with the server group, and re-execute processing.

## 15.28.9 jms9308

---

**JMS:ERROR: jms9308: No server has been registered with the specified server group. SERVERGROUP '%s'**

### Variable Information

%s = Server group name

### Explanation

No server has been registered with the specified server group (%s).

### System Action

The processing stops.

### User Action

Register a server with the server group, and re-execute processing.

## 15.28.10 jms9320

---

**JMS:ERROR: jms9320: An error was generated during the search process of the definition information.**

### Explanation

An error was generated during the search process of the definition information.

### System Action

The processing stops.

### User Action

Refer to the previous message output, identify and remove the cause of the error, and re-execute processing.

## 15.28.11 jms9321

---

**JMS:ERROR: jms9321: An error was generated during the registration process of the definition information.**

### Explanation

An error was generated during the registration process of the definition information.

### System Action

The processing stops.

### User Action

Refer to the previous message output, identify and remove the cause of the error, and re-execute the registration process.

## 15.28.12 jms9322

---

**JMS:ERROR: jms9322: An error was generated during the update process of the definition information.**

### Explanation

An error was generated during the update process of the definition information.

### System Action

The processing stops.

### User Action

Refer to the previous message output, identify and remove the cause of the error, and re-execute the update process.

## 15.28.13 jms9323

---

**JMS:ERROR: jms9323: An error was generated during the delete process of the definition information.**

### Explanation

An error was generated during the delete process of the definition information.

### System Action

The processing stops.

### User Action

Refer to the previous message output, identify and remove the cause of the error, and re-execute the deletion process.

## 15.28.14 jms9324

---

**JMS:ERROR: jms9324: An error was generated during the update confirmation process of the definition information.**

### Explanation

An error was generated during the update confirmation process of the definition information.

### System Action

The processing stops.

### User Action

Refer to the previous message output, identify and remove the cause of the error, and re-execute the update process.

## 15.28.15 jms9340

---

**JMS:ERROR: jms9340: The specified definition information has already been registered. NAME '%s1', TYPE '%s2', KEYS '%s3'**

### Variable Information

%s1 = Definition name

%s2 = Repository type

%s3 = Repository key

### Explanation

The specified definition information has already been registered.

### System Action

The processing stops.

## User Action

Specify the definition information that has not been registered, and re-execute processing.

### 15.28.16 jms9341

---

**JMS:ERROR: jms9341: The specified definition information is not the latest. NAME '%s1', TYPE '%s2', KEYS '%s3'**

#### Variable Information

%s1 = Definition name

%s2 = Repository type

%s3 = Repository key

#### Explanation

The specified definition information is not the most up-to-date.

#### System Action

The processing stops.

#### User Action

Obtain the most up-to-date definition information, and re-execute processing.

### 15.28.17 jms9342

---

**JMS:ERROR:jms9342: The specified definition information has already been registered. NAME '%s1'**

#### Variable Information

%s1 = Definition name

#### Explanation

The specified definition information has already been registered.

#### System Action

The processing stops.

#### User Action

Specify the definition information that has not been registered, and re-execute processing.

### 15.28.18 jms9343

---

**JMS:ERROR:jms9343: Failed to add the Managed Server to Server Group because Registered definition is different to the other. RESOURCE='%s1' NAME='%s2' INFO='%s3' SERVER='%s4'**

#### Variable Information

%s1 = Different resource

%s2 = Different resource name

%s3 = Different content

%s4 = Managed Server name

## Explanation

Because the Interstage JMS definition is different, you cannot add a Managed Server to a Server Group.

## System Action

The processing stops.

## User Action

The Interstage JMS definition of the Managed Servers that already belong to the Server Group and of the Reserve Server you attempted to add to the Server Group must match.

Use the Backup/Restore function to back up all of the Interstage services used by the Managed Servers that already belong to the Server Group, and then create backup resources. Next, restore the Reserve Servers that you want to add to the Server Group. Once this has been done, re-execute the operation to add the server to the Server Group.

## 15.28.19 jms9344

---

### **JMS:ERROR:jms9344: The name is not found. NAME '%s'**

#### Variable Information

%s = Definition name

#### Explanation

The process failed because the specified definition name could not be found.

#### System Action

The processing stops.

#### User Action

If this message is displayed when *ConnectionFactory* or *Destination* definition information is reacquired with Interstage Management Console, the JNDI name may have been deleted by a request from another user. Reacquire the *ConnectionFactory* or *Destination* list and then rerun the process.

## 15.29 jms9500 to jms9599

---

This section details the messages numbered between jms9500 and jms9599.

### 15.29.1 jms9500

---

#### **JMS:ERROR:jms9500: UNKNOWN EXCEPTION.**

#### Explanation

An internal error occurred.

#### System Action

The processing stops.

#### User Action

Collect diagnostic information with the *iscollectinfo* command, and contact the service engineer (SE).

## 15.30 jms9900 to jms9999

---

This section details the messages numbered between jms9900 and jms9999.

## 15.30.1 jms9997

---

**JMS:ERROR:jms9997: List acquisition failed. Defination(%s) containing the illegal character is registered.**

### Variable Information

%s = JNDI name

### Explanation

List acquisition failed because the registered JNDI name included an invalid character.

### System Action

The processing stops.

### User Action

Use the *jmsinfofact* or *jmsinfodst* command to check the JNDI name, or use the *jmsrmfact* or *jmsrmdst* command to delete the JNDI name.

## 15.30.2 jms9998

---

**JMS:ERROR:jms9998: System error occurred. EXCEPTION '%s'**

### Variable Information

%s = System Error information

### Explanation

System error (%s) occurred.

### System Action

The processing stops.

### User Action

The permissions required to access the directories and files under the Interstage installation directory may not be set. In this case, set the required permissions.

In other cases, collect diagnostic information with the *iscollectinfo* command, and contact the service engineer (SE).

## 15.30.3 jms9999

---

**JMS:ERROR:jms9999: System error occurred. METHOD '%s1', EXCEPTION '%s2'**

### Variable Information

%s1 = System Error information

%s2 = System Error information

### Explanation

System error (%s1) and system error (%s2) occurred.

### System Action

The processing stops.

### User Action

Collect diagnostic information with the *iscollectinfo* command, and contact the service engineer (SE).

# Chapter 16 Messages Beginning with 'JSSR'

This chapter explains the messages starting with 'JSSR'.

Note that the messages explained in this chapter are common to both Java EE session recovery and J2EE session recovery. If there are any differences in terminology and reference manuals, the following notation is used.

Notation used in this chapter	Java EE	J2EE
IJServer	IJServer cluster	IJServer WorkUnit
Server log/Container log	Server log	Container log
Java EE Operator's Guide or J2EE User's Guide	Java EE Operator's Guide	J2EE User's Guide
Servlet container	Web container	Servlet container
Port number for control	HTTP listener port number for control	Port number for control
Process concurrency level	Number of server instances	Process concurrency level
Service operator user/Start user	Service operator user	Start user

## Note

The session recovery functionality can be used in the products shown below. Note that it cannot be used in Web Package.

- **Session Registry Server**
  - Interstage Application Server Enterprise Edition
- **IJServer Cluster Session Registry Client**
  - Interstage Application Server Enterprise Edition
  - Interstage Application Server Standard-J Edition

## 16.1 JSSR20000 to JSSR20999

Session Registry Server messages.

### 16.1.1 JSSR20001

**JSSRS: ERROR: JSSR20001: The environment configuration is incorrect. definition=%s1 server=%s2 pid=%s3 tid=%s4**

#### Variable Information

- %s1 = Definition name
- %s2 = Session Registry Server name
- %s3 = Process ID of Session Registry Server
- %s4 = Processing thread

#### Explanation

The environment definition is incorrect.

#### System Action

Refer to the message that is output in the Session Registry Server log at the same time.

## User Action

Correct the definition shown in the variable information, and restart the Session Registry Server. For details about the definition, refer to "Session Registry Server Settings" in the J2EE User's Guide or Java EE Operator's Guide.

## Output Place

Server log / Container log

## 16.1.2 JSSR20002

---

**JSSRS: ERROR: JSSR20002: Insufficient memory. server=%s1 pid=%s2 tid=%s3**

### Variable Information

%s1 = Session Registry Server name

%s2 = Process ID of Session Registry Server

%s3 = Processing thread

### Explanation

There is insufficient memory.

### Cause

- There is insufficient memory (Heap), and real memory/swap for the system.
- There are insufficient file descriptors.

### System Action

Refer to the message that is output in the Session Registry Server log at the same time.

### User Action

- Refer to "JDK/JRE Tuning" in the Tuning Guide, fix the cause of the problem, and restart the Session Registry Server.
- Close unnecessary applications, or increase the number of file descriptors that can be used in the system.

### Output Place

Server log / Container log

## 16.1.3 JSSR20998

---

**JSSRS: ERROR: JSSR20998: An error occurred that the service could not be continued. server=%s1 pid=%s2 tid=%s3**

### Variable Information

%s1 = Session Registry Server name

%s2 = Process ID of Session Registry Server

%s3 = Processing thread

### Explanation

An error occurred, meaning that the application could not be continued.

### Cause

Refer to the message that is output in the Session Registry Server log at the same time.

### System Action

After this message is output, Session Registry Server cannot be used to perform backup or recovery.

IIServer blocks the processing request to Session Registry Server. For this reason, normal business applications can be continued, but backup and recovery of the session are not performed.

After the problem is resolved, IIServer automatically detects the Session Registry Server recovery when Session Registry Server is restarted, and backup and recovery processing are restarted.

#### User Action

Refer to the message that is output in the Session Registry Server log at the same time.

After the problem is resolved, restart the Session Registry Server.

#### Output Place

Server log / Container log

System log

## 16.1.4 JSSR20999

---

**JSSRS: ERROR: JSSR20999: An unexpected error occurred. detail=%s1 server=%s2 pid=%s3 tid=%s4**

#### Variable Information

%s1 = Detail information

%s2 = Session Registry Server name

%s3 = Process ID of Session Registry Server

%s4 = Processing thread

#### Explanation

An unexpected error occurred.

#### User Action

Use the *iscollectinfo* command to collect investigation information. Send the error information to a Systems Engineer.

#### Output Place

Server log / Container log

## 16.2 JSSR21000 to JSSR21999

---

Session Registry Server messages.

### 16.2.1 JSSR21001

---

**JSSRS: INFO: JSSR21001: Session Registry Server start processing has started. server=%s1 pid=%s2 tid=%s3**

#### Variable Information

%s1 = Session Registry Server name

%s2 = Process ID of Session Registry Server

%s3 = Processing thread

#### Explanation

Session Registry Server start processing has started.

#### Output Place

Server log / Container log

System log

## 16.2.2 JSSR21002

---

**JSSRS: INFO: JSSR21002: Session Registry Server was started. server=%s1 pid=%s2 tid=%s3**

### Variable Information

%s1 = Session Registry Server name

%s2 = Process ID of Session Registry Server

%s3 = Processing thread

### Explanation

Session Registry Server was started.

### Output Place

Server log / Container log

System log

## 16.2.3 JSSR21003

---

**JSSRS: ERROR: JSSR21003: Failed to start Session Registry Server. server=%s1 pid=%s2 tid=%s3**

### Variable Information

%s1 = Session Registry Server name

%s2 = Process ID of Session Registry Server

%s3 = Processing thread

### Explanation

Failed to start Session Registry Server.

### Cause

Initialization failed because the definition is incorrect.

Refer to the message that is output in the Session Registry Server log at the same time.

### System Action

Session Registry Server was not started. Backup and recovery of the session from the IJServer are not performed.

### User Action

Refer to the message that is output in the Session Registry Server log at the same time.

### Output Place

Server log / Container log

System log

## 16.2.4 JSSR21101

---

**JSSRS: INFO: JSSR21101: Session Registry Server stop processing has started. server=%s1 pid=%s2 tid=%s3**

### Variable Information

%s1 = Session Registry Server name

%s2 = Process ID of Session Registry Server

%s3 = Processing thread

#### Explanation

Session Registry Server stop processing has started.

#### Output Place

Server log / Container log

System log

## 16.2.5 JSSR21102

---

**JSSRS: INFO: JSSR21102: Session Registry Server was stopped. server=%s1 pid=%s2 tid=%s3**

#### Variable Information

%s1 = Session Registry Server name

%s2 = Process ID of Session Registry Server

%s3 = Processing thread

#### Explanation

Session Registry Server was stopped.

#### Output Place

Server log / Container log

System log

## 16.2.6 JSSR21103

---

**JSSRS: ERROR: JSSR21103: Failed to stop Session Registry Server. server=%s1 pid=%s2 tid=%s3**

#### Variable Information

%s1 = Session Registry Server name

%s2 = Process ID of Session Registry Server

%s3 = Processing thread

#### Explanation

Failed to stop Session Registry Server.

#### Cause

Refer to the message that is output in the Session Registry Server log at the same time.

#### System Action

Stops Session Registry Server.

#### User Action

Refer to the message that is output in the Session Registry Server log at the same time.

#### Output Place

Server log / Container log

System log

## 16.2.7 JSSR21201

---

**JSSRS: ERROR: JSSR21201: Configuration of the process concurrency is incorrect. pno=%s1 server=%s2 pid=%s3 tid=%s4**

### Variable Information

%s1 = Session Registry Server process serial number

%s2 = Session Registry Server name

%s3 = Process ID of Session Registry Server

%s4 = Processing thread

### Explanation

The process concurrency settings are incorrect.

### Cause

The process concurrency WorkUnit setting is not 1.

### System Action

The Session Registry Server process has not started. Backup and recovery of the session from the IIServer for the process are not performed.

### User Action

Set the process concurrency of the Session Registry Server WorkUnit settings to 1.

### Output Place

Server log / Container log

## 16.2.8 JSSR21301

---

**JSSRS: ERROR: JSSR21301: Could not create the directory for storing the serialized file of the session. path=%s1 server=%s2 pid=%s3 tid=%s4**

### Variable Information

%s1 = Specified path name

%s2 = Session Registry Server name

%s3 = Session Registry Server process ID

%s4 = Processing thread name

### Explanation

Could not create the subdirectory under the "directory for storing the serialized file of the session" specified in the Session Registry Server <serialize.file.path> environment definition.

Note that the "sr" subdirectory under the "directory for storing the serialized file of the session" specified in the environment definition file, and all the subdirectories under it, are created by Session Registry Server automatically.

### Cause

Possible causes are as follows:

- When the subdirectory under the "directory for storing the serialized file of the session" defined in the Session Registry Server <serialize.file.path> environment definition was created, either the parent directory did not exist as a result of some user operation, for example, or there were no service operator user privileges for Session Registry Server in the parent directory.
- There may also be a problem on the system, for example insufficient available disk space.
- A UNC path or network drive has been set in the Session Registry Server <serialize.file.path> environment definition.

## System Action

If this message is output while Session Registry Server is starting, the start is aborted.

If this message is output after Session Registry Server has started, the serialization of sessions related to the path that was output to this error message is aborted.

## User Action

Take one of the following actions, and then restart Session Registry Server as the previous user.

- Change the "directory for storing the serialized file of the session".
- Check whether a problem has occurred on the system, for example insufficient available disk space.
- If a UNC path or network drive has been set in <serialize.file.path>, set a path that is not a UNC path or network drive.

Note that all Session Registry Server service operator privileges are required for the "directory for storing the serialized file of the session" defined in the Session Registry Server <serialize.file.path> environment definition, and the directories and files under this directory.

## Output Place

Server log

## 16.2.9 JSSR21302

---

**JSSRS: ERROR: JSSR21302: The relative path of the directory for storing the serialized file of the session is incorrect. path=%s1 server=%s2 pid=%s3 tid=%s4**

### Variable Information

%s1 = Specified path name

%s2 = Session Registry Server name

%s3 = Session Registry Server process ID

%s4 = Processing thread name

### Explanation

The relative path of the directory for storing the serialized file of the Session Registry Server session specified in the Session Registry Server <serialize.file.path> environment definition is incorrect.

### Cause

Values other than "dat" cannot be specified for the relative path in the Session Registry Server <serialize.file.path> environment definition.

### System Action

The Session Registry Server start is aborted.

### User Action

Take one of the following actions:

- Specify the absolute path in the Session Registry Server <serialize.file.path> environment definition.
- Delete the Session Registry Server <serialize.file.path> environment definition.
- When specifying the relative path in the Session Registry Server <serialize.file.path> environment definition, specify "dat".

### Output Place

Server log

## 16.3 JSSR22000 to JSSR22999

---

Session Registry Server messages.

### 16.3.1 JSSR22001

---

**JSSRS: WARNING: JSSR22001: The processing request to the IJServer was prevented. client=%s1 server=%s2 pid=%s3 tid=%s4**

#### Variable Information

%s1 = IP address of IJServer:Control port number

%s2 = Session Registry Server name

%s3 = Process ID of Session Registry Server

%s4 = Processing thread

#### Explanation

An abnormality was detected in the IJServer status or the IJServer and Session Registry Server network, so the request for processing to the IJServer shown in <client> was prevented.

#### Cause

Refer to the message that is output in the Session Registry Server log at the same time.

#### System Action

After this message is output, requests for processing to the IJServer stop. This means that requests to obtain the updated session (and delete the session from the IJServer) stop when session recovery occurs. The session maintained in Session Registry Server is used.

If the problem is resolved, request blocking is canceled. automatically.

#### User Action

Refer to the message that is output in the Session Registry Server log at the same time.

#### Output Place

Server log / Container log

System log

### 16.3.2 JSSR22002

---

**JSSRS: INFO: JSSR22002: The processing request to the IJServer has started. client=%s1 server=%s2 pid=%s3 tid=%s4**

#### Variable Information

%s1 = IP address of IJServer:Control port number

%s2 = Session Registry Server name

%s3 = Process ID of Session Registry Server

%s4 = Processing thread

#### Explanation

The request for processing to the IJServer shown in <client> has started.

#### System Action

Requests to obtain the updated session (and delete the session from the IJServer) that stopped when session recovery occurred are processed.

## Output Place

Server log / Container log

System log

### 16.3.3 JSSR22003

---

**JSSRS: INFO: JSSR22003: The IJServer was registered. client=%s1 server=%s2 pid=%s3 tid=%s4**

#### Variable Information

%s1 = IP address of IJServer:Control port number

%s2 = Session Registry Server name

%s3 = Process ID of Session Registry Server

%s4 = Processing thread

#### Explanation

The IJServer shown in <client> was registered.

## Output Place

Server log / Container log

System log

### 16.3.4 JSSR22101

---

**JSSRS: WARNING: JSSR22101: Session consistency check was not performed. client=%s1 apl=%s2 server=%s3 pid=%s4 tid=%s5**

#### Variable Information

%s1 = IP address of IJServer:Control port number

%s2 = Web application name

%s3 = Session Registry Server name

%s4 = Process ID of Session Registry Server

%s5 = Processing thread

#### Explanation

The <apl> Web application session consistency check was not performed for the IJServer and Session Registry Server shown in <client>.

#### Cause

- After a communication error occurs between the IJServer and Session Registry Server, communication is recovered without the session consistency check.
- The session consistency check is not performed after the following:
  - Restart of Session Registry Server
  - Restart of the IJServer, or restart after the application process ends abnormally
  - Auto-reload when class auto-reload is used (J2EE only)
  - Module reactivation (J2EE), or module redeployment (Java EE)

#### System Action

The consistency check is performed automatically.

Depending on the consistency check, the IJServer session is backed up in the Session Registry Server, or the session recovered and processed in another IJServer is deleted from the original IJServer to ensure that uniqueness is maintained.

#### User Action

None.

#### Output Place

Server log / Container log

### 16.3.5 JSSR22102

---

**JSSRS: INFO: JSSR22102: Session consistency check processing has started. client=%s1 apl=%s2 server=%s3 pid=%s4 tid=%s5**

#### Variable Information

%s1 = IP address of IJServer:Control port number

%s2 = Web application name

%s3 = Session Registry Server name

%s4 = Process ID of Session Registry Server

%s5 = Processing thread

#### Explanation

The <apl> Web application session consistency check processing for the IJServer and Session Registry Server shown in <client> has started.

#### System Action

The consistency check is performed automatically.

Depending on the result of the consistency check, the IJServer session is backed up in Session Registry Server, or the session recovered and processed in another IJServer is deleted from the original IJServer to ensure that uniqueness is maintained.

#### Output Place

Server log / Container log

### 16.3.6 JSSR22103

---

**JSSRS: INFO: JSSR22103: The session consistency check is complete. client=%s1 apl=%s2 server=%s3 pid=%s4 tid=%s5**

#### Variable Information

%s1 = IP address of IJServer:Control port number

%s2 = Web application name

%s3 = Session Registry Server name

%s4 = Process ID of Session Registry Server

%s5 = Processing thread

#### Explanation

The <apl> Web application session consistency check for the IJServer and Session Registry Server shown in <client> is complete.

#### Output Place

Server log / Container log

## 16.3.7 JSSR22104

---

**JSSRS: ERROR: JSSR22104: The session consistency check failed. client=%s1 apl=%s2 detail=%s3 server=%s4 pid=%s5 tid=%s6**

### Variable Information

%s1 = IP address of IJServer:Control port number

%s2 = Web application name

%s3 = Internal information

%s4 = Session Registry Server name

%s5 = Process ID of Session Registry Server

%s6 = Processing thread

### Explanation

The <apl> Web application session consistency check for the IJServer and Session Registry Server shown in <client> failed.

### Cause

Refer to the message that is output in the Session Registry Server log at the same time.

### System Action

Refer to the message that is output in the Session Registry Server log at the same time.

### User Action

Refer to the message that is output in the Session Registry Server log at the same time.

### Output Place

Server log / Container log

## 16.3.8 JSSR22201

---

**JSSRS: ERROR: JSSR22201: The session backup failed. client=%s1 server=%s2 pid=%s3 tid=%s4**

### Variable Information

%s1 = IP address of IJServer:Control port number

%s2 = Session Registry Server name

%s3 = Process ID of Session Registry Server

%s4 = Processing thread

### Explanation

The session backup failed.

### Cause

Refer to the message that is output in the Session Registry Server log at the same time.

### System Action

Refer to the message that is output in the Session Registry Server log at the same time.

After the problem is resolved, the session consistency check for the IJServer and Session Registry Server is performed automatically, and the session is backed up.

### User Action

Refer to the message that is output in the Session Registry Server log at the same time.

## Output Place

Server log / Container log

### 16.3.9 JSSR22211

---

**JSSRS: ERROR: JSSR22211: The session recovery failed. client=%s1 apl=%s2 sessionid=%s3 server=%s4 pid=%s5 tid=%s6**

#### Variable Information

%s1 = IP address of IJServer:Control port number

%s2 = Web application name

%s3 = Session ID

%s4 = Session Registry Server name

%s5 = Process ID of Session Registry Server

%s6 = Processing thread

#### Explanation

Session recovery failed.

#### Cause

Refer to the message that is output in the Session Registry Server log at the same time.

#### System Action

The session is not recovered. If getSession(false) is executed in the application, null is returned. If the session is obtained using another method, a new session is returned. The behavior following this depends on the application

Also, refer to the message that is output in the Session Registry Server log at the same time.

#### User Action

Refer to the message that is output in the Session Registry Server log at the same time.

## Output Place

Server log / Container log

### 16.3.10 JSSR22212

---

**JSSRS: INFO: JSSR22212: The session was not recovered because it does not exist. client=%s1 apl=%s2 sessionid=%s3 server=%s4 pid=%s5 tid=%s6**

#### Variable Information

%s1 = IP address of IJServer:Control port number

%s2 = Web application name

%s3 = Session ID

%s4 = Session Registry Server name

%s5 = Process ID of Session Registry Server

%s6 = Processing thread

#### Explanation

Requests for recovery of the <sessionid> session from the IJServer shown in <client> are made, but the session was not recovered because it does not exist in Session Registry Server.

For details on the scope of session recovery, refer to "Session Recovery Scope" in the "Session Recovery" chapter of the J2EE User's Guide or in the "Functionality Provided in the Java EE Application" chapter of the Java EE Operator's Guide.

### System Action

The session is not recovered. If getSession(false) is executed in the application, null is returned. If the session is obtained according to another method, a new session is returned.

The behavior following this depends on the application

### Output Place

Server log / Container log

## 16.3.11 JSSR22213

---

**JSSRS: INFO: JSSR22213: The session was not recovered because it has been invalidated. client=%s1 apl=%s2 sessionid=%s3 server=%s4 pid=%s5 tid=%s6**

### Variable Information

%s1 = IP address of IJServer:Control port number

%s2 = Web application name

%s3 = Session ID

%s4 = Session Registry Server name

%s5 = Process ID of Session Registry Server

%s6 = Processing thread

### Explanation

Requests for recovery of the <sessionid> session from the IJServer shown in <client> are made, but the session was not recovered because it because it has been invalidated or timed out.

For details on the scope of session recovery, refer to "Session Recovery Scope" in the "Session Recovery" chapter of the J2EE User's Guide or in the "Functionality Provided in the Java EE Application" chapter of the Java EE Operator's Guide.

### System Action

The session is not recovered. If getSession(false) is executed in the application, null is returned. If the session is obtained using another method, a new session is returned.

The behavior following this depends on the application.

### Output Place

Server log / Container log

## 16.3.12 JSSR22214

---

**JSSRS: ERROR: JSSR22214: Failed to get swapped out data. The session was not recovered. client=%s1 apl=%s2 sessionid=%s3 server=%s4 pid=%s5 tid=%s6**

### Variable Information

%s1 = IP address of IJServer:Control port number

%s2 = Web application name

%s3 = Session ID

%s4 = Session Registry Server name

%s5 = Process ID of Session Registry Server

%s6 = Processing thread

## Explanation

Requests for recovery of the <sessionid> session from the IJServer shown in <client> are made, but session recovery failed because memory was not swapped out for a long time. The session is not recovered.

## Cause

Refer to the message that is output in the Session Registry Server log at the same time.

## System Action

The session is not recovered. If getSession(false) is executed in the application, null is returned. If the session is obtained according to another method, a new session is returned. The behavior following this depends on the application

## User Action

Refer to the message that is output in the Session Registry Server log at the same time.

## Output Place

Server log / Container log

## 16.3.13 JSSR22215

---

**JSSRS: INFO: JSSR22215: The session was not recovered because it is in use in another IJServer. client=%s1 client2=%s2 apl=%s3 sessionid=%s4 server=%s5 pid=%s6 tid=%s7**

### Variable Information

%s1 = IP address of IJServer from which session recovery request was received:Control port number

%s2 = IP address of IJServer using the session:Control port number

%s3 = Web application name

%s4 = Session ID

%s5 = Session Registry Server name

%s6 = Process ID of Session Registry Server

%s7 = Processing thread

## Explanation

In processing of the request for session recovery from the IJServer shown in <client>, the session in the IJServer shown in <client2> is being used (processing to obtain the updated session is timed out) so the session is not recovered.

## System Action

The session is not recovered. If getSession(false) is executed in the application, null is returned. If the session is obtained using another method, a new session is returned. The behavior following this depends on the application

## Output Place

Server log / Container log

## 16.3.14 JSSR22216

---

**JSSRS: INFO: JSSR22216: The session is recovered. client=%s1 apl=%s2 sessionid=%s3 detail=%s4 server=%s5 pid=%s6 tid=%s7**

### Variable Information

%s1 = IP address of IJServer:Control port number

%s2 = Web application name

%s3 = Session ID

%s4 = Detail information

%s5 = Session Registry Server name

%s6 = Process ID of Session Registry Server

%s7 = Processing thread

### Explanation

The session is recovered in the IJServer shown in <client>.

- <detail>=server:

The session already backed up and maintained in Session Registry Server is used.

- <detail>=latest:

The latest session is obtained from the IJServer that maintains the original session and used.

### Output Place

Server log / Container log

## 16.3.15 JSSR22301

---

**JSSRS: ERROR: JSSR22301: Failed to get the updated session. client=%s1 apl=%s2 sessionid=%s3 server=%s4 pid=%s5 tid=%s6**

### Variable Information

%s1 = IP address of IJServer:Control port number

%s2 = Web application name

%s3 = Session ID

%s4 = Session Registry Server name

%s5 = Process ID of Session Registry Server

%s6 = Processing thread

### Explanation

Failed to get the updated session from the IJServer shown in <client>.

### Cause

Refer to the message that is output in the Session Registry Server log at the same time.

### System Action

Uses a session already backed up in Session Registry Server.

Also, refer to the message that is output in the Session Registry Server log at the same time.

### User Action

Refer to the message that is output in the Session Registry Server log at the same time.

### Output Place

Server log / Container log

## 16.3.16 JSSR22501

---

**JSSRS: ERROR: JSSR22501: Failed to initialize the serialized function. server=%s1 pid=%s2 tid=%s3**

### Variable Information

%s1 = Session Registry Server name

%s2 = Process ID of Session Registry Server

%s3 = Processing thread

### Explanation

Failed to initialize the serialized function.

### Cause

Refer to the message that is output in the Session Registry Server log at the same time.

### System Action

Refer to the message that is output in the Session Registry Server log at the same time.

### User Action

Refer to the message that is output in the Session Registry Server log at the same time.

### Output Place

Server log / Container log

## 16.3.17 JSSR22502

---

**JSSRS: INFO: JSSR22502: Reading of the serialized sessions is complete. apl=%s1 server=%s2 pid=%s3 tid=%s4**

### Variable Information

%s1 = Web application name

%s2 = Session Registry Server name

%s3 = Process ID of Session Registry Server

%s4 = Processing thread

### Explanation

Reading of the <apl> Web application serialized session is complete.

### System Action

The application runs according to the read session information.

### Output Place

Server log / Container log

System log

## 16.3.18 JSSR22503

---

**JSSRS: ERROR: JSSR22503: Failed to read the serialized sessions. apl=%s1 server=%s2 pid=%s3 tid=%s4**

### Variable Information

%s1 = Web application name

%s2 = Session Registry Server name

%s3 = Process ID of Session Registry Server

%s4 = Processing thread

## Explanation

Failed to read the <apl> Web application serialized session.

## Cause

Refer to the message that is output in the Session Registry Server log at the same time.

## System Action

Starts processing without using session information for the application.

If the IJServer is running, sessions in the IJServer are automatically backed up and serialized.

## User Action

Refer to the message that is output in the Session Registry Server log at the same time.

## Output Place

Server log / Container log

System log

## 16.3.19 JSSR22504

---

**JSSRS: ERROR: JSSR22504: The session serialization failed. apl=%s1 server=%s2 pid=%s3 tid=%s4**

### Variable Information

%s1 = Web application name

%s2 = Session Registry Server name

%s3 = Process ID of Session Registry Server

%s4 = Processing thread

## Explanation

The <apl> Web application serialization of the session failed.

## Cause

Refer to the message that is output in the Session Registry Server log at the same time.

## System Action

The session could not be serialized. If Session Registry Server was restarted or the system was switched using a cluster, there is a possibility that the session cannot continue or that the session is old.

## User Action

Refer to the message that is output in the Session Registry Server log at the same time.

## Output Place

Server log / Container log

System log

## 16.3.20 JSSR22505

---

**JSSRS: WARNING: JSSR22505: Failed to swap out a session that was unused for a long time. apl=%s1 sessionid=%s2 server=%s3 pid=%s4 tid=%s5**

### Variable Information

%s1 = Web application name

%s2 = Session ID

%s3 = Session Registry Server name

%s4 = Process ID of Session Registry Server

%s5 = Processing thread

### Explanation

Failed to swap out a session that was unused for a long time.

### Cause

Refer to the message that is output in the Session Registry Server log at the same time.

### System Action

Stops swap out processing. Session swap out is performed to improve the memory usage in Session Registry Server. This message does not itself affect the application performance, such as disappearance of the session or a return to a previous session status. If the action described in the message is not taken, however, there is a possibility that problems related to serialization (such as serialization not being able to be used) might occur.

### User Action

Refer to the message that is output in the Session Registry Server log at the same time.

### Output Place

Server log / Container log

## 16.3.21 JSSR22801

---

**JSSRS: WARNING: JSSR22801: The maximum number of sessions that can be maintained was exceeded. The session will be deleted from the backup. apl=%s1 sessionid=%s2 server=%s3 pid=%s4 tid=%s5**

### Variable Information

%s1 = Web application name

%s2 = Session ID

%s3 = Session Registry Server name

%s4 = Process ID of Session Registry Server

%s5 = Processing thread

### Explanation

The maximum number of sessions that can be maintained in Session Registry Server was exceeded. The session is deleted from the backup.

### Cause

The number of sessions which can be maintained in the Session Registry Server has exceeded the maximum, which is defined in the "backup.limit" environment definition on the Session Registry Server or in the "com.fujitsu.interstage.jservlet.sessionrecovery.backup.limit" Java VM option on the IJServer cluster for Session Registry Server. There is a possibility that the number of sessions created exceeded the number estimated for the application.

### System Action

Deletes the session that was updated first from the backed up sessions.

The session itself is not invalidated by the IJServer, so application processing is not affected as long as there are no abnormalities (such as an IJServer crash, or a restart or network abnormality) in session recovery. If an abnormality occurs, the session cannot be recovered.

### User Action

Take the following action:

- Check that session invalidation (the calling of the invalidate method), such as logout or the end of a series of operations, in the application was performed correctly.
- If the Web browser is closed during processing, unnecessary sessions are not invalidated until the timeout. Make sure that the timeout value is not too great.
- If the problem is not shown above, reset the upper limit with due consideration to memory (Heap). Consider increasing the memory if necessary. For details about memory size, refer to "Memory Requirements" in the Tuning Guide.

#### Output Place

Server log / Container log

### 16.3.22 JSSR22901

---

**JSSRS: ERROR: JSSR22901: The expired session is not sent to any IJServers because an error occurred. apl=%s1 sessionid=%s2 server=%s3 pid=%s4 tid=%s5**

#### Variable Information

%s1 = Web application name

%s2 = Session ID

%s3 = Session Registry Server name

%s4 = Session Registry Server process ID

%s5 = Processing thread name

#### Explanation

An error has occurred, therefore the expired session is not sent to the IJServer from Session Registry Server.

#### Cause

Refer to the message that was output to the Session Registry Server log at the same time.

#### System Action

The expired session is not sent to the IJServer. For this reason, the following session destruction-related processes are not executed in the IJServer:

- javax.servlet.http.HttpSessionListener#sessionDestroyed(javax.servlet.http.HttpSessionEvent)
- javax.servlet.http.HttpSessionAttributeListener#attributeRemoved(javax.servlet.http.HttpSessionBindingEvent)
- javax.servlet.http.HttpSessionBindingListener#valueUnbound(javax.servlet.http.HttpSessionBindingEvent)

#### User Action

Refer to the message that was output to the Session Registry Server log at the same time.

#### Output Place

Server log / Container log

### 16.3.23 JSSR22902

---

**JSSRS: INFO: JSSR22902: The expired session was sent to the IJServer successfully. apl=%s1 sessionid=%s2 client=%s3 server=%s4 pid=%s5 tid=%s6**

#### Variable Information

%s1 = Web application name

%s2 = Session ID

%s3 = IJServer IP address:Port number for control

%s4 = Session Registry Server name

%s5 = Session Registry Server process ID

%s6 = Processing thread name

#### Explanation

The expired session was sent to the IJServer shown in <client>.

#### Output Place

Server log / Container log

### 16.3.24 JSSR22903

---

**JSSRS: ERROR: JSSR22903: Failed to send the expired sessions to the IJServer. apl=%s1 client=%s2 server=%s3 pid=%s4 tid=%s5**

#### Variable Information

%s1 = Web application name

%s2 = IJServer IP address:Port number for control

%s3 = Session Registry Server name

%s4 = Session Registry Server process ID

%s5 = Processing thread name

#### Explanation

The attempt to send the expired sessions to the IJServer shown in <client> failed.

#### Cause

Refer to the message that was output to the Session Registry Server log at the same time.

#### System Action

The attempt to send the expired sessions is aborted.

#### User Action

Refer to the message that was output to the Session Registry Server log at the same time.

#### Output Place

Server log / Container log

### 16.3.25 JSSR22904

---

**JSSRS: ERROR: JSSR22904: Failed to send the expired sessions to all of the IJServers. apl=%s1 server=%s2 pid=%s3 tid=%s4**

#### Variable Information

%s1 = Web application name

%s2 = Session Registry Server name

%s3 = Session Registry Server process ID

%s4 = Processing thread name

#### Explanation

An attempt was made to send the expired sessions to all the IJServers, however the attempt failed.

## Cause

Possible causes are as follows:

- The application was undeployed from the IJServer.
- All the IJServers have stopped.

## System Action

The expired sessions are not sent to the IJServer. For this reason, the following session destruction-related processes are not executed in the IJServer:

- `javax.servlet.http.HttpSessionListener#sessionDestroyed(javax.servlet.http.HttpSessionEvent)`
- `javax.servlet.http.HttpSessionAttributeListener#attributeRemoved(javax.servlet.http.HttpSessionBindingEvent)`
- `javax.servlet.http.HttpSessionBindingListener#valueUnbound(javax.servlet.http.HttpSessionBindingEvent)`

## User Action

If the application has been undeployed, deploy the application.

If the IJServer has stopped, start the IJServer.

## Output Place

Server log / Container log

## 16.3.26 JSSR22905

---

**JSSRS: INFO: JSSR22905: The IJServer has the same session as the expired session sent from the Session Registry Server. apl=%s1 sessionid=%s2 client=%s3 server=%s4 pid=%s5 tid=%s6**

### Variable Information

%s1 = Web application name

%s2 = Session ID

%s3 = IJServer IP address:Port number for control

%s4 = Session Registry Server name

%s5 = Session Registry Server process ID

%s6 = Processing thread name

### Explanation

The expired session was sent to the IJServer, however the same session already exists in the IJServer.

### Cause

The session may have been used for a long time in the IJServer, or the backup of the session may have taken a long time.

### System Action

The IJServer does not accept the expired session sent from Session Registry Server, but instead uses the session that already exists in the IJServer.

### User Action

If this message is output often, set a value for `invalid.session.waiting.time` (in J2EE) or `com.fujitsu.interstage.jservlet.sessionrecovery.invalid.session.waiting.time` (in Java EE) that exceeds the time set for use of the session by the application.

### Output Place

Server log / Container log

## 16.3.27 JSSR22906

---

**JSSRS: ERROR: JSSR22906: Failed to deserialize the expired session in the IJServer. apl=%s1 sessionid=%s2 client=%s3 server=%s4 pid=%s5 tid=%s6**

### Variable Information

- %s1 = Web application name
- %s2 = Session ID
- %s3 = IJServer IP address:Port number for control
- %s4 = Session Registry Server name
- %s5 = Session Registry Server process ID
- %s6 = Processing thread name

### Explanation

The expired session was sent to the IJServer, however the attempt to restore the session failed.

### Cause

The application was changed to an application that is incompatible with the session backed up in Session Registry Server.

### User Action

- To update the classes stored in the session attributes so that the session prior to the update can continue after reactivation or reload, refer to "Application Creation Method" in the "Session Recovery" chapter of the J2EE User's Guide or "Creating Web Applications when Using Session Recovery" in the "Java EE Application Development" chapter of the Java EE Operator's Guide, and then take action in the application.
- Check the Web application configuration (are there insufficient class files or JAR files?). Additionally, if necessary check whether there are sufficient class paths.

### Output Place

Server log / Container log

## 16.4 JSSR23000 to JSSR23999

---

Session Registry Server messages.

### 16.4.1 JSSR23101

---

**JSSRS: ERROR: JSSR23101: There is no directory for storing the serialized file of the session specified in the definition file. path=%s1 server=%s2 pid=%s3 tid=%s4**

### Variable Information

- %s1 = Specified path
- %s2 = Session Registry Server name
- %s3 = Process ID of Session Registry Server
- %s4 = Processing thread

### Explanation

The directory was not specified in the <serialize.file.path> element of the environment definition file.

### System Action

Stops the Session Registry Server startup.

## User Action

Check the <serialize.file.path>( <com.fujitsu.interstage.jservlet.sessionrecovery.serialize.file.path>) option for session serialization of the environment definition file. If the specified directory does not exist, create it.

## Output Place

Server log / Container log

## 16.4.2 JSSR23102

---

**JSSRS: ERROR: JSSR23102: The Session Registry Server start user has no authority to access the directory for storing the serialized file of the session specified in the definition file. path=%s1 server=%s2 pid=%s3 tid=%s4**

### Variable Information

%s1 = Specified path

%s2 = Session Registry Server name

%s3 = Process ID of Session Registry Server

%s4 = Processing thread

### Explanation

There is no Session Registry Server start user authority for the "directory for storing the serialized file of the session" specified in the environment definition file (IJServer cluster Java VM option).

### Cause

There is no Session Registry Server start user authority for the "directory for storing the serialized file of the session" defined in the <serialize.file.path>( <com.fujitsu.interstage.jservlet.sessionrecovery.serialize.file.path>) option for session serialization of the environment definition file (IJServer cluster Java VM option).

### System Action

Stops the Session Registry Server startup.

### User Action

Check that there is complete Session Registry Server start user authority for the "directory for storing the serialized file of the session" defined in the <serialize.file.path>( <com.fujitsu.interstage.jservlet.sessionrecovery.serialize.file.path>) option for session serialization of the environment definition file. If there is not, set it.

### Output Place

Server log / Container log

## 16.4.3 JSSR23103

---

**JSSRS: ERROR: JSSR23103: The Session Registry Server start user has no authority to access the subdirectory under the directory for storing the serialized file of the session specified in the definition file. path=%s1 server=%s2 pid=%s3 tid=%s4**

### Variable Information

%s1 = Specified path

%s2 = Session Registry Server name

%s3 = Process ID of Session Registry Server

%s4 = Processing thread

## Explanation

There is no Session Registry Server start user authority for the "sr" subdirectory under the "directory for storing the serialized file of the session" specified in the environment definition file (IJServer cluster Java VM option), or the subdirectories under it.

However, the "sr" subdirectory and all the subdirectories under it, are created by Session Registry Server automatically.

## Cause

Session Registry Server start user authority for the "sr" subdirectory under the "directory for storing the serialized file of the session", or the subdirectories under it, is not defined in the <serialize.file.path> (<com.fujitsu.interstage.jservlet.sessionrecovery.serialize.file.path>) option for session serialization of the environment definition file (IJServer cluster Java VM option).

## System Action

Stops the Session Registry Server startup.

## User Action

There is a possibility that the start user is not the same as the previous start user. Take the following action:

- Restart the Session Registry Server as the previous user.
- To restart the Session Registry Server as a different user to the previous user, take the following action:
  - Change the "directory for storing the serialized file of the session".
  - Execute the *jsrsadmin* command *clearsession* subcommand to clear the serialized session information in the "directory for storing the serialized file of the session" (in J2EE), or execute the operating system command to delete this information (in Java EE).

There must be complete Session Registry Server start user authority for the "directory for storing the serialized file of the session" defined in the <serialize.file.path> option for session serialization of the environment definition file.

## Output Place

Server log / Container log

## 16.4.4 JSSR23104

---

**JSSRS: ERROR: JSSR23104: Could not change the authority to access the directory for storing the serialized file of the session. path=%s1 server=%s2 pid=%s3 tid=%s4**

### Variable Information

%s1 = Specified path

%s2 = Session Registry Server name

%s3 = Process ID of Session Registry Server

%s4 = Processing thread

## Explanation

Authority for the subdirectory under the "directory for storing the serialized file of the session" specified in the environment definition file (IJServer cluster Java VM option) could not be changed.

However, the "sr" (sessionrecovery) subdirectory under the "directory for storing the serialized file of the session" specified in the environment definition file, and all the subdirectories under it, are created by Session Registry Server automatically.

## Cause

There is a possibility that authority for the "directory for storing the serialized file of the session" defined in the <serialize.file.path>(<com.fujitsu.interstage.jservlet.sessionrecovery.serialize.file.path>) option for session serialization of the environment definition file (IJServer cluster Java VM option), or the subdirectories under it, was changed according to a user operation.

## System Action

Stops startup of Session Registry Server if Session Registry Server is not running.

If Session Registry Server is running, stops serialization of the session for "path" that is output in this error.

## User Action

Take the following action and retort Session Registry Server as the previous user:

- Change the "directory for storing the serialized file of the session".
- Execute the *jssrsadmin* command *clearsession* subcommand to clear the serialized session information in the "directory for storing the serialized file of the session" (in J2EE), or execute the operating system command to delete this information (in Java EE).

There must be complete Session Registry Server start user authority for the "directory for storing the serialized file of the session" defined in the <serialize.file.path> option for session serialization of the environment definition file.

## Output Place

Server log / Container log

## 16.4.5 JSSR23105

---

**JSSRS: ERROR: JSSR23105: Could not create the directory for storing the serialized file of the session. path=%s1 server=%s2 pid=%s3 tid=%s4**

### Variable Information

%s1 = Specified path

%s2 = Session Registry Server name

%s3 = Process ID of Session Registry Server

%s4 = Processing thread

### Explanation

The subdirectory under the "directory for storing the serialized file of the session" specified in the environment definition file (IJServer cluster Java VM option) could not be created.

However, the "sr" (sessionrecovery) subdirectory under the "directory for storing the serialized file of the session" specified in the environment definition file (IJServer cluster Java VM option), and all the subdirectories under it, are created by Session Registry Server automatically.

### Cause

- When the subdirectory of the "directory for storing the serialized file of the session" defined in the <serialize.file.path> (<com.fujitsu.interstage.jservlet.sessionrecovery.serialize.file.path>) option for session serialization of the environment definition file (IJServer cluster Java VM option) is created, the parent directory no longer exists (possibly it was moved/renamed/deleted by a user), or that there is no Session Registry Server start user authority for the parent directory.
- The problem occurred because of insufficient system disk space.
- A UNC path or network drive has been set for <serialize.file.path> (an IJServer cluster Java VM option) in the environment definition file (<com.fujitsu.interstage.jservlet.sessionrecovery.serialize.file.path>).

## System Action

Stops startup of Session Registry Server if Session Registry Server is not running.

If Session Registry Server is running, stops serialization of the session for "path" that is output in this error.

## User Action

Take the following action and retort Session Registry Server as the previous user:

- Change the "directory for storing the serialized file of the session".

- Execute the *jssrsadmin* command *clearsession* subcommand to clear the serialized session information in the "directory for storing the serialized file of the session" (in J2EE), or execute the operating system command to delete this information (in Java EE).
- Check whether a problem such as insufficient disk capacity occurred on the system and take action.
- Confirm that a UNC path or network drive has not been set for <serialize.file.path> (<com.fujitsu.interstage.jservlet.sessionrecovery.serialize.file.path>).

There must be full Session Registry Server start user authority for the "directory for storing the serialized session file" (and the subdirectories and files) defined in the <serialize.file.path> (<com.fujitsu.interstage.jservlet.sessionrecovery.serialize.file.path>) option for session serialization of the environment definition file (IJSserver cluster Java VM option).

#### Output Place

Server log / Container log

### 16.4.6 JSSR23151

---

**JSSRS: ERROR: JSSR23151: The directory for storing the serialized file of the session specified does not exist. path=%s1 server=%s2 pid=%s3 tid=%s4**

#### Variable Information

- %s1 = Specified path name
- %s2 = Session Registry Server name
- %s3 = Session Registry Server process ID
- %s4 = Processing thread name

#### Explanation

The "directory for storing the serialized file of the session" specified in the Session Registry Server environment definition does not exist.

#### Cause

The "directory for storing the serialized file of the session" defined in the Session Registry Server <serialize.file.path> environment definition does not exist.

#### System Action

The Session Registry Server start is aborted.

#### User Action

Check the value for the <serialize.file.path> item that is related to the serialization of the session in the Session Registry Server environment definition.

If the specified directory does not exist, create it.

#### Output Place

Server log

### 16.4.7 JSSR23152

---

**JSSRS: ERROR: JSSR23152: The Session Registry Server service operator user does not have access privilege to the directory for storing the serialized file of the session specified. path=%s1 server=%s2 pid=%s3 tid=%s4**

#### Variable Information

- %s1 = Specified path name
- %s2 = Session Registry Server name

%s3 = Session Registry Server process ID

%s4 = Processing thread name

### Explanation

The service operator user of Session Registry Server does not have access privilege to the "directory for storing the serialized file of the session", which is specified in the Session Registry Server environment definition.

### Cause

There are no Session Registry Server service operator user privileges for the "directory for storing the serialized file of the session" defined in the <serialize.file.path> item that is related to the serialization of the session in the Session Registry Server environment definition.

### System Action

The Session Registry Server start is aborted.

### User Action

Check that there are full Session Registry Server service operator privileges for the "directory for storing the serialized file of the session" defined in the <serialize.file.path> item that is related to the serialization of the session in the Session Registry Server environment definition.

If there are no privileges, assign them.

### Output Place

Server log

## 16.4.8 JSSR23153

---

**JSSRS: ERROR: JSSR23153: The Session Registry Server service operator user does not have access privilege to the subdirectory under the directory for storing the serialized file of the session specified. path=%s1 server=%s2 pid=%s3 tid=%s4**

### Variable Information

%s1 = Specified path name

%s2 = Session Registry Server name

%s3 = Session Registry Server process ID

%s4 = Processing thread name

### Explanation

The service operator user of Session Registry Server does not have access privilege to the "sr" subdirectory under the "directory for storing the serialized file of the session", which is specified in the Session Registry Server environment definition.

However, the "sr" subdirectory, and the subdirectories under it, are created by Session Registry Server automatically.

### Cause

There are no Session Registry Server service operator user privileges for the "directory for storing the serialized file of the session"/sr, and the subdirectories under it, defined in the <serialize.file.path> item that is related to the serialization of the session in the Session Registry Server environment definition.

### System Action

The Session Registry Server start is aborted.

### User Action

The service operator user may be different from the previous service operator user. Take one of the following actions:

- Restart Session Registry Server as the previous user.

- To restart Session Registry Server as a different user from the previous user, take one of the following actions:
  - Change the "directory for storing the serialized file of the session".
  - Delete the "sr" subdirectory from the "directory for storing the serialized file of the session".

Note that the service operator user of Session Registry Server needs to have full privileges to the directories and files under the "directory for storing the serialized file of the session", which is specified in the Session Registry Server environment definition.

#### Output Place

Server log

## 16.4.9 JSSR23154

---

**JSSRS: ERROR: JSSR23154: Could not change the access privilege of the directory for storing the serialized file of the session specified. path=%s1 server=%s2 pid=%s3 tid=%s4**

#### Variable Information

- %s1 = Specified path name
- %s2 = Session Registry Server name
- %s3 = Session Registry Server process ID
- %s4 = Processing thread name

#### Explanation

Could not change the access privileges for the subdirectory under the "directory for storing the serialized file of the session" specified in the Session Registry Server environment definition.

However, the "sr" subdirectory under the "directory for storing the serialized file of the session" specified in the environment definition file, and all the subdirectories under it, are created by Session Registry Server automatically.

#### Cause

The access privileges for the "directory for storing the serialized file of the session" defined in the <serialize.file.path> item that is related to the serialization of the session in the Session Registry Server environment definition, or the subdirectories under it, may have been changed as a result of some user operation, for example.

#### System Action

If this message is output while Session Registry Server is starting, the start is aborted.

If this message is output after Session Registry Server has started, the serialization of sessions related to the path that was output to this error message is aborted.

#### User Action

Take one of the following actions, and then restart Session Registry Server as the previous user.

- Change the "directory for storing the serialized file of the session".
- Delete the "sr" subdirectory from the "directory for storing the serialized file of the session".

Note that the service operator user of Session Registry Server needs to have full privileges to the directories and files under the "directory for storing the serialized file of the session", which is specified in the Session Registry Server environment definition.

#### Output Place

Server log

## 16.4.10 JSSR23155

---

**JSSRS: ERROR: JSSR23155: Could not create the directory for storing the serialized file of the session. path=%s1 server=%s2 pid=%s3 tid=%s4**

## Variable Information

%s1 = Specified path name

%s2 = Session Registry Server name

%s3 = Session Registry Server process ID

%s4 = Processing thread name

## Explanation

Could not create the subdirectory under the "directory for storing the serialized file of the session" specified in the Session Registry Server environment definition.

Note that the "sr" subdirectory under the "directory for storing the serialized file of the session" specified in the environment definition file, and all the subdirectories under it, are created by Session Registry Server automatically.

## Cause

Possible causes are as follows:

- When the subdirectory under the "directory for storing the serialized file of the session" defined in the <serialize.file.path> item that is related to the serialization of the session in the Session Registry Server environment definition was created, either the parent directory did not exist as a result of some user operation, for example, or there were no service operator user privileges for Session Registry Server in the parent directory.
- There may also be a problem on the system, for example insufficient available disk space.
- A UNC path or network drive has been set in the <serialize.file.path> in the Session Registry Server environment definition.

## System Action

If this message is output while Session Registry Server is starting, the start is aborted.

If this message is output after Session Registry Server has started, the serialization of sessions related to the path that was output to this error message is aborted.

## User Action

Take one of the following actions, and then restart Session Registry Server as the previous user.

- Change the "directory for storing the serialized file of the session".
- Delete the "sr" subdirectory from the "directory for storing the serialized file of the session".
- Check whether a problem has occurred on the system, for example, insufficient available disk space.
- If a UNC path or network drive has been set in <serialize.file.path>, set a path that is not a UNC path or network drive.

Note that the service operator user of Session Registry Server needs to have full privileges to the directories and files under the "directory for storing the serialized file of the session", which is specified in the Session Registry Server environment definition.

## Output Place

Server log

## 16.4.11 JSSR23301

---

**JSSRS: ERROR: JSSR23301: Could not write the session into the serialized data. Current serialization was stopped. server=%s1 pid=%s2 tid=%s3**

## Variable Information

%s1 = Session Registry Server name

%s2 = Process ID of Session Registry Server

%s3 = Processing thread

## Explanation

Failed to serialize the session.

## Cause

Refer to the message that is output in the Session Registry Server log at the same time.

## System Action

Stops serialization processing.

## User Action

Refer to the message that is output in the Session Registry Server log at the same time.

## Output Place

Server log / Container log

System log

## 16.4.12 JSSR23311

---

**JSSRS: ERROR: JSSR23311: Could not write the data into the serialized file. file=%s1 server=%s2 pid=%s3 tid=%s4**

## Variable Information

%s1 = The serialized file name

%s2 = Session Registry Server name

%s3 = Process ID of Session Registry Server

%s4 = Processing thread

## Explanation

The data could not be saved in the <file> serialized file.

## Cause

Possible causes are as follows:

1. The storage directory was deleted.
2. There is no Session Registry Server start user authority for the storage directory.
3. There is no Session Registry Server start user authority for the serialized file saved previously.
4. There are insufficient file descriptors.
5. There was insufficient disk capacity.
6. The storage directory network was disconnected.
7. The disk crashed.
8. A UNC path or network drive has been set for the save destination directory.

## System Action

Refer to the message that is output in the Session Registry Server log at the same time.

## User Action

Check the cause of the trouble and take action.

1. The storage directory was deleted

Check the `<serialize.file.path>` (`<com.fujitsu.interstage.jservlet.sessionrecovery.serialize.file.path>`) option for session serialization of the environment definition file (JServer cluster Java VM option). If the specified directory does not exist, create it.

Check that there is complete Session Registry Server start user authority for the above directory. If there is not, set it.

After taking the necessary action, restart the Session Registry Server.

2. There is no Session Registry Server start user authority for the storage directory

There is a possibility that the start user is not the same as the previous start user. Take the following action:

- Restart the Session Registry Server as the previous user.
- To restart the Session Registry Server as a different user to the previous user, take the following action:
  - Change the "directory for storing the serialized file of the session".
  - Execute the `jsrsadmin` command `clearsession` subcommand to clear the serialized session information in the "directory for storing the serialized file of the session" (in J2EE), or execute the operating system command to delete this information (in Java EE).

There must be complete Session Registry Server start user authority for the "directory for storing the serialized file of the session" (and its subdirectories and files) defined in the `<serialize.file.path>` (`<com.fujitsu.interstage.jservlet.sessionrecovery.serialize.file.path>`) option for session serialization of the environment definition file (JServer cluster Java VM option).

3. There is no Session Registry Server start user authority for the serialized file saved previously

Take action according to 2.

4. There are insufficient file descriptors

Serialized files cannot be saved. Take the action shown below and restart the Session Registry Server.

- Close unnecessary applications.
- Increase the number of file descriptors that can be used in the system.

5. There was insufficient disk capacity

Check the file system status, and swap out or delete unnecessary resources.

After taking the necessary action, check the Session Registry Server status again.

6. The storage directory network was disconnected

Check the network status, and recover the network.

After the recovery, check the Session Registry Server status again.

7. The disk crashed

Check the disk status, and recover the disk.

After the recovery, restart the Session Registry Server.

8. A UNC path or network drive has been set for the save destination directory

Set a path that is not a UNC path or a network drive for the save destination directory, and then restart the Session Registry Server.

## Output Place

Server log / Container log

### 16.4.13 JSSR23411

---

**JSSRS: ERROR: JSSR23411: Could not get the data from the serialized file. file=%s1 server=%s2 pid=%s3 tid=%s4**

## Variable Information

%s1 = The serialized file name

%s2 = Session Registry Server name

%s3 = Process ID of Session Registry Server

%s4 = Processing thread

## Explanation

Could not get the data from the <file> serialized file.

## Cause

Possible causes are as follows:

1. The storage directory was deleted.
2. There is no Session Registry Server start user authority for the storage directory.
3. There is no Session Registry Server start user authority for the serialized file saved previously.
4. There are insufficient file descriptors.
5. The storage directory network was disconnected.
6. The disk crashed.
7. The serialized file is broken.
8. A UNC path or network drive has been set for the save destination directory

## System Action

Refer to the message that is output in the Session Registry Server log at the same time.

## User Action

Check the cause of the trouble and take action.

1. The storage directory was deleted

Check the <serialize.file.path> (<com.fujitsu.interstage.jservlet.sessionrecovery.serialize.file.path>) option for session serialization of the environment definition file (IJServer cluster Java VM option). If the specified directory does not exist, create it.

Check that there is complete Session Registry Server start user authority for the above directory. If there is not, set it.

After taking the necessary action, restart the Session Registry Server.

2. There is no Session Registry Server start user authority for the storage directory

There is a possibility that the start user is not the same as the previous start user. Take the following action:

- Restart the Session Registry Server as the previous user.
- To restart the Session Registry Server as a different user to the previous user, take the following action:
  - Change the "directory for storing the serialized file of the session".
  - Execute the *jsrsadmin* command *clearsession* subcommand to clear the serialized session information in the "directory for storing the serialized file of the session" (in J2EE), or execute the operating system command to delete this information (in Java EE).

There must be complete Session Registry Server start user authority for the "directory for storing the serialized file of the session" (and its subdirectories and files) defined in the <serialize.file.path> (<com.fujitsu.interstage.jservlet.sessionrecovery.serialize.file.path>) option for session serialization of the environment definition file (IJServer cluster Java VM option).

3. There is no Session Registry Server start user authority for the serialized file saved previously  
Take action according to 2.
4. There are insufficient file descriptors  
Serialized files cannot be saved. Take the action shown below and restart the Session Registry Server.
  - Close unnecessary applications.
  - Increase the number of file descriptors that can be used in the system.
5. The storage directory network was disconnected  
Check the network status, and recover the network.  
After the recovery, check the Session Registry Server status again.
6. The disk crashed  
Check the disk status, and recover the disk.  
After the recovery, restart the Session Registry Server.
7. The serialized file is broken  
Delete the serialized file.
8. A UNC path or network drive has been set for the save destination directory  
Set a path that is not a UNC path or a network drive for the save destination directory, and then restart the Session Registry Server.

#### Output Place

Server log / Container log

### 16.4.14 JSSR23511

---

**JSSRS: ERROR: JSSR23511: Could not delete the serialized file. file=%s1 server=%s2 pid=%s3 tid=%s4**

#### Variable Information

%s1 = The serialized file name

%s2 = Session Registry Server name

%s3 = Process ID of Session Registry Server

%s4 = Processing thread

#### Explanation

Could not delete the <file> serialized file.

#### Cause

Possible causes are as follows:

1. The storage directory was deleted.
2. There is no Session Registry Server start user authority for the storage directory.
3. There is no Session Registry Server start user authority for the serialized file saved previously.
4. Failed to delete a temporary file used for update in the update processing for the serialized file.
5. There are insufficient file descriptors.
6. The storage directory network was disconnected.
7. The disk crashed.
8. A UNC path or network drive has been set for the save destination directory

## System Action

Refer to the message that is output in the Session Registry Server log at the same time.

## User Action

Check the cause of the trouble and take action.

### 1. The storage directory was deleted

Check the `<serialize.file.path>` (`<com.fujitsu.interstage.jservlet.sessionrecovery.serialize.file.path>`) option for session serialization of the environment definition file (IJServer cluster Java VM option). If the specified directory does not exist, create it.

Check that there is complete Session Registry Server start user authority for the above directory. If there is not, set it.

After taking the necessary action, restart the Session Registry Server.

### 2. There is no Session Registry Server start user authority for the storage directory

There is a possibility that the start user is not the same as the previous start user. Take the following action:

- Restart the Session Registry Server as the previous user.
- To restart the Session Registry Server as a different user to the previous user, take the following action:
  - Change the "directory for storing the serialized file of the session".
  - Execute the `jsrsadmin` command `clearsession` subcommand to clear the serialized session information in the "directory for storing the serialized file of the session" (in J2EE), or execute the operating system command to delete this information (in Java EE).

There must be complete Session Registry Server start user authority for the "directory for storing the serialized file of the session" (and its subdirectories and files) defined in the `<serialize.file.path>` (`<com.fujitsu.interstage.jservlet.sessionrecovery.serialize.file.path>`) option for session serialization of the environment definition file (IJServer cluster Java VM option).

### 3. There is no Session Registry Server start user authority for the serialized file saved previously

Take action according to 2.

### 4. Failed to delete a temporary file used for update in the update processing for the serialized file.

Take action according to 2.

### 5. There are insufficient file descriptors

Serialized files cannot be saved. Take the action shown below and restart the Session Registry Server.

- Close unnecessary applications.
- Increase the number of file descriptors that can be used in the system.

### 6. The storage directory network was disconnected

Check the network status, and recover the network.

After the recovery, check the Session Registry Server status again.

### 7. The disk crashed

Check the disk status, and recover the disk.

After the recovery, restart the Session Registry Server.

### 8. A UNC path or network drive has been set for the save destination directory

Set a path that is not a UNC path or a network drive for the save destination directory, and then restart the Session Registry Server.

## Output Place

Server log / Container log

## 16.4.15 JSSR23512

---

**JSSRS: WARNING: JSSR23512: There is a file that is unnecessary file for updating serialized information. file=%s1 server=%s2 pid=%s3 tid=%s4**

### Variable Information

%s1 = The serialized file name  
%s2 = Session Registry Server name  
%s3 = Process ID of Session Registry Server  
%s4 = Processing thread

### Explanation

There is a temporary <file>serialized file that is unnecessary for update.

### Cause

There is a possibility that the access to the directory for storing the serialized file was made for a reason other than serialization processing, and therefore unnecessary.

### System Action

Continues serialization processing.

### User Action

Although serialization processing can continue, check whether the access to the directory for storing the serialized file was made for a reason other than serialization processing, and therefore unnecessary.

### Output Place

Server log / Container log

## 16.5 JSSR24000 to JSSR24999

---

Session Registry Server messages.

### 16.5.1 JSSR24001

---

**JSSRS: ERROR: JSSR24001: Connection to the IJServer Failed. client=%s1 uri=%s2 server=%s3 pid=%s4 tid=%s5**

### Variable Information

%s1 = IP address of IJServer:Control port number  
%s2 = Internal information  
%s3 = Session Registry Server name  
%s4 = Process ID of Session Registry Server  
%s5 = Processing thread

### Explanation

Connection to the IJServer Failed.

### Cause

Possible causes are as follows:

1. IJServer is not running.
2. An abnormality occurred in the network.

3. The WorkUnit stopped the IJServer by force using an application timeout.
4. The IJServer ended abnormally because of a Web application abnormality.
5. There are insufficient file descriptors.
6. **Windows32/64 Solaris32/64**  
There are insufficient TCP/IP resources.
7. The IJServer is overloaded. It is possible that there is insufficient memory in the Java VM.

### System Action

Refer to the message that is output in the Session Registry Server log at the same time.

### User Action

1. Start the IJServer.
2. Check whether there is an abnormality in the IJServer and Session Registry Server network connection.
3. Increase the IJServer application maximum processing time.
4. If the Servlet container stopped because of an application abnormality, check if there is trouble in the application. In particular, there is a possibility of trouble in applications that use JNI (Java Native Interface).
5. Close unnecessary applications, or increase the number of file descriptors that can be used in the system.
6. **Windows32/64 Solaris32/64**  
Close other applications, or increase the number of files that can be opened in the system. Tune the TCP/IP parameters. For details about the tuning method, refer to "Tuning TCP/IP Parameters" in the Tuning Guide.
7. If there is insufficient Java VM memory ("OutOfMemoryError" is output), refer to "JDK/JRE Tuning" in the Tuning Guide, and take action.

### Output Place

Server log / Container log

## 16.5.2 JSSR24002

---

**JSSRS: ERROR: JSSR24002: Sending of data to the IJServer failed. client=%s1 uri=%s2 server=%s3 pid=%s4 tid=%s5**

### Variable Information

- %s1 = IP address of IJServer:Control port number
- %s2 = Internal information
- %s3 = Session Registry Server name
- %s4 = Process ID of Session Registry Server
- %s5 = Processing thread

### Explanation

Sending of data to the IJServer failed.

### Cause

Possible causes are as follows:

1. IJServer is not running.
2. An abnormality occurred in the network.
3. The WorkUnit stopped the IJServer by force using an application timeout.

4. The IJServer ended abnormally because of a Web application abnormality.
5. The IJServer is overloaded. It is possible that there is insufficient memory in the Java VM.

#### System Action

Refer to the message that is output in the Session Registry Server log at the same time.

#### User Action

1. Start the IJServer.
2. Check whether there is an abnormality in the IJServer and Session Registry Server network connection.
3. Increase the IJServer application maximum processing time.
4. If the Servlet container stopped because of an application abnormality, check whether there is trouble in the application. In particular, there is a possibility of trouble in applications that use JNI (Java Native Interface).
5. If there is insufficient Java VM memory ("OutOfMemoryError" is output), refer to "JDK/JRE Tuning" in the Tuning Guide, and take action.

#### Output Place

Server log / Container log

### 16.5.3 JSSR24003

---

**JSSRS: ERROR: JSSR24003: Receipt of data from the IJServer failed. client=%s1 uri=%s2 server=%s3 pid=%s4 tid=%s5**

#### Variable Information

- %s1 = IP address of IJServer:Control port number
- %s2 = Internal information
- %s3 = Session Registry Server name
- %s4 = Process ID of Session Registry Server
- %s5 = Processing thread

#### Explanation

Receipt of data from the IJServer failed.

#### Cause

Possible causes are as follows:

1. IJServer is not running.
2. An abnormality occurred in the network.
3. The WorkUnit stopped the IJServer by force using an application timeout.
4. The IJServer ended abnormally because of a Web application abnormality.
5. The IJServer is overloaded. It is possible that there is insufficient memory in the Java VM.

#### System Action

Refer to the message that is output in the Session Registry Server log at the same time.

#### User Action

1. Start the IJServer.
2. Check whether there is an abnormality in the IJServer and Session Registry Server network connection.

3. Increase the IJServer application maximum processing time.
4. If the Servlet container stopped because of an application abnormality, check whether there is trouble in the application. In particular, there is a possibility of trouble in applications that use JNI (Java Native Interface).
5. If there is insufficient Java VM memory ("OutOfMemoryError" is output), refer to "JDK/JRE Tuning" in the Tuning Guide, and take action.

#### Output Place

Server log / Container log

## 16.5.4 JSSR24004

---

**JSSRS: ERROR: JSSR24004: Sending of data to the IJServer was timed out. client=%s1 uri=%s2 server=%s3 pid=%s4 tid=%s5**

#### Variable Information

%s1 = IP address of IJServer:Control port number

%s2 = Internal information

%s3 = Session Registry Server name

%s4 = Process ID of Session Registry Server

%s5 = Processing thread

#### Explanation

Sending of data to the IJServer was timed out.

#### Cause

Possible causes are as follows:

1. An abnormality occurred in the network.
2. IJServer processing was delayed because the IJServer is overloaded.

#### System Action

Refer to the message that is output in the Session Registry Server log at the same time.

#### User Action

1. Check whether there is an abnormality in the IJServer and Session Registry Server network connection.
2. Check the IJServer load status. Increase the wait time for obtaining the Session Registry Server updated session if necessary. If this value is changed, all other related settings must also be changed. For details, refer to "Session Recovery Settings", "Settings for each Timeout" in the J2EE User's Guide or Java EE Operator's Guide.

#### Output Place

Server log / Container log

## 16.5.5 JSSR24005

---

**JSSRS: ERROR: JSSR24005: Receipt of data from the IJServer was timed out. client=%s1 uri=%s2 server=%s3 pid=%s4 tid=%s5**

#### Variable Information

%s1 = IP address of IJServer:Control port number

%s2 = Internal information

%s3 = Session Registry Server name

%s4 = Process ID of Session Registry Server

%s5 = Processing thread

### Explanation

Receipt of data from the IJServer was timed out.

### Cause

Possible causes are as follows:

1. An abnormality occurred in the network.
2. IJServer processing was delayed because the IJServer is overloaded.

### System Action

Refer to the message that is output in the Session Registry Server log at the same time.

### User Action

1. Check whether there is an abnormality in the IJServer and Session Registry Server network connection.
2. Check the IJServer load status. Increase the wait time for obtaining the Session Registry Server updated session if necessary. If this value is changed, all other related settings must also be changed. For details, refer to "Session Recovery Settings", "Settings for Each Timeout" in the J2EE User's Guide or Java EE Operator's Guide.

### Output Place

Server log / Container log

## 16.5.6 JSSR24006

---

**JSSRS: ERROR: JSSR24006: An abnormal HTTP status code was returned from the IJServer. client=%s1 uri=%s2 status=%s3 server=%s4 pid=%s5 tid=%s6**

### Variable Information

%s1 = IP address of IJServer:Port number

%s2 = Internal information

%s3 = Status code

%s4 = Session Registry Server name

%s5 = Process ID of Session Registry Server

%s6 = Processing thread

### Explanation

An abnormal HTTP status code was returned from the IJServer.

### Cause

Possible causes are as follows:

1. The IJServer control port access permission IP address settings are incorrect.
2. An error occurred in the IJServer.

### System Action

Refer to the message that is output in the Session Registry Server log at the same time.

### User Action

1. Set the Session Registry Server IP address for the IJServer control port access permission IP address.

2. Refer to the IJServer server log / container log. If a message is output in the log, take action according to the message.

### Output Place

Server log / Container log

## 16.5.7 JSSR24007

---

**JSSRS: ERROR: JSSR24007: Data inconsistent with the HTTP was returned from the IJServer. client=%s1 uri=%s2 detail=%s3 server=%s4 pid=%s5 tid=%s6**

### Variable Information

%s1 = IP address of IJServer:Port number

%s2 = Internal information

%s3 = Detail information

%s4 = Session Registry Server name

%s5 = Process ID of Session Registry Server

%s6 = Processing thread

### Explanation

Data inconsistent with the HTTP was returned from the IJServer.

### Cause

Possible causes are as follows:

1. An abnormality occurred in the network.
2. An error occurred in the IJServer.

### System Action

Refer to the message that is output in the Session Registry Server log at the same time.

### User Action

1. Check whether there is an abnormality in the IJServer and Session Registry Server network connection.
2. Refer to the IJServer server log / container log. If a message is output in the log, take action according to the message.

### Output Place

Server log / Container log

## 16.5.8 JSSR24008

---

**JSSRS: ERROR: JSSR24008: Failed to get data sent from the IJServer. client=%s1 uri=%s2 server=%s3 pid=%s4 tid=%s5**

### Variable Information

%s1 = IP address of IJServer:Port number or IP address of IJServer

%s2 = Internal information

%s4 = Session Registry Server name

%s4 = Process ID of Session Registry Server

%s5 = Processing thread

## Explanation

Failed to get data sent from the IJServer.

## Cause

Possible causes are as follows:

1. An abnormality occurred in the network.
2. An error occurred in the IJServer.

## System Action

Refer to the message that is output in the Session Registry Server log at the same time.

## User Action

1. Check whether there is an abnormality in the IJServer and Session Registry Server network connection.
2. Refer to the IJServer server log / container log. If a message is output in the log, take action according to the message.

## Output Place

Server log / Container log

## 16.5.9 JSSR24010

---

**JSSRS: ERROR: JSSR24010: Failed to disconnect from the IJServer. client=%s1 uri=%s2 server=%s3 pid=%s4 tid=%s5**

### Variable Information

%s1 = IP address of IJServer:Port number

%s2 = Internal information

%s3 = Session Registry Server name

%s4 = Process ID of Session Registry Server

%s5 = Processing thread

## Explanation

Failed to disconnect from the IJServer.

## Cause

Possible causes are as follows:

1. IJServer is not running.
2. An abnormality occurred in the network.
3. The WorkUnit stopped the IJServer by force using an application timeout.
4. The IJServer ended abnormally because of a Web application abnormality.
5. The IJServer is overloaded. It is possible that there is insufficient memory in the Java VM.

## System Action

Refer to the message that is output in the Session Registry Server log at the same time.

## User Action

1. Start the IJServer.
2. Check whether there is an abnormality in the IJServer and Session Registry Server network connection.
3. Increase the IJServer application maximum processing time.

4. If the Servlet container stopped because of an application abnormality, check whether there is trouble in the application. In particular, there is a possibility of trouble in applications that use JNI (Java Native Interface).
5. If there is insufficient Java VM memory ("OutOfMemoryError" is output), refer to "JDK/JRE Tuning" in the Tuning Guide, and take action.

## Output Place

Server log / Container log

## 16.5.10 JSSR24011

---

**JSSRS: ERROR: JSSR24011: Data communication with the IJServer failed. client=%s1 uri=%s2 server=%s3 pid=%s4 tid=%s5**

### Variable Information

%s1 = IP address of IJServer:Port number or IP address of IJServer

%s2 = Internal information

%s3 = Session Registry Server name

%s4 = Process ID of Session Registry Server

%s5 = Processing thread

### Explanation

Data communication with the IJServer failed.

### Cause

Possible causes are as follows:

1. IJServer is not running.
2. An abnormality occurred in the network.
3. The WorkUnit stopped the IJServer by force using an application timeout.
4. The IJServer ended abnormally because of a Web application abnormality.
5. The IJServer is overloaded. It is possible that there is insufficient memory in the Java VM.
6. The IJServer or Session Registry Server are in a high-load state, therefore garbage collection has occurred frequently or took a long time.

### System Action

Refer to the message that is output in the Session Registry Server log at the same time.

### User Action

1. Start the IJServer.
2. Check whether there is an abnormality in the IJServer and Session Registry Server network connection.
3. Increase the IJServer application maximum processing time.
4. If the Servlet container stopped because of an application abnormality, check whether there is trouble in the application. In particular, there is a possibility of trouble in applications that use JNI (Java Native Interface).
5. If there is insufficient Java VM memory ("OutOfMemoryError" is output), refer to "JDK/JRE Tuning" in the Tuning Guide, and take action.
6. If the "IJServer30004" or "OM3204" messages were output frequently to the server log/container log of the IJServer or Session Registry Server, garbage collection may have occurred frequently or took a long time. Perform JavaVM tuning.

## Output Place

Server log / Container log

## 16.6.2 JSSR25002

---

**JSSRS: INFO: JSSR25002: An abnormality was detected in the IJServer. client=%s1 server=%s2 pid=%s3 tid=%s4**

### Variable Information

%s1 = IP address of IJServer:Port number

%s2 = Session Registry Server name

%s3 = Process ID of Session Registry Server

%s4 = Processing thread

### Explanation

An abnormality was detected in the IJServer.

### System Action

Refer to the message that is output in the Session Registry Server log at the same time.

## Output Place

Server log / Container log

## 16.6.3 JSSR25003

---

**JSSRS: INFO: JSSR25003: A recovery was detected in the IJServer. client=%s1 server=%s2 pid=%s3 tid=%s4**

### Variable Information

%s1 = IP address of IJServer:Port number

%s2 = Session Registry Server name

%s3 = Process ID of Session Registry Server

%s4 = Processing thread

#### Explanation

Notification that IJServer was restored was received.

#### System Action

Refer to the message that is output in the Session Registry Server log at the same time.

#### Output Place

Server log / Container log

## 16.6.4 JSSR25004

---

**JSSRS: INFO: JSSR25004: IJServer monitoring has stopped. client=%s1 server=%s2 pid=%s3 tid=%s4**

#### Variable Information

%s1 = IP address of IJServer:Port number

%s2 = Session Registry Server name

%s3 = Process ID of Session Registry Server

%s4 = Processing thread

#### Explanation

IJServer monitoring has stopped.

#### Output Place

Server log / Container log

## 16.7 JSSR27000 to JSSR27999

---

Session Registry Server messages.

### 16.7.1 JSSR27001

---

**JSSRS: INFO: JSSR27001: A monitoring request was received. client=%s1 server=%s2 pid=%s3 tid=%s4**

#### Variable Information

%s1 = IP address of IJServer:Port number

%s2 = Session Registry Server name

%s3 = Process ID of Session Registry Server

%s4 = Processing thread

#### Explanation

A monitoring request was received from the IJServer.

#### Output Place

Server log / Container log

### 16.7.2 JSSR27101

---

---

**JSSRS: INFO: JSSR27101: The backup request was received. client=%s1 apl=%s2 server=%s3 pid=%s4 tid=%s5**

#### Variable Information

%s1 = IP address of IJServer:Control port number  
%s2 = Web application name[, Web application name, ...]  
%s3 = Session Registry Server name  
%s4 = Process ID of Session Registry Server  
%s5 = Processing thread

#### Explanation

The backup request was received from the IJServer.

#### Output Place

Server log / Container log

### 16.7.3 JSSR27102

---

**JSSRS: INFO: JSSR27102: The recovery request was received. client=%s1 apl=%s2 sessionid=%s3 server=%s4 pid=%s5 tid=%s6**

#### Variable Information

%s1 = IP address of IJServer:Control port number  
%s2 = Web application name  
%s3 = Session ID  
%s4 = Session Registry Server name  
%s5 = Process ID of Session Registry Server  
%s6 = Processing thread

#### Explanation

The recovery request was received from the IJServer.

#### Output Place

Server log / Container log

### 16.7.4 JSSR27103

---

**JSSRS: INFO: JSSR27103: The recovery is complete notice was received. client=%s1 apl=%s2 sessionid=%s3 server=%s4 pid=%s5 tid=%s6**

#### Variable Information

%s1 = IP address of IJServer:Control port number  
%s2 = Web application name  
%s3 = Session ID  
%s4 = Session Registry Server name  
%s5 = Process ID of Session Registry Server  
%s6 = Processing thread

#### Explanation

The "recovery is complete" notice was received from the IJServer.

## Output Place

Server log / Container log

### 16.7.5 JSSR27104

---

**JSSRS: INFO: JSSR27104: The consistency check request was received. client=%s1 apl=%s2 detail=%s3 server=%s4 pid=%s5 tid=%s6**

#### Variable Information

%s1 = IP address of IJServer:Control port number

%s2 = Web application name

%s3 = Internal information

%s4 = Session Registry Server name

%s5 = Process ID of Session Registry Server

%s6 = Processing thread

#### Explanation

The session consistency check request was received from the IJServer.

## Output Place

Server log / Container log

### 16.7.6 JSSR27105

---

**JSSRS: INFO: JSSR27105: The get the updated session request is sent. client=%s1 apl=%s2 sessionid=%s3 server=%s4 pid=%s5 tid=%s6**

#### Variable Information

%s1 = IP address of IJServer:Control port number

%s2 = Web application name

%s3 = Session ID

%s4 = Session Registry Server name

%s5 = Process ID of Session Registry Server

%s6 = Processing thread

#### Explanation

The request to get the updated session was sent to the IJServer.

## Output Place

Server log / Container log

### 16.7.7 JSSR27106

---

**JSSRS: INFO: JSSR27106: The get the updated session result was received. client=%s1 apl=%s2 sessionid=%s3 server=%s4 pid=%s5 tid=%s6**

#### Variable Information

%s1 = IP address of IJServer:Control port number

%s2 = Web application name

%s3 = Session ID

%s4 = Session Registry Server name

%s5 = Process ID of Session Registry Server

%s6 = Processing thread

### Explanation

The updated session result was received from the IJServer.

### Output Place

Server log / Container log

## 16.8 JSSR30000 to JSSR30999

---

Session Registry Client messages.

### 16.8.1 JSSR30001

---

**JSSRC: WARNING: JSSR30001: The environment configuration is incorrect, so the default will be used. definition=%s1 default=%s2 ijserver=%s3 pno=%s4 pid=%s5 tid=%s6**

#### Variable Information

%s1 = Definition name

%s2 = Default value

%s3 = IJServer name (or IJServer cluster name (server instance name))

%s4 = Process number of IJServer

%s5 = Process ID of IJServer

%s6 = Processing thread

#### Explanation

The environment definition is incorrect, so the default will be used.

#### Cause

The environment definition is incorrect.

#### System Action

Uses the default shown in the variable information in place of the incorrect definition, and continues the Session Registry Client startup.

#### User Action

- Java EE

Check the defined value using the *asadmin* command, and then restart the IJServer cluster.

- J2EE

To edit the definition file using a text editor, specify the environment settings using the Interstage Management Console.

For details on the environment settings, refer to "Session Registry Client Settings" in the J2EE User's Guide or Java EE Operator's Guide.

#### Output Place

Server log / Container log

## 16.8.2 JSSR30002

---

**JSSRC: ERROR: JSSR30002: Insufficient memory. ijsrvr=%s1 pno=%s2 pid=%s3 tid=%s4**

### Variable Information

%s1 = IJServer name (or IJServer cluster name (server instance name))

%s2 = Process number of IJServer

%s3 = Process ID of IJServer

%s4 = Processing thread

### Explanation

There is insufficient memory.

### Cause

- There is insufficient memory (Heap), and real memory/swap for the system.
- There are insufficient file descriptors.

### System Action

Refer to the message that is output in the IJServer server log / container log at the same time.

### User Action

- Refer to "JDK/JRE Tuning" in the Tuning Guide, fix the cause of the problem, and restart the Session Registry Server.
- Close unnecessary applications, or increase the number of file descriptors that can be used in the system.

### Output Place

Server log / Container log

## 16.8.3 JSSR30999

---

**JSSRC: ERROR: JSSR30999: An unexpected error occurred. detail=%s1 ijsrvr=%s2 pno=%s3 pid=%s4 tid=%s5**

### Variable Information

%s1 = Detail information

%s2 = IJServer name

%s3 = Process number of IJServer

%s4 = Process ID of IJServer

%s5 = Processing thread

### Explanation

An unexpected error occurred.

### User Action

Use the *iscollectinfo* command to collect investigation information. Send the error information to a Systems Engineer.

### Output Place

Server log / Container log

## 16.9 JSSR31000 to JSSR31999

---

Session Registry Client messages.

### 16.9.1 JSSR31001

---

**JSSRC: INFO: JSSR31001: Session Registry Client start processing has started. ijservice=%s1 pno=%s2 pid=%s3 tid=%s4**

#### Variable Information

%s1 = IJServer name (or IJServer cluster name (server instance name))

%s2 = Process number of IJServer

%s3 = Process ID of IJServer

%s4 = Processing thread

#### Explanation

Session Registry Client start processing has started.

Session Registry Client runs as an add-in to the IJServer when session recovery is enabled.

#### Output Place

Server log / Container log

System log

### 16.9.2 JSSR31002

---

**JSSRC: INFO: JSSR31002: Session Registry Client was started. ijservice=%s1 pno=%s2 pid=%s3 tid=%s4**

#### Variable Information

%s1 = IJServer name (or IJServer cluster name (server instance name))

%s2 = Process number of IJServer

%s3 = Process ID of IJServer

%s4 = Processing thread

#### Explanation

Session Registry Client was started.

#### Output Place

Server log / Container log

System log

### 16.9.3 JSSR31003

---

**JSSRC: ERROR: JSSR31003: Failed to start Session Registry Client. ijservice=%s1 pno=%s2 pid=%s3 tid=%s4**

#### Variable Information

%s1 = IJServer name (or IJServer cluster name (server instance name))

%s2 = Process number of IJServer

%s3 = Process ID of IJServer

%s4 = Processing thread

## Explanation

Failed to start Session Registry Client.

## Cause

Refer to the message that is output in the IJServer server log / container log at the same time.

## System Action

IJServer cannot run applications using the session.

## User Action

Refer to the message that is output in the IJServer server log / container log at the same time.

## Output Place

Server log / Container log

System log

## 16.9.4 JSSR31051

---

**JSSRC: ERROR: JSSR31051: A required property was not specified in the lifecycle module for session recovery. property=%s1 ijservice=%s2 pno=%s3 pid=%s4 tid=%s5**

### Variable Information

%s1 = Property name

%s2 = IJServer name

%s3 = IJServer process sequence number

%s4 = IJServer process ID

%s5 = Processing thread name

## Explanation

A required property was not specified in the lifecycle module for session recovery defined in Session Registry Client.

## Cause

The following required properties must be specified in the lifecycle module for session recovery:

- <srsAddress>: IP address of the Session Registry Server that this Session Registry Client communicates with
- <srsPort>: Port number of the Session Registry Server that this Session Registry Client communicates with

## System Action

The Session Registry Client start is aborted.

The IJServer cannot be used for operations that use sessions.

## User Action

Specify the following required properties in the lifecycle module for session recovery:

- <srsAddress>: IP address of the Session Registry Server that this Session Registry Client communicates with
- <srsPort>: Port number of the Session Registry Server that this Session Registry Client communicates with

## Output Place

Server log

## 16.9.5 JSSR31052

---

**JSSRC: ERROR: JSSR31052: A property of the lifecycle module for session recovery is invalid. property=%s1 value=%s2 ijsserver=%s3 pno=%s4 pid=%s5 tid=%s6**

### Variable Information

%s1 = Property name

%s2 = Property value

%s3 = IJServer name

%s4 = IJServer process sequence number

%s5 = IJServer process ID

%s6 = Processing thread name

### Explanation

The property specified in the lifecycle module for session recovery defined in Session Registry Client is invalid.

### Cause

The property specified in the lifecycle module for session recovery defined in Session Registry Client is invalid.

### System Action

The Session Registry Client start is aborted.

The IJServer cannot be used for operations that use sessions.

### User Action

Check whether the property value shown in the property name in the variable information is correct.

### Output Place

Server log

## 16.9.6 JSSR31053

---

**JSSRC: WARNING: JSSR31053: A property that cannot be used was specified in the lifecycle module for session recovery. property=%s1 value=%s2 ijsserver=%s3 pno=%s4 pid=%s5 tid=%s6**

### Variable Information

%s1 = Property name

%s2 = Property value

%s3 = IJServer name

%s4 = IJServer process sequence number

%s5 = IJServer process ID

%s6 = Processing thread name

### Explanation

A property that cannot be used in the lifecycle module for session recovery defined in Session Registry Client was specified.

### Cause

A property that cannot be used in the lifecycle module for session recovery defined in Session Registry Client was specified.

### System Action

The Session Registry Client start is continued.

#### User Action

Check whether the property name shown in the variable information is correct.

#### Output Place

Server log

### 16.9.7 JSSR31054

---

**JSSRC: ERROR: JSSR31054: The lifecycle module for session recovery has already been initialized. ijsrver=%s1 pno=%s2 pid=%s3 tid=%s4**

#### Variable Information

%s1 = IJServer name

%s2 = IJServer process sequence number

%s3 = IJServer process ID

%s4 = Processing thread name

#### Explanation

The lifecycle module for session recovery defined in Session Registry Client has already been initialized.

#### Cause

Multiple lifecycle modules for session recovery were defined in a single IJServer, and initialization processing was executed multiple times.

#### System Action

The Session Registry Client start is aborted.

The IJServer cannot be used for operations that use sessions.

#### User Action

Define only a single lifecycle module for session recovery in a single IJServer.

#### Output Place

Server log

### 16.9.8 JSSR31061

---

**JSSRC: ERROR: JSSR31061: The virtual server property "valve\_sr" is invalid. virtual-server=%s1 value=%s2 ijsrver=%s3 pno=%s4 pid=%s5 tid=%s6**

#### Variable Information

%s1 = Virtual server name

%s2 = valve\_sr property value

%s3 = IJServer name

%s4 = IJServer process sequence number

%s5 = IJServer process ID

%s6 = Processing thread name

#### Explanation

The "valve\_sr" property of the virtual server is invalid.

## Cause

Either the "valve\_sr" property does not exist in the virtual server, or the "valve\_sr" property value is not "com.fujitsu.interstage.jservlet.sessionrecovery.client.core.isje5.ISJE5SessionRegistryValve".

## System Action

The Session Registry Client start is aborted.

The IJServer cannot be used for operations that use sessions.

## User Action

Specify "com.fujitsu.interstage.jservlet.sessionrecovery.client.core.isje5.ISJE5SessionRegistryValve" for the "valve\_sr" property value of the virtual server shown in the virtual server name in the variable information.

## Output Place

Server log

## 16.9.9 JSSR31062

---

**JSSRC: ERROR: JSSR31062: The virtual server does not exist. virtual-server=%s1 ijservice=%s2 pno=%s3 pid=%s4 tid=%s5**

### Variable Information

%s1 = Virtual server name

%s2 = IJServer name

%s3 = IJServer process sequence number

%s4 = IJServer process ID

%s5 = Processing thread name

### Explanation

The virtual server for control does not exist in the IJServer.

### Cause

The virtual server for control does not exist in the IJServer.

### System Action

The Session Registry Client start is aborted.

The IJServer cannot be used for operations that use sessions.

### User Action

Create the virtual server for control that has the virtual server name shown in the variable information in the IJServer shown in the IJServer name in the variable information.

### Output Place

Server log

## 16.9.10 JSSR31063

---

**JSSRC: ERROR: JSSR31063: The HTTP listener does not exist. http-listener=%s1 ijservice=%s2 pno=%s3 pid=%s4 tid=%s5**

### Variable Information

%s1 = HTTP listener name

%s2 = IJServer name

%s3 = IJServer process sequence number

%s4 = IJServer process ID

%s5 = Processing thread name

### Explanation

The HTTP listener for control does not exist in the IJServer.

### Cause

The HTTP listener for control does not exist in the IJServer.

### System Action

The Session Registry Client start is aborted.

The IJServer cannot be used for operations that use sessions.

### User Action

Create the HTTP listener that has the HTTP listener name shown in the variable information in the IJServer shown in the IJServer name in the variable information.

### Output Place

Server log

## 16.9.11 JSSR31064

---

**JSSRC: ERROR: JSSR31064: The HTTP listener property "requestCheck" is invalid. http-listener=%s1 value=%s2 ijsrvr=%s3 pno=%s4 pid=%s5 tid=%s6**

### Variable Information

%s1 = HTTP listener name

%s2 = requestCheck property value

%s3 = IJServer name

%s4 = IJServer process sequence number

%s5 = IJServer process ID

%s6 = Processing thread name

### Explanation

The requestCheck property of the HTTP listener for control is invalid.

### Cause

Either the requestCheck property of the HTTP listener for control does not exist, or the value is not "direct".

### System Action

The Session Registry Client start is aborted.

The IJServer cannot be used for operations that use sessions.

### User Action

Specify "direct" for the value of the requestCheck property of the HTTP listener for control shown in the HTTP listener name in the IJServer variable information in the IJServer name shown in the variable information.

### Output Place

Server log

## 16.9.12 JSSR31065

---

**JSSRC: ERROR: JSSR31065: The availability-enabled attribute of the availability service is not "true". value=%s1 ijservice=%s2 pno=%s3 pid=%s4 tid=%s5**

### Variable Information

%s1 = availability-enabled attribute value

%s2 = IJServer name

%s3 = IJServer process sequence number

%s4 = IJServer process ID

%s5 = Processing thread name

### Explanation

The availability-enabled attribute of the IJServer availability service is not "true".

### Cause

The availability-enabled attribute of the IJServer availability service is not "true".

### System Action

The Session Registry Client start is aborted.

The IJServer cannot be used for operations that use sessions.

### User Action

Specify "true" for the availability-enabled attribute value of the IJServer availability service shown in the IJServer name in the variable information.

### Output Place

Server log

## 16.9.13 JSSR31066

---

**JSSRC: ERROR: JSSR31066: The availability-enabled attribute of the Web container availability service is not "true". value=%s1 ijservice=%s2 pno=%s3 pid=%s4 tid=%s5**

### Variable Information

%s1 = availability-enabled attribute value

%s2 = IJServer name

%s3 = IJServer process sequence number

%s4 = IJServer process ID

%s5 = Processing thread name

### Explanation

The availability-enabled attribute of the IJServer availability for the Web Container is not "true".

### Cause

The availability-enabled attribute of the IJServer availability for the Web Container is not "true".

### System Action

The Session Registry Client start is aborted.

The IJServer cannot be used for operations that use sessions.

### User Action

Specify "true" for the availability-enabled attribute value of the IJServer availability for the Web Container shown in the IJServer name in the variable information.

### Output Place

Server log

## 16.9.14 JSSR31067

---

**JSSRC: ERROR: JSSR31067: The session recovery control application has not been deployed. ijservice=%s1 pno=%s2 pid=%s3 tid=%s4**

### Variable Information

%s1 = IJServer name

%s2 = IJServer process sequence number

%s3 = IJServer process ID

%s4 = Processing thread name

### Explanation

The session recovery control application has not been deployed to the IJServer.

### Cause

The session recovery control application has not been deployed to the IJServer.

### System Action

The Session Registry Client start is aborted.

The IJServer cannot be used for operations that use sessions.

### User Action

Deploy the session recovery control application to the IJServer shown in the IJServer name in the variable information.

### Output Place

Server log

## 16.9.15 JSSR31068

---

**JSSRC: ERROR: JSSR31068: The virtual server specified as the target for deployment of the session recovery control application is invalid. virtual-server=%s1 ijservice=%s2 pno=%s3 pid=%s4 tid=%s5**

### Variable Information

%s1 = Virtual server name

%s2 = IJServer name

%s3 = IJServer process sequence number

%s4 = IJServer process ID

%s5 = Processing thread name

### Explanation

The virtual server specified as the target for deployment of the session recovery control application is invalid.

### Cause

The session recovery control application was deployed to a virtual server other than the virtual server for session recovery.

### System Action

The Session Registry Client start is aborted.  
The IIServer cannot be used for operations that use sessions.

### User Action

Deploy the session recovery control application only to the virtual server for control.

### Output Place

Server log

## 16.9.16 JSSR31069

---

**JSSRC: INFO: JSSR31069: The session recovery functionality is disabled because application availability is not enabled. apl=%s1 ijsrvr=%s2 pno=%s3 pid=%s4 tid=%s5**

### Variable Information

%s1 = Application name  
%s2 = IIServer name  
%s3 = IIServer process sequence number  
%s4 = IIServer process ID  
%s5 = Processing thread name

### Explanation

The session recovery functionality is disabled because application availability is not enabled.

### Cause

The "--availabilityenabled=true" option was not specified when the application was deployed, therefore application availability is not enabled.

### System Action

The Session Registry Client start is continued.  
The IIServer cannot be used for operations that use the session recovery functionality.

### User Action

To enable the session recovery functionality in the application shown in the application name in the variable information, undeploy the application, specify the "--availabilityenabled=true" option, and then redeploy the application.

If the session recovery functionality is not used in the application shown in the application name in the variable information, there is no need to take any action.

### Output Place

Server log

## 16.9.17 JSSR31070

---

**JSSRC: ERROR: JSSR31070: The virtual server specified as the target for deployment of the application is invalid. virtual-server=%s1 ijsrvr=%s2 pno=%s3 pid=%s4 tid=%s5**

### Variable Information

%s1 = Virtual server name  
%s2 = IIServer name  
%s3 = IIServer process sequence number

%s4 = IJServer process ID

%s5 = Processing thread name

### Explanation

The virtual server specified as the target for deployment of the application is invalid.

### Cause

The "--virtualservers server" option was not specified when the application was deployed, therefore the virtual server specified as the target for deployment of the application is invalid.

### System Action

The Session Registry Client start is aborted.

The IJServer cannot be used for operations that use sessions.

### User Action

Specify the "--force" and "--virtualservers server" options, and then redeploy the application.

### Output Place

Server log

## 16.9.18 JSSR31071

---

**JSSRC: ERROR: JSSR31071: The HTTP listener was defined in an invalid virtual server. http-listener=%s1 virtual-server=%s2 ijservice=%s3 pno=%s4 pid=%s5 tid=%s6**

### Variable Information

%s1 = HTTP listener name

%s2 = Virtual server name

%s3 = IJServer name

%s4 = IJServer process sequence number

%s5 = IJServer process ID

%s6 = Processing thread name

### Explanation

The HTTP listener was defined in an invalid virtual server.

### Cause

The default HTTP listener was defined in the virtual server for control, or

The HTTP listener for control was defined in the default virtual server.

### System Action

The Session Registry Client start is aborted.

The IJServer cannot be used for operations that use sessions.

### User Action

The default HTTP listener was only defined in the default virtual server, and

Take action so that the HTTP listener for session recovery is only defined in the virtual server for session recovery.

### Output Place

Server log

## 16.9.19 JSSR31072

---

**JSSRC: ERROR: JSSR31072: The specified HTTP listener port number is invalid. http-listener=%s1 port=%s2 ijsrvr=%s3 pno=%s4 pid=%s5 tid=%s6**

### Variable Information

%s1 = HTTP listener name

%s2 = Port number

%s3 = IJServer name

%s4 = IJServer process sequence number

%s5 = IJServer process ID

%s6 = Processing thread name

### Explanation

The specified HTTP listener port number is invalid.

### Cause

A value other than an integer was specified for the HTTP listener port number.

### System Action

The Session Registry Client start is aborted.

The IJServer cannot be used for operations that use sessions.

### User Action

Specify an integer between 5001 and 65535 for the HTTP listener port number.

### Output Place

Server log

## 16.9.20 JSSR31101

---

**JSSRC: INFO: JSSR31101: Session Registry Client stop processing has started. ijsrvr=%s1 pno=%s2 pid=%s3 tid=%s4**

### Variable Information

%s1 = IJServer name (or IJServer cluster name (server instance name))

%s2 = Process number of IJServer

%s3 = Process ID of IJServer

%s4 = Processing thread

### Explanation

Session Registry Client stop processing has started.

### Output Place

Server log / Container log

System log

## 16.9.21 JSSR31102

---

---

**JSSRC: INFO: JSSR31102: Session Registry Client was stopped. ijsserver=%s1 pno=%s2 pid=%s3 tid=%s4**

**Variable Information**

- %s1 = IJServer name (or IJServer cluster name (server instance name))
- %s2 = Process number of IJServer
- %s3 = Process ID of IJServer
- %s4 = Processing thread

**Explanation**

Session Registry Client was stopped.

**Output Place**

- Server log / Container log
- System log

---

## 16.9.22 JSSR31103

---

**JSSRC: ERROR: JSSR31103: Failed to stop Session Registry Client. ijsserver=%s1 pno=%s2 pid=%s3 tid=%s4**

**Variable Information**

- %s1 = IJServer name (or IJServer cluster name (server instance name))
- %s2 = Process number of IJServer
- %s3 = Process ID of IJServer
- %s4 = Processing thread

**Explanation**

Failed to stop Session Registry Client.

**Cause**

Refer to the message that is output in the IJServer server log / container log at the same time.

**System Action**

Stops Session Registry Client.

**User Action**

Refer to the message that is output in the IJServer server log / container log at the same time.

**Output Place**

- Server log / Container log
- System log

---

## 16.10 JSSR32000 to JSSR32999

Session Registry Client messages.

---

### 16.10.1 JSSR32001

---

**JSSRC: WARNING: JSSR32001: The processing request to Session Registry Server was prevented. server=%s1 ijsserver=%s2 pno=%s3 pid=%s4 tid=%s5**

## Variable Information

- %s1 = IP address of Session Registry Server:Port number
- %s2 = IJServer name (or IJServer cluster name (server instance name))
- %s3 = Process number of IJServer
- %s4 = Process ID of IJServer
- %s5 = Processing thread

## Explanation

An abnormality was detected in the <server> Session Registry Server status or the IJServer and Session Registry Server network, so the request for processing to Session Registry Server was prevented.

## Cause

Refer to the message that is output in the IJServer server log / container log at the same time.

## System Action

After this message is output, requests for processing to Session Registry Server stop. This means that backup and recovery of the session are not performed.

If the problem is resolved, the control is deleted automatically.

## User Action

Refer to the message that is output in the IJServer server log / container log at the same time.

## Output Place

- Server log / Container log
- System log

## 16.10.2 JSSR32002

---

**JSSRC: INFO: JSSR32002: The processing request to Session Registry Server has started. server=%s1 ijsrver=%s2 pno=%s3 pid=%s4 tid=%s5**

## Variable Information

- %s1 = IP address of Session Registry Server:Port number
- %s2 = IJServer name (or IJServer cluster name (server instance name))
- %s3 = Process number of IJServer
- %s4 = Process ID of IJServer
- %s5 = Processing thread

## Explanation

The request for processing to the <server> Session Registry Server has started.

## System Action

After the request for processing has started, the consistency check with Session Registry Server is performed and the session is backed up.

## Output Place

- Server log / Container log
- System log

## 16.10.3 JSSR32003

---

**JSSRC: WARNING: JSSR32003: An abnormality was detected in Session Registry Server. server=%s1 ijsrvr=%s2 pno=%s3 pid=%s4 tid=%s5**

### Variable Information

%s1 = IP address of Session Registry Server:Port number  
%s2 = IJServer name (or IJServer cluster name (server instance name))  
%s3 = Process number of IJServer  
%s4 = Process ID of IJServer  
%s5 = Processing thread

### Explanation

An abnormality was detected in Session Registry Server.

### Cause

An abnormality occurred in Session Registry Server.  
Refer to the message that is output in the Session Registry Server log.

### System Action

Refer to the message that is output in the Session Registry Server log.

### User Action

Refer to the message that is output in the Session Registry Server log.

### Output Place

Server log / Container log

## 16.10.4 JSSR32101

---

**JSSRC: WARNING: JSSR32101: Session consistency check was not performed. server=%s1 apl=%s2 detail=%s3 ijsrvr=%s4 pno=%s5 pid=%s6 tid=%s7**

### Variable Information

%s1 = IP address of Session Registry Server:Port number  
%s2 = Web application name  
%s3 = Internal information  
%s4 = IJServer name (or IJServer cluster name (server instance name))  
%s5 = Process number of IJServer  
%s6 = Process ID of IJServer  
%s7 = Processing thread

### Explanation

The <apl> Web application session consistency check was not performed for the IJServer and Session Registry Server shown in <server>.

### Cause

- After a communication error occurs between the IJServer and Session Registry Server, communication is recovered without the session consistency check.

- The session consistency check is not performed after the following:
  - Restart of Session Registry Server
  - Restart of the IJServer, or restart after the application process ends abnormally
  - Auto-reload when class auto-reload is used (J2EE only)
  - Module redeployment (Java EE), or module reactivation (J2EE)

### System Action

The consistency check is performed automatically within a fixed time.

Depending on the consistency check, the IJServer session is backed up in Session Registry Server, or the session recovered and processed in another IJServer is deleted from the original IJServer to ensure that uniqueness is maintained.

### User Action

None.

### Output Place

Server log / Container log

## 16.10.5 JSSR32102

---

**JSSRC: INFO: JSSR32102: Session consistency check processing has started. server=%s1 apl=%s2 ijserver=%s3 pno=%s4 pid=%s5 tid=%s6**

### Variable Information

- %s1 = IP address of Session Registry Server:Port number
- %s2 = Web application name
- %s3 = IJServer name (or IJServer cluster name (server instance name))
- %s4 = Process number of IJServer
- %s5 = Process ID of IJServer
- %s6 = Processing thread

### Explanation

The <apl> Web application session consistency check for the IJServer and Session Registry Server shown in <server> has started.

### System Action

The consistency check is performed.

Depending on the consistency check, the IJServer session is backed up in Session Registry Server, or the session recovered and processed in another IJServer is deleted from the original IJServer to ensure that uniqueness is maintained.

### Output Place

Server log / Container log

## 16.10.6 JSSR32103

---

**JSSRC: INFO: JSSR32103: The session consistency check is complete. server=%s1 apl=%s2 ijserver=%s3 pno=%s4 pid=%s5 tid=%s6**

### Variable Information

- %s1 = IP address of Session Registry Server:Port number
- %s2 = Web application name

%s3 = IJServer name (or IJServer cluster name (server instance name))

%s4 = Process number of IJServer

%s5 = Process ID of IJServer

%s6 = Processing thread

#### Explanation

The <apl> Web application session consistency check for the IJServer and Session Registry Server shown in <server> is complete.

#### System Action

The session is backed up in Session Registry Server.

#### Output Place

Server log / Container log

## 16.10.7 JSSR32104

---

**JSSRC: ERROR: JSSR32104: The session consistency check failed. server=%s1 apl=%s2 detail=%s3 ijsrver=%s4 pno=%s5 pid=%s6 tid=%s7**

#### Variable Information

%s1 = IP address of Session Registry Server:Port number

%s2 = Web application name

%s3 = Internal information

%s4 = IJServer name (or IJServer cluster name (server instance name))

%s5 = Process number of IJServer

%s6 = Process ID of IJServer

%s7 = Processing thread

#### Explanation

The <apl> Web application session consistency check for the IJServer and Session Registry Server shown in <server> failed.

#### Cause

Refer to the message that is output in the IJServer server log / container log at the same time.

#### System Action

Refer to the message that is output in the IJServer server log / container log at the same time.

#### User Action

Refer to the message that is output in the IJServer server log / container log at the same time.

#### Output Place

Server log / Container log

## 16.10.8 JSSR32105

---

**JSSRC: INFO: JSSR32105: The session consistency check request was received from Session Registry Server. server=%s1 ijsrver=%s2 pno=%s3 pid=%s4 tid=%s5**

#### Variable Information

%s1 = IP address of Session Registry Server:Port number

%s2 = IJServer name (or IJServer cluster name (server instance name))

%s3 = Process number of IJServer

%s4 = Process ID of IJServer

%s5 = Processing thread

### Explanation

The session consistency check request was received from Session Registry Server.

The request is received if Session Registry Server is restarted, or Session Registry Server detects an abnormality in the IJServer network.

### System Action

Performs the session consistency check.

### Output Place

Server log / Container log

## 16.10.9 JSSR32201

---

**JSSRC: ERROR: JSSR32201: The session backup failed. server=%s1 apl=%s2 sessionid=%s3 ijservice=%s4 pno=%s5 pid=%s6 tid=%s7**

### Variable Information

%s1 = IP address of Session Registry Server:Port number

%s2 = Web application name

%s3 = Session ID

%s4 = IJServer name (or IJServer cluster name (server instance name))

%s5 = Process number of IJServer

%s6 = Process ID of IJServer

%s7 = Processing thread

### Explanation

The <sessionid> session backup in the <apl> Web application failed.

### Cause

Refer to the message that is output in the IJServer server log / container log at the same time.

### System Action

The updated session status (including invalidated sessions) is reflected in Session Registry Server.

If session recovery is necessary because the IJServer crashed, there is a possibility that the session will not be able to continue, or that the recovered session will be invalidated or a previous session.

Also, refer to the message that is output in the IJServer server log / container log at the same time.

### User Action

Refer to the message that is output in the IJServer server log / container log at the same time.

### Output Place

Server log / Container log

## 16.10.10 JSSR32202

---

---

**JSSRC: ERROR: JSSR32202: The sessions backup failed. server=%s1 ijservice=%s2 pno=%s3 pid=%s4 tid=%s5**

**Variable Information**

- %s1 = IP address of Session Registry Server:Port number
- %s2 = IJServer name (or IJServer cluster name (server instance name))
- %s3 = Process number of IJServer
- %s4 = Process ID of IJServer
- %s5 = Processing thread

**Explanation**

The fixed interval session backup in the <server> Session Registry Server failed.

**Cause**

Refer to the message that is output in the IJServer server log / container log at the same time.

**System Action**

The updated session status (including invalidated sessions) is reflected in Session Registry Server.

Session recovery following an IJServer crash may result in the following:

- The session will not be able to continue.
- The cancelled session will be recovered.
- The session will be recovered to its state prior to the crash.

Also, refer to the message that is output in the IJServer server log / container log at the same time.

**User Action**

Refer to the message that is output in the IJServer server log / container log at the same time.

**Output Place**

Server log / Container log

## 16.10.11 JSSR32203

---

**JSSRC: ERROR: JSSR32203: There was a session that could not be backed up. apl=%s1 sessionid=%s2 ijservice=%s3 pno=%s4 pid=%s5 tid=%s6**

**Variable Information**

- %s1 = Web application name
- %s2 = Session ID
- %s3 = IJServer name (or IJServer cluster name (server instance name))
- %s4 = Process number of IJServer
- %s5 = Process ID of IJServer
- %s6 = Processing thread

**Explanation**

The <sessionid> session in the <apl> Web application could not be backed up.

**Cause**

Refer to the message that is output in the IJServer server log / container log at the same time.

## System Action

The session was not backed up.

Session recovery following an IJServer crash may result in the following:

- The session will not be able to continue.
- The cancelled session will be recovered.
- The session will be recovered to its state prior to the crash.

The session is backed up with no effect on other sessions, and can also be recovered.

## User Action

Refer to the message that is output in the IJServer server log / container log at the same time.

## Output Place

Server log / Container log

## 16.10.12 JSSR32211

---

**JSSRC: ERROR: JSSR32211: The session recovery failed. server=%s1 apl=%s2 sessionid=%s3 ijservice=%s4 pno=%s5 pid=%s6 tid=%s7**

### Variable Information

%s1 = IP address of Session Registry Server:Port number

%s2 = Web application name

%s3 = Session ID

%s4 = IJServer name (or IJServer cluster name (server instance name))

%s5 = Process number of IJServer

%s6 = Process ID of IJServer

%s7 = Processing thread

### Explanation

The <sessionid> session recovery from the <server> Session Registry Server in the <apl> Web application failed.

### Cause

Refer to the message that is output in the IJServer server log / container log at the same time.

### System Action

The session is not recovered. If getSession(false) is executed in the application, null is returned. If the session is obtained according to another method, a new session is returned.

The behavior following this depends on the application

### User Action

Refer to the message that is output in the IJServer server log / container log at the same time.

### Output Place

Server log / Container log

## 16.10.13 JSSR32212

---

**JSSRC: INFO: JSSR32212: The session could not be recovered. server=%s1 apl=%s2 sessionid=%s3 ijsrver=%s4 pno=%s5 pid=%s6 tid=%s7**

### Variable Information

- %s1 = IP address of Session Registry Server:Port number
- %s2 = Web application name
- %s3 = Session ID
- %s4 = IJServer name (or IJServer cluster name (server instance name))
- %s5 = Process number of IJServer
- %s6 = Process ID of IJServer
- %s7 = Processing thread

### Explanation

The <sessionid> session in the <apl> Web application could not be recovered from the <server> Session Registry Server.

For details on the scope of session recovery, refer to "Session Recovery Scope" in the "Session Recovery" chapter of the J2EE User's Guide or in the "Functionality Provided in the Java EE Application" chapter of the Java EE Operator's Guide.

### System Action

The session is not recovered. If getSession(false) is executed in the application, null is returned. If the session is obtained according to another method, a new session is returned.

The behavior following this depends on the application.

### Output Place

Server log / Container log

## 16.10.14 JSSR32213

---

**JSSRC: INFO: JSSR32213: The session was recovered. server=%s1 apl=%s2 sessionid=%s3 ijsrver=%s4 pno=%s5 pid=%s6 tid=%s7**

### Variable Information

- %s1 = IP address of Session Registry Server:Port number
- %s2 = Web application name
- %s3 = Session ID
- %s4 = IJServer name (or IJServer cluster name (server instance name))
- %s5 = Process number of IJServer
- %s6 = Process ID of IJServer
- %s7 = Processing thread

### Explanation

The <sessionid> session in the <apl> Web application was recovered from the <server> Session Registry Server.

### Output Place

Server log / Container log

## 16.10.15 JSSR32301

---

**JSSRC: ERROR: JSSR32301: Failed to switch to the Session Registry Server updated session. server=%s1 apl=%s2 sessionid=%s3 ijservice=%s4 pno=%s5 pid=%s6 tid=%s7**

### Variable Information

%s1 = IP address of Session Registry Server:Port number  
%s2 = Web application name  
%s3 = Session ID  
%s4 = IJServer name (or IJServer cluster name (server instance name))  
%s5 = Process number of IJServer  
%s6 = Process ID of IJServer  
%s7 = Processing thread

### Explanation

Failed to switch to the <server> Session Registry Server <sessionid> updated session in the <apl> Web application.

### Cause

Refer to the message that is output in the IJServer server log / container log at the same time.

### System Action

The session is cleared from the IJServer. The session already backed up in Session Registry Server is recovered on a different IJServer and then used.

### User Action

Refer to the message that is output in the IJServer server log / container log at the same time.

### Output Place

Server log / Container log

## 16.10.16 JSSR32302

---

**JSSRC: INFO: JSSR32302: Processing for getting the updated session timed out because the session is in use. server=%s1 apl=%s2 sessionid=%s3 ijservice=%s4 pno=%s5 pid=%s6 tid=%s7**

### Variable Information

%s1 = IP address of Session Registry Server:Port number  
%s2 = Web application name  
%s3 = Session ID  
%s4 = IJServer name (or IJServer cluster name (server instance name))  
%s5 = Process number of IJServer  
%s6 = Process ID of IJServer  
%s7 = Processing thread

### Explanation

There was <sessionid> updated session in the <apl> Web application, but processing timed out because the session is in use in the IJServer.

## System Action

The session was not transferred to Session Registry Server because the session is in use. The session cannot be recovered to another IJServer.

## Output Place

Server log / Container log

## 16.10.17 JSSR32801

---

**JSSRC: ERROR: JSSR32801: Could not serialize the session attribute. sessionid=%s1 key=%s2 class=%s3 ijsrvr=%s4 pno=%s5 pid=%s6 tid=%s7**

### Variable Information

%s1 = Session ID

%s2 = Attribute key

%s3 = Class that could not be serialized

%s4 = IJServer name (or IJServer cluster name (server instance name))

%s5 = Process number of IJServer

%s6 = Process ID of IJServer

%s7 = Processing thread

### Explanation

Objects stored in the <key> attribute key in the <sessionid> session cannot be serialized. <class> is the class that cannot be serialized.

### Cause

Objects that reference object (class) fields stored in the session cannot be serialized (this also includes reference objects that reference other objects).

### System Action

Refer to the message that is output in the IJServer server log / container log at the same time.

### User Action

If session recovery is used, store objects that can be serialized. Assign the transient modifier to fields that do not require serialization recovery. For details, refer to "Application Creation Method" in the "Session Recovery" chapter of the J2EE User's Guide or "Creating Web Applications when Using Session Recovery" in the "Java EE Application Development" chapter of the Java EE Operator's Guide.

For details about serializing other objects, refer to "Object Serialization" in Java SE Documentation.

### Output Place

Server log / Container log

## 16.10.18 JSSR32802

---

**JSSRC: WARNING: JSSR32802: Could not deserialize the session attribute. sessionid=%s1 key=%s2 detail=%s3 ijsrvr=%s4 pno=%s5 pid=%s6 tid=%s7**

### Variable Information

%s1 = Session ID

%s2 = Attribute key

%s3 = Detail information

%s4 = IJServer name (or IJServer cluster name (server instance name))

%s5 = Process number of IJServer

%s6 = Process ID of IJServer

%s7 = Processing thread

## Explanation

Objects stored in the <key> attribute key in the <sessionid> session cannot be deserialized.

## Cause

1. If java.io.InvalidClassException is output in <detail>:

The class is updated, but the update cannot use the data before the update (the update is incompatible).

2. If java.lang.ClassNotFoundException is output in <detail>:

The class stored in the session could not be found. The class was deleted during the application update, or the class path settings or application configuration is incorrect.

3. If java.lang.NoClassDefFoundError is output in <detail>:

The class that references the class stored in the session (for compile) could not be found. The class path settings or application configuration is incorrect.

## System Action

Refer to the message that is output in the IJServer server log / container log at the same time.

## User Action

1. For details about continuing the session before the update after the attribute stored in the session is updated and reactivation and reload are performed, refer to "Application Creation Method" in the "Session Recovery" chapter of the J2EE User's Guide or "Creating Web Applications when Using Session Recovery" in the "Java EE Application Development" chapter of the Java EE Operator's Guide, and take action in the application.

For details about serializing other objects, refer to "Object Serialization" in Java SE Documentation.

2. Check the Web application configuration to determine whether the class files or JAR files are sufficient. Check whether the class files are sufficient if necessary.
3. Check the Web application configuration to determine whether the class files or JAR files are sufficient. Check whether the class files are sufficient if necessary.

For details about Exception/Error output in <detail>, refer to the Java SE Documentation.

## Output Place

Server log / Container log

## 16.10.19 JSSR32901

---

**JSSRC: WARNING: JSSR32901: The user application was deployed to an invalid virtual server. apl=%s1 virtual-server=%s2 ijsrvr=%s3 pno=%s4 pid=%s5 tid=%s6**

## Variable Information

%s1 = Application name

%s2 = Virtual server name

%s3 = IJServer name

%s4 = IJServer process sequence number

%s5 = IJServer process ID

%s6 = Processing thread name

#### Explanation

The user application was deployed to an invalid virtual server.

#### Cause

The "--virtualservers server" option was not specified when the user application was deployed, therefore the virtual server specified as the target for deployment of the user application is invalid.

#### System Action

The IJServer start is aborted.

#### User Action

Undeploy the user application, specify the "--virtualservers server" option, and then redeploy the user application.

#### Output Place

Server log

## 16.10.20 JSSR32902

---

**JSSRC: WARNING: JSSR32902 The session recovery control application was deployed to an invalid virtual server. apl=%s1 virtual-server=%s2 ijservice=%s3 pno=%s4 pid=%s5 tid=%s6**

#### Variable Information

%s1 = Application name

%s2 = Virtual server name

%s3 = IJServer name

%s4 = IJServer process sequence number

%s5 = IJServer process ID

%s6 = Processing thread name

#### Explanation

The session recovery control application was deployed to an invalid virtual server.

#### Cause

The session recovery control application was deployed to a virtual server other than the virtual server for control.

#### System Action

The IJServer start is aborted.

#### User Action

Undeploy the session recovery control application, specify the "--virtualservers \_\_sessionrecovery" option, and then redeploy the session recovery control application.

#### Output Place

Server log

## 16.10.21 JSSR32903

---

**JSSRC: ERROR: JSSR32903: The application cannot be used because an error occurred during startup. apl=%s1 ijsserver=%s2 pno=%s3 pid=%s4 tid=%s5**

### Variable Information

%s1 = Specified path name  
%s2 = IJServer name  
%s3 = IJServer process sequence number  
%s4 = IJServer process ID  
%s5 = Processing thread name

### Explanation

The application cannot be used because an error occurred during startup.

### Cause

Refer to the message that was output to the IJServer server log at the same time.

### System Action

The IJServer start is aborted.

### User Action

Refer to the message that was output to the IJServer server log at the same time.

### Output Place

Server log

## 16.10.22 JSSR32904

---

**JSSRC: ERROR: JSSR32904: The application cannot be used because the session recovery lifecycle module has not been started. apl=%s1 ijsserver=%s2 pno=%s3 pid=%s4 tid=%s5**

### Variable Information

%s1 = Specified path name  
%s2 = IJServer name  
%s3 = IJServer process sequence number  
%s4 = IJServer process ID  
%s5 = Processing thread name

### Explanation

The application cannot be used because the session recovery lifecycle module has not been started.

### Cause

The session recovery lifecycle module has not started. Causes are as follows:

- The session recovery lifecycle module has not been defined in the IJServer
- The session recovery lifecycle module is disabled
- The session recovery lifecycle module class name is invalid

## System Action

The IJServer start is aborted.

## User Action

- If the session recovery lifecycle module has not been defined in the IJServer, define it.
- If the session recovery lifecycle module is disabled, enable it.
- If ISJEE\_LCM0101 was output at the same time, it means that the session recovery lifecycle module class name is invalid. Review the class name.

## Output Place

Server log

# 16.11 JSSR34000 to JSSR34999

---

Session Registry Client messages.

## 16.11.1 JSSR34001

---

**JSSRC: ERROR: JSSR34001: Connection to Session Registry Server failed. server=%s1 uri=%s2 ijsrserver=%s3 pno=%s4 pid=%s5 tid=%s6**

### Variable Information

- %s1 = IP address of Session Registry Server:Port number
- %s2 = Internal information
- %s3 = IJServer name (or IJServer cluster name (server instance name))
- %s4 = Process number of IJServer
- %s5 = Process ID of IJServer
- %s6 = Processing thread

### Explanation

The connection to Session Registry Server failed.

### Cause

Possible causes are as follows:

1. Session Registry Server is not running.
2. An abnormality occurred in the network.
3. The IJServer session backup destination Session Registry Server address:port settings are incorrect.
4. The Session Registry Server environment settings are incorrect.
5. The WorkUnit stopped Session Registry Server by force using an application timeout.
6. There are insufficient file descriptors.
7. **Windows32/64** **Solaris32/64**  
There are insufficient TCP/IP resources.
8. The Session Registry Server is overloaded. It is possible that there is insufficient memory in the Java VM.

### System Action

Refer to the message that is output in the IJServer server log / container log at the same time.

## User Action

1. Start Session Registry Server.
2. Check whether there is an abnormality in the IJServer and Session Registry Server network connection.
3. Set the Session Registry Server IP address and port number for the "IJServer session backup destination Session Registry Server address:port".
4. To run Session Registry Server and the IJServer on separate servers, set "No" for "Run Web server and WorkUnit on the same machine?" in the Session Registry Server system environment settings (J2EE only).
5. Increase the Session Registry Server application maximum processing time.
6. Close unnecessary applications, or increase the number of file descriptors that can be used in the system.
7. **Windows32/64** **Solaris32/64**  
Close other applications, or increase the number of files that can be opened in the system. Tune the TCP/IP parameters. For details about the tuning method, refer to "Tuning TCP/IP Parameters" in the Tuning Guide.
8. If there is insufficient Java VM memory ("OutOfMemoryError" is output), refer to "JDK/JRE Tuning" in the Tuning Guide, and take action.

## Output Place

Server log / Container log

## 16.11.2 JSSR34002

---

**JSSRC: ERROR: JSSR34002: Sending of data to Session Registry Server failed. server=%s1 uri=%s2 ijserver=%s3 pno=%s4 pid=%s5 tid=%s6**

### Variable Information

- %s1 = IP address of Session Registry Server:Port number
- %s2 = Internal information
- %s3 = IJServer name (or IJServer cluster name (server instance name))
- %s4 = Process number of IJServer
- %s5 = Process ID of IJServer
- %s6 = Processing thread

### Explanation

Sending of data to Session Registry Server failed.

### Cause

Possible causes are as follows:

1. Session Registry Server is not running.
2. An abnormality occurred in the network.
3. The IJServer session backup destination Session Registry Server address:port settings are incorrect.
4. The Session Registry Server environment settings are incorrect.
5. The WorkUnit stopped Session Registry Server by force using an application timeout.
6. The Session Registry Server is overloaded. It is possible that there is insufficient memory in the Java VM.
7. Since the IJServer or Session Registry Server is overloaded, the garbage collections have occurred frequently or took a long time.

## System Action

Refer to the message that is output in the IJServer server log / container log at the same time.

## User Action

1. Start Session Registry Server.
2. Check whether there is an abnormality in the IJServer and Session Registry Server network connection.
3. Set the Session Registry Server IP address and port number for the "IJServer session backup destination Session Registry Server address:port".
4. Set "No" for "Run Web server and WorkUnit on the same machine?" in the Session Registry Server system environment settings.
5. Increase the Session Registry Server application maximum processing time.
6. If there is insufficient Java VM memory ("OutOfMemoryError" is output), refer to "JDK/JRE Tuning" in the Tuning Guide, and take action.
7. When the message of IJServer30004 or OM3204 is frequently output to the server log / the container log of the IJServer or Session Registry Server, the garbage collection has occurred frequently or took a long time. Tune JavaVM.

## Output Place

Server log / Container log

## 16.11.3 JSSR34003

---

**JSSRC: ERROR: JSSR34003: Receipt of data from Session Registry Server failed. server=%s1 uri=%s2 ijsserver=%s3 pno=%s4 pid=%s5 tid=%s6**

### Variable Information

- %s1 = IP address of Session Registry Server:Port number
- %s2 = Internal information
- %s3 = IJServer name (or IJServer cluster name (server instance name))
- %s4 = Process number of IJServer
- %s5 = Process ID of IJServer
- %s6 = Processing thread

### Explanation

Receipt of data from Session Registry Server failed.

### Cause

Possible causes are as follows:

1. Session Registry Server is not running.
2. An abnormality occurred in the network.
3. The IJServer session backup destination Session Registry Server address:port settings are incorrect.
4. The Session Registry Server environment settings are incorrect.
5. The WorkUnit stopped Session Registry Server by force using an application timeout.
6. The Session Registry Server is overloaded. It is possible that there is insufficient memory in the Java VM.

## System Action

Refer to the message that is output in the IJServer server log / container log at the same time.

## User Action

1. Start Session Registry Server.
2. Check whether there is an abnormality in the IJServer and Session Registry Server network connection.
3. Set the Session Registry Server IP address and port number for the "IJServer session backup destination Session Registry Server address:port".
4. Set "No" for "Run Web server and WorkUnit on the same machine?" in the Session Registry Server system environment settings.
5. Increase the Session Registry Server application maximum processing time.
6. If there is insufficient Java VM memory ("OutOfMemoryError" is output), refer to "JDK/JRE Tuning" in the Tuning Guide, and take the required action.

## Output Place

Server log / Container log

## 16.11.4 JSSR34004

---

**JSSRC: ERROR: JSSR34004: Sending of data to Session Registry Server was timed out. server=%s1 uri=%s2 ijsrserver=%s3 pno=%s4 pid=%s5 tid=%s6**

### Variable Information

- %s1 = IP address of Session Registry Server:Port number
- %s2 = Internal information
- %s3 = IJServer name (or IJServer cluster name (server instance name))
- %s4 = Process number of IJServer
- %s5 = Process ID of IJServer
- %s6 = Processing thread

### Explanation

Sending of data to Session Registry Server was timed out.

### Cause

Possible causes are as follows:

1. An abnormality occurred in the network.
2. Session Registry Server processing was delayed because the Session Registry Server is overloaded.
3. The IJServer session backup destination Session Registry Server address:port settings are incorrect.

### System Action

Refer to the message that is output in the IJServer server log / container log at the same time.

### User Action

1. Check whether there is an abnormality in the IJServer and Session Registry Server network connection.
2. Check the Session Registry Server load status. Increase the response wait time from Session Registry Server in the IJServer session recovery settings if necessary. If this value is changed, all other related settings must also be changed. For details, refer to "Session Recovery Settings", "Settings for each timeout" in the J2EE User's Guide or Java EE Operator's Guide.
3. Set the Session Registry Server IP address and port number for the "IJServer session backup destination Session Registry Server address:port".

## Output Place

Server log / Container log

## 16.11.5 JSSR34005

---

**JSSRC: ERROR: JSSR34005: Receipt of data from Session Registry Server was timed out. server=%s1 uri=%s2 ijservice=%s3 pno=%s4 pid=%s5 tid=%s6**

### Variable Information

- %s1 = IP address of Session Registry Server:Port number
- %s2 = Internal information
- %s3 = IJServer name (or IJServer cluster name (server instance name))
- %s4 = Process number of IJServer
- %s5 = Process ID of IJServer
- %s6 = Processing thread

### Explanation

Receipt of data from Session Registry Server was timed out.

### Cause

Possible causes are as follows:

1. An abnormality occurred in the network.
2. Session Registry Server processing was delayed because the Session Registry Server is overloaded.
3. The IJServer session backup destination Session Registry Server address:port settings are incorrect.

### System Action

Refer to the message that is output in the IJServer server log / container log at the same time.

### User Action

1. Check whether there is an abnormality in the IJServer and Session Registry Server network connection.
2. Check the Session Registry Server load status. Increase the response wait time from Session Registry Server in the IJServer session recovery settings if necessary. If this value is changed, all other related settings must also be changed. For details, refer to "Session Recovery Settings", "Settings for each timeout" in the J2EE User's Guide or Java EE Operator's Guide.
3. Set the Session Registry Server IP address and port number for the "IJServer session backup destination Session Registry Server address:port".

### Output Place

Server log / Container log

## 16.11.6 JSSR34006

---

**JSSRC: ERROR: JSSR34006: An abnormal HTTP status code was returned from Session Registry Server. server=%s1 uri=%s2 status=%s3 ijservice=%s4 pno=%s5 pid=%s6 tid=%s7**

### Variable Information

- %s1 = IP address of Session Registry Server:Port number
- %s2 = Internal information
- %s3 = Status code
- %s4 = IJServer name (or IJServer cluster name (server instance name))
- %s5 = Process number of IJServer
- %s6 = Process ID of IJServer

%s7 = Processing thread

## Explanation

An abnormal HTTP status code was returned from Session Registry Server.

## Cause

Possible causes are as follows:

1. The Web server IP address for the Session Registry Server Web server connector settings is incorrect.
2. Session Registry Server was not deployed.
3. An error occurred in Session Registry Server.
4. The IJServer session backup destination Session Registry Server address:port settings are incorrect.

## System Action

Refer to the message that is output in the IJServer server log / container log at the same time.

## User Action

1. Set the IJServer IP address for the Web server IP address settings in the Session Registry Server Web server connector settings.
2. Deploy Session Registry Server.
3. Refer to the Session Registry Server log. If a message is output in the log, take action according to the message.
4. Set the Session Registry Server IP address and port number for the "IJServer session backup destination Session Registry Server address:port".

To run the Session Registry Server on the same machine as the Servlet container, set 127.0.0.1 for the IP address.

## Output Place

Server log / Container log

## 16.11.7 JSSR34007

---

**JSSRC: ERROR: JSSR34007: Data inconsistent with the HTTP was returned from Session Registry Server. server=%s1 uri=%s2 detail=%s3 ijserver=%s4 pno=%s5 pid=%s6 tid=%s7**

## Variable Information

%s1 = IP address of Session Registry Server:Port number  
%s2 = Internal information  
%s3 = Detail information  
%s4 = IJServer name (or IJServer cluster name (server instance name))  
%s5 = Process number of IJServer  
%s6 = Process ID of IJServer  
%s7 = Processing thread

## Explanation

Data inconsistent with the HTTP protocol was returned from Session Registry Server.

## Cause

Possible causes are as follows:

1. An abnormality occurred in the network.
2. An error occurred in Session Registry Server.

3. The IJServer session backup destination Session Registry Server address:port settings are incorrect.

### System Action

Refer to the message that is output in the IJServer server log / container log at the same time.

### User Action

1. Check whether there is an abnormality in the IJServer and Session Registry Server network connection.
2. Refer to the Session Registry Server log. If a message is output in the log, take action according to the message.
3. Set the Session Registry Server IP address and port number for the "IJServer session backup destination Session Registry Server address:port".

### Output Place

Server log / Container log

## 16.11.8 JSSR34008

---

**JSSRC: ERROR: JSSR34008: Failed to get data sent from Session Registry Server. server=%s1 uri=%s2 ijsserver=%s3 pno=%s4 pid=%s5 tid=%s6**

### Variable Information

- %s1 = IP address of Session Registry Server:Port number
- %s2 = Internal information
- %s3 = IJServer name (or IJServer cluster name (server instance name))
- %s4 = Process number of IJServer
- %s5 = Process ID of IJServer
- %s6 = Processing thread

### Explanation

Failed to get data sent from Session Registry Server.

### Cause

Possible causes are as follows:

1. An abnormality occurred in the network.
2. An error occurred in Session Registry Server.
3. The IJServer session backup destination Session Registry Server address:port settings are incorrect.

### System Action

Refer to the message that is output in the IJServer server log / container log at the same time.

### User Action

1. Check whether there is an abnormality in the IJServer and Session Registry Server network connection.
2. Refer to the Session Registry Server log. If a message is output in the log, take action according to the message.
3. Set the Session Registry Server IP address and port number for the "IJServer session backup destination Session Registry Server address:port".

### Output Place

Server log / Container log

## 16.11.9 JSSR34009

---

**JSSRC: ERROR: JSSR34009: Failed to disconnect from Session Registry Server. server=%s1 uri=%s2 ijsrver=%s3 pno=%s4 pid=%s5 tid=%s6**

### Variable Information

- %s1 = IP address of Session Registry Server:Port number
- %s2 = Internal information
- %s3 = IJServer name (or IJServer cluster name (server instance name))
- %s4 = Process number of IJServer
- %s5 = Process ID of IJServer
- %s6 = Processing thread

### Explanation

Failed to disconnect from Session Registry Server.

### Cause

Possible causes are as follows:

1. Session Registry Server is not running.
2. An abnormality occurred in the network.
3. The WorkUnit stopped Session Registry Server by force using an application timeout.
4. The Session Registry Server is overloaded. It is possible that there is insufficient memory in the Java VM.

### System Action

Refer to the message that is output in the IJServer server log / container log at the same time.

### User Action

1. Start Session Registry Server.
2. Check whether there is an abnormality in the IJServer and Session Registry Server network connection.
3. Increase the Session Registry Server application maximum processing time.
4. If there is insufficient Java VM memory ("OutOfMemoryError" is output), refer to "JDK/JRE Tuning" in the Tuning Guide, and take action.

### Output Place

Server log / Container log

## 16.11.10 JSSR34010

---

**JSSRC: ERROR: JSSR34010: Data communication with Session Registry Server failed. server=%s1 uri=%s2 ijsrver=%s3 pno=%s4 pid=%s5 tid=%s6**

### Variable Information

- %s1 = IP address of Session Registry Server:Port number
- %s2 = Internal information
- %s3 = IJServer name (or IJServer cluster name (server instance name))
- %s4 = Process number of IJServer
- %s5 = Process ID of IJServer

%s6 = Processing thread

## Explanation

Data communication with Session Registry Server failed.

## Cause

Possible causes are as follows:

1. Session Registry Server is not running.
2. An abnormality occurred in the network.
3. The IJServer session backup destination Session Registry Server address:port settings are incorrect.
4. The WorkUnit stopped Session Registry Server by force using an application timeout.
5. The Session Registry Server is overloaded. It is possible that there is insufficient memory in the Java VM.

## System Action

Refer to the message that is output in the IJServer server log / container log at the same time.

## User Action

1. Start Session Registry Server.
2. Check whether there is an abnormality in the IJServer and Session Registry Server network connection.
3. Set the Session Registry Server IP address and port number for the "IJServer session backup destination Session Registry Server address:port".
4. Increase the Session Registry Server application maximum processing time.
5. If there is insufficient Java VM memory ("OutOfMemoryError" is output), refer to "JDK/JRE Tuning" in the Tuning Guide, and take action.

## Output Place

Server log / Container log

## 16.12 JSSR35000 to JSSR35999

---

Session Registry Client messages.

### 16.12.1 JSSR35001

---

**JSSRC: INFO: JSSR35001: Session Registry Server monitoring has started. server=%s1 ijserver=%s2 pno=%s3 pid=%s4 tid=%s5**

#### Variable Information

- %s1 = IP address of Session Registry Server:Port number
- %s2 = IJServer name (or IJServer cluster name (server instance name))
- %s3 = Process number of IJServer
- %s4 = Process ID of IJServer
- %s5 = Processing thread

## Explanation

Session Registry Server monitoring has started.

## Output Place

Server log / Container log

## 16.12.2 JSSR35002

---

**JSSRC: INFO: JSSR35002: An abnormality was detected in Session Registry Server. server=%s1 ijsrvr=%s2 pno=%s3 pid=%s4 tid=%s5**

### Variable Information

- %s1 = IP address of Session Registry Server:Port number
- %s2 = IJServer name (or IJServer cluster name (server instance name))
- %s3 = Process number of IJServer
- %s4 = Process ID of IJServer
- %s5 = Processing thread

### Explanation

An abnormality was detected in Session Registry Server.

### System Action

Refer to the message that is output in the IJServer server log / container log at the same time.

### Output Place

Server log / Container log

## 16.12.3 JSSR35003

---

**JSSRC: INFO: JSSR35003: A recovery was detected in Session Registry Server. server=%s1 ijsrvr=%s2 pno=%s3 pid=%s4 tid=%s5**

### Variable Information

- %s1 = IP address of Session Registry Server:Port number
- %s2 = IJServer name (or IJServer cluster name (server instance name))
- %s3 = Process number of IJServer
- %s4 = Process ID of IJServer
- %s5 = Processing thread

### Explanation

A recovery was detected in Session Registry Server.

### System Action

Refer to the message that is output in the IJServer server log / container log at the same time.

### Output Place

Server log / Container log

## 16.12.4 JSSR35004

---

**JSSRC: INFO: JSSR35004: Session Registry Server monitoring has stopped. server=%s1 ijsrvr=%s2 pno=%s3 pid=%s4 tid=%s5**

### Variable Information

- %s1 = IP address of Session Registry Server:Port number
- %s2 = IJServer name (or IJServer cluster name (server instance name))
- %s3 = Process number of IJServer

%s4 = Process ID of IJServer

%s5 = Processing thread

#### Explanation

Session Registry Server monitoring has stopped.

#### Output Place

Server log / Container log

## 16.13 JSSR37000 to JSSR37999

---

Session Registry Client messages.

### 16.13.1 JSSR37001

---

**JSSRC: INFO: JSSR37001: A monitoring request is sent. server=%s1 ijservice=%s2 pno=%s3 pid=%s4 tid=%s5**

#### Variable Information

%s1 = IP address of Session Registry Server:Port number

%s2 = IJServer name (or IJServer cluster name (server instance name))

%s3 = Process number of IJServer

%s4 = Process ID of IJServer

%s5 = Processing thread

#### Explanation

A monitoring request was sent to Session Registry Server.

#### Output Place

Server log / Container log

### 16.13.2 JSSR37002

---

**JSSRC: INFO: JSSR37002: A monitoring response was received. server=%s1 verify=%s2 ijservice=%s3 pno=%s4 pid=%s5 tid=%s6**

#### Variable Information

%s1 = IP address of Session Registry Server:Port number

%s2 = Internal information

%s3 = IJServer name (or IJServer cluster name (server instance name))

%s4 = Process number of IJServer

%s5 = Process ID of IJServer

%s6 = Processing thread

#### Explanation

A monitoring response was received from Session Registry Server.

#### Output Place

Server log / Container log

### 16.13.3 JSSR37101

---

**JSSRC: INFO: JSSR37101: The backup request is sent. server=%s1 apl=%s2 sessionid=%s3 ijsserver=%s4 pno=%s5 pid=%s6 tid=%s7**

#### Variable Information

- %s1 = IP address of Session Registry Server:Port number
- %s2 = Web application name
- %s3 = Session ID
- %s4 = IJServer name (or IJServer cluster name (server instance name))
- %s5 = Process number of IJServer
- %s6 = Process ID of IJServer
- %s7 = Processing thread

#### Explanation

The session backup request was sent to Session Registry Server.

#### Output Place

Server log / Container log

### 16.13.4 JSSR37102

---

**JSSRC: INFO: JSSR37102: The backup result was received. server=%s1 apl=%s2 sessionid=%s3 ijsserver=%s4 pno=%s5 pid=%s6 tid=%s7**

#### Variable Information

- %s1 = IP address of Session Registry Server:Port number
- %s2 = Web application name
- %s3 = Session ID
- %s4 = IJServer name (or IJServer cluster name (server instance name))
- %s5 = Process number of IJServer
- %s6 = Process ID of IJServer
- %s7 = Processing thread

#### Explanation

The session backup result was received from Session Registry Server.

#### Output Place

Server log / Container log

### 16.13.5 JSSR37103

---

**JSSRC: INFO: JSSR37103: The backup request is sent. server=%s1 ijsserver=%s3 pno=%s4 pid=%s5 tid=%s6**

#### Variable Information

- %s1 = IP address of Session Registry Server:Port number
- %s2 = IJServer name (or IJServer cluster name (server instance name))
- %s3 = Process number of IJServer

%s4 = Process ID of IJServer

%s5 = Processing thread

#### Explanation

The session backup request was sent to Session Registry Server.

#### Output Place

Server log / Container log

### 16.13.6 JSSR37104

---

**JSSRC: INFO: JSSR37104: The backup result was received. server=%s1 ijservice=%s3 pno=%s4 pid=%s5 tid=%s6**

#### Variable Information

%s1 = IP address of Session Registry Server:Port number

%s2 = IJServer name (or IJServer cluster name (server instance name))

%s3 = Process number of IJServer

%s4 = Process ID of IJServer

%s5 = Processing thread

#### Explanation

The session backup result was received from Session Registry Server.

#### Output Place

Server log / Container log

### 16.13.7 JSSR37105

---

**JSSRC: INFO: JSSR37105: The recovery request is sent. server=%s1 apl=%s2 sessionid=%s3 ijservice=%s4 pno=%s5 pid=%s6 tid=%s7**

#### Variable Information

%s1 = IP address of Session Registry Server:Port number

%s2 = Web application name

%s3 = Session ID

%s4 = IJServer name (or IJServer cluster name (server instance name))

%s5 = Process number of IJServer

%s6 = Process ID of IJServer

%s7 = Processing thread

#### Explanation

The session recovery request is sent to Session Registry Server.

#### Output Place

Server log / Container log

### 16.13.8 JSSR37106

---

---

**JSSRC: INFO: JSSR37106: The recovery result was received. server=%s1 apl=%s2 sessionid=%s3 ijsrver=%s4 pno=%s5 pid=%s6 tid=%s7**

#### Variable Information

%s1 = IP address of Session Registry Server:Port number  
%s2 = Web application name  
%s3 = Session ID  
%s4 = IJServer name (or IJServer cluster name (server instance name))  
%s5 = Process number of IJServer  
%s6 = Process ID of IJServer  
%s7 = Processing thread

#### Explanation

The session recovery result was received from Session Registry Server.

#### Output Place

Server log / Container log

---

### 16.13.9 JSSR37107

**JSSRC: INFO: JSSR37107: The recovery is complete notice is sent. server=%s1 apl=%s2 sessionid=%s3 ijsrver=%s4 pno=%s5 pid=%s6 tid=%s7**

#### Variable Information

%s1 = IP address of Session Registry Server:Port number  
%s2 = Web application name  
%s3 = Session ID  
%s4 = IJServer name (or IJServer cluster name (server instance name))  
%s5 = Process number of IJServer  
%s6 = Process ID of IJServer  
%s7 = Processing thread

#### Explanation

The "session recovery is complete" notice is sent to Session Registry Server.

#### Output Place

Server log / Container log

---

### 16.13.10 JSSR37108

**JSSRC: INFO: JSSR37108: The recovery is complete notice result was received. server=%s1 apl=%s2 sessionid=%s3 ijsrver=%s4 pno=%s5 pid=%s6 tid=%s7**

#### Variable Information

%s1 = IP address of Session Registry Server:Port number  
%s2 = Web application name  
%s3 = Session ID  
%s4 = IJServer name (or IJServer cluster name (server instance name))

%s5 = Process number of IJServer

%s6 = Process ID of IJServer

%s7 = Processing thread

#### Explanation

The "session recovery is complete" notice was received from Session Registry Server.

#### Output Place

Server log / Container log

### 16.13.11 JSSR37109

---

**JSSRC: INFO: JSSR37109: The consistency check request is sent. server=%s1 apl=%s2 detail=%s3 ijsrver=%s4 pno=%s5 pid=%s6 tid=%s7**

#### Variable Information

%s1 = IP address of Session Registry Server:Port number

%s2 = Web application name

%s2 = Internal information

%s4 = IJServer name (or IJServer cluster name (server instance name))

%s5 = Process number of IJServer

%s6 = Process ID of IJServer

%s7 = Processing thread

#### Explanation

The session consistency check request is sent to Session Registry Server.

#### Output Place

Server log / Container log

### 16.13.12 JSSR37110

---

**JSSRC: INFO: JSSR37110: The consistency check result was received. server=%s1 apl=%s2 detail=%s3 ijsrver=%s4 pno=%s5 pid=%s6 tid=%s7**

#### Variable Information

%s1 = IP address of Session Registry Server:Port number

%s2 = Web application name

%s3 = Internal information

%s4 = IJServer name (or IJServer cluster name (server instance name))

%s5 = Process number of IJServer

%s6 = Process ID of IJServer

%s7 = Processing thread

#### Explanation

The session consistency check request was received from Session Registry Server.

## Output Place

Server log / Container log

### 16.13.13 JSSR37111

---

**JSSRC: INFO: JSSR37111: The get the updated session request was received. server=%s1 apl=%s2 sessionid=%s3 ijsrver=%s4 pno=%s5 pid=%s6 tid=%s7**

#### Variable Information

- %s1 = IP address of Session Registry Server:Port number
- %s2 = Web application name
- %s3 = Session ID
- %s4 = IJServer name (or IJServer cluster name (server instance name))
- %s5 = Process number of IJServer
- %s6 = Process ID of IJServer
- %s7 = Processing thread

#### Explanation

The request for the updated session was received from Session Registry Server.

## Output Place

Server log / Container log

### 16.14 JSSR60000 to JSSR60999

---

Session Recovery function messages.

#### 16.14.1 JSSR60001

---

**JSSRS: ERROR: JSSR60001: The command was used incorrectly.**

#### Explanation

The command was used incorrectly.

#### System Action

Stops processing.

#### User Action

Specify the correct option and re-execute processing.

#### 16.14.2 JSSR60002

---

**JSSRS: ERROR: JSSR60002: A required service cannot be used.**

#### Explanation

A required service cannot be used.

#### System Action

Stops processing.

#### User Action

Check that required packages were installed.

### 16.14.3 JSSR60003

---

**JSSRS: ERROR: JSSR60003: This operation cannot currently be executed because a related operation is running. Details=%s1**

#### Variable Information

%s1 = Specified Session Registry Server name

#### Explanation

The current operation cannot be executed because a related operation is running.

#### System Action

Stops processing.

#### User Action

There is a possibility that the specified Session Registry Server is being referenced by a related operation.

Wait for a while and re-execute the command.

### 16.14.4 JSSR60004

---

**JSSRS: ERROR: JSSR60004: The specified Session Registry Server does not exist. Details=%s1**

#### Variable Information

%s1 = Specified Session Registry Server name

#### Explanation

The specified Session Registry Server does not exist.

#### System Action

Stops processing.

#### User Action

Check the name.

### 16.14.5 JSSR60005

---

**JSSRS: ERROR: JSSR60005: The specified WorkUnit is not Session Registry Server. Details=%s1**

#### Variable Information

%s1 = Specified Session Registry Server name

#### Explanation

The specified WorkUnit is not Session Registry Server.

#### System Action

Stops processing.

#### User Action

Check the name.

## 16.14.6 JSSR60006

---

**JSSRS: ERROR: JSSR60006: The serialized session information cannot be deleted because Session Registry Server is running. Details=%s1**

### Variable Information

%s1 = Specified Session Registry Server name

### Explanation

The serialized session information cannot be deleted because Session Registry Server is running.

### System Action

Stops processing.

### User Action

Stop Session Registry Server and re-execute processing.

## 16.14.7 JSSR60007

---

**JSSRS: ERROR: JSSR60007: The specified Session Registry Server session serialization settings are invalid. Details=%s1**

### Variable Information

%s1 = Specified Session Registry Server name

### Explanation

The session serialization (of the settings) on the specified Session Registry Server is invalid, so there is no need to delete the serialized session information.

### System Action

Stops processing.

### User Action

None.

## 16.14.8 JSSR60008

---

**JSSRS: ERROR: JSSR60008: The directory for storing the serialized file of the session was not specified. Details=%s1**

### Variable Information

%s1 = Specified Session Registry Server name

### Explanation

The serialized session information cannot be deleted because the directory for storing the serialized file of the session of the specified Session Registry Server was not specified.

### System Action

Stops processing.

### User Action

Check the Session Registry Server environment definition file.

## 16.14.9 JSSR60009

---

**JSSRS: ERROR: JSSR60009: Failed to delete the serialized file of the session. Details=%s1**

### Variable Information

%s1 = Detail information

### Explanation

Failed to delete the serialized file of the session.

### System Action

Stops processing.

### User Action

Establish the cause of the error according to the detail information and re-execute processing. Possible causes are as follows:

- The file or directory is being referenced by another application.  
Close other applications and re-execute processing.
- The access to the file or directory failed because the disk is broken.  
Check the disk.
- The disk could not be accessed temporarily because of competition with other processing.  
Re-execute processing.

If there is still no improvement, use the *iscollectinfo* command to collect investigation information. Send the error information to a Systems Engineer.

## 16.14.10 JSSR60010

---

**JSSRS: ERROR: JSSR60010: An abnormal system was generated. Details=%s1**

### Variable Information

%s1 = Detail information

### Explanation

A system abnormality occurred.

### System Action

Stops processing.

### User Action

Establish the cause of the error according to the detail information and re-execute processing. Possible causes are as follows:

- There is a possibility that the web.xml file is broken.  
Fix the web.xml file.

If there is still no improvement, use the *iscollectinfo* command to collect investigation information. Send the error information to a Systems Engineer.

## 16.14.11 JSSR60011

---

**JSSRS: INFO: JSSR60011: clearsession has started.**

#### Explanation

Deletion of the serialized session information has started.

#### System Action

Starts processing.

#### User Action

None.

### 16.14.12 JSSR60012

---

#### **JSSRS: INFO: JSSR60012: clearsession is complete.**

#### Explanation

Deletion of the serialized session information is complete.

#### System Action

Completes processing.

#### User Action

None.

### 16.14.13 JSSR60013

---

#### **JSSRS: ERROR: JSSR60013: clearsession terminated abnormally.**

#### Explanation

Deletion of the serialized file of the session terminated abnormally.

#### System Action

Stops processing.

#### User Action

Establish the cause of the error and re-execute processing.

### 16.14.14 JSSR60014

---

#### **JSSRS: INFO: JSSR60014: The serialized file of the session does not exist.**

#### Explanation

The serialized file of the session does not exist. Possible causes are as follows:

- The deletion target Web application serialized file does not exist.
- The <serialize.file.path> directory for storing the serialized file defined in web.xml does not exist.

#### System Action

Continues processing.

#### User Action

If necessary, check the Web application or directory for storing the serialized file specified in the -a option and re-execute processing.

## 16.14.15 JSSR60101

---

**JSSRS: ERROR: JSSR60101: Required packages was not installed. Please perform again after installing a required package.**

### Explanation

A required package was not installed.

### System Action

Stops processing.

### User Action

Install Interstage.

## 16.14.16 JSSR60102

---

**JSSRS: ERROR: JSSR60102: Permission denied.**

### Explanation

Permission denied.

### System Action

Stops processing.

### User Action

Perform the operation as a user with administrator authority.

## 16.14.17 JSSR60103

---

**JSSRS: ERROR: JSSR60103: Interstage package has not been installed.**

### Explanation

The Interstage package has not been installed.

### System Action

Stops processing.

### User Action

Install Interstage.

## 16.14.18 JSSR60104

---

**JSSRS: WARNING: JSSR60104: The timeout occurred.**

### Explanation

A timeout was detected.

### Explanation

1. There may be a memory shortage.

2. The machine may be overloaded.

#### System Action

Stops processing.

#### User Action

1. Stop other applications to decrease the machine load.
2. Wait until state returns from overloaded to normal.

If there is no improvement, collect diagnostic information using the *iscollectinfo* command, then contact your service engineer.

## 16.14.19 JSSR60105

---

**JSSRS: ERROR: JSSR60105: The error occurred in timeout processing. errno=%s1**

#### Variable Information

%s1 = Error number

#### Explanation

An timeout occurred.

#### System Action

Stops processing.

#### User Action

Collect diagnostic information using the *iscollectinfo* command, then contact your service engineer.

## 16.14.20 JSSR60106

---

**JSSRS: ERROR: JSSR60106: The error occurred in check processing of execution authority. errno=%s1**

#### Variable Information

%s1 = Error number

#### Explanation

There was an error during authority validation.

#### System Action

Stops processing.

#### User Action

Collect diagnostic information using the *iscollectinfo* command, then contact your service engineer.

## 16.14.21 JSSR60107

---

**JSSRS: ERROR: JSSR60107: An error occurred while the child process was starting. errno=%s1**

#### Variable Information

%s1 = Error number

### Explanation

There was an error during child process startup.

### System Action

Stops processing.

### User Action

Stop unnecessary processes and re-execute.

## 16.14.22 JSSR60108

---

### JSSRS: ERROR: JSSR60108: An error occurred in the executed command build processing.

### Explanation

There was an internal error during acquisition of Java common information .

### System Action

Stops processing.

### User Action

Collect diagnostic information using the *iscollectinfo* command, then contact your service engineer.

## 16.14.23 JSSR60109

---

### JSSRS: ERROR: JSSR60109: Failed to get the common Java information. func=%s1 errno=%s2

### Variable Information

%s1 = Internal information

%s2 = Detail code

### Explanation

Failed to get the common Java information.

### System Action

Stops processing.

### User Action

Take action based on the Detail code as follows:

Detail code	Action
1, 3-5	Reinstall Interstage.
2	There is insufficient memory. Terminate all unnecessary applications, and re-execute the command.
10	Use the <i>iscollectinfo</i> command to collect diagnostic information. Send the error information to your Systems Engineer.

## 16.14.24 JSSR60110

---

### JSSR: ERROR: JSSR60110: Not enough memory.

**Explanation**

Insufficient memory.

**System Action**

Stops processing.

**User Action**

Terminate all unnecessary applications and re-execute.

# Chapter 17 Messages Beginning with 'JSVLT'

This chapter explains the messages starting with 'JSVLT'.

If exception information is output following these messages, refer to the contents of the exception information and fix the error.

The WEB application name that is output in the messages may display as follows:

- With a slash (/) before the WEB application name.
- The WEB application name is not output if it is ROOT.

## 17.1 JSVLT50200 to JSVLT50299

---

This section details messages numbered between JSVLT50200 and JSVLT50299.

### 17.1.1 JSVLT50201

---

#### **JSVLT: ERROR: JSVLT50201: Error starting endpoint**

##### Explanation

An error occurred while the endpoint was started.

##### Cause

The specified port number is being used by another application.

##### User Action

Change the Servlet container port number.

##### Output Location

Container log

### 17.1.2 JSVLT50202

---

#### **JSVLT: INFO: JSVLT50202: Initializing Coyote HTTP/1.1 on port %s1**

##### Variable Information

%s1 = Port number (Protocol-IP address-Port number, or Protocol-Port number)

##### Explanation

Initializing the Web server connector connection function. The %s1 port will be used.

##### Output Location

Container log

### 17.1.3 JSVLT50203

---

#### **JSVLT: ERROR: JSVLT50203: Error reading request, ignored**

##### Explanation

An error occurred during reading of the request, but the error was ignored.

##### Cause

An exception occurred during request processing.

#### User Action

Refer to the contents of the messages and exceptions that are output before and after this message and fix the problem.

#### Output Location

Container log

### 17.1.4 JSVLT50204

---

#### **JSVLT: ERROR: JSVLT50204: Error initializing socket factory**

#### Explanation

An error occurred initializing the socket factory.

#### Cause

An exception occurred initializing the socket factory.

#### User Action

- Refer to the contents of the messages and exceptions that are output before and after this message and fix the problem.
- If the settings have been configured so that SSL is used for communication between the Web server connector and the Servlet container, check that the JSSE (Java Secure Socket Extension) JAR file set in the class path is the correct one for this product.
- Check whether there is an error in the OS network settings.
- If the error still occurs after checking the above, create the IJServer WorkUnit again.

#### Output Location

Container log

### 17.1.5 JSVLT50205

---

#### **JSVLT: INFO: JSVLT50205: Starting Coyote HTTP/1.1 on port %s1**

#### Variable Information

%s1 = Port number (Protocol-IP address-Port number, or Protocol-Port number)

#### Explanation

Starting the Web server connector connection function. The %s1 port will be used.

#### Output Location

Container log

### 17.1.6 JSVLT50206

---

#### **JSVLT: INFO: JSVLT50206: Stopping Coyote HTTP/1.1 on port %s1**

#### Variable Information

%s1 = Port number (Protocol-IP address-Port number, or Protocol-Port number)

#### Explanation

Stopping the Web server connector connection function.

#### Output Location

Container log

## 17.1.7 JSVLT50207

---

### [JSVLT: INFO: JSVLT50207: Pausing Coyote HTTP/1.1 on port %s1](#)

#### Variable Information

%s1 = Port number (Protocol-IP address-Port number, or Protocol-Port number)

#### Explanation

Pausing the Web server connector connection function.

#### Output Location

Container log

## 17.1.8 JSVLT50209

---

### [JSVLT: ERROR: JSVLT50209: Error processing request](#)

#### Explanation

An exception occurred in the Servlet container during the request processing.

#### Cause

Refer to the messages that are output before and after this message.

#### User Action

Refer to the contents of the messages and exceptions that are output before and after this message and fix the problem.

If the problem is still not resolved, use the `iscollectinfo` command to collect diagnostic information. Send the error information to a Systems Engineer.

#### Output Location

Container log

## 17.1.9 JSVLT50210

---

### [JSVLT: ERROR: JSVLT50210: Error finishing request](#)

#### Explanation

An exception occurred in the Servlet container during request close processing.

#### Cause

Refer to the messages that are output before and after this message.

#### User Action

Refer to the contents of the messages and exceptions that are output before and after this message and fix the problem.

If the problem is still not resolved, use the `iscollectinfo` command to collect diagnostic information. Send the error information to a Systems Engineer.

#### Output Location

Container log

## 17.1.10 JSVLT50211

---

### [JSVLT: ERROR: JSVLT50211: Error finishing response](#)

## Explanation

An exception occurred in the Servlet container during response close processing.

## Cause

Refer to the messages that are output before and after this message.

## User Action

Refer to the messages and exceptions that are output before and after this message and fix the problem.

If the problem is still not resolved, use the `iscollectinfo` command to collect diagnostic information. Send the error information to a Systems Engineer.

## Output Location

Container log

---

## 17.2 JSVLT51400 to JSVLT51499

---

This section details messages numbered between JSVLT51400 and JSVLT51499.

---

### 17.2.1 JSVLT51400

---

**JSVLT: WARNING: JSVLT51400: Parameters: Invalid chunk ignored.**

#### Explanation

Ignored because of an invalid request parameter.

#### Cause

The request parameter format is invalid.

#### System Action

Invalid request parameters are ignored, and processing continues.

#### User Action

Check the request parameter format.

#### Output Location

Container log

---

### 17.2.2 JSVLT51401

---

**JSVLT: WARNING: JSVLT51401: Parameters: Character decoding failed. Parameter skipped.**

#### Explanation

Failed to decode the request parameters.

#### Cause

The request parameter encoding format is invalid.

#### System Action

Request parameters for which decoding failed are ignored, and processing continues.

#### User Action

Check the request parameter encoding format.

Output Location

Container log

---

## 17.3 JSVLT51800 to JSVLT51899

---

This section details messages numbered between JSVLT51800 and JSVLT51899.

---

### 17.3.1 JSVLT51800

---

**JSVLT: ERROR: JSVLT51800: Endpoint %s1 shutdown due to exception: %s2**

Variable Information

%s1 = Servlet container request accept socket information

%s2 = Exception information

Explanation

The endpoint (%s1) is shut down because of an exception.

Cause

An exception occurred during Servlet container request accept processing.

User Action

Fix the cause of the error based on the exception information.

Output Location

Container log

---

### 17.3.2 JSVLT51801

---

**JSVLT: ERROR: JSVLT51801: Endpoint %s1 ignored exception: %s2**

Variable Information

%s1 = Servlet container request accept socket information

%s2 = Exception information

Explanation

An exception occurred during Servlet container request accept processing. The request accept socket is reinitialized and processing is continued.

Cause

Refer to the exception information.

User Action

Fix the cause of the error based on the exception information.

Output Location

Container log

---

### 17.3.3 JSVLT51802

---

**JSVLT: WARNING: JSVLT51802: Reinitializing ServerSocket**

## Explanation

The request accept socket is reinitialized.

## Output Location

Container log

### 17.3.4 JSVLT51803

---

#### **JSVLT: WARNING: JSVLT51803: Restarting endpoint**

## Explanation

The module for receiving the request is restarted.

## Output Location

Container log

### 17.4 JSVLT51900 to JSVLT51999

---

This section details messages numbered between JSVLT51900 and JSVLT51999.

#### 17.4.1 JSVLT51950

---

#### **JSVLT: ERROR: JSVLT51950: All threads (%s1) are currently busy, waiting. Increase maxThreads (%s2) or check the servlet status**

## Variable Information

%s1 = Current number of requests for connection

%s2 = Maximum number of processes + 1

## Explanation

All threads are currently busy waiting.

## Cause

The number of simultaneous requests for connection to the Servlet container has exceeded the specified number of simultaneous processes.

## User Action

- Check whether there is a problem with the system configuration (limit on the number of Web server connections, or load balancing device behavior) for the estimate of the number of simultaneous requests for connection to the Servlet container.
- Check the system load and memory usage, and if there is available capacity, increase the WorkUnit process concurrency (the application must not depend on the number of processes for file access competition, for example).
- If there is available capacity after checking the Servlet container load and JavaVM heap usage, or if the JavaVM heap upper limit is raised, increase the value for the number of simultaneous Servlet container processes in the WorkUnit settings (also increase the upper limit for the JavaVM heap if necessary).
- If there is no problem with the system configuration and there is also no available capacity mentioned above, consider a system scaleup.

## Output Location

Container log

#### 17.4.2 JSVLT51952

---

---

**JSVLT: ERROR: JSVLT51952: Caught exception (%s1) executing %s2, terminating thread****Variable Information**

%s1 = Internal information

%s2 = Exception information

**Explanation**

The thread (%s1) will be terminated because an exception (%s2) was caught while the thread was under execution.

**Cause**

An exception occurred during request accept processing.

**User Action**

Take action according to the exception information and message that is also output. For details about exceptions, refer to "Exceptions Output during J2EE Usage".

This may be output when a request was received during Servlet container close processing. In this case, ignore this message.

**Output Location**

Container log

---

## 17.5 JSVLT52200 to JSVLT52299

---

This section details messages numbered between JSVLT52200 and JSVLT52299.

---

### 17.5.1 JSVLT52204

---

**JSVLT: WARNING: JSVLT52204: Unexpected error forwarding to error page****Explanation**

An error occurred during forward processing to the error-page.

**Cause**

Refer to the message that was also output to the container log.

**User Action**

Refer to the message that was also output to the container log.

**Output Location**

Container log

---

### 17.5.2 JSVLT52205

---

**JSVLT: WARNING: JSVLT52205: Unexpected error forwarding to login page****Explanation**

An error occurred during forward processing to the login-page.

**Cause**

Refer to the message that was also output to the container log.

The deployment descriptor (web.xml) form-login-config tag or the tags under it may have been omitted.

**User Action**

Refer to the message that was also output to the container log.

The form-login-config tag or the tags under it cannot be omitted when form base authentication is used. Refer to "User Authentication" in the chapter "Web Application Environment Definition File (Deployment Descriptor)" of the "J2EE User's Guide" and correct the deployment descriptor (web.xml).

#### Output Location

Container log

### 17.5.3 JSVLT52250

---

#### **JSVLT52250: Protocol handler destroy failed: %s1**

##### Variable Information

%s1 = Detailed information

##### Explanation

Failed to destroy the protocol handler.

##### Cause

A problem occurred during close processing of the module for receiving the Servlet container request.

##### User Action

Fix the problem based on the detailed information and the message that is also output.

If the problem is still not resolved, use the iscollectinfo command to collect diagnostic information. Send the error information to a Systems Engineer.

##### Output Location

Container log

### 17.5.4 JSVLT52251

---

#### **JSVLT: ERROR: JSVLT52251: Protocol handler instantiation failed: %s1**

##### Variable Information

%s1 = Exception information

##### Explanation

Failed to start the protocol handler.

##### Cause

Failed to initialize the module for receiving the Servlet container request.

##### User Action

There may be a problem with the server.xml definition contents.

- Check that the connector definition for accepting user applications exists.
- Check that the port number definition for the connector for accepting control requests is correct.

##### Output Location

Container log

### 17.5.5 JSVLT52252

---

#### **JSVLT52252: Protocol handler start failed: %s1**

## Variable Information

%s1 = Detailed information

## Explanation

Failed to initialize the module for receiving the Servlet container request.

## Cause

Possible causes are as follows:

- The port number is already being used.
- The Servlet container IP address is incorrect.
- The IP address was not changed correctly when the resources were imported.

## User Action

- Change the Servlet container port number using the Interstage Management Console.
- Change the Servlet container IP address using the Interstage Management Console. If you are using the multiserver management function, delete the Managed Server from the site, change the IP address, and then add the Managed Server to the site again.
- If this message is output after the resources have been imported, the IP address may not have been changed correctly when the resources were imported. Refer to "Moving Resources to Another Server" in the chapter "Maintenance (Resource Backup)" of the "Operator's Guide", and then change the IP address to a correct IP address.

## Output Location

Container log

## 17.5.6 JSVLT52253

---

### **JSVLT: ERROR: JSVLT52253: An exception or error occurred in the container during the request processing**

## Explanation

An exception or error occurred in the connector during the request processing.

## Cause

An exception occurred in the Servlet container during the request processing.

## User Action

Refer to the contents of the messages and exceptions that are output before and after this message and fix the problem.

If the problem is still not resolved, use the iscollectinfo command to collect diagnostic information. Send the error information to a Systems Engineer.

## Output Location

Container log

## 17.5.7 JSVLT52254

---

### **JSVLT52254: getWriter() has already been called for this response**

## Explanation

getWriter() has already been called for this response.

## Cause

The getWriter and getOutputStream methods were called for the same response.

#### User Action

Either the `getWriter` or the `getOutputStream` method (but not both) can be used for the same response. Check the application and correct it.

#### Output Location

Container log

### 17.5.8 JSVLT52255

---

#### **JSVLT52255: `getOutputStream()` has already been called for this response**

##### Explanation

`getOutputStream()` has already been called for this response.

##### Cause

The `getOutputStream` and `getWriter` methods were called for the same response.

##### User Action

Either the `getWriter` or the `getOutputStream` method (but not both) can be used for the same response. Check the application and correct it.

##### Output Location

Container log

### 17.5.9 JSVLT52256

---

#### **JSVLT52256: Cannot reset buffer after response has been committed**

##### Explanation

The buffer cannot be reset after the response has been committed.

##### Cause

An attempt was made to reset the buffer for the response after the return of part or all of the response.

##### User Action

Check the application to determine whether the `resetBuffer` method of the response was called after the return of part or all of the response. If it was, correct the application accordingly.

##### Output Location

Container log

### 17.5.10 JSVLT52257

---

#### **JSVLT52257: Cannot call `sendError()` after the response has been committed**

##### Explanation

`sendError()` cannot be called after the response has been committed.

##### Cause

The `sendError` method of the response was called after the return of part or all of the response.

##### User Action

Check the application to determine whether the `sendError` method of the response was called after the return of part or all of the response. If it was, correct the application accordingly.

Output Location

Container log

## 17.5.11 JSVLT52258

---

### JSVLT52258: Cannot call sendRedirect() after the response has been committed

Explanation

sendRedirect() cannot be called after the response has been committed.

Cause

The sendRedirect method of the response was called after the return of part or all of the response.

User Action

Check the application to determine whether the sendRedirect method of the response was called after the return of part or all of the response. If it was, correct the application accordingly.

Output Location

Container log

## 17.5.12 JSVLT52259

---

### JSVLT52259: Cannot change buffer size after data has been written

Explanation

The buffer size cannot be changed after data has already been written.

Cause

The setBufferSize method of the response was called after the return of part or all of the response.

User Action

Check the application to determine whether the setBufferSize method of the response was called after the return of part or all of the response. If it was, correct the application accordingly.

Output Location

Container log

## 17.5.13 JSVLT52260

---

### JSVLT52260: getReader() has already been called for this request

Explanation

getReader() has already been called for this request.

Cause

The getInputStream and getReader methods were called for the same request.

User Action

Either the getReader or the getInputStream method (but not both) can be used for the same response. Check the application and correct it.

Output Location

Container log

## 17.5.14 JSVLT52261

---

### JSVLT52261: `getInputStream()` has already been called for this request

#### Explanation

`getInputStream()` has already been called for this request.

#### Cause

The `getReader` and `getInputStream` methods were called for the same request.

#### User Action

Either the `getInputStream` or the `getReader` method (but not both) can be used for the same response. Check the application and correct it.

#### Output Location

Container log

## 17.5.15 JSVLT52262

---

### JSVLT52262: Cannot create a session after the response has been committed

#### Explanation

A session cannot be created after the response has been committed.

#### Cause

An attempt was made to create a session after the return of part or all of the response.

#### User Action

Check the application to determine whether the `getSession` method of the response was called to create a session after the return of part or all of the response. If it was, correct the application accordingly.

#### Output Location

Container log

## 17.5.16 JSVLT52263

---

### JSVLT52263: Cannot call `setAttribute` with a null name

#### Explanation

Null cannot be specified for the `setAttribute` name parameter.

#### Cause

Null was specified for the name argument in the `setAttribute(String name, Object value)` method and then called for the request.

#### User Action

Check the application to determine whether null was specified. If it was, correct the application.

#### Output Location

Container log

## 17.5.17 JSVLT52264

---

### JSVLT: ERROR: JSVLT52264: Exception thrown by attributes event listener

## Explanation

The `attributeAdded`, `attributeRemoved`, or `attributeReplaced` method of the listener class threw an exception.

## Cause

The application may be incorrect.

## User Action

Refer to the contents of the exception that is output to the container log and fix the error.

## Output Location

Container log

## 17.5.18 JSVLT52267

---

### **JSVLT52267: Protocol handler initialization failed: %s1**

#### Variable Information

%s1 = Exception information

## Explanation

Failed to initialize the protocol handler.

## Cause

Refer to the message that was also output to the container log.

## User Action

Refer to the message that was also output to the container log.

## Output Location

Container log

## 17.5.19 JSVLT52269

---

### **JSVLT: ERROR: JSVLT52269: Invalid URI encoding; using HTTP default**

#### Explanation

The request URI encoding is incorrect.

## Cause

The contents configured for [Request URI encoding] in the Servlet container settings are incorrect. Alternatively, the encoding is not supported.

## System Action

Default encoding (ISO-8859-1) is used for the request URI.

## User Action

Set a correct value for [Request URI encoding] in the Servlet container settings.

## 17.5.20 JSVLT52270

---

### **JSVLT: WARNING: JSVLT52270: Exception thrown whilst processing POSTed parameters**

#### Explanation

An exception occurred while reading POST data.

### Cause

Sending of data from the client may have been aborted or delayed.

### System Action

POST data read is aborted.

### User Action

Establish the cause of the error based on the message output to the container log.

### Output Location

Container log

---

## 17.6 JSVLT52300 to JSVLT52399

This section details messages numbered between JSVLT52300 and JSVLT52399.

---

### 17.6.1 JSVLT52300

---

#### **JSVLT: ERROR: JSVLT52300: Exception thrown by attributes event listener**

#### Explanation

The attributeAdded, attributeRemoved, or attributeReplaced method of the listener class threw an exception.

#### Cause

The application may be incorrect.

#### User Action

Refer to the contents of the exception that is output to the container log and fix the error.

#### Output Location

Container log

---

### 17.6.2 JSVLT52301

---

#### **JSVLT52301: Path %s1 does not start with "/" character**

#### Variable Information

%s1 = Path

#### Explanation

The path to the servlet application that dispatches the request does not start with "/".

#### Cause

The application may be incorrect.

#### User Action

The path to the servlet application that dispatches the request must start with "/". Put a "/" at the start of the path that is indicated in the variable information.

#### Output Location

Container log

## 17.6.3 JSVLT52302

---

### JSVLT52302: Path %s1 does not start with a "/" character

#### Variable Information

%s1 = Path

#### Explanation

The path specified for the `javax.servlet.ServletContext.getResourcePaths` method does not start with "/".

#### Cause

The application may be incorrect.

#### User Action

Correct the application so that the path specified for the `javax.servlet.ServletContext.getResourcePaths` method starts with "/".

#### Output Location

Container log

## 17.6.4 JSVLT52303

---

### JSVLT52303: Name cannot be null

#### Explanation

Null cannot be specified for the attribute name in the `javax.servlet.ServletContext.setAttribute` method.

#### Cause

The application may be incorrect.

#### User Action

Correct the application so that null is not specified for the attribute name in the `javax.servlet.ServletContext.setAttribute` method.

#### Output Location

Container log

## 17.6.5 JSVLT52304

---

### JSVLT: ERROR: JSVLT52304: Allocate exception for servlet %s1

#### Variable Information

%s1 = Servlet name

#### Explanation

Failed to initialize the servlet. This servlet is invalid.

#### Cause

Possible causes are as follows:

- Cannot find the servlet class
- Failed to create the class
- The init method threw an exception

#### User Action

Refer to the contents of the exception and fix the error.

## Output Location

Container log

## Note

If this message is output as part of an Exception message, it displays as follows:

JSVLT52304: Allocate exception for servlet %s1

## 17.6.6 JSVLT52305

---

### **JSVLT: ERROR: JSVLT52305: Deallocate exception for servlet %s1**

#### Variable Information

%s1 = Servlet name

#### Explanation

The servlet destroy method failed.

#### Cause

The destroy method threw an exception.

#### User Action

Refer to the contents of the exception and fix the error.

#### Output Location

Container log

#### Note

If this message is output as part of an Exception message, it displays as follows:

JSVLT52305: Deallocate exception for servlet %s1

## 17.6.7 JSVLT52306

---

### **JSVLT52306: Cannot forward after response has been committed**

#### Explanation

Cannot forward the response after it has been committed.

#### Cause

The application may be incorrect.

#### User Action

Forward the response before committing the response or before the response is committed following the extension of processing. If the response is output when the response buffer size is exceeded, it may be committed automatically.

#### Output Location

Container log

## 17.6.8 JSVLT52307

---

### **JSVLT: WARNING: JSVLT52307: Servlet %s1 is currently unavailable**

#### Variable Information

%s1 = Servlet name

## Explanation

This servlet is currently unavailable because the servlet initialization failed.

## Cause

Possible causes are as follows:

- Cannot find the servlet class
- Failed to create the class
- The init method threw an exception

## User Action

Refer to the contents of the exception and fix the error.

## Output Location

Container log

## Note

If this message is output as part of an Exception message, it displays as follows:

JSVLT52307: Servlet %s1 is currently unavailable

## 17.6.9 JSVLT52308

---

### **JSVLT: ERROR: JSVLT52308: Servlet.service() for servlet %s1 threw exception**

#### Variable Information

%s1 = Servlet name

#### Explanation

The servlet service method threw an exception.

#### Cause

The servlet service method threw an exception.

#### User Action

Refer to the contents of the exception and fix the error.

#### Output Location

Container log

## 17.6.10 JSVLT52311

---

### **JSVLT: INFO: JSVLT52311: Container %s1 has not been started**

#### Variable Information

%s1 = Web application name

#### Explanation

Stop processing for the Web application(%s1) was not performed because the Web application failed to start previously.

#### Output Location

Container log

## Note

If this message is output as part of an Exception message, it displays as follows:

JSVLT52311: Container %s1 has not been started

### 17.6.11 JSVLT52312

---

#### JSVLT52312: Filter execution threw an exception

##### Explanation

Execution of the filter threw an exception.

##### Cause

Execution of the filter application failed.

##### User Action

An error occurred when the filter application was called. Refer to the container log and fix the error based on the contents of the error message.

##### Output Location

Container log

### 17.6.12 JSVLT52313

---

#### JSVLT52313: Servlet execution threw an exception

##### Explanation

Execution of the servlet threw an exception.

##### Cause

Execution of the servlet application failed.

##### User Action

An error occurred when the servlet application was called. Refer to the IJServer Container log and the error message to fix the error.

##### Output Location

Container log

### 17.6.13 JSVLT52321

---

#### JSVLT: ERROR: JSVLT52321: Error configuring application listener of class %s1

##### Variable Information

%s1 = Class name

##### Explanation

Failed to create the listener class.

##### Cause

Cannot find the listener class, or the attempt to create the class may have failed.

##### User Action

Refer to the contents of the exception and fix the error.

## Output Location

Container log

### 17.6.14 JSVLT52322

---

#### **JSVLT: ERROR: JSVLT52322: Skipped installing application listeners due to previous error(s)**

#### Explanation

Failed to initialize the listener class. The listener class was not registered.

#### Cause

Possible causes are as follows:

- Cannot find the listener class
- Failed to create the class

#### User Action

Refer to the contents of the exception and fix the error.

#### Output Location

Container log

### 17.6.15 JSVLT52324

---

#### **JSVLT52324: Error page location %s1 must start with a '/'**

#### Variable Information

%s1 = The value for the <location> tag

#### Explanation

The error page location must start with a '/'.

#### Cause

The value for the <location> tag that defined the error page in the Web application web.xml does not start with "/".

#### User Action

Specify the value for the <location> tag that defined the error page in the Web application web.xml so that it starts with "/", and then redeploy the Web application.

#### Output Location

Container log

### 17.6.16 JSVLT52325

---

#### **JSVLT52325: Filter mapping must specify either a <url-pattern> or a <servlet-name>**

#### Explanation

Either <url-pattern> or <servlet-name> must be specified for filter mapping.

#### Cause

Either the <url-pattern> or the <servlet-name> tag was not specified for the filter mapping defined in the Web application web.xml.

### User Action

Specify either the <url-pattern> or <servlet-name> tag specified for the filter mapping defined in the Web application web.xml, and then redeploy the Web application.

### Output Location

Container log

---

## 17.6.17 JSVLT52326

---

### JSVLT52326: Filter mapping specifies an unknown filter name %s1

#### Variable Information

%s1 = Filter name

#### Explanation

An unknown filter name was specified for filter mapping.

#### Cause

The specified filter application was not defined for filter mapping in the Web application web.xml.

#### User Action

Either specify a filter application for a filter that has already been defined in the Web application web.xml, or define a new filter and associate it for the filter mapping, and then redeploy the Web application.

#### Output Location

Container log

---

## 17.6.18 JSVLT52327

---

### JSVLT52327: Invalid <url-pattern> %s1 in filter mapping

#### Variable Information

%s1 = Invalid URL pattern

#### Explanation

There is an invalid <url-pattern> in filter mapping.

#### Cause

Filter mapping is invalid because characters that are incorrect for a URL were specified for filter mapping in the Web application web.xml.

#### User Action

Correct the characters in the Web application web.xml so that they can be used for the URL, and then redeploy the Web application.

#### Output Location

Container log

---

## 17.6.19 JSVLT52328

---

### JSVLT: ERROR: JSVLT52328: Exception starting filter %s1

#### Variable Information

%s1 = Filter name

## Explanation

Failed to initialize the filter class.

## Cause

Possible causes are as follows:

- Cannot find the filter class
- Failed to create the class
- The init method threw an exception

## User Action

Refer to the contents of the exception and fix the error.

## Output Location

Container log

## 17.6.20 JSVLT52330

---

**JSVLT: ERROR: JSVLT52330: Exception sending context initialized event to listener instance of class %s1**

### Variable Information

%s1 = Listener class name

## Explanation

This exception occurs while the context initialization event is being sent to the listener instance.

## Cause

The contextInitialized method of the listener class threw an exception.

## User Action

Refer to the contents of the exception and fix the error.

## Output Location

Container log

## 17.6.21 JSVLT52331

---

**JSVLT: ERROR: JSVLT52331: Exception sending context destroyed event to listener instance of class %s1**

### Variable Information

%s1 = Listener class name

## Explanation

This exception occurs while the context destruction event is being sent to the listener instance.

## Cause

The contextDestroyed method of the listener class returned an exception.

## User Action

Refer to the contents of the exception and fix the error.

## Output Location

Container log

### 17.6.22 JSVLT52332

---

#### JSVLT52332: Form error page %s1 must start with a '/'

##### Variable Information

%s1 = The value specified for the <form-error-page> tag

##### Explanation

The form error page must start with a '/'.

##### Cause

The value for the <form-error-page> tag (a sub-element of the <form-login-config> tag, which defines login in the Web application web.xml) does not start with a '/'.

##### User Action

Correct the value for the <form-error-page> tag so that it starts with a '/', and then redeploy the Web application.

## Output Location

Container log

### 17.6.23 JSVLT52333

---

#### JSVLT52333: Form login page %s1 must start with a '/'

##### Variable Information

%s1 = The value specified for the <form-login-page> tag

##### Explanation

The form login page must start with a '/'.

##### Cause

The value for the <form-login-page> tag (a sub-element of the <form-login-config> tag, which defines login in the Web application web.xml) does not start with a '/'.

##### User Action

Correct the value for the <form-login-page> tag so that it starts with a '/', and then redeploy the Web application.

## Output Location

Container log

### 17.6.24 JSVLT52334

---

#### JSVLT52334: Duplicate context initialization parameter %s1

##### Variable Information

%s1 = Parameter name

##### Explanation

The context initialization parameter is duplicated.

### Cause

The name of the context initialization parameter in web.xml is duplicated.

### User Action

Correct web.xml so that the name of the context initialization parameter is unique.

### Output Location

Container log

---

## 17.6.25 JSVLT52335

---

### **JSVLT: INFO: JSVLT52335: Reloading this Context has started**

#### Explanation

Context reloading has started.

#### Output Location

Container log

---

## 17.6.26 JSVLT52336

---

### **JSVLT: ERROR: JSVLT52336: Error starting static Resources**

#### Explanation

Failed to start the resources.

#### Cause

The document base does not exist, or cannot be read.

#### User Action

Check whether the document base exists and can be read.

#### Output Location

Container log

---

## 17.6.27 JSVLT52337

---

### **JSVLT52337: Invalid <url-pattern> %s1 in security constraint**

#### Variable Information

%s1 = Invalid URL

#### Explanation

There is an invalid <url-pattern> in the security constraint.

#### Cause

The value for the <url-pattern> tag in the security-constraint definition in web.xml (the Web application environment definition file) does not start with "/" or "\*".

#### User Action

Correct the value for the <url-pattern> tag so that it starts with "/" or "\*".

#### Output Location

Container log

## 17.6.28 JSVLT52338

---

### JSVLT52338: Servlet mapping specifies an unknown servlet name %s1

#### Variable Information

%s1 = Unknown servlet name

#### Explanation

Servlet mapping specifies an unknown servlet name.

#### Cause

The description for <servlet-name> in <servlet-mapping> of web.xml (the Web application environment definition file) is incorrect.

#### User Action

Specify the correct servlet name.

#### Output Location

Container log

## 17.6.29 JSVLT52339

---

### JSVLT52339: Invalid <url-pattern> %s1 in servlet mapping

#### Variable Information

%s1 = Invalid URL

#### Explanation

There is an invalid <url-pattern> in servlet mapping.

#### Cause

The description for <url-pattern> in <servlet-mapping> of web.xml (the Web application environment definition file) is incorrect.

#### User Action

Specify a valid value for <url-pattern>.

#### Output Location

Container log

## 17.6.30 JSVLT52340

---

### JSVLT: ERROR: JSVLT52340: Exception during cleanup after start failed

#### Explanation

An exception occurred during cleanup after the Web application failed to start.

#### Cause

An exception occurred when the Web application stopped.

#### User Action

A message informing you that the Web application failed to start is output before this message, so resolve the problem described in that message.

#### Output Location

Container log

## 17.6.31 JSVLT52341

---

### JSVLT: ERROR: JSVLT52341: Context [%s1] startup failed due to previous errors

#### Variable Information

%s1 = Web application name

#### Explanation

Failed to start the Web application because of a previous error.

#### Cause

Refer to the message that was output immediately before.

#### User Action

Refer to the exception that occurred immediately before and fix the error.

#### Output Location

Container log

## 17.6.32 JSVLT52342

---

### JSVLT: ERROR: JSVLT52342: Exception stopping Context

#### Explanation

This is an exception that occurs while loading is stopping.

#### Cause

Refer to the message that was also output to the container log.

#### User Action

Refer to the message that was also output to the container log.

#### Output Location

Container log

## 17.6.33 JSVLT52343

---

### JSVLT52343: JSP file %s1 must start with a '/'

#### Variable Information

%s1 = JSP file name

#### Explanation

The JSP file must start with a '/'.

#### Cause

The value for the <jsp-file> tag in the JSP definition specified in the Web application web.xml does not start with a '/'.

#### User Action

In the Web application web.xml, correct the <jsp-file> tag in the JSP definition containing the servlet definition so that it starts with a '/', and then redeploy the Web application.

#### Output Location

Container log

## 17.6.34 JSVLT52344

---

### JSVLT: INFO: JSVLT52347: XML validation enabled

#### Explanation

Validation for the XML file of the application is enabled.

#### Output Location

Container log

## 17.6.35 JSVLT52350

---

### JSVLT: INFO: JSVLT52350: Starting service %s1

#### Variable Information

%s1 = Service name

#### Explanation

The Service is starting.

#### Output Location

Container log

## 17.6.36 JSVLT52351

---

### JSVLT: INFO: JSVLT52351: Stopping service %s1

#### Variable Information

%s1 = IJServer name

#### Explanation

IJServer is stopping.

#### Output Location

Container log

## 17.6.37 JSVLT52352

---

### JSVLT52352: Error allocating a servlet instance

#### Explanation

An exception occurred when the servlet instance was initialized.

#### Cause

Cannot find the class, or the constructor may have thrown an exception.

#### User Action

Refer to the container log and fix the error based on the contents of the error message.

#### Output Location

Container log

## 17.6.38 JSVLT52353

---

---

**JSVLT: ERROR: JSVLT52353: Allocate exception for servlet %s1****Variable Information**

%s1 = Servlet name

**Explanation**

Failed to initialize the servlet. This servlet is invalid.

**Cause**

Possible causes are as follows:

- Cannot find the servlet class
- Failed to create the class
- The init method threw an exception

**User Action**

Refer to the contents of the exception and fix the error.

**Output Location**

Container log

---

**17.6.39 JSVLT52354**

---

**JSVLT: ERROR: JSVLT52354: Deallocate exception for servlet %s1****Variable Information**

%s1 = Servlet name

**Explanation**

Servlet release processing failed.

**Cause**

The servlet destroy method failed.

**User Action**

Refer to the contents of the exception and fix the error.

**Output Location**

Container log

---

**17.6.40 JSVLT52355**

---

**JSVLT52355: Servlet.destroy() for servlet %s1 threw exception****Variable Information**

%s1 = Servlet name

**Explanation**

Servlet.destroy() of the servlet threw an exception.

**Cause**

An exception occurred while processing the servlet application destroy method.

#### User Action

Refer to the container log and fix the error based on the contents of the error message.

#### Output Location

Container log

### 17.6.41 JSVLT52356

---

#### **JSVLT52356: Servlet.init() for servlet %s1 threw exception**

#### Variable Information

%s1 = Servlet name

#### Explanation

Servlet.init() threw an exception.

#### Cause

An exception occurred during servlet application initialization processing.

#### User Action

An error occurred while processing the servlet application init method. Refer to the container log and fix the error based on the contents of the error message.

#### Output Location

Container log

### 17.6.42 JSVLT52357

---

#### **JSVLT52357: Error instantiating servlet class %s1**

#### Variable Information

%s1 = Servlet class name

#### Explanation

An error occurred instantiating the servlet class.

#### Cause

An exception occurred instantiating the servlet class instance, or the constructor class may have thrown an exception.

#### User Action

Refer to the container log and fix the error based on the contents of the error message.

#### Output Location

Container log

### 17.6.43 JSVLT52358

---

#### **JSVLT: ERROR: JSVLT52358: Servlet %s1 is currently unavailable**

#### Variable Information

%s1 = Servlet name

#### Explanation

This servlet is currently unavailable because the servlet initialization failed.

## Cause

Possible causes are as follows:

- Cannot find the servlet class
- Failed to create the class
- The init method threw an exception

## User Action

Refer to the contents of the exception and fix the error.

## Output Location

Container log

## Note

If this message is output as part of an Exception message, it displays as follows:

JSVLT52358: Servlet %s1 is currently unavailable

## 17.6.44 JSVLT52359

---

### **JSVLT: ERROR: JSVLT52359: Servlet %s1 threw load() exception**

#### Variable Information

%s1 = Servlet name

#### Explanation

This servlet is currently unavailable because the servlet load failed.

#### Cause

Possible causes are as follows:

- Cannot find the servlet class
- Failed to create the class
- The init method threw an exception

#### User Action

Refer to the contents of the exception and fix the error.

#### Output Location

Container log

## 17.6.45 JSVLT52360

---

### **JSVLT52360: Wrapper cannot find servlet class %s1 or a class it depends on**

#### Variable Information

%s1 = Servlet class name

#### Explanation

Cannot find the servlet class or the class that the servlet class depends on.

#### Cause

The servlet class you tried to call does not exist, or there is no access authority for the servlet class.

#### User Action

Check that the servlet class exists in the Web application, and then redeploy the Web application.

#### Output Location

Container log

### 17.6.46 JSVLT52361

---

#### **JSVLT52361: No servlet class has been specified for servlet %s1**

#### Variable Information

%s1 = Servlet name

#### Explanation

No servlet class has been specified.

#### Cause

An attempt was made to call a servlet class that has not been defined in web.xml.

#### User Action

There may be no <servlet-class> tag element for the <servlet> tag in the Web application web.xml. Check the Web application web.xml, and then redeploy the Web application.

#### Output Location

Container log

### 17.6.47 JSVLT52363

---

#### **JSVLT52363: Class %s1 is not a Servlet**

#### Variable Information

%s1 = Class name

#### Explanation

The specified class is not a servlet.

#### Cause

The class (%s1) does not inherit the javax.servlet.http.HttpServlet or javax.servlet.GenericServlet classes, so it cannot be called as a servlet.

#### User Action

Correct the Web application so that the class (%s1) inherits the javax.servlet.http.HttpServlet or javax.servlet.GenericServlet class.

#### Output Location

Container log

### 17.6.48 JSVLT52365

---

#### **JSVLT: ERROR: JSVLT52365: Release filters exception for servlet %s1**

#### Variable Information

%s1 = Servlet name

#### Explanation

The servlet filter exception is released.

#### Cause

An exception occurred during filter application close processing in the Servlet application.

#### User Action

Refer to the container log and fix the error based on the error message.

#### Output Location

Container log

### 17.6.49 JSVLT52366

---

**JSVLT: ERROR: JSVLT52366: Servlet.service() for servlet %s1 threw exception**

#### Variable Information

%s1 = Servlet name

#### Explanation

Servlet.service() threw an exception.

#### Cause

The servlet service method returned an exception.

#### User Action

Refer to the contents of the exception and fix the error.

#### Output Location

Container log

### 17.6.50 JSVLT52367

---

**JSVLT: INFO: JSVLT52367: Marking servlet %s1 as unavailable**

#### Variable Information

%s1 = Servlet name

#### Explanation

This servlet is currently unavailable because the servlet initialization failed.

#### Output Location

Container log

### 17.6.51 JSVLT52368

---

**JSVLT: ERROR: JSVLT52368: Servlet %s1 threw unload() exception**

#### Variable Information

%s1 = Servlet name

#### Explanation

The servlet threw the unload() exception.

#### Cause

The servlet destroy method failed.

#### User Action

Refer to the contents of the exception and fix the error.

#### Output Location

Container log

---

### 17.6.52 JSVLT52371

---

#### **JSVLT: ERROR: JSVLT52371: ContainerBase.removeChild: stop:**

#### Explanation

Failed to stop the Container.

#### Cause

Refer to the exception information that was also output.

#### User Action

Fix the cause of the error based on the exception information.

#### Output Location

Container log

---

### 17.6.53 JSVLT52374

---

#### **JSVLT: ERROR: JSVLT52374: Exception invoking periodic operation:**

#### Explanation

An error occurred during background thread processing.

#### Cause

Refer to the message that was also output to the container log.

#### User Action

Refer to the message that was also output to the container log.

#### Output Location

Container log

---

### 17.6.54 JSVLT52375

---

#### **JSVLT: ERROR: JSVLT52375: createWrapper**

#### Explanation

Failed to create Wrapper.

#### Cause

Refer to the exception information that was also output.

#### User Action

Fix the cause of the error based on the exception information that was also output.

Output Location

Container log

## 17.6.55 JSVLT52379

---

### **JSVLT: ERROR: JSVLT52379: Error filterStart**

Explanation

Failed to initialize the filter class.

Cause

Possible causes are as follows:

- Cannot find the filter class
- Failed to create the class
- The init method threw an exception

User Action

Refer to the contents of the exception and fix the error.

Output Location

Container log

## 17.6.56 JSVLT52380

---

### **JSVLT: ERROR: JSVLT52380: Error getConfigured**

Explanation

An error occurred parsing web.xml.

Cause

Refer to the message that was also output.

User Action

Refer to the message that was also output.

Output Location

Container log

## 17.6.57 JSVLT52381

---

### **JSVLT: ERROR: JSVLT52381: Error in dependencyCheck**

Explanation

An error occurred checking the option package that the application depends on.

Cause

The contents of the manifest file are incorrect.

User Action

Check that the manifest file is correct based on the exception information that was also output.

Output Location

Container log

---

## 17.6.58 JSVLT52382

---

**JSVLT: ERROR: JSVLT52382: Error in resourceStart()**

Explanation

An error occurred while the resource was starting.

Cause

Refer to the message that was also output.

User Action

Refer to the message that was also output.

Output Location

Container log

---

## 17.6.59 JSVLT52383

---

**JSVLT: ERROR: JSVLT52383: Error listenerStart**

Explanation

An error occurred while the listener was starting.

Cause

Refer to the message that was also output.

User Action

Refer to the message that was also output.

Output Location

Container log

---

## 17.6.60 JSVLT52384

---

**JSVLT: ERROR: JSVLT52384: Error reading tld listeners %s1**

Variable Information

%s1 = Detailed information

Explanation

An error occurred during reading of the tag library descriptor.

Cause

Refer to the detailed information.

User Action

Fix the cause of the error based on the detailed information.

Output Location

Container log

## 17.6.61 JSVLT52394

---

### [JSVLT: INFO: JSVLT52394: Starting Servlet Engine: %s1](#)

#### Variable Information

%s1 = Servlet container version information

#### Explanation

This is the servlet container version information.

#### Output Location

Container log

## 17.7 JSVLT52400 to JSVLT52499

---

This section details messages numbered between JSVLT52400 and JSVLT52499.

### 17.7.1 JSVLT52403

---

#### [JSVLT: ERROR: JSVLT52403: Connector.initialize](#)

#### Explanation

Failed to initialize the Web server connector connection function.

#### Cause

Refer to the message that was also output to the container log.

#### User Action

Refer to the message that was also output to the container log.

#### Output Location

Container log

### 17.7.2 JSVLT52404

---

#### [JSVLT: ERROR: JSVLT52404: Connector.start](#)

#### Explanation

Failed to start the Web server connector connection function.

#### Cause

Refer to the message that was also output to the container log.

#### User Action

Refer to the message that was also output to the container log.

#### Output Location

Container log

### 17.7.3 JSVLT52405

---

#### [JSVLT: ERROR: JSVLT52405: Connector.stop](#)

## Explanation

Failed to stop the Web server connector connection function.

## Cause

Refer to the message that was also output to the container log.

## User Action

Refer to the message that was also output to the container log.

## Output Location

Container log

## 17.8 JSVLT52700 to JSVLT52799

---

This section details messages numbered between JSVLT52700 and JSVLT52799.

### 17.8.1 JSVLT52700

---

#### **JSVLT: ERROR: JSVLT52700: Resource '%s1' is missing**

#### Variable Information

%s1 = Resource name

#### Explanation

Cannot find the resource (%s1).

#### Cause

The resources may have been damaged or deleted during the application.

#### User Action

Refer to the Web application deployment directory and check that the resources, such as the application and the settings file, exist.

#### Output Location

Container log

### 17.8.2 JSVLT52701

---

#### **JSVLT: INFO: JSVLT52701: Additional JARs have been added : '%s1'**

#### Variable Information

%s1 = JAR file name

#### Explanation

A JAR file (%s1) was added.

#### Output Location

Container log

### 17.8.3 JSVLT52702

---

#### **JSVLT: INFO: JSVLT52702: Additional JARs have been added**

#### Explanation

A JAR file was added.

Output Location

Container log

## 17.8.4 JSVLT52704

---

**JSVLT: INFO: JSVLT52704: validateJarFile(%s1) - jar not loaded. See Servlet Spec 2.3, section 9.7.2. Offending class: %s2**

Variable Information

%s1 = JAR file name

%s2 = Class name

Explanation

The JAR file is illegal.

Cause

The JAR file may contain the servlet class (javax.servlet.Servlet).

User Action

Check the contents of the JAR file.

Output Location

Container log

## 17.9 JSVLT53100 to JSVLT53199

---

This section details messages numbered between JSVLT53100 and JSVLT53199.

### 17.9.1 JSVLT53150

---

**JSVLT: INFO: JSVLT53150: Cannot allocate servlet instance for path %s1**

Variable Information

%s1 = Servlet path

Explanation

Failed to initialize the servlet. This servlet is invalid.

Cause

Possible causes are as follows:

- Cannot find the servlet class
- Failed to create the class
- The init method threw an exception

User Action

Refer to the contents of the exception and fix the error.

Output Location

Container log

Note

If this message is output as part of an Exception message, it displays as follows:

JSVLT53150: Cannot allocate servlet instance for path %s1

## 17.9.2 JSVLT53151

---

**JSVLT: INFO: JSVLT53151: Cannot create servlet wrapper for path %s1**

### Variable Information

%s1 = Servlet path

### Explanation

Failed to create the servlet wrapper.

### Cause

Refer to the message that was also output to the container log.

### User Action

Refer to the message that was also output to the container log.

### Output Location

Container log

### Note

If this message is output as part of an Exception message, it displays as follows:

JSVLT53151: Cannot create servlet wrapper for path %s1

## 17.9.3 JSVLT53152

---

**JSVLT: INFO: JSVLT53152: Cannot deallocate servlet instance for path %s1**

### Variable Information

%s1 = Servlet path

### Explanation

The allocation of the servlet instance cannot be released.

### Cause

The servlet destroy method failed.

### User Action

Refer to the contents of the exception and fix the error.

### Output Location

Container log

### Note

If this message is output as part of an Exception message, it displays as follows:

JSVLT53152: Cannot deallocate servlet instance for path %s1

## 17.9.4 JSVLT53153

---

**JSVLT53153: No servlet name or class was specified in path %s1**

## Variable Information

%s1 = Servlet path

## Explanation

The servlet name or class name was not specified in path %s1.

## Cause

The application may be incorrect.

## User Action

Check whether the servlet name or class name was specified for the ServletContext#getRequestDispatcher() method parameter.

## Output Location

Container log

## 17.9.5 JSVLT53154

---

### JSVLT53154: Cannot call invoker servlet with a named dispatcher

## Explanation

The invoker servlet cannot be called using the dispatcher of that name.

## Cause

The application may be incorrect.

## User Action

Check that the correct servlet name was specified for the ServletContext#getNamedDispatcher() method parameter.

## Output Location

Container log

## 17.10 JSVLT53200 to JSVLT53299

---

This section details messages numbered between JSVLT53200 and JSVLT53299.

### 17.10.1 JSVLT53206

---

#### JSVLT: ERROR: JSVLT53206: Exception initializing random number generator of class %s1

## Variable Information

%s1 = Class name

## Explanation

This is an exception for initialization of the random number generator for class %s1.

## Cause

Failed to create the session ID using the java.security.SecureRandom class.

## System Action

The session ID is created again using the java.util.Random class, and processing is continued.

## User Action

Fix the cause of the error based on the exception information that was also output to the container log.

Output Location

Container log

## 17.10.2 JSVLT53214

---

### **JSVLT: ERROR: JSVLT53214: Session attribute event listener threw exception**

Explanation

The attributeRemoved, attributeAdded, attributeReplaced, sessionDidActivate, or sessionWillPassivate method of the listener class threw an exception.

Cause

The application may be incorrect.

User Action

Refer to the contents of the exception and fix the error.

Output Location

Container log

## 17.10.3 JSVLT53215

---

### **JSVLT: ERROR: JSVLT53215: Session binding event listener threw exception**

Explanation

The valueBound or valueUnbound method of the listener class threw an exception.

Cause

The application may be incorrect.

User Action

Refer to the contents of the exception and fix the error.

Output Location

Container log

## 17.10.4 JSVLT53216

---

### **JSVLT53216: invalidate: Session already invalidated**

Explanation

The session is already invalidated.

Cause

The IllegalStateException exception occurred because the invalidate method was called for an invalidated session.

User Action

The invalidate method cannot be called for an invalidated session instance (HttpSession instance). Check whether the invalidate method was called for a session instance that has already been invalidated in the Web application.

Output Location

Container log

## 17.10.5 JSVLT53217

---

### JSVLT53217: isNew: Session already invalidated

#### Explanation

The session is already invalidated.

#### Cause

The `IllegalStateException` exception occurred because the `isNew` method was called for an invalidated session.

#### User Action

The `isNew` method cannot be called for an invalidated session instance (`HttpSession` instance). Check whether the `isNew` method was called for a session instance that has already been invalidated in the Web application.

#### Output Location

Container log

## 17.10.6 JSVLT53218

---

### JSVLT53218: getAttribute: Session already invalidated

#### Explanation

The session is already invalidated.

#### Cause

The `IllegalStateException` exception occurred because the `getAttribute` method was called for an invalidated session.

#### User Action

The `getAttribute` method cannot be called for an invalidated session instance (`HttpSession` instance). Check whether the `getAttribute` method was called for a session instance that has already been invalidated in the Web application.

#### Output Location

Container log

## 17.10.7 JSVLT53219

---

### JSVLT53219: getAttributeNames: Session already invalidated

#### Explanation

The session is already invalidated.

#### Cause

The `IllegalStateException` exception occurred because the `getAttributeNames` method was called for an invalidated session.

#### User Action

The `getAttributeNames` method cannot be called for an invalidated session instance (`HttpSession` instance). Check whether the `getAttributeNames` method was called for a session instance that has already been invalidated in the Web application.

#### Output Location

Container log

## 17.10.8 JSVLT53220

---

### JSVLT53220: getCreationTime: Session already invalidated

## Explanation

The session is already invalidated.

## Cause

The `IllegalStateException` exception occurred because the `getCreationTime` method was called for an invalidated session.

## User Action

The `getCreationTime` method cannot be called for an invalidated session instance (`HttpSession` instance). Check whether the `getCreationTime` method was called for a session instance that has already been invalidated in the Web application.

## Output Location

Container log

## 17.10.9 JSVLT53221

---

### [JSVLT53221: getLastAccessedTime: Session already invalidated](#)

## Explanation

The session is already invalidated.

## Cause

The `IllegalStateException` exception occurred because the `getLastAccessedTime` method was called for an invalidated session.

## User Action

The `getLastAccessedTime` method cannot be called for an invalidated session instance (`HttpSession` instance). Check whether the `getLastAccessedTime` method was called for a session instance that has already been invalidated in the Web application.

## Output Location

Container log

## 17.10.10 JSVLT53222

---

### [JSVLT53222: getValueNames: Session already invalidated](#)

## Explanation

The session is already invalidated.

## Cause

The `IllegalStateException` exception occurred because the `getValueNames` method was called for an invalidated session.

## User Action

The `getValueNames` method cannot be called for an invalidated session instance (`HttpSession` instance). Check whether the `getValueNames` method was called for a session instance that has already been invalidated in the Web application.

## Output Location

Container log

## 17.10.11 JSVLT53224

---

### [JSVLT53224: removeAttribute: Session already invalidated](#)

## Explanation

The session is already invalidated.

## Cause

The `IllegalStateException` exception occurred because the `removeAttribute` method was called for an invalidated session.

## User Action

The `removeAttribute` method cannot be called for an invalidated session instance (`HttpSession` instance). Check whether the `removeAttribute` method was called for a session instance that has already been invalidated in the Web application.

## Output Location

Container log

## 17.10.12 JSVLT53225

---

### **JSVLT: ERROR: JSVLT53225: Session event listener threw exception**

## Explanation

The `sessionCreated` or `sessionDestroyed` method of the listener class returned an exception.

## Cause

The application may be incorrect.

## User Action

Refer to the contents of the exception and fix the error.

## Output Location

Container log

## 17.10.13 JSVLT53226

---

### **JSVLT53226: setAttribute: Non-serializable attribute**

## Explanation

An object that did not implement `java.io.Serializable` was set in the session.

## Cause

The Web application set an object that did not implement `java.io.Serializable` in the session. If you are using the session recovery function, the object set in the session must implement `java.io.Serializable`.

## User Action

Check whether the Web application has set an object that did not implement `java.io.Serializable` in the session.

## Output Location

Container log

## 17.10.14 JSVLT53227

---

### **JSVLT53227: setAttribute: Session already invalidated**

## Explanation

The session is already invalidated.

## Cause

The `IllegalStateException` exception occurred because the `setAttribute` method was called for an invalidated session.

## User Action

The `setAttribute` method cannot be called for an invalidated session instance (`HttpSession` instance). Check whether the `setAttribute` method was called for a session instance that has already been invalidated in the Web application.

## Output Location

Container log

## 17.10.15 JSVLT53228

---

### **JSVLT53228: setAttribute: name parameter cannot be null**

## Explanation

The name parameter of the `setAttribute` method cannot be null.

## Cause

The `IllegalArgumentException` exception occurred because null was given as the attribute name in the method argument.

## User Action

Check whether processing in the Web application is for an attribute in the `setAttribute` method with the name "null".

## Output Location

Container log

## 17.11 JSVLT53300 to JSVLT53399

---

This section details messages numbered between JSVLT53300 and JSVLT53399.

### 17.11.1 JSVLT53300

---

#### **JSVLT: ERROR: JSVLT53300: Error closing application web.xml**

## Explanation

An error occurred closing the application `web.xml`.

## Cause

Refer to the exception information that was also output to the container log.

## User Action

Fix the cause of the error based on the exception information that was also output to the container log.

## Output Location

Container log

### 17.11.2 JSVLT53301

---

#### **JSVLT: ERROR: JSVLT53301: Parse error in application web.xml file at %s1**

## Variable Information

%s1 = File name

## Explanation

Failed to parse the context (Web application) web.xml.

## Cause

The web.xml contents may be incorrect.

## User Action

Refer to the contents of the SAX exception that occurred immediately before and fix the error.

Additionally, refer to the chapter "Web Application Environment Definition File (Deployment Descriptor)" in the "J2EE User's Guide", and check whether a tag that is not supported was used, or that the description is correct.

## Output Location

Container log

## 17.11.3 JSVLT53302

---

**JSVLT: ERROR: JSVLT53302: Occurred at line %s1 column %s2**

## Variable Information

%s1 = Line number (This is -1 if the line number cannot be identified)

%s2 = Column number (This is -1 if the column number cannot be identified)

## Explanation

Failed to parse the context (Web application) web.xml.

## Cause

The web.xml contents may be incorrect.

## User Action

Check the location in the web.xml indicated in the variable information. Additionally, refer to the contents of the SAX exception that was output before and immediately after this message and fix the error.

## Output Location

Container log

## 17.11.4 JSVLT53303

---

**JSVLT: ERROR: JSVLT53303: Cannot instantiate an authenticator of class %s1**

## Variable Information

%s1 = Class name

## Explanation

Failed to create the authenticatorClass instance.

## Cause

There may be insufficient memory.

#### User Action

If there is insufficient memory, refer to "Tuning of IIServer " in the chapter "Tuning J2EE Applications" of the "Tuning Guide" and take the required action. If the problem is still not resolved, contact a Systems Engineer.

#### Output Location

Container log

---

### 17.11.5 JSVLT53304

---

#### **JSVLT: ERROR: JSVLT53304: Cannot configure an authenticator for method %s1**

#### Variable Information

%s1 = Authentication method name

#### Explanation

Failed to configure an authenticator for the authentication method (%s1).

#### Cause

The contents of the Web application environment definition file auth-method tag are incorrect.

#### User Action

Check the contents of the Web application environment definition file auth-method tag.

#### Output Location

Container log

---

### 17.11.6 JSVLT53305

---

#### **JSVLT: ERROR: JSVLT53305: Cannot load authenticators mapping list**

#### Explanation

Cannot load the authenticator mapping list.

#### Cause

Refer to the exception information that was also output to the container log.

#### User Action

Fix the cause of the error based on the exception information that was also output to the container log.

#### Output Location

Container log

---

### 17.11.7 JSVLT53306

---

#### **JSVLT: ERROR: JSVLT53306: Error closing default web.xml**

#### Explanation

An error occurred closing the default web.xml.

#### Cause

Refer to the exception information that was also output to the container log.

#### User Action

Fix the cause of the error based on the exception information that was also output to the container log.

Output Location

Container log

## 17.11.8 JSVLT53307

---

**JSVLT: ERROR: JSVLT53307: Missing default web.xml, using application web.xml only**

Explanation

Cannot find the default web.xml.

Cause

The IJServer internal settings file (web.xml) does not exist, or there is no access authority.

User Action

If the file shown below exists, check the access authority. If it does not exist, create the IJServer again.

**Windows32/64**

General J2EE directory\ijserver\IJServer WorkUnit name\web.xml

(The default general J2EE directory is C:\Interstage\J2EE\var\deployment)

**Solaris32/64 Linux32/64**

General J2EE directory/ijserver/IJServer WorkUnit name/web.xml

(The default general J2EE directory is /opt/FJSVj2ee/var/deployment)

Output Location

Container log

## 17.11.9 JSVLT53308

---

**JSVLT: ERROR: JSVLT53308: Parse error in default web.xml**

Explanation

This is a parse error in the default web.xml.

Cause

The contents of web.xml (the Web application environment definition file) may be incorrect.

User Action

Check that the web.xml contents are correct.

Output Location

Container log

## 17.11.10 JSVLT53309

---

**JSVLT: ERROR: JSVLT53309: Occurred at line %s1 column %s2**

Variable Information

%s1 = Line number (This is -1 if the line number cannot be identified)

%s2 = Column number (This is -1 if the column number cannot be identified)

## Explanation

Failed to parse the default web.xml.

## Cause

The default web.xml contents may be incorrect.

## User Action

Check the contents of the file shown below.

### Windows32/64

General J2EE directory\ijserver\IJServer WorkUnit name\web.xml

(The default general J2EE directory is C:\Interstage\J2EE\var\deployment)

### Solaris32/64 Linux32/64

General J2EE directory/ijserver/IJServer WorkUnit name/web.xml

(The default general J2EE directory is /opt/FJSVj2ee/var/deployment)

## Output Location

Container log

## 17.11.11 JSVLT53312

---

**JSVLT: WARNING: JSVLT53312: Security role name %s1 used in an <auth-constraint> without being defined in a <security-role>**

### Variable Information

%1: Security role name

### Explanation

The security role name (%1) that was used was not defined in the <security-role> definition of the web.xml <auth-constraint> definition. Processing continues for the security role name %s1 that is defined in the <security-role> definition.

### Output Location

Container log

## 17.11.12 JSVLT53313

---

**JSVLT: WARNING: JSVLT53313: Security role name %s1 used in a <role-link> without being defined in a <security-role>**

### Variable Information

%1: Security role name

### Explanation

The security role name (%1) that was used was not defined in the <security-role> definition of the web.xml <role-link> definition. Processing continues for the security role name %s1 that is defined in the <security-role> definition.

### Output Location

Container log

## 17.11.13 JSVLT53314

---

**JSVLT: WARNING: JSVLT53314: Security role name %s1 used in a <run-as> without being defined in a <security-role>**

### Variable Information

%s1 = Security role name

### Explanation

The security role name (%1) that was used was not defined in the <security-role> definition of the web.xml <run-as> definition. Processing continues for the security role name %s1 that is defined in the <security-role> definition.

### Output Location

Container log

## 17.11.14 JSVLT53315

---

**JSVLT: ERROR: JSVLT53315: Exception processing TLD %s1 in JAR at resource path %s2 in context %s3**

### Variable Information

%s1 = TagLibraryDescriptor file

%s2 = JAR file path

%s3 = Web application name

### Explanation

This is an exception that is used during processing of TLD %s1 of the JAR file in resource path %s2 of Web application %3.

### Cause

Possible causes are as follows:

- The JAR file indicated in the JAR file path does not exist.
- There is no access authority for the JAR file indicated in the JAR file path.
- There is no TagLibraryDescriptor file in the JAR file.

### User Action

Take the following action, and then re-deploy the Web application.

- Add the JAR file to the path indicated in the JAR file path, and then create the WAR file.
- Add access authority to the JAR file indicated in the JAR file path, and then create the WAR file.
- Add the TagLibraryDescriptor file to the JAR file indicated in the JAR file path, and then create the WAR file.

### Output Location

Container log

## 17.11.15 JSVLT53316

---

**JSVLT53316: Exception processing TLD at resource path %s1 in context %s2**

## Variable Information

%s1 = TagLibraryDescriptor file

%s2 = Web application name

## Explanation

This exception occurs during processing of the TLD of resource path %s1 of Web application %2.

## Cause

- The TagLibraryDescriptor file specified for tag library mapping in the <taglib-location> tag of the Web application web.xml does not exist.
- There is a TagLibraryDescriptor file that contains an error in the XML syntax under the Web application WEB-INF.

## User Action

Take the following action, and then re-deploy the Web application.

- Store the TagLibraryDescriptor file in the path described in the <taglib-location> tag of the Web application web.xml, and then create the WAR file.
- Check the TagLibraryDescriptor file, and correct the error locations in the XML syntax.

## Output Location

Container log

## 17.11.16 JSVLT53317

---

### **JSVLT: ERROR: JSVLT53317: Exception processing JAR at resource path %s1 in context %s2**

## Variable Information

%s1 = JAR file

%s2 = Web application name

## Explanation

This exception occurs during processing of the JAR file of resource path %s1 of Web application %2.

## Cause

- The JAR files does not exist.
- There is no read authority for the JAR file.

## User Action

- Check whether the JAR file exists.
- Check whether there is read authority for the JAR file.

## Output Location

Container log

## 17.11.17 JSVLT53318

---

### **JSVLT53318: Invalid TLD resource path %s1**

## Variable Information

%s1 = TagLibraryDescriptor file path

## Explanation

This exception occurs during processing of the TLD of the resource path (%s1).

## Cause

- The TagLibraryDescriptor file specified for tag library mapping in the <taglib-location> tag of the Web application web.xml does not exist.
- There is a TagLibraryDescriptor file that contains an error in the XML syntax under the Web application WEB-INF.

## User Action

Take the following action, and then re-deploy the Web application.

- Store the TagLibraryDescriptor file in the path specified in the <taglib-location> tag of the Web application web.xml, and then create the WAR file.
- Check the TagLibraryDescriptor file, and correct the error locations in the XML syntax.

## Output Location

Container log

## 17.11.18 JSVLT53319

---

### **JSVLT: ERROR: JSVLT53319: Marking this application unavailable due to previous error(s)**

## Explanation

This application is marked as being unavailable because of a previous error.

## Cause

An error occurred while starting the context (Web application).

## User Action

Refer to the exception that occurred immediately before and fix the error.

## Output Location

Container log

## 17.11.19 JSVLT53323

---

### **JSVLT: ERROR: JSVLT53323: Cannot find specified temporary folder at %s1**

## Variable Information

%s1 = Directory name

## Explanation

Cannot find the specified temporary directory %s1.

## Cause

The temporary directory specified for the "java.io.tmpdir" system property does not exist.

#### User Action

Check whether the directory specified for the "java.io.tmpdir" system property exists.

#### Output Location

Container log

### 17.11.20 JSVLT53333

---

#### **JSVLT: ERROR: JSVLT53333: Error deploying configuration descriptor %s1**

#### Variable Information

%s1 = Internal information

#### Explanation

This error occurs deploying the configuration descriptor (%s1).

Note: The configuration descriptor is an internal configuration file. Do not edit this file.

#### Cause

The web.xml may be incorrect.

#### User Action

Check that the web.xml description is correct.

Fix the cause of the error based on the exception information that is output before and after this error.

#### Output Location

Container log

### 17.11.21 JSVLT53334

---

#### **JSVLT: WARNING: JSVLT53334: A docBase %s1 inside the host appBase has been specified, and will be ignored**

#### Variable Information

%s1 = Document base

#### Explanation

Document base (%s1) is the directory under appBase. The specified document base is ignored.

#### Output Location

Container log

### **JSVLT: WARNING: JSVLT53351: Can't load server.xml from %s1**

#### Variable Information

%s1 = server.xml path name

#### Explanation

Failed to read server.xml.

#### Cause

- server.xml does not exist.
- There is no read authority for server.xml.

#### User Action

- Check whether server.xml exists. If it does not, create IJServer again.
- Assign read authority for server.xml.

#### Output Location

Container log

## 17.11.27 JSVLT53352

---

### **JSVLT: WARNING: JSVLT53352: Catalina.start using %s1 :**

#### Variable Information

%s1 = server.xml path name

#### Explanation

Failed to start the runtime.

#### Cause

server.xml is incorrect.

#### User Action

Fix the cause of the error based on the exception information that was also output.

Output Location

Container log

## 17.11.28 JSVLT53353

---

### **JSVLT: WARNING: JSVLT53353: Failed to load catalina.properties**

Explanation

Failed to read catalina.properties.

Cause

Refer to the message that was also output to the container log.

User Action

Refer to the message that was also output to the container log.

Output Location

Container log

## 17.11.29 JSVLT53354

---

### **JSVLT: INFO: JSVLT53354: No default web.xml**

Explanation

Cannot find the default web.xml.

Cause

The IJServer internal settings file (web.xml) does not exist, or there is no access authority.

User Action

If the file shown below exists, check the access authority. If it does not exist, create the IJServer again.

**Windows32/64**

General J2EE directory\ijserver\IJServer WorkUnit name\web.xml

(The default general J2EE directory is C:\Interstage\J2EE\var\deployment)

**Solaris32/64** **Linux32/64**

General J2EE directory/ijserver/IJServer WorkUnit name/web.xml

(The default general J2EE directory is /opt/FJSVj2ee/var/deployment)

Output Location

Container log

## 17.11.30 JSVLT53355

---

### **JSVLT: INFO: JSVLT53355: No web.xml, using defaults %s1**

Variable Information

%s1 = Internal information

## Explanation

Cannot find the web.xml of the application. Only the default web.xml is used.

## Output Location

Container log

## 17.11.31 JSVLT53361

---

### **JSVLT: INFO: JSVLT53361: Configured an authenticator for method %s1**

#### Variable Information

%s1 = Authentication method

#### Explanation

The authentication method (%s1) authenticator is set in the Servlet container.

## 17.11.32 JSVLT53362

---

### **JSVLT: ERROR: JSVLT53362: Error loading %s1 %s2**

#### Variable Information

%s1 = Class loader name

%s2 = Class name

#### Explanation

Failed to load the class.

#### Cause

Refer to the message that was output at the same time.

#### System Action

The corresponding class is not loaded.

#### User Action

Check that the corresponding class exists in the Web application or class path.

Check that the description for <servlet-class> in the <servlet> tag in web.xml is correct.

Fix the cause of the error based on the exception information that was also output.

## 17.12 JSVLT53600 to JSVLT53699

Fix the cause of the error based on the exception information that was also output.

#### Output Location

Container log

## 17.13 JSVLT53700 to JSVLT53799

---

This section details messages numbered between JSVLT53700 and JSVLT53799.

### 17.13.1 JSVLT53701

---

#### **JSVLT: ERROR: JSVLT53701: Exception sending request initialized lifecycle event to listener instance of class %s1**

#### Variable Information

%s1 = Class name

#### Explanation

requestInitialized of the listener class threw an exception.

#### Cause

The application may be incorrect.

#### User Action

Refer to the contents of the exception output to the container log and fix the error.

#### Output Location

Container log

### 17.13.2 JSVLT53702

---

#### **JSVLT: ERROR: JSVLT53702: Exception sending request destroyed lifecycle event to listener instance of class %s1**

#### Variable Information

%s1 = Class name

#### Explanation

requestDestroyed of the listener class threw an exception.

### Cause

The application may be incorrect.

### User Action

Refer to the contents of the exception that is output to the container log and fix the error.

### Output Location

Container log

## 17.13.3 JSVLT53752

---

### JSVLT53752: Name %s1 is not bound in this Context

#### Variable Information

%s1 = Key name

#### Explanation

The name (%s1) is not bound in this context.

#### Cause

The key specified in the Web application is not bound in this context.

#### User Action

Check that the Web application is correct.

#### Output Location

Container log

## 17.13.4 JSVLT53753

---

### JSVLT53753: Context is read only

#### Explanation

Context is read only.

#### Cause

An update was performed for a read only context in the Web application.

#### User Action

Check whether an update was performed for a read only context in the Web application.

#### Output Location

Container log

## 17.14 JSVLT53900 to JSVLT53999

---

This section details messages numbered between JSVLT53900 and JSVLT53999.

### 17.14.1 JSVLT53900

---

#### JSVLT53900: Document base %s1 does not exist or is not a readable directory

#### Variable Information

%s1 = Path name

## Explanation

Document base %s1 does not exist, or is not a readable directory.

## Cause

Possible causes are as follows:

- The webapps directory used for storing IJServer Web application resources does not exist, or the directory (%s) launched for the deployed Web application does not exist.
- Read permissions have not been assigned for the webapps directory.

## User Action

- Check whether the webapps directory and the directory (%s) launched for the deployed Web application exist.
- Assign read authority for the webapps directory.

## Output Location

Container log

## 17.14.2 JSVLT53901

---

### **JSVLT: WARNING: JSVLT53901: Could not get dir listing for %s1**

## Variable Information

%s1 = Path name

## Explanation

Failed to list the resources under the directory (%s1).

## Cause

Possible causes are as follows:

- The directory does not exist.
- There is no read authority for the directory.

## User Action

- Redeploy the application.
- Assign read authority for the directory.

## Output Location

Container log

## 17.14.3 JSVLT53904

---

### **JSVLT53904: Resource %s1 not found**

## Variable Information

%s1 = Resource name

## Explanation

Cannot find the resource (%s1).

## Cause

The resource (%s1) does not exist.

#### User Action

Check whether the resource exists.

#### Output Location

Container log

## 17.15 JSVLT55300 to JSVLT55399

---

This section details messages numbered between JSVLT55300 and JSVLT55399.

### 17.15.1 JSVLT55353

---

#### **JSVLT: ERROR: JSVLT55353: Compilation error**

##### Explanation

A compilation error occurred.

##### Cause

- An error occurred reading the Java file generated from the JSP.
- There was not enough available disk space.

##### User Action

Increase available disk space by deleting unnecessary files. Additionally, fix the error based on the exception information that was also output.

##### Output Location

Container log

### 17.15.2 JSVLT55357

---

#### **JSVLT: ERROR: JSVLT55357: Exception parsing file**

##### Explanation

An error occurred during reading of the JSP file.

##### Cause

Refer to the exception information that was also output.

##### User Action

Fix the cause of the error based on the exception information that was also output.

##### Output Location

Container log

### 17.15.3 JSVLT55358

---

#### **JSVLT: ERROR: JSVLT55358: Exception checking if recompile needed: %s1**

##### Variable Information

%s1 = Detailed information

##### Explanation

An exception occurred during recompile check processing.

## Cause

Refer to the detailed information and the message that was output to the container log.

## User Action

Fix the cause of the error based on the detailed information and the message that was output to the container log.

## Output Location

Container log

## 17.16 JSVLT55400 to JSVLT55499

---

This section details messages numbered between JSVLT55400 and JSVLT55499.

### 17.16.1 JSVLT55450

---

**JSVLT: ERROR: JSVLT55450: The scratchDir you specified: %s1 is unusable.**

#### Variable Information

%s1 = scratchDir value

#### Explanation

The directory name specified for scratchdir in <init-param> of web.xml is incorrect.

#### Cause

Possible causes are as follows:

- The directory does not exist.
- There is no read or write authority for the directory.
- A file with the same name as the specified directory already exists.

#### User Action

- Check whether the directory exists.
- Assign read and write authority for the directory.

#### Output Location

Container log

### 17.16.2 JSVLT55451

---

**JSVLT55451: Illegal value of 'scope' attribute: %s1 (must be one of "page", "request", "session", or "application")**

#### Variable Information

%s1 = Invalid value for the 'scope' attribute

#### Explanation

The value for the 'scope' attribute is invalid.

#### Cause

The contents of the <jsp:useBean> tag 'scope' attribute are incorrect.

#### User Action

Check the contents of the `<jsp:useBean>` tag 'scope' attribute.

#### Output Location

Container log

### 17.16.3 JSVLT55452

---

#### **JSVLT55452: Page directive: invalid buffer size**

#### Explanation

page directive: The value for the 'buffer' attribute is invalid.

#### Cause

The contents of the `<%@page>` tag 'buffer' attribute are incorrect.

#### User Action

Check the contents of the `<%@page>` tag buffer attribute.

#### Output Location

Container log

### 17.16.4 JSVLT55453

---

#### **JSVLT55453: Page directive: illegal to have multiple occurrences of 'contentType' with different values (old: %s1, new: %s2)**

#### Variable Information

%s1 = First value

%s2 = Second value

#### Explanation

page directive: 'contentType' is invalid if specified with more than one value.

#### Cause

The contents of the `<%@page>` tag 'contentType' attribute are incorrect. More than one value cannot be set for 'contentType'.

#### User Action

Check the contents of the `<%@page>` tag 'contentType' attribute.

#### Output Location

Container log

### 17.16.5 JSVLT55454

---

#### **JSVLT55454: Page directive: illegal to have multiple occurrences of 'session' with different values (old: %s1, new: %s2)**

#### Variable Information

%s1 = First value

%s2 = Second value

## Explanation

page directive: 'session' is invalid if specified with more than one value.

## Cause

The contents of the <% @page> tag 'session' attribute are incorrect. More than one value cannot be set for 'session'.

## User Action

Check the contents of the <% @page> tag 'session' attribute.

## Output Location

Container log

---

## 17.16.6 JSVLT55455

---

### JSVLT55455: Page directive: invalid value for session

## Explanation

page directive: The value for the 'session' attribute is invalid.

## Cause

The contents of the <% @page> tag 'session' attribute are incorrect. "true" or "false" must be specified for the 'session' attribute.

## User Action

Check the contents of the <% @page> tag 'session' attribute.

## Output Location

Container log

---

## 17.16.7 JSVLT55456

---

### JSVLT55456: Page directive: invalid value for isThreadSafe

## Explanation

page directive: The value for 'isThreadSafe' is invalid.

## Cause

The contents of the <% @page> tag 'isThreadSafe' attribute are incorrect. "true" or "false" must be specified for the 'isThreadSafe' attribute.

## User Action

Check the contents of the <% @page> tag 'isThreadSafe' attribute.

## Output Location

Container log

---

## 17.16.8 JSVLT55457

---

### JSVLT55457: Page directive: invalid value for isErrorPage

## Explanation

page directive: The value for the 'isErrorPage' attribute is invalid.

## Cause

The contents of the <% @page> tag 'isErrorPage' attribute are incorrect. "true" or "false" must be specified for the 'isErrorPage' attribute.

#### User Action

Check the contents of the <%@page> tag 'isErrorPage' attribute.

#### Output Location

Container log

### 17.16.9 JSVLT55458

---

**JSVLT55458: Page directive: illegal to have multiple occurrences of 'language' with different values (old: %s1, new: %s2)**

#### Variable Information

%s1 = First value

%s2 = Second value

#### Explanation

page directive: 'language' is invalid if specified with more than one value.

#### Cause

The contents of the <%@page> tag 'language' attribute are incorrect. More than one value cannot be set for 'language'.

#### User Action

Check the contents of the <%@page> tag 'language' attribute.

#### Output Location

Container log

### 17.16.10 JSVLT55459

---

**JSVLT55459: Page directive: invalid language attribute**

#### Explanation

page directive: The value for the 'language' attribute is invalid.

#### Cause

The contents of the <%@page> tag 'language' attribute are incorrect. Set "java" for the language.

#### User Action

Check the contents of the <%@page> tag 'language' attribute.

#### Output Location

Container log

### 17.16.11 JSVLT55460

---

**JSVLT55460: Page directive: illegal to have multiple occurrences of 'extends' with different values (old: %s1, new: %s2)**

#### Variable Information

%s1 = First value

%s2 = Second value

#### Explanation

page directive: 'extends' is invalid if specified with more than one value.

#### Cause

The contents of the <%@page> tag 'extends' attribute are incorrect. More than one different value cannot be set for 'extends'.

#### User Action

Check the contents of the <%@page> tag 'extends' attribute.

#### Output Location

Container log

## 17.16.12 JSVLT55461

---

### JSVLT55461: Page directive: invalid value for isELIgnored

#### Explanation

page directive: The value specified for 'isELIgnored' is invalid.

#### Cause

The contents of the <%@page> tag 'isELIgnored' attribute are incorrect. "true" or "false" must be specified for the 'isELIgnored' attribute.

#### User Action

Check the contents of the <%@page> tag 'isELIgnored' attribute.

#### Output Location

Container log

## 17.16.13 JSVLT55462

---

### JSVLT55462: Tag directive: illegal to have multiple occurrences of the attribute "%s1" with different values (old: %s2, new: %s3)

#### Variable Information

%s1 = Attribute name

%s2 = First value

%s3 = Second value

#### Explanation

Tag directive: It is illegal to specify more than one value in the attribute.

#### Cause

The contents of the <%@tag> tag attribute are incorrect. More than one value cannot be set for the same attribute in <%@tag>.

#### User Action

Check the contents of the <%@tag> tag attribute.

Output Location

Container log

## 17.16.14 JSVLT55463

---

**JSVLT55463: "%s1" contains invalid expression(s): %s2**

Variable Information

%s1 = EL contents

%s2 = Exception information

Explanation

EL contains an invalid expression.

Cause

EL contains an invalid expression.

User Action

Change the EL contents based on the exception information.

Output Location

Container log

## 17.16.15 JSVLT55464

---

**JSVLT55464: Attempted a bean operation on a null object.**

Explanation

A Bean operation was attempted on a null object.

Cause

The contents of the <jsp:getProperty> 'name' attribute are incorrect.

User Action

Check the contents of the <jsp:getProperty> 'name' attribute.

Output Location

Container log

## 17.16.16 JSVLT55465

---

**JSVLT55465: Can't find a method to write property '%s1' of type '%s2' in a bean of type '%s3'**

Variable Information

%s1 = Property name

%s2 = Property type

%s3 = Bean class name

#### Explanation

Could not find the set method for the `<jsp:setProperty>` 'property' attribute.

#### Cause

The contents of the `<jsp:setProperty>` 'property' attribute are incorrect.

#### User Action

Check the contents of the `<jsp:getProperty>` 'property' attribute.

#### Output Location

Container log

### 17.16.17 JSVLT55466

---

#### **JSVLT55466: Cannot find any information on property '%s1' in a bean of type '%s2'**

#### Variable Information

%s1 = Property name

%s2 = Bean class name

#### Explanation

Could not find the get method for the `<jsp:setProperty>` 'property' attribute.

#### Cause

The contents of the `<jsp:getProperty>` 'property' attribute are incorrect.

#### User Action

Check the contents of the `<jsp:getProperty>` 'property' attribute.

#### Output Location

Container log

### 17.16.18 JSVLT55467

---

#### **JSVLT55467: Cannot set indexed property**

#### Explanation

The value for the attribute array was specified incorrectly.

#### Cause

The contents of the `<jsp:setProperty>` 'value' attribute are incorrect.

#### User Action

Check the contents of the `<jsp:getProperty>` 'value' attribute.

#### Output Location

Container log

## 17.16.19 JSVLT55468

---

### JSVLT55468: Error: Attempt to clear a buffer that's already been flushed

#### Explanation

An attempt was made to clear a buffer that has already been flushed.

#### Cause

The location of the `<jsp:forward>` tag is inappropriate. The contents have already been flushed.

#### User Action

Check that the location of the `<jsp:forward>` tag is correct.

#### Output Location

Container log

## 17.16.20 JSVLT55469

---

### JSVLT55469: Error: JSP Buffer overflow

#### Explanation

There was a JSP buffer overflow.

#### Cause

The size of the contents that have not been flushed exceeded the value specified for the `<@page>` 'buffer' attribute.

#### User Action

Check that the value for the `<@page>` 'buffer' attribute, or the location of `out.flush()` is appropriate.

#### Output Location

Container log

## 17.16.21 JSVLT55470

---

### JSVLT55470: Illegal to clear() when buffer size == 0

#### Explanation

`clear()` is invalid when executed if the buffer size is [0].

#### Cause

The `<jsp:forward>` tag was specified when "none" was specified for the `<@page>` tag 'buffer' attribute.

#### User Action

When using the `<jsp:forward>` tag, specify the buffer size for the `<@page>` tag 'buffer' attribute.

#### Output Location

Container log

## 17.16.22 JSVLT55484

---

### **JSVLT: WARNING: JSVLT55484: Unknown element (%s1) in taglib**

#### Variable Information

%s1 = Unknown element

#### Explanation

There is an unknown element (%s1) in taglib.

#### Cause

An unknown tag (%s1) was specified for the tag library descriptor <taglib> tag.

#### User Action

Check that the contents of the tag library descriptor <taglib> tag are correct.

#### Output Location

Container log

## 17.16.23 JSVLT55485

---

### **JSVLT: WARNING: JSVLT55485: Unknown element (%s1) in tag**

#### Variable Information

%s1 = Unknown element

#### Explanation

There is an unknown element (%s1) in tag.

#### Cause

An unknown tag (%s1) was specified for the tag library descriptor <tag> tag.

#### User Action

Check that the contents of the tag library descriptor <tag> tag are correct.

#### Output Location

Container log

## 17.16.24 JSVLT55486

---

### **JSVLT: WARNING: JSVLT55486: Unknown element (%s1) in tag-file**

#### Variable Information

%s1 = Unknown element

#### Explanation

There is an unknown element (%s1) in tag-file.

#### Cause

An unknown tag (%s1) was specified for the tag library descriptor <tag-file> tag.

#### User Action

Check that the contents of the tag library descriptor <tag-file> tag are correct.

#### Output Location

Container log

### 17.16.25 JSVLT55487

---

#### **JSVLT: WARNING: JSVLT55487: Unknown element (%s1) in attribute**

#### Variable Information

%s1 = Unknown element

#### Explanation

There is an unknown element (%s1) in attribute.

#### Cause

An unknown tag (%s1) was specified for the tag library descriptor <attribute> tag.

#### User Action

Check that the contents of the tag library descriptor <attribute> tag are correct.

#### Output Location

Container log

### 17.16.26 JSVLT55488

---

#### **JSVLT: WARNING: JSVLT55488: Unknown element (%s1) in variable**

#### Variable Information

%s1 = Unknown element

#### Explanation

There is an unknown element (%s1) in variable.

#### Cause

An unknown tag (%s1) was specified for the tag library descriptor <variable> tag.

#### User Action

Check that the contents of the tag library descriptor <variable> tag are correct.

#### Output Location

Container log

### 17.16.27 JSVLT55489

---

#### **JSVLT: WARNING: JSVLT55489: Unknown element (%s1) in validator**

#### Variable Information

%s1 = Unknown element

### Explanation

There is an unknown element (%s1) in validator.

### Cause

An unknown tag (%s1) was specified for the tag library descriptor <validator> tag.

### User Action

Check that the contents of the tag library descriptor <validator> tag are correct.

### Output Location

Container log

## 17.16.28 JSVLT55490

---

### **JSVLT: WARNING: JSVLT55490: Unknown element (%s1) in validator's init-param**

#### Variable Information

%s1 = Unknown element

#### Explanation

There is an unknown element (%s1) in the init-param of validator.

#### Cause

An unknown tag (%s1) was specified for the <init-param> tag of the <validator> tag of the tag library descriptor.

#### User Action

Check that the contents of the <init-param> tag of the <validator> tag of the tag library descriptor are correct.

#### Output Location

Container log

## 17.16.29 JSVLT55491

---

### **JSVLT: WARNING: JSVLT55491: Unknown element (%s1) in function**

#### Variable Information

%s1 = Unknown element

#### Explanation

There is an unknown element (%s1) in function.

#### Cause

An unknown tag (%s1) was specified for the tag library descriptor <function> tag.

#### User Action

Check that the contents of the tag library descriptor <function> tag are correct.

#### Output Location

Container log

## 17.16.30 JSVLT55492

---

### JSVLT55492: Failed to load or instantiate TagExtraInfo class: %s1

#### Variable Information

%s1 = Class name

#### Explanation

Failed to load or instantiate TagExtraInfo class.

#### Cause

The contents of the tag library descriptor <tei-class> tag are incorrect.

#### User Action

Check that the contents of the tag library descriptor <tei-class> tag are correct.

#### Output Location

Container log

## 17.16.31 JSVLT55493

---

### JSVLT: ERROR: JSVLT55493: File "%s1" not found

#### Variable Information

%s1 = File name

#### Explanation

Cannot find JSP file "%s1".

#### Cause

The file (%s1) does not exist.

#### User Action

Check that the file indicated in the variable information exists.

#### Output Location

Container log

#### Note

If this message is output as part of an Exception message, it displays as follows:

JSVLT55493: File "%s1" not found

## 17.16.32 JSVLT55494

---

### JSVLT55494: Unable to find set method for attribute: %s1

#### Variable Information

%s1 = Attribute name

## Explanation

Cannot find the attribute (%s1) set method.

## Cause

The set method for the attribute described for the custom tag was not implemented for the tag handler class.

## User Action

Check that the custom tag description and tag handler class are correct.

## Output Location

Container log

## 17.17 JSVLT55500 to JSVLT55599

---

This section details messages numbered between JSVLT55500 and JSVLT55599.

### 17.17.1 JSVLT55501

---

#### **JSVLT55501: Failed to load or instantiate TagLibraryValidator class: %s1**

#### Variable Information

%s1 = Class name

#### Explanation

Failed to load or instantiate the TagLibraryValidator class.

#### Cause

- The class specified for the tag library descriptor <validator-class> tag does not exist.
- The class specified for the tag library descriptor <validator-class> tag does not inherit TagLibraryValidator.

#### User Action

- Check whether the class specified for the tag library descriptor <validator-class> tag exists.
- Check whether the class specified for the tag library descriptor <validator-class> tag inherits TagLibraryValidator.

#### Output Location

Container log

### 17.17.2 JSVLT55502

---

#### **JSVLT55502: Body of %s1 element must not contain any XML elements**

#### Variable Information

%s1 = Element name

#### Explanation

The body of the element (%s1) must not contain any XML elements.

#### Cause

An XML element was specified in the <jsp:scriptlet> tag.

#### User Action

Check that there are no XML elements specified in the <jsp:scriptlet> tag.

Output Location

Container log

### 17.17.3 JSVLT55503

---

**JSVLT: WARNING: JSVLT55503: Internal Error: File %s1 not found**

Variable Information

%s1 = File name

Explanation

Cannot find the file (%s1).

Cause

The application web.xml does not exist, or it may have been deleted.

User Action

Check whether the application web.xml exists.

If it does not, redeploy the application web.xml.

Output Location

Container log

### 17.17.4 JSVLT55504

---

**JSVLT: ERROR: JSVLT55504: Invalid PUBLIC ID: %s1**

Variable Information

%s1 = Invalid PUBLIC ID

Explanation

PUBLIC ID (%s1) is invalid.

Cause

PUBLIC ID in the tag library descriptor <!DOCTYPE> tag is incorrect.

User Action

Check the contents of the tag library descriptor <!DOCTYPE> tag PUBLIC ID.

Output Location

Container log

### 17.17.5 JSVLT55505

---

**JSVLT55505: Scripting elements ( <%!, <jsp:declaration, <%=, <jsp:expression, <%, <jsp:scriptlet ) are disallowed here.**

Explanation

Scripting elements are not allowed here.

Cause

Scripting elements are described in the <scripting-invalid> tag of the web.xml for JSP.

#### User Action

Check whether scripting elements are described in JSP.

#### Output Location

Container log

### 17.17.6 JSVLT55506

---

**JSVLT55506: Cannot specify both 'fragment' and 'type' attributes. If 'fragment' is present, 'type' is fixed as 'javax.servlet.jsp.tagext.JspFragment'**

#### Explanation

The 'fragment' and 'type' attributes cannot both be specified.

#### Cause

true was specified for the 'fragment' attribute in the tag file <%@attribute> tag, and the 'type' attribute was also specified.

#### User Action

Check that the "'fragment' and 'type' attributes are not both specified for the <%@attribute> tag of the tag file.

#### Output Location

Container log

### 17.17.7 JSVLT55507

---

**JSVLT: WARNING: JSVLT55507: Bad value %s1 in the url-pattern subelement in web.xml**

#### Variable Information

%s1 = Incorrect value

#### Explanation

There is an incorrect value (%s1) in the url-pattern sub-element of web.xml.

#### Cause

The description for the <url-pattern> tag of the <jsp-property-group> tag in web.xml is incorrect.

#### User Action

Check that the <url-pattern> tag of the <jsp-property-group> tag in web.xml is correct.

#### Output Location

Container log

### 17.17.8 JSVLT55508

---

**JSVLT55508: The attribute %s1 specified in the standard or custom action also appears as the value of the name attribute in the enclosed jsp:attribute**

#### Variable Information

%s1 = Attribute name

#### Explanation

The attribute (%s1) specified in the standard or custom action also appears as the value of the 'name' attribute in the enclosed jsp:attribute.

## Cause

The tag library attribute was specified in the tag and in the <jsp:attribute>.

## User Action

Check the tag library description.

## Output Location

Container log

## 17.17.9 JSVLT55509

---

### JSVLT55509: Invalid body-content (%s1) in tag directive

#### Variable Information

%s1 = Invalid attribute

#### Explanation

body-content (%s1) in the tag directive is invalid.

#### Cause

The contents of the <% @tag> tag 'body-content' attribute in the tag file are incorrect.

#### User Action

Check that the contents of the <% @tag> tag 'body-content' attribute in the tag file are correct.

#### Output Location

Container log

## 17.17.10 JSVLT55510

---

### JSVLT55510: According to TLD, tag %s1 must be empty, but is not

#### Variable Information

%s1 = Tag name

#### Explanation

According to the TLD, the tag (%s1) must be empty.

#### Cause

Body content was set for a tag for which "empty" was specified in <body-content> of the tag library descriptor.

#### User Action

Check that the tag description is correct.

#### Output Location

Container log

## 17.17.11 JSVLT55511

---

### JSVLT55511: The value of %s1 and the value of %s2 in line %s3 are the same.

## Variable Information

%s1 = First value

%s2 = Second value

%s3 = Line number

## Explanation

There is more than one <% @attribute> tag with the same 'name' attribute in the tag file.

## Cause

There is more than one <% @attribute> tag with the same 'name' attribute in the tag file.

## User Action

Check the contents of the <% @attribute> tag in the tag file.

## Output Location

Container log

## 17.17.12 JSVLT55512

---

**JSVLT55512: Cannot find an attribute directive with a name attribute with a value "%s1", the value of this name-from-attribute attribute.**

## Variable Information

%s1 = 'name-from-attribute' attribute value

## Explanation

Cannot find an attribute directive with a 'name' attribute that is the value in the attribute 'name-from-attribute' (%s1).

## Cause

The <% @attribute> tag for the attribute 'name-from-attribute' of the <% @variable> tag in the tag file does not exist.

## User Action

Check the contents of the <% @variable> tag in the tag file.

## Output Location

Container log

## 17.17.13 JSVLT55513

---

**JSVLT55513: The attribute directive (declared in line %s2 and whose name attribute is "%s1", the value of this name-from-attribute attribute) must be of type java.lang.String, is "required" and not a "rtexprvalue".**

## Variable Information

%s1 = Attribute name

%s2 = Line number

## Explanation

The contents of the <% @attribute> tag for the 'name-from-attribute' attribute of the <% @variable> tag in the tag file are incorrect.

## Cause

Possible causes are as follows:

- "false" was specified for the 'required' attribute in the <%@attribute> tag.
- The value specified for the 'type' attribute in the <%@attribute> tag was not "java.lang.String".
- "true" was specified for the 'rtexprvalue' attribute in the <%@attribute> tag.

## User Action

Check the contents of the <%@attribute> tag in the tag file and fix the error.

## Output Location

Container log

## 17.17.14 JSVLT55514

---

**JSVLT55514: High surrogate bits in UTF-8 sequence must not exceed 0x10 but found 0x%s1.**

### Variable Information

%s1 = Illegal character code

### Explanation

High surrogate bits in UTF-8 sequence must not exceed 0x10.

### Cause

The JSP file contains an illegal character code.

### User Action

Check the contents of the JSP file.

### Output Location

Container log

## 17.17.15 JSVLT55515

---

**JSVLT55515: Byte "%s1" not 7-bit ASCII.**

### Variable Information

%s1 = Illegal character code

### Explanation

The characters (%s1) are not 7-bit ASCII.

### Cause

The JSP file contains an illegal character code.

### User Action

Check the contents of the JSP file.

### Output Location

Container log

## 17.17.16 JSVLT55516

---

### **JSVLT55516: Either name-given or name-from-attribute attribute must be specified in a variable directive**

#### Explanation

Either of the attributes name-given or name-from-attribute must be specified in a variable directive.

#### Cause

Neither of the attributes name-given nor name-from-attribute were specified in the <%@variable> tag of the tag file.

#### User Action

Specify either name-given or name-from-attribute in the <%@variable> tag of the tag file.

#### Output Location

Container log

## 17.17.17 JSVLT55517

---

### **JSVLT55517: Cannot specify both name-given or name-from-attribute attributes in a variable directive**

#### Explanation

Both attributes name-given and name-from-attribute cannot be specified in a variable directive.

#### Cause

Both attributes name-given and name-from-attribute were specified in the <%@variable> tag of the tag file.

#### User Action

Specify either of the attributes name-given or name-from-attribute in the <%@variable> tag of the tag file.

#### Output Location

Container log

## 17.17.18 JSVLT55518

---

### **JSVLT55518: Both or none of the name-from-attribute and alias attributes must be specified in a variable directive**

#### Explanation

Both or neither of the attributes name-from-attribute and alias must be specified in a variable directive.

#### Cause

Only one of the attributes name-from-attribute or alias was specified in the <%@variable> tag of the tag file.

#### User Action

Specify both the attributes name-from-attribute and alias.

#### Output Location

Container log

## 17.17.19 JSVLT55519

---

### **JSVLT55519: Null attribute name**

#### Explanation

This is a null attribute name.

#### Cause

Null was specified for the attribute name.

#### User Action

Check the JSP file to see whether null was specified for the attribute name.

#### Output Location

Container log

## 17.17.20 JSVLT55520

---

### **JSVLT55520: The value for the useBean class attribute %s1 is invalid.**

#### Explanation

The value for the useBean class attribute (%s1) is invalid.

#### Cause

The class for the class attribute of the <jsp:useBean> tag does not exist.

#### User Action

Check the class attribute of the <jsp:useBean> tag.

#### Output Location

Container log

## 17.17.21 JSVLT55521

---

### **JSVLT: ERROR: JSVLT55521: An error occurred in the JSP file compile.**

#### Explanation

An error occurred in the JSP file compile.

#### Cause

Refer to the message that was also output to the container log.

#### User Action

Fix the cause of the error based on the message that was also output to the container log and the exception information.

#### Output Location

Container log

## 17.17.22 JSVLT55522

---

### **JSVLT55522: Unable to convert string "%s1" to class "%s2" for attribute "%s3": %s4**

#### Variable Information

%s1 = Value specified for the attribute that could not be converted

%s2 = Class name of the attribute that could not be converted

%s3 = Attribute name that could not be converted

%s4 = Detailed information

#### Explanation

Failed to convert the specified attribute value.

#### Cause

The following problems may have occurred in relation to the PropertyEditor method of the (%s2) class:

- The PropertyEditor of class (%s2) could not be found
- PropertyEditor processing generated an exception

#### System Action

An exception is notified to JSP.

#### User Action

Establish the cause of the error based on the detailed information.

## 17.18 JSVLT55700 to JSVLT55799

---

This section details messages numbered between JSVLT55700 and JSVLT55799.

### 17.18.1 JSVLT55750

---

#### **JSVLT: ERROR: JSVLT55750: Exception initializing page context**

#### Explanation

An exception occurred initializing pageContext.

#### Cause

Refer to the exception information that was also output.

#### User Action

Refer to the exception information that was also output and fix the error.

#### Output Location

Container log

### 17.18.2 JSVLT55751

---

#### **JSVLT: WARNING: JSVLT55751: Internal error flushing the buffer in release()**

#### Explanation

Failed to flush the buffer during JspWriter release processing.

### Cause

close() may have been executed for the JspWriter object (the implicit value 'out') in JSP.

### User Action

There is no need to execute close()for JspWriter in JSP.

Delete close().

### Output Location

Container log

# Chapter 18 Messages Beginning with 'od'

This chapter describes the messages displayed by the ObjectDirector (OD).

## 18.1 od00000 to od00099

This section details the messages numbered between od00000 and od00099.

### 18.1.1 od00001

**OD: ERROR: od00001:This EventID does not exist. EventID:%s1**

#### Variable Information

%s1 = Event ID

#### Explanation

Failed to open the message file.

A non-existent message ID was specified.

#### System Action

Continues processing.

#### User Action

This message may be output if a process uses a large number of file descriptors. Either close unnecessary files or increase the maximum allowable number of file descriptors.

If the message code for od%s1 is not contained in the online manual, use the *iscollectinfo* command to collect diagnostic information, then contact a Fujitsu service engineer.

### 18.1.2 od00002

**OD: ERROR: od00002:The number of merged strings is wrong. EventID:%s1**

#### Variable Information

%s1 = Event ID

#### Explanation

The number of variable information items with message code od%s1 does not match the number of character strings to be output.

#### System Action

Continues processing.

#### User Action

Note the od%s1 message code, use the *iscollectinfo* command to collect diagnostic information, then contact a Fujitsu service engineer.

### 18.1.3 od00004

**OD: ERROR: od00004:Address of merged strings is NULL. EventID: %s1**

#### Variable Information

%s1 = Event ID

#### Explanation

The character strings to which to the variable information items with message code od%s1 are output are not specified.

#### System Action

Continues processing.

#### User Action

Note message code od%s1, use the *iscollectinfo* command to collect diagnostic information, then contact a Fujitsu service engineer.

### 18.1.4 od00008

---

**OD: ERROR: od00008: Failed to construct strings. The next logging Message will not appear. Event ID: %s1**

#### Variable Information

%s1 = Event ID

#### Explanation

There was a failure in creating the message for message code od%s1.

The message for message code od%s1 could not be output.

#### System Action

Continues processing.

#### User Action

Note the od%s1 message code, use the *iscollectinfo* command to collect diagnostic information, then contact a Fujitsu service engineer.

### 18.1.5 od00016

---

**OD: ERROR: od00016: The next logging Message is not complete because of not enough memory. EventID: %s1**

#### Variable Information

%s1 = Event ID

#### Explanation

The message for message code od%s1 is incomplete due to insufficient memory.

#### System Action

Continues processing.

#### User Action

Close all unwanted programs, or expand main memory.

### 18.1.6 od00032

---

**OD: ERROR: od00032: Failed to open /dev/null. The next logging message will not appear on the console. Event ID: %s1**

#### Variable Information

%s1 = Event ID

#### Explanation

There was a failure when outputting to the console the message with message code od%s1. The message was output to the log file only.

## System Action

Continues processing.

## User Action

See the message with code `od%s1` that was output to the log file.

Log file

**Solaris32/64**

```
/var/adm/messages
```

Also, use the *pfiles* command to check the file descriptors acquired by processes and remove the cause of the file descriptor shortage.

## 18.2 od00100 to od00199

---

This section details the messages numbered between od000100 and od00199.

### 18.2.1 od00128

---

**OD: ERROR: od00128:At the next logging Message, severity in message file is wrong. EventID: %s1**

#### Variable Information

`%s1` = Event ID

#### Explanation

The severity in message code `od%s1` contains an error.

#### System Action

Continues processing.

#### User Action

Note the message code `od%s1`, use the *iscollectinfo* command to collect diagnostic information, then contact a Fujitsu service engineer.

## 18.3 od00200 to od00299

---

This section details the messages numbered between od00200 and od00299.

### 18.3.1 od00256

---

**OD: INFO: od00256: Failed to open /dev/null. The logging message will not appear on the console.**

#### Explanation

Failed to output a message to the control because of a file descriptor shortage. The message is output to the system log.

#### System Action

Continues processing.

#### User Action

Also, use the *pfiles* command to check the file descriptors acquired by processes, and remove the cause of the file descriptor shortage.

## 18.4 od10000 to od10099

---

This section details the messages numbered between od10000 and od10099.

## 18.4.1 od10001

---

**OD: ERROR: od10001:ObjectDirector license has been expired. Please purchase the product package.**

### Explanation

The trial period of ObjectDirector license has expired.

### User Action

Purchase the product package.

## 18.4.2 od10002

---

**OD: INFO: od10002:ObjectDirector started successful.**

### Explanation

ObjectDirector started successfully.

## 18.4.3 od10003

---

**OD:INFO: od10003:ObjectDirector accepted stop request.**

### Explanation

ObjectDirector accepted the stop request.

## 18.4.4 od10004

---

**OD: INFO: od10004:ObjectDirector is going to stop. Phase: %s1**

### Variable Information

%s1 = Phase

### Explanation

ObjectDirector is about to stop.

## 18.4.5 od10005

---

**OD: INFO: od10005:ObjectDirector stopped properly.**

### Explanation

ObjectDirector stopped successfully.

## 18.4.6 od10006

---

**OD: ERROR: od10006: ObjectDirector start failed.**

### Explanation

Failed to start the ObjectDirector.

If database connection tests are performed from the Interstage Management Console, this error may also occur if the CORBA Service is restarted without stopping the Interstage JMX Service.

### System Action

Fails to start the CORBA service.

## User Action

Remove the cause of the error, then restart the ObjectDirector.

If database connection tests are performed from the Interstage Management Console, restart the Interstage JMX Service according to the following procedure and then restart the CORBA Service if necessary.

**Windows32/64**

Restart the 'Interstage JServlet(OperationManagement)' Service.

**Solaris32/64** **Linux32/64**

Restart the Interstage JMX Service and the Servlet Service for the Interstage Management Console.

## 18.4.7 od10007

---

**OD: ERROR: od10007: ObjectDirector stop failed.**

### Explanation

Failed to stop the CORBA Service (ObjectDirector).

### User Action

Check the free space in memory or the CORBA Service (ObjectDirector) status.

## 18.5 od10100 to od10199

---

This section details the messages numbered between od10100 and od10199.

### 18.5.1 od10100

---

**OD: ERROR: od10100: cannot open impl.db file.**

#### Explanation

The impl.db file could not be found.

#### System Action

Fails to start the CORBA service.

#### User Action

Copy the impl.db.default file, create the impl.db file, and register the Implementation Repository with the *OD\_impl\_inst* command.

### 18.5.2 od10101

---

**OD: ERROR: od10101: The number of queues exceed max\_impl\_rep\_entries. Queue %s1. (max\_impl\_rep\_entries = %s2)**

#### Variable Information

%s1 = Queue name

%s2 = Value of max\_impl\_rep\_entries specified in the config file

#### Explanation

The queue definition number has exceeded the value of *max\_impl\_rep\_entries* specified in the config file while building the queuing policy for queue name %s1.

#### User Action

Increase the value of *max\_impl\_rep\_entries* in the config file.

## 18.5.3 od10102

---

**OD: ERROR: od10102: cannot open queue\_policy file.**

### Explanation

The queue\_policy file could not be found.

Alternatively, the *odsetque* command may have been executed using general user authority.

### User Action

If the queue\_policy file does not exist, copy the queue\_policy.default file and generate the queue\_policy file.

If the queue\_policy file exists, it may be that the *odsetque* command was executed using general user authority. Execute this command using administrator authority.

## 18.5.4 od10103

---

**OD: ERROR: od10103: queue\_policy file is bad format.**

### Explanation

The queue\_policy file contents are invalid.

### User Action

Copy the queue\_policy.default file, generate the queue\_policy file, and recreate the queuing policy with the *odsetque* command.

## 18.5.5 od10104

---

**OD: ERROR: od10104: The maximum number of request is invalid. Queue %s1. (max = %s2)**

### Variable Information

%s1 = Queue Name

%s2 = Maximum queue value

### Explanation

The maximum number of requests for the queue with the queue name of %s1 is invalid.

### User Action

Review the maximum number of requests for the queue with the queue name of %s1 is invalid.

## 18.5.6 od10105

---

**OD: ERROR: od10105: The number of requests exceed the limit %s1. (max = %s2)**

### Variable Information

%s1 = Maximum value exceeded value of queue

%s2 = Maximum queue value

### Explanation

The maximum queue value was exceeded by %s1.

### User Action

Correct the maximum queue value in the queue\_policy file.

## 18.5.7 od10106

---

---

**OD: ERROR: od10106: The maximum number of queue groups was exceeded. Queue Group %s1. (max\_impl\_rep\_entries = %s2)**

Variable Information

%s1 = Queue Group Name

%s2 = Value of max\_impl\_rep\_entries specified in the config file

Explanation

The number of queue group definitions has exceeded the value of max\_impl\_rep\_entries specified in the config file while building the queuing policy for queue group name %s1.

User Action

Increase the value of max\_impl\_rep\_entries in the config file.

---

## 18.5.8 od10107

---

**OD: INFO: od10107: RequestID %s1 (%s2) was canceled.**

Variable Information

%s1 = Request ID

%s2 = Connection ID

Explanation

Request of request ID %s1(Connection ID %s2) has been cancelled.

System Action

The request is canceled and the server application does not process the request. A NO\_IMPLEMENT exception is reported to the client.

User Action

This message does not indicate a problem.

---

## 18.5.9 od10108

---

**OD: INFO: od10108:OD\_stop timeout.**

Explanation

Termination of OD\_start service has not terminated within the required time.

System Action

Continues the CORBA service stop process.

---

## 18.6 od10200 to od10299

This section details the messages numbered between od10200 and od10299.

---

### 18.6.1 od10200

---

**OD: ERROR: od10200: Failed to open initial service file '%s1'.**

Variable Information

%s1 = File Name

## Explanation

There was a failure in opening the initial\_services (init\_svc) file.

## User Action

Confirm the permission for writing or reading to the initial\_services (init\_svc) file. If there is no permission for writing or reading to the init\_svc file, setup the permission. If the permissions are set correctly, the initial\_services file may fail to open due to insufficient resources.

**Windows32/64**

This message is only output following an operation executed by a general user (a user that belong to the 'Users' Group) if:

- Interstage was installed in a folder on an NTFS-formatted drive, and full control access permissions were not set for the 'Everyone' Group.

In this case, click the [Security] tab in the Interstage installation folder properties, and then set full control access permissions for the appropriate users.

If the [Security] tab is not displayed in the folder properties in Microsoft® Windows® XP, it can be displayed according to the following procedure:

1. Click [Start] - [Control Panel] to start [Folder Options].
2. Click the [View] tab, remove the check mark from [Share Simple Files (Recommended)] and then click [OK].

## 18.6.2 od10201

---

**OD: ERROR: od10201: Failed to write to initial service file '%s1'.**

### Variable Information

%s1 = File Name

### Explanation

There is not enough free space on the ObjectDirector installation drive, so the update of the initial\_services (init\_svc) file failed.

### User Action

Increase the free space on the ObjectDirector installation drive.

## 18.6.3 od10202

---

**OD: ERROR: od10202: Failed to close initial service file '%s1'.**

### Variable Information

%s1 = File Name

### Explanation

There was a failure in closing the initial\_services (init\_svc) file.

### User Action

It is possible that there is not sufficient free disk space on the drive on which a CORBA Service (ObjectDirector) was installed.

Re-estimate the amount of disk space needed and increase it if necessary. If there is already enough disk space, use the *iscollectinfo* command to collect diagnostic information, then contact the system administrator.

## 18.7 od10300 to od10399

---

This section details the messages numbered between od10300 and od10399.

## 18.7.1 od10300

---

**OD: ERROR: od10300: Failed to write orb object reference to file '%s1'.**

### Variable Information

%s1 = File Name

### Explanation

Writing to the orb\_oref file failed.

### System Action

Continues to process the CORBA service.

### User Action

If there is insufficient free space on the CORBA Service installation drive, increase the amount available. If writing to the orb\_oref file is not permitted, enable write permission.

**Windows32/64**

This message is only output following an operation executed by a general user (a user that belong to the 'Users' Group) if:

- Interstage was installed in a folder on an NTFS-formatted drive, and full control access permissions were not set for the 'Everyone' Group.

In this case, click the [Security] tab in the Interstage installation folder properties, and then set full control access permissions for the appropriate users.

If the [Security] tab is not displayed in the folder properties in Microsoft® Windows® XP, it can be displayed according to the following procedure.

1. Click [Start] - [Control Panel] to start [Folder Options].
2. Click the [View] tab, remove the check mark from [Share Simple Files (Recommended)] and then click [OK].

This message does not necessarily indicate an operational fault.

## 18.7.2 od10301

---

**OD: INFO: od10301: Process %s1 (%s2) has vanished.**

### Variable Information

%s1 = Process ID

%s2 = Process name

### Explanation

The process with process ID %s1 was terminated with an error.

**Windows32/64**

This message is also reported when the CORBA application is stopped from the task manager.

**Solaris32/64 Linux32/64**

This message is also reported when the *kill* command is used to stop the CORBA application.

### System Action

Collects the process resources registered with the CORBA service.

### User Action

Check for the cause of the application being reported by the process ID and the process name stopped. If the application ended abnormally or unexpectedly, check for the cause of the abnormal end.

If the WorkUnit is forcibly stopped, there is no need to take action according to this message.

## Remarks

The maximum number of characters that can be output in process name%2 is 127. If the full process name is not displayed, and the process corresponds to one of those shown below, the process name can be identified according to the method described below for each process.

### - The process is an application operated as IJServer

All process names are output in 'Startup Information' of 'WorkUnit > [WorkUnit Name] > Log Reference' in the Interstage Management Console. Process names can also be checked in the following log file:

**Windows32/64**

J2EE common directory\ijserver\[IJServer name]\log\[Process serial number]\info.log (this is the default)

**Solaris32/64 Linux32/64**

J2EE common directory/ijserver/[IJServer name]/log/[Process serial number]/info.log (this is the default)

For details of the above log, refer to 'J2EE User's Guide'. The relevant section is 'Environment for Operating J2EE Applications (IJServer)' - 'IJServer File Configuration'.

### - The process is an application operated as a CORBA WorkUnit

Check 'Start Parameters' for the target WorkUnit in 'WorkUnit > [WorkUnit Name] > [Implementation Repository ID] > Environment Settings' in the Interstage Management Console.

Additionally, refer to 'Param for Executable File' (the parameter that is passed when an application starts up) for the WorkUnit definition.

### - The process executes an operation that uses a Java applet

The argument can be identified by checking the 'PARAM NAME' settings value in the HTML file.

### - The process is started from a batch file, command prompt, or shell

Check the batch file, command prompt, or shell.

## 18.7.3 od10302

---

**OD: ERROR: od10302: Server process (%s1) %s2 timeout.**

### Variable Information

%s1 = Server Application Process ID

%s2 = Server Application Process name

### Explanation

A timeout occurred in the server application because the CORBA\_ORB\_init method could not be completed within period\_server\_timeout \* 5 seconds specified in the config file.

The probable causes are:

The system is overloaded.

The CORBA\_ORB\_init function is not issued after the CORBA service starts a server application with a start type other than persistent.

### System Action

Fails to start the server process.

### User Action

Review the processing if the application processing has hung up.

If the timeout time before the CORBA\_ORB\_init method is issued is short, increase the value of period\_server\_timeout.

If this does not solve the problem, use the *iscollectinfo* command to collect diagnostic information, then contact a Fujitsu service engineer.

## 18.7.4 od10303

---

**OD: ERROR: od10303: Named pipe error!! ObjectDirector cannot work properly.**

### Explanation

The receive process named pipe id failed.

### User Action

Re-execute ObjectDirector, or operation (if it is a start of an application). Re-execute ObjectDirector or, if the application has terminated, ignore the message.

## 18.7.5 od10305

---

**OD: ERROR: od10305: Server initialization failed, timeout. (period\_server\_timeout = %s1)**

### Variable Information

%s1 = value of period\_server\_timeout specified in the config file

### Explanation

A server application that is not of the persistent type could not complete its activation after startup within period\_server\_timeout \* 5 seconds specified in the config file.

### User Action

Increase the value for the period\_server\_timeout in the config file.

## 18.7.6 od10306

---

**OD: ERROR: od10306: The server could not be stopped (Process ID: %s1, Reason code: %s2)**

### Variable Information

%s1 = Process ID

%s2 = Reason code

### Explanation

The server process could not be stopped, as indicated by reason code %s2.

0x04: Resources for exclusive control could not be obtained.

0x05: Exclusivity could not be obtained.

0x06: Exclusivity could not be released.

### System Action

Terminates the Process %s1 forcibly.

### User Action

Take action according to the reason code %s2.

0x04: Check that there is no memory shortage.

0x05, 0x06: Record the detail information. Collect the error log using the *iscollectinfo* command, and contact an engineer.

## 18.8 od10400 to od10499

---

This section details the messages numbered between od10400 and od10499.

### 18.8.1 od10400

---

**OD: WARNING: od10400:invalid trace level '%s1'.**

#### Variable Information

%s1 = log\_level entry

#### Explanation

log collection level %s1 is invalid.

#### User Action

Check the log collection level %s1 in the config file.

### 18.8.2 od10401

---

**OD: INFO: od10401:log\_level is %s1.**

#### Variable Information

%s1 = Trace level

#### System Action

Starts collecting the internal log of the CORBA service at startup.

#### Explanation

This message is output if the collection of the internal log is specified. The current trace level has been set to %s1.

### 18.8.3 od10402

---

**OD: WARNING: od10402:The variable %s1 is set to %s2.**

#### Variable Information

%s1 = config parameter name

%s2 = Set value after parameter correction

#### System Action

Corrects the parameter value and continues processing.

#### Explanation

The %s1 set value of the config file is set to %s2.

#### User Action

This is a warning message and does not indicate a problem. Refer to config (CORBA Service) in the Tuning Guide for information on the conditions to be corrected.

### 18.8.4 od10404

---

**OD: ERROR: od10404: invalid keyword %s1 exists in config file. (line = %s2)**

#### Variable Information

%s1 = Keyword

%s2 = Line number in the config file

#### Explanation

An invalid keyword (%s1) exists in line number %s1 of the config file.

#### User Action

Correct the keyword in the config file.

## 18.8.5 od10405

---

**OD: ERROR: od10405: config file '%s1' does not exist.**

#### Variable Information

%s1 = Config File

#### Explanation

The config file could not be found.

Probable causes are as follows:

- The CORBA service installation path is more than 128 bytes.
- A character string of more than 128 bytes is specified in the environment variable OD\_HOME.
- The config file does not exist in the predefined location.

#### User Action

Check the config file.

Take the appropriate action from the following:

- Reinstall the CORBA service in an installation path no more than 128 bytes long.
- Specify a character string of no more than 128 bytes in the environment variable OD\_HOME.
- Confirm that the config file exists in the correct location.

## 18.8.6 od10406

---

**OD: WARNING: od10406:Invalid config file line, %s1.**

#### Variable Information

%s1 = Line number in config file

#### Explanation

An error exists in line %s1 of the config file.

#### User Action

Correct the contents of line %s1 in the config file.

## 18.8.7 od10407

---

**OD: ERROR: od10407: Can't access directory '%s1'.**

#### Variable Information

%s1 = Path Name

#### Explanation

The directory with path name %s1 does not exist.

## User Action

Confirm that the %s1 directory has not been deleted.

**Solaris32/64** **Linux32/64**

Confirm whether to correspond to the following conditions if path name %s1 is '/opt/FSUNod/var'(Solaris) or '/opt/FJSVod/var'(Linux).

1. The application uses the thread, and
2. The library directory '/opt/FSUNod/lib/nt' (Solaris) or '/opt/FJSVod/lib/nt' (Linux) for the process mode is set to LD\_LIBRARY\_PATH.

Set the library directory '/opt/FSUNod/var' (Solaris) or '/opt/FJSVod/var' (Linux) for the thread mode to LD\_LIBRARY\_PATH if the above-mentioned corresponds.

## 18.8.8 od10409

---

**OD: ERROR: od10409:home path %s1 is invalid.**

### Variable Information

%s1 = ObjectDirector installation path

### Explanation

The ObjectDirector installation path %s1 is too long.

### User Action

Check that the ObjectDirector installation path %s1 is valid.

## 18.8.9 od10410

---

**OD: INFO: od10410:Turning off logging.**

### Explanation

The output of an internal log is stopped.

### User Action

If it is necessary to output an internal log, take the following action:

1. Check that there is enough free space on the drive where the log file output destination exists.
2. Check the writing authority for the log file output destination.
3. Check whether there is a folder (a directory) on the log file output destination.

## 18.8.10 od10411

---

**OD: ERROR: od10411:Failed to find entry in /etc/services.**

### Explanation

The service name of ObjectDirector is not registered in the /etc/service file.

### System Action

Fails to start the CORBA service.

### User Action

Register the service name of ObjectDirector, a port number, a protocol in the /etc/service file.

## 18.8.11 od10412

---

**OD: ERROR: od10412: Failed to create log file '%s1'.**

### Variable Information

%s1 = File Name

### Explanation

There was a failure in generating the log file by either of the following Reasons:

1. There is not enough free space on the drive where the log file output destination exists.
2. You do not have the writing authority for the log file output destination.
3. A folder (a directory) does not exist on the log file output destination.

### User Action

Take the corresponding action, then restart CORBA service

1. Increase the free space on the drive where the log file output destination exists.
2. Add the writing authority for the log file output destination.
3. Make a folder (a directory) on the log file output destination.

For detail of the log file output destination, refer to 'config' in the Tuning Guide.

## 18.8.12 od10413

---

**OD: WARNING: od10413: log\_pipe\_reader\_thread exits.**

### Explanation

The log output thread has been completed.

### User Action

This is just a warning without a problem.

## 18.8.13 od10415

---

**OD: ERROR: od10415:Failed to create/open log pipe '%s1'.**

### Variable Information

%s1 = Log pipe file Name

### Explanation

Failed to create the log pipe file.

### User Action

Check the existence of the directories on the log pipe file output destination. Alternatively, check the free disk capacity.

## 18.8.14 od10416

---

**OD: ERROR: od10416:OD\_start service is already running.**

### Explanation

There are four possible explanations:

1. The OD\_start service has already started. Alternatively, an attempt was made to activate the OD\_start service without stopping the service completely.

2. An attempt was made to reactivate the OD\_start service without stopping the CORBA application.
3. An attempt was made to reactivate the OD\_start service without stopping the Servlet service.
4. An attempt was made to reactivate the OD\_start service without stopping the J2EE Deployment tool.

#### User Action

Complete the corresponding action for the explanation number above:

1. Terminate the OD\_start service. Alternatively, activate the OD\_start service after stopping the service completely.
2. Reactivate the OD\_start service after stopping the CORBA application.
3. Reactivate the OD\_start service after stopping the Servlet service.

## 18.8.15 od10417

---

**OD: ERROR: od10417:trace data is lost.**

#### Explanation

Failed to write the log in the log file.

#### System Action

Continues processing.

#### User Action

System operation is normal where:

- Interstage is stopping, or after Interstage stops
- When the application ends

Otherwise, check that the ObjectDirector application is running.

## 18.8.16 od10418

---

**OD: WARNING: od10418: Failed to output internal log file. (%s1 messages)**

#### Variable Information

%s1 = Number of lost messages

#### Explanation

Failed to write the internal log to the log file due to insufficient disk space or other. The lost message number is %s1.

#### User Action

Check whether there is sufficient free space at the output destination (under the CORBA Service installation path) of the log file.

## 18.9 od10500 to od10599

---

This section details the messages numbered between od10500 and od10599.

### 18.9.1 od10500

---

**OD: ERROR: od10500: fopen () errno = %s1. (file = %s2)**

#### Variable Information

%s1 = Error Number

%s2 = File name

## Explanation

There was a failure opening the impl.db file.

## User Action

Confirm the existence of the impl.db file. If the impl.db file does not exist, copy the impl.db.bak file and rename it impl.db. You may need to change the status of the file from Read-only to rename it. It is also possible the file cannot be used because of insufficient resources.

## 18.9.2 od10501

---

### **OD: ERROR: od10501: Failed to close impl\_rep\_db file.**

## Explanation

There was a failure to close the impl.db file.

## User Action

It is possible that there is insufficient free disk space on the drive on which a CORBA Service (ObjectDirector) was installed. Re-estimate the amount of disk space needed, and increase it if necessary. If there is sufficient disk space, use the *iscollectinfo* command to collect diagnostic information, then contact the system administrator.

## 18.9.3 od10502

---

### **OD: ERROR: od10502: Failed to write to impl.db file.**

## Explanation

Failed to write to the impl.db file.

## User Action

Check free disk space.

## 18.9.4 od10503

---

### **OD: ERROR: od10503: impl.db file not found.**

## Explanation

The impl.db file could not be found.

## User Action

Confirm the existence of the impl.db file.

If the impl.db file does not exist, copy the impl.db.bak file to the impl.db file.

## 18.9.5 od10504

---

### **OD: ERROR: od10504:Invalid syntax impl.db: line %s1.**

## Variable Information

%s1 = Line No.

## Explanation

An error exists in line %s1 of the impl.db file.

## User Action

Correct the contents of line %s1 in the file impl.db

## 18.9.6 od10507

---

**OD: ERROR: od10507: Failed to read impl.db file (line = %s1).**

### Variable Information

%s1 = Line number that failed to read

### Explanation

The contents of the impl.db file are invalid.

### User Action

Restore the impl.db file from the impl.db.bak file.

If the error re-occurs after the file is restored, use the *iscollectinfo* command to collect diagnostic information, then contact a technician.

## 18.9.7 od10508

---

**OD: ERROR: od10508: Implementation Repository DB is full. (max\_impl\_rep\_entries = %s1)**

### Variable Information

%s1 = Value of max\_impl\_rep\_entries specified in the config file

### Explanation

No space is available in the Implementation Repository DB.

### User Action

Increase the value of max\_impl\_rep\_entries in the config file. The new value is effective from the next time the CORBA service is started.

**Solaris32/64** **Linux32/64**

The system parameter must be set to change max\_impl\_rep\_entries. For details, refer to 'Setting the System Environment for a CORBA Service' in the 'Tuning Guide'.

## 18.9.8 od10509

---

**OD: WARNING: od10509:proc\_conc\_init is too large, %s1.**

### Variable Information

%s1 = Value of proc\_conc\_init

### Explanation

The proc\_conc\_init value is too large.

### User Action

Set proc\_conc\_init to a smaller value than %s1, with the *OD\_impl\_inst* command.

## 18.9.9 od10510

---

**OD: WARNING: od10510:proc\_conc\_max is too large, %s1. (proc\_conc\_max = %s2)**

### Variable Information

%s1 = Implementation Repository ID

%s2 = Value of proc\_conc\_max

## Explanation

The value of `proc_conc_max` specified by the `OD_impl_inst` command is too large.

## User Action

Set `proc_conc_max` to a smaller value with the `OD_impl_inst` command.

# 18.10 od10600 to od10699

---

This section details the messages numbered between od10600 and od10699.

## 18.10.1 od10602

---

### OD: ERROR: od10602: Too many files.

Windows32/64

## Explanation

The number of handles is insufficient.

## User Action

Close all other unnecessary applications and increase the free handles in the system.

Solaris32/64 Linux32/64

## Explanation

The number of file descriptors that can be opened in the process is insufficient.

## User Action

The number of file descriptors that the CORBA service can open is insufficient. Use the `ulimit` command for the bash or Bourne shell and the `limit` command for the C shell to increase the number of file descriptors that can be opened.

The number of file descriptors that can be opened may be set with an appropriate system parameter.

Solaris32/64

Edit the `rlim_fd_cur` system parameter. For details about changing the parameter, see the Solaris document.

The file descriptors that have been opened by processes can be checked using the `pfiles` command. For details about the `pfiles` command, see an appropriate Solaris document.

Linux32/64

Edit the `fs.file-max` system parameter. For details about changing the parameter, see an appropriate Linux document.

## 18.10.2 od10605

---

### OD: ERROR: od10605: %s1: send\_reply failed. (from = %s2, intf = %s3, op = %s4) errno = %s5.

## Variable Information

%s1 = Time

%s2 = IP address

%s3 = Interface

%s4 = Operation name

%s5 = Error number reported from the OS

## Explanation

Failed to send a response.

This message is displayed if response transmission fails because the connection to the client is disconnected when the response to a request is sent from the CORBA server application to the CORBA client:

- When the processing time of the CORBA server application is longer than the server method standby time (period\_receive\_timeout of the config file).
- When the client process terminated during request processing by the CORBA server application.
- When the net\_disconnect function released the communication resource in the client application during request processing by the CORBA server application.

## System Action

The server application has completed the request, but the results are not reported to the client application. It is not possible to determine from this message whether the server application has completed the request normally.

## User Action

If server system processing takes too long or hangs up, review it. If the server method standby time of the client system is too short, change it to an appropriate value.

If this message is displayed, a communication error (COMM\_FAILURE) is reported to the client application. Retransmit the request as required from the client application.

## 18.10.3 od10606

---

**OD: INFO: od10606: %s1: The reply cannot be processed.(from = %s2, intf = %s3, op = %s4) %s5.**

### Variable Information

%s1 = Time

%s2 = IP address

%s3 = Interface

%s4 = Operation name

%s5 = Error number reported from the OS

## Explanation

Sending the response failed.

## 18.11 od10700 to od10799

---

This section details the messages numbered between od10700 and od10799.

### 18.11.1 od10701

---

**OD: ERROR: od10701: Failed to get shared memory(con\_shm).**

 Windows32/64

### Explanation

Insufficient memory.

Alternatively, it tried to use a CORBA Service under a condition that a CORBA Service could not be used.

### User Action

Check the amount of free memory space.

Alternatively, check the condition of the CORBA Service (ObjectDirector).

Solaris32/64 Linux32/64

#### Explanation

Insufficient shared memory.

Alternatively, it tried to use a CORBA Service under a condition that a CORBA Service could not be used for.

#### User Action

Check the shared memory capacity of system parameter.

Alternatively, check the condition of the CORBA Service (ObjectDirector).

### 18.11.2 od10702

---

**OD: ERROR: od10702: Failed to create shared memory(con\_shm) :size = %s1 : key = 0x%s2.**

#### Variable Information

%s1 = Required size

%s2 = Shared memory identifier

Windows32/64

#### Explanation

Insufficient memory.

#### User Action

Check the amount of free memory space.

Solaris32/64 Linux32/64

#### Explanation

Insufficient shared memory.

#### User Action

The expansion of the shared memory size of the system parameter and check free memory capacity.

### 18.11.3 od10706

---

**OD: ERROR: od10706: Failed to create key: (svr\_shm).**

#### Explanation

The var or etc directory in the CORBA Service installation directory may have been deleted.

#### User Action

Check the existence of the var and etc directories.

### 18.11.4 od10707

---

**OD: ERROR: od10707: Failed to get shared memory(svr\_shm).**

Windows32/64

#### Explanation

Insufficient memory.

Alternatively, it tried to use a CORBA Service under a condition that a CORBA Service could not be used for.

### User Action

Check the amount of free memory space.

Alternatively, check the condition of the CORBA Service (ObjectDirector).

**Solaris32/64** **Linux32/64**

### Explanation

Insufficient shared memory.

Alternatively, it tried to use a CORBA Service under a condition that a CORBA Service could not be used for.

### User Action

Check the shared memory capacity of system parameter.

Alternatively, check the condition of the CORBA Service (ObjectDirector).

## 18.11.5 od10708

---

**OD: ERROR: od10708: Failed to create shared memory(svr\_shm):size = %s1: key = 0x%s2.**

### Variable Information

%s1 = Size

%s2 = Key

**Windows32/64**

### Explanation

Insufficient memory.

### User Action

Check the amount of free memory space.

**Solaris32/64** **Linux32/64**

### Explanation

Insufficient shared memory.

### User Action

The expansion of the shared memory size of the system parameter and check free memory capacity.

## 18.11.6 od10711

---

**OD: ERROR: od10711: Failed to attach(svr\_shm).**

**Windows32/64**

### Explanation

The system resources such as the number of handles and the amount of free memory space are insufficient.

### User Action

Close any unnecessary applications or install extended memory.

**Solaris32/64** **Linux32/64**

### Explanation

Insufficient the number which it can attach the shared memory space.

## User Action

The expansion of the attach number which it can attach of the shared memory size of the system parameter and check the present number of use.

## 18.11.7 od10712

---

**OD: ERROR:od10712: Failed to create key:(%1)**

### Variable Information

%1 = Shared memory id

### Explanation

The var or etc directory in the CORBA Service installation directory may have been deleted.

### User Action

Check that the var and etc directories exist.

## 18.11.8 od10713

---

**OD: ERROR: od10713:Failed to get shared memory(proc\_shm).**

**Windows32/64**

### Explanation

Insufficient memory.

Alternatively, it tried to use a CORBA Service under the condition that a CORBA Service could not be used for.

### User Action

Check the amount of free memory space.

Alternatively, check the condition of the CORBA Service (ObjectDirector).

**Solaris32/64** **Linux32/64**

### Explanation

Insufficient shared memory.

Alternatively, it tried to use a CORBA Service under the condition that a CORBA Service could not be used for.

### User Action

Check the shared memory capacity of system parameter.

Alternatively, check the condition of the CORBA Service (ObjectDirector).

## 18.11.9 od10714

---

**OD: ERROR: od10714:Failed to create shared memory(proc\_shm) :size = %s1 : key = 0x%s2.**

### Variable Information

%s1 = Size

%s2 = Key

**Windows32/64**

### Explanation

Insufficient memory.

## User Action

Check the amount of free memory space.

**Solaris32/64** **Linux32/64**

## Explanation

Insufficient shared memory.

## User Action

The expansion of the shared memory size of the system parameter and check free memory capacity.

## 18.11.10 od10717

---

**OD: ERROR: od10717: Failed to attach(proc\_shm).**

**Windows32/64**

## Explanation

Insufficient memory.

Alternatively, it tried to use a CORBA Service under the condition that a CORBA Service could not be used for

## System Action

If this message is output at an attempt to start the CORBA service, the CORBA service will fail to start.

If this message is output when a CORBA application issues the CORBA\_ORB\_init function, an UNKNOWN exception is reported and the CORBA\_ORB\_init function fails.

## User Action

Check the amount of free memory space.

Alternatively, check the condition of the CORBA Service (ObjectDirector).

**Solaris32/64** **Linux32/64**

## Explanation

Insufficient shared memory.

Alternatively, it tried to use a CORBA Service under the condition that a CORBA Service could not be used for

## System Action

if this message is output at an attempt to start the CORBA service, the CORBA service will fail to start.

If this message is output when a CORBA application issues the CORBA\_ORB\_init function, an UNKNOWN exception is reported and the CORBA\_ORB\_init function fails.

## User Action

Check the shared memory capacity of system parameter.

Alternatively, check the condition of the CORBA Service (ObjectDirector).

## 18.11.11 od10718

---

**OD: ERROR: od10718:Failed to create key:(gen\_shm).**

## Explanation

The application was executed in one of the following situations:

- The CORBA Service (ObjectDirector) is being started.
- The CORBA Service (ObjectDirector) is being terminated.
- The CORBA Service (ObjectDirector) has not been started.

## System Action

An UNKNOWN exception is reported and the CORBA\_ORB\_init function fails.

## User Action

If the CORBA service has been stopped or has not been started, start the CORBA service.

Check that the CORBA Service is active, then re-execute the application.

## 18.11.12 od10719

---

**OD: ERROR: od10719: Failed to get shared memory(gen\_shm,err=%s1).**

### Variable Information

%s1 = Error number reported from the OS

Windows32/64

### Explanation

Either the CORBA Service has not started, or there is insufficient memory.

### System Action

An UNKNOWN exception is reported, and the CORBA\_ORB\_init function fails.

### User Action

Check the amount of free memory space. Alternatively, check the condition of the CORBA Service (ObjectDirector).

Solaris32/64 Linux32/64

### Explanation

Either the CORBA Service has not started, or there is insufficient shared memory. Alternatively, an attempt was made to restart a CORBA Service that had already been started.

### System Action

An UNKNOWN exception is reported, and the CORBA\_ORB\_init function fails.

### User Action

Check the shared memory capacity of system parameter.

Alternatively, check the condition of the CORBA Service (ObjectDirector).

If the process where this message is output is 'OD\_start', a duplicate CORBA Service is started and no action is required.

## 18.11.13 od10720

---

**OD: ERROR: od10720: Failed to create shared memory(gen\_shm):size = %s1 :key = 0x%s2.**

## Variable Information

%s1 = Size

%s2 = Key

## Explanation

Allocation of a shared memory has failed. The following are possible causes:

- Memory space is insufficient.
- The system resource previously allocated by the CORBA Service or CORBA application has not been released thus preventing the re-allocation.

## User Action

Use the following method to allow the memory space to be allocated, and restart the CORBA Service:

- Expand the available memory space. Besides the CORBA Service (ObjectDirector), if a product is employed that uses the shared memory, the capacity corresponding to the CORBA Service must be added.
- Alternatively, terminate all the unnecessary application programs.
- If a COBRA application program is operating although the CORBA Service is stopped, terminate the CORBA application program.

**Solaris32/64** **Linux32/64**

- If this message is output in spite of the fact that the CORBA Service and CORBA application programs are stopped, use the *odrmipc* command to collect the system resources left uncollected.

## 18.11.14 od10721

---

**OD: ERROR: od10721:Failed to restore shared memory(gen\_shm).**

### Explanation

**Windows32/64**

Failed to delete the system resources such as the number of handles.

**Solaris32/64** **Linux32/64**

Failed to delete the shared memory identifier.

### User Action

Restart the CORBA Service (ObjectDirector).

## 18.11.15 od10722

---

**OD: ERROR: od10722: Failed to re-create shared memory(gen\_shm).**

**Windows32/64**

### Explanation

The system resources such as the number of handles and the amount of free memory space are insufficient.

### User Action

Close any unnecessary applications or install additional memory.

Solaris32/64 Linux32/64

#### Explanation

Failed to retrieve shared memory.

#### User Action

Increase the value for the shared memory segment size of the system parameter.

## 18.11.16 od10723

---

**OD: ERROR: od10723: Failed to attach(gen\_shm).**

Windows32/64

#### Explanation

The system resources such as the number of handles and the amount of free memory space are insufficient.

#### User Action

Close any unnecessary applications or install additional memory.

Solaris32/64 Linux32/64

#### Explanation

Insufficient the number which it can attach the shared memory space.

#### User Action

The expansion of the attach number which it can attach of the shared memory size of the system parameter and check the present number of use.

## 18.11.17 od10724

---

**OD: ERROR: od10724:Could not get IPC resource because identifier exists.(resource=%s1 key=%s2 path=%s3)**

#### Variable Information

%s1 = Resource name

%s2 = Key value

%s3 = Path name

#### Explanation

Since the required IPC resource is being used, the IPC resource could not be acquired. The IPC key values are duplicated. %s1 indicates the name of the resource that could not be acquired.

- shared memory: Shared memory
- semaphore: Semaphore
- message queue: Message queue

#### System Action

Fails to start the CORBA service.

#### User Action

The IPC key values are to be customized because they are duplicated during acquisition of the IPC resource.

For details, refer to the Tuning Guide. The status of the use of IPC resources can be checked using the *ipcs* command.

**Solaris32/64** **Linux32/64**

This message may be output if the CORBA Service is started without the OS being rebooted after that service is stopped forcibly by the *OD\_kill* or *K00stopod* command. If the CORBA service is forcefully terminated using the *OD\_kill* command, the IPC resources that the CORBA service has used before the termination must be collected using the *odrmipc* command.

This message may be output when the *OD\_start* process is terminated by the *kill* command.

If this message is output even though both the CORBA Service and CORBA application are inactive, collect the system resources that have not yet been collected by the *odrmipc* command.

## 18.11.18 od10725

---

**OD: ERROR: od10725:Could not get IPC resource.(resource=%s1 key=%s2 path=%s3 err=%s4)**

### Variable Information

%s1 = Resource name

%s2 = Key value

%s3 = Path name

%s4 = Error details

### Explanation

The required IPC resource could not be acquired.

%s1 indicates the name of the resource that could not be acquired.

- shared memory: Shared memory
- semaphore: Semaphore
- message queue: Message queue

### System Action

Fails to start the CORBA service.

### User Action

Check whether the required amount of resources has been set for or added to the system parameter. For information on estimating the amount of resources, see System Parameters in the Tuning Guide.

In addition, stopping and restarting the CORBA Service without stopping CORBA applications may also display this message. Stop all CORBA applications. When the CORBA Service is not executed, start the service. When the CORBA Service is being started, wait until the start is completed.

## 18.11.19 od10726

---

**OD: ERROR: od10726:Could not get IPC resource.(err=%s1)**

### Variable Information

%s1 = Error details

### Explanation

The resource could not be acquired.

## User Action

Quit unnecessary applications to release resources.

In addition, stopping and restarting the CORBA Service without stopping CORBA applications may also display this message. Stop all CORBA applications.

When the CORBA Service is not executed, start the service.

## 18.11.20 od10727

---

**OD: ERROR: od10727:Failed to create key.(path=%s1 id=%s2)**

### Variable Information

%s1 = Path name

%s2 = Identification information

### Explanation

The IPC key could not be generated.

### User Action

Check whether the file indicated by the path name exists.

## 18.11.21 od10728

---

**OD: ERROR: od10728:Failed to attach shared memory.**

### Explanation

The system resources (number of handles and free memory) are insufficient.

### User Action

Stop unnecessary applications or increase memory.

## 18.11.22 od10729

---

**OD: ERROR: od10729:Automatic extension failed. (pid: %s1(%s2), resource: %s3, count: %s4, code: %s5, errno: %s6 )**

### Variable Information

%s1 = Process ID

%s2 = Process name

%s3 = Resource to be extended

%s4 = Extension count

%s5 = Cause code

%s6 = Detailed code

### Explanation

The fourth automatic extension of resource %s3 of process ID %s1 (process name %s2) failed. Cause code %s5 has the following meanings:

- 0x01: Failed to acquire shared memory.

- 0x02: Failed to attach shared memory.
- 0x03: Failed to acquire exclusive memory.
- 0x04: Failed to acquire memory.
- 0xff: Failed for other reasons.

### User Action

Take the action indicated by cause code %s5.

A message containing detailed information may be output before this message is output. In this case, take the action indicated in that message.

Table 18.1 od10729 Cause Codes

Cause Code	Required Action
0x01	Stop unnecessary applications or increase memory.
0x02	
0x03	
0x04	
0xff	Take the action indicated by the message output before this message. If no message was output, use the <i>iscollectinfo</i> command to collect diagnostic information, then contact a Fujitsu SE.

Solaris32/64 Linux32/64

Cause Code	Required Action
0x01	Check whether the system parameters related to shared memory are correct.
0x02	
0x03	Check whether the system parameters related to the semaphore are correct.
0x04	Stop unnecessary applications and release or increase memory.
0xff	Take the action indicated by the message output before this message. If no message was output, use the <i>iscollectinfo</i> command to collect diagnostic information, then contact a Fujitsu SE.

## 18.11.23 od10730

**OD: ERROR: od10730:The semaphore operation failed. ( id=%s1, errno=%s2 )**

### Variable Information

%s1 = Semaphore ID

%s2 = Error ID from the OS

### Explanation

The semaphore %s1 operation failed.

### System Action

If the error is output during service startup, the service fails to start.

### User Action

Linux32/64

If this message is output in the following cases, there are no problems:.

- The message was output during Interstage start processing, and start processing ended normally.
  - The message was output during communication between CORBA applications, and no exception was sent to the applications.
- In all other cases, use the *iscollectinfo* command to collect diagnostic information, then contact a Fujitsu SE.

## 18.12 od10800 to od10899

---

This section details the messages numbered between od10800 and od10899.

### 18.12.1 od10800

---

**UX: OD: ERROR: od10800: Failed to create named pipe '%s1'.**

#### Variable Information

%s1 = File Name

#### Explanation

There was a failure in creating a named pipe.

#### User Action

Restart CORBA Service (ObjectDirector).

### 18.12.2 od10802

---

**OD: ERROR: od10802: Pipe cannot be re-bind. Process %s1 cannot receive requests any more.**

#### Variable Information

%s1 = Process ID

#### Explanation

There was a failure in starting the monitoring of the process with process ID %s1.

#### User Action

Close all other unnecessary applications and increase the free handles in the system.

## 18.13 od10900 to od10999

---

This section details the messages numbered between od10900 and od10999.

### 18.13.1 od10900

---

**OD: ERROR: od10900:Failed to create key:(impl\_shm).**

#### Explanation

The var or etc directory in the CORBA Service installation directory may have been deleted.

#### System Action

If this message is output at an attempt to start the CORBA service, the CORBA service will fail to start.

If this message is output when a CORBA application issues the CORBA\_ORB\_init function, an UNKNOWN exception is reported and the CORBA\_ORB\_init function fails.

#### User Action

Check that the var and etc directories exist.

## 18.13.2 od10901

---

**OD: ERROR: od10901: Failed to get shared memory(impl\_shm).**

Windows32/64

### Explanation

Insufficient memory.

Alternatively, it tried to use a CORBA Service under the condition that a CORBA Service could not be used for.

### System Action

If this message is output during command execution, it will interrupt command processing.

If this message is output when a CORBA application issues the CORBA\_ORB\_init function, an UNKNOWN exception is reported and the CORBA\_ORB\_init function fails.

### User Action

Check the amount of free memory space.

Alternatively, check the condition of the CORBA Service (ObjectDirector).

Solaris32/64 Linux32/64

### Explanation

Insufficient shared memory.

Alternatively, it tried to use a CORBA Service under the condition that a CORBA Service could not be used for.

### System Action

If this message is output during command execution, it will interrupt command processing.

If this message is output when a CORBA application issues the CORBA\_ORB\_init function, an UNKNOWN exception is reported and the CORBA\_ORB\_init function fails.

### User Action

Check the shared memory capacity of system parameter.

Alternatively, check the condition of the CORBA Service (ObjectDirector).

## 18.13.3 od10902

---

**OD: ERROR: od10902: Failed to create shared memory(impl\_shm) :size = %s1 : key = 0x%s2.**

### Variable Information

%s1 = Size

%s2 = Key

Windows32/64

### Explanation

Insufficient memory.

### User Action

Check the amount of free memory space.

Solaris32/64 Linux32/64

### Explanation

Insufficient shared memory.

#### User Action

The expansion of the shared memory size of the system parameter and confirm free memory capacity.

### 18.13.4 od10905

---

#### OD: ERROR: od10905: Failed to attach(impl\_shm).

Windows32/64

#### Explanation

The system resources such as the number of handles and the amount of free memory space are insufficient.

#### User Action

Close any unnecessary applications or install additional memory.

Solaris32/64 Linux32/64

#### Explanation

Insufficient the number which it can attach the shared memory space.

#### User Action

The expansion of the attach number which it can attach of the shared memory size of the system parameter and confirm the present number of use.

### 18.13.5 od10910

---

#### OD: ERROR: od10910: Failed to create key file '%s1'.

#### Variable Information

%s1 = Shared Memory Identifier

#### Explanation

The var or etc directory in the CORBA Service (ObjectDirector) installation directory may have been deleted.

#### User Action

Confirm the existence of the var and etc directory.

### 18.13.6 od10911

---

#### OD: ERROR: od10911: Failed to initialize semaphore set.

Windows32/64

#### Explanation

The system resources such as the number of handles and the amount of free memory space are insufficient.

#### User Action

Close any unnecessary applications or install additional memory.

Solaris32/64 Linux32/64

#### Explanation

Failed to initialize the semaphore setting.

#### User Action

Correct the system environment (semaphore).

## 18.13.7 od10912

---

**OD: ERROR: od10912: Failed to create/attach to semaphore set.(err=%s1)**

### Variable Information

%s1 = Error number reported from the OS

**Windows32/64**

### Explanation

The system resources such as the number of handles and the amount of free memory space are insufficient. Alternatively, the CORBA Service is not started.

### System Action

If this message is output at an attempt to start the CORBA service, the CORBA service will fail to start.

If this message is output when a CORBA application issues the CORBA\_ORB\_init function, an UNKNOWN exception is reported and the CORBA\_ORB\_init function fails.

### User Action

Close any unnecessary applications or install additional memory. If the CORBA Service is not started, start it.

**Solaris32/64 Linux32/64**

### Explanation

Failed to initialize the semaphore setting. Alternatively, the CORBA Service is not started.

### User Action

Increase the value for the semaphore size of the system parameter. If the CORBA Service is not started, start it.

## 18.13.8 od10913

---

**OD: ERROR: od10913: Failed to establish IPC link.**

### Explanation

The number of processes is more than the max\_processes value in the config file.

### System Action

An UNKNOWN exception is reported, and the CORBA\_ORB\_init function fails.

### User Action

Increase the value of max\_processes in the config file.

For the max\_processes value, specify a value that is larger than the number of CORBA applications to be started simultaneously on the machine.

By executing the *odprcurparam* command, it is possible to check the number of active CORBA applications. Also, by referring to the process log, it is possible to check history.

## 18.13.9 od10914

---

**OD: ERROR: od10914: Failed to create/attach to message queue.(err=%s1)**

### Variable Information

%s1 = Error number reported from the OS

### Explanation

There was a failure initializing the message queue.

## System Action

If this message is output at an attempt to start the CORBA service, the CORBA service will fail to start.

If this message is output when the CORBA API is issued, it notifies the application of a system exception.

## User Action

Close all other unnecessary applications and increase the free handles in the system.

The message queue could possibly have been removed improperly by other programs. In such a case, locate the program that has removed the message queue and take corrective measures.

## 18.13.10 od10915

---

**OD: ERROR: od10915: Internal error in ObjectDirector. (%s1, %s2): %s3, %s4 / %s5, pid = %s6(%s7), thread = %s8**

### Variable Information

%s1 = File Name

%s2 = Line No.

%s3 = Error Details

%s4 = Error No.

%s5 = Error Type

%s6 = Process ID

%s7 = Process name

%s8 = Thread No.

### Explanation

An internal error (error %s4) has occurred while processing Process %s6, Thread %s7.

### User Action

An application or environment setting error was detected in the CORBA Service (ObjectDirector). Review the application and environment settings. If another message was output at the same time, take action accordingly. In this case, this message shows detailed information of other error occurrence factors.

## 18.13.11 od10916

---

**OD: ERROR: od10916:Failed to create a thread(err=%s1).**

### Variable Information

%s1 = Error information

 Windows32/64

### Explanation

An error occurred in the call of thread formation function. As for the cause, resources are insufficient.

### System Action

If this message is output when the CORBA service or a CORBA application is started, processing will be cancelled.

If this message is output when the system is active, processing will continue.

## User Action

Close all other unnecessary applications and increase the free resources.

### Solaris32/64

## Explanation

The following cause is a possibility when an error occurs when invoking the thread creation function:

An attempt was made to start the process mode application without specifying `/opt/FSUNod/lib/nt` to the environment variable `LD_LIBRARY_PATH`.

Threads could not be created because of a resource shortage.

## System Action

If this message is output when the CORBA service or a CORBA application is started, processing will be cancelled.

If this message is output when the system is active, processing will continue.

## User Action

Confirm that `/opt/FSUNod/lib/nt` is specified for the `LD_LIBRARY_PATH`. If `/opt/FSUNod/lib/nt` is not specified for the `LD_LIBRARY_PATH`, specify `/opt/FSUNod/lib/nt` for the `LD_LIBRARY_PATH`.

If memory is insufficient, stop unnecessary applications and increase memory.

### Linux32/64

## Explanation

The following cause is a possibility when an error occurs when invoking the thread creation function (`pthread_create`):

### - When starting the process mode application:

- An attempt was made to start the process mode application without specifying `/opt/FJSVod/lib/nt` to the environment variable `LD_LIBRARY_PATH`.

### - When starting the thread mode application:

- An attempt was made to create threads, resulting in a total number of processes and threads in the system that exceeds the value specified in the system parameter `kernel.thread-max`.
- The memory area required to create threads was insufficient.
- An attempt was made to create a thread when the total number of processes and threads created by the user already exceeded the maximum number of processes that can be created by the user.

### - If Interstage startup failed:

- For the Interstage integration command (`isgndef`), Interstage was initialized with system scale specified as 'super'.
- The memory area required to create threads was insufficient.

## System Action

If this message is output when the CORBA service or a CORBA application is started, processing will be cancelled.

If this message is output when the system is active, processing will continue.

## User Action

Take one of the following actions in accordance with the condition under which the error occurred:

### - When starting a process mode application:

- Confirm that `/opt/FJSVod/lib/nt` is specified for the `LD_LIBRARY_PATH`. If `/opt/FJSVod/lib/nt` is not specified for the `LD_LIBRARY_PATH`, specify `/opt/FJSVod/lib/nt` for the `LD_LIBRARY_PATH`.

- **When starting a thread mode application:**

- Confirm that the total number of processes and threads in the system does not exceed the kernel.thread-max value. If this number is exceeded, increase the kernel.thread-max value.
- Check if creation of the thread causes the total number of processes and threads created by the user to exceed the maximum number of processes that can be created by the user. To create a thread when the maximum number of processes that can be created by the user has already been reached, use the 'ulimit' (for bash or Bourne shell types) or 'limit' (for C shell types) command to extend the maximum number of processes that can be used.

- **If Interstage startup failed:**

The system scale 'super' and ' the super scale system ' cannot be specified. Initialize Interstage again by either of the following methods.

- For the Interstage integration command (*isgendef*), initialize Interstage without system scale specified as 'super'.

If this message is output in other cases than the above, the error may be caused by insufficient memory. Check the memory size and the amount of memory in use. If the available memory is insufficient, either expand the memory or reduce the amount of memory in use.

It is also possible that the memory available for a process has been exceeded. Stack memory used by the process is calculated as 'number of threads x stack size'. The memory used by the stack can be reduced by changing the stack size. For details, refer to 'Number of Threads and Processes Used by Applications' in the 'Tuning Guide'. If this message is output from a CORBA server application or an EJB application, reduce the thread concurrency and increase the process concurrency. The memory area available to a process also includes the heap area. It is possible that memory for creating threads is insufficient because the size of the heap area used by the process is large. When specifying a Java application from the command line, ensure that the value set for the heap size is not large.

## 18.13.12 od10917

---

**OD: ERROR: od10917: The number of connections to a server on a process exceeded the maximum limit. (max\_IIOp\_local\_init\_con = %s1)**

### Variable Information

%s1 = Value of max\_IIOp\_local\_init\_con in config file

### Explanation

The number of connections from the client application to the server exceeded the max\_IIOp\_local\_init\_con value in the config file.

### System Action

Notifies the application of a COMM\_FAILURE exception. The request is not sent to the server.

### User Action

Set the max\_IIOp\_local\_init\_con value in the config file correctly.

## 18.13.13 od10918

---

**OD: ERROR: od10918: The number of connections from clients exceeded the maximum limit. (limit\_of\_max\_IIOp\_resp\_con = %s1)**

### Variable Information

%s1 = Value of limit\_of\_max\_IIOp\_resp\_con specified in the config file

### Explanation

A request was accepted by the server in which the number of allowable connections received from the client exceeds the value set by limit\_of\_max\_IIOp\_resp\_con in the config file.

## System Action

Notifies the client of a COMM\_FAILURE exception. The connection is canceled.

## User Action

Increase the value of limit\_of\_max\_IIOp\_resp\_con in the config file. It is possible to check the number of connections that have been accepted from clients by executing the *odprtcuparam* command,.

## 18.13.14 od10920

---

**OD: ERROR: od10920: The number of request processing threads exceeded the maximum limit. (max\_exec\_instance = %s1)**

### Variable Information

%s1 = Value of max\_exec\_instance specified in the config file

### Explanation

More server application request processing threads have been started than the number set by max\_exec\_instance in the config file.

### System Action

Notifies the application of a NO\_RESOURCES exception.

### User Action

Set the value of max\_exec\_instance correctly in the config file.

It is possible to check the number of request processing threads that have been started by executing the *odprtcuparam* command.

## 18.13.15 od10921

---

**OD: ERROR: od10921: ObjectDirector initialization time out.**

### Explanation

Initialization of the CORBA Service (ObjectDirector) has failed. The following are possible causes:

- Initialization has not been completed within the prescribed time (60 seconds). The system may be overloaded.
- The CORBA service (ObjectDirector) has already been started.
- The acquisition of IPC resources failed.
- Initialization has terminated abnormally due to another cause.

### System Action

Fails to start the CORBA service.

### User Action

Take the following action:

- Check the system load status, and re-execute the application program that was terminated with time-out.
- Check to see whether the CORBA service (ObjectDirector) has been started.
- Check to see if a message related to a failure to acquire IPC resources has been output.
- Verify that the semmnu and semume system parameters have been specified. **Solaris32/64**
- If initialization has abnormally terminated due to another cause, check the messages preceding or subsequent to the failure event, and remove the cause of error.

## 18.13.16 od10922

---

### OD: ERROR: od10922: Failed to get a semaphore.(err=%s1)

#### Variable Information

%s1 = Error number reported from the OS

Windows32/64

#### Explanation

The system resources such as the number of handles and the amount of free memory space are insufficient.

#### User Action

Close any unnecessary applications or install additional memory.

Solaris32/64 Linux32/64

#### Explanation

While semaphores are to be obtained from the settings in the environment definition, the semaphore cannot be obtained because the system limits have been reached. If a product is used that uses a semaphore other than that of ObjectDirector, it is necessary to overlay the part that uses ObjectDirector.

#### System Action

Fails to start the CORBA service or CORBA application.

#### User Action

Expand the semaphore that can be used following the settings in the system environment definitions.

Solaris32/64

If installed memory is insufficient, the value set in the system parameter may be invalid. Use the *sysdef* command to check whether the set value is valid during system startup.

Linux32/64

Use the *ipcs -l* command to check whether the set value is valid.

## 18.13.17 od10923

---

### OD: ERROR: od10923: Failed to get shared memory.(err=%s1)

#### Variable Information

%s1 = Error number reported from the OS

#### Explanation

Allocation of a shared memory has failed. The following are possible causes:

- Memory space is insufficient.
- The system resource previously allocated by the CORBA Service or CORBA application has not been released thus preventing the re-allocation.

#### System Action

Fails to start the CORBA service or CORBA application.

## User Action

Use the following method to allow the memory space to be allocated, and restart the CORBA Service:

- Expand the available memory space. Besides the CORBA Service (ObjectDirector), if a product is employed that uses the shared memory, the capacity corresponding to the CORBA Service must be added.
- Alternatively, terminate all the unnecessary application programs.
- If a COBRA application program is operating although the CORBA Service is stopped, terminate the CORBA application program.

**Solaris32/64** **Linux32/64**

- If this message is output in spite of the fact that the CORBA Service and CORBA application programs are stopped, use the *odrmipc* command to collect the system resources left uncollected.

**Solaris32/64**

If installed memory is insufficient, the value set in the system parameter may be invalid. Use the *sysdef* command to check whether the set value is valid during system startup.

**Linux32/64**

Use the *ipcs -l* command to check whether the set value is valid.

## 18.13.18 od10924

---

**OD: INFO: od10924: Information message of Object Director. (%s1, %s2): %s3, %s4 / %s5, pid = %s6(%s7), thrid = %s8**

### Variable Information

- %s1 = File name
- %s2 = Line number
- %s3 = Error details
- %s4 = Error number
- %s5 = Error type
- %s6 = Process number
- %s7 = Process name
- %s8 = Thread number

### Explanation

An ObjectDirector information message was output while %s6 (process number) %s7 (process name) and %s8 (thread number) were being processed.

### User Action

One of the error items in the following table is indicated at %s3, so take the corresponding action.

Table 18.2 od10924 Error Details

Error Details	Action
malloc	Memory is insufficient. Quit unnecessary applications to increase the amount of free memory.
gethostname	The machine name of the local host cannot be acquired. Check whether the network settings of the local host defined in the OS are correct.
ObjectDirector has stopped.	A process is operating as a CORBA process, but the CORBA Service is either stopped or has been restarted. Stop the process that generated this message.

Error Details	Action
accept	<p>Connection reception failed.</p> <p><b>Windows32/64</b></p> <p>The number of handles that can be used in the CORBA Service is insufficient. Add available handles to the system.</p> <p><b>Solaris32/64</b> <b>Linux32/64</b></p> <p>If error number (%s5) is 24, the number of file descriptors that can be used in the CORBA Service is insufficient. Increase the number of file descriptors.</p> <p>In cases other than those described above, requests may be received at the same time from a large number of clients. Check the number of clients started when the message was output. If the number of clients is too large, distribute the load and reduce the number of requests that can be received at the same time.</p>
OD_NET_FirstRead recv	<p>A connection disconnection was detected. Take the appropriate action based on the minor code reported to the application. If an exception is not reported to the application, no action is required.</p> <p>Communication from the server may be disconnected because the maximum number of connections received by the server is exceeded. If message od10918 is output to the server system, review limit_of_max_IIOp_resp_con in the config file (max_IIOp_resp_con if Interstage of the server system is V5 or earlier).</p>
cdr_string (CDR_ENCODE): NULL pointer specified	<p>The NULL pointer is set in the string type parameter. Review the application.</p>
semctl	<p>May be output depending on when the message is output, but does not indicate a problem with operation. No action is required.</p>
local_ip_setup	<p><b>Windows32/64</b></p> <p>If Interstage is operated on the Windows environment, it is possible the machine is cut from the network line. Connect the machine to the network line, and start Interstage.</p>

## 18.13.19 od10925

**OD: ERROR: od10925:Client timeout. (host=%s1,impl=%s2,intf=%s3,op=%s4) (type=%s5,receive\_timeout = %s6)**

### Variable Information

%s1 = Remote server host name

%s2 = Implementation Repository ID

%s3 = Interface Repository ID

%s4 = Operation name

%s5 = Type of the reply wait time

system = Timeout set up by period\_receive\_timeout specified in the config file

host = Timeout set by using CORBA\_ORB\_set\_client\_timer function

thread = Timeout set by using CORBA\_ORB\_set\_client\_request\_timer function

%s6 = Value of the reply wait time

## Explanation

Because the request issued to server host %s1 could not be replied to within the reply wait time (period\_receive\_timeout \* 5 seconds specified in the config file), a timeout occurred on the client side.

## System Action

Notifies the application of a COMM\_FAILURE exception. If there are no other requests waiting for reception, the system cancels the connection to the server.

## User Action

If server processing takes too long or hangs up, check the server processing.

If the request reply wait time on the client side is too short, increase the value of period\_receive\_timeout.

If this message is displayed, a communication error (COMM\_FAILURE) is reported to the client application. Retransmit the request as required in the client application.

## 18.13.20 od10926

---

**OD: INFO: od10926: The timeout occurred for the excess of non-communicated surveillance time.(client = %s1)**

### Variable Information

%s1 = IP address of the client machine

## Explanation

Because the status of no request transmission from the client continued longer than the non-communication monitoring time (period\_idle\_con\_timeout \* 5 seconds specified in the config file) of the server, the connection was disconnected. Even if this message is output, connection is re-established when the next request is sent.

## System Action

On the server, the connection is canceled. Application processing continues.

## User Action

Take the following actions depending on the form of operation.

- If the operation form assumes that the request interval from the client may exceed the non-communication monitoring time, there is no problem in operation because connection is re-established when the next request is sent. No action needs to be taken.
- If the operation form does not assume that the request interval from the client may exceed the non-communication monitoring time, check whether any error has occurred on the client side. If no error has occurred, there is no problem in operation because connection is re-established when the next request is sent. Check for any design problems in the client application.

Regarding the setting of non-communication surveillance time, refer to the period\_idle\_con\_timeout parameter explained under 'config' in the Tuning Guide.

## 18.13.21 od10927

---

**OD: ERROR: od10927: Failed to load library(%s1).**

### Variable Information

%s1 = Library name

## Explanation

Loading of library %s1 failed.

#### User Action

Check if a memory shortage has occurred, and if so, close unnecessary applications or increase the memory. Also check if access permission of library %s1 has been changed.

### 18.13.22 od10928

---

#### **OD: WARNING: od10928: Bad value of con\_accept in config.**

##### Explanation

A parameter set in con\_accept of the config file is in error.

##### User Action

Check the value of con\_accept in the config file. You can set either 'localhost' or 'all'.

### 18.13.23 od10929

---

#### **OD: WARNING: od10929:Bad IP address in config.(client\_bind)**

##### Explanation

The IP address set to client\_bind in the config file is in error.

##### User Action

Check the value of client\_bind in the config file. You can set an IP address or 'default'.

### 18.13.24 od10930

---

#### **OD: WARNING: od10930:Specified bind IP is not your own. Binding will be ignored.**

##### Explanation

The IP address set to client\_bind in the config file is not that of the local host. Communication will be conducted without specifying the IP address to be bound.

##### User Action

Check the IP address set to client\_bind in the config file. The IP address of the local host must be set.

### 18.13.25 od10931

---

#### **OD: INFO: od10931:Connection from a client is refused under IP restriction (client = %s1)**

##### Variable Information

%s1 = IP address that accepts connection (IP address of the local host)

##### Explanation

The host that accepts connection is restricted ('con\_accept=localhost' is set in the config file) to the local host. Because connection was requested from a host other than the local host, connection was rejected.

## 18.13.26 od10932

---

**OD: WARNING: od10932: Failed to recheck connected host name.**

### Explanation

The IP address of the client is restricted. Though the IP address of the connected client and that of the host that accepts the connection match, the host name obtained from the IP address does not match the local host name.

## 18.13.27 od10933

---

**OD: INFO: od10933: Connected host name checked.**

### Explanation

The IP address of the client is restricted. The IP address of the connected client and that of the host that accepts the connection and the host name obtained from the IP address and the local host name match.

## 18.13.28 od10934

---

**OD: INFO: od10934: IP restriction applied since hostnames have not been matched.(%s1, %s2)**

### Variable Information

%s1 = Host name of the client

%s2 = Local host name

### Explanation

The IP address of the client is restricted. Because the host name obtained from the IP address of the connected client and the local host name did not match, communication was disconnected.

## 18.13.29 od10935

---

**OD: INFO: od10935:Client IP address is bound to %s1.**

### Variable Information

%s1 = Bound IP address of the client

### Explanation

The IP address used by the client is bound.

## 18.13.30 od10936

---

**OD: ERROR: od10936:The number of processes has exceeded max\_processes.**

### Explanation

The number of activated CORBA applications exceeded the value of max\_processes in the config file.

## User Action

Set a value greater than the number of activated CORBA applications to `max_processes` in the config file. By executing the `odprtcurparam` command, it is possible to check the number of active CORBA applications. Also, by referring to the process log, it is possible to check history.

## 18.13.31 od10937

---

**OD: ERROR: od10937: Failed to connect to host(%s1),port(%s2). (%s3)**

### Variable Information

%s1 = Connection machine name or IP address

%s2 = Port number

%s3 = Error information posted from operating system

### Explanation

Failed to connect to the connection machine name or the IP address %s1, port %s2.

### User Action

Take the following measures:

- Check whether the CORBA Service has been activated using the connection machine name or IP address %s1.
- If %s1 is a machine name, check for any error in the hosts file and DNS settings.
- Check whether the IP address is converted to a wrong one.
- Check for any error in the network to the connection machine name or IP address %s1.
- Check whether the firewall is turned on in the source or target system, or whether there is a firewall configured between the source and target of the network traffic.

## 18.13.32 od10938

---

**OD: INFO: od10938:The code conversion package installed in the machine is used.**

### Explanation

**Windows32/64**

The code conversion package (ADJUST) is installed on the machine. The code conversion function of the code conversion package (ADJUST) is used, instead of the code conversion function contained in Interstage.

**Solaris32/64 Linux32/64**

The code conversion package (FSUNiconv) is installed on the machine. The code conversion function of the code conversion package (FSUNiconv) is used, instead of the code conversion function contained in Interstage.

## 18.13.33 od10939

---

**OD: ERROR: od10939:Failed to resolve hostname(%s1). (%s2)**

### Variable Information

%s1 = Host name

%s2 = Detailed error information

## Explanation

Failed to resolve the host %s1 name.

## System Action

Notifies the application of a COMM\_FAILURE exception. The request is not sent to the server.

## User Action

Variable information %s1 contains the host names defined in the object reference of the naming service, or those defined in the object reference of the server application. Name resolution failed on these host names. Check whether the host name defined in the object reference.

The host name defined in the object reference can be checked using the following command:

- Naming Service object reference  
*OD\_or\_adm -I* command
- Object reference registered in Naming Service  
*odlistns -I* command

Refer to the Reference Manual (Command Edition) for command details.

For operation using a hosts file, verify that the host names checked using the above command match the contents of the hosts file.

If the host names defined in the object reference contain no error, check to see whether name resolution is possible on the host names, using the contents of the hosts file or DNS settings.

## 18.13.34 od10940

---

**OD: ERROR: od10940:Failed to bind IIOP port=%s1 ip=%s2**

### Variable Information

%s1 = port number specified by /etc/services or IIOP\_port of the config file

%s2 = IP address of the specified host when IIOP\_hostname of the config file is specified or INADDR\_ANY when it is not specified

### Explanation

Failed to bind the IIOP port number.

### User Action

Take necessary actions according to the following occurring conditions.

- Change the port number when the specified port number %s1 is used by other application.
- When the CORBA Service or the service application is already active, start the CORBA Service after once terminating it.
- When the same port number is to be used in a system which has multiple IP addresses, use a different IP address.

## 18.13.35 od10941

---

**OD: INFO: od10941: Client side non-communicated surveillance time was passed.(server = %s1, timeout = %s2)**

### Variable Information

%s1 = Host name of the server machine

%s2 = Client side non-communicated surveillance time (second)

## Explanation

The client non-communication monitoring time (`period_client_idle_con_timeout * 5` seconds specified in the config file) was exceeded, so the connection with the server was closed. Even if this message is output, connection is re-established when the next request is sent.

In process mode, however, the connection with the server is not closed when the monitoring time is exceeded, but closed/re-established when the next request is sent. This message is output at that time.

For information on setting the non-communicated surveillance time, see 'period\_client\_idle\_con\_timeout' described in 'config' (CORBA Service) in the 'Tuning Guide.'

## 18.13.36 od10942

---

**OD: ERROR: od10942: Application processing time exceeded the observation time: IMPL=%s1 WU=%s2 USER=%s3 PID=%s4**

### Variable Information

%s1 = Implementation Repository ID

%s2 = WorkUnit name

%s3 = User name

%s4 = Process ID

### Explanation

The application aborted because the application processing time exceeded the observation time.

### System Action

The system stops the application.

### User Action

After estimating the observation time again in consideration of the system performance of the server, change the application maximum processing time in the WorkUnit definition to perform the processing again.

In addition, an error in the application may extend the application processing time. Check the application to eliminate the cause of error, and perform the processing again.

## 18.13.37 od10943

---

**OD: WARNING: od10943: Application processing time exceeded the observation time: IMPL=%s1 WU=%s2 USER=%s3 PID=%s4**

### Variable Information

%s1 = Implementation Repository ID

%s2 = WorkUnit name

%s3 = User name

%s4 = Process ID

### Explanation

The application processing time exceeded the observation time.

### System Action

The system continues to process the application.

### User Action

After estimating the observation time again in consideration of the system performance of the server, change the application maximum processing time in the WorkUnit definition to perform the processing again.

In addition, an error in the application may extend the application processing time. Check the application to eliminate the cause of error, and perform the processing again.

## 18.13.38 od10944

---

**OD: ERROR: od10944: Failed to get hostname.**

### Explanation

The local host name could not be acquired.

### User Action

Check whether the local host name is set appropriately.

## 18.13.39 od10945

---

**OD: ERROR: od10945: od10945: Failed to control of service(%s1). Service Name(%s2), Error Information(0x%s3)**

### Variable Information

%s1 = Service control API name

%s2 = Target service name

%s3 = Exception information

### Explanation

Service control function %s1 failed during setup of the service of service name %s2. Service %s2 cannot be controlled.

### User Action

Take one of the following actions according to the service control API name (%s1).

Table 18.3 od10945 Error Details

Service control API (%s1)	Action
CreateService	After checking the permission, make a retry. Alternatively, there may be a failure in the service. After restarting the operating system, perform the processing again.
Others	A failure of the service may occur. After restarting the operating system, perform the processing again.

## 18.13.40 od10946

---

**OD: ERROR: od10946: Fail to get the address of function. Function=%s1,PID=%s2,Error=%s3**

### Variable Information

%s1 = Function name

%s2 = Process ID

%s3 = Error information

#### Explanation

The function could not be loaded.

#### User Action

If one of the following function names is indicated, the correct version of the component transaction service may not be installed.

Make sure the correct version of the component transaction service is installed.

- extp\_is\_initwu
- extp\_is\_preapl
- extp\_is\_postapl
- ISP\_open\_proc2
- ISP\_open\_thrd2
- ISP\_put\_data2
- ISP\_close\_thrd2
- ISP\_close\_proc2

For a function other than the above, check if resources are insufficient.

## 18.13.41 od10947

---

**OD: ERROR: od10947: Fail to make directory. DIR=%s1,PID=%s2,Error=%s3**

#### Variable Information

%s1 = Directory name

%s2 = Process ID

%s3 = Error information

#### Explanation

An abnormality occurred while creating the directory.

#### User Action

Check whether there is permission to create the directory. Check that the file system has sufficient space.

## 18.13.42 od10948

---

**OD: ERROR: od10948:An internal error was detected in starting processing of WorkUnit:WU=%s1  
DETAIL=%s2**

#### Variable Information

%s1 = WorkUnit name

%s2 = Detailed information

#### Explanation

An internal error was detected during WorkUnit processing startup.

## System Action

Processing stopped.

## User Action

Note the detailed information and use the *iscollectinfo* command to collect diagnostic information, then contact a Fujitsu SE.

## 18.13.43 od10949

---

**OD: ERROR: od10949: An internal error was detected in stop processing of WorkUnit:WU=%s1 DETAIL=%s2**

### Variable Information

%s1 = WorkUnit name

%s2 = Detailed information

### Explanation

An internal error was detected during WorkUnit processing startup.

## System Action

Processing stopped.

## User Action

Note the detailed information and use the *iscollectinfo* command to collect diagnostic information, then contact a Fujitsu SE.

## 18.13.44 od10950

---

**OD: ERROR: od10950: The definition of application does not exist in Implementation repository:WU=%s1 IMPL=%s2**

### Variable Information

%s1 = WorkUnit name

%s2 = Implementation Repository ID

### Explanation

Information, on the application that failed to start in WorkUnit, is not registered with the Implementation Repository.

Alternatively, the Implementation Repository registered in the queue policy is started as the WorkUnit.

## System Action

Processing stopped.

## User Action

Register information of the application to be started with the Implementation Repository.

Alternatively, delete the Implementation Repository of the starting application from the queue policy.

## 18.13.45 od10951

---

**OD: ERROR: od10951: Any applications other than persistent type cannot be started as WorkUnit.:WU=%s1 IMPL=%s2**

## Variable Information

%s1 = WorkUnit name

%s2 = Implementation Repository ID

## Explanation

An attempt was made to start an application under the WorkUnit that was registered as something other than 'persistent' with the Implementation Repository.

## System Action

Processing stopped.

## User Action

Change the starting type registered with the Implementation Repository to 'persistent'.

## 18.13.46 od10952

---

**OD: ERROR: od10952: Process concurrency of the WorkUnit definition exceeds that of Implementation Repository(proc\_conc\_max):WU=%s1 IMPL=%s2**

## Variable Information

%s1 = WorkUnit name

%s2 = Implementation Repository ID

## Explanation

The process multiplicity specified in the WorkUnit definition exceeds the maximum process multiplicity (proc\_conc\_max) of the application specified in the Implementation Repository.

If this message is output during activation change of the WorkUnit, it might mean that the addition of the values calculated for process concurrency of the started application and process concurrency after activation change has exceeded the maximum process concurrency (proc\_conc\_max) for the application.

## System Action

Processing stopped.

## User Action

Restart the WorkUnit after reducing the process multiplicity in the WorkUnit definition, and re-register it.

Alternatively, restart the WorkUnit after increasing the corresponding maximum process multiplicity (proc\_conc\_max) of the application registered with the Implementation Repository.

## 18.13.47 od10953

---

**OD: ERROR: od10953: The specified application is already starting:WU=%s1 IMPL=%s2**

## Variable Information

%s1 = WorkUnit name

%s2 = Implementation Repository ID

## Explanation

The application being started under the WorkUnit has already been started outside the WorkUnit.

## System Action

Processing stopped.

## User Action

Check that no application (CORBA, EJB) of the same interface repository name has already been started.

## 18.13.48 od10954

---

**OD: ERROR: od10954: User other than the user who started the WorkUnit tried to stop the WorkUnit:WU=%s1 USER=%s2**

### Variable Information

%s1 = WorkUnit name

%s2 = Operator name

### Explanation

An attempt was made to stop a WorkUnit that had been started by another user. Only the user who started the WorkUnit can stop it.

## System Action

Processing stopped.

## User Action

The user who started the WorkUnit needs to stop it.

## 18.13.49 od10955

---

**OD: ERROR: od10955: The application contained in queue\_policy definition cannot be started as WorkUnit:WU=%s1 IMPL=%s2**

### Variable Information

%s1 = WorkUnit name

%s2 = Implementation Repository ID

### Explanation

The application being started under the WorkUnit is specified in the queue policy definition.

It is not allowed to start an application defined in the queue policy, under the WorkUnit.

## System Action

Processing stopped.

## User Action

Delete the relevant application name from the queue policy file.

## 18.13.50 od10956

---

**OD: ERROR: od10956: The Work Unit application cannot be operated.**

### Explanation

It is not allowed to operate an application under the WorkUnit using the *odcntlque* command.

## User Action

Inhibit and permit applications operating under the WorkUnit using the *isinhibitque* and *ispermitque* commands respectively.

Use the *isstoppwu* command to stop an application operating under the WorkUnit.

## 18.13.51 od10957

---

**OD: ERROR: od10957: The implementation repository ID(%s1) of application differs from that of Work Unit definition(%s2).**

### Variable Information

%s1 = Implementation Repository ID of the application

%s2 = Implementation Repository ID in the WorkUnit definition

### Explanation

The Implementation Repository ID of the application being started does not match that in the WorkUnit definition.

### User Action

Check that Impl ID in the [Application Program] section of the WorkUnit definition is correct and that Executable File in the [Application Program] section is correct.

## 18.13.52 od10958

---

**OD: WARNING: od10958: The setting value of IP-version is ignored.**

### Explanation

The setting value of IP-version set in the environment definition file (config) of the CORBA Service is ignored.

This message is output when 'v6' or 'V6' is specified in IP-version in environments that do not support IPv6.

### User Action

To validate the setting, operate in an environment where IPv6 is supported.

In other cases, this message does not affect the operation. Continue the operation.

## 18.13.53 od10959

---

**OD: ERROR: od10959: The request delayed due to the message queue shortage(%s1).**

### Variable Information

%s1 = Transmission waiting message queue ID

### Explanation

Processing is delayed due to the shortage of message queues in the system.

### System Action

The system retries until the shortage of message queues is solved and message queues become available.

### User Action

Check the state of message queues in the system with the *ipcs -aq* command.

Messages are resident in message queues whose QNUM field value is other than zero. The value in the CBYTES field indicates the number of resident bytes. The number of message queues that can reside in the entire system is the value of msginfo\_msgtql specified in the /etc/system file. If the total value in the QNUM field is equal to the value of msginfo\_msgtql, the value estimated for the message queues may be too low.

The total number of bytes of multiple messages that can reside on one message queue is the value of msginfo\_msgmnb specified in the /etc/system file. If this value is close to the value of the CBYTES field, the value estimated for the message queues may be too low.

Investigate the applications that use message queues and check the estimate of IPC resources in the system. If the shortage of message queues is found as the result of estimate, increase the values of msginfo\_msgtql and msginfo\_msgmnb in the /etc/system file, and then re-start the machine.

If no problem is found in the estimate of IPC resources, use the *iscollectinfo* command to collect diagnostic information, then contact a Fujitsu SE.

## 18.13.54 od10960

---

**OD: ERROR: od10960: The specified port number(%s) is used.**

### Explanation

The specified port number is used with already/etc/services.

### User Action

Specify the port number not used for/etc/services.

## 18.13.55 od10961

---

**OD: ERROR: od10961: Application processing time exceeded the observation time: APP=%s1 WU=%s2 PID=%s3**

### Variable Information

%s1 = Application name

%s2 = WorkUnit name

%s3 = Process ID

### Explanation

The application terminated abnormally because the application processing time exceeded the observation time.

### System Action

Cancel the application.

### User Action

Consider system performance on the server side when estimating the observation time. Open the Interstage Management Console, change the maximum application processing time of the WorkUnit definition, and then execute processing again.

Application errors may also increase application processing time. Check the application, resolve any remaining errors, and then execute processing again.

## 18.13.56 od10962

---

**OD: WARNING: od10962: Application processing time exceeded the observation time: APP=%s1 WU=%s2 PID=%s3**

### Variable Information

%s1 = Application name

%s2 = WorkUnit name

%s3 = Process ID

### Explanation

The application processing time exceeded the observation time.

### System Action

Continues application processing as is.

### User Action

Consider system performance on the server side when estimating the observation time. Open the Interstage Management Console, change the maximum application processing time of the WorkUnit definition, and then execute processing again.

Application errors may also increase application processing time. Check the application, resolve any remaining errors, and then execute processing again.

## 18.13.57 od10963

---

**OD: ERROR: od10963: An internal error was detected in starting processing of WorkUnit:WU=%s1 APP=%s2 DETAIL='%s3'**

### Variable Information

%s1 = Application name

%s2 = WorkUnit name

%s3 = Detail code

### Explanation

An internal conflict was detected in WorkUnit startup.

### System Action

Cancels processing.

### User Action

Record detail code %s3, use the *iscollectinfo* command to collect diagnostic information, then call your Fujitsu systems engineer (SE).

## 18.13.58 od10964

---

**OD: ERROR: od10964: The timeout occurred in reading from a socket.(read\_interval\_timeout = %s1)**

### Variable Information

%s1 = Value of config file parameter read\_interval\_timeout

### Explanation

Timeout occurred when reading from a socket.

### User Action

- Ensure that the network between the server and client is fully operational.
- If this error occurs frequently, re-estimate the network environment and improve quality of network operation.

## 18.13.59 od10965

---

**OD: ERROR: od10965: The timeout occurred in the writing to a socket.(write\_interval\_timeout = %s1)**

### Variable Information

%s1 = Value of config file parameter read\_interval\_timeout

### Explanation

Timeout occurred when writing to a socket in non-blocking mode.

### User Action

- Ensure that the network between the server and client is fully operational.
- Send an amount of requested data larger than the server communication buffer length from the client to the server, then confirm that the requested data is accumulated on the network. For more details on the communication buffer, refer to Buffer Control in the OLTP Server User's Guide.
- If this error occurs frequently, re-estimate the network environment and improve quality of network operation.

## 18.13.60 od10966

---

**OD: ERROR: od10966: The name of current host cannot be gotten.**

The machine name of the local host could not be obtained.

### User Action

Check the network settings of the local host for errors.

## 18.13.61 od10967

---

**OD: ERROR: od10967: Starting of a surveillance process went wrong.**

Starting of the surveillance process failed.

### User Action

Ensure there are sufficient resources available.

## 18.13.62 od10968

---

**OD: ERROR: od10968: The number of requests on a client exceeded the maximum limit.  
(limit\_of\_max\_IIOp\_resp\_requests = %s1)**

### Variable Information

%s1 = limit\_of\_max\_IIOp\_resp\_requests value of config file

### Explanation

The number of requests from clients received on the server exceeded the maximum limit.

### System Action

A NO\_RESOURCES exception is reported to the client.

## User Action

Increase the `limit_of_max_IIOp_resp_requests` value in the config file. The number of requests in use can be checked by executing the `odprtcurparam` command.

## 18.13.63 od10969

---

**OD: ERROR: od10969: The number of requests on a client process exceeded the maximum limit. (max\_IIOp\_local\_init\_requests = %s1)**

### Variable Information

%s1 = `max_IIOp_local_init_requests` value of config file

### Explanation

The number of requests sent from one client process to the server exceeded the `max_IIOp_local_init_requests` value in the config file.

### System Action

Notifies the application of a `COMM_FAILURE` exception. The request is not sent to the server.

### User Action

Increase the `max_IIOp_local_init_requests` value in the config file.

If this message is reported from the Servlet container, set the `max_IIOp_local_init_requests` value to be the same as the Servlet container thread concurrency value, or larger.

## 18.13.64 od10970

---

**OD: WARNING: od10970: Failed to use an external function. (function code:%s1, reason code:%s2, detail code:%s3)**

### Variable Information

%s1 = Function Code

%s2 = Reason Code

%s3 = Detail Code

### Explanation

The external function corresponding to Function Code %s1 failed.

Function Code %s1 has the following meaning:

- 0x01: The function which coordinates with Workload Organizer.

If the function which coordinates with Workload Organizer failed, Reason Code %s2 has the following meanings:

- 0x01: Loading the library of Workload Organizer is failed.
- 0x02: Executing the function which coordinates with Workload Organizer is failed.

### User Action

Take the appropriate action based on the Reason Code.

- 0x01: Make sure Workload Organizer is installed.
- 0x02: Make sure the `bind_processor_id` value in the config file is set to 0 or -1. Make sure the system environment setup of Workload Organizer is completed.

## 18.13.65 od10971

---

### OD: WARNING: od10971:ObjectDirector has stopped.

#### Explanation

The process that has output this message runs as a CORBA process, but processing cannot continue because the CORBA service has been stopped or restarted.

If database connection tests are performed from the Interstage Management Console, this error may also occur if the CORBA Service is restarted without stopping the Interstage JMX Service.

#### User Action

Stop the process that has output this message, then restart it, if required.

**Solaris32/64** **Linux32/64**

The process name can be determined from the beginning (character string subsequent to the host name) of the line containing this message in the system log (/var/adm/messages for Solaris and /var/log/messages for Linux).

If database connection tests are performed from the Interstage Management Console, restart the Interstage JMX Service according to the following procedure and then restart the CORBA Service if necessary.

**Windows32/64**

Restart the 'Interstage JServlet(OperationManagement)' Service.

**Solaris32/64** **Linux32/64**

Restart the Interstage JMX Service and the Servlet Service for the Interstage Management Console.

## 18.13.66 od10972

---

### OD: ERROR: od10972:Failed to accept connection. errno=%s1

#### Variable Information

%s1 = Error number

#### Explanation

Failed to accept a connection.

#### User Action

Increase the max\_IIOp\_local\_init\_requests value in the config file.

If this message is reported from the Servlet container, set the max\_IIOp\_local\_init\_requests value to be the same as the Servlet container thread concurrency value, or larger.

**Windows32/64**

The number of handles that the CORBA service can use is insufficient. Terminate unnecessary processes to increase the number of available system handles.

The number of handles used by each process can be checked using the task manager, etc.

**Solaris32/64** **Linux32/64**

If the error number (%s1) is '24', the number of file descriptors that the CORBA service can use is insufficient. Use the *ulimit* command for the bash or Bourne shell and the *limit* command for the C shell to increase the number of file descriptors.

The number of file descriptors that can be opened can be set with an appropriate system parameter.

**Solaris32/64**

Edit the `rlim_fd_cur` system parameter. For details about changing the parameter, see an appropriate Solaris document.

The file descriptors that have been opened by processes can be checked using the `pfiles` command. For details about the `pfiles` command, see the Solaris document.

#### **Linux32/64**

Edit the `fs.file-max` system parameter. For details about changing the parameter, see an appropriate Linux document.

If this does not solve the problem, requests may have been accepted from a large number of clients simultaneously. Check the number of clients that were started when this message was output. If the number of clients is large, perform load distribution to decrease the number of request that can be accepted simultaneously.

The number of clients that can be connected simultaneously can be checked by using the `odprcurparam` command. For details of the command, see 'Reference Manual (Command Edition).'

## **18.13.67 od10973**

---

### **OD: WARNING: od10973: The OD-Java runtime is operating in process mode.**

#### **Explanation**

The OD-Java runtime is operating in process mode.

Operation of the OD-Java runtime in process mode is not guaranteed.

#### **System Action**

The OD-Java runtime continues to operate in process mode.

#### **User Action**

Check that the library path for process mode, `/opt/FSUNod/lib/nt(Solaris)` or `/opt/FJSVod/lib/nt(Linux)`, is set for the environment variable `LD_LIBRARY_PATH`.

If it is, change the environment variable `LD_LIBRARY_PATH` to set the library path for the thread mode, `/opt/FSUNod/lib(Solaris)` or `/opt/FJSVod/lib(Linux)`.

## **18.13.68 od10974**

---

### **OD: ERROR: od10974: Failed to obtain resources to control CORBA communication processing. (PID=%s1, API=%s2, errno=%s3)**

#### **Variable Information**

`%s1` = Process ID

`%s2` = Operating system API name

`%s3` = Error information posted from operating system

#### **Explanation**

The system failed to obtain resources for the internal control used for CORBA communication processing.

#### **System Action**

Posts a system exception to the CORBA application.

#### **User Action**

There may be a memory shortage.

If there is insufficient memory, close unnecessary applications to free memory, or increase the memory size.

If sufficient memory is available, note the detailed information and use the *iscollectinfo* command to collect diagnostic information, then contact customer support.

## 18.13.69 od10975

---

**OD: WARNING: od10975: The specified code set is not supported. (Data type:%s1, Code Set:%s2)**

### Variable Information

%s1 = Data type

%s2 = Code Set

### Explanation

A code set that is not supported by the data type %s1 has been specified.

### System Action

Does not convert the code.

### User Action

Check the code set specified for the client and server, and specify the code set that is supported by the data type %s1.

## 18.13.70 od10978

---

**OD: WARNING: od10978: The number of binded objects exceeded the maximum limit. (max\_bind\_instances = %s1)**

### Variable Information

%s1 = Value of max\_bind\_instances specified in the config file

### Explanation

An attempt was made to bind the objects when the value of max\_bind\_instances specified in the config file was exceeded.

### System Action

The NO\_RESOURCE exception is sent to the application.

### User Action

Increase the value of max\_bind\_instances specified in the config file. Execute the *odprcurparam* command to check the number of binds that are being used.

## 18.13.71 od10979

---

**OD: INFO: od10979: A timeout occurred in the exit function. (type = %s1, impl = %s2, pid = %s3, timeout = %s4)**

### Variable Information

%s1 = Exit function type (reply\_interceptor)

%s2 = Implementation repository ID

%s3 = Process ID

%s4 = Maximum processing time for the exit function (in seconds)

## Explanation

Processing of the exit function for process %s3 was still not complete after %s4 seconds, therefore a timeout occurred.

## System Action

Terminates process %s3 by force.

## User Action

Exit function processing takes too long, or hangs up. Review exit function processing.

If there is no problem with exit function processing, the maximum exit function processing time is too short. Change the `reply_interceptor_timeout` value for the implementation repository definition.

# 18.14 od11000 to od11099

---

This section details the messages numbered between od11000 and od11099.

## 18.14.1 od11002

---

### OD: ERROR: od11002: ftok () for Queue control failed.

#### Explanation

The var or etc directory in the ObjectDirector installation directory may have been deleted.

#### System Action

If this message is output at an attempt to start the CORBA service, the CORBA service will fail to start.

If this message is output when a CORBA application issues the `CORBA_ORB_init` function, an UNKNOWN exception is reported and the `CORBA_ORB_init` function fails.

#### User Action

Confirm the existence of the var and etc directories.

## 18.14.2 od11003

---

### OD: ERROR: od11003:shmget() for Queue Control failed.

**Windows32/64**

#### Explanation

Insufficient memory.

Alternatively, it tried to use a CORBA Service under the condition that the queue control of the CORBA Service could not be used for.

#### System Action

An UNKNOWN exception is reported and the `CORBA_ORB_init` function fails.

#### User Action

Check the amount of free memory space.

Alternatively, check the condition of the queue control of the CORBA Service (ObjectDirector).

**Solaris32/64** **Linux32/64**

#### Explanation

Insufficient shared memory.

Alternatively, a CORBA Service may have been used under a condition that the queue control of the CORBA Service could not be used for.

#### System Action

An UNKNOWN exception is reported and the CORBA\_ORB\_init function fails.

#### User Action

Check the shared memory capacity of system parameter.

Alternatively, check the condition of the queue control of the CORBA Service (ObjectDirector).

---

### 18.14.3 od11004

---

**OD: ERROR: od11004:Failed to attach shared memory for Queue Control.**

#### Explanation

Insufficient memory.

#### System Action

If this message is output at an attempt to start the CORBA service, the CORBA service will fail to start.

If this message is output when a CORBA application issues the CORBA\_ORB\_init function, an UNKNOWN exception is reported and the CORBA\_ORB\_init function fails.

#### User Action

Check free memory.

---

### 18.14.4 od11007

---

**OD: ERROR: od11007:OD\_QUEUE\_BuildQueueSystem failed.**

#### Explanation

Failed to create the queuing policy.

#### System Action

Fails to start the CORBA service.

#### User Action

Correct the queuing policy.

Since it is possible that the creation of queuing policy failed due to an error that occurred immediately beforehand, take action according to the error if an error message was output.

---

## 18.15 od11100 to od11199

---

This section details the messages numbered between od11100 and od11199.

---

### 18.15.1 od11100

---

**OD: INFO: od11100:ObjectDirector uses queue policy.**

#### Explanation

The queue policy of ObjectDirector is valid.

---

### 18.15.2 od11101

---

---

**OD: INFO: od11101:ObjectDirector does not use queue policy.****Explanation**

The queue policy of ObjectDirector is invalid.

**System Action**

The CORBA service does not use the queuing policy.

**User Action**

Because this is an information message indicating that the queue policy is not used, no action is required.

When the CORBA Service is started, this message or message od11100 is output.

When the queue policy is used, message od11100 is output.

---

**18.15.3 od11102**

---

**OD: INFO: od11102:ObjectDirector accepted stop request of application. Queue: %s1 Mode: %s2****Variable Information**

%s1 = Queue Name

%s2 = Mode

**Explanation**

The ObjectDirector accepted a stop request of an application of which queue name is %s1.

---

**18.15.4 od11103**

---

**OD: INFO: od11103:ObjectDirector started to accept requests. Queue: %s1****Variable Information**

%s1 = Queue Name

**Explanation**

The ObjectDirector has started to accept requests from queue name %s1.

---

**18.15.5 od11104**

---

**OD: INFO: od11104:ObjectDirector stopped to accept requests. Queue: %s1****Variable Information**

%s1 = Queue Name

**Explanation**

The ObjectDirector has stopped accepting requests from queue name %s1.

---

**18.15.6 od11105**

---

**OD: INFO: od11105:ObjectDirector started to dispatch requests. Queue: %s1****Variable Information**

%s1 = Queue Name

**Explanation**

The ObjectDirector has started to dispatch requests from queue %s1.

## 18.15.7 od11106

---

**OD: INFO: od11106:ObjectDirector stopped to dispatch requests. Queue: %s1**

### Variable Information

%s1 = Queue Name

### Explanation

The ObjectDirector has stopped dispatching requests from queue %s1.

## 18.15.8 od11107

---

**OD: WARNING: od11107:The number of waiting message became to the monitoring queuing number(%s1-%s2-%s3)**

### Variable Information

%s1 = WorkUnit name

%s2 = Application or implementation repository ID

%s3 = Monitoring queuing number

### Explanation

The number of wait messages for WorkUnit %s1 is the same as the number for monitor queuing described in the WorkUnit configuration in %s3.

The following are output in %s2, depending on the WorkUnit type:

- IIServer: IIServer name
- CORBA WorkUnit: Implementation repository ID

### System Action

Continues queuing processing.

### User Action

If this message appears repeatedly, check the WorkUnit definition. When modifying the WorkUnit definition, register the WorkUnit with the *isaddwundef* command again, then restart the WorkUnit.

## 18.15.9 od11108

---

**OD: WARNING: od11108:The number of waiting message exceeded the maximum queuing number(%s1-%s2-%s3)**

### Variable Information

%s1 = WorkUnit name

%s2 = Application or implementation repository ID

%s3 = Maximum queuing number

### Explanation

The number of wait messages for WorkUnit %s1 has exceeded the maximum number for monitor queuing described in the WorkUnit configuration in %s3.

The following are output in %s2, depending on the WorkUnit type:

- IIServer: IIServer name
- CORBA WorkUnit: Implementation repository ID

## System Action

The server application does not process the request. The NO\_RESOURCE exception is notified to the client.

## User Action

If this message appears repeatedly, check the WorkUnit definition.

When modifying the WorkUnit definition, register the WorkUnit with the *isaddwundef* command again and then restart the WorkUnit.

## 18.15.10 od11109

---

**OD: INFO: od11109: The number of waiting message became to restart monitoring queuing number(%s1-%s2-%s3)**

### Variable Information

%s1 = WorkUnit name

%s2 = Application or implementation repository ID

%s3 = Restart monitoring queuing number

### Explanation

The number of wait messages for WorkUnit %s1 is the same as the number for the restart of monitor queuing described in the WorkUnit configuration in %s3.

The following are output in %s2, depending on the WorkUnit type:

- IJServer: IJServer name
- CORBA WorkUnit: Implementation repository ID

## System Action

Continues queuing processing.

## User Action

If this message appears repeatedly, check the WorkUnit definition.

When modifying the WorkUnit definition, register the WorkUnit with the *isaddwundef* command again, then restart the WorkUnit.

## 18.15.11 od11110

---

**OD: WARNING: od11110: The amount of used buffer is approaching the maximum number:WU=%s1 IMPL=%s2**

### Variable Information

%s1 = WorkUnit name

%s2 = Implementation Repository ID

### Explanation

The number of buffers used for the destination indicated by the WorkUnit name and Implementation Repository ID exceeded 90% of the maximum value.

## System Action

If the usage exceeds its maximum value, client requests must wait for connection in the queue of the CORBA Service.

## User Action

If this message is output frequently, re-estimate the buffer value in the WorkUnit definition.

## 18.15.12 od11111

---

**OD: WARNING: od11111: The amount of used common buffer is approaching the maximum number.**

### Explanation

The number of shared buffers used exceeded 90% of the maximum value.

### System Action

When buffer usage exceeds the maximum available, the client demands must wait for connection in the queue of the CORBA Service.

### User Action

Check common buffer size (`number_of_common_buffer`) of the config file when this message is frequently output.

By executing the `odprtcparam` command, it is possible to check the present common buffer consumption.

## 18.15.13 od11112

---

**OD: WARNING: od11112: The number of connections from clients is approaching the maximum number. (limit\_of\_max\_IIOp\_resp\_con = %s1)**

### Variable Information

%s1 = `limit_of_max_IIOp_resp_con` value of config file

### Explanation

The number of connections received from the client exceeded 90% of the maximum value.

### System Action

If the maximum number of connections used is exceeded, a new connection from the client is disconnected.

### User Action

If this message is output frequently, re-estimate the `limit_of_max_IIOp_resp_con` value in the config file. Refer to the Tuning Guide for details on `limit_of_max_IIOp_resp_con`.

By executing the `odprtcparam` command, it is possible to check the number of connections that have been accepted from clients.

## 18.15.14 od11113

---

**OD: WARNING: od11113: The number of requests from clients is approaching the maximum number. (limit\_of\_max\_IIOp\_resp\_requests = %s1)**

### Variable Information

%s1 = `limit_of_max_IIOp_resp_requests` value of config file

### Explanation

The number of requests received from the client exceeded 90% of the maximum value.

The number of requests in use can be checked by executing the `odprtcparam` command.

## System Action

If the maximum number of requests used is exceeded, a request is not processed and a `NO_RESOURCES` exception is reported to the client.

## User Action

If this message is output frequently, re-estimate the `limit_of_max_IIOp_resp_requests` value in the config file. Refer to the Tuning Guide for details on `limit_of_max_IIOp_resp_requests`.

## 18.15.15 od11114

---

**OD: WARNING: od11114:The number of processes is approaching the maximum number. (max\_processes = %s1)**

### Variable Information

`%s1` = `max_processes` value of config file

### Explanation

The number of CORBA Services started exceeded 90% of the maximum value.

### System Action

If the maximum number of CORBA Services used is exceeded, a new CORBA Service cannot be started.

### User Action

If this message is output frequently, re-estimate the `max_processes` value in the config file.

By executing the `odprtcuParam` command, it is possible to check the number of active CORBA applications.

Also, by referring to the process log, it is possible to check history.

## 18.15.16 od11115

---

**OD: WARNING: od11115:The number of request processing threads is approaching the maximum number.(max\_exec\_instance = %s1)**

### Variable Information

`%s1` = `max_exec_instance` value of config file

### Explanation

The number of request processing threads of the server application exceeded 90% of the maximum value.

### System Action

If the maximum number of threads used is exceeded, activation processing of the application fails.

### User Action

If this message is output frequently, re-estimate the `max_exec_instance` value in the config file.

By executing the `odprtcuParam` command, it is possible to check the number of request processing threads that have been started.

## 18.16 od11200 to od11299

---

This section details the messages numbered between od11200 and od11299.

## 18.16.1 od11200

---

**OD: WARNING: od11200:%s1 service is already running.**

### Variable Information

%s1 = Service name

### Explanation

An attempt was made to start %s1 when the service indicated by %s1 had already been started.

### User Action

None.

## 18.16.2 od11201

---

**OD: WARNING: od11201:%s1 service was already stopped.**

### Variable Information

%s1 = Service name

### Explanation

An attempt was made to stop %s1 when the service indicated by %s1 had already been stopped.

### User Action

None.

## 18.16.3 od11202

---

**OD: ERROR: od11202:%s1 service does not exist.**

### Variable Information

%s1 = Service name

### Explanation

An attempt was made to perform an operation for a nonexistent service.

### User Action

Refer to the service indicated by %s1 and check whether Interstage is correctly set up.

## 18.16.4 od11203

---

**OD: ERROR: od11203:System error occurred (%s1).**

### Variable Information

%s1 = Error detailed information

### Explanation

A system error occurred.

### User Action

Use the *iscollectinfo* command to collect diagnostic information, then contact a Fujitsu SE.

## 18.16.5 od11204

---

---

**OD: ERROR: od11204:Parameter is invalid(%s1).****Variable Information**

%s1 = Error detailed information

**Explanation**

The parameter value is invalid.

**User Action**

Set an appropriate value.

---

**18.16.6 od11205**

---

**OD: ERROR: od11205:%s1 is already updated.****Variable Information**

%s1 = Setting name

**Explanation**

The setting has already been updated by another user.

**User Action**

Take the appropriate action according to the error details shown in the following table.

Table 18.4 od11205 Error Details

Error Details	Required Action
configuration	The CORBA Service setting was updated by another user. Re-update the setting as required.
SSLconfiguration	The CORBA Service SSL setting was updated by another user. Re-update the setting as required.

---

**18.16.7 od11206**

---

**OD: ERROR: od11206:Failed to create %s1 file.****Variable Information**

%s1 = File name

**Explanation**

File creation failed.

**User Action**

Check the authority of the directory where file %s is to be created and the amount of free disk space.

---

**18.16.8 od11207**

---

**OD: ERROR: od11207:Not Initialized Error(%s1).****Variable Information**

%s1 = Error detailed information

**Explanation**

An initialization failure occurred.

**User Action**

Take the appropriate action according to the error details shown in the following table.

Table 18.5 od11207 Error Details

Error Details	Required Action
SSL Environment	An attempt was made to retrieve an SSL definition name when the SSL environment was not set up. Set up the SSL environment and retrieve the SSL definition.

## 18.16.9 od11208

**OD: ERROR: od11208:Registration of CORBA application failed(CODE=%s1, INFO=%s2).**

### Variable Information

%s1 = Error code

%s2 = Error information

### Explanation

An error occurred during the registration of a CORBA application.

### User Action

Take appropriate action referring to the error code table.

If an error code not listed in the table is output, record the error code and the error information, use the *iscollectinfo* command to collect diagnostic information, then contact a Fujitsu service engineer.

Table 18.6 od11208 Error Details

Error code	Cause	User Action
15000	A memory shortage occurred.	Either terminate unnecessary applications to release more memory or expand memory.
15005	The Implementation Repository ID has already been registered.	Use an unregistered Implementation Repository ID.
15006	The Implementation Repository ID cannot be deleted.	If an application with the Implementation Repository ID is active, terminate the application.
15007	Failed to write to the impl.db file.	Check the free disk space.
15009	The Implementation Repository ID is not registered.	Specify a registered Implementation Repository ID.
15010	The CORBA service has not been started.	Start the CORBA service.
15013	Failed to register the Implementation Repository ID.	If the ID has already been registered, check the Implementation Repository ID to be registered. In the case of a disk resource shortage, allocate additional free disk space. If the value of max_impl_rep_entries is too small, increase the max_impl_rep_entries value in the config file.
15016	The Implementation Repository ID is too long.	Shorten the Implementation Repository ID.
15017	Failed in initialization.	If the CORBA service has not been started, start the CORBA service. If the CORBA service has been started, there is a memory shortage. Either terminate unnecessary files or expand memory.
15511	Failed to open a file.	Check to see whether the file specified by the error information exists.
10507	The content of the impl.db file is invalid.	Recover the impl.db file from the impl.db.bak file. If the problem occurs even after recovery, use the <i>iscollectinfo</i>

Error code	Cause	User Action
		command to collect diagnostic information, then contact a Fujitsu service engineer.
15514	The Interface Repository ID is too long.	Shorten the Interface Repository ID.
15515	The Implementation Repository ID is too long.	Shorten the Implementation Repository ID.
15038	The object group name specification contains an error.	Check to see whether the object group name specification contains an error.

## 18.16.10 od11209

---

**OD: ERROR: od11209:Deletion of CORBA application registration failed(CODE=%s1, INFO=%s2).**

### Variable Information

%s1 = Error code

%s2 = Error information

### Explanation

An error occurred during the registration of a CORBA application.

### User Action

Refer to the error code table for message od11208, follow the appropriate user action for each error code.

## 18.17 od15000 to od15099

This section details the messages numbered between od15000 and od15999.

### 18.17.1 od15000

---

**OD: ERROR: od15000:memory allocation fail.**

### Explanation

Memory allocation has failed.

### User Action

Close any unnecessary applications to release the memory space, or install additional memory.

### 18.17.2 od15001

---

**OD: ERROR: od15001:thread concurrency value is invalid.**

### Explanation

There is an error in the initial thread concurrency (definition file) specified by the *OD\_impl\_inst* command.

### User Action

Modify the initial thread concurrency in the definition file.

### 18.17.3 od15003

---

**OD: ERROR: od15003:user-id is invalid.**

#### Explanation

There is an error in the user ID specified by the *OD\_impl\_inst* command.

#### User Action

Check the user ID.

### 18.17.4 od15004

---

#### **OD: ERROR: od15004:group-id is invalid.**

#### Explanation

There is an error in the group ID specified by the *OD\_impl\_inst* command.

#### User Action

Check the group ID.

### 18.17.5 od15005

---

#### **OD: ERROR: od15005:Implementation Repository ID is already registered.**

#### Explanation

The Implementation Repository ID is already registered.

#### System Action

Cancels command processing

#### User Action

Use an unregistered Implementation Repository ID.

Alternatively, delete the registered Implementation Repository ID, then retry the command.

### 18.17.6 od15006

---

#### **OD: ERROR: od15006:Implementation Repository ID delete fails.**

#### Explanation

The Implementation Repository ID cannot be deleted.

#### System Action

Cancels command processing

#### User Action

If the application for the Implementation Repository ID has started, terminate the application.

### 18.17.7 od15007

---

#### **OD: ERROR: od15007:FJ\_ImplementationRep\_synch failed.**

#### Explanation

Failed to write to the impl.db file.

#### User Action

Check free disk space.

## 18.17.8 od15008

---

**OD: ERROR: od15008:FJ\_ImplementationRep\_synch failed. exception-id: %s1**

### Variable Information

%s1 = Exception information

### Explanation

Failed to write to the impl.db file.

### System Action

Stops the command processing.

### User Action

If an odxxxxx message is output in the event log or system log message at around the time that the message is output, take action according to that message (xxxxx is a 5-digit numerical value).

In addition, check the available disk space.

## 18.17.9 od15009

---

**OD: ERROR: od15009:Implementation Repository ID is not registered.**

### Explanation

The Implementation Repository ID is not registered.

### System Action

Cancels command processing

### User Action

Specify an already registered Implementation Repository ID.

## 18.17.10 od15010

---

**OD: ERROR: od15010:ObjectDirector is not running.**

### Explanation

ObjectDirector has not been started.

### User Action

Start ObjectDirector.

## 18.17.11 od15013

---

**OD: ERROR: od15013:fj\_ImplementationRep\_create\_impl\_deffailed.**

### Explanation

Failed to register the Implementation Repository.

Possible causes are as follows:

- An implementation repository ID that has already been registered was specified.
- There are insufficient disk resources.

- There is a problem with the combination of IOR version and either code information (locale) or SSL information (ssl).
- There are at least two blank lines occurring successively in the CORBA application information definition file (the file specified by executing the OD\_impl\_inst command -ax option).
- The max\_impl\_rep\_entries value is too small.
- An implementation repository ID that has already been registered in the queuing policy was specified.

### User Action

Take the action shown below that corresponds to the cause:

- If the implementation repository ID has already been registered, review the implementation repository that is about to be registered.
- If there are insufficient disk resources, secure available unused disks.
- If there is an error in the CORBA application information definition file, edit the CORBA application information definition file and then register the server application again.
- If the max\_impl\_rep\_entries value is too small, add the max\_impl\_rep\_entries value of the config file. The parameter value that was edited will be enabled the next time the CORBA service is started.
- If this message was output when the implementation repository ID that had already been registered in the queuing policy was specified, it means that the registration of the implementation repository was successful. No action is required in this case. However, if the CORBA application information definition file was used and multiple definitions were entered in this file, the output of this message does not necessarily mean that the registration of all the defined implementation repositories was successful. Execute the "OD\_impl\_inst -p" command to check whether the implementation repository has been registered.

**Solaris32/64** **Linux32/64**

The system parameter must be set to change max\_impl\_rep\_entries. For details, refer to 'Setting the System Environment for a CORBA Service' in the 'Tuning Guide'.

## 18.17.12 od15016

---

### OD: ERROR: od15016:Implementation Repository ID is too long.

#### Explanation

The Implementation Repository ID is too long.

#### User Action

Specify a smaller Implementation Repository ID.

## 18.17.13 od15017

---

### OD: ERROR: od15017: Initialization is failed.

#### Explanation

Initialization failed.

#### User Action

Activate the OD\_start service if it is not active.

If the OD\_start service is active, a resource shortage has occurred. Close all unwanted applications.

When od10936 appeared immediately before this message, initialization failed because the max\_processor value in the config file was too small. Take the action indicated in od10936.

**Solaris32/64** **Linux32/64**

If "iss\_use = yes" has been set in the config file, the user does not have authority to execute the command. Check the value set for iss\_group in the config file and execute the command as a user that belongs to the corresponding group.

## 18.17.14 od15018

---

### OD: ERROR: od15018: Output of SNAP information is failed.

#### Explanation

The *odformsnap* command failed to output snap information as a file.

#### User Action

The *odformsnap* command outputs a file to the current directory. Check whether write permission has been assigned to the current directory. If not, assign write permission to the current directory.

**Windows32/64**

If write permission has been assigned to the current directory, a resource shortage has occurred. Close all unwanted applications.

**Solaris32/64** **Linux32/64**

If write permission has been assigned to the current directory, a memory shortage has occurred. Close all unnecessary programs or expand the memory.

## 18.17.15 od15019

---

### OD: ERROR: od15019: SNAP information is unable to be cleared.

#### Explanation

SNAP information failed to be cleared using the *odfreesnap* command.

#### User Action

**Windows32/64**

A resource shortage has occurred. Close all unwanted applications.

**Solaris32/64** **Linux32/64**

A memory shortage has occurred. Close all unnecessary programs or expand the memory.

## 18.17.16 od15020

---

### OD: ERROR: od15020: Specified process ID is not found.

#### Explanation

The specified process ID could not be found.

#### User Action

The specified process ID does not exist or is not a CORBA application process ID. Specify a CORBA application process ID.

## 18.17.17 od15021

---

### OD: ERROR : od15021: Start of collecting the SNAP information is failed.

## Explanation

Collection of SNAP information failed to be started using the *odstartsnap* command.

## User Action

Windows32/64

A resource shortage has occurred. Close all unwanted applications.

Solaris32/64 Linux32/64

A memory shortage has occurred. Close all unnecessary programs or expand the memory.

## 18.17.18 od15022

---

**OD: ERROR : od15022: Stop of collecting the SNAP information is failed.**

## Explanation

Collection of SNAP information failed to be stopped using the *odstopsnap* command.

## User Action

Windows32/64

A resource shortage has occurred. Close all unwanted applications.

Solaris32/64 Linux32/64

A memory shortage has occurred. Close all unnecessary programs or expand the memory.

## 18.17.19 od15023

---

**OD: ERROR : od15023:An error was found in %s1 service. (exception-id: %s2, minor = %s3)**

## Variable Information

%s1 = Service Name

%s2 = Exception Information

%s3 = Minor Code

## Explanation

An error was detected in the service indicated by %s1. This service is unavailable because it is stopped or faulty. If exception information (%s2) and minor code (%s3) exist, an exception (%s2, %s3) has occurred. If they do not exist, the process for the service (%s1) does not exist.

One of the following services is set in %s1:

### ImplementationRepository

Implementation Repository Service

### NameService

Naming Service

### FJ\_LoadBalancingOption

Load Balancing function

### InterfaceRepository

Interface Repository Service (for standard interface)

InterfaceRepository\_e

Interface Repository Service (for value interface)

#### User Action

Check the exception information (%s2) and minor code (%s3), and rectify. For details about the exception information and minor codes, refer to Exception Information Minor Codes Reported from the CORBA Service.

**Solaris32/64**

If the Cluster Service function is used, take action according to the Cluster Service function operation method.

## 18.17.20 od15024

---

**OD: ERROR : od15024:The initialization was failed. (exception-id: %s1, minor = %s2)**

#### Variable Information

%s1 = Exception Information

%s2 = Minor Code

#### Explanation

This command failed to be initialized. The CORBA Service or the service to be monitored is unavailable.

#### User Action

Check the exception information (%s2) and minor code (%s3), and eliminate the cause. For details about the exception information and minor codes, refer to Exception Information Minor Codes Reported from the CORBA Service.

## 18.17.21 od15025

---

**OD: ERROR : od15025:Invalid arguments.**

#### Explanation

The specified command arguments are invalid.

#### User Action

Specify valid arguments.

## 18.17.22 od15026

---

**OD: ERROR : od15026:File conversion has failed.**

#### Explanation

File conversion by *odcvtrace* command failed. The contents of the specified file are not correct.

#### User Action

Specify the correct file.

## 18.17.23 od15027

---

**OD: ERROR : od15027:The option %s1 was defined doubly.**

#### Variable Information

%s1 = Option name

#### Explanation

The option %s1 is defined duplicate.

#### User Action

Do not define the option in duplicate.

### 18.17.24 od15028

---

**OD: ERROR : od15028:The parameter was specified to be the option without a parameter(%s1).**

#### Variable Information

%s1 = Parameter name

#### Explanation

The parameter %s1 is specified for the option without a parameter.

#### User Action

Do not specify parameter for the option.

### 18.17.25 od15029

---

**OD: ERROR : od15029:%s1 is not specified.**

#### Variable Information

%s1 = Parameter name

#### Explanation

The parameter %s1 is not specified.

#### User Action

Specify the %s1 parameter.

### 18.17.26 od15030

---

**OD: ERROR : od15030:The object reference cannot be written in a file.**

#### Explanation

The object reference cannot be written in a file.

#### User Action

Check if the write permission has been assigned to the file.

### 18.17.27 od15031

---

**OD: ERROR : od15031:The specified character set is wrong.**

#### Explanation

There is an error in the character set.

#### System Action

Cancels command processing

#### User Action

Check the setting of the character set.

### 18.17.28 od15032

---

**OD: ERROR : od15032:The specified port is wrong.**

#### Explanation

There is an error in the specified port number.

#### User Action

Check that the specified port number is correct.

### 18.17.29 od15033

---

**OD: ERROR : od15033:It is necessary to specify %s1 and %s2 simultaneously.**

#### Variable Information

%s1 = Option name

%s2 = Option name

#### Explanation

The options %s1 and %s2 must be specified simultaneously.

#### User Action

Specify the options %s1 and %s2 simultaneously.

### 18.17.30 od15034

---

**OD: ERROR : od15034:%s1 cannot be specified in version 1.0.**

#### Variable Information

%s1 = Parameter information

#### Explanation

The parameter information %s1 cannot be specified in version 1.0 of IOR.

#### User Action

Do not specify the parameter information %s1 in version 1.0 of IOR.

### 18.17.31 od15035

---

---

**OD: ERROR : od15035:Failed to create Object References.****Explanation**

Creating Object References has failed. The following are possible causes:

- If this message was output when the OD\_or\_adm command was executed, the format used to specify the interface repository ID in the -c option was invalid.
- Failed to obtain memory.

**User Action**

Take the following action:

- Make sure that the format used to specify the interface repository ID in the -c option of the OD\_or\_adm command is as follows:

```
format:identification-information:version
```

- format: literal "IDL".
- identification-information: Module and interface names defined in IDL, separated by /.
- version: Not necessary, unless version 1.0 is used.

If the value specified for the interface repository ID was invalid, then specify the correct value and re-execute the OD\_or\_adm command.

- In cases other than those described above, close unnecessary applications and increase available memory.

## 18.17.32 od15036

---

**OD: ERROR : od15036:Failed to get locale information.****Explanation**

Acquiring of code system information has failed.

**User Action**

Check that the environment variable OD\_HOME is set correctly.

## 18.17.33 od15038

---

**OD: ERROR : od15038:Specification of LB Group Name is wrong.****Explanation**

There is an error in the specification of Object Group Name.

**User Action**

Check if there is an error in Object Group Name specified.

## 18.17.34 od15039

---

**OD: ERROR : od15039:%s1 option cannot be specified when the version of IOR is 1.0.****Variable Information**

%s1 = Option name

#### Explanation

The option %s1 cannot be specified in version 1.0 of IOR.

#### User Action

Do not specify the option %s1 when the version of IOR is 1.0.

### 18.17.35 od15040

---

**OD: ERROR : od15040:%s1 and %s2 option cannot be specified at once.**

#### Variable Information

%s1 = Option name

%s2 = Option name

#### Explanation

The options %s1 and %s2 can not be specified simultaneously.

#### User Action

Do not specify the options %s1 and %s2 simultaneously.

### 18.17.36 od15041

---

**OD: ERROR : od15041:The contents of proxy\_file are wrong.**

#### Explanation

There is an error in the contents of the proxy\_file.

#### User Action

Check contents of the proxy\_file that is designated by the *OD\_or\_adm* command and correct the errors.

### 18.17.37 od15042

---

**OD: ERROR : od15042:Environment variable OD\_HOME has not been set up.**

#### Explanation

The environment variable OD\_HOME is not set up.

#### User Action

Set up the environment variable OD\_HOME.

### 18.17.38 od15043

---

**OD: ERROR : od15043:The generation environment of object reference is wrong.**

#### Explanation

A memory shortage has been detected when object reference was created.

## User Action

Close unnecessary applications and expand the memory space.

### 18.17.39 od15044

---

**OD: ERROR : od15044:You don't have the authority which sets up environment information (file = %s1).**

#### Variable Information

%s1 = File name

#### Explanation

There is no write permission to file %s1.

#### User Action

Check your write permission to file %s1, or check memory space of the disk.

### 18.17.40 od15045

---

**OD: ERROR : od15045:Failed to lock the passwd file.**

#### Explanation

The passwd file is being used.

#### User Action

Check that other users are not using the passwd file.

### 18.17.41 od15046

---

**OD: ERROR : od15046:This UID(%s1) is not registered in passwd information.**

#### Variable Information

%s1 = User ID

#### Explanation

The user of UID(%s1) is not registered in the passwd file of the system.

#### User Action

1. Ensure that user ID%s1 is correct.
2. Ensure that user ID%s1 is registered in the passwd file.

### 18.17.42 od15047

---

**OD: ERROR : od15047:Not super-user.**

#### Explanation

A small rectangular screenshot showing the text "Windows32/64" in a green box.

The user does not belong to the Administrators group.

Solaris32/64 Linux32/64

The user is not a superuser.

#### User Action

Windows32/64

Perform the operation with a user ID belonging to the Administrators group.

Solaris32/64 Linux32/64

Execute the action as a superuser.

## 18.17.43 od15048

---

**OD: ERROR : od15048:Invalid password.**

#### Explanation

There is an error in the input password.

#### User Action

Check the password.

## 18.17.44 od15049

---

**OD: ERROR : od15049:The set-up number of users was exceeded.**

#### Explanation

The number of the user identifications registered by the *odlogin* command has exceeded that of the *max\_user\_login* which is set in the config file.

#### User Action

Ensure that the value than that of the *max\_user\_login* is sufficient to meet the number of user identifications that will be registered by the *odlogin*.

## 18.17.45 od15050

---

**OD: ERROR : od15050:%s1 is already registered.**

#### Variable Information

%s1 = User name

#### Explanation

The identification information of the user %s1 to be registered by *odlogin* command is already registered.

#### User Action

Check the user %s1 to be registered by the *odlogin* command.

## 18.17.46 od15051

---

**OD: ERROR : od15051:%s1 is not registered.**

## Variable Information

%s1 = User name

## Explanation

The user %s1 to be deleted by the *odlogout* command is not registered.

## User Action

Check the user to be deleted by the *odlogout* command.

## 18.17.47 od15052

---

**OD: ERROR : od15052:CORBA service (ObjectDirector) is not started.**

## Explanation

CORBA Service (ObjectDirector) is not started.

## User Action

Start CORBA Service (ObjectDirector).

## 18.17.48 od15053

---

**OD: ERROR : od15053:groupname not found.**

## Explanation

The groupname can not be found.

## User Action

Check the groupname.

## 18.17.49 od15054

---

**OD: ERROR : od15054:groupname is not specified.**

## Explanation

The groupname is not specified.

## User Action

Specify the groupname.

## 18.17.50 od15055

---

**OD: ERROR : od15055:groupname already exists.**

## Explanation

The groupname already exists.

## User Action

Check the groupname.

## 18.17.51 od15056

---

**OD: ERROR : od15056:groupname is invalid.**

### Explanation

The groupname is invalid.

### User Action

Check the groupname.

## 18.17.52 od15057

---

**OD: ERROR : od15057:groupname is too long.**

### Explanation

The groupname is too long.

### User Action

Specify a shorter groupname.

## 18.17.53 od15058

---

**OD: ERROR : od15058:membername already registered.**

### Explanation

The membername is already registered.

### User Action

Check the membername.

## 18.17.54 od15059

---

**OD: ERROR: od15059:Cannot create queue\_policy file.**

### Explanation

The queue\_policy file can not be created.

### User Action

Check that the execution user has write permission to the file.

Alternatively, check the available memory space of the disk.

## 18.17.55 od15060

---

**OD: ERROR: od15060:Writing queue\_policy file failed.**

### Explanation

Writing to the queue\_policy file failed.

#### User Action

Check that there is write permission to the queue\_policy file.

Alternatively, check the available space of the disk.

### 18.17.56 od15061

---

**OD: ERROR: od15061:Renaming queue\_policy file failed.**

#### Explanation

Renaming the queue\_policy file failed.

#### User Action

Check the write permission to the queue\_policy file.

Alternatively, check the available memory space of the disk.

### 18.17.57 od15062

---

**OD: ERROR: od15062:The specified version or IOR is wrong.**

#### Explanation

There is an error in the version of the specified IOR.

#### User Action

Specify the correct version of IOR.

### 18.17.58 od15063

---

**OD: ERROR: od15063:The specified name(%s1) is wrong.**

#### Variable Information

%s1 = Name information

#### Explanation

The specified name %s1 is wrong.

#### User Action

Specify the correct name.

### 18.17.59 od15064

---

**OD: ERROR: od15064:membername not found.**

#### Explanation

The membername cannot be found.

#### User Action

Check the membername.

## 18.17.60 od15065

---

**OD: ERROR: od15065: Snapshot function is disable. (snap\_use = no)**

### Explanation

Snapshot function is disabled.

### User Action

When the Snapshot function is used, the snap\_use parameter of the config file is set to 'yes'.

When the Snapshot function is not used, the action is unnecessary as the operation is normal.

## 18.17.61 od15066

---

**OD: ERROR: od15066: The permission which gets IPC resources is denied.**

### Explanation

There is insufficient permission to acquire IPC resources.

If "iss\_use = yes" has been specified in the config file, only a user that belongs to the group specified in iss\_group can perform the task.

### User Action

Perform the task as a user that belongs to the group specified in the iss\_group parameter in the config file.

## 18.17.62 od15067

---

**OD: ERROR: od15067: Failed to output trace information in the file. (PID=%s1)**

### Variable Information

%s1 = Process ID

### Explanation

Failed to output trace information for processID%s1 in the file using the *odformtrace* command.

If applications are running and memory trace information is changed while it is being output to the trace file, an inconsistency may be detected in the trace information that results in this message being output.

### System Action

Does not output trace information for process ID%s1 in the file.

### User Action

Re-execute the *odformtrace* command.

## 18.17.63 od15068

---

**OD: ERROR: od15068: There is insufficient authority to register the server application.**

### Explanation

There is insufficient authority to register shared or unshared servers using the OD\_impl\_inst command.

## System Action

Stops command processing.

## User Action

Execute the `OD_impl_inst` command with administrator authority.

## 18.17.64 od15069

---

**OD: WARNING: od15069: The value that was set (%s1) is invalid.**

### Variable Information

%s1 = `OD_impl_inst` command parameter

### Explanation

There is no authorization for registering the value set for %s1 using the `OD_impl_inst` command. The value that was set is invalid.

### System Action

Sets the default value for %s1 and continues processing.

### User Action

Check the registered contents using the `OD_impl_inst` command. If there is a problem, delete the contents and then register them again as a superuser.

## 18.18 od15500 to od15599

---

This section details the messages numbered between od15500 and od15599.

### 18.18.1 od15500

---

**OD: ERROR: od15500: %s1 failed. exception-id: %s2.**

### Variable Information

%s1 = Method Call

%s2 = Exception

### Explanation

An exception %s2 has occurred due to %s1 call.

### System Action

Cancels command processing

### User Action

Check the following points.

- The CORBA Service may not have started. Start the CORBA Service, and then re-execute the command.
- The naming service might not have been started. Start the naming service, then re-execute the command. If the `-u` option was specified in the `OD_or_adm` command, then the naming services in machines running the linked naming services must be running.
- The command may have been executed at the same time as the `OD_or_adm` command. Complete the `OD_or_adm` command, and then re-execute the command.
- Operation target implementation information may not have been registered. Use the `OD_impl_inst` command to check that the operation target implementation information has been registered.

- During processing of the registering of an object reference in the *OD\_or\_adm* command, another object reference with the same name may have been registered. Use the *odlistns* command to check whether an object reference with the same name has been registered.
- During processing of the deletion of an object reference in the *OD\_or\_adm* command, another object reference with the same name may have been deleted. Use the *odlistns* command to check whether an object reference that is a target for deletion has been registered.
- The setting of load balance function information in the *OD\_or\_adm* command may have failed. Check the information for the operated load balance function, and then re-execute the command if necessary.

In all other cases, use the *iscollectinfo* command to collect diagnostic information, then contact a Fujitsu service engineer.

## 18.18.2 od15505

---

**OD: ERROR: od15505:no service is specified.**

### Explanation

The service is not specified.

### User Action

Specify the service.

## 18.18.3 od15506

---

**OD: ERROR: od15506:Name is not specified.**

### Explanation

The name is not specified.

### User Action

Specify the name.

## 18.18.4 od15508

---

**OD: ERROR: od15508:Interface Repository ID is wrong. %s1.**

### Variable Information

%s1 :Interface Repository ID

### Explanation

The Interface Repository ID is invalid.

### User Action

Check the Interface Repository ID %s1.

## 18.18.5 od15510

---

**OD: ERROR: od15510:can't find '%s1' in initial\_services.**

### Variable Information

%s1 = Name information

### Explanation

There is an error in the specified service name %s1.

## User Action

Specify the correct service name. Check the service name by -l option of the *OD\_or\_adm* command (Refer to OD\_or\_adm in the Reference Manual (Command Edition)).

---

### 18.18.6 od15511

---

**OD: ERROR: od15511: Cannot open file '%s1'.**

#### Variable Information

%s1 = File name

#### Explanation

File %s1 could not be opened.

#### User Action

Check if the specified file exists.

---

### 18.18.7 od15512

---

**OD: ERROR: od15512:Failed to write to file.**

#### Explanation

Data could not be written to the file.

#### User Action

Check the file write authority.

---

### 18.18.8 od15513

---

**OD: ERROR: od15513:Implementation Repository ID is wrong. %s1.**

#### Variable Information

%s1 = Implementation Repository ID

#### Explanation

An error exists in the Implementation Repository ID.

#### User Action

Check the Implementation Repository ID.

---

### 18.18.9 od15514

---

**OD: ERROR: od15514:Interface Repository ID is too long.**

#### Explanation

The Interface Repository ID is too long.

#### User Action

Specify a smaller Interface Repository ID.

---

### 18.18.10 od15515

---

---

**OD: ERROR: od15515:Implementation Repository ID is too long.****Explanation**

The Implementation Repository ID is too long.

**User Action**

Specify a smaller Implementation Repository ID.

## 18.18.11 od15516

---

**OD: ERROR: od15516:Registry access failed. (error = %s1)****Variable Information**

%s1 = Error number reported from the OS

**Explanation**

An error was reported from the OS during operation (display, registration, or deletion) of the registry.

**User Action**

No authority to access the registry may have been granted. Execute the command with the administrator authority.

If the error number is 2, an attempt was possibly made to remove the un-registered item. Please ignore it.

## 18.18.12 od15517

---

**OD: INFO: od15517:Overwrote registry %s1 value from %s2 to %s3****Variable Information**

%s1 = Registry name

%s2 = Numeric value before setting

%s3 = Numeric value after setting

**Explanation**

A value set in the registry was overwritten.

## 18.18.13 od15518

---

**OD: INFO: od15518:No value is got from registry %s1****Variable Information**

%s1 = Registry name

**Explanation**

No registry value could be referenced.

## 18.18.14 od15520

---

**OD: ERROR: od15520:Number is required for the argument.**

## Explanation

Numeric values must be set to arguments in the command options.

## User Action

Set appropriate numeric values to arguments in the command options.

## 18.18.15 od15521

---

**OD: ERROR: od15521:Hyphen '-' is required for the argument.**

## Explanation

A hyphen '-' is required for the argument.

## User Action

Enter a hyphen '-' prior to the argument.

## 18.18.16 od15522

---

**OD: ERROR: od15522:Number in argument is out of range.**

## Explanation

Numeric value specified in the option arguments is out of range.

## User Action

Set a numeric value within the range to the option arguments.

## 18.18.17 od15540

---

**OD: ERROR: od15540:Failed to modify initial host file. (Error = %s1)**

## Variable Information

%s1 = Error code

## Explanation

Another application may be editing the `initial_hosts` (`inithost`) file.

Alternatively, the `odsethost` command may have been executed using general user authority.

## User Action

Execute again after the application accessing the `initial_hosts` (`inithost`) file terminates.

If this message is output after the `odsethost` command was executed using general user authority, execute the command using administrator authority.

## 18.18.18 od15541

---

**OD: ERROR: od15541:Invalid %s1 file. (line = %s2)**

## Variable Information

%s1 = Error code

%s2 = Line number

#### Explanation

The line number %s2 in the file %s1 contains an inappropriate statement.

There is a possibility that the parameters are invalid, or the value set is outside the permitted range.

#### User Action

Correct the inappropriate statement in file %s1.

If there are no inappropriate statements in file %s1, check whether the code type described for file %s1 is correct.

## 18.18.19 od15542

---

**OD: ERROR: od15542:host not exist: %s1**

#### Variable Information

%s1 = Host name

#### Explanation

The host %s1 is not set in the host information.

#### User Action

Check the host information using the -v option of the *odsethost* command.

## 18.18.20 od15543

---

**OD: ERROR: od15543:host already registered: %s1**

#### Variable Information

%s1 = Host name

#### Explanation

The host %s1 is already set in the host information.

#### User Action

Delete the host %s1, then add it again.

## 18.18.21 od15544

---

**OD: ERROR: od15544:%s1 sets of host names are already registered.**

#### Variable Information

%s1 = Maximum number of settable hosts

#### Explanation

The maximum number %s1 of hosts are already set in the host information.

#### User Action

Add again after deleting unnecessary host names.

## 18.19 od16200 to od16299

---

This section details the messages numbered between od16200 and od16299.

### 18.19.1 od16200

---

**OD: WARNING: od16200:library of INTERSTAGE Operating Environment Definition File not found.**

#### Explanation

The library could not be found.

#### User Action

If the package containing the library is not required, no problem will be caused. If the package is required, check whether the library is damaged or installed correctly. Reinstall the library if necessary.

### 18.19.2 od16201

---

**OD: INFO: od16201:Default hostname:%s1.**

#### Variable Information

%s1 = Host name

#### Explanation

The default host name %s1 is used.

### 18.19.3 od16202

---

**OD: INFO: od16202:Default port no:%s1.**

#### Variable Information

%s1 = Port number

#### Explanation

The default port number %s1 is used.

### 18.19.4 od16205

---

**OD: ERROR: od16205:Storing file:%s1 failed.**

#### Variable Information

%s1 = File name

#### Explanation

Failed to back up the file %s1.

#### User Action

Check the authority for the backup directory and the free disk capacity.

### 18.19.5 od16206

---

**OD: WARNING: od16206:File:%s1 is not found.**

#### Variable Information

%s1 = File name

#### Explanation

The file %s1 could not be found.

#### User Action

Check whether the file %s1 exists.

### 18.19.6 od16207

---

**OD: ERROR: od16207:File:%s1 is not found, need to setup ObjectDirector.**

#### Variable Information

%s1 = File name

#### Explanation

The file %s1 could not be found.

#### User Action

Check whether the file %s1 exists.

Alternatively, reinstall the CORBA Service (ObjectDirector).

### 18.19.7 od16208

---

**OD: ERROR: od16208:File:%s1 is not found, backup file is invalid.**

#### Variable Information

%s1 = File name

#### Explanation

The file %s1 could not be found. Backup data is invalid.

#### User Action

Check whether the backup data contains the file %s1. If the backup data contains an error, make backup copies again.

### 18.19.8 od16209

---

**OD: ERROR: od16209:Can not create file:%s1.**

#### Variable Information

%s1 = File name

#### Explanation

File %s1 could not be created.

#### User Action

Check the authority for the storage directory of the file %s1 to be created and the free disk capacity.

### 18.19.9 od16210

---

**OD: ERROR: od16210:Can not delete file:%s1.**

#### Variable Information

%s1 = File name

#### Explanation

File %s1 could not be deleted.

#### User Action

Check the authority for the file %s1 to be deleted.

### 18.19.10 od16211

---

**OD: ERROR: od16211:Can not move file:%s1 to %s2.**

#### Variable Information

%s1 = File name

%s2 = File name

#### Explanation

The file name of the file %s1 could not be changed to the file name %s2.

#### User Action

Check the authority for the file %s1, file storage directory, and free disk capacity.

### 18.19.11 od16212

---

**OD: ERROR: od16212:Can not copy file:%s1 to %s2.**

#### Variable Information

%s1 = File name

%s2 = File name

#### Explanation

The file %s1 could not be copied to the file %s2.

#### User Action

Check the authority for the file %s1, file storage directory, and free disk capacity.

### 18.19.12 od16213

---

**OD: ERROR: od16213:Converting initial services is failed.**

#### Explanation

Failed to convert the initial service.

#### User Action

The initial\_services (init\_svc) file may be damaged.

### 18.19.13 od16214

---

**OD: ERROR: od16214:odsetconfig failed.**

## Explanation

Failed to execute the *odsetconfig* command.

## User Action

Check for any error in the config file. Also, check the existence of the *odsetconfig* command and the environment during installation.

## 18.19.14 od16215

---

**OD: ERROR: od16215:Backupdir:%s1 is not found.**

### Variable Information

%s1 = Name of the storage directory of CORBA Service resources

### Explanation

Storage directory %s1 of CORBA Service resources could not be found.

### User Action

Take the following action:

- Check if the resource storage directory of another platform was specified.  
Resources from other platforms cannot be restored. Refer to the 'Operator's Guide' and make the required environment settings.
- Otherwise, specify the correct CORBA Service resource storage directory %s1.

## 18.19.15 od16216

---

**OD: ERROR: od16216:Invalid own host name.**

### Explanation

The local host name or the IP address of the local host is incorrect.

### System Action

If this message is output at an attempt to start the CORBA service, the CORBA service will fail to start.

If this message is output while the *odrestoresys* command is being executed, command processing will be canceled.

### User Action

Take appropriate action, depending on the circumstance in which the message was output:

- If this message is output during execution of the *odrestoresys* command, designate the correct host name, or designate the correct IP address and re-execute the command.
- If this message is output during startup of the CORBA Service, designate the correct host name of its own, to the CORBA Host Name (or *IIOP\_hostname* parameter of config file) of the Interstage operating environment definition.
- If 'IP-version = v4' is set in the config file, the local host name needs to be resolved in the IPv4 format.

If the local host name can be resolved only in the IPv6 format, set 'IP-version = v6' in the config file or set so that the local host name can be resolved in the IPv4 format.

## 18.19.16 od16220

---

**OD: ERROR: od16220:odconvconfig failed.**

## Explanation

Failed to execute the *odconvconfig* command.

## User Action

Check for any error in the config file at the backup source. Also, check the existence of the *odconvconfig* command and the environment during installation.

## 18.19.17 od16221

---

### OD: ERROR: od16221:OD\_set\_env failed.

## Explanation

Failed to execute the *OD\_set\_env* command.

## User Action

Check for any error in the *boa.env* file at the backup source. Also, check the existence of the *OD\_set\_env* command and the installation environment.

## 18.19.18 od16222

---

### OD: ERROR: od16222:ObjectDirector is running.

## Explanation

The CORBA Service (ObjectDirector) is running.

## System Action

Cancels command processing.

## User Action

Stop the CORBA service (ObjectDirector) temporarily according to the method shown below, and then restart the command.

**Windows32/64**

Specify the *isstop* command in the *-f* option and execute the command. Alternatively, in the Services window, click [Control Panel], and then [Services], or click [Control Panel] - [Administrative Tools] - [Services]. Select the 'OD\_start' service and then stop it.

For details of the *isstop* command, refer to the Reference Manual (Command Edition).

**Solaris32/64** **Linux32/64**

Specify the *isstop* command in the *-f* option and execute the command. Alternatively, execute the *OD\_stop* command.

For details of the *isstop* and *OD\_stop* commands, refer to the Reference Manual (Command Edition).

## 18.19.19 od16223

---

### OD: ERROR: od16223:%s1 already exists.

## Variable Information

%s1 = File name or directory name

## Explanation

The file or directory %s1 already exists.

#### User Action

Re-execute after deleting the file or directory %s1.

### 18.19.20 od16224

---

**OD: ERROR: od16224:Directory:%s1 already exists.**

#### Variable Information

%s1 = File name or directory name

#### Explanation

The file or directory %s1 already exists.

#### User Action

Re-execute after deleting the file or directory %s1.

### 18.19.21 od16225

---

**OD: ERROR: od16225:Create directory:%s1 failed.**

#### Variable Information

%s1 = Directory name

#### Explanation

Failed to create the directory %s1.

#### User Action

Check whether the high-level directory exists. If the directory exists, check the authority of the directory and the free disk capacity.

### 18.19.22 od16226

---

**OD: WARNING: od16226:Too many IORs in initial services.**

#### Explanation

There are too many object references of the initial\_services (init\_svc) file.

### 18.19.23 od16227

---

**OD: WARNING: od16227:Read initial services failed.**

#### Explanation

Failed to read the initial\_services (init\_svc) file.

### 18.19.24 od16228

---

**OD: INFO: od16228:Storing started.**

## Explanation

Storing started.

## System Action

Continues command processing.

## 18.19.25 od16229

---

**OD: INFO: od16229:Storing done.**

## Explanation

Storing ended.

## System Action

Completes command processing.

## 18.19.26 od16230

---

**OD: ERROR: od16230:A necessary file does not exist Error information(%s1)**

## Variable Information

%s1 = Target resource name

## Explanation

A necessary file does not exist.

## User Action

Check whether the target resource %s1 exists.

If this message is output while the *odrestoresys* command is running and the target resource %s1 resides in the directory shown below, it may mean that there is no LBO directory in the CORBA Service resources backup destination path.

If the LBO directory is used in the environment for backup, check the load balance resources in the CORBA Service resources backup destination path. If the LBO directory is not used in the environment for backup, create the following empty directory in the CORBA Service resources backup destination path.

**Windows32/64**

(CORBA Service resources backup destination path)\OD\LBO

**Solaris32/64**

(CORBA Service resources backup destination path)/FSUNod/LBO

**Linux32/64**

(CORBA Service resources backup destination path)/FJSVod/LBO

## 18.19.27 od16231

---

**OD: ERROR: od16231:An internal error was detected Error information(%s1)**

## Variable Information

%s1 = Error information

## Explanation

A system internal error was detected.

## User Action

Note the error information contained in %s1, use the *iscollectinfo* command to collect diagnostic information, then contact a Fujitsu service engineer.

## 18.19.28 od16232

---

### **OD: ERROR: od16232:A memory shortage occurred.**

## Explanation

A memory shortage occurred.

## User Action

Check the free space of memory.

## 18.19.29 od16233

---

### **OD: ERROR: od16233:A disk resource shortage occurred.**

## Explanation

A disk capacity shortage occurred.

## User Action

Check the free disk capacity.

## 18.19.30 od16234

---

### **OD: ERROR: od16234:An I/O error occurred Error information(%s1)**

## Variable Information

%s1 = Error information

## Explanation

An I/O error occurred.

## User Action

Note the error information contained in %s1, use the *iscollectinfo* command to collect diagnostic information, then contact a Fujitsu service engineer.

## 18.19.31 od16235

---

### **OD: ERROR: od16235:A system error occurred Error information(%s1)**

## Variable Information

%s1 = Error information

## Explanation

A system error occurred.

## User Action

Note the error information contained in %s1, use the *iscollectinfo* command to collect diagnostic information, then contact a Fujitsu service engineer.

## 18.19.32 od16240

---

### **OD: ERROR: od16240:System name is too long.**

## Explanation

The system name is too long.

## User Action

Specify the correct system name with up to eight characters.

## 18.19.33 od16241

---

### **OD: ERROR: od16241:System name is invalid.**

## Explanation

The system name is incorrect or a reserved word.

## User Action

Specify the correct system name with up to eight en-size alphanumeric characters (The first character is an en-size alphabetical character). The following system names are reserved words and thus cannot be specified.

- td001
- ec001

## 18.19.34 od16242

---

### **OD: ERROR: od16242:Specified system does not exist.**

## Explanation

The specified system does not exist.

## User Action

Specify a correct registered system name.

## 18.19.35 od16243

---

### **OD: ERROR: od16243:Get extended system info failed.**

## Explanation

Failed to acquire extended system information.

## User Action

Check whether the installation environment is correct. Also, check for any error in the extended system settings.

Check if a memory shortage has occurred, and if so, close unnecessary applications or increase the memory.

## 18.19.36 od16250

---

### **OD: ERROR: od16250:NamingService start failed**

#### Explanation

Failed to start the naming service.

#### User Action

Re-execute after checking whether the naming service can be started in the environment.

If the same error occurs after re-execution, use the *iscollectinfo* command to collect diagnostic information, then contact your system administrator.

## 18.19.37 od16251

---

### **OD: ERROR: od16251:LoadBalancingOption start failed**

#### Explanation

Failed to start the load balancing option.

#### User Action

Re-execute after checking whether the load balancing option can be started in the environment.

If the same error occurs after re-execution, use the *iscollectinfo* command to collect diagnostic information, then contact your system administrator.

## 18.19.38 od16252

---

### **OD: ERROR: od16252:File contains an error. Error information(%s1)**

#### Variable Information

%s1 = Target resources

#### Explanation

Because the file required for executing the command is incorrect, the command could not be executed.

#### User Action

Backup resources may be damaged. In this case, make backup copies again, then perform restoring using correct resources.

## 18.19.39 od16253

---

### **OD: ERROR: od16253:File contains an error or memory allocation failed Error information(%s1)**

#### Variable Information

%s1 = Target resources

## Explanation

The file required for executing the command is incorrect or a memory shortage occurred.

## User Action

Check whether the backup resources are damaged.

If they are damaged, make backup copies again, then restore using correct resources.

If they are not damaged, check whether sufficient memory is reserved because a memory shortage can be assumed.

## 18.19.40 od16254

---

### **OD: ERROR: od16254:Failed to create object reference.**

## Explanation

Because no object reference could be created, processing was stopped.

## User Action

Resources such as memory may be insufficient. Re-execute the command after checking whether sufficient resources are reserved.

If the same error occurs after re-execution, use the *iscollectinfo* command to collect diagnostic information, then contact your system administrator.

## 18.19.41 od16255

---

### **OD: ERROR: od16255:Abnormality notified from ObjectDirector (error: %s1, id: %s2)**

## Variable Information

%s1 = Interface name of the application in which an error occurred

%s2 = Detailed information

## Explanation

Because an error was reported from the CORBA Service (ObjectDirector), processing was stopped.

## System Action

Fails to start the CORBA service.

## User Action

Note the error information contained in %s1, use the *iscollectinfo* command to collect diagnostic information, then contact a Fujitsu service engineer.

## 18.19.42 od16256

---

### **OD: ERROR: od16256:NamingService stop failed**

## Explanation

Failed to stop the naming service.

## User Action

Check the naming service status after executing the command.

If the service is stopped, re-execute the command. If the same error occurs again, use the *iscollectinfo* command to collect diagnostic information, then contact your system administrator.

If the service is not stopped, record the service status, use the *iscollectinfo* command to collect diagnostic information, then contact your system administrator.

## 18.19.43 od16257

---

### OD: ERROR: od16257:LoadBlancingOption stop failed

#### Explanation

Failed to stop the load balancing option.

#### User Action

Check the load balancing option status after executing the command.

If the service is stopped, re-execute the command. If the same error occurs again, use the *iscollectinfo* command to collect diagnostic information, then contact your system administrator.

If the service is not stopped, record the service status, use the *iscollectinfo* command to collect diagnostic information, then contact your system administrator.

## 18.19.44 od16270

---

### OD: ERROR: od16270:The restoration directory of the database of IR is invalid.(PATH=%s1)

#### Variable Information

%s1 = Restore directory of the database of the interface Repository

#### Explanation

The directory to restore the Interface Repository database is incorrect.

#### User Action

Specify the correct restore directory in the command options and restore definition file, then re-execute the command.

## 18.19.45 od16271

---

### OD: ERROR: od16271: The database of InterfaceRepository already exists in the destination.

#### Explanation

Because the database of Interface Repository already exists in the destination directory of movement or of restoration, processing is stopped.

#### User Action

When the CORBA Service resource is imported, the database of the interface repository cannot be restored to the directory if the database of the interface repository already exists. Do the following, corresponding to the importing method.

- When the CORBA Service resource is imported using the *odrestoresys* command (-r option is not specified), specify a correct value for the -irpath option.
- When the CORBA Service resource is imported using the restore definition file of the *iscrestoresys* command (-f option is specified), specify a correct value for 'IR path for DB file'.

After a correct value is specified for an import destination, delete the duplicate interface repository database, then re-execute the command.

## 18.19.46 od16272

---

**OD: WARNING: od16272: The setting value of IP-version change to %s1.**

### Variable Information

%s1 = The IP-version value of the config file

### Explanation

The value of IP-version set in the environment definition file (config) of the CORBA Service is changed.

This message is output under the following conditions when it is imported with the *odrestoresys* command.

1. When the setting value in the import source is 'v6' and the import destination is a system that does not support IPv6.
2. When the setting value in the import source is 'v6', and a host name supported only by IPv4 is specified.
3. When the setting value in the import source is 'v4' and a host name that can be resolved in IPv6 is specified.

### User Action

Check that the value of the newly set IP version causes no problem as the expected system. For the IP version setting, refer to IP-version explained in config (CORBA Service) in the Tuning Guide.

## 18.19.47 od16273

---

**OD: ERROR: od16273: Path is too long.**

### Explanation

The specified path exceeded the maximum allowable length (512 bytes).

### System Action

Cancels command processing.

### User Action

Make sure that the path does not exceed 512 bytes, the maximum allowable length. Retry the command.

If this message is output when *isbackup*, *isimport*, or *isrestore* is executed, correct the path specified with the `COMMON_PATH` parameter.

## 18.19.48 od16274

---

**OD: ERROR: od16274: The CORBA Service start control failed. (Cause Code:%s1, Detail Code:%s2)**

### Variable Information

%s1 = Cause Code

%s2 = Detail Code

### Explanation

The CORBA Service start control failed..

Possible reasons are as follows:

- The CORBA Service or CORBA application might not be running.

- One of the commands below is running (only one instance of each can be running at the same time):
  - *odbackupsys*
  - *odrestoresys*
  - *odchgservice*

#### System Action

Stops command processing.

#### User Action

Take the following action:

- If the CORBA Service or CORBA application is running, stop the CORBA Service or CORBA application, and then execute the command again.
- If one of the commands below is running, wait for it to finish, and then execute the command again:
  - *odbackupsys*
  - *odrestoresys*
  - *odchgservice*

## 18.19.49 od16275

---

### **OD: ERROR: od16275: Failed to convert 'impl.db'.**

#### Explanation

Failed to convert 'impl.db'.

#### System Action

Stops command processing.

#### User Action

Check if the 'impl.db' file in the import destination directory has write authority. Establish the cause from the error message returned immediately before this error, and then execute the command again.

## 18.20 od18000 to od18099

---

This section details the messages numbered between od18000 and od18099.

### 18.20.1 od18001

---

#### **OD: ERROR: od18001:config.default file is invalid.**

#### Explanation

The prototype file (config.default) of the config file has been destroyed.

#### User Action

Re-install the CORBA Service or copy the config.default file of this version and level into the 'CORBA Service installation directory / etc' and execute again.

### 18.20.2 od18002

---

#### **OD: ERROR: od18002:Rename Error: '%s1' to '%s2'.**

## Variable Information

%s1 = File Name

%s2 = File Name

## Explanation

Renaming of file %s1 to file %s2 failed.

## User Action

Write permission may not be assigned to file %s2. Take the following steps for file %s2.

- config.old

Execute the command again after deleting this file.

- config

If write permission is not assigned to the file, assign it and execute the command again. If write permission is already assigned to the file, another application may be performing exclusive processing to the file. If this is the case, execute the command again after closing the other application.

# 18.21 od19000 to od19099

---

This section details the messages numbered between od19000 and od19099.

## 18.21.1 od19001

---

### **OD: ERROR: od19001:File access Error for MethodTrace. %s1 %s2 %s3**

#### Variable Information

%s1 = Function Name

%s2 = Process Name

%s3 = Error No.

#### Explanation

An error (Error No.) %s3 has occurred in the process (Process Name) %s2, while accessing file of method trace function.

#### User Action

When the value of %s3 is 27, it is possible that there is insufficient disk space of var of the installation directory follower of ObjectDirector. Re-estimate the amount of disk space required, and if necessary increase the available disk space. If the value of %s3 is 5, it is possible that an IO error occurred in the disk. Check the disk.

## 18.21.2 od19002

---

### **OD: ERROR: od19002:Invalid Argument for MethodTrace. %s1 %s2 %s3**

#### Variable Information

%s1 = Function name

%s2 = Argument name

%s3 = Argument value

#### Explanation

An error exists in a method trace function argument (Argument name = %s2, Argument value = %s3).

## User Action

Use the *iscollectinfo* command to collect diagnostic information, then contact your software supplier.

---

### 18.21.3 od19003

---

**OD: ERROR: od19003:Internal error In MethodTrace. %s1 %s2 %s3**

#### Variable Information

%s1 = Function name

%s2 = Process name

%s3 = Error No.

#### Explanation

An internal error %s3 has occurred in the method trace function.

#### User Action

Use the *iscollectinfo* command to collect diagnostic information, then contact your software supplier.

---

### 18.21.4 od19004

---

**OD: ERROR: od19004:No Memory for MethodTrace. %s1**

#### Variable Information

%s1 = Process name

#### Explanation

Insufficient memory in process %s1 of the method trace function.

#### User Action

Close all unwanted programs, or increase main memory.

---

### 18.21.5 od19005

---

**OD: ERROR: od19005:MethodTrace stopped.**

#### Explanation

An error caused the method trace function to stop. The cause is logged prior to function stop.

#### User Action

Remove the cause of the error that caused the method trace function to stop. When the error is removed, the method trace function restarts automatically.

---

### 18.21.6 od19006

---

**OD: INFO: od19006:MethodTrace restarted.**

#### Explanation

The method trace function has restarted.

---

### 18.21.7 od19007

---

**OD: INFO: od19007:MethodTrace already started.**

## Explanation

The method trace function has already been started.

## 18.22 od19100 to od19199

---

This section details the messages numbered between od19100 and od19199.

### 18.22.1 od19101

---

**OD: ERROR: od19101:File access error for index file. %s1 (%s2 = %s3)**

#### Variable Information

%s1 = File name

%s2 = Process name

%s3 = Error No.

#### Explanation

An error (%s3) has occurred in process (%s2) in the file (%s1) while accessing index file.

#### User Action

When the value of %s3 is 27, it is possible there is insufficient disk space or etc of the installation directory follower of ObjectDirector. Re-estimate the necessary disk space, and if necessary increase the disk space. When the value of %s3 is 5, it is possible that an IO error occurred in the disk. Check the disk.

### 18.22.2 od19102

---

**OD: ERROR: od19102:No Memory for Index file access. %s1**

#### Variable Information

%s1 = Process name

#### Explanation

Insufficient memory for process (%s1) to create index file.

#### User Action

Close all unwanted programs, or expand main memory.

## 18.23 od20000 to od20099

---

This section details the messages numbered between od20000 and od20099.

### 18.23.1 od20001

---

**OD: INFO: od20001:InterfaceRepositoryCache completely loaded.**

#### Explanation

The loading of the cache server is complete, and the Interface Repository has been activated normally.

### 18.23.2 od20002

---

**OD: WARNING: od20002: The database of InterfaceRepository may have broken.**

## Explanation

The system down and disk area shortage, etc. might occur during transaction processing, and the database may be destroyed.

## System Action

When the error occurs by starting the Interface Repository, it cancels loading processes.

When the error occurs by the IDL compilation, it cancels the registration of interface information.

## User Action

Restore the Interface Repository using either of the following methods, then restart the Interface Repository:

- Use the *ismodifyservice* command to reconstruct the Interface Repository (refer to [Interface Repository Reconstruction Procedure](#)), then register interface information in the interface repository.
- Use the *odrestoresys* command to restore resources of the CORBA Service (ObjectDirector) saved by the *odbackupsys* command in advance.

When the error occurs by the IDL compilation, the disk area may be insufficient. Specify the directory with enough capacity for the disk area in the following data base storage destination. Restore the Interface Repository using the procedure above, and re-start the Interface Repository.

### Windows32/64

C:\Interstage\td\var\IRDB

### Solaris32/64

For the default system: /opt/FSUNtd/var/IRDB

For the extended system: /var/opt/FJSVisas/system/(system name)/FSUNod/IRDB

### Linux32/64

/opt/FJSVtd/var/IRDB

If the same error recurs after the above actions have been taken, use the *iscollectinfo* command to collect diagnostic information, then contact your system administrator.

## Interface Repository Reconstruction Procedure

Use the following procedure to rebuild the Interface Repository. For details of the *ismodifyservice* command, see 'Reference Manual (Command Edition)'.

1. Use the *ismodifyservice* command to change the Interface Repository reference destination to a remote host. Specify any valid name as the host name. Because this procedure will not actually reference an Interface Repository on a remote host, it is possible to specify a host name that does not actually exist.

```
ismodifyservice -r -h host name IR
```

2. Use the *ismodifyservice* command again to reset the Interface Repository reference destination to the local host.

```
ismodifyservice -a IR
```

## 18.23.3 od20003

### OD: ERROR: od20003: InterfaceRepositoryCache load error.

#### Explanation

The loading of the cache server has failed.

#### System Action

Cancels cache server loading processing.

Interface repository startup continues, and the interface repository subsequently operates without cache.

#### User Action

Determine if:

- If the error message of od20019 is displayed immediately before this message, take the action indicated in the error message of od20019.
- Terminate unnecessary programs or expand the memory.

If the cause of this error is not listed above, use the *iscollectinfo* command to collect diagnostic information, then contact your system administrator.

### 18.23.4 od20004

---

**OD: ERROR: od20004: Contradiction occurred inside the database of InterfaceRepository.**

#### Explanation

An internal conflict has occurred.

#### System Action

Processing stopped.

#### User Action

Restore the Interface Repository using either of the following methods, then restart the Interface Repository:

- Use the *ismodifyservice* command to reconstruct the Interface Repository (refer to [Interface Repository Reconstruction Procedure](#)), then register interface information in the interface repository.
- Use the *odrestoresys* command to restore resources of the CORBA Service (ObjectDirector) saved by the *odbackupsys* command in advance.

If the same error recurs after the above actions have been taken, use the *iscollectinfo* command to collect diagnostic information, then contact your system administrator.

### 18.23.5 od20005

---

**OD: ERROR: od20005: The database of InterfaceRepository doesn't exist.**

#### Explanation

The database (ObjectFile) does not exist.

#### System Action

Processing stopped.

#### User Action

Confirm whether a database exists in the database storage directory.

If no database exists, restructure the Interface Repository using the *ismodifyservice* command (refer to [Interface Repository Reconstruction Procedure](#)).

If the database exists, use the *iscollectinfo* command to collect diagnostic information, then contact your system administrator.

### 18.23.6 od20006

---

**OD: ERROR: od20006: The database of InterfaceRepository already exists.**

#### Explanation

The database (ObjectFile) already exists.

## System Action

Processing stopped.

## User Action

Delete the unnecessary Interface Repository database from the specified location. Alternatively, change the location of the specified database.

The database of the Interface Repository comprises the following files:

- irobf.qfp
- irobf.qfl
- irobftan

If a similar error occurs after re-execution, use the *iscollectinfo* command to collect diagnostic information, then contact your system administrator.

## 18.23.7 od20007

---

### **OD: ERROR: od20007: I/O error occurred inside the database of InterfaceRepository.**

#### Explanation

An I/O error has occurred.

#### System Action

Processing stopped.

#### User Action

Restore the Interface Repository using either of the following methods, then restart the Interface Repository:

- Use the *ismodifyservice* command to reconstruct the Interface Repository (refer to [Interface Repository Reconstruction Procedure](#)), and then register interface information in the interface repository.
- Use the *odrestoresys* command to restore resources of the CORBA Service (ObjectDirector) saved by the *odbackupsys* command in advance.

If the same error recurs after the above actions have been taken, use the *iscollectinfo* command to collect diagnostic information, then contact your system administrator.

## 18.23.8 od20008

---

### **OD: ERROR: od20008: The access error occurred inside the database of InterfaceRepository.**

#### Explanation

An access error has occurred.

#### System Action

Processing stopped.

#### User Action

Restore the Interface Repository using either of the following methods, then restart the Interface Repository:

- Use the *ismodifyservice* command to reconstruct the Interface Repository (refer to [Interface Repository Reconstruction Procedure](#)), then register interface information in the interface repository.
- Use the *odrestoresys* command to restore resources of the CORBA Service (ObjectDirector) saved by the *odbackupsys* command in advance.

If the same error recurs after the above actions have been taken, use the *iscollectinfo* command to collect diagnostic information, then contact your system administrator.

## 18.23.9 od20009

---

### **OD: ERROR: od20009: Failed to opening the database of InterfaceRepository.**

#### Explanation

An open error has occurred on opening the database.

#### System Action

Processing stopped.

#### User Action

Restore the Interface Repository using either of the following methods, then restart the Interface Repository:

- Use the *ismodifyservice* command to reconstruct the Interface Repository (refer to [Interface Repository Reconstruction Procedure](#)), then register interface information in the interface repository.
- Use the *odrestoresys* command to restore resources of the CORBA Service (ObjectDirector) saved by the *odbackupsys* command in advance.

If the same error recurs after the above actions have been taken, use the *iscollectinfo* command to collect diagnostic information, then contact your system administrator.

## 18.23.10 od20010

---

### **OD: ERROR: od20010: The data base of InterfaceRepository is broken.**

#### Explanation

The database is corrupted.

#### System Action

Processing stopped.

#### User Action

Restore the Interface Repository using either of the following methods, then restart the Interface Repository:

- Use the *ismodifyservice* command to reconstruct the Interface Repository (refer to [Interface Repository Reconstruction Procedure](#)), then register interface information in the interface repository.
- Use the *odrestoresys* command to restore resources of the CORBA Service (ObjectDirector) saved by the *odbackupsys* command in advance.

If the same error recurs after the above actions have been taken, use the *iscollectinfo* command to collect diagnostic information, then contact your system administrator.

## 18.23.11 od20011

---

### **OD: ERROR: od20011: The disk spaces for database creation of InterfaceRepository are insufficient.**

#### Explanation

Insufficient disk area for database.

#### System Action

Processing stopped.

## User Action

Using the *ismodifyservice* command, specify a drive and directory that has sufficient disk space to hold the database, then re-set up the Interface Repository environment.

## 18.23.12 od20012

---

### **OD: ERROR: od20012: The object stored in the database of InterfaceRepository overlaps.**

#### Explanation

An internal conflict has caused the key of the object generated to be duplicated.

#### System Action

Processing stopped.

#### User Action

Restore the Interface Repository using either of the following methods, then restart the Interface Repository:

- Use the *ismodifyservice* command to reconstruct the Interface Repository (refer to [Interface Repository Reconstruction Procedure](#)), then register interface information in the interface repository.
- Use the *odrestoresys* command to restore resources of the CORBA Service (ObjectDirector) saved by the *odbackupsys* command in advance.

If the same error recurs after the above actions have been taken, use the *iscollectinfo* command to collect diagnostic information, then contact your system administrator.

## 18.23.13 od20013

---

### **OD: ERROR: od20013: Shortage of memory occurred in the database of InterfaceRepository.**

#### Explanation

Insufficient memory in the ObjectFile.

#### System Action

Processing stopped.

#### User Action

Close all unwanted programs, or allocate more memory.

## 18.23.14 od20014

---

### **OD: ERROR: od20014: Shortage of virtual memory occurred in the database of InterfaceRepository.**

#### Explanation

Insufficient virtual memory available to create the ObjectFile.

#### System Action

Processing stopped.

#### User Action

Close all unwanted programs, or allocate more memory.

## 18.23.15 od20015

---

**OD: ERROR: od20015: The data specified in the database of InterfaceRepository don't exist.**

### Explanation

The specified data does not exist.

### System Action

Processing stopped.

### User Action

Restore the Interface Repository using either of the following methods, then restart the Interface Repository:

- Use the *ismodifyservice* command to reconstruct the Interface Repository (refer to [Interface Repository Reconstruction Procedure](#)), then register interface information in the interface repository.
- Use the *odrestoresys* command to restore resources of the CORBA Service (ObjectDirector) saved by the *odbackupsys* command in advance.

If the same error recurs after the above actions have been taken, use the *iscollectinfo* command to collect diagnostic information, then contact your system administrator.

## 18.23.16 od20016

---

**OD: ERROR: od20016: InterfaceRepository error. :%s1:%s2:%s3:%s4**

### Variable Information

%s1 = File Name

%s2 = Line Number

%s3 = Method Name

%s4 = Repository ID

### Explanation

An internal error was detected within the Interface Repository.

### System Action

Processing stopped.

### User Action

Restore the Interface Repository using either of the following methods, then restart the Interface Repository:

- Use the *ismodifyservice* command to reconstruct the Interface Repository (refer to [Interface Repository Reconstruction Procedure](#)), then register interface information in the interface repository.
- Use the *odrestoresys* command to restore resources of the CORBA Service (ObjectDirector) saved by the *odbackupsys* command in advance.

If the same error recurs after the above actions have been taken, use the *iscollectinfo* command to collect diagnostic information, then contact your system administrator.

## 18.23.17 od20017

---

---

**OD: ERROR: od20017: The disk spaces for automatic database expansion of InterfaceRepository are insufficient.**

**Explanation**

Insufficient memory available.

**System Action**

Processing stopped.

**User Action**

Delete unwanted programs.

## 18.23.18 od20018

---

**OD: ERROR: od20018: InterfaceRepository system error. %s1:%s2:%s3:%s4:%s5:%s6**

**Variable Information**

%s1 = File Name

%s2 = Line Number

%s3 = Method Name

%s4 = ObjectDirector Method Name

%s5 = Exception Information

%s6 = Repository ID

**Explanation**

Exception information (%s5) was notified from ObjectDirector.

**System Action**

Processing stopped.

**User Action**

When the exception information (%s5) is 'InterfaceRepository\_Err', there is a possibility that a conflict occurred in the registered information of Interface Repository. Take a note of the error information, and use the *iscollectinfo* command to collect diagnostic information, then contact your system administrator.

When the exception information (%s5) is other than 'InterfaceRepository\_Err', refer to 'Exception Information Minor Codes Reported from the CORBA Service' and correct the cause of the failure.

## 18.23.19 od20019

---

**OD: ERROR: od20019: InterfaceRepository error. (C) :%s1:%s2:%s3:%s4**

**Variable Information**

%s1 = File Name

%s2 = Line Number

%s3 = Method Name

%s4 = Repository Number

**Explanation**

An error was detected in the interface repository cache server.

## System Action

Processing stopped.

If this message displays when the interface repository is being started, start processing will be cancelled.

If during start processing loading fails, the loading will be canceled but the start processing will continue. In this instance, the error message of od20003 is displayed after this message (od20019).

If this message (od20019) is displayed when IDL is being compiled or registered information is being referenced during the interface repository operation, compilation or reference processing will be canceled.

## User Action

Determine if:

- Interface Repository performs the CORBA communication on start-up. If an od1xxxx error message is displayed before this message, the message may indicate whether an error, caused by CORBA communications failure, had been detected in the interface repository cache server.

Correct the problem identified by the error message displayed before this message, this will address the issues for both error messages.

- This error may have been generated because the registered information being updated was referenced.

Check if another process is referencing the interface information that is being updated. This interface information is registered in the interface repository.

For example, this error may occur if you start the WorkUnit of the transaction application which references the interface information being registered by the *tdc* command. The remedy in this case would be to start the WorkUnit after interface repository update processing has been completed.

- If the monitoring time (*period\_server\_timeout* value) set in config file of the CORBA service is 0, the interface repository cannot be started. Review the monitoring time (*period\_server\_timeout* value).

If the cause of this error is any of the above, it is not necessary to recover the interface repository after taking the appropriate action.

If the cause of this error is not any of the above, record the error information, use the *iscollectinfo* command to collect diagnostic information, then contact your system administrator.

To recover the error after contacting the system administrator, recover the interface repository in any of the following methods and restart the repository:

- Use the *ismodifyservice* command to reconstruct the Interface Repository (refer to [Interface Repository Reconstruction Procedure](#)), and then register interface information in the interface repository.
- Use the *odrestoresys* command to restore resources of the CORBA Service (ObjectDirector) saved by the *odbackupsys* command in advance.

## 18.23.20 od20020

---

**OD: ERROR: od20020: InterfaceRepository system error. (C): %s1:%s2:%s3:%s4:%s5:%s6**

### Variable Information

%s1 = File Name

%s2 = Line Number

%s3 = Method Name

%s4 = CORBA Service Method Name

%s5 = Exception Information

%s6 = Repository ID

## Explanation

A %s5 exception was notified from CORBA Service.

Note: A CORBA service exception may occur because the interface repository is a CORBA server application.

## System Action

Processing stopped.

## User Action

Take the following action:

- If the CORBA service method name %s4 is 'CORBA\_ORB\_init', the CORBA service may have not been started normally.

Check if the CORBA service was started normally when the interface repository was started. Also check if the information message of 'od10002' is displayed before this message by referencing the following logs.

### Windows32/64

- Event viewer application log

### Solaris32/64

- System log (/var/adm/messages)

### Linux32/64

- System log (/var/log/messages)

The information message of 'od10002' displayed before this message indicates that the CORBA service was started normally.

If the CORBA service is not started normally, the contents of the status transition procedure in the cluster system operation may be incorrect. If the CORBA service is inactive in the status transition procedure, or if the interface repository was started during start processing, correct the program so that the interface repository will be started after CORBA service start processing has been completed.

- If this message is output with the CORBA Service method name (%s4) 'FJ\_ImplementationRep\_lookup\_id' and the exception information (%s5) 'IDL:FJ/NameDoesntExist:1.0' at the start of Interface Repository, this indicates that Interface Repository has not been registered in Implementation Repository. Configure the environment settings to use Interface Repository in a local host, and then re-start Interface Repository.
- If this message is output with the CORBA Service method name (%s4) 'CORBA\_Repository\_get\_primitives' and the exception information (%s5) 'IDL:CORBA/StExcep/NO\_RESOURCE:1.0 minor=0x464a0923' at the start of Interface Repository, there is a possibility that the number of processes that can be executed by the CORBA service was exceeded. Check the setting value of max\_processes in the config file.

If the value is correct, there is a possibility that the CORBA service environment was damaged (The required modules for the start of Interface Repository can not be found). Re-Install the CORBA service.

- Solaris32/64 Linux32/64

If this message is output with the CORBA Service method name (%s4) 'CORBA\_BOA\_impl\_is\_ready' and the exception information (%s5) 'IDL:CORBA/StExcep/NO\_RESOURCES:1.0 minor=0x464a0073' at the start of Interface Repository, the interface repository service in the same standard interface or the Value interface has already started. In this situation, it is not possible to start at the same time.

- If the cause of this error is not any of the above and the exception information (%s5) is 'InterfaceRepository\_Err', there is a possibility that registered information of Interface Repository contains a conflict. Record the error information, use the *iscollectinfo* command to collect diagnostic information, then contact your system administrator.
- If the cause of this error is not any of the above and the exception information (%s5) is other than 'InterfaceRepository\_Err', refer to 'Exception Information Minor Codes Reported from the CORBA Service' and eliminate the cause of the failure.

If it is difficult to correct the cause of the error although exception information was referenced, record the error information, use the *iscollectinfo* command to collect diagnostic information, then contact your system administrator.

## 18.23.21 od20021

---

### **OD: ERROR: od20021: Failed to connect SCManager.**

#### Explanation

There was a failure in connecting to the SCManager.

#### System Action

Interface Repository environment setup will be cancelled.

#### User Action

After restarting the system, set up the Interface Repository environment by using the *ismodifyservice* command. If the same error recurs after the environment has been set up, use the *iscollectinfo* command to collect diagnostic information, then contact your system administrator.

## 18.23.22 od20022

---

### **OD: ERROR: od20022: Failed to create the service object of InterfaceRepository.**

#### Explanation

There was a failure in creating a service object.

#### System Action

Interface Repository environment setup will be cancelled.

#### User Action

After restarting the system, set up the Interface Repository environment by using the *ismodifyservice* command. If the same error recurs after the environment has been set up, use the *iscollectinfo* command to collect diagnostic information, then contact your system administrator.

## 18.23.23 od20023

---

### **OD: INFO: od20023:InterfaceRepository was registered in Service.**

#### Explanation

The Interface Repository is registered in the service.

## 18.23.24 od20024

---

### **OD: ERROR: od20024: Can not get information from the initialize file.**

#### Explanation

ObjectDirector initialization file not recognized.

#### System Action

Interface Repository environment setup will be cancelled.

#### User Action

The CORBA Service (ObjectDirector) may have failed to be installed. Re-install ObjectDirector. If the same error recurs after ObjectDirector has been re-installed, use the *iscollectinfo* command to collect diagnostic information, then contact your system administrator.

### 18.23.25 od20025

---

#### **OD: ERROR: od20025: InterfaceRepositoryServer registration failed.**

##### Explanation

There was a failure in registering the Implementation Repository of the Interface Repository.

##### System Action

Interface Repository environment setup will be cancelled.

##### User Action

The disk may be full. Increase the free space on the CORBA Service installation drive.

### 18.23.26 od20026

---

#### **OD: ERROR: od20026: InitialService registration failed.**

##### Explanation

Failure in registering initial\_services(init\_svc) of the Interface Repository.

##### System Action

Interface Repository environment setup will be cancelled.

##### User Action

The disk may be full. Increase the free space on the CORBA Service installation drive.

### 18.23.27 od20027

---

#### **OD: ERROR: od20027: Failed to create the database of InterfaceRepository.**

##### Explanation

Database cannot be created.

##### System Action

Interface Repository environment setup will be cancelled.

##### User Action

Confirm that there is authority to write to the directory containing the database. If there is not, modify the directory so that there is write permission, then set up the Interface Repository environment by using the *ismodifyservice* command.

### 18.23.28 od20028

---

#### **OD: ERROR: od20028: InterfaceRepository was not registered in Service.**

## Explanation

The Interface Repository is not registered in the service.

## System Action

Interface Repository environment setup will be cancelled.

## User Action

After restarting the system, set up the Interface Repository environment by using the `ismodifyservice` command. If the same error recurs after the environment has been set up, use the `iscollectinfo` command to collect diagnostic information, then contact your system administrator.

## 18.23.29 od20029

---

**OD: INFO: od20029:InterfaceRepository setup was successful.**

## Explanation

The Interface Repository setup completed successfully.

## 18.23.30 od20030

---

**OD: ERROR: od20030: InterfaceRepository Service open error.**

## Explanation

There was a failure in opening the Interface Repository Service.

## System Action

Interface Repository environment setup will be cancelled.

## User Action

After restarting the system, set up the Interface Repository environment by using the `ismodifyservice` command. If the same error recurs after the environment has been set up, use the `iscollectinfo` command to collect diagnostic information, then contact your system administrator.

## 18.23.31 od20031

---

**OD: ERROR: od20031: InterfaceRepository was not deleted from Service.**

## Explanation

The Interface Repository could not be deleted from the service.

## System Action

Interface Repository environment setup will be cancelled.

## User Action

After restarting the system, set up the Interface Repository environment by using the `ismodifyservice` command. If the same error recurs after the environment has been set up, use the `iscollectinfo` command to collect diagnostic information, then contact your system administrator.

## 18.23.32 od20032

---

**OD: INFO: od20032:InterfaceRepository was deleted from Service.**

### Explanation

The Interface Repository was deleted from the service.

## 18.23.33 od20033

---

**OD: ERROR: od20033: Failed to access the database of InterfaceRepository.**

### Explanation

There was a failure in accessing the database file.

The probable causes are shown below.

- The specified database store directory is absent or inaccessible.
- The file may already be open.

### System Action

Interface Repository environment setup will be cancelled.

### User Action

Make sure the database store directory is correctly specified.

After restarting the system, set up the Interface Repository environment by using the *ismodifyservice* command.

If the same error recurs after the environment has been set up, use the *iscollectinfo* command to collect diagnostic information, then contact your system administrator.

## 18.23.34 od20034

---

**OD: ERROR: od20034: InterfaceRepository registration failed. :%s1**

### Variable Information

%s1 = Error

### Explanation

An %s1 error caused a failure in registering the Interface Repository.

### System Action

Interface Repository environment setup will be cancelled.

### User Action

The following causes are possible:

- Another server is specified in the inithost file. If this is the case, invalidate the server name by making it a comment and re-execute the command.
- The monitoring time set in the period\_server\_timeout parameter in the CORBA Service (ObjectDirector) config file is set to 0. If this is the case, change the period\_server\_timeout value.

If these causes do not apply, set up the Interface Repository environment by using the `ismodifyservice` command. If the same error recurs after the environment has been set up, use the `iscollectinfo` command to collect diagnostic information, then contact your system administrator.

## 18.23.35 od20035

---

**OD: INFO: od20035:InterfaceRepository accepted stop request.**

### Explanation

The Interface Repository accepted a stop request.

## 18.23.36 od20036

---

**OD: INFO: od20036:Database of InterfaceRepository is ready to be accessed.**

### Explanation

The Interface Repository database is ready to be accessed.

## 18.23.37 od20037

---

**OD: ERROR: od20037:InterfaceRepository start failed.**

### Explanation

Failed to start the Interface Repository.

### System Action

Interface Repository will be stopped.

### User Action

It is possible that a contradiction arises because the environment file of InterfaceRepository or a database file does not exist. Reinstall ObjectDirector. If this is not the case, use the `iscollectinfo` command to collect diagnostic information, then contact your system administrator.

## 18.23.38 od20038

---

**OD: INFO: od20038:InterfaceRepository stopped properly.**

### Explanation

The Interface Repository stopped successfully.

## 18.23.39 od20039

---

**OD: ERROR: od20039:Searching the object is failed.:%s1**

### Variable Information

%s1 = Exception Information

## Explanation

The search for the object failed.

The following causes are possible:

- ObjectDirector has not been activated.
- The Interface Repository has not been activated.

## System Action

Processing stopped.

## User Action

Check the exception information (%s1).

When the exception information (%s1) is 'IDL:CORBA/StExcep/NO\_IMPLEMENT:1.0 minor=0x464a0880', there is a possibility that the Interface Repository server has not been started. Check whether the Interface Repository server has been started, and retry the operation.

If the cause of this error is not any of the above and the exception information (%s1) is 'InterfaceRepository\_Err', there is a possibility that the registered information of Interface Repository contains a conflict. Record the error information, use the *iscollectinfo* command to collect diagnostic information, then contact your system administrator.

If the exception information (%s5) is other than 'InterfaceRepository\_Err', refer to 'Exception Information Minor Codes Reported from the CORBA Service' and correct the cause of the failure.

If the same error recurs after changes have been made, note the error number and use the *iscollectinfo* command to collect diagnostic information, then contact your system administrator.

## 18.23.40 od20040

---

### **OD: ERROR: od20040:File is already exist.**

## Explanation

A file with the same name already exists.

## System Action

Processing stopped.

## User Action

Specify a different file name.

## 18.23.41 od20041

---

### **OD: ERROR: od20041:Library function error.:%s1(errno=%s2)**

## Variable Information

%s1 = Error Information

%s2 = Error Number

## Explanation

A library function error occurred.

## System Action

Processing stopped.

#### User Action

Eliminate the cause of the %s2 error and re-execute the command.

### 18.23.42 od20042

---

**OD: ERROR: od20042:Loading the library is failed.:%s1**

#### Variable Information

%s1 = Library Name

#### Explanation

Loading of %s1 library failed.

#### System Action

Processing stopped.

#### User Action

The %s1 library file may have been deleted. Re-install this file.

### 18.23.43 od20043

---

**OD: ERROR: od20043:Initialization is failed.:%s1(%s2)**

#### Variable Information

%s1 = Method Name

%s2 = Exception Information

#### Explanation

Initialization failed.

#### System Action

Processing stopped.

#### User Action

Check the exception information and eliminate the cause of the error. For details about the exception information, refer to Exception Information Minor Codes Reported from the CORBA Service.

### 18.23.44 od20044

---

**OD: ERROR: od20044:RepositoryID can not be found.**

#### Explanation

The Repository ID cannot be found.

#### System Action

Processing stopped.

#### User Action

Specify a Repository ID for the object registered in the Interface Repository.

## 18.23.45 od20045

---

**OD: INFO: od20045:InterfaceRepositoryCache is started to load.**

### Explanation

The loading of the Interface Repository cache server has started.

## 18.23.46 od20046

---

**OD: ERROR: od20046:InterfaceRepositoryCache is failed to load. InterfaceRepository is stopped.**

### Explanation

The loading of the Interface Repository cache server failed. The Interface Repository has been stopped.

### System Action

Interface Repository will be stopped.

### User Action

Take the action indicated by the error message immediately preceding this message. If this error still occurs although the appropriate action was taken or if the immediately preceding error message is not displayed, use the *iscollectinfo* command to collect diagnostic information, then contact your system administrator.

## 18.23.47 od20047

---

**OD: WARNING: od20047:Partial cache management is terminated.:%s1**

### Variable Information

%s1 = Error Information

### Explanation

Partial caching of the object has been suspended for the reason outlined in %s1. All registered objects will be cached.

### System Action

Cancels partial cache.

Continues Interface Repository start processing.

## 18.23.48 od20048

---

**OD: ERROR: od20048:The exception of ObjectDirector was detected.:%s1:%s2:%s3**

### Variable Information

%s1 = Command Name

%s2 = Method Name

%s3 = Exception Information

### Explanation

ObjectDirector posted an exception (%s3) while the command (%s1) was being executed.

## System Action

Processing stopped.

## User Action

When the exception information (%s3) is 'IDL:CORBA/StExcep/NO\_IMPLEMENT:1.0 minor=0x464a0880', there is a possibility that the Interface Repository server has not been started. Check whether the Interface Repository server has been started, and retry the operation.

If the cause of this error is not any of the above, check the exception information (%s3), correct the cause of the failure, and retry the operation. Refer to Exception Information Minor Codes Reported from the CORBA Service.

## 18.23.49 od20049

---

### **OD: ERROR: od20049:Failed to open file.:%s1(errno=%s2)**

#### Variable Information

%s1 = File Name

%s2 = Error Number

#### Explanation

The file (%s1) failed to open.

#### System Action

Processing stopped.

#### User Action

Eliminate the cause of the error (%s2), then re-execute the command.

## 18.23.50 od20050

---

### **OD: ERROR: od20050:Insufficient memory available.(errno=%s1)**

#### Variable Information

%s1 = Error Number

#### Explanation

Memory allocation failed.

#### System Action

Processing stopped.

#### User Action

Eliminate the cause of the error (%s1), then re-execute the command.

## 18.23.51 od20051

---

### **OD: ERROR: od20051:DefinitionKind of RepositoryId is wrong. Please specify Interface,Module or Value.**

#### Explanation

There is an error in the interface kind of the Repository ID specified in the *export* command of the interface information.

## System Action

Processing stopped.

## User Action

Specify the object of interface kind of either InterfaceDef, ModuleDef, or ValueDef as the object of the Repository ID (refer to odexportir in the Reference Manual (Command Edition)).

## 18.23.52 od20052

---

**OD: ERROR: od20052:An error occurred in the system function.:%s1(errno=%s2)**

### Variable Information

%s1 = Detail Error Number

%s2 = Error Number

### Explanation

An error occurred in the system function

### System Action

Processing stopped.

If the Interface Repository environment is being set up when this error occurs, the environment setup will be cancelled.

### User Action

Eliminate the cause of the error number %s2 of the detailed error information %s1, and execute again.

## 18.23.53 od20053

---

**OD: ERROR: od20053:It failed in the convert of the data.(%s1)**

### Variable Information

%s1 = Error Number

### Explanation

Data conversion failed.

### System Action

Processing stopped.

### User Action

Note the details of error number %s1, use the *iscollectinfo* command to collect diagnostic information, then contact your system administrator.

## 18.23.54 od20054

---

**OD: ERROR: od20054:A specified file breaks.**

### Explanation

The specified interface information file is corrupted.

System Action

Processing stopped.

User Action

Create the interface information file again by the *export* command of the interface information.

### 18.23.55 od20055

---

**OD: ERROR: od20055:An invalid file was specified.**

Explanation

A file other than the interface information file was specified.

System Action

Processing stopped.

User Action

Specify the interface information file exported by the *export* command of the interface information.

### 18.23.56 od20056

---

**OD: ERROR: od20056:The version of the file isn't correct.**

Explanation

The version of the interface information file specified by the *import* command of the interface information cannot be imported by this *import* command of interface information.

System Action

Processing stopped.

User Action

Check the version of the specified interface information, and specify the interface information file with the same version as the import destination. The version information will be displayed in 'VERSION:' by executing 'odimportir -i interface information file.'

List of the interface information file version of the Interstage products per each version.

Table 18.7 od20056 Error Details

IS products version	Standard interface	Value interface
- V2	01	-
V2 -		02
V3 -		03

### 18.23.57 od20057

---

**OD: ERROR: od20057:Object which has the same RepositoryId exists.**

Explanation

The Repository ID is already registered with the same name as that of the Repository to be imported into the database of interface Repository.

## System Action

Processing stopped.

## User Action

Delete the Repository ID with the same name or re-execute after specifying replacement of the Repository ID by the *import* command of interface information (Refer to the *odimportir* in the Reference Manual (Command Edition)).

## 18.23.58 od20058

---

**OD: ERROR: od20058:It failed in practice of the command.:%s1**

### Variable Information

%s1 = Detail information

### Explanation

Execution of the command failed due to the cause of detailed information %s1.

### System Action

Processing stopped.

### User Action

If the same error recurs after the command was re-executed, note the causes of the detail information %s1, and use the *iscollectinfo* command to collect diagnostic information, then contact your system administrator.

## 18.23.59 od20059

---

**OD: ERROR: od20059:There is no free capacity which is enough on the disk.**

### Explanation

There is not sufficient space on the disk.

### System Action

Processing stopped.

### User Action

Allocate sufficient disk space. When there is sufficient disk space, use the *iscollectinfo* command to collect diagnostic information, then contact your system administrator.

## 18.23.60 od20060

---

**OD: ERROR: od20060:An environment variable doesn't exist.**

### Explanation

The environment variable OD\_HOME does not exist.

### System Action

Processing stopped.

If the Interface Repository environment is being set up when the error message displays, the environment setup will be cancelled..

## User Action

Set up the environment variable OD\_HOME, and re-execute.

## 18.23.61 od20061

---

**OD: ERROR: od20061:An environment file doesn't exist.:%s1**

### Variable Information

%s1 = Environment file name

### Explanation

There is not an environment file %s1.

### System Action

Processing stopped.

### User Action

Check that there is an environment file %s1, and re-execute.

## 18.23.62 od20062

---

**OD: ERROR: od20062:A database file doesn't exist.**

### Explanation

Either one of the database files (irobf.qfp, irobf.qfl, or irobftran) of the interface Repository does not exist.

### System Action

Processing stopped.

If the Interface Repository environment is being set up when the error message displays, the environment setup will be cancelled..

### User Action

Check that the database files (irobf.qfp, irobf.qfl, irobftran) of the interface Repository exist and re-execute.

## 18.23.63 od20063

---

**OD: ERROR: od20063:Object file deletion error.**

### Explanation

Deletion of the object file (ObjectFile) failed.

### System Action

Cancels the Interface Repository environment setup.

### User Action

The following are the possible causes.

- Access permission is not assigned.
- The object file (ObjectFile) does not exist in the storing location of the database of the interface Repository.

Eliminate the cause of the error, and re-execute. If the same error recurs even if the cause of the error was eliminated, use the *iscollectinfo* command to collect diagnostic information, then contact your system administrator.

## 18.23.64 od20064

---

**OD: ERROR : od20064:Object file preparation pass deletion error.**

### Explanation

Deletion of the pass information by which the object file was made failed.

### System Action

Interface Repository environment setup will be cancelled.

### User Action

Check that write permission is assigned to the irpth file, and re-execute.

## 18.23.65 od20065

---

**OD: ERROR : od20065:An illegal directory was specified.:%s1**

### Variable Information

%s1 = Directory information

### Explanation

An illegal directory was specified.

### System Action

Processing stopped.

### User Action

Check that the directory %s1 exists, or if access is available. If the directory exists and access is available, use the *iscollectinfo* command to collect diagnostic information, then contact your system administrator.

## 18.23.66 od20066

---

**OD: ERROR: od20066:There are no log data.**

### Explanation

There are no log data.

### System Action

Processing stopped.

### User Action

Restart the interface Repository service after setting 'yes' to the parameter 'logging' of the irconfig file (Refer to irconfig in the Tuning Guide).

Execute the operation again and collect the log.

## 18.23.67 od20067

---

### **OD: ERROR: od20067:A log file pass is illegal.**

#### Explanation

The specified path for storing the log file is invalid.

#### System Action

Processing stopped.

#### User Action

There is an error in the information set up in the parameter 'logfile path' of the irconfig file. Set up the correct path name (Refer to irconfig in the Tuning Guide).

## 18.23.68 od20068

---

### **OD: ERROR: od20068:A logging memory size is illegal**

#### Explanation

There is an error in logging memory size.

#### System Action

Processing stopped.

#### User Action

A value other than numbers is set up in the parameter 'logging memory size' of the irconfig file. Set up the correct value (Refer to irconfig in the Tuning Guide).

## 18.23.69 od20069

---

### **OD: WARNING: od20069:Failed to acquisition of the standby time of InterfaceRepository. 30 minutes is set up as standby time.**

#### Explanation

Failed to the acquisition of ir\_timeout (Standby time until request's to InterfaceRepository returning) of the irconfig file in the start of InterfaceRepository. 30 minutes is set up as standby time.

#### System Action

Sets the response time to 30 minutes, and starts the Interface Repository.

#### User Action

There is an error in the information set up in the parameter 'ir\_timeout' of the irconfig file. Set up the correct value (Refer to irconfig of the Tuning Guide).

## 18.24 od30100 to od30199

---

This section details the messages numbered between od30100 and od30199.

### 18.24.1 od30101

---

---

**OD: INFO: od30101:NamingService started successful.**

#### Explanation

The Naming Service started successfully.

## 18.24.2 od30102

---

**OD: ERROR: od30102:NamingService start failed. %s1, %s2**

#### Variable Information

%s1 = Process name

%s2 = Error reason

#### Explanation

An error occurred in (%s1) process as per (%s2) and thus failed to start the Naming Service.

#### System Action

Cancels Naming Service start processing.

#### User Action

Take any of the following actions:

- If the process name %s1 is 'CORBA\_ORB\_init' and the error reason %s2 is 'IDL:CORBA/StExcep/UNKNOWN:1.0', the CORBA service may have not been started normally.

Check if the CORBA service was started normally when the Naming Service was started. Also check if the error message of 'od10002' is displayed before this message by referencing the following logs.

#### Windows32/64

- Event viewer application log

#### Solaris32/64

- System log (/var/adm/messages)

#### Linux32/64

- System log (/var/log/messages)

If the 'od10002' error message is displayed before this message, this indicates that the CORBA service was started normally.

If the CORBA service is not started normally, the contents of the status transition procedure in the cluster system operation may be incorrect. If the CORBA service is inactive in the status transition procedure or if the Naming Service was started during start processing, correct the program so that the Naming Service will be started after CORBA service start processing has been completed.

- If the process name %s1 is 'FJ\_ImplementationRep\_lookup:\_IMPL\_CosNaming\_NamingContext' and the error reason %s2 is 'IDL:FJ/NameDoesntExist:1.0', Naming Service settings may have been set so that they will reference other hosts. Check the settings with the *OD\_or\_adm* command (-l option). For details on this command, see 'OD\_or\_adm' in the Reference Manual (Command Edition).

If Naming Service settings are made to reference other hosts, you need not start the Naming Service.

For example, if the cluster system is in operation, the contents of the status transition procedure may be incorrect. If the Naming Service is started despite the fact that it is set to reference other hosts, correct the program so that the Naming Service will not be started.

- **Solaris32/64 Linux32/64**

If the process name %s1 is 'CORBA\_BOA\_impl\_is\_ready' and the error reason %s2 is 'IDL:CORBA/StExcep/NO\_RESOURCES:1.0 minor code:0x464a0073', the Naming Service may have already been started. In this situation, it is not possible to start at the same time.

- If an error message is displayed before this message, an error may have occurred in the Naming Service for the reason indicated by the displayed message. Correct the cause of the unsuccessful start by referencing the message displayed before this message.
- If error reason %s2 includes CORBA service exception information, correct the cause. For information about exception information, refer to Exception Information Minor Codes Reported from the CORBA Service.

Note: A CORBA service exception may occur because the Naming Service is a CORBA server application.

If the cause of this error is not any of the above, record the detailed information (process name %s1, error reason %s2, etc.), use the `iscollectinfo` command to collect diagnostic information, then contact your system administrator.

## 18.24.3 od30103

---

**OD: INFO: od30103:NamingService stopped properly.**

### Explanation

The Naming Service closed successfully.

## 18.24.4 od30104

---

**OD: INFO: od30104:NamingService accepted stop request.**

### Explanation

The Naming Service has accepted a stop request.

## 18.24.5 od30105

---

**OD: ERROR: od30105:Internal error in NamingService. (%s1, %s2): %s3**

### Variable Information

%s1 = File in which an internal error occurred

%s2 = Line in the file in which an internal error occurred

%s3 = Error reason

### Explanation

An internal error occurred due to reason %s3 at line %s2 in the Naming Service file %s1.

### System Action

If this message is displayed when the Naming Service is being started, start processing will be cancelled.

If this message is displayed when the Naming Service is in operation, an INTERNAL exception will be returned to the client.

### User Action

Take any of the following actions:

- If another error message is displayed before this message, an error may have occurred in the Naming Service for the reason indicated by the previously displayed message. First correct the cause of the error identified in the previous message, this should resolve the current error message as well.
- If the error reason %s3 is 'SystemException occurred in communication with LBO. id=%s4 minor=%s5', an error occurred during communication with the load balance function (%s4: CORBA service exception information, %s5: CORBA service minor code).

Correct the cause of this error by referencing Exception Information Minor Codes to be Reported from the CORBA Service.

Note: When the load balance function is used, the Naming Service communicates for the load balance function with the CORBA server.

- If the error reason %s3 is the exception information for the CORBA service (id: 'Exception ID' minor code: 'minor code (hexadecimal)'), refer to 'Exception information/minor code reported by the CORBA service' and correct the cause of the failure.

If the cause of this error is not any of the above, record the detailed information (File in which an internal error occurred %s1, Line in the file in which an internal error occurred %s2, Error reason %s3, etc.), use the *iscollectinfo* command to collect diagnostic information, then contact your system administrator.

## 18.24.6 od30106

---

**OD: ERROR: od30106:config file error for NamingService. %s1 : %s2**

### Variable Information

%s1 = Environment setup file parameter of Naming Service

%s2 = Environment setup file parameter value of Naming Service

### Explanation

The %s2 value of the %s1 parameter in the Naming Service environment setup file is inappropriate.

### User Action

Correct the Naming Service environment setting.

## 18.24.7 od30107

---

**OD: INFO: od30107:NamingService started in async mode.**

### Explanation

The Naming Service started in async mode.

## 18.24.8 od30108

---

**OD: INFO: od30108: Naming service database created.**

### Explanation

The Naming Service database has been created.

## 18.25 od30200 to od30299

---

This section details the messages numbered between od30200 and od30299.

### 18.25.1 od30201

---

**OD: ERROR: od30201: File access error for naming service. %s1 (%s2 = %s3)**

### Variable Information

%s1 = File Name

%s2 = Process Name

%s3 = Error Number

### Explanation

In file access in the naming service, an error with error number %s3 has occurred in process %s2 with file name %s1.

### User Action

When the value of %s3 is 27, it is possible that there is insufficient disk space in one of the following directories. Estimate the amount of use of a disk again, and increase it if necessary. When the value of %s3 is 5, it is possible that an IO error has occurred in the disk. Check the disk for errors.

 Windows32/64

```
C:\Interstage\ODWIN\etc\CosNaming
```

Solaris32/64

```
/opt/FSUNod/etc/CosNaming
```

Linux32/64

```
/opt/FSUNod/etc/CosNaming
```

## 18.25.2 od30202

---

**OD: ERROR: od30202:Not enough memory for NamingService. %s1**

### Variable Information

%s1 = Process name

### Explanation

Insufficient memory in process %s1.

### User Action

Close all unwanted programs, or allocate more memory.

## 18.25.3 od30203

---

**OD: WARNING: od30203:The number of maximum naming contexts exceeded. %s1**

### Variable Information

%s1 = The maximum Naming Contexts

### Explanation

The maximum number (%s1) naming contexts has been exceeded.

### User Action

Delete any unnecessary naming context using the *OD\_or\_adm* command.

Delete unbinded (binding is deleted) naming context using the *odrmubncns* command.

In this case, processing is repeated until the maximum value set for the number of naming contexts is reached. Check the processing in the application and make sure that the naming context created using *CosNaming\_NamingContext\_new\_context()* is registered in *CosNaming\_NamingContext\_bind\_context()*.

## 18.25.4 od30204

---

**OD: WARNING: od30204:The number of maximum binding iterators exceeded. %s1**

### Variable Information

%s1 = Maximum number of binding iterators

### Explanation

The maximum number of binding iterators has been exceeded.

### User Action

Delete unnecessary binding iterators using *CosNaming\_BindingIterator\_destroy()*.

If the binding iterators cannot be deleted, restart the naming service.

## 18.26 od30300 to od30399

---

This section details the messages numbered between od30300 and od30399.

### 18.26.1 od30307

---

**OD:ERROR:od30307:Abnormality notified from ObjectDirector. (%s1, %s2, %s3)%s4**

#### Variable Information

%s1 = Internal information 1

%s2 = Internal information 2

%s3 = Internal information 3

%s4 = Error detail information

#### Explanation

The processing was aborted because an abnormality was reported by the CORBA Service.

#### User Action

Take the action shown in the table according to the Error detail information (%s4) displayed in the Variable Information.

Error detail information (exception information) (%s4)	Meaning/Required Action
IDL:CORBA/StExcep/ NO_IMPLEMENT:1.0 minor=0x464a0880	Take any of the following actions: <ul style="list-style-type: none"><li>- Check whether the Naming Service has been started.</li><li>- Check whether the binding name is a naming context, then retry the operation.</li></ul>
IDL:CosNaming/NamingContext/ CannotProceed:1.0	Make sure that the specified naming context is an unbound naming context, then re-execute.
IDL:CosNaming/NamingContext/ NotFound:1.0	There is a possibility that the specified naming context has not been registered. Make sure that the specified naming context has been registered, then re-execute.
None of the above	Take the necessary action according to Error detail information (%s4), then re-execute. For details on exception information, refer to the " <a href="#">Chapter 29 Exception Information Minor Codes Reported from the CORBA Service</a> " chapter.

### 18.26.2 od30308

---

**OD: ERROR: od30308:An abnormality occurred. (%s1)**

#### Variable Information

%s1 = Internal information

#### Explanation

The environment setup of Naming Service failed.

#### System Action

Naming Service environment setup processing is cancelled.

#### User Action

Use the isinit command to set up the environment of Naming Service again.

### 18.26.3 od30309

---

---

**OD:ERROR:od30309:An abnormality occurred. (402, %s1)****Variable Information**

%s1 = Error code

**Explanation**

Failed in setting the environment of naming service.

**System Action**

Naming Service environment setup processing is cancelled.

**User Action**

Execute the environment setup of naming service again.

If the Properties screen of 'Service' is being displayed, terminate the Properties screen and then execute the environment setup of naming service.

---

**18.26.4 od30310**

---

**OD: ERROR: od30310:Failed to get Object Reference for NamingService.****Explanation**

The processing was aborted because the object reference for Naming Service could not be acquired.

**User Action**

Make sure Naming Service is registered in the initial service.

In addition, when the initial\_hosts (inithost) file is used to reference Naming Service, make sure the host name defined in the initial\_hosts (inithost) file is resolved.

After checking these points, execute the command again.

---

**18.26.5 od30311**

---

**OD: INFO: od30311:Binding of the NamingContext that has no entity has been deleted.****Explanation**

The Naming Service deleted an invalid binding because the naming context registered with that binding had no entity.

---

**18.26.6 od30312**

---

**OD: WARNING: od30312:Failed to output log file '%s1'.****Variable Information**

%s1 = Detail information

**Explanation**

Failed to output the log when the user exception occurred.

Possible causes are as follows:

- If the detailed information (%s1) contains 'get home directory', it means that the attempt to get the installation directory failed. There is a possibility that the installation failed.
- If the detailed information (%s1) contains 'malloc', it means that there was insufficient memory for log output processing.
- If the detailed information (%s1) contains 'create file', it means that the attempt to create the log file failed.
- If the detailed information (%s1) contains 'open file', it means that the attempt to open the log file failed.

- If the detailed information(%s1) contains 'write', it means that the attempt to write to the log file failed.

### System Action

Continues Naming Service processing.

### User Action

Take any of the following actions:

- If the detailed information (%s1) contains 'get home directory', re-install Interstage.
- If detailed information (%s1) contains 'malloc', close all unnecessary programs, or increase the memory.
- If detailed information (%s1) contains 'create file', 'open file', or 'write', take one of the following actions:
  - There is insufficient available disk space to output the log file. Increase the disk space.
  - The log file output directory does not have write authority. Assign write authority to the directory.
  - The specified logfile output directory does not exist. Create a directory for log file output.

For details on the directory specified for log file output, refer to the Distributed Application Development Guide (CORBA Service Edition).

If the cause of this error is not identified above, use the *iscollectinfo* command to collect diagnostic information, and then contact your system administrator.

## 18.26.7 od30313

---

**OD: ERROR: od30313: The odrsubncns command cannot be executed in the Naming Service that was defined as the reference destination.**  
**%s1**

### Variable Information

%s1 = Detail information

### Explanation

The odrsubncns command cannot be executed in the naming service defined as the reference destination. This command is supported in naming services of Interstage Application Server V9.2 or later.

### System Action

Stops the command processing.

### User Action

Take action according to the following procedure.

1. In the OD\_or\_adm command (containing the -l option), check the host used to run the naming service defined as the reference destination. For details on the OD\_or\_adm command, refer to the "Reference Manual (Command Edition)", section "OLTP System Operation Edition" > "CORBA Service Operation Commands" > "OD\_or\_adm".
2. Check the version of Interstage Application Server that installed in the host mentioned above. If the version is V9.1 or earlier, then initialize the naming service using the isinit command, and delete the naming context that was unbinded.

## 18.27 od31000 to od31099

---

This section details the messages numbered between od31000 and od31099.

### 18.27.1 od31001

---

**OD: INFO: od31001: LBO started successfully**

## Explanation

LBO has been started without error.

## 18.27.2 od31002

### OD: INFO: od31002: LBO stopped properly

## Explanation

LBO was terminated without error.

## 18.27.3 od31003

### OD: ERROR: od31003: LBO unable to start. Reason code (%s1-%s2-%s3-%s4)

## Variable Information

%s1 = Error Reason Code

%s2 = Detail Code 1

%s3 = Detail Code 2

%s4 = Detail Code 3

## Explanation

The LBO startup failed for the reason shown in the Error Reason Code.

## System Action

The LBO startup failed.

## User Action

Take the appropriate action depending on the Error Reason Code, as shown in the following table.

Table 18.8 od31003: Error Reason Codes

No.	Code	Reason	Action
1	01	A system resource shortage has occurred.	<b>Windows32/64</b> Close all unnecessary applications, or expand the memory and allocate resources. Then, restart the LBO. If there are no problems with the resources, use the <i>iscollectinfo</i> command to collect diagnostic information, then contact your system administrator. <b>Solaris32/64 Linux32/64</b> Check the system tuning parameter. Then, restart the LBO. If there are no problems with the system resources, use the <i>iscollectinfo</i> command to collect diagnostic information, then contact your system administrator.
2	02	A system error has occurred.	Use the <i>iscollectinfo</i> command to collect diagnostic information, then contact your system administrator.
3	03	The OD is not started.	Start the ObjectDirector.
4	04	There is an error reported by the OD.	Refer to the message that was output to the screen and take the appropriate action. If FJ_ImplementationRep_lookup_id is output for Detail Code 2 and IDL: FJ/NameDoesntExist: 1.0 is output for Detail Code 3, then the LBO is not registered in the Implementation Repository. Set up the LBO (local host) environment, then startup the LBO again.

No.	Code	Reason	Action
			<p>If CORBA_ORB_resolve_initial_reference (xxx) is output to Detail Code 2 and IDL: CORBA/StExcep/COMM_FAILURE: 1.0 is output to Detail Code 3, it may be that one of the services below (corresponding to xxx) is not registered to the initial service. Confirm that the following services are registered, then restart the LBO:</p> <p>LBO: LBO</p> <p>NS: Naming Service</p> <p>Intf: Interface Repository service</p> <p>Impl: Implementation Repository service</p> <p>If CORBA_BOA_impl_is_ready is output to Detail Code 2 and IDL: CORBA/StExcep/NO_RESOURCES: 1.0 is output to Detail Code 3, it may be that the specified thread concurrency is outside of the specified range in the <i>odsetlbo</i> command. Use the <i>odsetlbo</i> command to specify the correct thread multiplexing level, and start the LBO again.</p> <p>In all other circumstances, use the <i>iscollectinfo</i> command to collect diagnostic information, then contact your system administrator.</p>
5	05	There is a resource shortage reported by the OD.	Re-examine the ObjectDirector operating environment and restart the LBO.
6	06	A database access error has occurred.	<p>If 00002010 is output to Detail Code 2 then either there is not enough room on the disk, or the system directory (see the following references) does not exist.</p> <p><b>Windows32/64</b></p> <p>C:\Interstage\ODWIN\ETC\LBO</p> <p><b>Solaris32/64</b></p> <p>/opt/FSUNod/etc/LBO</p> <p><b>Linux32/64</b></p> <p>/opt/FJSVod/etc/LBO</p> <p>Check the necessary disk capacity and the system directory.</p> <p>If 00002012 is output to Detail Code 2, the number of objects registered to object groups, the number of malfunctioning servers registered exceeds the maximum value, or there is not enough disk space. When this is the case, it may be that either the object group information or the malfunctioning server information used has been deleted. Check the number of object group/malfunctioning server registration and check the available disk space.</p>
7	07	The LBO is not registered to the initial service.	Set up the LBO environment and register the LBO to the initial service.
8	08	There is not enough disk capacity.	Check the required disk capacity.
9	09	The OD_HOME environment variable is not set.	Set the OD_HOME environment variable and reissue the command
10	20	NS Load Balancing Option service is in process.	After stopping the NS Load Balancing Option service, execute the command again.
11	21	Command startup failed because of the lack of	Execute the command in an account where it can be executed.

No.	Code	Reason	Action
		authority to execute the command	
12	a0~fe	A miscellaneous error has occurred.	Use the <i>iscollectinfo</i> command to collect diagnostic information, then contact your system administrator.
13	ff	A miscellaneous error has occurred.	<p><b>Windows32/64</b></p> <p>If '80001001' is output for Detail Code 1, 'fffffffe' is output for Detail Code 2, and 'NULL' is output for Detail Code 3, it failed in the start of LBO. Check that the NS LoadBalancingOption service has stopped, then startup the NS LoadBalancingOption.</p> <p>If the cause of this error is not any of the above, use the <i>iscollectinfo</i> command to collect diagnostic information, then contact your system administrator.</p>
			<p><b>Solaris32/64 Linux32/64</b></p> <p>Use the <i>iscollectinfo</i> command to collect diagnostic information, then contact your system administrator.</p>

## 18.27.4 od31004

**OD: ERROR: od31004: LBO terminated abnormally. Reason code (%s1-%s2-%s3- %s4)**

### Variable Information

%s1 = error Reason Code

%s2 = Detail Code 1

%s3 = Detail Code 2

%s4 = Detail Code 3

### Explanation

The LBO terminated abnormally for the reason shown in the Error Reason Code.

### System Action

The LBO terminated abnormally.

### User Action

Take the appropriate action depending on the Error Reason Code.

## 18.27.5 od31005

**OD: WARNING: od31005: An abnormality occurred in LBO Reason code (%s1-%s2- %s3-%s4)**

### Variable Information

%s1 = error Reason Code

%s2 = Detail Code 1

%s3 = Detail Code 2

%s4 = Detail Code 3

### Explanation

An error has occurred for the reason shown in the Error Reason Code System action

Processing continues.

## User Action

Take the appropriate action depending on the Error Reason Code.

## 18.28 od31100 to od31199

---

This section details the messages numbered between od31100 and od31199.

### 18.28.1 od31101

---

**OD: INFO: od31101:Command name The command was processed normally**

#### Explanation

The command executed successfully.

### 18.28.2 od31102

---

**OD: ERROR: od31102:Command name An abnormality occurred in the command Reason code(%s1)**

#### Variable Information

%s1 = Abnormality reason code

#### Explanation

The command executed abnormally due to the reason shown in the Abnormality reason code.

#### System Action

Stops the command processing.

#### User Action

Carry out the actions described in the Reason Codes table ([Table 18.8 od31003: Error Reason Codes](#) located in the description of od31003), according to the specified 'Abnormality reason code'.

### 18.28.3 od31103

---

**OD: ERROR: od31103:Command name The command contradiction detected Reason code(%s1-%s2)**

#### Variable Information

%s1 = Detail Code1

%s2 = Detail Code2

#### Explanation

A contradiction was found in the command.

#### System Action

Stops the command processing.

#### User Action

Restructure the LBO using the *isinit* command, or restart Interstage after you restore a saved CORBA Service resource. Use the *iscollectinfo* command to collect diagnostic information, then contact your system administrator.

### 18.28.4 od31104

---

**OD: ERROR: od31104:Command name A system resource shortage occurred Reason code(%s1-%s2-%s3)**

## Variable Information

%s1 = Detail Code1

%s2 = Detail Code2

%s3 = Detail Code3

## Explanation

Insufficient system resources.

## System Action

Stops the command processing.

## User Action

Correct the system tuning parameter, then re-execute the command. If the system estimation value is correct, use the *iscollectinfo* command to collect diagnostic information, then contact your system administrator.

## 18.28.5 od31105

---

**OD: ERROR: od31105:Command name A system error occurred Reason code(%s1-%s2-%s3)**

## Variable Information

%s1 = Detail Code1

%s2 = Detail Code2

%s3 = Detail Code3

## Explanation

A system error occurred.

## System Action

Stops the command processing.

## User Action

If detail code 3 is '0000000c' or '00000008', system resources may be insufficient. Correct the system tuning parameter, then re-execute the command. If the code output is not one the above codes, use the *iscollectinfo* command to collect diagnostic information, then contact your system administrator.

## 18.28.6 od31106

---

**OD: ERROR: od31106:Command name The option specification is incorrect**

## Explanation

The specified option is invalid. The command cannot be executed.

## System Action

Stops the command processing.

## User Action

Specify the correct option, then re-execute the command.

## 18.28.7 od31107

---

**OD: ERROR: od31107:Command name The operand specification contains an error**

## Explanation

The specified operand is invalid. The command cannot be executed.

## System Action

Stops the command processing.

## User Action

Specify the correct operand, then re-execute the command.

## 18.28.8 od31108

---

### **OD: ERROR: od31108:Command name LBO did not start**

## Explanation

The LBO has not started. The command cannot be executed.

## System Action

Stops the command processing.

## User Action

Start the LBO, then re-execute the command.

## 18.28.9 od31109

---

### **OD: ERROR: od31109:Command name LBO is already started up**

## Explanation

If the LBO has started, or more than one LBO environment setup process is executed at the same time, the command cannot be executed.

## System Action

Stops the command processing.

## User Action

Terminate the LBO, then re-execute the command. Execute one environment setup process at a time.

## 18.28.10 od31110

---

### **OD: ERROR: od31110:Command name ObjectDirector is not started up**

## Explanation

The OD is not started. The command cannot be executed.

## System Action

Stops the command processing.

## User Action

Start the OD, then re-execute the command.

## 18.28.11 od31111

---

---

**OD: ERROR: od31111:Command name Abnormality notified from ObjectDirector Reason code(%s1-%s2-%s3)****Variable Information**

%s1 = Detail Code 1

%s2 = Detail Code 2

%s3 = Detail Code 3

**Explanation**

The command cannot be executed because of an error notification from the ObjectDirector.

**System Action**

Stops the command processing.

**User Action**

If CORBA\_ORB\_resolve\_initial\_reference (xxx) is output to Detail Code 2 and IDL:

CORBA/StExcep/COMM\_FAILURE: 1.0 is output to Detail Code 3, the service corresponding to xxx may not be registered to the initial service.

LBO: LBO

NS: Naming Service

Intf: Interface Repository service

Impl: Implementation Repository service

Check the registration status of the corresponding service and execute the command again.

If ISOD\_LBO\_notify\_down, ISOD\_LBO\_notify\_recover or ISOD\_LBO\_resolve\_LBG is output to Detail Code 2 and IDL: CORBA/StExcep/COMM\_FAILURE: 1.0 is output to Detail Code 3, it is possible the server address specified in the LBO (remote host) environment settings is incorrect. Check the specified server address and execute the command again.

If another code is output, or if there are problems with the results of the actions above, confirm that the ObjectDirector, the Naming Service, and the LBO have started up correctly. If there is no problem with the startup, use the *iscollectinfo* command to collect diagnostic information, then contact your system administrator.

## 18.28.12 od31112

---

**OD: ERROR: od31112:Command name ObjectDirector resource shortage occurred Reason code(%s1)****Variable Information**

%s1 = Detail Code

**Explanation**

Cannot execute command because of ObjectDirector resource shortage.

**System Action**

Stops the command processing.

**User Action**

Check the ObjectDirector operating environment and execute the command again.

## 18.28.13 od31113

---

---

**OD: ERROR: od31113:Command name The specified ObjectGroup name contains an error**

Explanation

The specified object group name is invalid.

System Action

Stops the command processing.

User Action

Specify the correct object group name, then re-execute the command.

## 18.28.14 od31114

---

**OD: ERROR: od31114:Command name The specified ObjectGroup is not registered**

Explanation

The specified object group name is not registered.

System Action

Stops the command processing.

User Action

Check the specified object group name, then re-execute the command.

## 18.28.15 od31115

---

**OD: ERROR: od31115:Command name The specified Object has already been registered in the ObjectGroup**

Explanation

The specified object is already registered in the object group.

System Action

Stops the command processing.

User Action

Check each parameter of the specified object, then re-execute the command.

## 18.28.16 od31116

---

**OD: ERROR: od31116:Command name The specified Object is not registered in the ObjectGroup**

Explanation

The specified object is not registered in the object group.

System Action

Stops the command processing.

User Action

Check each parameter of the specified object, then re-execute the command.

## 18.28.17 od31117

### OD: ERROR: od31117:Command name Object registration failed Reason code(%s1-%s2)

#### Variable Information

%s1 = Detail Code 1

%s2 = Detail Code 2

#### Explanation

There is a failure in registering an object.

#### System Action

Stops the command processing.

#### User Action

Take the appropriate action indicated by the Command Failure Detail Codes in the following table.

Table 18.9 od31117: Command Failure Detail Codes

No.	Detail Code 1	Detail Code 2	
		Reason	Action
1	FJ_ImplementationRep_lookup_id	IDL: FJ/NameDoesntExist: 1.0	
		The specified Implementation Repository ID is not registered in the Implementation Repository.	Register the Implementation Repository ID into the Implementation Repository and execute the command again.
2	ISOD_LBO_resolve_LBG	IDL: ISOD/LBO/CannotProceed: 1.0	
		The Naming Service may not have started.	Check the status of the Naming Service. If this detail code is generated when the Naming Service has started, use the <i>iscollectinfo</i> command to collect diagnostic information, then contact your system administrator.
3	ISOD_LBO_notify_down	IDL: ISOD/LBO/InvalidArgument: 1.0	
		The specified host name is invalid.	Check the specified host name and execute the command again.
4	ISOD_LBO_notify_recover	IDL: ISOD/LBO/InvalidArgument: 1.0	
		The specified host name is invalid.	Check the specified host name and execute the command again.
5	ISOD_LBG_bind	IDL: ISOD/LBG/BadObject: 1.0	
		The specified Interface Repository ID is invalid.	Check the specified Interface Repository ID and execute the command again.
6	ISOD_LBG_rebind_default	IDL: ISOD/LBG/BadObject: 1.0	
		The specified Interface Repository ID is invalid.	Check the specified Interface Repository ID and execute the command again.
		IDL: ISOD/LBG/CannotProceed2: 1.0	

No.	Detail Code 1	Detail Code 2	
		Reason	Action
		The Naming Service may not have started.	Check the status of the Naming Service. If this detail code is generated when the Naming Service has started, use the <i>iscollectinfo</i> command to collect diagnostic information, then contact your system administrator.
7	CORBA_BOA_create	IDL: CORBA/StExcep/NO_RESOURCES: 1.0	
		The specified Interface Repository ID may be invalid.	Check the specified Interface Repository ID and execute the command again.
8	Other	Other	
		The ObjectDirector, Naming Service or LBO may not have started up correctly.	Confirm that the ObjectDirector, Naming Service, and LBO were started correctly.

## 18.28.18 od31118

---

**OD: ERROR: od31118:Command name Object unregistration failed Reason code(%s1-%s2)**

### Variable Information

%s1 = Detail Code 1

%s2 = Detail Code 2

### Explanation

Failure in removing object.

### System Action

Stops the command processing.

### User Action

Take the appropriate action indicated by the Command Failure Detail Codes.

## 18.28.19 od31119

---

**OD: ERROR: od31119:Command name DefaultObject reregistration failed Reason code(%s1-%s2)**

### Variable Information

%s1 = Detail Code 1

%s2 = Detail Code 2

### Explanation

Failure in reregistering default object in object group.

### System Action

Stops the command processing.

## User Action

Take the appropriate action indicated by the Command Failure Detail Codes. If there is no problem, use the *odlistns* command to confirm the existence of the target object group. If the target object group does not exist, there may be an error in the Naming Service database. If this is the case, rebuild the environment from the beginning.

## 18.28.20 od31120

---

### OD: ERROR: od31120:Command name DefaultObject is not registered

#### Explanation

There was a failure in changing the default because the default object is not registered.

#### System Action

Stops the command processing.

#### User Action

Change default objects only on object groups wherein the default object is registered.

## 18.28.21 od31121

---

### OD: ERROR: od31121:Command name Object References creation failed Reason code(%s1)

#### Variable Information

%s1 = Detail Code

#### Explanation

Failure generating object reference.

#### System Action

Stops the command processing.

#### User Action

It is possible that the resources, such as memory, are not sufficient. Check the resources and restart the LBO. If the error recurs, use the *iscollectinfo* command to collect diagnostic information, then contact your system administrator.

## 18.28.22 od31122

---

### OD: ERROR: od31122:Command name LBO unable to stop Reason code(%s1-%s2)

#### Variable Information

%s1 = Detail Code 1

%s2 = Detail Code 2

#### Explanation

Failure in stopping LBO.

#### System Action

Stops the command processing.

## User Action

Take the appropriate action indicated by the Command Failure Detail Codes.

### 18.28.23 od31123

---

**OD: ERROR: od31123:Command name DownServer notification failed Reason code(%s1-%s2)**

#### Variable Information

%s1 = Detail Code 1

%s2 = Detail Code 2

#### Explanation

There was a failure in notifying the LBO of a down server.

#### System Action

Stops the command processing.

#### User Action

Take the appropriate action indicated by the Command Failure Detail Codes.

### 18.28.24 od31124

---

**OD: ERROR: od31124:Command name RecoverdServer notification failed Reason code(%s1-%s2)**

#### Variable Information

%s1 = Detail Code 1

%s2 = Detail Code 2

#### Explanation

There was a failure in notifying the LBO of a recovered server.

#### System Action

Stops the command processing.

#### User Action

Take the appropriate action indicated by the Command Failure Detail Codes.

### 18.28.25 od31125

---

**OD: ERROR: od31125:Command name LBO is not registered in the initial service**

#### Explanation

The LBO is not registered in the initial service.

#### System Action

Stops the command processing.

#### User Action

Set up the LBO environment to register the LBO to the initial service and execute the command again.

## 18.28.26 od31126

---

**OD: ERROR: od31126:Command name Object display failed Reason code(%s1-%s2)**

### Variable Information

%s1 = Detail Code 1

%s2 = Detail Code 2

### Explanation

There was a failure in displaying an object.

### System Action

Stops the command processing.

### User Action

Take the appropriate action indicated by the Command Failure Detail Codes.

## 18.29 od31200 to od31299

---

This section details the messages numbered between od31100 and od31999.

### 18.29.1 od31201

---

**OD: ERROR: od31201:NamingService is not registered in Service.**

### Explanation

Because the naming service is not registered with the initial service, processing was stopped.

### User Action

Register the naming service with the initial service, start it, and re-execute the command.

### 18.29.2 od31202

---

**OD: ERROR: od31202:LoadBalancingOption is not registered in Service.**

### Explanation

Because the load balancing option is not registered with the initial service, processing was stopped.

### User Action

Register the load balancing option with the initial service, start it, and re-execute the command.

### 18.29.3 od31203

---

**OD: ERROR: od31203:The specified file does not exist. Error information(%s1)**

### Variable Information

%s1 = Target file name

### Explanation

Because the specified file %s1 does not exist, the command could not be executed.

## User Action

Specify the correct path, then re-execute the command.

### 18.29.4 od31204

---

**OD: ERROR: od31204:The specified file already exist. Error information(%s1)**

#### Variable Information

%s1 = Target file name

#### Explanation

Because the specified file %s1 already exists, the command could not be executed.

#### User Action

Delete the file %s1 or specify a different file name, then re-execute the command.

### 18.29.5 od31205

---

**OD: ERROR: od31205:Failed to open file. Error information(%s1: %s2)**

#### Variable Information

%s1 = Target file name

%s2 = Detailed error information

#### Explanation

Because the file could not be opened, processing was stopped.

#### User Action

Refer to the detailed error information %s2, take necessary action, and re-execute the command.

### 18.29.6 od31206

---

**OD: ERROR: od31206:The specified file contains an error. Error information(%s1)**

#### Variable Information

%s1 = Target file name

#### Explanation

Because the file is incorrect, processing was stopped.

#### User Action

If the target file %s1 is a converted information file of the host name, the coding format is incorrect. Correct the coding format, then re-execute the command.

If the target file %s1 is an export resource, the resource may be damaged. Re-execute the *export* command so that the correct resource can be used before re-executing the command.

### 18.29.7 od31207

---

**OD: ERROR: od31207:Failed to operate file. Error information(%s1: %s2)**

#### Variable Information

%s1 = Target file name

%s2 = Detailed error information

## Explanation

Because the file %s1 manipulation failed, processing was stopped.

## User Action

Refer to the detailed error information %s2, take necessary action, and re-execute the command.

## 18.29.8 od31208

---

**OD: ERROR: od31208:Memory allocation failed.**

## Explanation

A memory shortage occurred.

## User Action

Check whether sufficient memory is reserved.

## 18.29.9 od31209

---

**OD: ERROR: od31209:The specified file contains an error or memory allocation failed. Error information(%s1)**

## Variable Information

%s1 = Target file name

## Explanation

The file %s1 is incorrect or a memory shortage occurred.

## User Action

Check whether export resources are damaged.

If any export resource is damaged, re-execute the *export* command so that correct resources can be used for re-executing restoring.

If no export resource is damaged, check whether sufficient memory is reserved because a memory shortage can be assumed.

## 18.29.10 od31210

---

**OD: ERROR: od31210:Failed to create Object Reference.**

## Explanation

Because no object reference could be created, processing was stopped.

## User Action

Resources such as memory may be insufficient. Check whether sufficient resources are reserved, then re-execute the command. If the same error occurs after re-execution, use the *iscollectinfo* command to collect diagnostic information, then contact your system administrator.

## 18.29.11 od31211

---

**OD: ERROR: od31211:Failed to unregister Object Reference.**

## Explanation

An attempt was made to delete a registered object reference because an error occurred during processing, but the deletion failed.

## User Action

Import was not performed correctly. Delete the object reference registered with the naming service, review the environment, and re-execute the command.

## 18.29.12 od31212

---

**OD: ERROR: od31212:Abnormality notified from ObjectDirector.**  
**error:%s1**  
**id:%s2**

### Variable Information

%s1 = Interface name of the application in which an error occurred

%s2 = Detailed error information

### Explanation

An error was reported from the CORBA Service, so processing was stopped.

### User Action

Take any of the following actions:

- When the detailed error information (%s2) is 'IDL:CORBA/StExcep/NO\_IMPLEMENT:1.0 minor=0x464a0880', there is a possibility that the Naming Service has not been started, or the load balance function may have not been started if the target is an object group.

Check whether the Naming Service or the load balance function has been started, and retry the operation.

- When the detailed error information (%s2) is 'IDL:CosNaming/NamingContext/AlreadyBound:1.0', the same binding name has already been registered.
- When the detailed error information (%s2) is 'IDL:CosNaming/NamingContext/CannotProceed:1.0', the following directory has insufficient free space, and there is a possibility that the processing cannot be performed:

#### Windows32/64

```
C:\Interstage\ODWIN\etc\CosNaming
```

#### Solaris32/64

```
/opt/FSUNod/etc/CosNaming
```

#### Linux32/64

```
/opt/FJSVod/etc/CosNaming
```

Secure the required capacity.

In Solaris/Linux, it is possible to change the CosNaming directory to a disk partition with large available capacity. Refer to the examples shown below.

### Examples

#### Windows32/64

```
cp -rp C:\Interstage\ODWIN\etc\CosNaming directory-name
```

```
rm -rf C:\Interstage\ODWIN\etc\CosNaming
```

```
ln -s directory-name C:\Interstage\ODWIN\etc\CosNaming
```

#### Solaris32/64

```
cp -rp /opt/FSUNod/etc/CosNaming directory-name
```

```
rm -rf /opt/FSUNod/etc/CosNaming
```

```
In -s directory-name /opt/FSUNod/etc/CosNaming
```

**Linux32/64**

```
cp -rp /opt/FJSVod/etc/CosNaming directory-name
```

```
rm -rf /opt/FJSVod/etc/CosNaming
```

```
In -s directory-name /opt/FJSVod/etc/CosNaming
```

- When the detailed error information (%s2) is 'IDL:ISOD/LBO/AlreadyExist:1.0', an object group with the same name has already been registered.

If the cause of this error is not any of the above, refer to the detailed error information (%s2), take necessary action, and re-execute the command. For more details about exceptions, refer to 'Exception Information Minor Codes Reported from the CORBA Service'.

## 18.30 od32000 to od32099

---

This section details the messages numbered between od32000 and od32099.

### 18.30.1 od32001

---

**OD: ERROR: od32001:Memory allocation failed.**

Explanation

Memory could not be acquired.

User Action

Quit unnecessary applications to release or expand memory.

### 18.30.2 od32002

---

**OD: ERROR: od32002:Environment variable OD\_HOME has not been set up.**

Explanation

The OD\_HOME environment variable is not set.

User Action

Set the OD\_HOME environment variable.

### 18.30.3 od32003

---

**OD: ERROR: od32003:%s1 failed. exception-id(%s2), minor(0x%s3)**

Variable Information

%s1 = Service control API name

%s2 = Exception information

%s3 = Minor code

Explanation

Service control API %s1 failed.

User Action

Check exception information %s2 and minor code %s3 to eliminate the cause. For details about the exception information, refer to Exception Information Minor Codes to be Reported from the CORBA Service.

## 18.30.4 od32004

---

**OD: ERROR: od32004:An InterfaceRepository database administrator's user name is wrong.**

### Explanation

The user name of the database administrator in the interface repository is illegal.

### User Action

Specify the correct user name.

## 18.30.5 od32005

---

**OD: ERROR: od32005:An InterfaceRepository database administrator's group name is wrong.**

### Explanation

The group name of the database administrator in the interface repository is illegal.

### User Action

Specify the correct group name.

## 18.30.6 od32006

---

**OD: ERROR: od32006:Failed to change of file owner. '%s1'**

### Variable Information

%s1 = File name

### Explanation

An attempt to change the owner of the file %s1 failed.

### User Action

Check the access right of the directory in which the file %s1 is stored.

## 18.30.7 od32020

---

**OD: ERROR: od32020:Failed to control of service(%s1). Service Name(%s2), Error Information(0x%s3)**

### Variable Information

%s1 = Service control API name

%s2 = Service name of object

%s3 = Exception information

### Explanation

Service control function %s1 failed while setting a service for service %s2.

Service %s2 cannot be controlled.

### User Action

When service %s1 is 'CreateService,' check the permission and then perform the processing again. Alternatively, there may be a failure in the service. Perform the processing again after restarting the system.

Otherwise, there may be a failure in the service. Perform the processing again after restarting the operating system.

## 18.30.8 od32021

---

---

**OD: ERROR: od32021:Failed to search directories. Error information(0x%s1)****Variable Information**

%s1 = Error information

**Explanation**

A system error occurred.

**User Action**

Note the error information %s1 and use the *iscollectinfo* command to collect diagnostic information, then contact your system administrator.

---

**18.30.9 od32022**

---

**OD: ERROR: od32022:Failed to remove files. Error information(0x%s1)****Variable Information**

%s1 = Error information

**Explanation**

The file could not be deleted.

**User Action**

Check the permission for the file stored in C:\Interstage\ODWIN\etc\CosNaming (default installation path).

---

**18.30.10 od32023**

---

**OD: ERROR: od32023:Failed to next search directories. Error information(0x%s1)****Variable Information**

%s1 = Error information

**Explanation**

A system error occurred.

**User Action**

Note error information %s1 and use the *iscollectinfo* command to collect diagnostic information, then contact your system administrator.

---

**18.30.11 od32024**

---

**OD: ERROR: od32024:The installation path of ObjectDirector does not exist or invalid.****Explanation**

The installation path for the CORBA Service (ObjectDirector) is invalid or absent.

**User Action**

The package may have been installed incorrectly. Install it again.

---

**18.31 od40000 to od40099**

This section details the messages numbered between od40000 and od40099.

## 18.31.1 od40001

---

**OD: INFO: od40001: http tunneling started successfully.**

### Explanation

HTTP tunneling started successfully.

## 18.31.2 od40002

---

**OD: INFO: od40002: http tunneling stopped properly.**

### Explanation

HTTP tunneling stopped properly.

## 18.31.3 od40003

---

**OD: INFO: od40003: %s1 session was deleted.**

### Variable Information

%s1 = Session ID

### Explanation

Session ID%s1 timed out and was deleted.

## 18.31.4 od40004

---

**OD: INFO: od40004: not enough memory for %s1.**

### Variable Information

%s1 = Process Name

### Explanation

Waited to obtain memory blocks used for each session and request.

### User Action

Normally, no action is required; however, if this message is output frequently and the response is lowered significantly, use the *iscollectinfo* command to collect diagnostic information, then contact your system administrator.

## 18.31.5 od40005

---

**OD: INFO: od40005: request id (%s1) is not registered.**

### Variable Information

%s1 = Request ID

### Explanation

Although a response was received from the server, the return address for request ID %s1 could not be found.

## 18.31.6 od40006

---

**OD: INFO: od40006: client connection was deleted. (%s1, %s2)**

### Variable Information

%s1 = Request ID

%s2 = Session ID

#### Explanation

A request failed because, while waiting for a response for request ID %s1, the connection with the session ID %s2 client application was deleted.

### 18.31.7 od40007

---

**OD: INFO: od40007: invalid request. (%s1)**

#### Variable Information

%s1 = Client IP Address

#### Explanation

The request from %s1 is not in the HTTP tunneling format. Check the access log output from the Web server and check the connection source client to see whether the HTTP tunneling start format is correct.

### 18.31.8 od40008

---

**OD: INFO: od40008: The timeout was notified from the HTTP tunneling.**

#### Explanation

The timeout was notified from HTTP tunneling.

#### User Action

When the processing of a server is heavily loaded, or has hung, please check the logic of the server or increase its processing power.

When the request reply standby time of HTTP tunneling is short, please edit gwconfig and increase the value of timeout\_response.

## 18.32 od40100 to od40199

---

This section details the messages numbered between od40100 and od40199.

### 18.32.1 od40101

---

**OD: ERROR: od40101: http tunneling start failed. (%s1, %s2)**

#### Variable Information

%s1 = Process Name

%s2 = Error Number

#### Explanation

There was an error in the %s1 process during startup, causing a failure in the HTTP tunneling startup.

#### User Action

It may be that the required environment variable OD\_HOME was not set at startup, or that the OD\_HOME environment variables are identical and there are multiple HTTP tunneling startups on a single machine. Check whether environment variable OD\_HOME is set, and reboot the Web server.

Table 18.10 od40101: Environment Variables

Process Name	Action Taken
getenv('OD_HOME')	The environment variable OD_HOME is not set.

## 18.32.2 od40102

---

**OD: ERROR: od40102: internal error in http tunneling (%s1, %s2, %s3, %s4)**

### Variable Information

%s1 = File Name  
%s2 = Line Number  
%s3 = Process Name  
%s4 = Error Number

### Explanation

An internal error occurred during the %s3 process, stopping processing.

### System Action

Cancels processing for the request where the error occurred.

### User Action

The error causes for process name %s3 and details of the required action are shown in the following table.

Table 18.11 od40102: Process Name %s3 Error Causes and Required Action

Process Name	Cause	Required Action
ISAPI ReadClient	An error occurred in reading data from the client.	Re-send the client request.
ISAPI ServerSupportFunction	An error occurred in returning data to the client.	A timeout may have occurred because the wait time passed before the server method returned to the client. Specify a greater value for the wait time set in the period_receive_timeout parameter of the config file.
gethostbyname()	The server host name could not be resolved.	Review the network setup so that the server host name can be resolved on the Web server.
socket connect()	Failed to connect to the server.	Review the network setup so that the Web server can be connected to the server host name.
socket write()	Data could not be sent to the server.	If an error occurred in the server application, correct the error. Otherwise, check the network setup.
Other	A shortage may have occurred in a resource (e.g. memory).	Check the resource concerned and restart the Web server.

## 18.32.3 od40103

---

**OD: ERROR: od40103: config file error for http tunneling. (%s1, %s2)**

### Variable Information

%s1 = Item Name  
%s2 = Set Value

### Explanation

Value %s2 of HTTP tunneling environment definitions file parameter %s1 is incorrect.

### System Action

Continues processing assuming that the parameter values are the default values.

## User Action

Correct the HTTP tunneling environment definitions file set value and restart the Web server.

## 18.32.4 od40104

---

### OD: ERROR: od40104: Failed to create shared memory. (%s1, %s2)

#### Variable Information

%s1 = Use Application

%s2 = Request Size

#### Windows32/64

#### Explanation

The system resources such as the number of handles and the amount of free memory space are insufficient.

#### System Action

HTTP tunneling start processing fails.

#### User Action

Close any unnecessary applications or install additional memory.

#### Solaris32/64

#### Explanation

There was a failure in creating shared memory for %s1.

#### User Action

Increase the shared memory maximum segment size in the system parameters.

## 18.32.5 od40105

---

### OD: ERROR: od40105: Failed to create/attach semaphore. (%s1)

#### Variable Information

%s1 = Use Application

#### Windows32/64

#### Explanation

The system resources such as the number of handles and the amount of free memory space are insufficient.

#### System Action

HTTP tunneling start processing fails.

#### User Action

Close any unnecessary applications or install additional memory.

#### Solaris32/64

#### Explanation

There was a failure in creating the semaphore for %s1.

#### User Action

Increase the value for the number of semaphores in the system parameters.

## 18.33 od40200 to od40299

---

This section details the messages with message numbers between od40200 and od40299.

### 18.33.1 od40201

---

**OD: INFO: od40201: SSL environment initialize successful.**

#### Explanation

This is the environment in which the SSL linkage can be used.

### 18.33.2 od40202

---

**OD: ERROR: od40202:Failed to bind SSL port=%s1 ip=%s2**

#### Variable Information

%s1 = port number specified by /etc/services or IIOP\_port of the config file.

%s2 = IP address of the specified host when IIOP\_hostname of the config file is specified or INADDR\_ANY when it is not specified.

#### Explanation

Failed to bind the port number of the IIOP used by the SSL linkage.

#### User Action

Take necessary actions according to the following occurring conditions.

- Change the port number when the specified port number %s1 is used by other application.
- When the CORBA Service or the service application is already active, start the CORBA Service after once terminating it.
- When the same port number is to be used in a system which has multiple IP addresses, use a different IP address.

## 18.34 od40300 to od40399

---

This section details the messages with message numbers between od40300 and od40399.

### 18.34.1 od40301

---

**OD: ERROR: od40301:cannot open ssl.env file.**

#### Explanation

The SSL linkage is called still in the status that the SSL environment setup is not established yet or the environment variable OD\_HOME is not set yet.

There is no problem if this message is output while the import of CORBA service resources is being processed.

#### User Action

Set the environment variable OD\_HOME if it has not yet been set.

If this message is still displayed although OD\_HOME was set, refer to the Security System Guide and set up the SSL environment again.

After importing the CORBA service resources, refer to 'Importing CORBA Service Resource' in the 'Operator's Guide' and ensure SSL environment settings are used.

### 18.34.2 od40302

---

**OD: ERROR: od40302:Invalid ssl.env file. %s1**

### Variable Information

%s1 = Keyword

### Explanation

An incorrect value is specified in the keyword %s1 of the ssl.env file.

### User Action

Refer to the Security System Guide and set up the SSL environment again.

## 18.34.3 od40303

**OD: ERROR: od40303: Failed to SSL %s1, errno = %s2, syserrno = %s3**

### Variable Information

%s1 = SSL operation identifier

%s2 = Error occurrence supplementary information

%s3 = Error occurrence detailed information

### Explanation

An error was detected in SSL linkage.

### User Action

Review the SSL environment.

To import a CORBA service environment using the certificate/key management environment set up with the SMEE command, execute the *odsetSSL* command according to the import destination certificate/key management environment and configure SSL environment settings.

If a system exception such as COMM\_FAILURE occurs at SSL linkage and this message is output, the errno value in the message to failure can be used to check the detail information.

The asterisk mark (\*) in the remarks column indicates request to review the system environment and application. For the items that do not have the asterisk mark (\*) in the remarks column, review the contents of certificate and the environment setup.

### Meaning and Supplementary Information for the Error Occurrence

Table 18.12 Error Message Definitions

Error no.	Meaning	Remarks
0x000052	If detailed information %s3 is 0x80000054, the SMEE2 library is being used under the SMEE3 environment.	
0x010001	A timeout is detected in the SSL communication	
0x020001	Shortage of memory resource is detected.	Note 1
0x100008	Validity date of the certificate is already expired. Obtain a new certificate and make registration.	Note 2
0x100009	Validity date of the CA station certificate is already expired. Obtain a new certificate and make registration.	Note 2
0x10000C	The certificate is void. Check the certificate and make a new registration correctly.	Note 3
0x100013	Data error is detected in the SSL communication.	
0x100016	The certificate is void. Check the certificate and make a new registration correctly.	Note 3
0x100017	The CA station certificate is void. Check the certificate and make a new registration correctly.	Note 3
0x100018	Validity date of the server certificate is already expired.	
0x100019	Contents of the server certificate are inappropriate.	

Error no.	Meaning	Remarks
0x10001A	Contents of the server certificate are inappropriate.	
0x100020	Designating the nickname is omitted in <i>odsetSSL</i> .	Note 4
0x10002D	The certificate is already canceled. Obtain a new certificate and make registration.	
0x10002E	Validity date of the client certificate is already expired.	
0x100035	Contents of the client certificate are inappropriate.	
0x100036	There is an error in the environment setup of SSL. The operation control directory is not set yet.	
0x10003B	<p>The secret key that corresponds to the certificate does not exist in the token. Check the followings.</p> <ul style="list-style-type: none"> <li>- Whether the slot directory path that is specified by <i>odsetSSL</i> is correct or not.</li> <li>- Whether it matches with the slot directory that is designated when creating the certificate or not.</li> <li>- Whether it matches with the slot directory in which the secret key is registered.</li> <li>- Whether the certificate that corresponds to the nickname is the certificate of its own host, or not.</li> <li>- Whether the certificate of other person is registered as the certificate of its own host or not.</li> <li>- Whether the secret key that corresponds to the certificate is registered or not.</li> </ul>	
0x10003C	There is an error in the environment setup of SSL. The slot information directory is not set yet. Set the slot information directory with the <i>odsetSSL</i> command correctly.	
0x10003E	<p>The certificate of its own host that corresponds to nickname, does not exist.</p> <p>If you are not using an Interstage certificate environment, use the <i>cmlicert</i> command to check the certificate.</p> <ul style="list-style-type: none"> <li>- If certificate of the designated nickname does not exist, designate the correct nickname.</li> <li>- If certificate of the designated nickname exists, '-own' is not designated at the time of registration. Delete the certificate once. Designate '-own' and make a new registration again.</li> </ul> <p>To use an Interstage certificate environment, check the certificate using the Interstage management Console. Refer to the Security System Guide for details of checking certificates.</p> <ul style="list-style-type: none"> <li>- If a site certificate has not been registered, register the certificate for the site you are using in the Interstage certificate environment.</li> <li>- If a site certificate has been registered, set a nickname for the site certificate in the SSL definition.</li> </ul>	Note 5
0x10003F	<p>The CA station certificate that corresponds to nickname, does not exist. Check the certificate using the <i>cmlicert</i> command and others.</p> <ul style="list-style-type: none"> <li>- If certificate of the designated nickname does not exist, designate the correct nickname.</li> <li>- If certificate of the designated nickname exists, '-ca' is not designated at the time of registration. Delete the certificate once. Designate '-ca' and make a new registration again.</li> </ul>	Note 5
0x100040	The certificate is void. Check the certificate and make a new registration correctly.	Note 3
...		

Error no.	Meaning	Remarks
0x100046		
0x100047 ... 0x100049	The certificate is void. Check the CA station certificate and make a new registration correctly.	Note 3
0x10004A	The CA station certificate is already canceled. Obtain a new certificate and make registration.	
0x10004B	<p>There is an error in designation of slot directory.</p> <p>If detailed information %s3 is 0x80000054, the SMEE2 library is being used under the SMEE3 environment.</p> <p>If the detailed information %s3 of the error occurrence is '0x80000010,' and the Interstage Certificate Environment is used, there is a possibility that the user executing the application does not have access permission to the Interstage Certificate Environment. Check the access permission settings. For details about the setting access permissions for the Interstage Certificate Environment, refer to 'Setting up Access Permissions in the Interstage Certificate Environment' of Security System Guide.</p> <p>If detailed information %s3 is 0x80000010, and the Interstage Certificate Environment is not used, there is a possibility that the user executing the application does not have access permission to the slot directory. Check the access permission setting. For details about setting access permissions for the slot directory, refer to 'How to Use SSL with the CORBA Service' in the Security System Guide.</p>	
0x10004C	There is an error in the token label setup. Designate the token label that exists in the specified slot of the slot directory.	
0x10004D	There is an error in the user password that corresponds to the token. Designate the password that corresponds to the token label that is designated by odsetSSL.	
0x10004E	An error in designation of the operation control directory of certificate.	
0x150001	Stoppage of the communication is instructed from the opposite end of communication.	
0x400001	A socket function error occurred.	Note 6
0x400002	A bind function error occurred.	Note 6
0x400003	A listen function error occurred.	Note 6
0x400004	A connect function error occurred.	Note 6
0x400005	A accept function error occurred.	Note 6
0x400006	A send function error occurred.	Note 6
0x400007	A write function error occurred. If identifier %s1 of the SSL operation is CONNECT, the maximum number of connections to be received at the connection location may be exceeded.	Note 6
0x400008	A recv function error occurred.	Note 6
0x400009	A read function error occurred.	Note 6
0x40000a	A select function error occurred.	Note 6
0x40000b	A shutdown function error occurred.	Note 6
0x40000c	A close function error occurred.	Note 6
0x500003	SSL version of own station does not match with the SSL version of the corresponding station.	
0x500004	The encryption system of own station does not match with the encryption system of the corresponding station.	

Error no.	Meaning	Remarks
0x600001	Error has occurred during exchange of the SSL encryption information.	
0x700001 0x700002	Having received the inappropriate data.	Note 1
0x700003	The handshaking of SSL3.0 failed because of the following causes: <ul style="list-style-type: none"> <li>- There is no agreement in the encryption specification with the counterpart center</li> <li>- The client certificate is not correct in the client certificate operation.</li> </ul>	
0x800001	Error has occurred while waiting for the SSL data.	
0x900B0065	There is a possibility that the user executing the application does not have access permission to the certificate environment. Check the access permission settings for the certificate environment.  If the Interstage Certificate Environment is used, refer to 'Setting up Access Permissions in the Interstage Certificate Environment' in the Security System Guide.  If the Interstage Certificate Environment is not used, refer to 'How to Use SSL with the CORBA Service' in the Security System Guide.	
Other error	Error is detected inside the SL control. Review the SSL environment. If the same error occurs even after taking measure, use the <i>iscollectinfo</i> command to collect diagnostic information, then contact your system administrator.	

#### Notes

1. Review the system environment and application. (Other than those, review the contents of the certificate and review the environment setup.)
2. Register the new certificate and then restart the CORBA Service.
3. The certificate may not be possibly registered correctly. ('Root certificate is not registered', 'CA station certificates are not registered' and others can be thought.)
4. If operating without a client certificate, ignore this message.
5. The certificate can be checked by using the *cmlistcert* command.

**When you want to show all of the registered certificates of the list**

`cmlistcert -ed certificateoperation control directory`

**When you want to show the list of CA station certificates**

`cmlistcert -ed certificateoperation control directory -ca`

**When you want to show the list of own host certificates**

`cmlistcert -ed certificateoperation control directory -own`

**When you want to check if the designated nickname is registered or not**

`cmlistcert -ed certificateoperation control directory -nn nickname`

6. Take the action indicated by the error number (value of detailed information %s3) of the system call posted from the system.

## 18.34.4 od40304

**OD: ERROR: od40304:The path name of a slot information directory is too long.**

#### Explanation

The path name for the specified directory is too long.

## System Action

Command processing is stopped.

## User Action

Recreate the slot information directory so that the path name is shorter than 260 characters. After recreating the slot information directory, re-execute the command.

---

## 18.34.5 od40305

**OD: ERROR: od40305:The slot information directory (%s1) does not exist.**

## Variable Information

%s1 = Slot information directory

## Explanation

The specified directory does not exist.

## System Action

Command processing is stopped.

## User Action

Specify the correct slot information directory and retry the operation.

If the slot information directory does not exist, create it and retry the operation.

---

## 18.34.6 od40306

**OD: ERROR: od40306:The path name of a certificate management directory is too long.**

## Explanation

The path name for the specified directory is too long.

## System Action

Command processing is stopped.

## User Action

Recreate the certificate management directory so that the path name is shorter than 260 characters. After recreating the certificate management directory, re-execute the command.

---

## 18.34.7 od40307

**OD: ERROR: od40307:The certificate management directory (%s1) does not exist.**

## Variable Information

%s1 = Certificate management directory

## Explanation

The specified directory does not exist.

## System Action

Command processing is stopped.

## User Action

Specify the correct certificate management directory and retry the operation.

If the certificate management directory does not exist, create it and retry the operation.

## 18.34.8 od40308

---

**OD: ERROR: od40308:An error is in the user PIN.**

### Explanation

The input user PIN contains an error.

### System Action

Command processing is stopped.

### User Action

Specify the correct user PIN and retry the operation.

## 18.34.9 od40309

---

**OD: ERROR: od40309:The user PIN cannot be checked.**

### Explanation

The character string of the user PIN contains invalid characters or its length is incorrect.

### System Action

Command processing is stopped.

### User Action

Specify the correct user PIN and retry the operation.

## 18.34.10 od40310

---

**OD: ERROR: od40310:The slot is not found.**

### Explanation

The slot does not exist.

### System Action

Command processing is stopped.

### User Action

Confirm that the correct slot information directory is specified.

## 18.34.11 od40311

---

**OD: ERROR: od40311:The token is not found.**

### Explanation

The token does not exist.

### System Action

Command processing is stopped.

#### User Action

Confirm that the correct slot information directory is specified.

### 18.34.12 od40312

---

**OD: ERROR: od40312:It failed in the encrypt of user PIN.**

#### Explanation

The encryption of the user PIN failed.

#### System Action

Command processing is stopped.

#### User Action

Confirm that the correct slot information directory is specified.

### 18.34.13 od40313

---

**OD: ERROR: od40313:It failed in creation of SSL environmental definition file.**

#### Explanation

The creation of the SSL environment definition file failed.

#### System Action

Command processing is stopped.

#### User Action

Confirm that the CORBA Service (ObjectDirector) is installed correctly.

If this message is output after the *odsetSSL* command was executed using general user authority, execute the command using administrator authority.

### 18.34.14 od40314

---

**OD: ERROR: od40314:The installation directory of ObjectDirector is not found.**

#### Explanation

The install directory of the CORBA Service (ObjectDirector) is not found.

#### System Action

Command processing is stopped.

#### User Action

Confirm that the CORBA Service (ObjectDirector) is installed correctly.

### 18.34.15 od40315

---

**OD: ERROR: od40315: SSL communication could not be established. (from:%s1)**

### Variable Information

%s1 = IP address

### Explanation

SSL communication with Client %s1 could not be established.

### System Action

Disconnects the connection with Client %s1.

### User Action

Check that the SSL environment is set correctly for the server and the Client %s1.

## 18.34.16 od40316

---

### OD: ERROR: od40316: Can not get ssl configuration. (name:%s1, error:%s2)

### Variable Information

%s1 = SSL definition name

%s2 = Error information

### Explanation

Failed to get the SSL definition for the Interstage certificate environment. The meaning of error information %s1 is shown below.

Error Information	Explanation
2	The SSL definition information does not exist. Possible causes are: <ul style="list-style-type: none"><li>- Interstage certificate environment resources (the SSL definition file) have not been restored or imported.</li><li>- Interstage certificate environment resources (the SSL definition file) have been deleted.</li></ul>
7	The Interstage certificate environment does not exist. Possible causes are: <ul style="list-style-type: none"><li>- Interstage certificate environment resources (the certificate environment file) have been deleted, or have not been created.</li><li>- Interstage certificate environment resources (the certificate environment file) have not been restored or imported.</li></ul>

### System Action

Does not use the SSL linkage function.

### User Action

Take action according to error information %s1.

Error information	User Action
2	<ul style="list-style-type: none"><li>- Restore or import the backed up Interstage certificate environment resources (the SSL definition file) and restart the CORBA service. Refer to 'Maintenance (Resource Backup)' in the Operator's Guide for details of restoring and importing.</li><li>- Create the SSL definition for using the Interstage certificate environment. Refer to 'Setup and Use of the Interstage Certificate Environment' in the Security System Guide for details of creating SSL definitions.</li></ul>

Error information	User Action
7	<ul style="list-style-type: none"> <li>- Execute the <i>scsmakeenv</i> command to create the Interstage certificate environment and restart the CORBA service. Refer to 'Setup and Use of the Interstage Certificate Environment' in the Security System Guide for details of creating Interstage certificate environments.</li> <li>- Restore or import the backed up Interstage certificate environment resources (the certificate environment file) and restart the CORBA service. Refer to 'Maintenance (Resource Backup)' in the Operator's Guide for details of restoring and importing.</li> </ul>

## 18.34.17 od40317

---

**OD: ERROR: od40317: failed to change of SSL communication mode. :EXCEPTION=%s1, minor=%s2**

### Variable Information

%s1 = Exception information

%s2 = Minor code

### Explanation

Failed to change to a mode that never uses SSL communication for client and server CORBA communication on one machine.

### System Action

Settings processing is stopped.

### User Action

Refer to the exception information (%s1) and the minor code (%s2), take necessary measures, and retry the operation. For exception information, refer to 'Exception Information Minor Codes to be Reported from the CORBA Service'.

## 18.34.18 od40318

---

**OD: ERROR: od40318: failed to change of SSL communication mode. :EXCEPTION=%s1, minor=%s2**

### Variable Information

%s1 = Exception information

%s2 = Minor code

### Explanation

Failed to change to a mode that never uses SSL communication for client and server CORBA communication on one machine.

### System Action

Settings processing is stopped.

### User Action

Refer to the exception information (%s1) and the minor code (%s2), take necessary measures, and retry the operation. For exception information, refer to 'Exception Information Minor Codes to be Reported from the CORBA Service'.

## 18.35 od51000 to od51099

---

This section details the messages numbered between od51000 and od51099.

## 18.35.1 od51001

**OD: ERROR: od51001:%s1:Failed to open file:%s2 ERRORNO=%s3**

### Variable Information

%s1 = Command name

%s2 = File name

%s3 = Error number

### Explanation

Opening of the file failed.

### User Action

Take the appropriate action to the error number %s3 by referring to the following table. If other error numbers were displayed, use the *iscollectinfo* command to collect diagnostic information, then contact your system administrator.

Table 18.13 od51001: Meaning and Corrective Action for Error Occurrence

Error number	Meaning	Action
2	ICreation of IDLc product failed.	Take either of the following actions and re-execute: <ul style="list-style-type: none"><li>- Shorten the identifier specified in the IDL file.</li><li>- Check that the DOS device name is not specified in the IDL file identifier.</li></ul>
11	A memory shortage occurred during processing.	Refer to od51007.
12	Getting virtual memory failed.	Refer to od51007.
13	There is no access permission to the file and the directory.	Refer to od51002.  Alternatively, there is a file with the same name as the file to be created and with reading permission assigned. Move or delete the existing file and re-execute.
20	There is no directory with the specified IDL file name.	When the file name is to be specified to the file %s1 with full path, specify the existing directory and re-execute.
23	The number of open files is the maximum number of files that can be open.	Close unnecessary files and re-execute.
24	The file descriptor has reached the upper limit.	Close unnecessary files and re-execute.
26	The IDL file is now being used.	Stop the IDL file being used by other operations and re-execute.
28	Disk space to open the file to be created can not be allocated.	Allocate sufficient disk space to create the file and re-execute.
78	The IDL file name is too long.	Shorten the IDL file name and re-execute it.
90	The file symbolic link is too long.	Shorten the symbolic name of the file and re-execute it.

### System Action

Command processing is stopped.

## 18.35.2 od51002

**OD: ERROR: od51002:%s1:Failed to read file: %s2**

### Variable Information

%s1 = Command name

%s2 = File name

### Explanation

Reading the file has failed.

### User Action

Take the appropriate action referring to the relevant manual depending on the message exception detail code output at the same time.

When there is no message output at the same time, a memory shortage may have occurred. Refer to the manual of the following related information and check that sufficient memory is allocated. Or check if a memory shortage occurred due to other applications. If there is a memory shortage, expand the main memory or a page file.

If the same error recurs after the above actions have been taken, permission to the file or the directory may not be allocated. Check that it is allocated and have a user with change or access permission continue processing.

### System Action

Command processing is stopped.

### Related Information

'Memory Requirements' in the Tuning Guide.

## 18.35.3 od51006

---

**OD: WARNING: od51006:%s1:%s2: No object to delete.**

### Variable Information

%s1 = Command name

%s2 = Object name

### Explanation

The object to be deleted does not exist or the information corresponding to the specified IDL definition is not registered in the interface Repository, but there is no problem for operation.

### System Action

Processing is continued.

## 18.35.4 od51007

---

**OD: ERROR: od51007:%s1:Failed to allocate virtual memory.**

### Variable Information

%s1 = Command name

### Explanation

A memory shortage has occurred.

### User Action

If this message is output frequently, refer to the manual of the following related information and check that sufficient memory is allocated. Or check that there is no memory shortage due to other applications. If there is a memory shortage, expand the main memory or a page file.

### System Action

Command processing is stopped.

### Related Information

'Memory Requirements' in the Tuning Guide.

## 18.35.5 od51009

---

**OD: ERROR: od51009:%s1:Failed to create directory.:%s2:ERRORNO = %s3**

### Variable Information

%s1 = Command name

%s2 = File name

%s3 = Error number

### Explanation

Creation of the directory %s2 failed.

### User Action

Take the appropriate action to the error number %s3 by referring to the following table. If other error numbers were displayed, use the *iscollectinfo* command to collect diagnostic information, then contact your system administrator.

Table 18.14 od51009: Meaning and Corrective Action for Error Occurrence

Error number	Meaning	Action
0	The file exists with the same name as the directory which the IDLc creates.	Take either of the following actions and re-execute: <ul style="list-style-type: none"><li>- Move or delete the existing file.</li><li>- Check that the DOS device name is not specified in the IDL file identifier.</li></ul>
2	The hierarchy of the directory which the IDLc creates is too long.	Shorten the module name of the IDL definition.

### System Action

Command processing is stopped.

## 18.35.6 od51011

---

**OD: ERROR: od51011:%s1:No space left on %s2.**

### Variable Information

%s1 = Command name

%s2 = Directory name

### Explanation

There is no space for the work directory.

### User Action

If this message is output frequently, it means that there is not enough space in the disk where the current work directory now being used was created. Check that there is sufficient space. If the disk space is insufficient, expand the disk, or assign the disk with more space with the -T option and re-execute.

Even if there is sufficient disk space, there may be shortage of space for the work directory. In this case delete unnecessary files under the work directory.

#### System Action

Command processing is stopped.

## 18.36 od51100 to od51199

---

This section details the messages numbered between od51100 and od51199.

### 18.36.1 od51101

---

**OD: ERROR: od51101:%s1:Undefined data type: %s2. FILE=%s3 LINE=%s4**

#### Variable Information

%s1 = Command name

%s2 = Data type

%s3 = IDL file name

%s4 = Line number

#### Explanation

An undefined data type was specified.

#### User Action

Re-examine the data type definition of the IDL file and re-execute the processing.

#### System Action

Command processing is stopped.

#### Related Information

'Data Types and Type Declaration' under 'IDL-supported Data Types' in the Distributed Application Development Guide (CORBA Service Edition) for the Interstage Application Server Enterprise Edition.

### 18.36.2 od51102

---

**OD: ERROR: od51102:%s1:Undefined exception: %s2. FILE=%s3 LINE=%s4**

#### Variable Information

%s1 = Command name

%s2 = Exception name

%s3 = IDL file name

%s4 = Line number

#### Explanation

An undefined exception was specified.

#### User Action

Re-examine the exception definition of the IDL file and re-execute the processing.

#### System Action

Command processing is stopped.

## Related Information

'Exception Declaration' in the Distributed Application Development Guide (CORBA Service Edition) for the Interstage Application Server Enterprise Edition.

### 18.36.3 od51103

---

**OD: ERROR: od51103:%s1:Undefined interface: %s2. FILE=%s3 LINE=%s4**

#### Variable Information

%s1 = Command name

%s2 = Interface name

%s3 = IDL file name

%s4 = Line number

#### Explanation

An undefined interface was specified.

#### User Action

Re-examine the interface definition of the IDL file and re-execute the processing.

#### System Action

Command processing is stopped.

#### Related Information

'Interface Declaration' in the Distributed Application Development Guide (CORBA Service Edition) for the Interstage Application Server Enterprise Edition.

### 18.36.4 od51104

---

**OD: ERROR: od51104:%s1:Redeclaration of %s2 as a member of a structure. FILE=%s3 LINE=%s4**

#### Variable Information

%s1 = Command name

%s2 = Structure member name

%s3 = IDL file name

%s4 = Line number

#### Explanation

The structure member was doubly defined.

#### User Action

Re-examine the structure member definition and re-execute the processing.

#### System Action

Command processing is stopped.

#### Related Information

'Data Types and Type Declaration' - 'Structures' in the Distributed Application Development Guide (CORBA Service Edition) for the Interstage Application Server Enterprise Edition.

### 18.36.5 od51105

---

---

**OD: ERROR: od51105:%s1:Redeclaration of %s2 as an element of a union type. FILE=%s3 LINE=%s4**

**Variable Information**

%s1 = Command name

%s2 = Element name of union

%s3 = IDL file name

%s4 = Line number

**Explanation**

The element name of the union was doubly defined.

**User Action**

Re-examine the element name of the union of the IDL file and re-execute the processing.

**System Action**

Command processing is stopped.

**Related Information**

'Data Types and Type Declaration' - 'Unions' in the Distributed Application Development Guide (CORBA Service Edition) for the Interstage Application Server Enterprise Edition.

---

## 18.36.6 od51106

---

**OD: ERROR: od51106:%s1:Redeclaration of %s2 as a union statement of case. FILE=%s3 LINE=%s4**

**Variable Information**

%s1 = Command name

%s2 = Constant expression of case

%s3 = IDL file name

%s4 = Line number

**Explanation**

The case constant expression of the union was doubly defined.

**User Action**

Re-examine the case constant expression of the IDL file and re-execute the processing.

**System Action**

Command processing is stopped.

**Related Information**

'Data Types and Type Declaration' - 'Unions' in the Distributed Application Development Guide (CORBA Service Edition) for the Interstage Application Server Enterprise Edition.

---

## 18.36.7 od51107

---

**OD: ERROR: od51107:%s1:Redeclaration of %s2 as an identifier. FILE=%s3 LINE=%s4**

**Variable Information**

%s1 = Command name

%s2 = Identifier name

%s3 = IDL file name

%s4 = Line number

#### Explanation

The identifier name was doubly defined.

#### User Action

Re-examine the identifier name, and re-execute the processing.

#### System Action

Command processing is stopped.

#### Related Information

'IDL Format' - 'Identifiers' in the Distributed Application Development Guide (CORBA Service Edition) for the Interstage Application Server Enterprise Edition.

## 18.36.8 od51108

---

**OD: ERROR : od51108:%s1:Redeclaration of exception %s2 in raises phrase. FILE=%s3 LINE=%s4**

#### Variable Information

%s1 = Command name

%s2 = Exception name

%s3 = IDL file name

%s4 = Line number

#### Explanation

The exception was doubly defined in the raises clause of the operation definition.

#### User Action

Re-examine the operation declaration of the IDL file and re-execute the processing.

#### System Action

Command processing is stopped.

#### Related Information

'IDL Format' - 'Identifiers' in the Distributed Application Development Guide (CORBA Service Edition) for the Interstage Application Server Enterprise Edition.

## 18.36.9 od51109

---

**OD: ERROR : od51109:%s1:Duplicate inheritance %s2 interface. FILE=%s3 LINE=%s4**

#### Variable Information

%s1 = Command name

%s2 = Interface name

%s3 = IDL file name

%s4 = Line number

#### Explanation

The interface was inherited doubly.

### User Action

Re-examine the interface definition of the IDL file, and re-execute the processing.

### System Action

Command processing is stopped.

### Related Information

'Interface Declaration' in the Distributed Application Development Guide (CORBA Service Edition) for the Interstage Application Server Enterprise Edition.

## 18.36.10 od51110

---

**OD: ERROR: od51110:%s1:Unsupported %s2 in %s3. FILE=%s4 LINE=%s5**

### Variable Information

%s1 = Command name

%s2 = Data type

%s3 = Constant declaration

%s4 = IDL file name

%s5 = Line number

### Explanation

The data type not supported was specified in the constant expression type specified in the constant declaration.

### User Action

Re-examine the support range of the constant declaration and re-execute the processing.

### System Action

Command processing is stopped.

### Related Information

'Constant Declaration' in the Distributed Application Development Guide (CORBA Service Edition) for the Interstage Application Server Enterprise Edition.

## 18.36.11 od51111

---

**OD: ERROR: od51111:%s1:Undefined constant: %s2. FILE=%s3 LINE=%s4**

### Variable Information

%s1 = Command name

%s2 = Constant

%s3 = IDL file name

%s4 = Line number

### Explanation

It is an undefined constant.

### User Action

Re-examine the constant definition of the IDL file and re-execute the processing.

## System Action

Command processing is stopped.

## Related Information

'IDL Format' - 'Constants' in the Distributed Application Development Guide (CORBA Service Edition) for the Interstage Application Server Enterprise Edition.

## 18.36.12 od51112

---

**OD: ERROR: od51112:%s1:Undefined escape character: %s2. FILE=%s3 LINE=%s4**

### Variable Information

%s1 = Command name

%s2 = Escape character

%s3 = IDL file name

%s4 = Line number

### Explanation

An undefined escape character was specified.

### User Action

Re-examine the escape character definition specified in the constant expression of the IDL file and re-execute the processing.

## System Action

Command processing is stopped.

## Related Information

'IDL Format' - 'Constants' in the Distributed Application Development Guide (CORBA Service Edition) for the Interstage Application Server Enterprise Edition.

## 18.36.13 od51113

---

**OD: ERROR: od51113:%s1:Unknown operator: %s2**

### Variable Information

%s1 = Command name

%s2 = Operator

### Explanation

An undefined operator was specified.

### User Action

Re-examine the operator definition specified in the constant expression of the IDL file and re-execute the processing.

## System Action

Command processing is stopped.

## Related Information

'Constant Declaration' in the Distributed Application Development Guide (CORBA Service Edition) for the Interstage Application Server Enterprise Edition.

## 18.36.14 od51114

---

**OD: ERROR: od51114:%s1:Unknown constant type: %s2**

### Variable Information

%s1 = Command name

%s2 = Constant

### Explanation

A type which cannot be used in the constant declaration was specified.

### User Action

Re-examine the constant declaration of the IDL file and re-execute the processing.

### System Action

Command processing is stopped.

### Related Information

'Constant Declaration' in the Distributed Application Development Guide (CORBA Service Edition) for the Interstage Application Server Enterprise Edition.

## 18.36.15 od51115

---

**OD: ERROR: od51115:%s1:Unsupported data type.:%s2**

### Variable Information

%s1 = Command name

%s2 = Data type

### Explanation

The data type specified by the IDL file is not supported.

### User Action

The displayed data type cannot be used. Re-examine the IDL file, delete the definition of the data type and re-execute.

### System Action

Command processing is stopped.

## 18.36.16 od51121

---

**OD: ERROR: od51121:%s1:%s2 undefined identifier. FILE=%s3 LINE=%s4**

### Variable Information

%s1 = Command name

%s2 = Constant

%s3 = IDL file name

%s4 = Line number

## Explanation

This is an undefined constant.

## User Action

Re-examine the identifier definition of the IDL file and re-execute the processing.

## System Action

Command processing is stopped.

## Related Information

'IDL Format' - 'Identifiers' in the Distributed Application Development Guide (CORBA Service Edition) for the Interstage Application Server Enterprise Edition.

# 18.37 od51200 to od51299

---

This section details the messages numbered between od51200 and od51299.

## 18.37.1 od51201

---

**OD: ERROR: od51201:%s1:Syntax error: %s2. FILE=%s3 LINE=%s4**

### Variable Information

%s1 = Command name

%s2 = Detail information

%s3 = IDL file name

%s4 = Line number

### Explanation

There is a syntax error.

### User Action

Re-examine the IDL file depending on the detail information %s2 and re-execute the processing.

### System Action

Command processing is stopped.

### Related Information

'IDL' in the Distributed Application Development Guide (CORBA Service Edition) for the Interstage Application Server Enterprise Edition.

## 18.37.2 od51202

---

**OD: ERROR: od51202:%s1:Not a data type: %s2. FILE=%s3 LINE=%s4**

### Variable Information

%s1 = Command name

%s2 = Data type

%s3 = IDL file name

%s4 = Line number

## Explanation

The declaration of the data type is not done where the data type must be used.

## User Action

Re-examine if there is not an error in the data type declaration of the IDL file, and re-execute the processing.

## System Action

Command processing is stopped.

## Related Information

'Data Type and Type Declaration' in the Distributed Application Development Guide (CORBA Service Edition) for the Interstage Application Server Enterprise Edition.

## 18.37.3 od51203

---

**OD: ERROR: od51203:%s1:Not an exception: %s2. FILE=%s3 LINE=%s4**

### Variable Information

%s1 = Command name

%s2 = Exception name

%s3 = IDL file name

%s4 = Line number

## Explanation

A type other than exception was specified in the raise clause.

## User Action

Re-examine the exception of the operation declaration of the IDL file and re-execute the processing.

## System Action

Command processing is stopped.

## Related Information

'Operation Declaration' in the Distributed Application Development Guide (CORBA Service Edition) for the Interstage Application Server Enterprise Edition.

## 18.37.4 od51204

---

**OD: ERROR: od51204:%s1:Illegal constant type: %s2. FILE=%s3 LINE=%s4**

### Variable Information

%s1 = Command name

%s2 = Constant

%s3 = IDL file name

%s4 = Line number

## Explanation

A constant was allocated to a type which cannot be used as a constant.

## User Action

Allocate a constant to a type which can be used as a constant and re-execute the processing.

## System Action

Command processing is stopped.

## Related Information

'Constant Declaration' in the Distributed Application Development Guide (CORBA Service Edition) for the Interstage Application Server Enterprise Edition.

## 18.37.5 od51205

---

**OD: ERROR: od51205:%s1:Illegal exception type: %s2. FILE=%s3 LINE=%s4**

### Variable Information

%s1 = Command name

%s2 = Type name

%s3 = IDL file name

%s4 = Line number

### Explanation

A definition of an equation is made in which an equation using operators can not be written.

### User Action

An equation using operators is described in the place where it cannot be described. Re-examine the definition of the equation and re-execute the processing.

## System Action

Command processing is stopped.

## Related Information

'Constant Declaration' in the Distributed Application Development Guide (CORBA Service Edition) for the Interstage Application Server Enterprise Edition.

## 18.37.6 od51206

---

**OD: ERROR: od51206:%s1:Array size too large. FILE=%s2 LINE=%s3**

### Variable Information

%s1 = Command name

%s2 = IDL file name

%s3 = Line number

### Explanation

The number of dimensions of the array exceeded the maximum number (5).

### User Action

Make the number of dimensions less than 5 for the array of the IDL file and re-execute the processing.

## System Action

Command processing is stopped.

## Related Information

'Data Types and Type Declaration' - 'Arrays' in the Distributed Application Development Guide (CORBA Service Edition) for the Interstage Application Server Enterprise Edition.

## 18.37.7 od51208

---

**OD: ERROR: od51208:%s1:Illegal data type %s2 is used in union-switch. FILE=%s3 LINE=%s4**

### Variable Information

%s1 = Command name

%s2 = Type definition of switch statement of union

%s3 = IDL file name

%s4 = Line number

### Explanation

A type which cannot be used in the switch statement of union is specified.

### User Action

Re-examine the switch statement type definition of the IDL file and re-execute the processing.

### System Action

Command processing is stopped.

### Related Information

'Data Types and Type Declaration' - 'Unions' in the Distributed Application Development Guide (CORBA Service Edition) for the Interstage Application Server Enterprise Edition.

## 18.37.8 od51209

---

**OD: ERROR: od51209:%s1 Identifier too long. Max(%s2). FILE=%s3 LINE=%s4**

### Variable Information

%s1 = Command name

%s2 = Maximum identifier length

%s3 = IDL file name

%s4 = Line number

### Explanation

The length of the identifier exceeded the maximum identifier length.

### User Action

Make the length of the identifier specified in the IDL file shorter than the displayed maximum length and re-execute the processing.

### System Action

Command processing is stopped.

### Related Information

'IDL Format' - 'Identifiers' in the Distributed Application Development Guide (CORBA Service Edition) for the Interstage Application Server Enterprise Edition.

## 18.37.9 od51210

---

**OD: ERROR: od51210:%s1:Not an interface: %s2. FILE=%s3 LINE=%s4**

### Variable Information

%s1 = Command name

%s2 = Interface name

%s3 = IDL file name

%s4 = Line number

### Explanation

A name which is not an interface was specified.

### User Action

Re-examine the interface definition of the IDL file and re-execute the processing.

### System Action

Command processing is stopped.

### Related Information

'Interface Declaration' in the Distributed Application Development Guide (CORBA Service Edition) for the Interstage Application Server Enterprise Edition.

## 18.37.10 od51211

---

**OD: ERROR: od51211:%s1:Not a constant: %s2. FILE=%s3 LINE=%s4**

### Variable Information

%s1 = Command name

%s2 = Constant name

%s3 = IDL file name

%s4 = Line number

### Explanation

A name other than a constant was specified.

### User Action

Re-examine the constant definition of the IDL file and re-execute the processing.

### System Action

Command processing is stopped.

### Related Information

'IDL Format' - 'Constants' in the Distributed Application Development Guide (CORBA Service Edition) for the Interstage Application Server Enterprise Edition.

## 18.37.11 od51212

---

**OD: ERROR : od51212:%s1:operator %s2, out of range. FILE=%s3 LINE=%s4**

### Variable Information

%s1 = Command name

%s2 = Operator

%s3 = IDL file name

%s4 = Line number

### Explanation

The number of the shifts of the shift operator exceeded the maximum value (32).

### User Action

Re-examine the number of the shifts of the shift operator and re-execute the processing.

### System Action

Command processing is stopped.

### Related Information

'Constant Declaration' in the Distributed Application Development Guide (CORBA Service Edition) for the Interstage Application Server Enterprise Edition.

## 18.37.12 od51213

---

**OD: ERROR: od51213:%s1:%s2:Operator divides by zero. FILE=%s3 LINE=%s4**

### Variable Information

%s1 = Command name

%s2 = Operation

%s3 = IDL file name

%s4 = Line number

### Explanation

There is a definition of an operator in which division by zero is specified.

### User Action

Re-examine the processing of calculating a quotient or a remainder of the IDL file and re-execute the processing.

### System Action

Command processing is stopped.

## 18.37.13 od51214

---

**OD: ERROR: od51214:%s1:%s2:Operator cannot be used by %s3. FILE=%s4 LINE=%s5**

### Variable Information

%s1 = Command name

%s2 = Operation

%s3 = Constant type

%s4 = IDL file name

%s5 = Line number

### Explanation

The operator %s1 can not be handled for the constant %s2.

### User Action

Re-examine how to use the operator for the IDL file and re-execute the processing.

## System Action

Command processing is stopped.

## Related Information

'Constant Declaration' in the Distributed Application Development Guide (CORBA Service Edition) for the Interstage Application Server Enterprise Edition.

## 18.37.14 od51215

---

**OD: ERROR: od51215:%s1:%s2:Overflow. FILE=%s3 LINE=%s4**

### Variable Information

%s1 = Command name

%s2 = Constant type(long double value or Floating point value)

%s3 = IDL file name

%s4 = Line number

### Explanation

The constant displayed by the command %s1 is larger than the maximum or smaller than the minimum value.

### User Action

Specify the constant definition in the IDL file such that it is bigger than the minimum and smaller than the maximum value, and re-execute the processing.

In the following is shown the range of each constant value.

- float: 3.402823466e+38 to -3.402823466e+38

double: 1.79769313486231558e+308 to -1.79769313486231558e+308

#### **Solaris32/64**

- long double: 1.189731495357231765085759326628007016E+4932L to -1.189731495357231765085759326628007016E+4932L

## System Action

Command processing is stopped.

## 18.37.15 od51216

---

**OD: ERROR: od51216:%s1:Different types: %s2, %s3. Cannot assign values. FILE=%s4 LINE=%s5**

### Variable Information

%s1 = Command name

%s2 = Type type

%s3 = Type type

%s4 = IDL file name

%s5 = Line number

### Explanation

The type %s2 and type %s3 are different types so that a constant cannot be allocated.

### User Action

Re-examine the constant definition of the IDL file and re-execute the processing.

### System Action

Command processing is stopped.

### Related Information

'IDL Format' - 'Constants' in the Distributed Application Development Guide (CORBA Service Edition) for the Interstage Application Server Enterprise Edition.

## 18.37.16 od51218

---

**OD: ERROR: od51218:%s1:%s2:Syntax error because of %s3 number. FILE=%s4 LINE=%s5**

### Variable Information

%s1 = Command name

%s2 = Escape character

%s3 = Number (hexadecimal or octal)

%s4 = IDL file name

%s5 = Line number

### Explanation

There is an error in the escape character %s2 of the IDL file %s4.

### User Action

Re-examine the escape character of the IDL file and re-execute the processing.

### System Action

Command processing is stopped.

### Related Information

'IDL Format' - 'Constants' in the Distributed Application Development Guide (CORBA Service Edition) for the Interstage Application Server Enterprise Edition.

## 18.37.17 od51219

---

**OD: ERROR: od51219:%s1:Positive integer constant only. FILE=%s2 LINE=%s3**

### Variable Information

%s1 = Command name

%s2 = IDL file name

%s3 = Line number

### Explanation

A value other than a constant of a positive integer type was specified.

### User Action

Re-examine the places where a constant of a positive integer type is to be specified for the IDL file and re-execute the processing.

- size specification of the string type

- size specification of the sequence type
- size specification of an array

#### System Action

Command processing is stopped.

### 18.37.18 od51220

**OD: ERROR: od51220:%s1:Failed to execute command: %s2. ERRORNO=%s3**

#### Variable Information

%s1 = Command name

%s2 = Module name

%s3 = Error number

#### Explanation

Command execution of the IDL compiler failed.

#### User Action

Take the appropriate action depending on the error number code %s3 as shown in the following table. When other error numbers were displayed, use the *iscollectinfo* command to collect diagnostic information, then contact your system administrator.

Table 18.15 od51220: Meaning and Corrective Action for Error Occurrence

Error number	Meaning	Action
14	A memory shortage has occurred.	Refer to od51007.
33 108 170	The resource (file) to be used by the request of the executed IDL compiler may be used by another IDL compiler.	Re-execute after the processing of other IDL compiler has ended. Check the ending of the processing by task manager.
39 112	There is no available space of the work directory.	Refer to od51011.

#### System Action

Command processing is stopped.

### 18.37.19 od51221

**OD: ERROR: od51221:%s1:%s2:Command error. STATUS=%s3**

#### Variable Information

%s1 = Command name

%s2 = Module name

%s3 = Error status

#### Explanation

The IDL compile failed.

## User Action

Eliminate the error according to the message output at the same time and re-execute.

Error codes:

1. analysis error
2. syntax error
3. an unsupported error was called.
4. system abnormal end

## System Action

Command processing is stopped.

## 18.37.20 od51222

---

**OD: WARNING: od51222:%s1:Detected identifier more than 30 characters.**

### Variable Information

%s1 = Command name

### Explanation

There is an identifier name which exceeded the limit (30 characters).

### User Action

Make the identifier name not more than 30 characters long and this message will not be displayed.

### System Action

Processing is continued.

## 18.37.21 od51223

---

**OD: WARNING: od51223:%s1:Changed id from \"%s2\" to \"%s3\".**

### Variable Information

%s1 = Command name

%s2 = Old identifier name

%s3 = New identifier name

### Explanation

The identifier name %s2 exceeded the limit of 30 characters so that it was changed to the identifier name %s3 with not more than 30 characters.

### User Action

Make the identifier name not more than 30 characters long and this message will not be displayed.

### System Action

Processing is continued.

## 18.37.22 od51224

---

**OD: ERROR: od51224:%s1:Supported digit size is 1 to 18. Current digit size is %s2.**

### Variable Information

%s1 = Command name

%s2 = Digit size

### Explanation

The number of the digits of the specified Fixed type exceeded the limit.

### User Action

Make the number of the digits of the specified Fixed type within 1 -18 digits and re-execute the command.

### System Action

Command processing is stopped.

### Related Information

'Data Types and Type Declaration' - 'Fixed' in the Distributed Application Development Guide (CORBA Service Edition) for the Interstage Application Server Enterprise Edition.

## 18.37.23 od51225

---

**OD: ERROR: od51225:%s1:Supported decimal size is 1 to 18. Current decimal size is %s2.**

### Variable Information

%s1 = Command name

%s2 = Decimal size

### Explanation

The number of the digits of the decimal fraction of the specified Fixed type exceeded the limit.

### User Action

Make the number of the digits of the decimal fraction of the Fixed type within 1 to 18 and re-execute the command.

### System Action

Command processing is stopped.

### Related Information

'Data Types and Type Declaration' - 'Fixed' in the Distributed Application Development Guide (CORBA Service Edition) for the Interstage Application Server Enterprise Edition.

## 18.37.24 od51226

---

**OD: ERROR: od51226:%s1:Supported total digit size is 1 to 18. Current total digit size is %s2.**

### Variable Information

%s1 = Command name

%s2 = Total digit size

## Explanation

The total number of digits of the specified Fixed type exceeded the limit.

## User Action

Make the total number of digits of the Fixed type within 1 to 18 and re-execute the command.

## System Action

Command processing is stopped.

## Related Information

'Data Types and Type Declaration' - 'Fixed' in the Distributed Application Development Guide (CORBA Service Edition) for the Interstage Application Server Enterprise Edition.

## 18.37.25 od51229

---

**OD: ERROR: od51229:%s1:Command error. STATUS = %s2**

### Variable Information

%s1 = Command name

%s2 = Error code

### Explanation

The IDL compilation failed.

### User Action

Eliminate the error according to the message output simultaneously and re-execute.

### System Action

Command processing is stopped.

## 18.37.26 od51234

---

**OD: ERROR: od51234:%s1:Constant value is outside the range of COBOL %s2: %s3**

### Variable Information

%s1 = Command name

%s2 = Scope name

%s3 = Data type name

### Explanation

The value of the constant is out of the range of COBOL. The range of the value of each constant is shown below.

- short: 9999 to -9999
- unsigned short: 9999 to 0
- long: 999999999 to -999999999
- unsigned long: 999999999 to 0
- long long: 9999999999999999 to -9999999999999999
- float: 3.40282336e38 to -3.4028233e38

- double: 7.2e75 to -7.2e75

#### User Action

Check the value of the constant and re-execute.

#### System Action

Command processing is stopped.

#### Related Information

'Data Types and Type Declaration' - 'IDL-supported Data Types' in the Distributed Application Development Guide (CORBA Service Edition) for the Interstage Application Server Enterprise Edition.

## 18.37.27 od51235

---

**OD: ERROR: od51235:%s1:Constant value is smaller than expression value of COBOL double: %s2**

#### Variable Information

%s1 = Command name

%s2 = Scope name

#### Explanation

The value of the constant is smaller than the value that can be expressed by the COBOL double. The range of the COBOL double is from 7.2e75 to -7.2e75.

#### User Action

Check the value of the constant and re-execute.

#### System Action

Command processing is stopped.

#### Related Information

'Data Types and Type Declaration' - 'IDL-supported Data Types' in the Distributed Application Development Guide (CORBA Service Edition) for the Interstage Application Server Enterprise Edition.

## 18.37.28 od51236

---

**OD: ERROR: od51236:%s1:Constant value is more than expression value of COBOL double: %s2**

#### Variable Information

%s1 = Command name

%s2 = Scope name

#### Explanation

The value of the constant is larger than the value that can be expressed by the COBOL double. The range of the COBOL double is from 7.2e+75 to -7.2e+75.

#### User Action

Check the value of the constant and re-execute.

#### System Action

Command processing is stopped.

## Related Information

'Data Types and Type Declaration' - 'IDL-supported Data Types' in the Distributed Application Development Guide (CORBA Service Edition) for the Interstage Application Server Enterprise Edition.

### 18.37.29 od51237

---

**OD: ERROR: od51237:%s1:Unsupported multiple source files.**

#### Variable Information

%s1 = Command name

#### Explanation

The multiple number of the IDL files cannot be specified.

#### User Action

Specify only one IDL file and re-execute the command.

#### System Action

Command processing is stopped.

### 18.37.30 od51238

---

**OD: ERROR: od51238:%s1:Illegal file name. Extension may be wrong. FILE=%s2**

#### Variable Information

%s1 = Command name

%s2 = File name

#### Explanation

There is an error in the IDL file name.

#### User Action

Specify the correct IDL file name (extension: .idl) and re-execute the command.

#### System Action

Command processing is stopped.

### 18.37.31 od51239

---

**OD: ERROR: od51239:%s1:File not found. FILE=%s2**

#### Variable Information

%s1 = Command name

%s2 = File name

#### Explanation

The specified IDL File cannot be found.

#### User Action

Specify an IDL file that exists and re-execute the command.

#### System Action

Command processing is stopped.

### 18.37.32 od51240

---

**OD: ERROR: od51240:%s1:A fatal error was discovered. ErrorNumber = %s2**

#### Variable Information

%s1 = Command name

%s2 = Error number

#### Explanation

There is an error in the definition of the IDL.

#### User Action

Eliminate the error according to the message output simultaneously and re-execute.

#### System Action

Command processing is stopped.

### 18.37.33 od51241

---

**OD: ERROR: od51241:%s1:Illegal system name. Extension may be wrong.**

#### Variable Information

%s1 = Command name

#### Explanation

There is an error in the system name.

#### User Action

Specify a correct system name in the M option and re-execute the command.

When the M option is omitted, there is an error in the default system name. Specify a correct system name in the M option and re-execute the command.

#### System Action

Command processing is stopped.

### 18.37.34 od51243

---

**OD:ERROR:od51243:%s1: The length of the specified operation name exceeds limitation.Max(%s2). FILE=%s3 LINE=%s4**

#### Variable Information

%s1 = Command name

%s2 = Maximum identifier length

%s3 = IDL file name

%s4 = Line number

#### Explanation

The length of the operation name exceeds the maximum length.

#### User Action

The length of the operation name specified in the IDL file exceeds the indicated maximum length. Shorten the identifier name and perform the processing again.

#### System Action

Command processing is stopped.

## 18.37.35 od51244

---

**OD:ERROR:od51244:%s1 The length of the identifier which adjusted a specified module name and an interface name exceeds limitation.Max(%s2). FILE=%s3 LINE=%s4**

#### Variable Information

%s1 = Command name

%s2 = Maximum identifier length

%s3 = IDL file name

%s4 = Line number

#### Explanation

The length of the module name (plus either the identifier or the repository ID added to the interface name) specified using IDL file name %s3 exceeded maximum identifier length %s2.

#### User Action

Shorten the identification name and then re-execute processing.

#### System Action

Command processing is stopped.

## 18.38 od51400 to od51499

---

This section details the messages numbered between od51400 and od51499.

### 18.38.1 od51401

---

**OD: ERROR: od51401:%s1:Exception raised(%s2):ExceptionID=%s3: minor=0x%s4**

#### Variable Information

%s1 = Command name

%s2 = Abnormality occurrence function

%s3 = Exception information

%s4 = Minor code

#### Explanation

An exception occurred in the CORBA function. Eliminate the error according to the output minor code and re-execute.

## User Action

Take the appropriate action referring to the manual of the following related information, based on the exception information and the minor code.

The following a system exception:

If, after referring to the manual containing related information, the cause of this error cannot be corrected, use the *iscollectinfo* command to collect diagnostic information, then contact your system administrator.

### (Exception code)

The following exception codes can be displayed to indicate a system exception:

IDL:CORBA/StExcep/UNKNOWN:1.0

An unknown exception occurred.

IDL:CORBA/StExcep/BAD\_PARAM:1.0

An invalid parameter was found.

IDL:CORBA/StExcep/NO\_MEMORY:1.0

Memory shortage occurred.

IDL:CORBA/StExcep/IMP\_LIMIT:1.0

The number of concurrently activated server applications reached the maximum limit.

IDL:CORBA/StExcep/COMM\_FAILURE:1.0

A communication error occurred. Communication with the Interface Repository service was disabled.

IDL:CORBA/StExcep/INV\_OBJREF:1.0

Object reference is invalid.

IDL:CORBA/StExcep/NO\_PERMISSION:1.0

The user is not authorized for method execution.

IDL:CORBA/StExcep/INTERNAL:1.0

An internal error occurred in ObjectDirector.

IDL:CORBA/StExcep/MARSHAL:1.0

A marshaling error was detected in a parameter or result.

IDL:CORBA/StExcep/INITIALIZE:1.0

Initialization of ObjectDirector failed.

IDL:CORBA/StExcep/NO\_IMPLEMENT:1.0

Interface Repository service has not been activated.

IDL:CORBA/StExcep/BAD\_TYPECODE:1.0

Type code is invalid.

IDL:CORBA/StExcep/BAD\_OPERATION:1.0

Operation is invalid.

IDL:CORBA/StExcep/NO\_RESOURCES:1.0

Resources are not enough for requests.

IDL:CORBA/StExcep/NO\_RESPONSE:1.0

Interface Repository service does not respond.

IDL:CORBA/StExcep/PERSIST\_STORE:1.0

Persistent storage failed.

IDL:CORBA/StExcep/BAD\_INV\_ORDER:1.0

Routine calling is abnormal.

IDL:CORBA/StExcep/TRANSIENT:1.0

An error occurred during transition. The request is reissued.

IDL:CORBA/StExcep/FREE\_MEM:1.0

Memory release failed.

IDL:CORBA/StExcep/INV\_IDENT

Syntax of identifier is invalid.

IDL:CORBA/StExcep/INV\_FLAG:1.0

Flag is invalid.

IDL:CORBA/StExcep/INTF\_REPOS:1.0

An error occurred during access to the Interface Repository.

IDL:CORBA/StExcep/CONTEXT:1.0

An error occurred in a context object.

IDL:CORBA/StExcep/OBJ\_ADAPTER:1.0

An error occurred in the object adapter.

IDL:CORBA/StExcep/DATA\_CONVERSION:1.0

A data conversion error occurred.

The system exceptions due to environment setting errors, and their corrective actions are as follows:

#### Exception code

IDL:CORBA/StExcep/NO\_MEMORY:1.0

#### Cause

A shortage of system memory was detected.

#### Measures

Expand the system and swap memory.

#### Exception code

IDL:CORBA/StExcep/COMM\_FAILURE:1.0

#### Cause

Communication with the Interface Repository service failed due to one of the following causes:

- a) Communication with the server is disabled because it has not been turned on, or the CORBA Service has not been started.
- b) Interface Repository processing was not completed within the time specified by `ir_timeout` in `irconfig`. The default is 1800 seconds.
- c) The number of requests to the server has exceeded the maximum limit specified by `max_IOP_resp_con` in `config`. The default is 8.
- d) A network environment error occurred.
- e) An error was found in the `initial_hosts` (`init_host`) setting.
- f) The Interface Repository service for the value `interface` is not started (for EJB application development).

#### Measures

Corrective action is as follows:

- a) Connect power to the server and turn it on, then start the Interface Repository server.
- b) Increase the value of `ir_timeout` in `irconfig`.

- c) Increase the value of max\_IIOp\_resp\_con in config.
- d) Check the network environment and resolve all errors.
- e) Correct the initial\_hosts (init\_host) setting.
- f) For EJB application development, specify the EJB option in the Interstage initialization processing.

#### Exception code

IDL:CORBA/StExcep/NO\_IMPLEMENT:1.0

#### Cause

The Interface Repository server has not been started.

#### Measures

Start the Interface Repository server. If startup fails, review the environment setup and retry startup. For EJB application development, specify the EJB option in the Interstage initialization processing.

#### Exception code

IDL:CORBA/StExcep/NO\_RESOURCE:1.0

#### Cause

The object used to call the Interface Repository service cannot be invoked, or a server with the same implementation ID has already been started.

#### Measures

Retry processing later, or stop the server with the duplicate implementation ID, and review implementation IDs.

#### System Action

Command processing is stopped.

#### Related Information

Exception Information Minor Codes to be Reported from the CORBA Service

## 18.38.2 od51403

---

**OD: ERROR: od51403:%s1:Failed to create TypeCode.**

#### Variable Information

%s1 = Command name

#### Explanation

Creation of the type code failed.

#### User Action

Take the appropriate action referring to the manual of the following related information, based on the exception information and the minor code output simultaneously.

#### System Action

Command processing is stopped.

#### Related Information

Exception Information Minor Codes to be Reported from the CORBA Service

## 18.39 od60000 to od60099

---

This section details the messages numbered between od60000 and od60099.

## 18.39.1 od60001

---

### OD: ERROR: od60001:OD-Java runtime error %s1

#### Variable Information

%s1 = Exception information

#### Explanation

An error was detected during processing in the preinstalled Java library.

#### User Action

Use the *iscollectinfo* command to collect diagnostic information, then contact your system administrator.

## 18.39.2 od60002

---

### OD: WARNING: od60002:OD-Java runtime detected exception %s1

#### Variable Information

%s1 = Exception information

#### Explanation

An error was detected during processing in the preinstalled Java library.

#### User Action

Take the following action:

- If a string containing "access denied (java.io.SerializablePermission enableSubclassImplementation)" is output to exception information (%s1), take one of the following actions:
  - Set the following system property:

`jdk.corba.allowOutputStreamSubclass=true`
  - Set the SerializablePermission enableSubclassImplementation permission in the following Java libraries:
    - /opt/FSUNod/etc/class/ODjava4.jar
    - User application classes and libraries
- Otherwise, after checking exception information (%s1), take the necessary action. If %s1 is CORBA Service exception information, then refer to "Exception Information Minor Codes Reported from the CORBA Service" and take action.

## 18.39.3 od60003

---

### OD: INFO: od60003:OD-Java runtime received exception %s1

#### Variable Information

%s1 = Exception information

#### Explanation

The preinstalled Java library received an exception.

#### User Action

The following causes are assumed:

- The processing time of the application may have exceeded the monitoring time. If an error message is output immediately before this message, take the action indicated in that error message.

- An exception may have been generated on the server system. Refer to the error message displayed on the server system and remove the cause of the exception.

If the cause of this error is not listed above, refer to the exception information (%s1), take necessary measures, and retry the operation. For exception information, refer to 'Exception Information Minor Codes to be Reported from the CORBA Service'.

# Chapter 19 Messages Beginning with 'ots'

This chapter describes the messages displayed by the Object Transaction Service (OTS).

## 19.1 ots9000 to ots9099

---

This section describes the error messages of the following commands:

- *otssetup*: OTS system operating environment setup
- *otssetrsc*: Register/Delete resource definition file
- *otslinkrsc*: Create resource manager.
- *otsxamkpgm*: Create XA
- *otsmklog*: Create/Delete system log file
- *otsalive*: Display operation information

### 19.1.1 ots9001

---

**OTS: INFO: ots9001:OTS system is not running. : %s1 %s2 %s3**

#### Variable Information

- %s1 = Error information 1
- %s2 = Error information 2
- %s3 = Error information 3

#### Explanation

The OTS system has not started.

#### User Action

Start the OTS system.

### 19.1.2 ots9002

---

**OTS: INFO: ots9002: It is the condition that command cannot be executed. : DETAIL=%d1 CODE=%d2**

#### Variable Information

- %d1 = Maintenance code
- %d2 = Maintenance code

#### Explanation

The command cannot be executed.

#### System Action

Stops the command processing.

#### User Action

Reexecute the command after a short delay. If this message is still output, use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer.

### 19.1.3 ots9003

---

---

**OTS: INFO: ots9003:This 'Resource-definition-file' is already registered. : DETAIL=%d**

Variable Information

%d = Maintenance code

Explanation

Duplicated resource manager registration.

User Action

Register the resource manager with a different resource definition name.

## 19.1.4 ots9004

---

**OTS: INFO: ots9004:There is no registered 'Resource-definition-file'. : DETAIL=%d**

Variable Information

%d = Maintenance code

Explanation

An attempt was made to refer to information for an unregistered resource manager.

User Action

Register the resource manager.

## 19.1.5 ots9005

---

**OTS: ERROR: ots9005: Required option not defined.**

Explanation

Required option not defined.

User Action

Define the required option and reexecute the process.

## 19.1.6 ots9006

---

**OTS: ERROR: ots9006: An illegal option(%s) was specified.**

Variable Information

%s = Option Name

Explanation

An unidentified option has been specified.

User Action

Specify a correct option and reexecute the process.

## 19.1.7 ots9007

---

**OTS: ERROR: ots9007: %s option was specified more than once.**

Variable Information

%s = Option Name

## Explanation

An option is specified more than once.

## User Action

Specify a correct option and reexecute the process.

### 19.1.8 ots9008

---

**OTS: ERROR: ots9008: %s1 option and %s2 option can not be specified simultaneously.**

## Variable Information

%s1, %s2 = Option Name

## Explanation

Options that cannot be used together are specified at the same time.

## User Action

Specify a correct option and reexecute the process.

### 19.1.9 ots9009

---

**OTS: ERROR: ots9009: %s option argument was not specified.**

## Variable Information

%s = Option Name

## Explanation

There is an option argument that is not defined.

## User Action

Specify a correct option and reexecute the process.

### 19.1.10 ots9010

---

**OTS: ERROR: ots9010: %s option argument was invalid.**

## Variable Information

%s = Option Name

## Explanation

There is an error in an option argument. This error may have been caused by:

- the option argument containing invalid syntax
- the specified value exceeding the maximum limit
- the length of the specified character string exceeding the maximum limit.

## User Action

Correct the option argument and reexecute the process.

### 19.1.11 ots9011

---

**OTS: ERROR: ots9011: %s option argument was specified more than once.**

#### Variable Information

%s = Option Name

#### Explanation

There is a redundant option argument.

#### User Action

Specify a correct option and reexecute the process.

### 19.1.12 ots9012

---

**OTS: ERROR: ots9012: Too many %s options were specified.**

#### Variable Information

%s = Option Name

#### Explanation

There are too many options set.

#### User Action

Specify a correct option and reexecute the process.

### 19.1.13 ots9013

---

**OTS: WARNING: ots9013 Since the maximum number specified for OTS system was exceeded, maximum is set up.**

#### Explanation

There is an error in the specification of OTS system concurrency.

#### User Action

The range of thread concurrency allowed for the OTS system is 1 to 31.

### 19.1.14 ots9014

---

**OTS: ERROR: ots9014: The maximum concurrent number specified for the recovery program was invalid. : option = %s1 value = %s2**

#### Variable Information

%s1 = Option Name

%s2 = Specified Value

#### Explanation

There is an error in specifying the recovery program multiplexing level.

#### User Action

Set the concurrency correctly and execute the process again. The set value must be a positive integer.

### 19.1.15 ots9015

---

**OTS: ERROR: ots9015: The maximum transaction number specified was invalid. : option = %s1 value = %s2**

## Variable Information

%s1 = Option Name

%s2 = Specified Value

## Explanation

There is an error in specifying the maximum number of transactions.

## User Action

**Windows32/64**

Correctly specify the maximum number of transactions and execute the process again. The set value must be a positive integer no more than 256.

**Solaris32/64 Linux32/64**

Correctly specify the maximum number of transactions and execute the process again. The set value must be a positive integer no more than 1024.

## 19.1.16 ots9016

---

**OTS: ERROR: ots9016: The resource number specified was invalid. : option = %s1 value = %s2**

## Variable Information

%s1 = Option Name

%s2 = Specified Value

## Explanation

There is an error in specifying the number of resources.

## User Action

Correctly specify the number of resources and execute the process again. The number of resources must be an integer between 2 and 32, inclusive.

## 19.1.17 ots9017

---

**OTS: WARNING: ots9017: Since the maximum number specified for the resource management program was exceeded, maximum is set up.**

## Explanation

The maximum value was set because the specified value exceeds the limit of resource management program concurrency.

## User Action

Specify resource management program concurrency settings within the following range:

- OTS resource control program: 1 to 31
- JTS resource control program: 1 to 32

## 19.1.18 ots9018

---

**OTS: ERROR: ots9018:Required command argument is missing.**

## Explanation

Required command argument is not specified.

## System Action

Terminates command processing.

## User Action

Specify the required command argument.

## 19.1.19 ots9019

---

**OTS: WARNING: ots9019: OTS working environment has been already created.**

### Explanation

The OTS system operating environment has already been created.

### System Action

Processing stops.

### User Action

If this message is output on the console screen of the Interstage Management Console, the operating environment of the OTS system may have been created using an integrated command, or the *otssetup* command. If so, restart the Interstage Management Console.

If the operating environment of the OTS system created using an integrated command is to be changed on the Interstage Management Console, first execute the integrated command by adding the "type1 [EJB]" option. Then restart the Interstage Management Console, and set Transaction Service to [Use].

If the operating environment of the OTS system created using the *otssetup* command is to be changed on the Interstage Management Console, first delete the operating environment using the *otssetup* command. Then restart the Interstage Management Console, and set Transaction Service to [Use].

If the operating environment of the OTS system needs to be recreated during the use of the *otssetup* command, delete the operating environment of the OTS system, then reexecute the command.

If it is necessary to remake the OTS system operating environment, first delete the OTS system operating environment, and then execute the command again.

This message is also output when the *isinit* command is executed to initialize an environment created with *otssetup* command. Delete the environment using the *otssetup* command, and then execute the *isinit* command again.

## 19.1.20 ots9020

---

**OTS: WARNING: ots9020: OTS working environment has been already removed.**

### Explanation

Either the OTS system operating environment has not been created or it has already been deleted.

### User Action

Two actions can lead to this error:

- Reconstructing Interstage using the *isinit* command
- Deleting the OTS system using the *otssetup* command

#### Windows32/64

Check whether the "C:\Interstage\ots\etc\sysconfig" file exists. If not, copy "C:\Interstage\ots\default\sysconfig.default" to "C:\Interstage\ots\etc\sysconfig."

#### Solaris32/64

Check whether the "/opt/FSUNots/etc/sysconfig" file exists. If not, copy "/opt/FSUNots/default/sysconfig.default" to "/opt/FSUNots/etc/sysconfig."

#### Linux32/64

Check whether the "/opt/FJSVots/etc/sysconfig" file exists. If not, copy "/opt/FJSVots/default/sysconfig.default" to "/opt/FJSVots/etc/sysconfig."

## 19.1.21 ots9021

---

**OTS: ERROR: ots9021: Error occurred when removing OTS working environment.**

### Explanation

There was an error detected in the OTS system operating environment deletion process.

### User Action

Refer to the previous message displayed on an event log or a command input screen.

## 19.1.22 ots9022

---

**OTS: ERROR: ots9022: The resource management program could not be made.**

### Explanation

Could not generate the resource control program. This may be because the option specified in the command is not specified correctly, or because the folder containing the output file cannot be written to.

### User Action

Specify the option correctly or change the folder properties to enable files to be modified.

**Solaris32/64 Linux32/64**

If the following message is generated, ensure that the switch name is correct, then reexecute the command from *otsmkxapgm*.

Id: CRITICAL ERROR: Symbol reference error. No output to ora\_resource.

## 19.1.23 ots9023

---

**OTS: ERROR: ots9023: This command cannot operate OTS working environment.**

### Explanation

The *otssetup* command could not run in this working environment.

### System Action

Processing stops.

### User Action

Use the Interstage integration command.

## 19.1.24 ots9024

---

**OTS: ERROR: ots9024: Specify the user ID by an option or the Resource definition file.**

### Explanation

Compulsory user ID has not been specified.

### System Action

Stops the command processing.

### User Action

Designate user ID to either command option or resource definition file, and execute the command again.

## 19.1.25 ots9025

---

**OTS: ERROR: ots9025: Specify the group ID by an option or the Resource definition file.**

### Explanation

Compulsory group ID has not been specified.

### System Action

Stops the command processing.

### User Action

Designate group ID to either command option or resource definition file, and execute the command again.

## 19.1.26 ots9026

---

**OTS: ERROR: ots9026: This command cannot stop OTS system.**

### Explanation

This command cannot be stopped by the *otsstop* command because the OTS system is not started up by the *otsstart* command.

### System Action

Stops the processing.

### User Action

Stop it using the Interstage integration command.

## 19.1.27 ots9027

---

**OTS: ERROR: ots9027: The environment is not executable. : MODE=%s**

### Variable Information

%s = Setup mode

### Explanation

Cannot start the OTS system because the node enabling operation of the OTS system, is not set.

### System Action

Stops the processing.

### User Action

Review the system configuration. If you want to run the OTS system with this system, modify the definition file and perform the setup again.

## 19.1.28 ots9028

---

**OTS: ERROR: ots9028: The line form of the file was invalid. : line number=%d**

### Variable Information

%d = Number of lines

### Explanation

There is syntax error in the description of the file contents.

#### System Action

Stops the processing.

#### User Action

Review the contents of the definition and reexecute the file.

### 19.1.29 ots9029

---

**OTS: ERROR: ots9029: The key word(%s) was invalid.**

#### Variable Information

%s = Name of key word

#### Explanation

The keyword that is described in the file is incorrect.

#### System Action

Stops the processing.

#### User Action

Review the contents of the definition and reexecute the file.

Also, ensure that JTS is specified for rscType in the JTS resource definition file, then register the file again.

### 19.1.30 ots9030

---

**OTS: ERROR: ots9030: The key word(%s) was not specified.**

#### Variable Information

%s = Name of key word

#### Explanation

The compulsory key word is not designated.

#### System Action

Stops the processing.

#### User Action

Review the contents of the definition and reexecute the file.

### 19.1.31 ots9031

---

**OTS: ERROR: ots9031:Command argument was invalid.**

#### Explanation

The specified command argument has exceeded the maximum value.

#### System Action

Stops the command processing.

#### User Action

Specify a correct command argument and execute the process again.

## 19.1.32 ots9032

---

**OTS: ERROR: ots9032:Failed to open a file. : DETAIL=%d**

### Variable Information

%d = Maintenance code

### Explanation

Permission to access the tmp folder under the current folder has been denied or there are insufficient system resources.

### System Action

Stops the processing.

### User Action

If there is no permission to access the folder, set the access permission. If there is insufficient memory in the folder, delete any unnecessary files. Then, reexecute the command.

## 19.1.33 ots9033

---

**OTS: ERROR: ots9033:Failed to write a file. : DETAIL=%d**

### Variable Information

%d = Maintenance code

### Explanation

Unable to read the file.

### System Action

Stops the command processing.

### User Action

After verifying the following points, correct the system environment and restart.

- Disk space not available.
- Insufficient system resources.

## 19.1.34 ots9034

---

**OTS: ERROR: ots9034:Failed to close a file. : DETAIL=%d**

### Variable Information

%d = Maintenance code

### Explanation

Unable to close the file.

### System Action

Stops the command processing.

### User Action

After verifying the following points, correct the system environment and restart.

- Disk space not available.
- Insufficient system resources.

### 19.1.35 ots9035

---

**OTS: ERROR: ots9035: Length of the Resource definition file is more than the maximum value.**

#### Explanation

The length of the resource definition file name has exceeded the maximum value allowed for it.

#### System Action

Terminates command processing.

#### User Action

Specify a resource definition file name of a valid length.

### 19.1.36 ots9036

---

**OTS: ERROR: ots9036:NamingService is not running.**

#### Explanation

The Naming Service has not been started.

#### System Action

Stops the command processing.

#### User Action

Start the Naming Service and reexecute the command.

If the -a option is added to the *otssetup* command, change to the -o option, then reexecute the command.

### 19.1.37 ots9037

---

**OTS: ERROR: ots9037:Environment variable does not exist or is invalid. : EXCEPTION=%s**

#### Variable Information

%s = Maintenance information

#### Explanation

An environment variable does not exist or an error was found in the specified contents.

#### System Action

Stops the command processing.

#### User Action

Set the valid environment variables.

### 19.1.38 ots9038

---

**OTS: ERROR: ots9038:Failed to register to ImplementationRepository. : EXCEPTION=%s**

#### Variable Information

%s = Maintenance information

#### Explanation

Unable to register in Implementation Repository.

### System Action

Stops the command processing.

### User Action

Determine whether the CORBA Service is running and try to register again. Registration is not required if the CORBA Service is in operation.

## 19.1.39 ots9039

---

**OTS: ERROR: ots9039:Failed to register to NamingService. : EXCEPTION=%s**

### Variable Information

%s = Maintenance information

### Explanation

Unable to register to Naming Service.

### System Action

Stops the command processing.

### User Action

Check whether CORBA Service is being operated and try to register again. Registration is not required if CORBA Service is in operation.

## 19.1.40 ots9040

---

**OTS: ERROR: ots9040:Failed to delete from ImplementationRepository. : EXCEPTION=%s**

### Variable Information

%s = Maintenance information

### Explanation

Unable to delete from Implementation Repository.

### System Action

Stops the command processing.

### User Action

Check whether CORBA Service is being operated and retry. If CORBA Service is operating, that means the file has already been deleted.

## 19.1.41 ots9041

---

**OTS: ERROR: ots9041:Failed to delete from NamingService or InitialServices. : EXCEPTION=%s**

### Variable Information

%s = Maintenance information

### Explanation

Unable to delete from Naming Service or initial service.

### System Action

Stops the command processing.

## User Action

Check whether CORBA Service and Naming Service are being operated and retry. If CORBA Service and Naming Service are in operation that means the file has already been deleted.

### 19.1.42 ots9042

---

**OTS: ERROR: ots9042:Invalid user or group name is specified. : CODE=%d**

#### Variable Information

%d = Maintenance code

#### Explanation

User name or group name is not registered.

#### System Action

Stops the command processing.

#### User Action

Specify valid user name or group name.

If secure mode is active, check if the USER item in the resource definition file or the user name specified by the *otssetrsc* command's -u option belongs to the group nominated for secure mode.

### 19.1.43 ots9043

---

**OTS: ERROR:ots9043:OTS system is already running. : CODE=%d**

#### Variable Information

%d = Maintenance code

#### Explanation

OTS system is already started.

#### System Action

Stops the command processing.

#### User Action

This message is generated whenever the *otssetup* command is used to delete the system log file and the OTS system has already started.

Stop the OTS system, then reissue the command.

### 19.1.44 ots9044

---

**OTS: ERROR: ots9044:Specified raw device does not exist. : CODE=%d**

#### Variable Information

%d = Maintenance code

#### Explanation

Specified raw device does not exist.

#### System Action

Stops the command processing.

## User Action

Use the instructions in the following table as a guide, then reexecute the command.

Table 19.1 ots9044 Error Details

Maintenance code (%d)	Unusual cause	Countermeasures
1	A directory is specified	Specify a raw device
2	A specified path does not exist	Specify a correct path
3	An ordinary file is specified	Specify a raw device
4	A raw device has not been created	Specify a raw device
<b>Linux32/64</b> 5	The bind target of the raw device is not found	Correctly create a raw device
6	The device is being used as a file system	Specify an available raw device, if required unmount it, then reexecute the command
99	An internal conflict has occurred	If this message displays after action is taken according to the message output before or after this message, use the <i>iscollectinfo</i> command to collect investigation information, then contact a Fujitsu service engineer.

### 19.1.45 ots9045

---

**OTS: ERROR: ots9045:OTS system is not running properly. : CODE=%d**

#### Variable Information

%d = Maintenance code

#### Explanation

OTS system is not running properly.

#### System Action

Stops the command processing.

#### User Action

Restart the OTS system.

### 19.1.46 ots9046

---

**OTS: ERROR: ots9046:OD did not start.**

#### Explanation

The CORBA service has not been installed, has not started, or there are insufficient resources notified from the CORBA service.

#### System Action

Command failed.

#### User Action

Check if the CORBA service has been installed. If not, install the CORBA service, start it and reexecute the command. If the CORBA service is installed but has not been started, start it and reexecute the command. If the CORBA service has already been started, check whether the resources required for the operation are available.

## 19.1.47 ots9047

---

**OTS: ERROR: ots9047:Abnormality notified from OD. (%s1-%s2)**

### Variable Information

%s1 = Error information 1

%s2 = Error information 2

### Explanation

Abnormality is notified from CORBA Service.

### System Action

Command failed.

### User Action

Take the action for the CORBA service exception information as indicated by Error Information 1, then reexecute the command.

## 19.1.48 ots9048

---

**OTS: ERROR: ots9048:Object reference could not be acquired. (%s1-"%s2")**

### Variable Information

%s1 = Type

%s2 = Abnormality reason (Abnormality reason notified at completion.)

### Explanation

Service ended abnormally while issuing service for CORBA Service.

### System Action

Command failed.

### User Action

If the values of %s1 and %s2 are as shown below, take the action described in countermeasures and reexecute the command. If the values of %s1 and %s2 are other than those shown below, take the appropriate action for the CORBA service exception information as indicated by %s2, then reexecute the command.

Service name(%s1): Naming Service

Abnormality reason (%s2): IDL:CORBA/StExcep/NO\_IMPLEMENT

Countermeasures: Check the status of the Naming Service. If the Naming Service has not started, start it.

## 19.1.49 ots9049

---

**OTS: ERROR: ots9049: Object is not registered in OD.**

### Explanation

The CORBA Service and the Naming Service have not been started.

### System Action

Command failed.

### User Action

Check whether the CORBA Service and the Naming Service are active, then reexecute the command.

## 19.1.50 ots9050

---

### OTS: ERROR: ots9050: Object could not be deleted in OD. (%s1)

#### Variable Information

%s1 = Object name

#### Explanation

The object shown in [Variable information] cannot be deleted from the CORBA service. The following causes are possible:

- The object may have been deleted with the *OD\_or\_adm* command.  
For details about the *OD\_or\_adm* command, refer to the Reference Manual (Command Edition).
- The Naming Service has been terminated, or communication could not be established.
- The object is not registered.

#### System Action

Command failed.

#### User Action

Check that the object delete method is correct, or if the Naming Service has stopped. Check the cause, but do not stop the Naming Service if it is running.

## 19.1.51 ots9051

---

### OTS: ERROR: ots9051:An abnormality occurred in the command for compile or link. (%d)

#### Variable Information

%d = Maintenance code

#### Explanation

Either the compile or link commands failed to execute, or an error was detected in them.

#### System Action

Command failed.

#### User Action

If an error occurred in the compile or link commands, carry out the actions described by their respective error messages, then reexecute the command.

**Windows32/64**

If either of the following messages is generated:

```
otsenvxamkpgm.obj: error LNK2001: external symbol "_imp_switch name" is incomplete.  
XA linkage program name: fatal error LNK1120: External reference 1 is incomplete.
```

ensure that the switch name is correct, then reexecute the command.

If the error message is a current message, check the compile or link command environment settings. If a setting is incorrect, set the environment properly, then reexecute this command.

If this message is output after the environment is set up correctly, use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer.

## 19.1.52 ots9052

---

---

**OTS:ERROR: ots9052:The user does not belong to Administrators.****Explanation**

A user, other than an administrator in the local group, attempted to execute the command.

**System Action**

Terminates command processing.

**User Action**

Reexecute the command as an administrator in the local group.

---

**19.1.53 ots9053**

---

**OTS:ERROR: ots9053: Specified system logfile device does not exist. : CODE=%d.****Variable Information**

%d = Maintenance code

**Explanation**

The path name of the specified system log file name is incorrect, or there is no system log file.

**System Action**

Terminates command processing.

**User Action**

Specify a correct system logfile name.

If the sysconfig file exists, and this message is output when deleting by the *otsmklog* command, there is a possibility that the system log file was deleted from the OS. Unless the system log file is restored, deletion by the *otsmklog* command cannot be executed, so delete the sysconfig file from the OS.

If this message is output from the *isinit* command or the *otsmklog* command, there is a possibility that the system log file already exists. Either delete the system log file or designate another file name and execute the command again.

---

**19.1.54 ots9054**

---

**OTS: ERROR: ots9054: The value of the key word(%s) was not specified.****Variable Information**

%s = Name of key word

**Explanation**

A necessary definition value has not been specified.

**System Action**

Stops the processing.

**User Action**

Review the contents of the definition and reexecute the file.

---

**19.1.55 ots9055**

---

**OTS: ERROR: ots9055: The value of the key word was beyond the limits.KEY=%s1 VALUE=%s2****Variable Information**

%s1 = Name of key word

%s2 = Value

#### Explanation

The specified value is outside the valid range.

#### System Action

Stops the processing.

#### User Action

Review the contents of the definition and reexecute the file.

### 19.1.56 ots9056

---

**OTS: ERROR: ots9056: The value of the key word(%s) was too long.**

#### Variable Information

%s = Name of key word

#### Explanation

Characters have exceeded the maximum length.

#### System Action

Stops the processing.

#### User Action

Review the contents of the definition and reexecute the file.

### 19.1.57 ots9057

---

**OTS: ERROR: ots9057: The value of the key word was invalid. KEY=%s1 VALUE=%s2**

#### Variable Information

%s1 = Name of key word

%s2 = Value

#### Explanation

Characters have exceeded the maximum length or the designated definition name cannot be used.

#### System Action

Stops the processing.

#### User Action

If this message is generated at the OTS system setup, refer to the "Database Linkage Service Environment Definition" appendix in the Tuning Guide.

### 19.1.58 ots9058

---

**OTS: ERROR: ots9058: The key word(%s) was specified more than once.**

#### Variable Information

%s = Name of key word

#### Explanation

The same keyword is designated more than once.

### System Action

Stops the processing.

### User Action

Review the contents of the definition and reexecute the file.

## 19.1.59 ots9059

---

**OTS: ERROR: ots9059: Failed to write the sysconfig file. : CODE=%d**

### Variable Information

%d = Maintenance code

### Explanation

Failed in writing the file.

### System Action

Stops the processing.

### User Action

The following causes can be considered. Review the system environment and restart the system.

- There is no free space in the disk.
- Shortage of system resource has occurred.

## 19.1.60 ots9060

---

**OTS: ERROR: ots9060: Failed to write the Resource definition file. : CODE=%d**

### Variable Information

%d = Maintenance code

### Explanation

Failed in writing the file.

### System Action

Stops the processing.

### User Action

The following causes can be considered. Review the system environment and restart the system.

- There is no free space in the disk.
- Shortage of system resource has occurred.

## 19.1.61 ots9061

---

**OTS:ERROR: ots9061: System logfile already exists. : DETAIL=%d**

### Variable Information

%d = Maintenance code

### Explanation

The system log file already exists.

## User Action

### Windows32/64

The sysconfig file in C:\Interstage\ots\etc may have been deleted without using the *otssetup* command, or the package may have been uninstalled and reinstalled without deleting the Database Linkage Service environment. Therefore, delete the system log file, then recreate it with the *otssetup* command, or execute the *otssetup* command in overwrite mode.

### Solaris32/64

The sysconfig file in /opt/FSUNots/etc may have been deleted without using the *otssetup* command or the package may have been uninstalled and reinstalled without deleting the Database Linkage Service environment. Therefore, specify the -o option in the *otssetup* command, then reconstruct the OTS system, or execute the *otssetup* command in overwrite mode.

### Linux32/64

The sysconfig file in /opt/FJSVots/etc may have been deleted without using the *otssetup* command or the package may have been uninstalled and reinstalled without deleting the Database Linkage Service environment. Therefore, specify the -o option in the *otssetup* command, then reconstruct the OTS system, or execute the *otssetup* command in overwrite mode.

## 19.1.62 ots9062

---

**OTS: ERROR: ots9062:Sysconfig file does not exist. : DETAIL=%d**

### Variable Information

%d = Maintenance code

### Explanation

The sysconfig file does not exist.

### System Action

Stops the command processing.

### User Action

Determine whether there is a sysconfig file under the data base linkage service install folder\etc. If the sysconfig file exists, an internal conflict may have occurred; use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer. The sysconfig file is created by using the *otssetup* command.

## 19.1.63 ots9063

---

**OTS: ERROR: ots9063:I/O error occurred. : DETAIL=%d**

### Variable Information

%d = Maintenance code

### Explanation

An I/O error occurred while accessing the disk.

### System Action

Stops the command processing.

### User Action

The disk device may be defective; use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer.

## 19.1.64 ots9064

---

---

**OTS: ERROR: ots9064:Permission denied to read sysconfig file. : DETAIL=%d****Variable Information**

%d = Maintenance code

**Explanation**

The user does not have read access permission to the sysconfig file.

**System Action**

Stops the command processing.

**User Action**

Reexecute the command as a System Administrator. In addition, sysconfig file is created by *otssetup* command.

---

**19.1.65 ots9065**

---

**OTS: ERROR: ots9065:Invalid description in sysconfig file. : DETAIL=%d****Variable Information**

%d = Maintenance code

**Explanation**

A [Meaning] error occurred in the sysconfig file.

**System Action**

Stops the command processing.

**User Action**

An internal conflict may have occurred; use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer.

In addition, sysconfig file is created by *otssetup* command.

---

**19.1.66 ots9066**

---

**OTS: ERROR: ots9066:Failed to read sysconfig file. : DETAIL=%d****Variable Information**

%d = Maintenance code

**Explanation**

Unable to read the sysconfig file.

**System Action**

Stops the command processing.

**User Action**

Reexecute the command as a System Administrator. In addition, sysconfig file is created by *otssetup* command.

---

**19.1.67 ots9067**

---

**OTS: ERROR: ots9067:Enough memory is not available. : CODE=%d****Variable Information**

%d = Maintenance code

## Explanation

Insufficient memory.

## System Action

Stops the command processing.

## User Action

Execute the process again later. If this message is generated frequently, refer to the Tuning Guide, reestimate the memory that is needed to run Interstage, and confirm that there is enough memory.

If there is enough memory (relative to the amount of memory needed to run Interstage), it may be that there is inadequate memory to run other applications. Reestimate the amount of memory needed for the other applications running on the same machine as well to determine if there is an appropriate amount of memory.

Contact your system administrator if the reestimation indicates that the memory is insufficient. Ask the system administrator to either increase the size of the main memory or to increase the size of the page file.

## 19.1.68 ots9068

---

**OTS: ERROR: ots9068:System logfile is already opened. : DETAIL=%d**

### Variable Information

%d = Maintenance code

### Explanation

The system log file is already open.

### System Action

Stops the command processing.

### User Action

Terminate the OTS system, then reexecute the command.

## 19.1.69 ots9069

---

**OTS: ERROR: ots9069:Permission denied to access system logfile. : DETAIL=%d**

### Variable Information

%d = Maintenance code

### Explanation

Execute the command again after reviewing the system log file for the following causes.

There is no access permission for the system log file, or the system log file name is incorrect.

### System Action

Stops the command processing.

### User Action

Reexecute the command as a System Administrator, or, specify the correct system log file name and execute a command.

## 19.1.70 ots9070

---

**OTS: ERROR: ots9070:I/O error occurred to system logfile. : DETAIL=%d**

## Variable Information

%d = Maintenance code

## Explanation

An I/O error occurred while accessing the system log file.

## System Action

Stops the command processing.

## User Action

The disk device may be defective; use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer.

## 19.1.71 ots9071

---

**OTS: ERROR: ots9071:Fatal error occurred. : DETAIL=%d**

## Variable Information

%d = Maintenance code

## Explanation

An error occurred and the process cannot continue.

The possible causes of the error are as follows:

- The system log file name contains invalid characters.
- An internal contradiction has occurred.

## System Action

Stops the command processing.

## User Action

Check the system log file name. If there is no problem, an internal conflict may have occurred; use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer.

## 19.1.72 ots9072

---

**OTS: ERROR: ots9072:Enough disk space is not available for system logfile. : DETAIL=%d**

## Variable Information

%d = Maintenance code

## Explanation

Insufficient space in the system log file.

## System Action

Stops the command processing.

## User Action

Increase the system log file size; this may result in the file partition being increased in size.

## 19.1.73 ots9073

---

**OTS: ERROR: ots9073:System logfile does not exist. : DETAIL=%d**

## Variable Information

%d = Maintenance code

## Explanation

The system log file does not exist.

## System Action

Stops the command processing.

## User Action

An internal conflict may have occurred; use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer.

## 19.1.74 ots9074

---

**OTS: ERROR: ots9074:Protocol error occurred. : DETAIL=%d**

## Variable Information

%d = Maintenance code

## Explanation

A protocol error has occurred.

## System Action

Stops the command processing.

## User Action

An internal conflict may have occurred; use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer.

## 19.1.75 ots9075

---

**OTS: ERROR: ots9075:Permission denied to access sysconfig file. : DETAIL=%d**

## Variable Information

%d = Maintenance code

## Explanation

Cannot access the sysconfig file.

## System Action

Stops the command processing.

## User Action

Reexecute the command as a System Administrator. In addition, sysconfig file is created by *otssetup* command.

## 19.1.76 ots9076

---

**OTS: ERROR: ots9076:Enough system resource is not available. : DETAIL=%d**

## Variable Information

%d = Maintenance code

## Explanation

Cannot extract the system resources.

## System Action

Stops the command processing.

## User Action

Execute the process again later. If this message is generated frequently, refer to the Tuning Guide, reestimate the memory that is needed to run Interstage, and confirm that there is enough memory.

If there is enough memory (relative to the amount of memory needed to run Interstage), it may be that there is inadequate memory to run other applications. Reestimate the amount of memory needed for the other applications running on the same machine as well to determine if there is an appropriate amount of memory.

Contact your system administrator if the reestimation indicates that the memory is insufficient. Ask the system administrator to either increase the size of the main memory or to increase the size of the page file.

## 19.1.77 ots9077

---

**OTS: ERROR: ots9077:System error occurred. : DETAIL=%d**

### Variable Information

%d = Maintenance code

### Explanation

A system error has occurred.

### System Action

Stops the command processing.

### User Action

A defect may have occurred in the system; use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer.

## 19.1.78 ots9078

---

**OTS: ERROR: ots9078:Unknown error occurred. : DETAIL=%d**

### Variable Information

%d = Maintenance code

### Explanation

An unknown error has occurred.

### System Action

Stops the command processing.

### User Action

An internal conflict may have occurred; use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer.

## 19.1.79 ots9079

---

**OTS: ERROR: ots9079:Failed to display information. : CODE=%d**

## Variable Information

%d = Maintenance code

## Explanation

Failed to display the information.

## System Action

Stops the command processing.

## User Action

Insufficient memory. Close all unwanted programs, then reexecute the command.

## 19.1.80 ots9080

---

**OTS: ERROR: ots9080:Internal error occurred. : CODE=%d**

## Variable Information

%d = Maintenance code

## Explanation

An internal contradiction has occurred.

## System Action

Stops the command processing.

## User Action

An internal conflict may have occurred; use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer.

## 19.1.81 ots9081

---

**OTS: ERROR: ots9081: The system name is too long.**

## Explanation

The designated system name is too long.

## System Action

Stops the command processing.

## User Action

A system name must be 8 characters or less.

## 19.1.82 ots9082

---

**OTS: ERROR: ots9082:Failed to delete a file. : DETAIL=%d**

## Variable Information

%d = Maintenance code

## Explanation

Insufficient disk space or resources.

## System Action

Stops the command processing.

## User Action

Correct the system environment, then reexecute the command.

### 19.1.83 ots9083

---

**OTS: ERROR: ots9083:A file is corrupted. : FileName=%s**

#### Variable Information

%s = Filename

#### Explanation

The file is corrupted.

#### System Action

Stops the command processing.

#### User Action

An internal conflict may have occurred; use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer.

### 19.1.84 ots9084

---

**OTS: WARNING: ots9084:Sysconfig file already exists. : DETAIL=%d**

#### Variable Information

%d = Maintenance code

#### Explanation

The sysconfig file already exists.

#### System Action

Stops the command processing.

#### User Action

Because the sysconfig file has registered, the processing cannot be executed. Please execute again after deleting once using the *otssetup* command when you continue processing. When the *otssetup* command is executed, the sysconfig file is made.

If the sysconfig file exists, and if this message is output when deleting using the *otssetup*, there is a possibility that the system log file was deleted from the OS. Unless the system log file is restored, deletion by the *otssetup* command cannot be executed, so delete the sysconfig file from the OS.

### 19.1.85 ots9085

---

**OTS: ERROR: ots9085:Failed to get OTS information. : DETAIL=%d1, CODE=%d2**

#### Variable Information

%d1, %d2 = Maintenance code

#### Explanation

Failed to get the OTS information.

#### System Action

Stops the command processing.

### User Action

A defect may have occurred in the system; use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer.

## 19.1.86 ots9086

---

**OTS: ERROR: ots9086:Resource management program is still running. : DETAIL=%d1, CODE=%d2**

### Variable Information

%d1, %d2 = Maintenance code

### Explanation

An attempt was made to delete the resource manager while it was operating.

### System Action

Stops the command processing.

### User Action

Terminate the resource manager with the *otsstop* command, then reexecute the command.

## 19.1.87 ots9087

---

**OTS: ERROR: ots9087:A specified Resource definition name is not registered. : DETAIL=%d1, CODE=%d2**

### Variable Information

%d1, %d2 = Maintenance code

### Explanation

An attempt was made to use an unregistered resource manager.

### System Action

Stops the command processing.

### User Action

Specify the correct file name.

## 19.1.88 ots9088

---

**OTS: ERROR:ots9088: A resource management program can not be registered more over.**

### Explanation

The number of registered resource managers has reached the maximum limit. A maximum of 32 resource managers can be registered.

### System Action

Command failed.

### User Action

Delete all unwanted resource managers with the *otssetrsc* command -d option.

## 19.1.89 ots9089

---

**OTS: ERROR:ots9089: The maximum transaction number was exceeded.**

## Explanation

The number of transactions has exceeded the maximum limit.

For Solaris: 1024

## System Action

Command failed.

## User Action

Specify a transaction within the range, then reexecute the command.

## 19.1.90 ots9090

---

**OTS: ERROR:ots9090: The maximum concurrent number specified for resource was exceeded.**

## Explanation

The number of concurrent processes has exceeded the maximum limit.

## System Action

Command failed.

## User Action

Specify a concurrent process number less than or equal to the maximum, then reexecute the command.

## 19.1.91 ots9091

---

**OTS: ERROR: ots9091: The system name is invalid. : SYSTEM=%s**

## Variable Information

%s = System name

## Explanation

The designated system name is incorrect.

## System Action

Stops the processing.

## User Action

Designate a valid system name.

## 19.1.92 ots9092

---

**OTS: ERROR: ots9092: Failed to register to InterfaceRepository.**

## Explanation

Failed in registration to the Interface Repository.

## System Action

Stops the processing.

## User Action

After confirming that the CORBA service and the Interface Repository are working correctly, reexecute the command.

## 19.1.93 ots9093

---

### **OTS: ERROR: ots9093: Failed to delete from InterfaceRepository.**

#### Explanation

Failed in deletion from the Interface Repository.

#### System Action

Stops the processing.

#### User Action

After confirming that the CORBA service and the Interface Repository are working correctly, reexecute the command.

## 19.1.94 ots9094

---

### **OTS: ERROR: ots9094: OTS working environment is already converted.**

#### Explanation

The operating environment of the OTS system is already converted and the command does not need to be executed.

The operating environment of the current version of the OTS system does not need to be converted.

#### System Action

Stops the processing.

#### User Action

It is not necessary to execute the *otssetup -c* command.

## 19.1.95 ots9095

---

### **OTS: ERROR: ots9095: Necessary to convert OTS working environment.**

#### Explanation

The operating environment of the OTS system is created by a previous version. Therefore, an OTS operating system upgrade is required.

#### System Action

Stops the processing.

#### User Action

After completing the upgrade of the operating environment of the OTS system, execute the command again. Refer to the "Database Linkage Service Environment Definition" appendix in the Tuning Guide for details.

## 19.1.96 ots9096

---

### **OTS: ERROR: ots9096: The key word (%s1) have to be specified with (%s2) simultaneously.**

#### Variable Information

%s1 = Key word name 1

%s2 = Key word name 2

#### Explanation

Keyword 1 and Keyword 2 must be specified at the same time.

#### System Action

Stops the processing.

#### User Action

Reevaluate the definitions, then reexecute the process.

### 19.1.97 ots9097

---

**OTS: WARNING: ots9097:%s already exists, Replace ? (yes/no, default=no)**

#### Variable Information

%s = Resource management program name

#### Explanation

The specified resource management program name already exists.

#### System Action

Selecting yes (YES) continues the command process.

Selecting no (NO) cancels the command process.

#### User Action

Select yes to continue, or no to cancel.

### 19.1.98 ots9098

---

**OTS: ERROR: ots9098: OTS system or resource management program is starting. (%s)**

#### Variable Information

%s = Error information

#### Explanation

Command execution failed because the OTS system or resource management program was running.

#### System Action

Stops the command processing.

#### User Action

Check the operating status of the OTS system and resource control program using the *otsalive* command. Stop both the OTS system and resource management program. Then, reexecute the command.

### 19.1.99 ots9099

---

**OTS: ERROR: ots9099: The OTS package is not installed.**

#### Explanation

An operation was executed for the transaction service when the OTS package was not installed.

#### System Action

Stops processing.

#### User Action

To use the transaction service, install the OTS package.

## 19.2 ots9100 to ots9199

---

This section describes the error messages of the following commands.

- *otsstart*: Starts the OTS system .
- *otsstarttrsc*: Start the resource management program.
- *otsstop*: Stops the OTS system.
- *otsstoprsc*: Stop the resource management program.

## 19.2.1 ots9100

---

**OTS: ERROR: ots9100:A signal was received. Failed to start resource management program.**

### Explanation

Failed in starting up the resource control program because a signal interrupt has occurred.

### System Action

Stops the command processing.

### User Action

Reexecute the *otsstarttrsc* command.

## 19.2.2 ots9101

---

**OTS: ERROR: ots9101:A signal was received. Termination of resource management program failed.**

### Explanation

Failed in stopping the resource control program because a signal interrupt has occurred.

### System Action

Stops the command processing.

### User Action

Reexecute the *otsstarttrsc* command.

## 19.2.3 ots9102

---

**OTS: INFO: ots9102:Invoking observation process.**

### Explanation

Invoking the observation process.

## 19.2.4 ots9103

---

**OTS: ERROR: ots9103:Resource management program was not invoked.**

### Explanation

The startup process is not executed.

### System Action

Stops the command processing.

### User Action

Reexecute the *otsstarttrsc* command.

## 19.2.5 ots9104

---

---

**OTS: INFO: ots9104:Starting observation process succeeded.**

Explanation

Successfully started the observation process.

## 19.2.6 ots9105

---

**OTS: INFO: ots9105:Invoking OTS system.**

Explanation

Invoking the OTS system.

## 19.2.7 ots9106

---

**OTS: ERROR: ots9106:The termination processing in the ordinary mode was not completed.(%d1-%d2)**

Variable Information

%d1 = Maintenance information 1

%d2 = Maintenance information 2

Explanation

Normal termination of the OTS system or the resource management program failed.

User Action

If there is any other message that is output at the same time, refer to that message to remove the cause of the error, then reexecute the command.

If ots9160 is output immediately before this message, a transaction has not been completed.

If not waiting for the transaction to be completed, terminate it forcibly.

If the problem is not solved even after appropriate action is taken, use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer.

## 19.2.8 ots9107

---

**OTS: INFO: ots9107:Starting OTS system succeeded.**

Explanation

Successfully started the OTS system.

## 19.2.9 ots9108

---

**OTS: INFO: ots9108:Invoking resource management program.**

Explanation

Invoking the resource management program.

## 19.2.10 ots9110

---

**OTS: INFO: ots9110:Starting resource management program succeeded.**

Explanation

Successfully started the resource management program.

## 19.2.11 ots9111

---

**OTS: INFO: ots9111:Starting resource management program succeeded. Resource definition name:%s**

### Variable Information

%s = Resource definition name

### Explanation

The resource manager was activated successfully.

## 19.2.12 ots9120

---

**OTS: INFO: ots9120:Observation process is begin stopped by exit direction.**

### Explanation

The observation process was stopped by an exit direction.

## 19.2.13 ots9121

---

**OTS: INFO: ots9121:OTS system is already running.**

### Explanation

The OTS system is already running.

## 19.2.14 ots9122

---

**OTS: INFO: ots9122:Specified process is already running. Resource definition name:%s**

### Variable Information

%s = Resource definition name

### Explanation

The specified process is already running.

When "JTSRMP" is output to a resource definition name, it means that the message was output from the resource control program for JTS.

## 19.2.15 ots9125

---

**OTS: INFO: ots9125:Transaction timeout already finished. TransactionID:%s**

### Variable Information

%s = Transaction ID

### Explanation

Timed out transaction has been terminated.

## 19.2.16 ots9127

---

**OTS: INFO: ots9127:Timer observation is skipped.**

### Explanation

Information message that timer observation is skipped.

## 19.2.17 ots9128

---

**OTS: INFO: ots9128:Timeout check of the resource management program is skipped. Resource definition name:%s**

### Variable Information

%s = Resource definition name

### Explanation

A timeout check of the resource management program is skipped.

When "JTSRMP" is output to a resource definition name, it means that the message was output from the resource control program for JTS.

## 19.2.18 ots9129

---

**OTS: INFO: ots9129:Timeout check of OTS system is skipped.**

### Explanation

A timeout check of the OTS system is skipped.

## 19.2.19 ots9130

---

**OTS: INFO: ots9130:Rollback of timeout transaction is skipped.**

### Explanation

Timeout transaction rollback is skipped.

## 19.2.20 ots9131

---

**OTS: INFO: ots9131:Rollback of timeout transaction ended normally. TransactionID:%s**

### Variable Information

%s = TransactionID

### Explanation

Timeout transaction rollback completed successfully.

## 19.2.21 ots9133

---

**OTS: INFO: ots9133:Starting to wait for OTS system to finish transactions.**

### Explanation

Transaction processing is in progress. Completion of the OTS system transaction is pending.

## 19.2.22 ots9134

---

**OTS: INFO: ots9134:Exit mode is shifted from normal to force.**

### Explanation

Even if the ordinary mode is specified for the end mode of *otsstop* or the *otsstoprsc* command after this message is displayed, becomes a compulsion mode. This message is displayed as follows.

- When the memory breakdown occurs while stopping the OTS system or the resource control program by the ordinary mode.
- When the transaction completion waiting from the resource exceeds the value of parameter RSCSTOP\_CHECK\_COUNT in the OTS system environment definition file while stopping the resource control program by the ordinary mode.

## 19.2.23 ots9135

---

**OTS: INFO: ots9135:Starting to wait for resource management program to finish transactions.**

### Explanation

Two-phase transaction of the resource manager is in progress. Completion of the two- phase transaction is pending.

## 19.2.24 ots9136

---

**OTS: INFO: ots9136:Canceling to wait for OTS system to finish transactions.**

### Explanation

The OTS system waiting state to finish transactions has been cancelled.

## 19.2.25 ots9137

---

**OTS: INFO: ots9137:Canceling to wait for resource management program to finish transactions.**

### Explanation

Waiting state of the resource management program completing transactions has been cancelled.

## 19.2.26 ots9138

---

**OTS: INFO: ots9138:The received signal is ignored. SignalNo:%d**

### Variable Information

%d = Signal no.

### Explanation

Information message indicating that the signal number received by the observation process has been ignored.

## 19.2.27 ots9139

---

**OTS: INFO: ots9139:Config information(%s1) was set to %s2.**

### Variable Information

%s1 = Parameter name in operating environment file

%s2 = Value

### Explanation

Information message shows the configuration parameter value when starting the OTS system.

## 19.2.28 ots9140

---

**OTS: INFO: ots9140:Rollback of timeout transaction is started. TransactionID:%s**

### Variable Information

%s = TransactionID

### Explanation

Timeout transactions rollback has started.

## 19.2.29 ots9141

---

---

**OTS: INFO: ots9141:OTS system is begin stopping.**

Explanation

Exiting the OTS system process.

---

### 19.2.30 ots9143

---

**OTS: INFO: ots9143:Termination of OTS system succeeded.**

Explanation

Successfully terminated the OTS system.

---

### 19.2.31 ots9144

---

**OTS: INFO: ots9144:Resource management program is begin stopping.**

Explanation

Terminating the resource management program.

---

### 19.2.32 ots9146

---

**OTS: INFO: ots9146:Termination of resource management program succeeded.**

Explanation

Successfully terminated the resource management program.

---

### 19.2.33 ots9147

---

**OTS: INFO: ots9147:Termination of resource management program succeeded. Resource definition name: %s**

Variable Information

%s = Resource definition name

Explanation

The resource management program has completed.

---

### 19.2.34 ots9159

---

**OTS: ERROR: ots9159:There is not a sysconfig file or a system log file. : DETAIL=%d**

Variable Information

%d = Maintenance code

Explanation

Sysconfig file or a system log file does not exist.

System Action

Stops the command processing.

User Action

Check whether <Interstage install folder>/ots/etc subordinate have the sysconfig file.

Check also whether there is any system log file created by the *otssetup* command.

The sysconfig file is created by using the *otssetup* command.

- When neither file exists, create a system log file with the *otssetup* command.
- When there is only no sysconfig file, the sysconfig file may have been deleted without using *otssetup* command. In this case, create a system log file with the *otssetup* command after deleting the system log file.
- When there is only no system log file, the system log file may have been deleted without using *otssetup* command. In such cases, specify the -o option in the *otssetup* command, and reconstruct the OTS system.
- If both exist, the environment of the naming service may have been changed with the OTS system being in an already set up environment. If so, manually delete the system log file from the "LOGFILE" line of the sysconfig file. Then, execute the *otssetup* command by adding the -o and -f options and specifying the path of the sysconfig file for an argument to reconfigure the OTS system.
- When a sysconfig file and a system log file both exist, you should consider the following causes, improve the system environment and restart the command.
  - Disk space not available.
  - Insufficient system resources.

If the same message is output after the above action is taken and a restart is performed, use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer.

## 19.2.35 ots9160

---

**OTS: WARNING: ots9160:Some transactions was not completed until the resource management program was terminated.**

### Explanation

When the resource management program is terminated by *otsstoprsc* command with normal mode in conjunction with a global transaction, the system waits for the transaction to complete within the time calculated below.

This message is output when the transaction is not completed within the time:

$RSCSTOP\_CHECK\_COUNT * OBSERVE\_CYCLE\_TIME$  (second)

### System Action

Continues the command processing.

## 19.2.36 ots9161

---

**OTS: ERROR: ots9161:Option or parameter is missing.**

### Explanation

An option or parameter is missing.

### System Action

Stops the command processing.

### User Action

Specify the correct option or parameter.

## 19.2.37 ots9162

---

**OTS: ERROR: ots9162:Invalid option(unknown).**

### Explanation

An invalid option has been specified.

#### System Action

Stops the command processing.

#### User Action

Specify a valid option.

### 19.2.38 ots9163

---

**OTS: ERROR: ots9163: Multiply specified option or parameter format error.**

#### Variable Information

%s = Option name

#### Explanation

Duplicate option error, or invalid parameter type.

#### System Action

Stops the command processing.

#### User Action

Specify a correct option or parameter.

### 19.2.39 ots9164

---

**OTS: ERROR: ots9164:Resource invocation format or parameter format error.**

#### Explanation

Invalid resource start parameter, or parameter type.

#### System Action

Stops the command processing.

#### User Action

Specify a valid resource start parameter or parameter type.

### 19.2.40 ots9165

---

**OTS: ERROR: ots9165:Parameter format is invalid(unknown).**

#### Explanation

Invalid parameter type.

#### System Action

Stops the command processing.

#### User Action

Specify a valid option or parameter type.

### 19.2.41 ots9166

---

**OTS: ERROR: ots9166:Resource management program was not invoked. Resource definition name:%s**

#### Variable Information

%s = Resource definition name

## Explanation

Could not invoke the start process.

## System Action

Stops the command processing.

## User Action

Refer to the previous message displayed on an event log or a command input screen.

## 19.2.42 ots9167

---

### **OTS: ERROR: ots9167:Some resource management program didn't start properly.**

## Explanation

A resource management program did not start properly.

## System Action

Stops the command processing.

## User Action

 Windows32/64

Refer to the previous message displayed on an event log or a command input screen.

If the failure was in starting up the resource control program of JTS, there is a possibility that the class path setup is not executed. Set the class path by referring to the "Database Linkage Service Environment Definition" appendix in the Tuning Guide.

If the message ots9912 is recorded in the event log, take any corrective action indicated by the message. Alternately, reduce the resource control program concurrency, then reexecute the process.

## 19.2.43 ots9168

---

### **OTS: ERROR: ots9168:Starting OTS system failed. ErrorPoint:%x / ResultCode:%d**

## Variable Information

%x, %d = Maintenance code

## Explanation

Either insufficient memory, or insufficient process or message resources.

## System Action

Stops the command processing.

## User Action

Correct the system environment, then reexecute the command. If this fails, use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer.

## 19.2.44 ots9169

---

### **OTS: ERROR: ots9169:Failed to invoke OTS system.**

## Explanation

Unable to start the OTS system.

#### System Action

Stops the command processing.

#### User Action

Refer to the previous message displayed on an event log or a command input screen.

### 19.2.45 ots9170

---

**OTS: ERROR: ots9170:A signal was received. Failed to invoke OTS system.**

#### Explanation

The signal interrupt resulted in the OTS system startup being stopped.

#### System Action

Stops the command processing.

#### User Action

Reexecute the *otsstart* command.

### 19.2.46 ots9171

---

**OTS: ERROR: ots9171:A signal was received. Failed to start resource management program. Resource definition name:%s**

#### Variable Information

%s = Resource definition name

#### Explanation

The signal interrupt resulted in the resource manager startup being stopped.

#### System Action

Stops the command processing.

#### User Action

Reexecute the *otsstarttrsc* command.

### 19.2.47 ots9172

---

**OTS: ERROR: ots9172:Received a terminate notice of observation process.**

#### Explanation

A termination notification was received by the observation process from the system.

#### System Action

Stops the command processing.

#### User Action

Restart the OTS system.

### 19.2.48 ots9173

---

**OTS: ERROR: ots9173:Wrong path to the resource management program is specified, or this is not executable file. Path Name:%s**

## Variable Information

%s = Path name

## Explanation

The possible causes of this error are as follows:

- The pathname of the resource control program is invalid.
- The file specified as the resource control program name is not an executable file.
- The pathname length exceeds the maximum limit.

## System Action

Stops the command processing.

## User Action

Specify the correct path of resource management program.

To use the -c option of the *otslinkrsc* command, in the -o option specify only the resource management program name.

## 19.2.49 ots9174

---

**OTS: ERROR: ots9174:A signal was received. OTS system stop failed.**

## Explanation

The signal interrupt resulted in canceling the stop for the OTS system.

## System Action

Stops the command processing.

## User Action

Reexecute the *otsstop* command.

## 19.2.50 ots9175

---

**OTS: ERROR: ots9175:A signal was received. Termination of resource management program failed.  
Resource definition name:%s**

## Variable Information

%s = Resource definition name

## Explanation

Since the signal was interrupted, resource management program termination failed.

## System Action

Stops the command processing.

## User Action

Reexecute the *otsstoprsc* command.

## 19.2.51 ots9176

---

**OTS: ERROR: ots9176:Initialization failed. ErrorPoint:%s1 / ResultCode:%s2**

## Variable Information

%s1, %s2 = Maintenance code

## Explanation

Initialization failed.

## System Action

Stops the command processing.

## User Action

Take the action for the CORBA service exception information as indicated by %s2, then reexecute the command.

## 19.2.52 ots9177

**OTS: ERROR: ots9177:Initialization failed. ErrorPoint:%x / ResultCode:%d**

## Variable Information

%x, %d = Maintenance code

## Explanation

The following causes are possible:

- The area allocated to the system (to create the system log file) is insufficient.
- Insufficient memory
- Insufficient process resources
- Insufficient message resources
- Insufficient disk space

## System Action

Stops the command processing.

## User Action

**Windows32/64**

Correct the system environment, then reexecute the command. If this fails, use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer.

**Solaris32/64 Linux32/64**

Correct the system environment, then reexecute the command.

If the Error Point indicates 0, take corrective action by following the instructions in the following table.

Table 19.2 ots9177 Error Details

Result code (%d)	Countermeasures
28	There is insufficient disk space. <b>Solaris32/64</b> Increase the size of /opt/FSUNots/var. <b>Linux32/64</b> Increase the size of /opt/FJSVots/var.
23,24	There are not enough file descriptors available to be opened in the OTS system process. Increase the maximum available for a process.
12	Execute the process again later. If this message is generated frequently, refer to the Tuning Guide, reestimate the memory that is needed to run Interstage, and confirm that there is enough memory.

Result code (%d)	Countermeasures
Others	Database Linkage Service may be installed incorrectly. If the Database Linkage Service installation directory "/var" does not exist, it may have been deleted. Reinstall the Database Linkage Service.

If this message is output after the above action is taken, use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer.

## 19.2.53 ots9178

---

**OTS: ERROR: ots9178:Environment variable(%s) is not set.**

### Variable Information

%s = Environment variable name

### Explanation

The environment variables are not declared.

### System Action

Stops the command processing.

### User Action

Declare the environment variables.

## 19.2.54 ots9179

---

**OTS: ERROR: ots9179:Failed to receive a message. ErrorPoint:%x / ResultCode:%d**

### Variable Information

%x, %d = Maintenance code

### Explanation

Failed to receive the message.

### System Action

Stops the command processing.

### User Action

An internal conflict may have occurred; use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer.

## 19.2.55 ots9180

---

**OTS: ERROR: ots9180:Failed to get a signal information. ResultCode:%d**

### Variable Information

%d = Maintenance code

### Explanation

There was an error in getting the signal information.

### System Action

Stops the command processing.

## User Action

An internal conflict may have occurred; use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer.

## 19.2.56 ots9181

---

**OTS: ERROR: ots9181:Internal error(%s) occurred. ErrorPoint:%x**

### Variable Information

%s, %x = Maintenance code

### Explanation

An internal error has occurred.

### System Action

Stops the command processing.

### User Action

An internal conflict may have occurred; use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer.

## 19.2.57 ots9182

---

**OTS: ERROR: ots9182:Specified process is not running. ErrorPoint:%x**

### Variable Information

%x = Maintenance code

### Explanation

The process the user is attempting to terminate has not started yet.

### System Action

Stops the command processing.

### User Action

If the resource definition name is invalid, specify the correct resource definition name.

## 19.2.58 ots9183

---

**OTS: ERROR: ots9183:Failed to send exit direction. ErrorPoint:%x / ResultCode:%s**

### Variable Information

%x, %s = Maintenance code

### Explanation

Failed to send an exit directive due to insufficient memory or resources.

### System Action

Stops the command processing.

### User Action

Close all unwanted programs, then reexecute the command. If this fails after unnecessary programs are terminated and a restart is performed, use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer.

## 19.2.59 ots9184

---

**OTS: ERROR: ots9184:Enough memory is not available. Management cannot continue. ErrorPoint:%x**

### Variable Information

%x = Maintenance code

### Explanation

Insufficient memory. The process cannot continue.

### System Action

Stops the command processing.

### User Action

Execute the process again later. If this message is generated frequently, refer to the Tuning Guide, reestimate the memory that is needed to run Interstage, and confirm that there is enough memory.

If there is enough memory (relative to the amount of memory needed to run Interstage), it may be that there is inadequate memory to run other applications. Reestimate the amount of memory needed for the other applications running on the same machine as well to determine if there is an appropriate amount of memory.

Contact your system administrator if the reestimation indicates that the memory is insufficient. Ask the system administrator to either increase the size of the main memory or to increase the size of the page file.

## 19.2.60 ots9186

---

**OTS: ERROR: ots9186:Failed to get multiple process level. ErrorPoint:%x / ResultCode:%s1 / Resource definition name:%s2**

### Variable Information

%x, %s1 = Maintenance code

%s2 = Resource definition name

### Explanation

Failed to get the multiple process level.

### System Action

Stops the command processing.

### User Action

The resource manager program may have been registered without using the *otssetrsc* command. Execute the *otssetrsc* command, then reregister the resource manager program.

## 19.2.61 ots9187

---

**OTS: ERROR: ots9187:Invoking failed. ErrorPoint:%x,%d1 / ResultCode:%d2**

### Variable Information

%x,%d1,%d2 = Maintenance code

### Explanation

The following reasons are possible:

- The resource definition file is specified incorrectly.
- The resource definition name does not exist.

- The resource manager does not exist.
- Insufficient process resources.
- Insufficient memory.

**Windows32/64**

- Shortage of a class path.

**Solaris32/64 Linux32/64**

- The method used to create the resource management program was invalid.

### System Action

Stops the command processing.

### User Action

Take the following action.

- Confirm that the resource definition file is specified correctly.
- Check if there is any error in the resource control program name or resource definition name specified at the starting time. If there is no problem in either name, the problem could be that resources are insufficient.
- In the resource manager does not exist, specify a valid resource manager, then reexecute the command.
- For insufficient resources, correct the value of the `max_exec_instance` parameter in the ORB environment definition. Check the multiple levels for the OTS system and the resource manager. Check that the process resources are sufficient.
- For insufficient memory, close all unwanted programs, then reexecute the command.

**Windows32/64**

- When using JTS, check whether the specified JDK/JRE PATH used in the resource control program is valid.

## 19.2.62 ots9188

---

**OTS:ERROR: ots9188: %s is not set. Please set system logfile of OTS.**

### Variable Information

%s = File name

### Explanation

The system log file is not set. Please set system logfile of OTS.

### System Action

Stops the command processing.

### User Action

The system log file of OTS may not be set up by `otssetup` command. Set the OTS system log file with the `otssetup` command, then reexecute the command.

## 19.2.63 ots9189

---

**OTS: ERROR: ots9189:A specified Resource definition name is not registered. : NAME=%s**

### Variable Information

%s = Resource definition name

## Explanation

The resource control program about to be operated is unregistered.

## System Action

Stops the command processing.

## User Action

Specify the correct resource definition name.

## 19.2.64 ots9191

---

**OTS: ERROR: ots9191:Failed to send a message. ErrorPoint:%x / ResultCode:%d**

### Variable Information

%x, %d = Maintenance code

### Explanation

Failed to send a message.

### System Action

Stops the command processing.

### User Action

An internal conflict or system error may have occurred; use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer.

## 19.2.65 ots9192

---

**OTS: ERROR: ots9192:Enough system resource is not available. ErrorPoint:%x**

### Variable Information

%x = Maintenance code

### Explanation

Insufficient System resources.

### System Action

Stops the command processing.

### User Action

Execute the process again later. If this message is generated frequently, refer to the Tuning Guide, reestimate the memory that is needed to run Interstage, and confirm that there is enough memory.

If there is enough memory (relative to the amount of memory needed to run Interstage), it may be that there is inadequate memory to run other applications. Reestimate the amount of memory needed for the other applications running on the same machine as well to determine if there is an appropriate amount of memory.

Contact your system administrator if the reestimation indicates that the memory is insufficient. Ask the system administrator to either increase the size of the main memory or to increase the size of the page file.

If there is no problem with the memory capacity, the mapping address of the shared memory overlaps with that of another product. In this case, change the value specified in *shmaddr* in the *\etc\ots.ini* file under the Database Linkage Service installation folder, then rerun the command.

## 19.2.66 ots9193

---

---

**OTS: ERROR: ots9193:Failed to open the environmental file. ResultCode:%d / Environment File Name: %s**

**Variable Information**

%d = Maintenance code

%s = File name

**Explanation**

Unable to open the environmental file (config, sysconfig).

**System Action**

Stops the command processing.

**User Action**

If the application environment file (config) does not exist in the OTS install folder\etc, it may have been deleted. If the file has been backed up, restore it. If the file has not been backed up, reinstall it.

If the sysconfig file does not exist in the OTS install folder\etc, the *otssetup* command may not have been executed. In this situation, execute the *otssetup* command. The sysconfig file is created by executing the *otssetup* command.

---

## 19.2.67 ots9194

---

**OTS: ERROR: ots9194 : Trace buffer could not be gotten. ResultCode:%d**

**Variable Information**

%d = Result code

**Explanation**

The area for storing the trace information output by the *otsgetdump* command could not be acquired. A memory shortage occurs.

**System Action**

Stops the command processing.

**User Action**

Close all unwanted programs, then reexecute the command.

---

## 19.2.68 ots9195

---

**OTS: ERROR: ots9195:Loading program failed. ProgramPath:%s / ResultCode:%d**

**Variable Information**

%s = Path name

%d = Maintenance code

**Explanation**

Failed to load the program.

**System Action**

Stops the command processing.

**User Action**

The specified program is not an executable program.

## 19.2.69 ots9196

---

**OTS: ERROR: ots9196: ObjectDirector is unavailable now.**

### Explanation

Unable to use the CORBA service.

The CORBA service is not installed or has not been started. Alternatively, the operating environment has not been tuned.

### System Action

Stops the command processing.

### User Action

Check if the CORBA service has been installed.

If the CORBA service has not been installed, install the CORBA service then start it.

If the CORBA service has been installed, check the operating environment then restart the CORBA service.

## 19.2.70 ots9197

---

**OTS: ERROR: ots9197: Failed to open resource definition file. ResultCode:%d / Resource definition name:%s**

### Variable Information

%d = Maintenance code

%s = Resource definition name

### Explanation

Failed to open the resource definition file. The following are the possible causes of this error.

- The specified resource definition file does not exist.
- The specified resource definition file is already open.
- The file format of the specified resource definition file is invalid.

### System Action

Stops the command processing.

### User Action

Determine whether the specified resource definition file exists, whether it is already open, or whether the file format is valid. If the resource definition file for the resource management program that has been registered does not exist, the resource management program need not be registered again after the resource definition file has been created.

## 19.2.71 ots9198

---

**OTS: ERROR: ots9198: Improper Java Execution environment.**

### Explanation

Processing failed because there is an error in the Java execution environment.

### System Action

Stops the command processing.

### User Action

The specified process is currently not executing, so termination is not required.

Check the following items:

- Check if there is any error in the environment (such as environment variable and others) or not.
- Check if the version of JDK/JRE in use is correct or not.
- Check if shortage of memory is occurring or not.
- Check if contents that are described in the config file have no error or not.
- Check that the JDK/JRE is correctly installed.

Remove the cause of the error and then reexecute the process.

#### Note

If the J2EE compatibility feature, or JDK/JRE which supports the J2EE compatibility feature, has not been installed, JTS resource management programs cannot be used. If Interstage Management Console's [Use JTS RMP] is set to "Yes", change it to "No". Note that, if [Transaction Service (OTS)] is set to "Yes", [Use JTS RMP] will also be set to "Yes" by default.

## 19.2.72 ots9199

---

### OTS: ERROR: ots9199: Environment of OTS system cannot be changed in this operation.

#### Explanation

The operating environment of the OTS system cannot be changed with this operation because the operating environment of the OTS system has been created with a method other than this operation.

#### System Action

Processing stops.

#### User Action

If the operating environment of the OTS system created using an integrated command is to be changed on the Interstage Management Console, first execute the integrated command by adding the "type1 [EJB]" option. Then, restart the Interstage Management Console and set Transaction Service to [Use].

If the operating environment of the OTS system created using the *otssetup* command is to be changed on the Interstage Management Console, first delete the operating environment using the *otssetup* command. Then, restart the Interstage Management Console and set Transaction Service to [Use].

## 19.3 ots9200 to ots9299

---

This section details the messages with message numbers between ots9200 and ots9299.

### 19.3.1 ots9206

---

#### OTS: ERROR: ots9206:Specified process is not running.

#### Explanation

The specified process has not started.

#### System Action

Stops the command processing.

#### User Action

The specified process is currently not executing, so termination is not required.

### 19.3.2 ots9208

---

---

**OTS: ERROR: ots9208:Stopping resource management program failed. ErrorPoint:%x / ResultCode:%d**

Variable Information

%x, %d = Maintenance code

Explanation

Unable to stop the resource management program.

System Action

Stops the command processing.

User Action

An internal conflict or system error may have occurred; use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer.

---

### 19.3.3 ots9209

---

**OTS: ERROR: ots9209:Terminating was not execute. Resource definition name:%s**

Variable Information

%s = Resource definition name

Explanation

Unable to execute the exit process.

System Action

Stops the command processing.

User Action

Follow the previous event log or the message displayed on the command input screen from this message.

---

### 19.3.4 ots9210

---

**OTS: ERROR: ots9210:Termination of OTS system failed.**

Explanation

Unable to exit the OTS system.

System Action

Stops the command processing.

User Action

Refer to the previous message displayed on an event log or a command input screen.

---

### 19.3.5 ots9211

---

**OTS: ERROR: ots9211:Termination of resource management program failed.**

Explanation

Failed to exit the resource management program.

System Action

Stops the command processing.

#### User Action

Refer to the previous message displayed on an event log or a command input screen.

### 19.3.6 ots9212

---

#### **OTS: ERROR: ots9212:Failed to start observation process.**

#### Explanation

Failed to start the monitor process.

#### System Action

Stops the command processing.

#### User Action

Refer to the previous message displayed on an event log or a command input screen.

### 19.3.7 ots9213

---

#### **OTS:ERROR: ots9213: The user does not belong to Administrators.**

#### Explanation

A user, other than an administrator in the local group, attempted to execute the command.

#### System Action

Terminates command processing.

#### User Action

Reexecute the command as an administrator in the local group.

### 19.3.8 ots9214

---

#### **OTS:ERROR: ots9214: It is the condition that command cannot be executed.**

#### Explanation

There is a memory shortage, or the command cannot be executed because the OTS system is stopping or starting.

#### System Action

Terminates command processing.

#### User Action

Confirm the OTS system status and reexecute the command.

If this message appears again, there is a memory shortage. Refer to the Tuning Guide, reestimate the memory that is needed to run Interstage, and check whether there is enough memory.

If there is enough memory to run Interstage, it may be that there is inadequate memory to run other applications. Reestimate the amount of memory required for the other applications running on the same machine to determine if there is an appropriate amount of memory.

Contact your system administrator if the reestimation indicates that the memory is insufficient. Ask the system administrator to either increase the size of the main memory or to increase the size of the page file.

### 19.3.9 ots9220

---

#### **OTS: ERROR: ots9220:This operation cannot be executed from the managed server**

#### Explanation

This operation cannot be executed from the Managed Server.

#### System Action

Terminates the command processing.

#### User Action

Log in to the Administrative Server on the Interstage Management Console, and execute the same operation from that server.

### 19.3.10 ots9221

---

**OTS: ERROR: ots9221: The server cannot be added to the server group because the transaction service (OTS) has been setup in SYS mode.**

#### Explanation

The server could not be added to the server group because the transaction service (OTS) was set up in SYS mode.

#### System Action

Terminates the processing.

#### User Action

Review the server configuration being added to the server group.

The server can be added to the server group when the transaction service is set up in RMP mode.

### 19.3.11 ots9222

---

**OTS: WARNING: ots9222: The previous processing was interrupted. (%s)**

#### Variable Information

%s = Error information

#### Explanation

The defined update processing has not been completed.

#### System Action

Displays the status in the environment setup error on the Interstage Management Console.

#### User Action

Continue the previous processing.

### 19.3.12 ots9223

---

**OTS: ERROR: ots9223: The specified resource definition has already been registered. (NAME=%s)**

#### Variable Information

%s = Resource definition name

#### Explanation

The specified resource definition has already been registered.

#### System Action

Terminates the processing.

## User Action

Delete the resource definition already registered, or register it under a different resource definition name.

### 19.3.13 ots9224

---

**OTS: ERROR: ots9224: The specified resource definition has not been registered. (NAME=%s)**

#### Variable Information

%s = Resource definition name

#### Explanation

The resource definition information with the specified resource name has not been registered.

#### System Action

Terminates the processing.

#### User Action

Specify the resource definition name already registered.

### 19.3.14 ots9225

---

**OTS: ERROR: ots9225: Transaction Service (JTSRMP) cannot be started. Exception=%s**

#### Variable Information

%s: Exception information

#### Explanation

The transaction service (JTSRMP) could not be started for the following reason.

"No" was set for [Use JTS RMP] in "Transaction Service Detailed Settings", so the transaction service (JTSRMP) could not be started.

#### System Action

Stops processing.

#### User Action

If %s is as follows, take action according to the action method.

Exception information(%s)	Action Method
NOT USE	To use the transaction service (JTSRMP), set "Yes" to be used in [Use JTS RMP].
If %s is another value	Use the <i>iscollectinfo</i> command to collect investigation information. Send the error information to a Systems Engineer.

### 19.3.15 ots9241

---

**OTS: WARNING: ots9241:Configfile(Path:%s) is in invalid format(Line:%d). This line is ignored.**

#### Variable Information

%s = File name

%d = line number

#### Explanation

Since the operating environment file format (Path:config\_name) is invalid (Line:line\_num), this line is ignored.

### System Action

Continues processing the command.

### User Action

Correct the operating environment file format.

## 19.3.16 ots9242

---

**OTS: WARNING: ots9242:Error occurred in accessing shared memory. ErrorPoint:%x**

### Variable Information

%x = Maintenance code

### Explanation

Shared memory is corrupted.

### System Action

Continues the command processing.

### User Action

If the operation continues with corrupted shared memory, the OTS system will operate with the following functions disabled.

- Timer observation function.
- Normal stop function (operations are forcibly stopped even if normal stop is specified).
- The ability to start new resource programs.

Please reactivate the OTS system after executing the *otsstop* command once when you use the above-mentioned functions.

## 19.3.17 ots9243

---

**OTS: WARNING: ots9243:A signal was received from unknown process(PID = %d). ErrorPoint:%x**

### Variable Information

%d = Process ID

%x = Maintenance code

### Explanation

A signal was received from another system process (process ID = %d) by the OTS system.

### System Action

Continues the command processing.

### User Action

No countermeasures are required.

## 19.3.18 ots9244

---

**OTS: ERROR: ots9244:Exit direction was sent to OTS system, but the process ended abnormally. ExitCode:%d**

### Variable Information

%d = Maintenance code

### Explanation

Exit directives were sent to the OTS system, but the OTS system exited abnormally.

### System Action

Stops the command processing.

### User Action

An internal conflict or system error may have occurred; use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer.

## 19.3.19 ots9245

---

**OTS: ERROR: ots9245: Exit direction was sent to resource management program, but the resource management program ended abnormally. ExitCode:%d / Resource definition name:%s**

### Variable Information

%d = Maintenance code

%s = Resource definition name

### Explanation

Exit directives were sent to the resource management program, but the resource management program exited abnormally.

### System Action

Stops the command processing.

### User Action

An internal conflict or system error may have occurred; use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer.

## 19.3.20 ots9246

---

**OTS: ERROR: ots9246:OTS system ended abnormally. ExitCode:%d**

### Variable Information

%d = Maintenance code

### Explanation

The OTS System exited abnormally.

### System Action

Stops the command processing.

### User Action

Restart the OTS system. An internal conflict or system error may have occurred; use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer.

## 19.3.21 ots9247

---

**OTS: ERROR: ots9247: Resource management program ended abnormally. Resource definition name:%s / ExitCode:%d**

### Variable Information

%s = Resource definition name

%d = Maintenance code

#### Explanation

The resource management program exited abnormally.

#### System Action

Stops the command processing.

#### User Action

Restart the resource management program. An internal conflict or system error may have occurred; use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer.

### 19.3.22 ots9248

---

**OTS: ERROR: ots9248:OTS system(%s) ended abnormally by a signal. SignalCode:%d**

#### Variable Information

%s = Name by which OTS is registered to OD

%d = Maintenance code

#### Explanation

The OTS system terminated abnormally due to receiving the displayed (%d) signal interrupt.

#### System Action

Stops the command processing.

#### User Action

Restart the OTS system. An internal conflict or system error may have occurred; use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer.

### 19.3.23 ots9249

---

**OTS: ERROR: ots9249: Resource management program ended abnormally by a signal. Resource definition name:%s / SignalCode:%d**

#### Variable Information

%s = Resource definition name

%d = Maintenance code

#### Explanation

The resource management program terminated abnormally due to receiving a signal interrupt. A signal number is displayed on SignalCode.

When "JTSRMP" is output to a resource definition name, it means that the message was output from the resource control program for JTS.

#### System Action

Stops the command processing.

#### User Action

Restart the resource management program. An internal conflict or system error may have occurred; use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer.

## 19.3.24 ots9250

---

**OTS: ERROR: ots9250:Enough memory is not available. ErrorPoint:%x**

### Variable Information

%x = Maintenance code

### Explanation

Insufficient memory.

### System Action

Stops the command processing.

### User Action

Carry out the actions described in the subsequent message.

## 19.3.25 ots9251

---

**OTS: ERROR: ots9251:System function call error occurred. function:%s / ResultCode:%d**

### Variable Information

%s = Function name

%d = Maintenance code

### Explanation

A system function call error has occurred.

### System Action

Stops the command processing.

### User Action

Execute the process again later. If this message is generated frequently, refer to the Tuning Guide, reestimate the memory required to run Interstage, and check whether there is enough memory.

If there is enough memory to run Interstage, there may be inadequate memory to run other applications. Reestimate the amount of memory required for the other applications running on the same machine to determine if there is an appropriate amount of memory.

Contact your system administrator if the reestimation indicates that the memory is insufficient. Ask the system administrator to either increase the size of the main memory or to increase the size of the page file.

If there is enough memory, an internal conflict or system error may have occurred; use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer.

## 19.3.26 ots9252

---

**OTS: ERROR: ots9252:Transaction of the resource management program is in timeout state. Please start resource management program again. Resource definition name:%s1 / TransactionID:%s2**

### Variable Information

%s1 = Resource definition name

%s2 = TransactionID

### Explanation

A resource management program transaction is in the timeout state.

When "JTSRMP" is output to a resource definition name, it means that the message was output from the resource control program for JTS.

#### System Action

Stops the command processing.

#### User Action

Review tuning of the OTS system and resource control program by examining the following three tuning parameters:

- RESOURCE\_TRANMAX in the config file
- OTS\_FACT\_THR\_CONC in the setup information file
- OTS\_RMP\_PROC\_CONC in the resource definition file

Then, restart the corresponding resource management program.

If there are no problems with the parameters listed above, the timeout detection time (the 2PC timeout time) between phases may exceed the CORBA Service client non-communication monitoring time.

The timeout detection time between phases must be set so that it is shorter than the client non-communication monitoring time. Check the values set for "2PC\_TIME\_OUT" in the OTS system config file and "period\_client\_idle\_con\_timeout" in the CORBA Service config file. If after checking, the "2PC\_TIME\_OUT" value is changed, the OTS system must be restarted. Similarly, if the "period\_client\_idle\_con\_timeout" value is changed, the CORBA Service must be restarted

For details about the config files and parameters, refer to the Tuning Guide.

### 19.3.27 ots9253

---

**OTS: ERROR: ots9253:Failed to get an ObjectReference of OTS system. ResultCode:%s**

#### Variable Information

%s = Maintenance code

#### Explanation

Failed to get an OTS system object reference.

#### System Action

Stops the command processing.

#### User Action

If CORBA Service is not running, then start it.

### 19.3.28 ots9254

---

**OTS: ERROR: ots9254:Preparing rollback of timeout transaction failed. TransactionID:%s**

#### Variable Information

%s = TransactionID

#### Explanation

Transaction rollback preparation processing failed.

#### System Action

Stops the command processing.

#### User Action

Follow the previous message displayed on an event log.

## 19.3.29 ots9255

---

**OTS: ERROR: ots9255: Rollback of timeout transaction failed. ResultCode:%s1 / TransactionID:%s2**

### Variable Information

%s1 = Maintenance code

%s2 = TransactionID

### Explanation

An error occurred during the rollback of a timed out transaction.

### System Action

Stops the command processing.

### User Action

Correct the system environment. The following causes are possible:

- Network error
- Insufficient memory
- System resources.

#### Windows32/64

Check whether the `period_receive_timeout` value in the application environment file of CORBA service (C:\Interstage\ODWIN\etc\config) is value larger than the timeout surveillance time of the transaction.

To continue running the OTS system, stop the server program, then restart it.

#### Solaris32/64

Check whether the `period_receive_timeout` value in the application environment file of CORBA service (/opt/FSUNod/etc/config) is value larger than the timeout surveillance time of the transaction.

#### Linux32/64

Check whether the `period_receive_timeout` value in the application environment file of CORBA service (/opt/FJSVod/etc/config) is value larger than the timeout surveillance time of the transaction.

To continue running the OTS system, stop the server program, then restart it.

## 19.3.30 ots9256

---

**OTS: ERROR: ots9256:Invalid message was received. MsgMode:%d1 / Process Discriminate:%d2**

### Variable Information

%d1 = Message mode

%d2 = Process identifier

### Explanation

An invalid message was received.

### System Action

Stops the command processing.

### User Action

An internal conflict has occurred; use the `iscollectinfo` command to collect investigation information, then contact a Fujitsu service engineer.

### 19.3.31 ots9258

---

**OTS: WARNING: ots9258:Config information(%s) is not specified. The value is set to the default(%d).**

#### Variable Information

%d1 = Parameter name in operating environment file

%d2 = Parameter value

#### Explanation

A parameter in the operating environment file is not set.

#### System Action

Continues the command processing.

#### User Action

The OTS system is operating with default config information. If other values are required, the values must be set in the operating environment file.

### 19.3.32 ots9259

---

**OTS: WARNING: ots9259:Config information(%s) is less than the minimum value. The value is set to the minimum(%d).**

#### Variable Information

%s = Parameter name in operating environment file

%d = Minimum value of parameter

#### Explanation

A parameter in the operating environment file is less than the minimum value.

#### System Action

Continues the command processing.

#### User Action

The OTS system operates with a minimum value. If another value is required, the value must be set in the operating environment file.

### 19.3.33 ots9260

---

**OTS: WARNING: ots9260:Config information(%s) is more than the maximum value. The value is set to the maximum(%d).**

#### Variable Information

%s = Parameter name in operating environment file

%d = Maximum value of parameter

#### Explanation

A parameter in the operating environment config file exceeds the maximum value.

#### System Action

Continues the command processing.

#### User Action

The OTS system operates with a maximum value. To change the maximum value, the value must be set in the operating environment config file.

### 19.3.34 ots9261

---

**OTS: ERROR: ots9261:OTS system is unstable. After stopping OTS system, please restart.**

#### Explanation

This OTS system exited abnormally.

#### System Action

Stops the command processing.

#### User Action

Close the OTS system, then restart it

### 19.3.35 ots9262

---

**OTS: WARNING: ots9262:Observation process started abnormally. Terminate all process and restart.**

#### Explanation

The observation process started abnormally.

#### System Action

Continues the command processing.

#### User Action

Close all active OTS-related processes, then restart the OTS system.

### 19.3.36 ots9263

---

**OTS: ERROR: ots9263>Error occurred in accessing shared memory, or enough system resource is not available. ErrorPoint:%x**

#### Variable Information

%x = Maintenance code

#### Explanation

Either an error occurred while accessing shared memory, or there are insufficient system resources.

#### System Action

Stops the command processing.

#### User Action

Close the OTS system, then restart it.

### 19.3.37 ots9264

---

**OTS: WARNING: ots9264:Terminate all process and restart.**

#### Explanation

All OTS processes currently running must be terminated and then restarted.

### System Action

Continues the command processing.

### User Action

Close all active OTS-related processes. This message is displayed with message number 9262.

## 19.3.38 ots9265

---

**OTS: WARNING: ots9265: Please terminate OTS system.**

### Explanation

Please terminate the OTS system.

### System Action

Continues the command processing.

### User Action

Close the OTS system, then restart it. This message is displayed with message number 9262.

## 19.3.39 ots9266

---

**OTS: WARNING: ots9266: Please terminate resource management program. Resource definition name: %s**

### Variable Information

%s = Resource definition name

### Explanation

Please terminate the resource management program.

When "JTSRMP" is output to a resource definition name, it means that the message was output from the resource control program for JTS.

### System Action

Continues the command processing.

### User Action

Exit the specified resource management program. This message is displayed with message number ots9262.

## 19.3.40 ots9290

---

**OTS: ERROR: ots9290: Resource definition could not be registered**

### Explanation

Failed to register a resource definition.

### User Action

If there is any other error message that is output to the console, take action according to that message.

## 19.3.41 ots9291

---

**OTS: ERROR: ots9291: Resource definition could not be deleted**

### Explanation

Failed to delete a resource definition.

#### User Action

If there is any other error message that is output to the console, take action according to that message.

### 19.3.42 ots9292

---

**OTS: ERROR: ots9292: Creation of Object Transaction Service(OTS) failed.**

#### Explanation

Failed to configure the environment of the transaction service.

#### User Action

If there is any other error message that is output to the console, take action according to that message.

### 19.3.43 ots9293

---

**OTS: ERROR: ots9293: Deletion of Object Transaction Service(OTS) failed.**

#### Explanation

Failed to delete the environment of the transaction service.

#### User Action

If there is any other error message that is output to the console, take action according to that message.

## 19.4 ots9300 to ots9399

---

This section details the messages with message numbers between ots9300 and ots9399.

### 19.4.1 ots9301

---

**OTS: INFO: ots9301:Transaction list does not exist.**

#### Explanation

The target transaction does not exist in the specified object.

### 19.4.2 ots9302

---

**OTS: INFO: ots9302:Unable to use this subcommand due to the end of line.**

#### Explanation

Unable to use the subcommand due to the premature end of line.

### 19.4.3 ots9303

---

**OTS: INFO: ots9303:Transaction does not exist. : Tid=%s**

#### Variable Information

%s = TransactionID

#### Explanation

The transaction does not exist.

### 19.4.4 ots9304

---

---

**OTS: INFO: ots9304:The specified transaction has already solved. : Tid=%s**

Variable Information

%s = TransactionID

Explanation

Information message that the specified transaction (TransactionID) is already solved.

---

## 19.4.5 ots9305

---

**OTS: ERROR: ots9305:Required option is missing.**

Explanation

A required option is not specified.

User Action

Specify the required option and rerun the command.

---

## 19.4.6 ots9306

---

**OTS: ERROR: ots9306:An illegal option(%s) was specified.**

Variable Information

%s = Option Name

Explanation

An invalid option is specified.

User Action

Specify a valid option and rerun the command.

---

## 19.4.7 ots9307

---

**OTS: ERROR: ots9307:%s option was specified more than once.**

Variable Information

%s = Option Name

Explanation

The same option is specified more than once.

User Action

Specify the option correctly and rerun the command.

---

## 19.4.8 ots9308

---

**OTS: ERROR: ots9308:%s1 option and %s2 option can not be specified simultaneously.**

Variable Information

%s1, %s2 = Option Name

Explanation

These options cannot be specified at the same time.

## User Action

Specify the options correctly and rerun the command.

### 19.4.9 ots9309

---

**OTS: ERROR: ots9309:%s option argument was not specified.**

#### Variable Information

%s = Option Name

#### Explanation

No option argument is specified.

#### User Action

Specify the option correctly and rerun the command.

### 19.4.10 ots9310

---

**OTS: ERROR: ots9310:%s option argument was invalid.**

#### Variable Information

%s = Option Name

#### Explanation

The option argument is invalid. The specified value exceeds the allowed limit.

#### User Action

Specify the option argument correctly and rerun the command.

### 19.4.11 ots9311

---

**OTS: ERROR: ots9311:OTS system is not setup.**

#### Explanation

The OTS system has not been set up. The possible causes of this error are as follows:

- The *otssetup* command has not been executed.
- The CORBA service was uninstalled and then reinstalled.

#### System Action

Stops the command processing.

#### User Action

Set up the OTS system operating environment by executing the *otssetup* command, then run the *otsstart* command to restart the OTS system.

### 19.4.12 ots9331

---

**OTS: ERROR: ots9331:Wrong parameter is specified. : CODE=%d**

#### Variable Information

%d = Maintenance code

#### Explanation

An invalid command parameter is specified.

#### System Action

Stops the command processing.

#### User Action

Specify a valid command parameter.

### 19.4.13 ots9332

---

**OTS: ERROR: ots9332:Wrong subcommand is specified. : CODE=%d**

#### Variable Information

%d = Maintenance code

#### Explanation

The subcommand is invalid.

#### System Action

Stops the subcommand processing.

#### User Action

Specify a valid subcommand.

### 19.4.14 ots9333

---

**OTS: ERROR: ots9333:Wrong subcommand parameter is specified. : CODE=%d**

#### Variable Information

%d = Maintenance code

#### Explanation

A subcommand parameter is invalid.

#### System Action

Stops the subcommand processing.

#### User Action

Specify a valid subcommand parameter.

### 19.4.15 ots9334

---

**OTS: ERROR: ots9334:An unavailable subcommand which cannot use specified. : CODE=%d**

#### Variable Information

%d = Maintenance code

#### Explanation

Cannot use this subcommand. The following causes are possible:

- In *otstranlist*, the *commit*, *rollback*, *save* and *scroll* subcommands are executed without executing the *info* subcommand.
- In *otspendlist*, the *commit*, *rollback*, *delete*, *save* and *scroll* subcommands are executed without executing the *info* subcommand.

- *Commit* and *rollback* subcommands are executed when the *-s* option (OTS system) is specified while starting *otspendlist*.
- The *delete* subcommand is executed when the *-r* option (resource manager) is specified while starting *otspendlist*.

#### System Action

Stops the subcommand processing.

#### User Action

Specify a useable subcommand.

### 19.4.16 ots9335

---

**OTS: ERROR: ots9335:The specified value is beyond the limits. : CODE=%d**

#### Variable Information

%d = Maintenance code

#### Explanation

The specified transaction has not been displayed yet, however, transactions that have been displayed can be specified even if they were not displayed in the current session.

#### System Action

Stops the subcommand processing.

#### User Action

Specify a transaction that has already been displayed.

### 19.4.17 ots9336

---

**OTS: ERROR: ots9336:The file already exists. : FileName=%s**

#### Variable Information

%s = Filename

#### Explanation

The file already exists.

#### System Action

Stops the subcommand processing.

#### User Action

Specify a different filename.

### 19.4.18 ots9337

---

**OTS: ERROR: ots9337:Length of subcommand exceeds maximum.**

#### Explanation

The length of the string that can be specified as a length of the subcommand exceeded limitation value (1150).

#### System Action

Stops the subcommand processing.

#### User Action

Specify the subcommand within the maximum length.

## 19.4.19 ots9338

---

**OTS: ERROR: ots9338:Environment variable does not exist or is invalid. : EXCEPTION=%s**

### Variable Information

%s = Maintenance information

### Explanation

The environment variable does not exist, or is invalid.

### System Action

Stops the subcommand processing.

### User Action

Specify a valid environment variable.

## 19.4.20 ots9339

---

**OTS: ERROR: ots9339:Already starting to get dumpfile. : EXCEPTION=%s**

### Variable Information

%s = Maintenance information

### Explanation

The dump file is already activated.

### System Action

Stops the command processing.

### User Action

Since the dump file is already activated, do not activate again.

## 19.4.21 ots9340

---

**OTS: ERROR: ots9340:Already stopping to get dumpfile. : EXCEPTION=%s**

### Variable Information

%s = Maintenance information

### Explanation

The stopping and getting of the dump file is currently in progress.

### System Action

Stops the command processing.

### User Action

Do not repeat the stop request, as the dump is being obtained.

## 19.4.22 ots9341

---

**OTS: ERROR: ots9341:ObjectDirector is unavailable now. : CODE=%d**

### Variable Information

%d = Maintenance code

### Explanation

The CORBA Service is unavailable.

If this is output when a subcommand of the *otspendlist* command is executed, startup of the OTS system may not be complete.

### System Action

Stops the command processing.

### User Action

Start the CORBA Service.

If this is output when a subcommand of the *otspendlist* command is executed, check if startup of the OTS system is complete. If it is not running, start it. When startup has finished, reexecute the *otspendlist* command.

## 19.4.23 ots9342

---

**OTS: ERROR: ots9342:OTS system is not running. : CODE=%d**

### Variable Information

%d = Maintenance code

### Explanation

The OTS system is not running.

### System Action

Stops the command processing.

### User Action

Start the OTS system, then reexecute the command.

## 19.4.24 ots9343

---

**OTS: ERROR: ots9343:OTS system might not be running. : DETAIL=%d**

### Variable Information

%d = Maintenance code

### Explanation

The OTS system may not be running.

### System Action

Stops the command processing.

### User Action

Start the OTS system. If it has been started, a system error may have occurred; use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer.

## 19.4.25 ots9344

---

**OTS: ERROR: ots9344:The specified resource management program is not running. : DETAIL=%d**

### Variable Information

%d = Maintenance code

### Explanation

The specified resource program manager is not activated.

### System Action

Stops the command processing.

### User Action

Start the resource program manager.

## 19.4.26 ots9345

---

**OTS: ERROR: ots9345:Unregistered resource management program is specified. : CODE=%d**

### Variable Information

%d = Maintenance code

### Explanation

The specified resource program manager is not registered.

### System Action

Stops the command processing.

### User Action

Either register the specified resource program manager, or specify a registered one.

## 19.4.27 ots9346

---

**OTS: ERROR: ots9346:Error occurred in command initialization. : EXCEPTION=%s CODE=%d**

### Variable Information

%s = Maintenance information

%d = Maintenance code

### Explanation

The following causes are possible:

- Insufficient memory
- Insufficient process resources
- Insufficient message resources
- Network error

### System Action

Stops the command processing.

### User Action

Take the action for the CORBA service exception information as indicated by %s (maintenance information), then reexecute the command.

If the value of %s (maintenance information) is as shown in the following table, take the action described below.

Table 19.3 ots9346 Maintenance Information and Countermeasures

Maintenance information (%s)	Maintenance code (%d)	Countermeasures
IDL:FJ/NameDoesentExist:1. 0	1280	The <i>otssetup</i> command has not been executed. Reexecute the command after executing the <i>otssetup</i> command.

## 19.4.28 ots9347

**OTS: ERROR: ots9347:Failed to get transaction. : EXCEPTION=%s CODE=%d**

### Variable Information

%s = Maintenance information

%d = Maintenance code

### Explanation

The following causes are possible:

- Insufficient memory
- Insufficient process resources
- Insufficient message resources
- Network error
- Access to the resource manager failed

### System Action

Stops the command processing.

### User Action

Take the action for the CORBA service exception information as indicated by %s (maintenance information), then reexecute the command.

If %s (maintenance information) of the variable information is EXCEPTION=IDL:com/fujitsu/interstage/ots/jts/ResourceNotFound:1.0, the access to the resource manager may have failed. Check that the resource manager is active, and that the resource definition file is all correct, and then perform the operation again.

## 19.4.29 ots9348

**OTS: ERROR: ots9348:Error occurred in commit operation. : EXCEPTION=%s CODE=%d**

### Variable Information

%s = Maintenance information

%d = Maintenance code

### Explanation

The following causes are possible:

- Insufficient memory
- Insufficient process resources
- Insufficient message resources
- Network error

### System Action

Stops the command processing.

#### User Action

Take the action for the CORBA service exception information as indicated by %s (maintenance information), then reexecute the command.

### 19.4.30 ots9349

---

**OTS: ERROR: ots9349:Error occurred in rollback operation. : EXCEPTION=%s CODE=%d**

#### Variable Information

%s = Maintenance information

%d = Maintenance code

#### Explanation

The following causes are possible:

- Insufficient memory
- Insufficient process resources
- Insufficient message resources
- Network error

#### System Action

Stops the command processing.

#### User Action

Take the action for the CORBA service exception information as indicated by %s (maintenance information), then reexecute the command.

### 19.4.31 ots9350

---

**OTS: ERROR: ots9350:Error occurred in delete operation. : EXCEPTION=%s CODE=%d**

#### Variable Information

%s = Maintenance information

%d = Maintenance code

#### Explanation

The following causes are possible:

- Insufficient memory
- Insufficient process resources
- Insufficient message resources
- Network error

#### System Action

Stops the command processing.

#### User Action

Take the action for the CORBA service exception information as indicated by %s (maintenance information), then reexecute the command.

## 19.4.32 ots9351

---

**OTS: ERROR: ots9351:Heuristic error occurred. : EXCEPTION=%s CODE=%d**

### Variable Information

%s = Maintenance information

%d = Maintenance code

### Explanation

A heuristic error has occurred. The error code for maintenance is set in EXCEPTION, CODE.

### System Action

Stops the command processing.

### User Action

Check the resource manager environment.

## 19.4.33 ots9352

---

**OTS: ERROR: ots9352:Transaction might be already solved. : EXCEPTION=%s CODE=%d**

### Variable Information

%s = Maintenance information

%d = Maintenance code

### Explanation

The transaction may be already solved.

### System Action

Stops the command processing.

### User Action

Since the transaction may be already solved, do not reexecute it.

## 19.4.34 ots9353

---

**OTS:ERROR :ots9353: The user does not belong to Administrators.**

### Explanation

A user, other than an administrator in the local group, attempted to execute the command.

### System Action

Terminates command processing.

### User Action

Reexecute the command as an administrator in the local group.

## 19.4.35 ots9355

---

**OTS:ERROR :ots9355:Invalid filename is specified.**

### Explanation

The specified file name is invalid.

This error may have been caused by:

- A syntax error in the file name.
- The name of the specified file exceeds its maximum length.
- The specified file does not exist.
- Read and write permission is not given for the specified file.

#### System Action

Causes the command to fail.

#### User Action

Specify a valid file name and reexecute the command.

### 19.4.36 ots9361

---

**OTS: ERROR: ots9361:Enough memory is not available. : CODE=%d**

#### Variable Information

%d = Maintenance code

#### Explanation

Insufficient memory.

#### System Action

Stops the command processing.

#### User Action

Execute the process again later. If this message is generated frequently, refer to the Tuning Guide, reestimate the memory that is needed to run Interstage, and confirm that there is enough memory.

If there is enough memory (relative to the amount of memory needed to run Interstage), it may be that there is inadequate memory to run other applications. Reestimate the amount of memory needed for the other applications running on the same machine as well to determine if there is an appropriate amount of memory.

Contact your system administrator if the reestimation indicates that the memory is insufficient. Ask the system administrator to either increase the size of the main memory or the size of the page file.

### 19.4.37 ots9362

---

**OTS: ERROR: ots9362:System error occurred. : EXCEPTION=%s CODE=%d**

#### Variable Information

%s = Maintenance information

%d = Maintenance code

#### Explanation

A system error has occurred.

#### System Action

Stops the command processing.

#### User Action

A system error has occurred; use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer.

## 19.4.38 ots9363

---

**OTS: ERROR: ots9363:Internal error occurred. : CODE=%d**

### Variable Information

%d = Maintenance code

### Explanation

An internal contradiction has occurred.

### System Action

Stops the command processing.

### User Action

An internal conflict has occurred; use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer.

## 19.4.39 ots9364

---

**OTS: ERROR: ots9364:Failed to open a file. : DETAIL=%d**

### Variable Information

%d = Maintenance code

### Explanation

Unable to open the file.

### System Action

Stops the command processing.

### User Action

Specify another file name or folder with the appropriate access permissions.

## 19.4.40 ots9365

---

**OTS: ERROR: ots9365:Failed to write a file. : DETAIL=%d1, CODE=%d2**

### Variable Information

%d1, %d2 = Maintenance code

### Explanation

The following causes are possible:

- Disk Full
- Insufficient resources

### System Action

Stops the command processing.

### User Action

Correct the system environment, then reexecute the command.

## 19.4.41 ots9366

---

---

**OTS: ERROR: ots9366:Failed to close a file. : DETAIL=%d****Variable Information**

%d = Maintenance code

**Explanation**

The following causes are possible:

- Disk Full.
- Insufficient resources.

**System Action**

Stops the command processing.

**User Action**

Correct the system environment, then reexecute the command.

---

**19.4.42 ots9367**

---

**OTS: ERROR: ots9367:Communication error occurred. : EXCEPTION=%s, CODE=%d****Variable Information**

%s = Maintenance information

%d = Maintenance code

**Explanation**

A communication error occurred.

**System Action**

Stops the command processing.

**User Action**

Restore the communications network, then reexecute the command, or execute the command on the local system.

---

**19.4.43 ots9369**

---

**OTS: ERROR: ots9369:Failed to get resource. : EXCEPTION=%s, CODE=%d****Variable Information**

%s = Maintenance information

%d = Maintenance code

**Explanation**

Failed to get resources.

**System Action**

Stops the command processing.

**User Action**

Close all unwanted programs, then reexecute the command.

---

**19.4.44 ots9370**

---

**OTS: ERROR: ots9370:Internal error occurred. : EXCEPTION=%s CODE=%d****Variable Information**

%s = Maintenance information

%d = Maintenance code

**Explanation**

An internal contradiction has occurred.

**System Action**

Stops the command processing.

**User Action**

An internal conflict has occurred; use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer.

---

**19.4.45 ots9371**

---

**OTS: ERROR: ots9371:Failed to get a log. : NAME=%s****Variable Information**

%s = Resource definition file name

**Explanation**

Failed to get the log. The log daemon process may have terminated due to an unknown reason, for example:

- Forced exit
- Power cutoff

**System Action**

Stops the command processing.

**User Action**

Restart the OTS system, then restart the resource program manager.

---

**19.4.46 ots9376**

---

**OTS: ERROR: ots9376:An unexpected error occurred. : EXCEPTION=%s, CODE=%d****Variable Information**

%s = Maintenance information

%d = Maintenance code

**Explanation**

An unexpected error has occurred.

**System Action**

Stops the command processing.

**User Action**

Use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer.

---

**19.4.47 ots9377**

---

**OTS: ERROR: ots9377: System error occurred. : CODE=%d****Variable Information**

%d = Maintenance code

**Explanation**

A system error has occurred.

**System Action**

Stops the command processing.

**User Action**

Use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer.

---

**19.4.48 ots9378**

---

**OTS: ERROR: ots9378:Failed to refer dump data. : EXCEPTION=%s, CODE=%d****Variable Information**

%s = Maintenance information

%d = Maintenance code

**Explanation**

The possible causes of this error are as follows:

- The target process for dump collection has not been started.
- There is insufficient disk space.

**System Action**

Stops the command processing.

**User Action**

If the target process for dump collection has not been started, start the OTS system or the resource management program, then rerun the job. If there is insufficient disk space, review the system environment, then rerun the job.

---

**19.4.49 ots9379**

---

**OTS: ERROR: ots9379:Failed to output dump data. : EXCEPTION=%s, CODE=%d****Variable Information**

%s = Maintenance information

%d = Maintenance code

**Explanation**

The following causes are possible:

- Insufficient output area for dump data
- An I/O error occurred in the dump output

**System Action**

Stops the command processing.

**User Action**

Correct the system environment, then reexecute the command.

## 19.4.50 ots9380

---

**OTS: ERROR: ots9380:Failed starting to get dumpfile. : EXCEPTION=%s, CODE=%d**

### Variable Information

%s = Maintenance information

%d = Maintenance code

### Explanation

The following causes are possible:

- Insufficient output area for dump data
- An I/O error occurred in the dump output

### System Action

Stops the command processing.

### User Action

Correct the system environment, then reexecute the command.

## 19.4.51 ots9381

---

**OTS: ERROR: ots9381:Failed stopping to get dumpfile. : EXCEPTION=%s, CODE=%d**

### Variable Information

%s = Maintenance information

%d = Maintenance code

### Explanation

The following causes are possible:

- Insufficient output area for dump data
- An I/O error occurred in the dump output
- Failed stopping to get dump file.

### System Action

Stops the command processing.

### User Action

Correct the system environment, then reexecute the command.

## 19.4.52 ots9382

---

**OTS: ERROR: ots9382:Failed to get control table. : DETAIL=%d**

### Variable Information

%d = Maintenance code

### Explanation

Unable to retrieve the control table.

### System Action

Stops the command processing.

## User Action

Use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer.

## 19.5 ots9400 to ots9499

---

This section details the messages with message numbers between ots9400 and ots9499.

### 19.5.1 ots9462

---

**OTS: ERROR: ots9462:Failed to get shared memory. : CODE=%d**

#### Variable Information

%d = Maintenance code

#### Explanation

Failed to allocate shared memory, and thus failed to start the OTS system.

#### System Action

Stops the command processing.

#### User Action

Close all unwanted programs, then reexecute the *otsstart* command. If this action fails, tune the system parameters.

### 19.5.2 ots9463

---

**OTS: ERROR: ots9463:Enough memory is not available. : CODE=%d**

#### Variable Information

%d = Maintenance code

#### Explanation

Insufficient memory. Failed to start the OTS system

#### System Action

Stops the command processing.

#### User Action

Execute the process again later. If this message is generated frequently, refer to the Tuning Guide, reestimate the memory that is needed to run Interstage, and confirm that there is enough memory.

If there is enough memory (relative to the amount of memory needed to run Interstage), it may be that there is inadequate memory to run other applications. Reestimate the amount of memory needed for the other applications running on the same machine as well to determine if there is an appropriate amount of memory.

Contact your system administrator if the reestimation indicates that the memory is insufficient. Ask the system administrator to either increase the size of the main memory or to increase the size of the page file.

### 19.5.3 ots9464

---

**OTS: ERROR: ots9464:Error occurred in accessing shared memory. : CODE=%d**

#### Variable Information

%d = Maintenance code

## Explanation

Since shared memory is corrupted, an error was found while accessing shared memory. Failed to start the OTS system

## System Action

Stops the command processing.

## User Action

The shared memory has been destroyed for some reason. To investigate the cause, use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer.

## 19.5.4 ots9466

---

**OTS: ERROR: ots9466:Invalid environment variable(%s) is specified. : CODE=%d**

### Variable Information

%s = Environment variable name

%d = Maintenance code

### Explanation

The environment variable is either not specified, or is invalid. Failed to start the OTS system.

### System Action

Stops the command processing.

### User Action

Specify the correct environment variable, then reexecute the command.

## 19.5.5 ots9467

---

**OTS: ERROR: ots9467: Trace buffer could not be gotten. : CODE=%d**

### Variable Information

%d = Result code

### Explanation

Unable to open the system log file.

### System Action

Stops the command processing.

### User Action

Create the system log file with the *otsmklog* command, then reexecute the command.

## 19.5.6 ots9470

---

**OTS: ERROR: ots9470:ObjectDirector is unavailable now.**

### Explanation

The CORBA Service is unavailable.

### System Action

Stops the command processing.

## User Action

Check the CORBA Service operating environment, then restart the CORBA Service.

## 19.5.7 ots9471

---

**OTS: ERROR: ots9471:ObjectDirector initialization failed. : CODE=%d, EXCEPTION=%s**

### Variable Information

%d = Maintenance code

%s = Maintenance information

### Explanation

Failed to initialize the CORBA Service, and failed to start the OTS system.

### System Action

Stops the command processing.

### User Action

An internal conflict or system error may have occurred; use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer.

## 19.5.8 ots9472

---

**OTS: ERROR: ots9472:OTS system is not setup. : CODE=%d**

### Variable Information

%d = Maintenance code

### Explanation

The OTS system has not been set up. The following causes are possible:

- The *otssetup* command was not executed.
- The *odadmin* command was executed.
- The OTS service is uninstalled, and must be reinstalled.

### System Action

Stops the command processing.

### User Action

Set the OTS system operating environment with the *otssetup* command, then reexecute the *otsstart* command.

## 19.5.9 ots9473

---

**OTS: ERROR: ots9473:NamingService is not running.**

### Explanation

The Naming Service is not activated.

### System Action

Stops the command processing.

### User Action

Start the Naming Service.

## 19.5.10 ots9474

---

**OTS: ERROR: ots9474:Internal error occurred in OTS system initialization. : CODE=%d, EXCEPTION=%s**

### Variable Information

%d = Maintenance code

%s = Maintenance information

### Explanation

An internal contradiction was found during OTS initialization.

### System Action

Stops the command processing.

### User Action

An internal conflict has occurred; use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer.

## 19.5.11 ots9475

---

**OTS: ERROR: ots9475:OTS system initialization failed. : EXCEPTION=%s**

### Variable Information

%s = Maintenance information

### Explanation

OTS system initialization failed. Failed to start the OTS system.

### System Action

Stops the command processing.

### User Action

An internal conflict or system error may have occurred; use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer.

## 19.5.12 ots9476

---

**OTS: ERROR: ots9476:OTS system activation failed. : EXCEPTION=%s**

### Variable Information

%s = Maintenance information

### Explanation

Failed to activate or start the OTS system.

### System Action

Stops the command processing.

### User Action

If %s is as shown in the following table, take the action indicated below and reexecute the command. Otherwise, take the action indicated in the CORBA service exception information, and reexecute the command.

Table 19.4 ots9476 Maintenance Information and Required Action

Maintenance information (%s)	Action
IDL:CORBA/StExcep/NO_RESOURCES:1.0	Reduce the concurrency level of the recovery program and reexecute the command. The concurrency level of the recovery program can be set using the <i>otssetup</i> command.

## 19.5.13 ots9480

### OTS: ERROR: ots9480:Internal error occurred in OTS system. : CODE=%d

#### Variable Information

%d = Maintenance code

#### Explanation

An internal contradiction has occurred. Exiting the OTS system.

#### System Action

Stops the command processing.

#### User Action

An internal conflict has occurred; use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer.

## 19.6 ots9500 to ots9599

This section details the messages with message numbers between ots9500 and ots9599.

### 19.6.1 ots9500

#### OTS: ERROR: ots9500:System error occurred. : CODE=%d1-%d2

#### Variable Information

%d1, %d2 = Maintenance code

#### Explanation

A system error has occurred. Exiting the OTS system.

#### System Action

Stops the command processing.

#### User Action

A system error has occurred; use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer.

### 19.6.2 ots9501

#### OTS: ERROR: ots9501:I/O error occurred in accessing transaction logfile. : CODE=%d1-%d2

#### Variable Information

%d1, %d2 = Maintenance code

#### Explanation

An I/O error occurred while accessing the transaction log file. Exiting the OTS system.

### System Action

Stops the command processing.

### User Action

The disk unit may be faulty. Contact your System Administrator.

## 19.6.3 ots9502

---

**OTS: ERROR: ots9502:Failed to register resource management program. : CODE=%d**

### Variable Information

%d = Maintenance code

### Explanation

Failed to register the resource program manager.

### System Action

Stops the command processing.

### User Action

An internal conflict may have occurred; use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer.

## 19.6.4 ots9503

---

**OTS: ERROR: ots9503:Failed to get a new number of transaction data. : CODE=%d**

### Variable Information

%d = Maintenance code

### Explanation

An error occurred while trying to get new transaction data.

### System Action

Stops the command processing.

### User Action

An internal conflict may have occurred; use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer.

## 19.6.5 ots9506

---

**OTS: ERROR: ots9506:Failed to access transaction logfile. : CODE=%d1-%d2**

### Variable Information

%d1, %d2 = Maintenance code

### Explanation

Failed to the access transaction log file.

### System Action

Stops the command processing.

## User Action

An internal conflict may have occurred; use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer.

## 19.6.6 ots9507

---

**OTS: ERROR: ots9507:Permission denied to access transaction logfile. : CODE=%d**

### Variable Information

%d = Maintenance code

### Explanation

Transaction log file access permission denied. Failed to start the OTS system.

### System Action

Stops the command processing.

### User Action

Start the OTS system as a System Administrator.

## 19.6.7 ots9508

---

**OTS: ERROR: ots9508:Permission denied to access shared memory. : CODE=%d**

### Variable Information

%d = Maintenance code

### Explanation

Access to shared memory denied. Failed to start the OTS system.

### System Action

Stops the command processing.

### User Action

Start the OTS system as a System Administrator.

## 19.6.8 ots9509

---

**OTS: ERROR: ots9509:Internal error occurred in getting shared memory. : CODE=%d**

### Variable Information

%d = Maintenance code

### Explanation

An internal error was found while accessing shared memory. Failed to start the OTS system.

### System Action

Stops the command processing.

### User Action

Close all unwanted programs, then reexecute the command. If this action fails, change the system parameters.

## 19.6.9 ots9510

---

---

**OTS: ERROR: ots9510:Failed to read sysconfig file. : CODE=%d****Variable Information**

%d = Maintenance code

**Explanation**

Failed to read the sysconfig file. Failed to start the OTS system.

**System Action**

Stops the command processing.

**User Action**

Create a new log file because the sysconfig file is invalid. Use the *otssetup* command to create the sysconfig file.

---

**19.6.10 ots9511**

---

**OTS: ERROR: ots9511:Shared memory shortage occurred. : CODE=%d****Variable Information**

%d = Maintenance code

**Explanation**

Insufficient shared memory.

**System Action**

Stops the command processing.

**User Action**

Execute the process again later. If this message is generated frequently, refer to the Tuning Guide, reestimate the memory that is needed to run Interstage, and confirm that there is enough memory.

If there is enough memory (relative to the amount of memory needed to run Interstage), it may be that there is inadequate memory to run other applications. Reestimate the amount of memory needed for the other applications running on the same machine as well to determine if there is an appropriate amount of memory.

Contact your system administrator if the reestimation indicates that the memory is insufficient. Ask the system administrator to either increase the size of the main memory or to increase the size of the page file.

---

**19.6.11 ots9512**

---

**OTS: ERROR: ots9512:Error occurred in system call. : CODE=%d1-%d2****Variable Information**

%d1, %d2 = Maintenance code

**Explanation**

An error occurred during a system call.

**System Action**

Stops the command processing.

**User Action**

An internal conflict or system error has occurred; use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer.

## 19.6.12 ots9513

---

**OTS: ERROR: ots9513:Software signal is received. : CODE=%d**

### Variable Information

%d = Maintenance code

### Explanation

A signal interrupt was received.

### System Action

Stops the command processing.

## 19.6.13 ots9522

---

**OTS: WARNING: ots9522:Heuristic status occurred. : CODE=%d**

### Variable Information

%d = Maintenance code

### Explanation

An heuristic status occurred in the resource manager.

### System Action

Continues processing.

### User Action

Check the resource manager environment.

## 19.6.14 ots9523

---

**OTS: WARNING: ots9523:Error occurred in accessing shared memory. : CODE=%d**

### Variable Information

%d = Maintenance code

### Explanation

Shared memory is corrupted due to an unknown reason.

### System Action

Stops the transaction timer monitor process.

### User Action

The OTS system is operable, but transaction timer observation processing has stopped. Restart the OTS system, If this error occurs, use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer.

## 19.6.15 ots9524

---

**OTS: WARNING: ots9524:Enough memory is not available. : CODE=%d**

### Variable Information

%d = Maintenance code

## Explanation

Insufficient memory.

## System Action

Stops the command processing.

## User Action

Execute the process again later. If this message is generated frequently, refer to the Tuning Guide, reestimate the memory that is needed to run Interstage, and confirm that there is enough memory.

If there is enough memory (relative to the amount of memory needed to run Interstage), it may be that there is inadequate memory to run other applications. Reestimate the amount of memory needed for the other applications running on the same machine as well to determine if there is an appropriate amount of memory.

Contact your system administrator if the reestimation indicates that the memory is insufficient. Ask the system administrator to either increase the size of the main memory or to increase the size of the page file.

## 19.6.16 ots9525

---

**OTS: WARNING: ots9525:Exceeded maximum transaction number. : CODE=%d1- %d2**

### Variable Information

%d1, %d2 = Maintenance code

### Explanation

The number of transactions to be processed has exceeded the maximum limit.

### System Action

Stops the command processing.

### User Action

Reduce the number of execution transactions below the number TRANMAX (sysconfig file) and reexecute. If this error occurs frequently, it will be necessary to setup OTS again because the specified value for the number TRANMAX in the sysconfig files is probably too small.

Remaking the system log file with the *otssetup* command will also be necessary. When the system log file is made by the *otssetup* command, the sysconfig file is also made.

## 19.6.17 ots9526

---

**OTS: WARNING: ots9526:Internal error occurred in commit or rollback operation to resource management program. : CODE=%d1-%d2**

### Variable Information

%d1, %d2 = Maintenance code

### Explanation

An internal error was found during the commit and rollback processes of the resource program manager. The following causes are possible:

- Network error
- Insufficient resources
- Memory resources
- Resource program manager has not started
- The system log file is destroyed

## System Action

Stops the transaction time monitor process.

## User Action

If resource manager resources remain locked, restart the user applications. If a message is displayed requesting that the resource program manager be restarted, do so.

When the system log file is destroyed, it must be created again.

## 19.6.18 ots9527

---

**OTS: WARNING: ots9527:Commit or rollback operation to resource management program failed. : CODE=%d1-%d2**

### Variable Information

%d1, %d2 = Maintenance code

### Explanation

An error was found during the commit and rollback processes of the resource program manager. The following causes are possible:

- Network error
- Insufficient resources
- Memory resources
- Resource control program is not running
- Resource manager error

## System Action

Stops the transaction timer monitor process.

## User Action

If resource manager resources remain locked, restart the user applications. If a message is displayed requesting that the resource program manager be restarted, do so.

When an error in the resource manager is detected, restart the OTS system, resource control program or server application after determining the cause of, and rectifying, the error.

## 19.6.19 ots9551

---

**OTS: ERROR: ots9551:Failure in processing with the following system. : System=%s1 Transaction=%s2 Process=%s3 Exception=%s4**

### Variable Information

%s1 = System Name

%s2 = Transaction ID

%s3 = Process Name

%s4 = Exception Name

### Explanation

Transaction completion processing failed.

## System Action

Stops the command processing.

## User Action

Eliminate the cause of the error based on the exception information (%s4) and reexecute the command.

If "IDL:CORBA/StExcept/NO\_RESOURCE" is displayed in the exception name, review tuning of the OTS system and resource control program by examining the following three tuning parameters:

- RESOURCE\_TRANMAX in the config file
- OTS\_FACT\_THR\_CONC in the setup information file
- OTS\_RMP\_PROC\_CONC in the resource definition file

Alternately, ensure the classpath is set correctly by referring to the "Database Linkage Service Environment Definition" appendix in the Tuning Guide.

## 19.7 ots9600 to ots9699

---

This section details the messages with message numbers between ots9600 and ots9699.

### 19.7.1 ots9602

---

**OTS: INFO: ots9602:Recovery process of the resource management program is not executed. Tid:%s**

#### Variable Information

%s = TransactionID

#### Explanation

Cannot carry out the recovery of the resource program manager. The TransactionID is unsolved, and set to Tid. It will be recovered the next time the OTS system is started.

### 19.7.2 ots9603

---

**OTS: INFO: ots9603:Recovery process exit.**

#### Explanation

Terminating the recovery process.

### 19.7.3 ots9604

---

**OTS: INFO: ots9604:Recovery process of the transaction is not executed. Tid:%s**

#### Variable Information

%s = TransactionID

#### Explanation

Cannot carry out the recovery of the resource program manager. The TransactionID is unsolved, and set to Tid. It will be recovered the next time the OTS system is started.

### 19.7.4 ots9605

---

**OTS: INFO: ots9605:Recovery process exit. Exit Point:%x**

#### Variable Information

%x = Maintenance code

#### Explanation

Exits the recovery process.

## 19.7.5 ots9606

---

**OTS: INFO: ots9606:Recovery process is started. pending num = %d**

### Variable Information

%d = Pending transaction number

### Explanation

The recovery process has started. The pending transaction number is displayed.

## 19.7.6 ots9607

---

**OTS: INFO: ots9607:Pending transaction solved. TransactionID:%s**

### Variable Information

%s = TransactionID

### Explanation

The pending transaction of TransactionID is solved.

## 19.7.7 ots9608

---

**OTS: INFO: ots9608:Recovery process is finished.**

### Explanation

The recovery process is complete.

## 19.7.8 ots9609

---

**OTS: INFO: ots9609:Recovery process is finished. But pending num = %d**

### Variable Information

%d = Pending transaction number

### Explanation

The recovery process is complete, however, unsolved transaction numbers exist and must be solved. The methods for solving them are as follows:

If the resource program manager resource control program is inactive, start it to execute recovery processing.

If a communication error occurs between the resource manager program and the OTS system, restart the resource manager after the network is connected. When the program starts, recovery processing is executed.

Solve all unsolved transactions using the *otspendlist* command.

## 19.7.9 ots9631

---

**OTS: ERROR: ots9631:Initialization failed. ErrorPoint:%s1 / ResultCode:%s2**

### Variable Information

%s1, %s2 = Maintenance code

### Explanation

Initialization failed.

## System Action

Stops the recovery process.

## User Action

An internal conflict or system error has occurred; use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer.

## 19.7.10 ots9632

---

**OTS: ERROR: ots9632:Initialization failed. ErrorPoint:%x / ResultCode:%d**

### Variable Information

%x, %d = Maintenance code

### Explanation

Initialization failed.

### System Action

Stops the recovery process.

### User Action

An internal conflict or system error has occurred; use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer.

## 19.7.11 ots9633

---

**OTS: ERROR: ots9633:Environment variable(%s) is not set.**

### Variable Information

%s = Environment variable name

### Explanation

The environment variable is not set.

### System Action

Stops the recovery process.

### User Action

Set the correct environment variable.

## 19.7.12 ots9634

---

**OTS: ERROR: ots9634:Error occurred in accessing shared memory when setting config information. ErrorPoint:%x**

### Variable Information

%x = Maintenance code

### Explanation

A shared memory access error occurred while setting up the operating environment file. Shared memory may be corrupted.

### System Action

Stops the recovery process.

## User Action

Restart the OTS system. If the operation continues, the system can operate using the default operating environment information, however, it is recommended that the system be restarted.

### 19.7.13 ots9635

---

**OTS: ERROR: ots9635:Recovery process failed. ErrorPoint:%x / ResultCode:%d**

#### Variable Information

%x, %d = Maintenance code

#### Explanation

Recovery process failed.

#### System Action

Recovery processing failed.

#### User Action

An internal conflict or system error has occurred; use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer.

### 19.7.14 ots9636

---

**OTS: ERROR: ots9636:Commit operation ended abnormally by ObjectDirector's error. ErrorPoint:%x / ResultCode:%s Recovery Process Exit.**

#### Variable Information

%x, %s = Maintenance code

#### Explanation

The commit process failed due to error in the ObjectDirector.

#### System Action

Stops the recovery process.

#### User Action

An internal conflict or system error has occurred; use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer.

### 19.7.15 ots9637

---

**OTS: ERROR: ots9637: Receiving a signal failed. ErrorPoint:%x / ResultCode:%d**

#### Variable Information

%x, %d = Maintenance code

#### Explanation

Failed to receive the signal.

#### System Action

Stops the recovery process.

## User Action

An internal conflict or system error has occurred; use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer.

## 19.7.16 ots9638

---

**OTS: ERROR: ots9638:Error occurred in terminating a process. ErrorPoint:%x / ResultCode:%d**

### Variable Information

%x, %d = Maintenance code

### Explanation

An error occurred while exiting the process.

### System Action

Stops the recovery process.

### User Action

An internal conflict or system error has occurred; use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer.

## 19.7.17 ots9639

---

**OTS: ERROR: ots9639:System memory is insufficient.**

### Explanation

Insufficient system memory.

### System Action

Stops the recovery process.

### User Action

Execute the process again later. If this message is generated frequently, refer to the Tuning Guide, reestimate the memory that is needed to run Interstage, and confirm that there is enough memory.

If there is enough memory (relative to the amount of memory needed to run Interstage), it may be that there is inadequate memory to run other applications. Reestimate the amount of memory needed for the other applications running on the same machine as well to determine if there is an appropriate amount of memory.

Contact your system administrator if the reestimation indicates that the memory is insufficient. Ask the system administrator to either increase the size of the main memory or to increase the size of the page file.

## 19.7.18 ots9640

---

**OTS: ERROR: ots9640:Watching a timer failed.**

### Explanation

Timer failed.

### System Action

Stops the recovery process.

### User Action

An internal conflict or system error has occurred; use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer. Restart the OTS system.

## 19.7.19 ots9642

---

**OTS: ERROR: ots9642:System function call error occurred. function:%s / ResultCode:%d**

### Variable Information

%s = Function name

%d = Maintenance code

### Explanation

System function call error.

### System Action

Stops the recovery process.

### User Action

An internal conflict or system error has occurred; use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer. Restart the OTS system.

## 19.7.20 ots9643

---

**OTS: ERROR: ots9643:Trace buffer could not be gotten. ResultCode:%d**

### Variable Information

%d = Maintenance code

### Explanation

Insufficient shared memory. Failed to create or connect to the login buffer.

### System Action

Stops the recovery process.

### User Action

Close all unwanted programs, then reexecute the process.

## 19.7.21 ots9644

---

**OTS: ERROR: ots9644:Initialization of recovery process failed. ErrorPoint:%x1 / ResultCode:%x2**

### Variable Information

%x1, %x2: Maintenance code

### Explanation

The initializing recovery process failed.

### System Action

Stops the recovery process.

### User Action

An internal conflict or system error has occurred; use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer.

## 19.7.22 ots9645

---

**OTS: ERROR: ots9645:OTS system activation failed. : EXCEPTION=%s**

## Variable Information

%s = Maintenance information

## Explanation

Failed to activate or start the OTS system.

## System Action

Stops the command processing.

## User Action

If %s is as shown in the following table, take the action indicated below and reexecute the command. Otherwise, take the action indicated in the CORBA service exception information, and reexecute the command.

Table 19.5 ots9645 Maintenance Information and Required Action

Maintenance information (%s)	Action
IDL:CORBA/StExcep/NO_RESOURCES:1.0	Reduce the concurrency level of the recovery program and reexecute the command. The concurrency level of the recovery program can be set using the <i>otssetup</i> command.

---

## 19.7.23 ots9651

**OTS: ERROR: ots9651:I/O error occurred in accessing system logfile.**

### Explanation

An I/O error occurred while accessing the system log file.

### System Action

Stops the recovery process.

### User Action

The disk device may be defective; use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer.

---

## 19.7.24 ots9652

**OTS: ERROR: ots9652:ObjectDirector is unavailable now.**

### Explanation

The CORBA Service is unavailable.

### System Action

Stops the recovery process.

### User Action

Check the CORBA Service operating environment, then restart it.

---

## 19.7.25 ots9653

**OTS: ERROR: ots9653:OTS system is not setup.**

### Explanation

The OTS system is not setup.

### System Action

Stops the recovery process.

### User Action

The *otssetup* command might not have been invoked. Set the OTS system operating environment with the *otssetup* command, then restart the process.

## 19.7.26 ots9661

---

**OTS: WARNING: ots9661: The default config information(%s) is used. Default value:%d**

### Variable Information

%s = Parameter name in operating environment file

%d = Default value of parameter

### Explanation

The default config information is used.

### System Action

Continues the recovery process.

### User Action

The default is used because the operating environment file is not set. If necessary, set the operating environment file.

## 19.7.27 ots9662

---

**OTS: WARNING: ots9662: The transaction information could not be gotten. ErrorPoint:%x / ResultCode:%d**

### Variable Information

%x, %d = Maintenance code

### Explanation

Failed to retrieve the transaction status.

### System Action

Continues the recovery process.

### User Action

An internal conflict or system error may have occurred; use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer.

Transactions remain unsolved. Perform the recovery process when the OTS system is restarted.

## 19.7.28 ots9663

---

**OTS: WARNING: ots9663: Commit processing failed. ErrorPoint:%x / ResultCode:%d**

### Variable Information

%x, %d = Maintenance code

### Explanation

Commit preparation failed.

## System Action

Continues the recovery process.

## User Action

Terminate all unnecessary programs due to insufficient memory. If this fails to solve the problem, an internal conflict or system error may have occurred; use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer.

The target transaction remains unsolved. Perform the recovery process when the OTS system is restarted.

## 19.7.29 ots9664

---

**OTS: ERROR: ots9664:Unknown error occurred in sending commit operation. ErrorPoint:%x / ResultCode:%s**

### Variable Information

%x, %s = Maintenance code

### Explanation

An unknown error occurred when sending the commit operation.

### System Action

Stops the recovery process.

### User Action

An internal conflict or system error may have occurred; use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer. Restart the OTS system.

## 19.7.30 ots9665

---

**OTS: WARNING: ots9665:Commit operation ended abnormally(Retry:%d1th). ErrorPoint:%x / ResultCode:%d2**

### Variable Information

%d1 = Retry number

%x, %d2 = Maintenance code

### Explanation

Commit processing terminated abnormally.

### System Action

Continues the recovery process.

### User Action

The target transaction remains unsolved. It will be recovered the next time the OTS system is started.

## 19.7.31 ots9666

---

**OTS: ERROR: ots9666:System memory or system resource is insufficient(Retry:%d1th). ErrorPoint:%x / ResultCode:%d2**

### Variable Information

%d1 = Retry number

%x, %d2 = Maintenance code

## Explanation

Insufficient system memory or system resources.

## System Action

Stops the recovery process.

## User Action

The target transaction remains unsolved. Recovery is performed when the OTS system is restarted.

### 19.7.32 ots9667

---

**OTS: ERROR: ots9667:Communication failure or resource management program is not running(Retry: %d1th). ErrorPoint:%d2 / ResultCode:%d3**

## Variable Information

%d1 = Retry number

%x, %d2 = Maintenance code

## Explanation

A communication failure has occurred, or the resource management program is not running.

## System Action

Stops the recovery process.

## User Action

Please check the network and the resource control program or the resource manager. The target transaction remains unsolved. It will be recovered the next time the OTS system is started.

### 19.7.33 ots9668

---

**OTS: WARNING: ots9668: A heuristic outcome was reported. ErrorPoint:%x / ResultCode:%s**

## Variable Information

%x, %s = Maintenance code

## Explanation

Result of sending commit is heuristic.

## System Action

Continues the recovery process.

## User Action

An heuristic error occurred in the resource manager. The resource manager environment must be investigated.

## 19.8 ots9700 to ots9799

---

This section details the messages with message numbers between ots9700 and ots9799.

### 19.8.1 ots9701

---

**OTS: INFO: ots9701: Recovery process is started. : %s1d %s2**

## Variable Information

%s1 = Error information 1

%s2 = Error information 2

## Explanation

The recovery process has started.

## 19.8.2 ots9702

---

**OTS: INFO: ots9702:Pending transaction was solved. : %s1**

## Variable Information

%s1 = Error information 1

## Explanation

Pending transactions are solved.

## 19.8.3 ots9703

---

**OTS: INFO: ots9703:Recovery process has finished. : RESOURCE=%s**

## Variable Information

%s1 = Error information 1

## Explanation

The recovery process is complete.

## 19.8.4 ots9704

---

**OTS: INFO: ots9704:Although pending transaction exists, recovery process is stopped. : %s1 %s2**

## Variable Information

%s1 = Error information 1

%s2 = Error information 2

## Explanation

Recovery processing is complete, however, unsolved transactions exist and must be solved. The following methods are provided:

If the OTS system is inactive, start it, then restart the resource manager. When the resource manager starts, recovery processing is executed. If a communication error occurs between the resource manager and the OTS system, restart the resource manager after the network cable is connected. As soon as it starts, recovery processing is executed. Solve all unsolved transactions with the *otspendlist* command.

## 19.8.5 ots9731

---

**OTS: ERROR: ots9731:Cannot find 'Resource-definition-file'. : NAME=%s, CODE=%d**

## Variable Information

%s = Resource definition name

%d = Maintenance code

## Explanation

The specified resource definition file could not be found.

CODE: Detail code

#### System Action

Stops the command process.

#### User Action

Check that the path and resource definition file name are valid.

### 19.8.6 ots9732

---

**OTS: ERROR: ots9732:Failed to read 'Resource-definition-file'. : NAME=%s, CODE=%d**

#### Variable Information

%s = Resource definition name

%d = Maintenance code

#### Explanation

Failed to read the resource definition file.

#### System Action

Stops the resource manager start process.

#### User Action

Check that the permission is set to the resource definition file.

### 19.8.7 ots9733

---

**OTS: ERROR: ots9733:Invalid invocation parameter is specified. : %s1 %s2 %s3**

#### Variable Information

%s1 = Error information 1

%s2 = Error information 2

%s3 = Error information 3

#### Explanation

The resource program manager start parameter is invalid.

#### System Action

Start the resource manager start process.

#### User Action

Check that the start parameter for the resource program manager is correct, and resolve any errors.

### 19.8.8 ots9734

---

**OTS: ERROR: ots9734:Failed to get shared memory. : CODE=%d**

#### Variable Information

%d = Maintenance code

#### Explanation

Failed to retrieve shared memory.

## System Action

Stops the process.

## User Action

Check that the appropriate value is set in the system parameter for shared memory size. Check the definition values related to the resource manager in the operating environment file.

When JTS is used, please check whether the OTS system or the resource control program is started and perform again.

## 19.8.9 ots9735

---

**OTS: ERROR: ots9735:Error occurred in accessing shared memory. : CODE=%d**

### Variable Information

%d = Maintenance code

### Explanation

Another process or user instruction may have caused an error while accessing shared memory.

### System Action

Stops the resource manager start process.

### User Action

Restart the resource control program. If the error persists, stop any other processes that are not being used. Ensure that other processes do not access the shared memory area, then restart the program.

If this message continues to be output, use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer.

## 19.8.10 ots9736

---

**OTS: ERROR: ots9736:Enough system semaphore resource is not available. : CODE=%d**

### Variable Information

%d = Maintenance code

### Explanation

Failed to retrieve a necessary semaphore while starting the resource program manager.

The possible causes of this error are as follows:

- The number of semaphores has not been tuned.
- There is a system memory shortage.

### System Action

Stops the resource manager start process.

### User Action

Check that an accurate value is set in the system parameter for the number of semaphores. Check the definition values related to the resource manager in the operating environment file.

If there is a memory shortage, refer to the Tuning Guide, reestimate the memory that is needed to run Interstage, and check whether there is enough memory.

If there is enough memory to run Interstage, it may be that there is inadequate memory to run other applications. Reestimate the amount of memory required for the other applications running on the same machine to determine if there is an appropriate amount of memory.

Contact your system administrator if the reestimation indicates that the memory is insufficient. Ask the system administrator to either increase the size of the main memory or to increase the size of the page file.

## 19.8.11 ots9737

---

**OTS: ERROR: ots9737:Semaphore operation failed. : CODE=%d**

### Variable Information

%d = Maintenance code

### Explanation

An error was found in a resource program manager semaphore. Cancels the resource program manager process.

### System Action

Stops the resource manager start process.

### User Action

Shared memory may have been destroyed by another process or user instruction. Restart the resource manager after checking that there is nothing causing shared memory destruction.

## 19.8.12 ots9739

---

**OTS: ERROR: ots9739:Invalid environment variable(%s) is specified.**

### Variable Information

%s = Environment variable

### Explanation

The environment variables are invalid.

### System Action

Stops the resource manager start process.

### User Action

Set the correct environment variables.

## 19.8.13 ots9740

---

**OTS: ERROR: ots9740:ObjectDirector is unavailable now. : %s1 %s2 %s3**

### Variable Information

%s1 = Error information 1

%s2 = Error information 2

%s3 = Error information 3

### Explanation

The CORBA Service is unavailable.

### System Action

Stops the process.

### User Action

Take the following action.

- If starting the JTS resource management program fails, the setting of ORB or class path may be incorrect. Check the JDK/JRE PATH used by the resource management program is correct.
- If OD\_IMPLID is set in the system environment variable, delete it.
- If you are using the Event Service, check whether an Event Service message was output before this message and follow the action advised.

#### Windows32/64

- Check the CORBA Service operating environment, then restart the CORBA Service.
- Check that Naming Service is activated.

#### Solaris32/64 Linux32/64

- Check whether there was a problem in the creation of the thread mode/process mode environment.
- A resource management program which does not correspond to the content specified for THREAD in the resource definition file may have been used. If the setting is THREAD=OFF (or the setting is omitted), use the resource management program which is used for process mode. If the setting is THREAD=ON, use the resource management program which is used for thread mode. If there are no problems in the thread mode/process mode environment settings, review the CORBA service operating environment then restart the CORBA service.

## 19.8.14 ots9741

---

**OTS: ERROR: ots9741:ObjectDirector initialization failed. : %s1 %s2 %s3**

### Variable Information

%s1 = Error information 1

%s2 = Error information 2

%s3 = Error information 3

### Explanation

An error was found while initializing the ObjectDirector.

### System Action

Stops the resource manager start process.

### User Action

Take whatever action is necessary according to the following the instructions:

- If the error appears to be associated with the CORBA Service or Database Linkage Service, restart the resource control program.
- If the error appears to be associated with tuning of the operating environment file of the CORBA Service, inspect the operating environment file of the CORBA Service, then restart Interstage. Finally, restart the resource control program.
- If it appears an incorrect definition in the setup information file is used for allocating the resource control program to a separate node, reevaluate the definitions in the setup information file. Also, set up the definitions and the node on which the OTS system operates. For more information about the settings for operating the resource control program on a separate node, refer to the OLTP Server User's Guide.

If any other error messages were associated with this one, take whatever action is indicated by these messages.

## 19.8.15 ots9742

---

**OTS: ERROR: ots9742: 'Resource-definition-file' is not registered in ObjectDirector.: NAME=%s1 %s**

### Variable Information

%s1 = Resource definition name

%s2 = Error information

### Explanation

The resource management program registered with the *otssetrsc* command is not registered in the CORBA service (ObjectDirector). The following reasons are possible:

- The *odadmin* command was executed.
- The CORBA service was uninstalled then reinstalled.

### System Action

Stops the resource manager start process.

### User Action

Delete the resource management program (that was registered with *otssetrsc -a -rf*) using the *otssetrsc -d -n* command, reregister it in the CORBA service using *otssetrsc -a -rf*, then execute the *otsstart* command.

## 19.8.16 ots9743

---

**OTS: ERROR: ots9743: NamingService is not running. : %s1 %s2**

### Variable Information

%s1 = Error information 1

%s2 = Error information 2

### Explanation

The Naming Service is not activated.

### System Action

Stops the resource manager start process or transaction process.

### User Action

Start the Naming Service.

## 19.8.17 ots9745

---

**OTS: ERROR: ots9745: Resouce management program initialization failed. : %s1 %s2 %s3 %s4**

### Variable Information

%s1 = Error information 1

%s2 = Error information 2

%s3 = Error information 3

%s4 = Error information 4

### Explanation

Failed to initialize the resource management program.

### System Action

Stops the resource manager start process.

### User Action

An internal conflict or system error may have occurred; use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer.

## 19.8.18 ots9746

---

**OTS: ERROR: ots9746:Activating resource management program failed. : %s1 %s2 %s3**

### Variable Information

%s1 = Error information 1

%s2 = Error information 2

%s3 = Error information 3

### Explanation

Failed to activate the resource program manager.

### System Action

Stops the resource manager start process.

### User Action

If the OTS resource management program is used, an internal conflict or system error may have occurred; use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer.

## 19.8.19 ots9747

---

**OTS: WARNING: ots9747:Down recovery process failed. : %s1 %s2**

### Variable Information

%s1 = Error information 1

%s2 = Error information 2

### Explanation

The down recovery process failed. Unsolved transactions exist.

CODE: Detail code

### System Action

Stops the resource manager start process.

### User Action

Correct the system environment, then close the unprocessed transactions after starting the resource program manager. The following causes are possible:

- The OTS system has not started
- Communication network error

Before the resource manager can be quickly restarted, *otspendlist* must first be used to correct and resolve transactions. However, if the *otspendlist* command is going to be used, integrity of the multiple resource managers will be determined by the judgment of manager.

## 19.8.20 ots9748

---

**OTS: ERROR: ots9748:Failed to open logfile. : CODE=%d**

### Variable Information

%d = Maintenance code

### Explanation

Unable to open the log file.

## System Action

Stops the resource manager start process.

## User Action

Insufficient shared memory. Close all unwanted programs, then reexecute the process.

## 19.8.21 ots9750

---

**OTS: ERROR: ots9750:System error occurred. : %s1 %s2**

### Variable Information

%s1 = Error information 1

%s2 = Error information 2

### Explanation

A system error has occurred.

### System Action

Stops the resource manager start process.

### User Action

If the OTS resource management program is used, the OPENINFO character sequence of a resource definition file is not set up correctly. If the OPENINFO character string is set correctly, a system error caused the error message to display. Use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer.

If the JTS resource control program is used, please carry out the following management according to a phenomenon.

- "CODE=0x00000000 0x3e010006" is outputted to the error information 2.

Abnormalities may have occurred at the time of communication. Follow the message displayed before this message.

- "CODE=0x00000000 0x3e030001" is outputted to the error information 2.

A system error may have occurred; use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer.

- Following CODE is outputted to the error information 2

"CODE=0x00000000 0x3e040015"

"CODE=0x00000000 0x3e050003"

"CODE=0x00000000 0x3e060002"

"CODE=0x00000000 0x3e060006"

Follow the message displayed before this message.

If "CODE=0x00000000 0x3e060002" is output and no message is output before this message, the Java setting used by the resource management program may be incorrect. Check the JDK/JRE PATH used by the resource management program is correct.

- CODE(s) other than the above are outputted to the error information 2

Abnormalities occurred in the execution environment of java. A system error has occurred; use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer.

If this message is output when the Interstage JMX service is running, the problem may be related to the location specified for the resource file definition storage directory. In a cluster environment, this directory may have been set to a shared disk. Refer to the High Availability System Guide, and check the resource definition file storage directory settings.

## 19.8.22 ots9751

---

**OTS: ERROR: ots9751:Cannot find 'Resource-definition-file'. : NAME=%s, CODE=%d**

## Variable Information

%s = Resource definition name

%d = Maintenance code

## Explanation

The resource definition file could not be found.

## System Action

Start the resource manager start process.

## User Action

Specify the correct resource definition file name.

## 19.8.23 ots9752

---

**OTS: ERROR: ots9752:Failed to read 'Resource-definition-file' : NAME=%s, CODE=%d**

## Variable Information

%s = Resource definition name

%d = Maintenance code

## Explanation

Failed to read the resource definition file.

## System Action

Stops the resource manager start process.

## User Action

The user may not have resource definition file access permission. Check the file, then restart the process.

## 19.8.24 ots9753

---

**OTS: ERROR: ots9753:Invalid syntax in 'Resource-definition-file' : NAME=%s, CODE=%d**

## Variable Information

%s = Resource definition name

%d = Maintenance code

## Explanation

The resource definition file is invalid.

## System Action

Stops the resource manager start process.

## User Action

Check the invalid resource definition file, then restart the process.

## 19.8.25 ots9754

---

**OTS: ERROR: ots9754:Internal error occurred. : CODE=%d1-%d2**

## Variable Information

%s1 = Error information 1

%s2 = Error information 2

#### Explanation

An internal contradiction was found.

#### System Action

Stops the resource manager start process or transaction process.

#### User Action

An internal conflict has occurred; use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer. Refer to "19.9.13 ots9821", as the cause described in "Explanation" of ots9821 is also possible.

## 19.8.26 ots9760

---

**OTS: ERROR: ots9760:Error occurred in accessing Database. : resource manager. : %s1 %s2 %s3 %s4 %s5**

#### Variable Information

%s1 = Error information 1

%s2 = Error information 2

%s3 = Error information 3

%s4 = Error information 4

%s5 = Error information 5

#### Explanation

An error was found while accessing the resource manager.

#### System Action

Stops the resource manager start process or transaction process.

#### User Action

Check the following possible causes, then restart the process:

- The OPENINFO string of resource definition file is incorrect  
Ensure that the OPENINFO character string is specified correctly.
- The environment variables required for the resource manager have not been set  
If Oracle is used, ensure that the environment variables such as ORACLE\_SID are correct.
- The resource manager is not activated  
Ensure that the database and resource adapter to be connected are started correctly.
- The resource manager is corrupted  
Verify that the message from the resource control program is not output.  
If the character string that includes "JCA:" is displayed in the error information, it indicates that an error occurred in the J2EE Connector Architecture.
- If both Oracle and JTS are used, it is conceivable that the database was not created correctly.

## 19.8.27 ots9761

---

**OTS: ERROR: ots9761:Error occurred in recovery processing. : CODE=%d1-%d2**

## Variable Information

%d1, %d2 = Maintenance code

## Explanation

An error occurred in the recovery process.

## System Action

Stops the resource manager.

## User Action

An internal conflict has occurred; use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer. Restart the resource manager.

## 19.8.28 ots9762

---

**OTS: ERROR: ots9762:Enough memory is not available. : %s1 %s2**

## Variable Information

%s1 = Error information 1

%s2 = Error information 2

## Explanation

Insufficient memory.

CODE: Detail code

## System Action

Stops the resource manager.

## User Action

Execute the process again later. If this message is generated frequently, refer to the Tuning Guide, reestimate the memory that is needed to run Interstage, and confirm that there is enough memory.

If there is enough memory (relative to the amount of memory needed to run Interstage), it may be that there is inadequate memory to run other applications. Reestimate the amount of memory needed for the other applications running on the same machine as well to determine if there is an appropriate amount of memory.

Contact your system administrator if the reestimation indicates that the memory is insufficient. Ask the system administrator to either increase the size of the main memory or to increase the size of the page file.

## 19.8.29 ots9763

---

**OTS: ERROR: ots9763:Error occurred in commit operation. : %s1 %s2 %s3**

## Variable Information

%s1 = Error information 1

%s2 = Error information 2

%s3 = Error information 3

## Explanation

An error was found in the commit process.

## System Action

Stops the resource manager.

## User Action

If both Oracle and JTS are used, it is conceivable that the database is not created correctly.

An internal conflict has occurred; use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer. Restart the resource manager.

## 19.8.30 ots9764

---

**OTS: ERROR: ots9764:Error occurred in rollback operation. : %s1 %s2 %s3**

### Variable Information

%s1 = Error information 1

%s2 = Error information 2

%s3 = Error information 3

### Explanation

Error found in rollback process.

### System Action

Stops the resource manager.

### User Action

If both Oracle and JTS are used, it is conceivable that the database is not created correctly.

An internal conflict has occurred; use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer. Restart the resource manager.

## 19.8.31 ots9765

---

**OTS: ERROR: ots9765:Heuristic error occurred in commit operation. : %s1 %s2 %s3**

### Variable Information

%s1 = Error information 1

%s2 = Error information 2

%s3 = Error information 3

### Explanation

An heuristic error was found in the commit process.

### System Action

Stops the resource manager.

### User Action

An heuristic error occurred in the resource manager. Check the resource manager environment.

## 19.8.32 ots9766

---

**OTS: ERROR: ots9766:Heuristic error occurred in rollback operation. : %s1 %s2 %s3**

### Variable Information

%s1 = Error information 1

%s2 = Error information 2

%s3 = Error information 3

#### Explanation

An heuristic error was found in the rollback process.

#### System Action

Stops the resource manager.

#### User Action

An heuristic error occurred in the resource manager. Check the resource manager environment.

### 19.8.33 ots9767

---

**OTS: ERROR: ots9767:Fatal error occurred in accessing resource manager. : CODE=%d**

#### Variable Information

%d = Maintenance code

#### Explanation

A fatal error occurred while accessing the resource manager. Exit the resource program manager.

#### System Action

Stops the resource manager.

#### User Action

Fatal error occurred in the resource manager. Check the resource manager environment.

### 19.8.34 ots9770

---

**OTS: ERROR: ots9770:Permission denied to access shared memory. : CODE=%d**

#### Variable Information

%d = Maintenance code

#### Explanation

The user does not have shared memory access permission.

#### System Action

Stops the resource manager.

#### User Action

An internal conflict has occurred; use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer.

### 19.8.35 ots9771

---

**OTS: ERROR: ots9771:Internal error occurred in accessing shared memory. : CODE=%d**

#### Variable Information

%d = Maintenance code

#### Explanation

An internal error was found while accessing shared memory.

### System Action

Stops the resource manager.

### User Action

Insufficient semaphore resources. Close all unwanted programs, then restart the resource manager.

## 19.8.36 ots9772

---

**OTS: ERROR: ots9772:Failed to read sysconfig file. : CODE=%d**

### Variable Information

%d = Maintenance code

### Explanation

Failed to read the sysconfig file.

### System Action

Stops the resource manager.

### User Action

Check if access permission to the sysconfig file has been provided. The *otssetup* command can be used to create the sysconfig file if necessary.

## 19.8.37 ots9773

---

**OTS: ERROR: ots9773:Failed to get system resource. : CODE=%d**

### Variable Information

%d = Maintenance code

### Explanation

Failed to get system resources.

CODE: Detail code

### System Action

Stops the resource manager.

### User Action

Close all unwanted programs, then restart the resource manager.

## 19.8.38 ots9775

---

**OTS: ERROR: ots9775:Software signal is received. : CODE=%d**

### Variable Information

%d = Maintenance code

### Explanation

A signal interrupt (CODE=%d) was received.

### System Action

Stops the resource manager.

## 19.8.39 ots9776

---

**OTS: ERROR: ots9776: The resource management could not be started.**

### Explanation

The resource control program could not be started.

### System Action

Ends the resource control program.

### User Action

**Windows32/64**

Follow the recommendations contained in the message output prior to this message to the event log, or displayed in the command input screen.

**Solaris32/64 Linux32/64**

Follow the recommendations contained in the message output prior to this message to the file specified for user.err in /etc/syslog.conf, or displayed in the command input screen. For details about syslog.conf, see an appropriate explanation using the *man* command.

## 19.8.40 ots9780

---

**OTS: INFO: ots9780: The down recovery processing begins.**

### Explanation

The resource control program has started the recovery process for system down.

## 19.8.41 ots9781

---

**OTS: INFO: ots9781: The down recovery processing has been completed.: CODE=%x1 %x2**

### Variable Information

%x1 = Maintenance code 1

%x2 = Maintenance code 2

### Explanation

The resource control program completed system down recovery processing.

## 19.8.42 ots9782

---

**OTS: WARNING: ots9782: The down recovery processing stands by.: COUNT=%d EXCEPTION=%s CODE=%x1 %x2**

### Variable Information

%d = Retry count

%s = Exception

%x1 = Maintenance code 1

%x2 = Maintenance code 2

### Explanation

The system recovery process has entered the standby state.

## System Action

When the system recovery process comes out of the standby state, the system restarts processing.

System recovery is repeated until the retry count reaches the RECOVERY\_RETRY\_MAX value.

## User Action

Proceed according to the message displayed prior to this message.

## 19.8.43 ots9783

---

**OTS: WARNING: ots9783:Recovery process of the resource manager stands by.: NAME=%s1  
EXCEPTION=%s2 CODE=%x1 %x2.**

### Variable Information

%s1 = Resource definition name

%s2 = Exception that occurred

%x1 = Maintenance code 1

%x2 = Maintenance code 2

### Explanation

The resource manager recovery process has entered the standby state.

## System Action

When the system recovery process comes out of the standby state, the system restarts processing.

## User Action

Proceed according to the message displayed prior to this message.

## 19.9 ots9800 to ots9899

---

This section details the messages with message numbers between ots9800 and ots9899.

### 19.9.1 ots9800

---

**OTS: ERROR: ots9800: ObjectTransactionService is unavailable now. : %s1 %s2 %s3**

#### Variable Information

%s1 = Error information 1

%s2 = Error information 2

%s3 = Error information 3

#### Explanation

The database linkage service cannot be used.

#### System Action

Stops command processing.

#### User Action

When "SYSTEMNAME=" is output as Error information 1 (%s1), operations will now use the "Extended System". Use the database linkage service only while using the "Default system".

If the cause is other than the above, use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer.

This section details the messages with message numbers between ots9800 and ots9899.

## 19.9.2 ots9802

---

**OTS: WARNING: ots9802:Error occurred in accessing shared memory. : CODE=%d**

### Variable Information

%d = Maintenance code

### Explanation

Another process or user instruction may have caused an error while accessing shared memory.

### System Action

Continues processing.

### User Action

Restart the resource control program. If the error persists, stop any other processes that are not being used. Ensure that other processes do not access the shared memory area, then restart the program. If this message continues to be output, use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer.

## 19.9.3 ots9811

---

**OTS: ERROR: ots9811: Environment variable(%s) was invalid.**

### Variable Information

%s = Environment Variable Name

### Explanation

An environment variable is not set.

### System Action

Processing stops.

### User Action

Correctly set the environment variable.

## 19.9.4 ots9812

---

**OTS: ERROR: ots9812: ObjectDirector is not started.**

### Explanation

The CORBA Service is not in a usable state.

### System Action

Processing stops.

### User Action

Start the CORBA Service and execute the process again.

## 19.9.5 ots9813

---

**OTS: ERROR: ots9813: Error was received from ObjectDirector (%s-%d).**

## Variable Information

%s = Error Reason

%d = Error Information

## Explanation

There is a notification of error from the CORBA Service.

## System Action

Processing stops.

## User Action

Take the action described in the table below, according to Error reason (%s) and Error information (%d), and then reexecute the process.

Error reason (%s)	Error information (%d)	Reason	Action
IDL: CORBA/ StExcep/ NO_MEMORY: 1.0	327689	The value specified for the PARTICIPATE parameter of the setup information file using the <i>otssetup</i> command is incorrect.	Specify the value for the PARTICIPATE parameter of the setup information file using the <i>otssetup</i> command, as the number of resources to be linked by one transaction.
	Other than 327689,65543	There is insufficient memory available.	Retry after ending all unnecessary programs.
IDL:FJ/NameExit:1.0	65543	Implementation Repository ID of the server application is not registered in the CORBA service.	Register the Implementation Repository ID of the server application in the CORBA service.
		Implementation Repository ID is incorrect.	Specify a valid Implementation Repository ID.
All other cases	65540 458756	Naming Service has not started.	Check the Naming Service status.
		Communications error with the machine on which the Naming Service is started.	Check the network settings.
		Error in the information specified by the transaction initialization interface.	Check transaction initialization interface arguments.
	65543 458759	The Implementation Repository ID of the server application has not been registered in the CORBA service.	If the Implementation Repository ID of the server application has not been registered in the CORBA service, register it.
		Error in the Implementation Repository ID specified in the transaction initialization interface.	If the Implementation Repository ID is incorrect, specify the correct ID.
	65561-65575	Resource control program is not registered.	Register the resource control program.
			Check the CORBA Service status.
	327689	The OTS System is shut down	Check the OTS system status.
Communications error with the OTS system.		Check the network settings.	

Error reason (%s)	Error information (%d)	Reason	Action
			Check if a CORBA service message or log has been output immediately before. If it has, take the action advised.
	-	-	Use the <i>iscollectinfo</i> command to collect investigation information, then contact a Fujitsu service engineer.

## 19.9.6 ots9814

---

**OTS: ERROR: ots9814: The server application information registered is invalid.**

### Explanation

There are the following errors in the data line of the server application information registered by the *OD\_impl\_inst* command

- The format is invalid.
- The specified data length exceeds the maximum limit.

### System Action

Processing stops.

### User Action

Confirm that there are no errors in the server application information.

## 19.9.7 ots9815

---

**OTS: ERROR: ots9815: The resource management program specified was not registered. CODE=%s**

### Variable Information

%s = Resource Definition Name

### Explanation

An unregistered resource control program has been specified.

### System Action

Processing stops.

### User Action

Specify a registered resource control program and retry, or register the specified resource control program and retry.

## 19.9.8 ots9816

---

**OTS: ERROR: ots9816: The resource definition file is invalid. : %s1 %s2 %s3 %s4**

### Variable Information

%s1 = Error information 1

%s2 = Error information 2

%s3 = Error information 3

%s4 = Error information 4

## Explanation

There are resource definition file syntax errors.

## System Action

Processing stops.

## User Action

Ensure that the resource definition file syntax is correct. For details, refer to the "Database Linkage Service Environment Definition" appendix in the Tuning Guide

## 19.9.9 ots9817

---

**OTS: ERROR: ots9817: The resource definition name was not registered. : %s1 %s2 %s3**

### Variable Information

%s1 = Error information 1

%s2 = Error information 2

%s3 = Error information 3

## Explanation

The specified resource definition file is not registered.

## System Action

Processing stops.

## User Action

Check whether the resource definition name is correct.

If this message is output when JTS is used, it is conceivable that the resource definition name is not registered, resource definition file is coded incorrectly, or the necessary class path is not specified.

For more information about the resource definition file, refer to the "Database Linkage Service Environment Definition" appendix in the Tuning Guide.

## 19.9.10 ots9818

---

**OTS: ERROR: ots9818: OTS or the resource management program is not available.**

### Explanation

OTS System or Resource control program not in a usable state, because either:

- (a) The resource control program, corresponding to the resource definition name specified in the application server registration information, has not started, or
- (b) Insufficient resources are available at the start of the resource control program.

### System Action

Processing stops.

### User Action

- If (a) above, start up the corresponding resource management program, then restart the process.
- If (b) above, take whatever action is indicated by the message associated with the resource shortage. Alternately, increase the resource management program concurrency, then restart the process.

## 19.9.11 ots9819

---

**OTS: ERROR: ots9819: There was not enough memory.**

### Explanation

A memory shortage has occurred.

### System Action

Processing stops.

### User Action

Execute the process again later. If this message is generated frequently, refer to the Tuning Guide, reestimate the memory that is needed to run Interstage, and confirm that there is enough memory.

If there is enough memory (relative to the amount of memory needed to run Interstage), it may be that there is inadequate memory to run other applications. Reestimate the amount of memory needed for the other applications running on the same machine as well to determine if there is an appropriate amount of memory.

Contact your system administrator if the reestimation indicates that the memory is insufficient. Ask the system administrator to either increase the size of the main memory or to increase the size of the page file.

## 19.9.12 ots9820

---

**OTS: ERROR: ots9820: The resource definition file could not be read. : %s1 %s2 %s3**

### Variable Information

%s1 = Error information 1

%s2 = Error information 2

%s3 = Error information 3

### Explanation

An error occurred while reading the resource definition file.

### System Action

Processing stops.

### User Action

Confirm that the correct version is set up in the resource definition file.

## 19.9.13 ots9821

---

**OTS: ERROR: ots9821: Error occurred when access to the resource manager. %s1 %s2 %s3**

### Variable Information

%s1 = Error information 1

%s2 = Error information 2

%s3 = Error information 3

### Explanation

An error was detected in accessing resource manager.

The following reasons can be considered:

- If the *OPENINFO* character string in the resource definition file is incorrect
- If the resource manager has not started

- If there is a failure in the resource manager

#### System Action

Processing stops.

#### User Action

Try again after checking the possible causes. The code that appears at the end of error information 3 shall be the return code of XA. Refer to the manual of Resource Manager, and take an action according to the return code of XA.

### 19.9.14 ots9822

---

#### **OTS: ERROR: ots9822: The sysconfig file could not be read.**

#### Explanation

There was a failure while reading the sysconfig file.

#### System Action

Processing stops.

#### User Action

Check the following possible causes, then restart the process:

- If there is no authority for accessing the *sysconfig* file, provide that authority.
- If there is no *sysconfig* file, generate the *sysconfig* file after stopping all operations.
- Generate the *sysconfig* file using the *otssetup* command.

### 19.9.15 ots9823

---

#### **OTS: ERROR: ots9823: System resource could not be got. : CODE=%d**

#### Variable Information

%d = Maintenance Code

#### Explanation

There was a failure in obtaining system resources obtain.

#### System Action

Processing stops.

#### User Action

End unnecessary programs, and try again. If this message is generated frequently, refer to the Tuning Guide, reestimate the memory that is needed to run Interstage, and confirm that there is enough memory.

If there is enough memory to run Interstage, it may be that there is inadequate memory to run other applications. Reestimate the amount of memory required for the other applications running on the same machine to determine if there is an appropriate amount of memory.

Contact your system administrator if the reestimation indicates that the memory is insufficient. Ask the system administrator to either increase the size of the main memory or to increase the size of the page file.

If there is no problem with the memory capacity, the mapping address of the shared memory overlaps with that of another product. In this case, change the value specified in *shmaddr* in the *\etc\ots.ini* file under the Database Linkage Service installation folder, then rerun the command.

### 19.9.16 ots9824

---

#### **OTS: ERROR: ots9824: System error occurred. : CODE=%d**

## Variable Information

%d = Maintenance Code

## Explanation

A system error has occurred.

## System Action

Processing stops.

## User Action

It may be that there was an internal conflict, or system error. Make a note of the message number and variable information and contact a technician.

If there is no problem with the resource definition file, use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer. It will be necessary to restart the OTS system.

## 19.9.17 ots9825

---

### OTS: ERROR: ots9825: System state was invalid. : CODE=%d

## Variable Information

%d = Maintenance Code

## Explanation

An internal conflict has been detected.

## System Action

Processing stops.

## User Action

If %d is as shown in the following table, take the appropriate action and execute the process again.

Table 19.6 ots9825 Maintenance Code and Action

Maintenance code (%d)	Action
65537 1048577 1048581 1114113	Set the resource definition file authority so that the user that that launches the server application is able to reference the resource definition file.
196609 262147 327687 393217 1179649 1179652 1245185 1310721 1310724 1376257	The transaction ended with a timeout. Adjust the timeout period according to the type of application processes.

If the maintenance code (%d) is other than the above or if the problem is not solved even after appropriate action is taken, use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer.

## 19.9.18 ots9826

---

---

**OTS: WARNING: ots9826: Protocol error occurred.**

Explanation

A method has been invoked when there has been no transaction Start declaration from the Client Application.

System Action

Processing continues.

---

### 19.9.19 ots9827

---

**OTS: ERROR: ots9827: specified XA linkage program is invalid.**

Explanation

XA linkage program specified in Transaction initial interface for OTS.

System Action

Terminates processing.

User Action

Specify the correct XA linkage program name in Transaction initial interface.

---

### 19.9.20 ots9828

---

**OTS: ERROR: ots9828: Invalid environment variable(%s) is specified.**

Variable Information

%s = Environment variable

Explanation

Environment variable not set.

System Action

Processing stops.

User Action

Correctly set the environment variable.

---

### 19.9.21 ots9829

---

**OTS: ERROR: ots9829: ObjectDirector was not started.**

Explanation

The CORBA Service has not been started.

System Action

Processing stops.

User Action

Start the CORBA Service and try again. If the CORBA Service has been started already, check for shortages in the resources that are required for operation.

---

### 19.9.22 ots9830

---

**OTS: ERROR: ots9830: ObjectDirector reported error. (%s-%d)**

## Variable Information

%s = Error Reason

%d = Error Information

## Explanation

There has been an error notification from the CORBA service.

## System Action

Processing stops.

## User Action

If %s is as shown in the following table, take the appropriate action and execute the process again.

Table 19.7 ots9830 Error Reason and Action

Error reason (%s)	Action
IDL: CORBA/StExcep/NO_MEMORY: 1.0	End all unnecessary programs and try again.

If %s is other than the above, use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer.

---

## 19.9.23 ots9831

**OTS: ERROR: ots9831: OTS or The resource management program was not available.**

## Explanation

The OTS system or resource control program is not in a usable state.

## System Action

Processing stops.

## User Action

Restart the OTS system or resource control program and execute the process again.

---

## 19.9.24 ots9832

**OTS: ERROR: ots9832: There was not enough resource. : DETAIL=%d1 CODE=%d2**

## Variable Information

%d1 = Error Information 1

%d2 = Error Information 2

## Explanation

A resource shortage has occurred.

## System Action

Processing stops.

## User Action

Add the memory and resources required for operation.

If there is no problem with the system-estimated value, use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer.

---

## 19.9.25 ots9833

---

**OTS: ERROR: ots9833: System is invalid state. (%d1-%d2)****Variable Information**

%d1 = Error Information 1

%d2 = Error Information 2

**Explanation**

An internal conflict has been detected.

**System Action**

Processing stops.

**User Action**

Use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer.

---

**19.9.26 ots9834**

---

**OTS: ERROR: ots9834: The object reference could not found. (%s1-%s2)****Variable Information**

%s1 = Type

%s2 = Error Reason

**Explanation**

Could not get object reference.

**System Action**

Processing stops.

**User Action**

Take the action specified for each error reason and error type:

Table 19.8 ots9834 Error Reasons and Actions

type (%s1)	Error reason (%s2)	Action
Naming Service or Implementation Repository	IDL: CORBA/StExcep/NO_IMPLEMENT: 1.0	Check the Naming Service status. If it has not started already, start the Naming Service.
	IDL: CORBA/StExcep/NO_MEMORY: 1.0	Add the memory and resources required for operation.

If %s1 and %s2 are other than the above, or if the problem is not solved after appropriate action is taken, use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer.

---

**19.9.27 ots9835**

---

**OTS: ERROR: ots9835: Information for the resource management program registered could not be found. : %s1 %s2****Variable Information**

%s1 = Error information 1

%s2 = Error information 2

## Explanation

Cannot reference the resource control program registration information because an old version of the resource control program is still registered.

## System Action

Processing stops.

## User Action

Use the Resource Control Program Registration Information Restore/Delete tool to manipulate the registration information from the previous version, and then perform the processing again.

Refer to the OLTP Server User's Guide for information regarding the Resource Control Program Registration Information Restore/Delete tool.

## 19.9.28 ots9836

---

### OTS: ERROR: ots9836: System call error occurred.(%d1-%d2-%s)

#### Variable Information

%d1 = Error Information 1

%d2 = Error Information 2

%s = Error Information 3

#### Explanation

A system function invoke error has occurred, or there may be a memory shortage.

#### System Action

Processing stops.

#### User Action

If there is a memory shortage, execute the process again later. If this message is generated frequently, refer to the Tuning Guide, reestimate the memory that is needed to run Interstage, and confirm that there is enough memory.

If there is enough memory to run Interstage, it may be that there is inadequate memory to run other applications. Reestimate the amount of memory required for the other applications running on the same machine to determine if there is an appropriate amount of memory.

Contact your system administrator if the reestimation indicates that the memory is insufficient. Ask the system administrator to either increase the size of the main memory or to increase the size of the page file.

If there is enough memory, use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer.

## 19.9.29 ots9837

---

### OTS: ERROR: ots9837: The resource management program was not registered. : NAME=%s CODE=%d

#### Variable Information

%s = Resource Definition Name

%d = Error Information

#### Explanation

An attempt has been made to operate an unregistered resource control program.

#### System Action

Processing stops.

User Action

Register the resource control program and try again.

### 19.9.30 ots9841

**OTS: ERROR: ots9841: Invalid environment variable(%s) is specified.**

Variable Information

%s = Environment Variable Name

Explanation

The specified environment variable is incorrect.

System Action

Processing stops.

User Action

Specify a valid environment variable.

### 19.9.31 ots9842

**OTS: ERROR: ots9842: File was not obtained. : %s1 %s2 %s3**

Variable Information

%s1 = Error Information 1

%s2 = Error Information 2

%s3 = Error Information 3

Explanation

A file could not be acquired.

System Action

Processing stops.

User Action

Contact a technician.

Check whether the file shown in error information 1 (%s1) exists. If it does not, do as described in the following table.

Table 19.9 Error Table for ots9842

Error information 1 (%s1)	Action
<p><b>Windows32/64</b></p> <p>FILE=C:\Interstage\ots\etc\RMP.properties</p>	<p>Copy the C:\Interstage\ots\default\RMP.properties.default file and paste it under C:\Interstage\ots\etc under. Change the file name to RMP.properties.</p> <p>For more information about how to write RMP.properties, refer to the Tuning Guide.</p>
<p><b>Solaris32/64</b></p> <p>FILE=/opt/FSUNots/etc/RMP.properties</p>	<p>Copy the /opt/FSUNots/default/RMP.properties.default file and paste it under /opt/FSUNots/etc under. Change the file name to RMP.properties.</p> <p>For more information about how to write RMP.properties, refer to the Tuning Guide.</p>
<p><b>Linux32/64</b></p> <p>FILE=/opt/FJSVots/etc/RMP.properties</p>	<p>Copy the /opt/FJSVots/default/RMP.properties.default file and paste it under /opt/FJSVots/etc under. Change the file name to RMP.properties.</p>

Error information 1 (%s1)	Action
	For more information about how to write RMP.properties, refer to the Tuning Guide.
<p><b>Windows32/64</b></p> <p>FILE=C:\Interstage\ots\etc\repository\resource.list</p> <p><b>Solaris32/64</b></p> <p>FILE=/opt/FSUNots/etc/repository/resource.list</p> <p><b>Linux32/64</b></p> <p>FILE=/opt/FJSVots/etc/repository/resource.list</p>	<p>Refer to the Interstage Operator's Guide and restore the file.</p> <p>If the problem is not solved even after reexecution, use the <i>iscollectinfo</i> command to collect investigation information, then contact a Fujitsu service engineer.</p>

## 19.9.32 ots9843

**OTS: ERROR: ots9843: The file is invalid. : %s1 %s2 %s3 %s4**

### Variable Information

%s1 = Error Information 1

%s2 = Error Information 2

%s3 = Error Information 3

%s4 = Error Information 4

### Explanation

There is an error in the file description.

### System Action

Processing stops.

### User Action

Refer to error information 1, and do as described in the following table.

Table 19.10 Error Table for ots9843

Error information 1 (%s1)	Action
<p><b>Windows32/64</b></p> <p>FILE=C:\Interstage\ots\etc\RMP.properties</p> <p><b>Solaris32/64</b></p> <p>FILE=/opt/FSUNots/etc/RMP.properties</p> <p><b>Linux32/64</b></p> <p>FILE=/opt/FJSVots/etc/RMP.properties</p>	Refer to the Tuning Guide, and rewrite the file correctly.
<p><b>Windows32/64</b></p> <p>FILE=C:\Interstage\ots\etc\repository\resource.list</p> <p><b>Solaris32/64</b></p> <p>FILE=/opt/FSUNots/etc/repository/resource.list</p> <p><b>Linux32/64</b></p>	<p>Refer to the Interstage Operator's Guide and restore the file.</p> <p>If the problem is not solved even after reexecution, use the <i>iscollectinfo</i> command to collect investigation information, then contact a Fujitsu service engineer.</p>

Error information 1 (%s1)	Action
FILE=/opt/FJSVots/etc/repository/resource.list	

## 19.9.33 ots9844

**OTS: ERROR: ots9844: The transaction controlling was failed. : METHOD=%s1 EXCEPTION=%s2 CODE=%d1 %d2**

### Variable Information

%s1 = Transaction controlling

%s2 = Exception that occurred

%d1 = Error code 1

%d2 = Error code 2

### Explanation

Transaction operation failed.

### System Action

Processing stops.

### User Action

Determine the cause, remove it, and reexecute.

Check whether any of the following causes is applicable. If it is, clear the cause, and then perform the operation again.

- Either rollback or commit transaction operation was performed without closing the connection.
- Either rollback or commit transaction operation was performed after transaction time-out had occurred.
- OTS is not started.

If %s1 and %s2 are as shown in the following table, take the appropriate action and execute the process again.

If %s2 is javax.transaction.SystemException, it is conceivable that OTS is not started, Naming Service is not started, or ORB setting is wrong. For the details of ORB setting, refer to "Specifying ORB (Object Request Broker)" in the Distributed Application Development Guide (CORBA Service Edition).

If there is another error message displayed at the same time, refer to the message, clear the cause of the error, and execute the command again.

If the problem is not solved even after appropriate action is taken, use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer.

Table 19.11 ots9844 Transaction controlling , Exception and Countermeasures

Transaction controlling (%s1)	Exception that occurred (%s2)	Countermeasures
begin	javax.transaction. NotSupportedException	The nested transaction is not supported. Finish the transaction and reexecute.
	javax.transaction.SystemExceptio n	When maintenance code 2(%x2) is 0x540f0002, the OTS system is not started. Execute it again by starting the OTS system. Moreover, follow the message when another message has been output before this message is output.
commit	java.lang. IllegalStateException	The transaction has not started. Start the transaction.

Transaction controlling (%s1)	Exception that occurred (%s2)	Countermeasures
	java.lang. SecurityException	An attempt was made to finish the transaction by an application that did not start it. Finish using the application that started the transaction.
	javax.transaction. RollbackException	The transaction is rolled back or is specified to the Rollback.  When the error code 2 (%d2) is 0x00000003, roll back the transaction.
	javax.transaction.HeuristicMixed Exception	The transaction can have been completed by the judgment of the resource manager.  Execute the recovery processing by reactivating the resource management program.
	javax.transaction.HeuristicRollba ckException	The transaction can have been rolled back by the judgment of the resource manager.  Execute the recovery processing by reactivating the resource management program.
	javax.transaction.SystemExceptio n	When another message has been output before this message is output, follow the recommendations of the first message.
rollback	java.lang. IllegalStateException	The transaction has not started or is rolled back. Start the transaction.
	java.lang.SecurityException	It started completing the transaction excluding the application which began the transaction. Please complete it by the beginning application.
	javax.transaction.System Exception	When another message has been output before this message is output, follow the recommendations of the first message.
setRollbackOnly	java.lang. IllegalStateException	The transaction has not started or is rolled back. Start the transaction.
	javax.transaction.System Exception	When another message has been output before this message is output, follow the recommendations of the first message.
resume	javax.transaction. InvalidTransaction Exception	The transaction is already related to the thread. Finish the transaction and reexecute.
	java.lang. IllegalStateException	Not in the suspend state. Either stop executing this process, or execute after suspending.
	javax.transaction.System Exception	When another message has been output before this message is output, follow the recommendations of the first message.
suspend	java.lang. IllegalStateException	The transaction has not started. Start the transaction.
	javax.transaction.System Exception	When another message has been output before this message is output, follow the recommendations of the first message.
enlistResource	java.lang.	The transaction has not started. Start the transaction.

Transaction controlling (%s1)	Exception that occurred (%s2)	Countermeasures
	IllegalStateException	
	javax.transaction. RollbackException	The transaction is set to Rollback. Rollback the transaction.
	javax.transaction.xa. XAException	The database cannot be used or the transaction is rolled back. If characters beginning with XA_RB are included in the exception that occurred (%s2), it means that the transaction is rolled back, so start the transaction anew. If not, the problem may be that the database is not activated or telecommunication cannot be made.  Refer to the database manual regarding the details of the error.
	com.fujitsu.interstage.ots. jts.RegistFailure: org.omg.NO_IMPLEMENT	The OTS system is not running. Please start the OTS system.
	com.fujitsu.interstage.ots. jts.RegistFailure: org.omg.NO_MEMORY	The number of maximum resources in which it was able to participate in the transaction was exceeded.  Review the composition of the application, and set the number of applications to participate in one transaction in PARTICIPATE value (32) as follows.
	com.fujitsu.interstage.ots. jts.RegistFailure: org.omg.TRANSACTION_ROL LEDBACK	The transaction is set to rollback. Roll back this transaction now.
	com.fujitsu.interstage.ots. jts.RegistFailure: org.omg.TRANSACTION_ REQUIRED	The transaction is not begun. Begin the transaction.
	com.fujitsu.interstage.ots.jts.Regi stFailure: org.omg.INVALID_ TRANSACTION	An illegal transaction context spread. Please review the environment of the system.  If the situation does not change even after appropriate action is taken, use the <i>iscollectinfo</i> command to collect investigation information, then contact a Fujitsu service engineer.
	com.fujitsu.interstage.ots. jts.RegistFailure: Other CORBA errors	The error occurred by the OTS system or the CORBA service.  When another message has been output before this message is output, follow the recommendations of the first message.
	javax.transaction.System Exception	When another message has been output before this message is output, follow the recommendations of the first message.
	oracle.jdbc.xa. OracleXAException. XAER_NOTA	If this message is output during rollback/commit transaction operations, it may mean that Connection close processing was not performed in the application.  Check whether Connection close processing was performed correctly in the application.
delistResource	java.lang.	The transaction has not started. Start the transaction.

Transaction controlling (%s1)	Exception that occurred (%s2)	Countermeasures
	IllegalStateException	
	javax.transaction.xa.XAException	The database cannot be used or the transaction is rolled back. If characters beginning with XA_RB are included in the exception that occurred (%s2), it means that the transaction is rolled back, so start the transaction anew. If not, the problem may be that the database is not activated or telecommunication cannot be made.  Refer to the database manuals regarding the details of the error.
	javax.transaction.SystemException	When another message has been output before this message is output, follow the recommendations of the first message.
	oracle.jdbc.xa.OracleXAException.XAER_NOTA	If this message is output during rollback/commit transaction operations, it may mean that Connection close processing was not performed in the application.  Check whether Connection close processing was performed correctly in the application.
getstatus	javax.transaction.SystemException	When another message has been output before this message is output, follow the recommendations of the first message.
setTransactionTimeout	javax.transaction.SystemException	When another message has been output before this message is output, follow the recommendations of the first message.
registerSynchronization	java.lang.IllegalStateException	The transaction has not started. Start the transaction.
	javax.transaction.RollbackException	The transaction is set to the Rollback. Rollback the transaction.
	javax.transaction.SystemException	When another message has been output before this message is output, follow the recommendations of the first message.

### 19.9.34 ots9845

**OTS: ERROR: ots9845: Information of file was not obtained. : %s1 %s2 %s3**

#### Variable Information

%s1 = Error information 1

%s2 = Error information 2

%s3 = Error information 3

#### Explanation

The file information could not be acquired.

#### System Action

Processing stops.

## User Action

In high-security environments, some specific resources may not be accessible. Contact the system administrator to obtain permission to access them.

Alternatively, the OTS system environment may have not been assembled correctly or has become corrupted.

If the problem persists after the OTS system is reconfigured, use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer.

## 19.9.35 ots9846

---

**OTS: ERROR: ots9846: Failed to get an object. : %s1 %s2 %s3**

### Variable Information

%s1 = Error Information 1

%s2 = Error Information 2

%s3 = Error Information 3

### Explanation

Could not obtain the object.

### System Action

Processing stops.

### User Action

Set the path of the driver for resource manager to the class path of J2EE Properties in the Interstage Management Console correctly.

## 19.9.36 ots9847

---

**OTS: ERROR: ots9847:Resource management program is not running. : EXCEPTION=%s**

### Variable Information

%s = Exception occurred

### Explanation

The Resource management program has not started.

### System Action

Processing stops.

### User Action

Proceed according to the message displayed prior to this message.

## 19.9.37 ots9848

---

**OTS: INFO: ots9848: Recovery process of the resource manager is started. : NAME=%s**

### Variable Information

%s = Resource definition name

### Explanation

Recovery process of the resource manager will be started.

## 19.9.38 ots9849

**OTS: INFO: ots9849: Recovery process of the resource manager is finished. : %s1 %s2 %s3 %s4**

### Variable Information

- %s1 = Resource definition name
- %s2 = Number of targets of recovery
- %s3 = Maintenance code 1
- %s4 = Maintenance code 2

### Explanation

Failed in the recovery processing of resource manager.

## 19.9.39 ots9850

**OTS: WARNING: ots9850: Recovery process of the resource manager failed. : %s1 %s2 %3**

### Variable Information

- %s1 = Resource definition name
- %s2 = Maintenance code 1
- %s3 = Maintenance code 2

### Explanation

Failed in the recovery processing of resource manager

### System Action

Processing stops.

### User Action

Take the following action, then reexecute processing.

- If %s3 is one of the following, take the action recommended in the Countermeasures column.

Table 19.12 ots9850 Error Information and Countermeasures

Error information (%s3)	Countermeasures
com.fujitsu.interstage.ots.jts.ResourceException	An error has occurred in the resource manager. Check the state of the resource manager and restart the transaction manager (JTSRMP).
com.fujitsu.interstage.ots.jts.FjtsResourceNotFound Exception	The JTS resource definition information may be invalid. Refer to the resource definition information to check whether the information is set correctly.
java.lang.ClassCast Exception	Set the path of the driver for resource manager to the class path of J2EE Properties in the Interstage Management Console correctly.
java.sql.SQLException	An error has occurred during the establishment of a connection to the resource manager. Check whether the resource manager has been started correctly and restart the transaction manager (JTSRMP).
javax.transaction.xa.XAException	If Oracle was used as the resource manager, there may be insufficient connected user access privileges. Refer to "Procedure for Using JTS", "Flow to Operation Start", "Notes on using Oracle as a resource manager" in the "Operating J2EE Applications" chapter of the "J2EE User's Guide", then take action.

Error information (%s3)	Countermeasures
Error other than the above	A system-dependent error may have occurred. Restart the system and reexecute processing. If the problem is not solved, an internal error may have occurred; use the <i>iscollectinfo</i> command to collect investigation information, then contact a Fujitsu service engineer.

- If any other error message is output at the same time, refer to the error rectification instructions in that message to remove the cause of the error.
- The resource definition name (%s1) specified in the RMP property may be incorrect. Check whether the name is the registered resource name. If it is not, specify a correct name. For detailed information about the RMP property, refer to "RMP Property" in the "Database Linkage Service Environment Definition" appendix of the Tuning Guide.

If the problem is not solved even after appropriate action is taken, use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer.

## 19.9.40 ots9851

**OTS: INFO: ots9851: Recovery process of transaction is started. : NAME=%s1 XID=%s2 CODE=%s3 %s4**

### Variable Information

- %s1 = Resource definition name
- %s2 = XID
- %s3 = Maintenance code 1
- %s4 = Maintenance code 2

### Explanation

Recovery process of transaction is started.

## 19.9.41 ots9852

**OTS: INFO: ots9852: Recovery process of transaction is finished. : NAME=%s1 XID=%s2 CODE=%s3 %s4**

### Variable Information

- %s1 = Resource definition name
- %s2 = XID
- %s3 = Maintenance code 1
- %s4 = Maintenance code 2

### Explanation

Recovery process of transaction is completed.

## 19.9.42 ots9853

**OTS: ERROR: ots9853: Recovery process of transaction failed.: NAME=%s1 XID=%s2 EXCEPTION=%s3 CODE=%s4 %s5**

### Variable Information

- %s1 = Resource definition name
- %s2 = XID
- %s3 = Error Information
- %s4 = Maintenance code 1
- %s5 = Maintenance code 2

## Explanation

Failed in the recovery processing of transaction.

## User Action

Investigate the cause and remove the cause. After removing the cause, reexecute the command.

If error information %s3 is described in the following table, take countermeasures according to the reasons and actions shown. After that reexecute the process.

If there is any other message that is output at the same time, refer to that message to remove the cause of the error. Then, reexecute the command.

Table 19.13 ots9853 Error Reasons and Actions

Error Information (%s3)	Reasons and Actions
org.omg.NO_IMPLEMENT	The OTS system is not started up yet. After the OTS system is started up, reexecute the command.
org.omg.NO_RESOURCES	Memory space is possibly short. After a short period of time reexecute the process.  If this message is output frequently, reestimate the memory space that is necessary to run Interstage by referring to the Tuning Guide, and check that sufficient memory space has been allocated.
org.omg.TRANSACTION_ROLLEDBACK	The transaction is in a status in which recovery cannot be executed. Review the environment of resource manager. If resource manager is free from any problems, an error has possibly occurred in the OTS system. Please contact an engineer.
An error of other CORBA services.	The CORBA service is not in a usable status. Check status of the CORBA service and reexecute the command.
Errors other than the above.	An error that depends on the system has possibly occurred. Restart the system and execute the command again.  If the problem is not solved, an internal error may have occurred; use the <i>iscollectinfo</i> command to collect investigation information, then contact a Fujitsu service engineer.

If the problem is not solved even after appropriate action is taken, use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer.

## 19.9.43 ots9854

### OTS: ERROR: ots9854: TransactionService initialization failed. : %s1 %s2

#### Variable Information

%s1 = Error information 1

%s2 = Error information 2

#### Explanation

Initialization of the Transaction Service failed. The initialization of Transaction Service (TransactionService.identifyORB interface) is invoked upon issuance of ORB\_init, only when Dcom.fujitsu.ObjectDriector.CORBA.GlobalTransactionMode=True is specified in the property of the application. An error occurred in this operation.

#### System Action

Processing stops.

## User Action

Take the following action, then reexecute processing.

- The client application must have `fjtsclient.jar` specified for the class path. Specify the correct class path, and perform the operation again.
- If the `ots9845` message was generated immediately before this one, see instructions for `ots9845`.
- Check whether Database Linkage Service is installed correctly.
- Check that CORBA Service and OTS is active.
- If there is another message output at the same time, refer to the message, clear the cause of the error, and then execute the command again.

If the problem is not solved even after appropriate action is taken, use the `iscollectinfo` command to collect investigation information, then contact a Fujitsu service engineer.

## 19.9.44 ots9855

---

**OTS: INFO: ots9855: The connection to the resource manager was established. : PID=%s1 NAME=%s2 CODE=%s3**

### Variable Information

%s1 = Process ID

%s2 = Resource definition name

%s3 = Maintenance code

### Explanation

Connection to resource manager is completed.

## 19.9.45 ots9856

---

**OTS: ERROR: ots9856: Shared memory overlaps. : INFO=%s1 ADDRESS=%s2 CODE=%d1 %d2**

### Variable Information

%s1 = Shared memory information

%s2 = Shared memory address

%s3 = Maintenance code 1

%s4 = Maintenance code 2

### Explanation

A collision has occurred between the identifiers when obtaining shared memory. The shared memory that is not obtained by the database linkage service, is going to be referred to. It is going to refer to the shared memory which is not a shared memory which database linkage service acquired.

### System Action

Processing stops.

### User Action

Take the following measures.

1. Stop all services.
  - `otsstop -f`
  - `otsstoprsc -f -n Resource definition name`

- otstoprsc -f -j

2. Save the file /opt/FJSVots/etc/sysconfig once, and delete /opt/FJSVots/etc/sysconfig. Recovey the saved file by copying the sysconfig file to /opt/FJSVots/etc.
3. Reregister all of the resource definition files.

## 19.9.46 ots9857

---

**OTS: ERROR: ots9857: The connection to the resource manager was established. : NAME :%s1 XID=%x1 EXCEPTION=%s2 CODE=%x2 %x3**

### Variable Information

%s1 = Resource definition name

%x1 = XID

%s2 = Exception

%x2 = Maintenance code 1

%x3 = Maintenance code 2

### Explanation

Because the number of resources has exceeded the upper limit of the resources that can participate in the transaction, this application cannot participate in the transaction.

### User Action

Review configuration of the application and reduce the number of applications the PARTICIPATE value (32) or less.

## 19.9.47 ots9859

---

**OTS: ERROR: ots9859:The OTS system is inactive.: METHOD=%s1 EXCEPTION=%s2 CODE=%x1 %x2**

### Variable Information

%s1 = Function name

%s2 = Exception that occurred

%x1 = Maintenance code 1

%x2 = Maintenance code 2

### Explanation

The OTS system has not started.

### System Action

The system has suspended processing specified by METHOD because the OTS system is not running.

### User Action

Start the OTS system.

## 19.9.48 ots9860

---

**OTS: INFO: ots9860:In-doubt transaction was detected. : NAME=%s NUM=%d**

### Variable Information

%s = Resource definition name

%d = Number of in-doubt transactions

## Explanation

In-doubt transactions were detected during the resource manager recovery process.

### 19.9.49 ots9861

---

**OTS: WARNING: ots9861:Failed to create or write to the JTS log file. : EXCEPTION=%s CODE=%x1 %x2**

#### Variable Information

%s = Function name

%x1 = Maintenance code 1

%x2 = Maintenance code 2

#### Explanation

An error has occurred when creating or writing to the JTS log file, which may have been caused by:

- Insufficient disk space.
- Insufficient system resources.
- Invalid content defined for the JTS log definition.

#### System Action

One of the following will occur:

- If the error occurred during log output and is temporary, then the log output process will continue.
- If the error occurred during log creation, then the process will continue but log output will be disabled.

#### User Action

Take the following action, and then restart the application in which the error was detected:

- If there is insufficient disk space, then delete unnecessary files.
- Make sure that there are sufficient system resources.
- Make sure that the content defined for the JTS log definition is valid.

### 19.9.50 ots9862

---

**OTS: WARNING: ots9862:Failed to write to the JTS log file. : EXCEPTION=%s1 DATA=%s2 CODE=%x1 %x2**

#### Variable Information

%s1 = Function name

%s2 = Log information

%x1 = Maintenance code 1

%x2 = Maintenance code 2

#### Explanation

An error has occurred when writing to the JTS log file, which may have been caused by:

- Insufficient disk space.
- Insufficient system resources.

#### System Action

One of the following will occur:

- If the error is temporary, then the log output process will continue.
- If the error is ongoing, then the process will continue but the log output will be disabled.

#### User Action

Take the following action, and then restart the application in which the error was detected:

- If there is insufficient disk space, then delete unnecessary files.
- Make sure that there are sufficient system resources.

### 19.9.51 ots9870

---

**OTS: INFO: ots9870: Command ended normally.**

#### Explanation

The command has terminated normally.

### 19.9.52 ots9871

---

**OTS: ERROR: ots9871: Restore process failed. Error information(%s)**

#### Variable Information

%s = Error Information

#### Explanation

Failed in the restore process.

#### System Action

Stops the processing.

#### User Action

Refer to the error message that is output at the same time, remove the cause of the error and execute the command again.

### 19.9.53 ots9872

---

**OTS: ERROR: ots9872: Backup process failed. Error information(%s)**

#### Variable Information

%s = Error Information

#### Explanation

Failed in the backup process.

#### System Action

Stops the processing.

#### User Action

Refer to the error message that is output at the same time, remove the cause of the error and execute the command again.

### 19.9.54 ots9873

---

**OTS: INFO: ots9873: Backup process is started.**

#### Explanation

Backup process of OTS is started.

## 19.9.55 ots9874

---

**OTS: INFO: ots9874: Restore process is started.**

### Explanation

The restore process of the OTS backup resource is started.

## 19.9.56 ots9875

---

**OTS: INFO: ots9875: Backup process ended normally.**

### Explanation

The OTS backup process has terminated normally.

## 19.9.57 ots9876

---

**OTS: INFO: ots9876: Restore process ended normally.**

### Explanation

The restore process of the OTS backup resource has terminated normally.

## 19.9.58 ots9877

---

**OTS: ERROR: ots9877: Backup terminated abnormally.**

### Explanation

The backup processing has terminated abnormally.

### System Action

Stops the processing.

### User Action

Refer to the error message that is output at the same time, remove the cause of the error and execute the command again.

## 19.9.59 ots9878

---

**OTS: ERROR: ots9878: Restore terminated abnormally.**

### Explanation

The restore processing has terminated abnormally.

### System Action

Stops the processing.

### User Action

Refer to the error message that is output at the same time, remove the cause of the error and execute the command again.

## 19.9.60 ots9879

---

**OTS: ERROR: ots9879: The option specification is incorrect.**

### Explanation

There is an error in the option that is designated to the command.

#### System Action

Stops the processing.

#### User Action

Designate the correct option and execute the command again.

### 19.9.61 ots9880

---

#### **OTS: ERROR: ots9880: The backup directory is not specified.**

#### Explanation

The backup directory is not designated as an option of the command.

#### System Action

Stops the processing.

#### User Action

Designate the correct backup directory as an option of the command and execute the command again.

### 19.9.62 ots9881

---

#### **OTS: ERROR: ots9881: The backup directory is not specified.**

#### Explanation

The backup directory that is designated as an option of the command does not exist.

#### System Action

Stops the processing.

#### User Action

Designate the correct backup directory as an option of the command and execute the command again.

### 19.9.63 ots9882

---

#### **OTS: ERROR: ots9882: The backup resources already exist in the specified directory.**

#### Explanation

Because a backup resource already exists in the backup directory that is designated by the command, the processing is stopped.

#### System Action

Stops the processing.

#### User Action

The backup operation cannot be executed more than once to the same folder. Designate the correct backup directory as an option of the command and execute the command again.

### 19.9.64 ots9883

---

#### **OTS: ERROR: ots9883: Permission denied.**

#### Explanation

The authority to execute the command is not given.

## System Action

Stops the command processing.

## User Action

The backup/restore command can be executed only by a user who has the administrator authority. Reexecute the command as a user who has the administrator authority.

## 19.9.65 ots9884

---

**OTS: ERROR: ots9884: Interstage started.**

### Explanation

Because Interstage in the process of startup, the command cannot be executed.

### System Action

Stops the processing.

### User Action

After all services of Interstage are stopped, execute the command again.

## 19.9.66 ots9885

---

**OTS: ERROR: ots9885: A necessary resource does not exist. Error information(%s)**

### Variable Information

%s = Error Information

### Explanation

Because the target resources that are necessary for backup or restore of environment do not exist, the command cannot be executed.

### System Action

Stops the processing.

### User Action

If this error occurs during execution of the backup process, the OTS is possibly not installed correctly or the environment may have been destroyed. In such a case, reinstall the OTS.

If this error occurs during execution of the restore process, the backup resource may possibly have been destroyed. In such a case, execute the backup again and then perform the restore process for the correct resources.

## 19.9.67 ots9886

---

**OTS: ERROR: ots9886: An internal error was detected. Error information(%s)**

### Variable Information

%s = Error Information

### Explanation

A contradiction has occurred inside the system.

### System Action

Stops the processing.

## User Action

If the error information is another value, use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer.

---

### 19.9.68 ots9887

---

#### **OTS: ERROR: ots9887: A memory shortage occurred.**

##### Explanation

Shortage of memory space has occurred.

##### System Action

Stops the processing.

##### User Action

After a short period of time execute the process again. If this message continues to be output, reestimate the memory space that is required for running Interstage by referring to the Tuning Guide, and confirm that sufficient memory space is available.

If sufficient memory space is already available for Interstage, the memory space for other applications is possibly insufficient. Reestimate the memory space that is necessary for other applications that are running on the same machine, and determine whether sufficient memory space has been provided.

If insufficient memory space is found as the result of the above reestimations, contact a system administrator. The system administrator must increase the memory space or extend the page file.

---

### 19.9.69 ots9888

---

#### **OTS: ERROR: ots9888: A disk resource shortage occurred.**

##### Explanation

The required disk space is insufficient in the backup destination or in the restore destination.

##### System Action

Stops the processing.

##### User Action

Secure the free disk space and execute the command again.

---

### 19.9.70 ots9889

---

#### **OTS: ERROR: ots9889: An I/O error occurred. Error information (%s)**

##### Explanation

Input/output error has occurred.

##### System Action

Stops the processing.

##### User Action

The disk device or media in which backup resource or Interstage is installed.

---

### 19.9.71 ots9890

---

#### **OTS: ERROR: ots9890: A system error occurred. Error information(%d)**

## Variable Information

%d = Error Information

## Explanation

Input/output error has occurred.

## System Action

Stops the processing.

## User Action

If error information (%d) is 0, the message which follows will identify the primary cause of the error. Follow the advice in the message to rectify the problem.

If the error information (%d) is another value, use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer.

## 19.9.72 ots9891

---

**OTS: ERROR: ots9891: The specified system name does not exist or it is a reserved word.**

### Explanation

The system name specified in the command option contains an error, or it uses a reserved word. The command could not be executed.

### System Action

Processing stops.

### User Action

Specify a valid system name and execute the command again.

Note: The following system names are reserved and cannot be used: "td001", "ec001"

## 19.9.73 ots9892

---

**OTS: ERROR: ots9892: The specified system name is incorrect.**

### Explanation

The system name specified in the command option contains invalid characters.

### System Action

Processing stops.

### User Action

Specify a valid system name and execute the command again.

Note: Valid characters for the system name are: alpha-numeric (A to Z; a to z and 0 to 9). However, a numeric value cannot be used as the first character of the system name.

## 19.9.74 ots9893

---

**OTS: ERROR: ots9893: The specified system name is too long.**

### Explanation

The system name specified in the command option exceeds 8 bytes. The command could not be executed.

### System Action

Processing stops.

#### User Action

Specify a system name of the 8 or fewer bytes, and execute the command again.

### 19.9.75 ots9894

---

#### **OTS: ERROR: ots9884: INTERSTAGE started.**

#### Explanation

Because Interstage is in the process of startup, the command cannot be executed.

#### System Action

Stops the processing.

#### User Action

After all services of Interstage are stopped, execute the command again.

### 19.9.76 ots9895

---

#### **OTS: ERROR: ots9885: A necessary file does not exist Error information. Error information(%s)**

#### Variable Information

%s = Error Information

#### Explanation

Because the target resources that are necessary for backup or restore of environment do not exist, the command cannot be executed.

#### System Action

Stops the processing.

#### User Action

If this error occurs during execution of a backup process, the OTS is possibly not installed correctly or the environment may have been destroyed. In such a case, reinstall the OTS.

If this error occurs during execution of a restore process, the backup resource may have been destroyed. In such a case, execute the backup again and perform the restore process for the correct resources.

### 19.9.77 ots9896

---

#### **OTS: ERROR: ots9886: An internal error was detected Error information. Error information(%s)**

#### Variable Information

%s = Error Information

#### Explanation

A contradiction has occurred inside the system.

#### System Action

Stops the processing.

#### User Action

An internal contradiction has occurred. Take note of the message number and the variables information, and contact an engineer.

### 19.9.78 ots9897

---

---

**OTS: ERROR:ots9897: The number of option is incorrect.****Explanation**

Number of options that are designated by the command contains an error.

**System Action**

Stops the command processing.

**User Action**

Designate the correct options and execute the command again.

---

**19.9.79 ots9898**

---

**OTS: ERROR:ots9898: The specified backup resource can not restore to the specified system name.****Explanation**

The backed-up resource could not be restored. The restore process could not be executed because the combination between the level of the system to be restored and the level of the backup resource system is incorrect.

**System Action**

Processing stops.

**User Action**

Execute the restore process using the correct combination between the backup resource and the restore destination. Refer to the Interstage Operator's Guide for details.

---

**19.9.80 ots9899**

---

**OTS: INFO: ots9899: The resource manager reported information. (%s1-%s2-%d)****Variable Information**

%s1 = Information 1

%s2 = Information 2

%d = Information 3

**Explanation**

The information is reported from the resource control program.

---

**19.10 ots9900 to ots9999**

This section details the messages with message numbers between ots9900 and ots9999.

---

**19.10.1 ots9901**

---

**OTS: INFO: ots9901:OTS service started.****Explanation**

The OTS service has started.

---

**19.10.2 ots9902**

---

**OTS: INFO: ots9902:OTS service stopped.**

## Explanation

The OTS service has stopped.

### 19.10.3 ots9903

---

#### **OTS: ERROR: ots9903:OTS service is not started.**

## Explanation

The OTS service has not started because another service was running.

## System Action

Stops the processing.

## User Action

After the operation of the other service is complete, start the OTS service, then reexecute the command.

### 19.10.4 ots9910

---

#### **OTS: ERROR: ots9910:OTS system error occurred.: (%d1:%s:%d2:%d3)**

## Variable Information

%d1 = Process identifier (decimal)

%s = Internal information 1 (function name)

%d2 = Internal information 2 (Error code)

%d3 = Internal information 3 (Line number)

## Explanation

A system error was found in the OTS service and library process.

## System Action

Stops the processing.

## User Action

Check the error and remove the cause, then restart the OTS system service.

### 19.10.5 ots9911

---

#### **OTS: ERROR: ots9911:OTS is not installed correctly.: (%d1:%d2:%d3)**

## Variable Information

%d1 = Process identifier (decimal)

%d2 = Internal information1 (decimal)

%d3 = Internal information2 (decimal)

## Explanation

The OTS is not installed correctly.

## System Action

Stops the processing.

## User Action

Registry installation information cannot be retrieved, or the information has been destroyed. Reinstall the OTS.

## 19.10.6 ots9912

---

**OTS: ERROR: ots9912:Requests exceed limit of OTS environment request parameter.: (%s)**

### Variable Information

%s = Operand name

### Explanation

Requests exceed the OTS environment request parameter limit.

### System Action

Stops the processing.

### User Action

Correct the operand setting value (shown in [Variable Information]) for the OTS operating environment in the setup file, then restart the OTS system service.

## 19.10.7 ots9913

---

**OTS: ERROR: ots9913:System error occurred. (%d1,%d2,%s1,%d3,%d4,%s2)**

### Variable Information

%d1 = Process id

%d2 = Thread id

%s1, %d3, %d4, %s2 = Maintenance information

### Explanation

A system error has occurred.

### System Action

Stops the processing.

### User Action

An internal conflict or system error may have occurred; use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer. Restart the OTS system.

## 19.10.8 ots9914

---

**OTS: WARNING: ots9914: Parameter (%s) in ini-file of database linkage service was exceeded. The value is set to the default(%d).**

### Variable Information

%s = Parameter name in OTS.ini file

%d = Default value for parameter

### Explanation

The value specified with parameter in OTS.ini file for OTS is exceeded the range which can be specified. The value is set to the default and processing is continued.

### User Action

OTS operates with initial value. When changing value, it needs to be set as OTS.ini file.

## 19.10.9 ots9915

---

**OTS: ERROR: ots9915: Error occurred in message (Message Number: %d1) output operation. (%s,%d2).**

### Variable Information

%d1 = Originally output message ID

%s = Failed operation

%d2 = Detailed information

### Explanation

An error occurred during message output.

### System Action

Stops the processing.

### User Action

Refer to the following table and take the appropriate action.

Table 19.14 ots9915 Variable Information and Action

Variable information (%s)	Variable information (%d2)	Action
FormatMessage	1452	A resource shortage has occurred. Add memory space and resources required for the operation.  If there is no problem with the system-estimated value, use the <i>iscollectinfo</i> command to collect investigation information, then contact a Fujitsu service engineer.
	Other than 1452	An error has occurred in the FormatMessage function.  Use the <i>iscollectinfo</i> command to collect investigation information, then contact a Fujitsu service engineer.
Invalid argument	0	An internal conflict has occurred.
No ID	0	Use the <i>iscollectinfo</i> command to collect investigation information, then contact a Fujitsu service engineer.

## 19.10.10 ots9916

---

**OTS: ERROR: ots9916:There was not enough memory.: (%d1:%s:%d2:%d3)**

### Variable Information

%d1 = Process identifier (decimal)

%s = Internal information 1 (function name)

%d2 = Internal information 2 (error code)

%d3 = Internal information 3 (line number)

### Explanation

There was insufficient memory.

### System Action

Terminates the command processing.

## User Action

Execute the process again later. If this message is generated frequently, refer to the Tuning Guide, reestimate the memory required to run Interstage, and check whether there is enough memory.

If there is enough memory to run Interstage, it may be that there is inadequate memory to run other applications. Reestimate the amount of memory required for the other applications running on the same machine to determine if there is an appropriate amount of memory.

Contact your system administrator if the reestimation indicates that the memory is insufficient. Ask the system administrator to either increase the size of the main memory or to increase the size of the page file.

# Chapter 20 Messages Beginning with 'scs'

This chapter explains the messages beginning with 'scs'.

## 20.1 scs0000 to scs0999

---

### 20.1.1 scs0100

---

**SCS: INFO: scs0100: Interstage certificate environment was created**

Explanation

The Interstage certificate environment has been created.

### 20.1.2 scs0101

---

**SCS: INFO: scs0101: CSR was issued <filename>**

Variable Information

<filename> = CSR file name

Explanation

A CSR (certificate signing request) has been created.

### 20.1.3 scs0102

---

**SCS: INFO: scs0102: Self-sign certificate was issued**

Explanation

A self-sign certificate (site certificate) for testing has been created.

### 20.1.4 scs0103

---

**SCS: INFO: scs0103: Certificate was deleted**

Explanation

The specified certificate has been deleted.

### 20.1.5 scs0104

---

**SCS: INFO: scs0104: Certificate was imported**

Explanation

The specified certificate has been registered.

### 20.1.6 scs0105

---

**SCS: INFO: scs0105: CRL was imported**

Explanation

The specified CRL has been registered.

### 20.1.7 scs0106

---

---

**SCS: INFO: scs0106: No CRL was imported****Explanation**

There is no information to be displayed because no CRL is registered.

---

**20.1.8 scs0107**

---

**SCS: INFO: scs0107: Site certificate and private key was exported <filename>****Variable Information**

<filename> = File name of PKCS#12 data

**Explanation**

The specified site certificate and private key were exported from the Interstage certificate environment to a file in PKCS#12 data format.

---

**20.1.9 scs0108**

---

**SCS: INFO: scs0108: CA certificate was imported <nickname>****Variable Information**

<nickname> = Nickname of the CA certificate

**Explanation**

A CA certificate was extracted from PKCS#12 data and imported to the Interstage certificate environment.

---

**20.1.10 scs0109**

---

**SCS: INFO: scs0109: Site certificate was imported <nickname>****Variable Information**

<nickname> = Nickname of the site certificate

**Explanation**

A site certificate and its corresponding private key were extracted from PKCS#12 data and imported to the Interstage certificate environment.

---

**20.1.11 scs0110**

---

**SCS: ERROR: scs0110: Parameter error (No parameters have been entered)****Explanation**

A parameter required for command execution was not specified.

**User Action**

Check the command format displayed, or the command specification, and re-enter the command with the required parameters specified.

---

**20.1.12 scs0111**

---

**SCS: ERROR: scs0111: Parameter error (Parameters: <parameter>)****Variable Information**

<parameter> = Parameter

## Explanation

The parameter <parameter> was specified incorrectly. The error contents are indicated in <parameter>.

If, while restoring or importing resources collectively, the ISSCS\_TARGET or target is displayed in the <parameter> parameter, it means that Interstage certificate environment resources are not included in the resources to back up, and the restore/import fails.

## User Action

Check the command format displayed, or the command specification, and re-enter the command with a valid parameter specified.

Alternatively, check whether unspecifiable characters are used and whether the number of characters specified is incorrect, then re-execute the command by specifying the correct parameter.

If, while restoring or importing resources collectively, the ISSCS\_TARGET or target is displayed in the <parameter> parameter, add the Interstage certificate environment resources to the target resources, back them up, and then re-execute the command. Alternatively, when defining the resources for back up/restore, change the ISSCS\_TARGET or target definition value in the ISSCS section to "off" (this removes it as a target of resources for back up) and then re-execute the command. Alternatively, if ISSCS\_TARGET or option is displayed in the <parameter> parameter, specify the correct value for the ISSCS\_OPTION or option and then re-execute the command. For details about backing up and restoring resources collectively, refer to "Collective Maintenance" the Interstage Application Server Operator's Guide.

## 20.1.13 scs0112

---

**SCS: ERROR: scs0112: Invalid file name: PATH=<filename>**

### Variable Information

<filename> = Invalid file name

### Explanation

The specified file name <filename> contains a syntax error, or is too long, or is not a file.

### User Action

Specify the absolute path of the file. If the absolute path was specified, check the specified file name and re-enter the command with a valid file name specified.

## 20.1.14 scs0113

---

**SCS: ERROR: scs0113: Directory dose not exist: PATH=<directory>**

### Variable Information

<directory> = Directory name

### Explanation

The specified directory <directory> could not be found.

### User Action

Re-enter the command with a valid directory name specified.

## 20.1.15 scs0114

---

**SCS: ERROR: scs0114: File does not exist: PATH=<filename>**

### Variable Information

<filename> = File name

### Explanation

The specified file <filename> could not be found.

## User Action

Re-enter the command with a valid file name specified.

**Solaris32/64** **Linux32/64**

If the file name (<filename>) is "/etc/opt/FJSVisas/contractcertlist", check the installation environment for this product, and use the *iscollectinfo* command to collect diagnostic information. Send the error information to a Systems Engineer. The installation environment for this product may have been corrupted, or the environment may not have been installed correctly.

---

## 20.1.16 scs0115

---

### SCS: ERROR: scs0115: Incorrect password

#### Explanation

The length of the specified password is invalid, or the specified password contains an invalid character.

#### User Action

Specify the password with 6 to 128 characters, or use characters that can be specified. Refer to the command specifications for details of the characters that can be specified.

---

## 20.1.17 scs0116

---

### SCS: ERROR: scs0116: Password does not match

#### Explanation

The specified password does not match the registered password.

#### User Action

Specify a valid password, and re-enter the command.

---

## 20.1.18 scs0117

---

### SCS: ERROR: scs0117: Specified nickname's certificate already exists

#### Explanation

Another certificate has already been registered with the specified nickname.

#### User Action

Specify another valid nickname that is unique and re-enter the command. Note that the nickname is not case sensitive.

---

## 20.1.19 scs0118

---

### SCS: ERROR: scs0118: Invalid nickname

#### Explanation

The length of the specified nickname is invalid, or the specified nickname contains an invalid character.

#### User Action

Specify the nickname with 1 to 32 characters beginning with an alphanumeric character, or use characters that can be specified. Refer to the command specifications for details of the characters that can be specified.

---

## 20.1.20 scs0119

---

### SCS: ERROR: scs0119: Invalid character

## Explanation

A non-ASCII character is included in the specified characters.

## User Action

Re-enter the command with only ASCII characters specified.

## 20.1.21 scs0120

---

### SCS: ERROR: scs0120: Interstage certificate environment has not been created

## Explanation

An Interstage certificate environment has not been created.

## User Action

If the resources are backed up collectively, when defining the resources for back up/restore, change the ISSCS\_TARGET or target definition value in the ISSCS section to "off", and then re-execute the command. For details, refer to "Collective Maintenance" in the Interstage Application Server Operator's Guide.

If the back up command is not executed, use the *scsmakeenv* command to create an Interstage certificate environment, and then re-enter the command.

## 20.1.22 scs0121

---

### SCS: ERROR: scs0121: Nickname already registered as CSR

## Explanation

A private key and CSR (certificate signing request) have already been created with the specified nickname.

## User Action

Re-enter the command with another nickname specified. Alternatively, re-enter the command using the -o option if the specified certificate is a site certificate.

## 20.1.23 scs0122

---

### SCS: ERROR: scs0122: Specified certificate is not a site certificate

## Explanation

There was no private-key that has the specified nickname. The specified certificate could not be identified as your site certificate.

## User Action

When the specified certificate is your site certificate, specify the nickname of the private key designated when creating the CSR (certificate signing request) using the *scsmakeenv* command. Then re-execute the command. Otherwise, register it using the appropriate options.

## 20.1.24 scs0123

---

### SCS: ERROR: scs0123: Certificate does not match nickname

## Explanation

The specified nickname does not match the nickname of the private key specified when the CSR (certificate signing request) was created.

## User Action

Specify the nickname designated when creating the CSR (certificate signing request) using the *scsmakeenv* command, then re-execute the command. Alternatively, obtain a valid site certificate and re-execute the command.

## 20.1.25 scs0124

---

### SCS: ERROR: scs0124: Invalid country name

#### Explanation

An invalid country name was specified.

#### User Action

Use an ISO3166 country code (two alphabetic characters) to specify the country name.

## 20.1.26 scs0125

---

### SCS: ERROR: scs0125: Environment variable is not set (IS\_HOME)

#### Explanation

The environment variable IS\_HOME that should have been set during Interstage installation has not been set.

#### User Action

Check the Interstage installation environment. The environment may have been destroyed or may not have been installed correctly. Check the value of the environment variable IS\_HOME and use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer, or set the environment variable IS\_HOME correctly and re-enter the command.

## 20.1.27 scs0126

---

### SCS: ERROR: scs0126: Environment variable is not set (CLASSPATH)

#### Explanation

The environment variable CLASSPATH that should have been set during Interstage installation has not been set.

#### User Action

Check the Interstage installation environment. The environment may have been destroyed or may not have been installed correctly. Set the environment variable CLASSPATH correctly and re-enter the command.

## 20.1.28 scs0127

---

### SCS: ERROR: scs0127: Exceeded maximum number of password retries

#### Explanation

Password input processing was cancelled because an invalid password was entered more times than allowed.

#### User Action

Re-enter the command, then enter a valid password and retype it for confirmation.

## 20.1.29 scs0128

---

### SCS: ERROR: scs0128: Certificate not found

#### Explanation

The certificate with the specified nickname could not be found. The specified nickname may be invalid. If the *scsexpfx* command was executed, the certificate with the specified nickname is not a site certificate.

#### User Action

Re-enter the command with a valid nickname specified.

Alternatively, use the Interstage management console to check the certificate nickname registered. If the *scsexpfix* command was executed, re-execute the command by specifying the nickname of a site certificate.

## 20.1.30 scs0129

---

### SCS: ERROR: scs0129: Invalid certificate

#### Explanation

A certificate could not be identified. Three possible causes are as follows:

- The specified data is not a certificate.
- The certificate data is damaged.
- The certificate data cannot be analyzed.

#### User Action

Contact the issuer of the certificate and obtain a valid certificate.

Alternatively, check whether the data was obtained according to the correct procedure. Obtain certificate data in binary data format (DER) or Base64 encoding data format (PEM). For information on the Base64 encoding data, refer to the *scsenter* command in the Reference Manual (Command Edition).

Refer to 'Certificates and Private Keys' in 'Setting and Use of the Interstage Certificate Environment' in the Security System Guide for information on the certificates supported by the Interstage certificate environment.

## 20.1.31 scs0130

---

### SCS: ERROR: scs0130: Unsupported certificate

#### Explanation

Processing failed because the specified certificate was not X.509 V1, V2, or V3.

Alternatively, the certificate could not be registered because an unsupported certificate extension was set in the certificate.

#### User Action

Contact the issuer of the certificate to request the certificate version and information that is set in the certificate.

Refer to 'Certificates and Private Keys' in 'Setting and Use of the Interstage Certificate Environment' in the Security System Guide for information on the certificates supported by the Interstage certificate environment.

If an error occurred with a certificate supported by the Interstage certificate environment, use the *iscollectinfo* command to collect diagnostic information, and then contact a Fujitsu service engineer.

## 20.1.32 scs0131

---

### SCS: ERROR: scs0131: Certificate already exists

#### Explanation

The same certificate has already been registered.

#### User Action

The certificate does not need to be registered again. Check the nickname, if desired, using the Interstage management console.

## 20.1.33 scs0132

---

### SCS: ERROR: scs0132: Unsupported date format of Certificate or CRL

#### Explanation

Processing failed because the validity period of the certificate or the CRL update date is 2050 or later.

#### User Action

Request the certificate or CRL issuer to re-issue the certificate or CRL with a reasonable expiration date or update date.

### 20.1.34 scs0133

---

#### SCS: ERROR: scs0133: Invalid certification path

##### Explanation

Certificate verification failed.

Five major possible causes are as follows:

- The CA certificate and intermediate CA certificate are not registered (cannot be found).
- The CA certificate and intermediate CA certificate are too old (the key has been renewed).
- The validity period for the specified certificate (or the CA certificate and intermediate CA certificate) has expired.
- Information on the specified certificate (or the CA certificate and intermediate CA certificate) is incorrect.
- The specified certificate (or the CA certificate and intermediate CA certificate) have been revoked and listed in the CRL.

##### User Action

First adjust the system time correctly and re-enter the command.

If all of the required certificates have not been arranged, obtain them from the CA and register them.

If the order in which the certificates were registered is not correct, register them in order from the CA certificate.

A certificate that has expired or been revoked can no longer be used. Obtain and use a new certificate. If verification still fails, use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer.

### 20.1.35 scs0134

---

#### SCS: ERROR: scs0134: Unsupported signature algorithm

##### Explanation

Processing failed because the digital signature was not based on the MD5+RSA or SHA1+RSA encryption algorithm.

##### User Action

Request the issuer of the certificate or CRL to issue a certificate that uses one of the above signature algorithms.

Refer to 'Certificates and Private Keys' in 'Setting and Use of the Interstage Certificate Environment' in the Security System Guide. for information on the certificates and CRLs supported by the Interstage certificate environment.

### 20.1.36 scs0135

---

#### SCS: ERROR: scs0135: Invalid CRL

##### Explanation

CRL verification failed because the CRL was invalid. Three possible causes are as follows:

- The specified data is not a CRL.
- The signature part of the CRL is damaged.
- The certificate of the CRL issuer is too old (the key has been renewed).
- The CRL cannot be analyzed.

## User Action

Contact the issuer of the CRL and obtain a valid CRL. Alternatively, check whether the data was obtained according to the correct procedure. Obtain CRL data in binary data format (DER) or Base64 encoding data format (PEM). For information on the Base64 encoding data, refer to the *scsenter* command in the Reference Manual (Command Edition).

If the CRL is not damaged, the registered certificate of the CRL issuer may be too old. Obtain the latest certificate of the CRL issuer and register it, then re-enter the command.

Refer to 'Certificates and Private Keys' in 'Setting and Use of the Interstage Certificate Environment' in the Security System Guide for information on the CRLs supported by the Interstage certificate environment.

## 20.1.37 scs0136

---

### SCS: ERROR: scs0136: Unsupported CRL

#### Explanation

Processing failed because the specified CRL was neither X.509 V1 or V2.

Alternatively, the CRL could not be registered because an unsupported CRL extension was set in the CRL.

#### User Action

Contact the issuer of the CRL and request the CRL version and information that is set in the CRL.

Refer to 'Certificates and Private Keys' in 'Setting and Use of the Interstage Certificate Environment' in the Security System Guide for information on the CRLs supported by the Interstage certificate environment.

## 20.1.38 scs0137

---

### SCS: ERROR: scs0137: CRL issuer certificate not found

#### Explanation

The certificate of the CRL issuer is not registered.

#### User Action

Obtain the certificate of the CRL issuer and register it, then re-enter the command.

## 20.1.39 scs0138

---

### SCS: ERROR: scs0138: CRL already exists

#### Explanation

The same CRL is already registered.

#### User Action

The specified CRL does not need to be registered.

## 20.1.40 scs0139

---

### SCS: ERROR: scs0139: CRL number already exists

#### Explanation

An attempt was made to register a delta CRL but a CRL with the same CRL number was already registered.

#### User Action

The specified CRL does not need to be registered.

## 20.1.41 scs0140

---

### SCS: ERROR: scs0140: Base CRL not found

#### Explanation

An attempt was made to register a delta CRL but the base CRL for the delta CRL had not been registered.

#### User Action

Contact the issuer of the delta CRL and obtain the base CRL for the delta CRL, register it, and re-enter the command.

## 20.1.42 scs0141

---

### SCS: ERROR: scs0141: Cannot read contract certificate list file

#### Explanation

The CA certificate could not be read.

#### User Action

Check the Interstage installation environment, and use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer. The Interstage installation environment may have been damaged or may not have been installed correctly.

## 20.1.43 scs0142

---

### SCS: ERROR: scs0142: Interstage certificate environment permission denied

#### Explanation

The user does not have permission to access the Interstage certificate environment.

#### User Action

Check the Interstage installation environment, and use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer.

## 20.1.44 scs0143

---

### SCS: ERROR: scs0143: File permission denied

#### Explanation

The user does not have permission to access the file.

#### User Action

Check the access permission and specify a file that the user has permission to access, then re-enter the command.

## 20.1.45 scs0144

---

### SCS: ERROR: scs0144: Insufficient memory

#### Explanation

A memory shortage occurred.

#### User Action

Increase the usable memory space size, and re-enter the command.

## 20.1.46 scs0145

---

---

### SCS: ERROR: scs0145: Insufficient disk space

#### Explanation

The disk has insufficient free space.

#### User Action

Increase the amount of free disk space and re-enter the command. Alternatively, delete any unnecessary site certificates using the *scsdelete* command.

---

## 20.1.47 scs0146

---

### SCS: ERROR: scs0146: Execution is not permitted

#### Explanation

A user without administrator authority cannot execute the command.

#### User Action

Execute the command as a user with administrator authority. Refer to the command specifications for details of the necessary type of authority.

---

## 20.1.48 scs0147

---

### SCS: ERROR: scs0147: Interstage certificate environment was destroyed

#### Explanation

The Interstage certificate environment may have been destroyed. Alternatively, the Interstage certificate environment may not have been created correctly.

#### User Action

Restore the resource that was backed up previously, and re-enter the command. Refer to the Operator's Guide for details of the restore procedure. If the *scsmakeenv* command was executed for the first time and an error occurred during creation of an Interstage certificate environment, recreate an Interstage certificate environment. Refer to the notes on the *scsmakeenv* command in the Reference Manual (Command Edition) for details of the recreation procedure.

---

## 20.1.49 scs0148

---

### SCS: ERROR: scs0148: Java error occurred <errorcode1, errorcode2>

#### Variable Information

<errorcode1> = Error information

<errorcode2> = Error information

#### Explanation

An error occurred during Java processing.

#### User Action

Take the action indicated by the error message displayed during Java processing. Responses to a number of error messages are listed below:

- keytool error: java.lang.Exception: Key pair not generated, alias <nickname> already exists

The Interstage certificate environment may have been destroyed.

If so, restore the resource that was backed up previously, and re-enter the command. Refer to the Operator's Guide for details of the restore procedure. If the *scsmakeenv* command was executed for the first time and an error occurred during creation of an Interstage certificate environment, recreate an Interstage certificate environment. Refer to the notes on the *scsmakeenv* command in the Reference Manual (Command Edition) for details of the recreation procedure.

- keytool error: java.lang.Exception: Input not an X.509 certificate

A certificate with a key length not supported by the Interstage certificate environment may have been specified. Refer to 'Certificates and Private Keys' in 'Setting and Use of the Interstage Certificate Environment' in the Security System Guide, and use a certificate that is supported by the Interstage certificate environment.

- keytool error: java.security.NoSuchAlgorithmException: 1.2.840.113549.1.1.10 Signature not available

A certificate signed using an algorithm not supported by the Interstage certificate environment may have been specified. Refer to 'Certificates and Private Keys' in 'Setting and Use of the Interstage Certificate Environment' in the Security System Guide, and use a certificate that is supported by the Interstage certificate environment.

## 20.1.50 scs0149

---

### SCS: ERROR: scs0149: Cryptographic error: <errorcode1>,<errorcode2>

#### Variable Information

<errorcode1> = Error information

<errorcode2> = Error information

#### Explanation

An error occurred during encryption processing.

#### User Action

Use the *iscollectinfo* command to collect investigation information, then report it to a Fujitsu service engineer together with error information <errorcode1> and <errorcode2>.

## 20.1.51 scs0150

---

### SCS: ERROR: scs0150: System function error: <errorcode1>,<errorcode2>

#### Variable Information

<errorcode1> = Error information

<errorcode2> = Error information

#### Explanation

A system call error occurred during processing.

#### User Action

Re-enter the command. If this message is still displayed, use the *iscollectinfo* command to collect investigation information, then report it to a Fujitsu service engineer together with error information <errorcode1> and <errorcode2>.

## 20.1.52 scs0151

---

### SCS: ERROR: scs0151: Could not lock Interstage certificate environment

#### Explanation

The Interstage certificate environment is used exclusively.

#### User Action

Re-enter the command later. Alternatively, restart the service and re-enter the command.

If the Interstage certificate environment still cannot be used, use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer.

## 20.1.53 scs0152

---

### SCS: ERROR: scs0152: Environment variable is not set (JAVA\_HOME)

Windows32/64

#### Explanation

The environment variable JAVA\_HOME that should have been set during Interstage installation has not been set.

#### User Action

Check the Interstage installation environment. The environment may have been destroyed or may not have been installed correctly. Alternatively, set the environment variable JAVA\_HOME correctly and re-enter the command.

Solaris32/64 Linux32/64

#### Explanation

The environment variable (JAVA\_HOME) is not set, or an invalid path is set for the environment variable (JAVA\_HOME).

#### User Action

Re-execute by setting the JDK or JRE installation path correctly for the environment variable (JAVA\_HOME).

## 20.1.54 scs0154

---

### SCS: ERROR: scs0154: Could not import any more certificates, reached maximum limit

#### Explanation

The specified certificate could not be registered because the maximum allowed number of registered certificates had been reached.

#### User Action

Delete unnecessary certificates and re-enter the command.

## 20.1.55 scs0155

---

### SCS: ERROR: scs0155: Logical error: <errorcode1>

#### Variable Information

<errorcode1> = Error information

#### Explanation

An internal error was detected.

#### User Action

Use the *iscollectinfo* command to collect investigation information, then report it to a Fujitsu service engineer together with the operation performed when this error occurred and error information <errorcode1>.

## 20.1.56 scs0159

---

### SCS: ERROR: scs0159: Group name or Group ID does not exist

#### Explanation

The specified group name or group ID does not exist in the system.

#### User Action

Re-execute by specifying a correct group name or group ID registered in the system. For an explanation of groups, see " Setting and Use of the Interstage Certificate Environment " in the Security System Guide.

## 20.1.57 scs0160

---

### SCS: ERROR: scs0160: Specified file already exists PATH=<filename>

#### Variable Information

< filename > = File name

#### Explanation

The specified file already exists.

#### User Action

Re-execute by specifying a non-existent file name.

## 20.1.58 scs0161

---

### SCS: ERROR: scs0161: Could not generate available nickname

#### Explanation

A nickname was automatically created, but is not an available one.

#### User Action

Re-execute by specifying the prefix of another, unduplicated nickname for the prefix of the nickname to be automatically created.

## 20.1.59 scs0162

---

### SCS: ERROR: scs0162: Private key not found

#### Explanation

The private key corresponding to the site certificate is not registered. The specified certificate may not be a site certificate or the Interstage certificate environment may have been destroyed.

#### User Action

Check whether the specified certificate is a site certificate. If it is a site certificate, restore backed up resources and re-execute. For details about restoring them, see the Operator's Guide.

## 20.1.60 scs0163

---

### SCS: ERROR: scs0163: CA Certificate not found

#### Explanation

The site certificate cannot be exported because no CA certificate is registered in the Interstage certificate environment.

#### User Action

Register the CA certificate of the site certificate, and re-execute.

## 20.1.61 scs0164

---

### SCS: ERROR: scs0164: Program to access keystore was not installed

#### Explanation

The library for accessing the keystore is not installed correctly, or the specification of the environment variable (JAVA\_HOME) is incorrect.

## User Action

Re-execute by setting the JDK or JRE installation path correctly for the environment variable (JAVA\_HOME). Alternatively, check the Interstage installation environment.

### 20.1.62 scs0165

---

#### **SCS: ERROR: scs0165: Keystore was destroyed**

##### Explanation

The keystore file may have been destroyed.

##### User Action

Restore backed up resources and re-execute. For details about restoring them, see the Operator's Guide.

### 20.1.63 scs0166

---

#### **SCS: ERROR: scs0166: Unsupported PKCS#12(PFX)**

##### Explanation

The PKCS#12 data cannot be processed because it is unsupported.

##### User Action

The specified PKCS#12 data is not supported, and cannot be processed with this command.

Refer to 'Certificates and Private Keys' in 'Setting and Use of the Interstage Certificate Environment' in the Security System Guide for information on supported PKCS#12 data.

### 20.1.64 scs0167

---

#### **SCS: ERROR: scs0167: Invalid PKCS#12(PFX)**

##### Explanation

The specified data could not be recognized as PKCS#12 data. There are three possible reasons:

- The specified data is not PKCS#12 data
- The PKCS#12 data has been destroyed
- The PKCS#12 data cannot be analyzed

##### User Action

Check if the PKCS#12 data has been destroyed. Alternatively, check if there are any problems with the data acquisition method. If there are any problems, acquire the PKCS#12 data again and re-execute.

Refer to 'Certificates and Private Keys' in 'Setting and Use of the Interstage Certificate Environment' in the Security System Guide for information on supported PKCS#12 data.

### 20.1.65 scs0168

---

#### **SCS: ERROR: scs0168: Incorrect PKCS12(PFX) password**

##### Explanation

The length of the password of the PKCS#12 data is not appropriate, or the password contains an unspecified character.

##### User Action

Enter the password of PKCS#12 data in the range of 6 to 128 characters, using the specified characters. For details about the specified characters, check "Reference Manual (Command Edition)."

## 20.1.66 scs0169

---

### SCS: ERROR: scs0169: PKCS12(PFX) password not matched

#### Explanation

The password entered does not match the password used to protect the PKCS#12 data.

#### User Action

Re-execute by entering the correct password of the PKCS#12 data.

## 20.1.67 scs0171

---

### SCS: ERROR: scs0171: Unsupported private key

#### Explanation

The private key cannot be processed because it does not conform to the RSA algorithm.

#### User Action

Re-execute by specifying the nickname of the site certificate corresponding to the RSA private key.

## 20.1.68 scs0172

---

### SCS: ERROR: scs0172: Incorrect private key

#### Explanation

The private key contained in the PKCS#12 data is invalid.

#### User Action

Check with the data acquisition source to verify if the PKCS#12 data contains an unsupported private key or illegal private key data.

Refer to 'Certificates and Private Keys' in 'Setting and Use of the Interstage Certificate Environment' in the Security System Guide for information on supported PKCS#12 data and private keys.

## 20.1.69 scs0174

---

### SCS: ERROR: scs0174: Could not open any more sessions, reached maximum limit

#### Explanation

Processing cannot continue because the maximum number of programs that can simultaneously access the Interstage certificate environment has been reached.

#### User Action

Terminate unnecessary programs accessing the Interstage certificate environment, and re-execute.

## 20.1.70 scs0180

---

### SCS: INFO: scs0180: The owners group of Interstage certificate environment was set

#### Explanation

The specified group is set as the owner group of the Interstage certificate environment.

## 20.1.71 scs0181

---

### SCS: INFO: scs0181: Interstage certificate environment has already been created

## Explanation

An Interstage certificate environment has already been created.

### 20.1.72 scs0184

---

**SCS: INFO: scs0184: CSR has not been created. Or, all the site certificates of issued CSR have already registered**

## Explanation

This message is displayed in either of the following cases:

- The CSR (Certificate Signing Request) has not been created.
- All the site certificates of the issued CSR (Certificate Signing Request) have already been registered.

### 20.1.73 scs0185

---

**SCS: INFO: scs0185: No Site certificate was imported**

## Explanation

The site certificate has not been registered, therefore there is no information to display.

### 20.1.74 scs0186

---

**SCS: INFO: scs0186: No CA certificate was imported**

## Explanation

The CA certificate has not been registered, therefore there is no information to display.

### 20.1.75 scs0190

---

**SCS: WARNING: scs0190: No nickname was specified, please enter nickname**

## Explanation

The information (character string) to be set as a nickname is not included in the PKCS#12 data. No nickname can be set.

## User Action

Specify a nickname to continue processing.

### 20.1.76 scs0191

---

**SCS: WARNING: scs0191: Specified nickname was invalid, please enter valid nickname <nickname>**

## Variable Information

< nickname > = Nickname (If the input nickname is invalid, it is displayed as <...>.)

## Explanation

The information (character string) to be set as a nickname is extracted from the PKCS#12 data, but cannot be set as a nickname, or the input character string cannot be set as a nickname.

The length of the character string is invalid to be set as a nickname or contains an unspecified character.

## User Action

Enter an appropriate nickname to continue processing.

The nickname must begin with an alphanumeric character and consist of 1 to 32 specifiable characters. For details about the specified characters, refer to "Reference Manual (Command Edition)."

## 20.1.77 scs0192

---

**SCS: WARNING: scs0192: Specified nickname already exists, please enter a different nickname <nickname>**

### Variable Information

< nickname> = Nickname

### Explanation

The information (character string) to be set as a nickname is extracted from the PKCS#12 data, but cannot be set as a nickname because it is duplicated.

### User Action

Enter another, unduplicated nickname to continue processing.

## 20.2 scs1000 to scs1999

---

### 20.2.1 scs1002

---

**SCS: ERROR: scs1002: Could not obtain list of site certificates**

### Explanation

Processing to list site certificates failed because an error occurred.

### User Action

Re-execute the operation. If the same problem recurs, use the *iscollectinfo* command to collect investigation information, and contact a Fujitsu service engineer.

### 20.2.2 scs1004

---

**SCS: ERROR: scs1004: Could not obtain list of CA certificates**

### Explanation

Processing to list CA certificates failed because an error occurred.

### User Action

Re-execute the operation. If the same problem recurs, use the *iscollectinfo* command to collect investigation information, and contact a Fujitsu service engineer.

### 20.2.3 scs1006

---

**SCS: INFO: scs1006: SSL configuration 'name' was deleted**

### Variable Information

name = SSL configuration name

### Explanation

The specified SSL configuration has been deleted.

### 20.2.4 scs1009

---

**SCS: ERROR: scs1009: SSL configuration 'name' could not be deleted because it is currently in use**

## Variable Information

name = SSL configuration name

## Explanation

The specified SSL configuration could not be deleted because it was being used by a service.

## User Action

To delete the SSL configuration, change the settings so that the specified SSL configuration will not be used by a service, and re-execute the delete operation.

## 20.2.5 scs1010

---

### **SCS: INFO: scs1010: SSL configuration 'name' was created**

## Variable Information

name = SSL configuration name

## Explanation

The SSL configuration has been created.

## 20.2.6 scs1012

---

### **SCS: WARNING: scs1012: Site certificate does not exist in Interstage certificate environment**

## Explanation

An SSL configuration could not be created because a site certificate had not been registered in the Interstage certificate environment.

## User Action

A site certificate must be registered in the Interstage certificate environment. Register a site certificate by referring to "Setting and Use of the Interstage Certificate Environment" in the Security System Guide, and re-execute the operation.

## 20.2.7 scs1014

---

### **SCS: ERROR: scs1014: Specified SSL configuration 'name' already exists, please specify a different name**

## Variable Information

name = SSL configuration name

## Explanation

The specified SSL configuration cannot be created because an SSL configuration with the specified name already exists.

## User Action

Re-execute the operation with another SSL configuration name specified.

## 20.2.8 scs1019

---

### **SCS: INFO: scs1019: SSL configuration 'name' was updated successfully**

## Variable Information

name = SSL configuration name

## Explanation

The specified SSL configuration has been updated.

## 20.2.9 scs1021

---

### **SCS: WARNING: scs1021: Selected site certificate 'name' does not exist in Interstage certificate environment**

#### Variable Information

name = Nickname of site certificate

#### Explanation

The site certificate selected for the SSL configuration could not be found in the Interstage certificate environment. The site certificate has been deleted from the Interstage certificate environment.

#### User Action

Select another site certificate or register the site certificate to be used in the Interstage certificate environment, and re-execute the operation. For details of the registration procedure, refer to "Setting and Use of the Interstage Certificate Environment" in the Security System Guide.

## 20.2.10 scs1022

---

### **SCS: WARNING: scs1022: Selected CA certificate 'name' does not exist in Interstage certificate environment**

#### Variable Information

name = Nickname of CA certificate

#### Explanation

The CA certificate selected for the SSL configuration could not be found in the Interstage certificate environment. The CA certificate has been deleted from the Interstage certificate environment.

#### User Action

Select another CA certificate or register the CA certificate to be used in the Interstage certificate environment, and re-execute the operation. For details of the registration procedure, refer to "Setting and Use of the Interstage Certificate Environment" in the Security System Guide.

## 20.2.11 scs1024

---

### **SCS: ERROR: scs1024: SSL configuration does not exist**

#### Explanation

A required SSL configuration could not be found and may have been deleted by another user.

#### User Action

Collect an SSL configuration listing and obtain the latest SSL list.

## 20.2.12 scs1029

---

### **SCS: WARNING: scs1029: CA certificate does not exist in Interstage certificate environment**

#### Explanation

No CA certificate exists in the Interstage certificate environment.

#### User Action

If client authentication is to be implemented, a CA certificate must be registered. For details of the registration procedure, refer to "Setting and Use of the Interstage Certificate Environment" in the Security System Guide.

If a self-signing certificate is to be used for testing, and client authentication is not to be implemented, a CA certificate is not required. Continue processing.

## 20.2.13 scs1030

---

### **SCS: WARNING: scs1030: SSL configuration 'name' cannot be modified**

#### Variable Information

name = SSL configuration name

#### Explanation

The deletion operation for the specified SSL configuration causes an error. Therefore, the configuration cannot be modified.

#### User Action

Delete the current SSL configuration, then create the correct configuration.

## 20.2.14 scs1031

---

### **SCS: WARNING: scs1031: Site certificate does not exist in Interstage certificate environment 'name'**

#### Variable Information

name = Server name

#### Explanation

An SSL configuration could not be created because a site certificate had not been registered in the Interstage certificate environment at the Managed Server (name).

#### User Action

A site certificate must be registered in the Interstage certificate environment at the Managed Server (name). Register a site certificate by referring to "Setting and Use of the Interstage Certificate Environment" in the Security System Guide, and re-execute the operation.

## 20.2.15 scs1032

---

### **SCS: WARNING: scs1032: CA certificate does not exist in Interstage certificate environment 'name'**

#### Variable Information

name = Server name

#### Explanation

No CA certificate exists in the Interstage certificate environment at the Managed Server (name).

#### User Action

If client authentication is to be implemented, a CA certificate must be registered. For details of the registration procedure, refer to "Setting and Use of the Interstage Certificate Environment" in the Security System Guide.

If a self-signing certificate is to be used for testing, and client authentication is not to be implemented, a CA certificate is not required. Continue processing.

## 20.2.16 scs1033

---

### **SCS: WARNING: scs1033: Selected site certificate 'name1' does not exist in Interstage certificate environment 'name2'**

#### Variable Information

name1 = Nickname of site certificate

name2 = Server name

### Explanation

The site certificate selected for the SSL configuration could not be found in the Interstage certificate environment at the Managed Server (name2). The site certificate has been deleted from the Interstage certificate environment at the Managed Server (name2).

### User Action

Select another site certificate or register the site certificate to be used in the Interstage certificate environment at the Managed Server (name2), and re-execute the operation. For details of the registration procedure, refer to "Setting and Use of the Interstage Certificate Environment" in the Security System Guide.

## 20.2.17 scs1034

---

**SCS: WARNING: scs1034: Selected CA certificate 'name1' does not exist in Interstage certificate environment 'name2'**

### Variable Information

name1 = Nickname of CA certificate

name2 = Server name

### Explanation

The CA certificate selected for the SSL configuration could not be found in the Interstage certificate environment at the Managed Server (name2). The CA certificate has been deleted from the Interstage certificate environment at the Managed Server (name2).

### User Action

Select another CA certificate or register the CA certificate to be used in the Interstage certificate environment at the Managed Server (name2), and re-execute the operation. For details of the registration procedure, refer to "Setting and Use of the Interstage Certificate Environment" in the Security System Guide.

## 20.3 scs2000 to scs2999

---

### 20.3.1 scs2000

---

**SCS: ERROR: scs2000: Internal error occurred. <detail>**

### Variable Information

<detail> = Detailed information

### Explanation

An unexpected error occurred during processing of a certificate or SSL configuration.

### User Action

Use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer.

### 20.3.2 scs2001

---

**SCS: ERROR: scs2001: Installation directory not found. <pathname>**

### Variable Information

<pathname> = Installation directory

### Explanation

Processing could not continue because the installation directory could not be found. Interstage may not be installed correctly.

## User Action

Check whether Interstage is installed correctly. If it is installed correctly, use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer.

### 20.3.3 scs2002

---

**SCS: ERROR: scs2002: Insufficient permissions to access installation directory. <detail>**

#### Variable Information

<detail> = Detailed information

#### Explanation

Processing cannot continue because the user does not have permission to access the installation directory.

#### User Action

Refer to the detailed information and check whether Interstage is installed correctly. If it is installed correctly, use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer.

### 20.3.4 scs2003

---

**SCS: ERROR: scs2003: SSL configuration file not found. <pathname>**

#### Variable Information

<pathname> = Path of SSL configuration file

#### Explanation

The specified SSL configuration file could not be found.

#### User Action

The specified SSL configuration file may have been deleted. Restore the SSL configuration resource that was backed up previously. Re-display an SSL configuration listing and re-execute the operation.

### 20.3.5 scs2004

---

**SCS: ERROR: scs2004: Insufficient permissions to access SSL configuration file. <detail>**

#### Variable Information

<detail> = Detailed information

#### Explanation

The user does not have permission to access the SSL configuration file.

#### User Action

Check whether access permission is set for the SSL configuration file (see <detail> for the file path), then re-execute the operation.

### 20.3.6 scs2005

---

**SCS: WARNING: scs2005: Interstage certificate environment does not exist. Try again after creating Interstage certificate environment using the 'scsmakeenv' command.**

#### Explanation

The specified site certificate and CA certificate could not be registered because an Interstage certificate environment had not been created.

## User Action

Re-execute the operation after creating an Interstage certificate environment. For details of the required procedure, refer to "Setting and Use of the Interstage Certificate Environment" in the Security System Guide.

## 20.3.7 scs2006

---

### SCS: ERROR: scs2006: Insufficient permissions to access Interstage certificate environment.

#### Explanation

The user does not have permission to access the Interstage certificate environment.

#### User Action

Check whether access permission is set for the Interstage certificate environment. If access permission is set correctly, restore the Interstage certificate environment that was backed up previously, and re-execute the operation.

## 20.3.8 scs2007

---

### SCS: ERROR: scs2007: Interstage certificate environment has been destroyed.

#### Explanation

The Interstage certificate environment has been corrupted.

#### User Action

Restore the Interstage certificate environment that was backed up previously, and re-execute the operation. Refer to the Operator's Guide for details of the restore procedure.

## 20.3.9 scs2008

---

### SCS: ERROR: scs2008: Could not access Interstage certificate environment because installation is incomplete. <detail>

#### Variable Information

<detail> = Detailed information

#### Explanation

Processing failed because a required library could not be found. Interstage may not be installed correctly. Alternatively, required packages may be uninstalled. Packages that are required in order to process are as follows:

**Windows32/64**

- secure communication service

**Solaris32/64 Linux32/64**

- FJSVisscs
- FJSVsmee
- FJSVsclr

#### User Action

**Windows32/64**

Check whether required packages have been installed correctly. If they have not been installed correctly, or they had been uninstalled, then install them and re-execute the operation. If this does not solve the problem, use the *iscollectinfo* command to collect investigation information. Then contact a Fujitsu service engineer.

**Solaris32/64 Linux32/64**

Check whether required packages have been installed correctly. If they have not been installed correctly or they had been uninstalled, then install them, restart the Interstage JMX service and re-execute the operation. If they have been installed correctly, restart the Interstage JMX service and re-execute the operation. If this does not solve the problem, use the *iscollectinfo* command to collect investigation information. Then contact a Fujitsu service engineer.

#### Note

If IJServer is started when the above services are restarted, it will not be possible to execute monitor reference or use the HotDeploy function for that IJServer. Restart the IJServer at the same time as the above operation.

### 20.3.10 scs2009

---

**SCS: ERROR: scs2009: Could not create directory to store SSL configuration file. <pathname>**

#### Variable Information

<pathname> = Directory containing an SSL configuration file

#### Explanation

A directory used to store an SSL configuration file could not be allocated. Interstage may not be installed correctly.

#### User Action

Check whether Interstage is installed correctly. If it is installed correctly, use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer.

### 20.3.11 scs2010

---

**SCS: ERROR: scs2010: Error occurred in Interstage certificate environment.**

#### Explanation

An internal error occurred during access to the Interstage certificate environment.

#### User Action

Increase the amount of free disk space or delete unnecessary files, and re-execute the operation. If this does not solve the problem, use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer.

### 20.3.12 scs2011

---

**SCS: ERROR: scs2011: An SSL configuration with this name already exists.**

#### Explanation

The specified SSL configuration could not be created because an SSL configuration with the same name already exists.

#### User Action

Re-execute the operation with another SSL configuration name specified.

### 20.3.13 scs2012

---

**SCS: ERROR: scs2012: SSL configuration was modified by another user.**

#### Explanation

The specified SSL configuration could not be updated. Possible causes are as follows.

- The same SSL configuration has been updated by another user.
- The Allocation destination (a Managed Server operating alone or a Server Group) of SSL configuration has been modified by another user.

#### User Action

Recollect then update the SSL configuration contents.

### 20.3.14 scs2013

---

**SCS: ERROR: scs2013: SSL configuration file has been destroyed. <pathname>**

#### Variable Information

<pathname> = SSL configuration file

#### Explanation

Processing could not continue because the SSL configuration file had been destroyed.

#### User Action

Restore the SSL configuration resource that was backed up previously, and re-execute the operation. Refer to the Operator's Guide for details of the restore procedure.

### 20.3.15 scs2014

---

**SCS: ERROR: scs2014: Could not create SSL configuration file. <detail>**

#### Variable Information

<detail> = Detailed information

#### Explanation

An SSL configuration file could not be created.

#### User Action

Refer to the detailed information, remove the cause of the failure, and re-execute the operation.

### 20.3.16 scs2015

---

**SCS: ERROR: scs2015: Could not write to SSL configuration file. <detail>**

#### Variable Information

<detail> = Detailed information

#### Explanation

Writing to the SSL configuration file failed.

#### User Action

Refer to the detailed information, remove the cause of the failure, and re-execute the operation.

### 20.3.17 scs2016

---

**SCS: ERROR: scs2016: Could not read SSL configuration file. <detail>**

#### Variable Information

<detail> = Detailed information

#### Explanation

Reading from the SSL configuration file failed.

## User Action

Refer to the detailed information, remove the cause of the failure, and re-execute the operation.

### 20.3.18 scs2017

---

#### **SCS: ERROR: scs2017: SSL configuration error. <detail>**

##### Variable Information

<detail> = Detailed information

##### Explanation

The SSL configuration has been destroyed.

##### User Action

Recreate an SSL configuration or update the existing one. If this does not solve the problem, use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer.

### 20.3.19 scs2018

---

#### **SCS: ERROR: scs2018: Could not delete SSL configuration because it is currently in use.**

##### Explanation

The specified SSL configuration could not be deleted because it was being used by a service.

##### User Action

Re-execute the operation to delete the SSL configuration after changing the settings so that the specified SSL configuration cannot be used by a service.

### 20.3.20 scs2019

---

#### **SCS: ERROR: scs2019: Invalid SSL configuration name.**

##### Explanation

The SSL configuration name was specified incorrectly.

##### User Action

Specify the SSL configuration name with from 1 to 32 characters. The characters that can be used are as follows: A to Z, a to z, 0 to 9, \_, -, [], and (). Specify the SSL configuration name correctly and re-execute the operation.

### 20.3.21 scs2020

---

#### **SCS: ERROR: scs2020: Invalid SSL configuration. <detail>**

##### Variable Information

<detail> = Detailed information

##### Explanation

The contents of the SSL configuration are invalid.

##### User Action

Check the contents of the SSL configuration to ensure that the required parameters are set correctly and re-execute the operation.

### 20.3.22 scs2021

---

---

**SCS: ERROR: scs2021: Specified certificate is not registered in Interstage certificate environment.  
<nickname>**

Variable Information

<nickname> = Nickname of site certificate or CA certificate

Explanation

The site certificate or CA certificate specified for the SSL configuration could not be found in the Interstage certificate environment.

User Action

Re-execute the operation after specifying another site certificate or CA certificate, or after registering the site certificate or CA certificate in the Interstage certificate environment.

---

### 20.3.23 scs2022

---

**SCS: ERROR: scs2022: Could not access Interstage certificate environment information.**

Explanation

Interstage certificate environment information could not be obtained.

User Action

Use the *iscollectinfo* command to collect investigation information, then contact a Fujitsu service engineer.

---

### 20.3.24 scs2023

---

**SCS: ERROR: scs2023: Insufficient memory.**

Explanation

Processing cannot continue due to insufficient free memory space.

User Action

Increase the free disk space by appropriate means, such as terminating unnecessary programs to increase free memory space or deleting unnecessary files, and re-execute the operation.

---

### 20.3.25 scs2024

---

**SCS: ERROR: scs2024: An error occurred in Interstage JMX Service.**

Explanation

An error occurred in the Interstage JMX service.

User Action

Refer to the Interstage JMX service log file, remove the cause of the error, and re-execute the operation.

---

### 20.3.26 scs2025

---

**SCS: ERROR: scs2025: An error occurred in Interstage JMX Service.**

Explanation

An error occurred in the Interstage JMX service.

User Action

Refer to the Interstage JMX service log file, remove the cause of the error, and re-execute the operation.

## 20.3.27 scs2026

---

### SCS: ERROR: scs2026: Specified SSL configuration does not exist. <detail>

#### Variable Information

<detail> = Detailed information

#### Explanation

The specified SSL configuration does not exist. The possible causes are follows.

- The SSL configuration has been deleted by another user.
- The Allocation destination (a Managed Server operating alone or a Server Group) of SSL configuration has been modified by another user.

#### User Action

Obtain a listing of the latest SSL configurations.

## 20.3.28 scs2027

---

### SCS: ERROR: scs2027: A required package has not been installed.

#### Explanation

Processing is impossible because a required package is not installed.

#### User Action

**Windows32/64**

Install the secure communication service package and re-execute the operation.

**Solaris32/64 Linux32/64**

Install the package listed below and restart the Interstage JMX service, then re-execute the operation.

- FJSVisscs
- FJSVsmee
- FJSVsclr

#### Note

If IJServer is started when the above services are restarted, it will not be possible to execute monitor reference or use the HotDeploy function for that IJServer. Restart the IJServer at the same time as the above operation.

## 20.3.29 scs2030

---

### SCS: ERROR: scs2030: Can not create SSL configuration. <name>

#### Variable Information

<name> = SSL configuration name

#### Explanation

The specified SSL configuration could not be created at the Managed Server.

#### User Action

Refer to the error message displayed before this message and remove the cause of the error of the applicable Managed Server. Then execute the SSL configuration environment setup. This action creates the SSL configuration again at the Managed Server where the SSL configuration could not be created.

## 20.3.30 scs2031

---

### SCS: ERROR: scs2031: Can not modify SSL configuration. <name>

#### Variable Information

<name> = SSL configuration name

#### Explanation

The specified SSL configuration could not be modified at the Managed Server.

#### User Action

Refer to the error message displayed before this message and remove the cause of the error of the applicable Managed Server. Then re-execute the modify operation.

## 20.3.31 scs2032

---

### SCS: ERROR: scs2032: Can not delete SSL configuration. <name>

#### Variable Information

<name> = SSL configuration name

#### Explanation

The specified SSL configuration could not be deleted from the Managed Server.

#### User Action

Refer to the error message displayed before this message and remove the cause of the error of the applicable Managed Server. Then re-execute the delete operation.

## 20.3.32 scs2033

---

### SCS: ERROR: scs2033: Information set in the Allocation destination is incorrect.

#### Explanation

Information set in the Allocation destination (a Managed Server operating alone or a Server Group) has become incorrect. The possible causes are follows.

- A Managed Server operating alone or a Server Group has been deleted.
- A Managed Server operating alone has been changed to a Reserve Server.
- A Managed Server has been deleted from a Server Group.

#### User Action

Select the SSL configuration Allocation destination again, and recreate the new SSL configuration. Set an existing Managed Server, or a Server Group that includes a Managed Server in the SSL configuration Allocation destination.

## 20.3.33 scs2035

---

### SCS: ERROR: scs2035: The nickname for the site certificate has not been set.

#### Explanation

A Managed Server has been added to a Server Group but a nickname for the site certificate has not been set for the added Managed Server.

## User Action

Press the reset button or re-obtain the configuration button, and set the nickname for the site certificate in the SSL configuration for the Managed Server, then re-execute the operation.

## 20.3.34 scs2036

---

**SCS: ERROR: scs2036: Failed to add the Managed Server <name> to Server Group because Registered definition is different to the other. <detail>**

### Variable Information

<name> = server name

<detail> = Detailed information

RESOURCE=%s1: Name of the resource in which the mismatch was detected

"SSL-Configuration": This indicates that the resource in which the mismatch was detected is an SSL configuration.

NAME=%s2: Name of the SSL configuration in which the mismatch was detected

INFO=%s3: Information on the contents that are different

"Not exist on managed server": The SSL configuration is not in the Managed Server.

"Definition is not in agreement": The SSL configuration contents do not match.

### Explanation

A Managed Server in which the configuration information does not match cannot be added to a Server Group.

### User Action

All the Managed Servers belonging to the Server Group must have the same SSL configurations when they are Reserve Servers or before they are added to the site.

Before adding a Managed Server to a Server Group, use the Backup/Restore command to export the all Interstage resources for Managed Servers that are run in the Server Group. Then import the configurations for the Managed Server to be added.

For details about backing up and restoring resources for a Managed Server, refer to the "Interstage Application Server Operator's Guide". The relevant section is "Multiserver Management Function" - "Backup/Restore" - "Backup/Restore of the Managed Server" - "Adding a Server to a Server Group".

# Chapter 21 Messages Beginning with 'sso'

This chapter describes the messages having message numbers that begin with sso.

- Messages sso00001 to sso00207 and sso10000 to sso10001 are output from all Single Sign-on servers
- Messages sso01000 to sso01213 and sso11001 to sso11008 are output from a Single Sign-on Repository server
- Messages sso02000 to sso02057 and sso12001 to sso12011 are output from a Single Sign-on Authentication server
- Messages sso03000 to sso03064 and sso13001 to sso13008 are output from a Single Sign-on Business server
- Messages sso04000 to sso04769 are output from the Single Sign-on Interstage Management Console
- Messages sso06000 to sso06900 and sso16001 to sso16007 are output from a Single Sign-on session management server
- Messages sso07000 to sso07011 are output from a Single Sign-on Integrated Windows Authentication application
- Messages sso20000 to sso20914 are output from a Single Sign-on log daemon

If a problem results from a server side, its details are output to the system log; if the problem results from a client side, its content is only output to a Single Sign-on access log. Therefore, reference the Single Sign-on access log together with the system log.

## 21.1 sso00001 to sso00207

### 21.1.1 sso00001

**SSO: ERROR: sso00001: Interstage certificate environment has not been created. ServerKind=(%s1)**

Variable Information

%s1 = Server name or command name

Explanation

The possible causes are as follows:

Table 21.1 Possible causes

Contents of the server or command name (%s1)	Cause
Business server	The Interstage certificate environment required to use SSL communication between the business server and the authentication server was not set up.
Authentication server	The Interstage certificate environment required to use SSL communication between the authentication server and the repository server (update system) or repository server (reference system) was not set up.

User Action

Take one of the following actions:

Table 21.2 User actions

Contents of the server or command name (%s1)	Action
Business server	Create the Interstage certificate environment in the business server environment. (*1)
Authentication server	If SSL communication is not used in the repository server (update system) or the repository server (reference system), check whether the authentication server environment settings repository server (update system) URL or the repository server (reference system) URL scheme name is "https". (*2)

Contents of the server or command name (%s1)	Action
	<p>If the repository server (reference system) scheme name is "https", change it to "http". If the repository server (update system) scheme name is incorrect, set up the authentication server again. (*3)</p> <p>If SSL communication is used in the repository server (update system) or the repository server (reference system), create the Interstage certificate environment in the authentication server environment. (*4)</p>

\*1 For details, refer to "Environment setup (Business server administrators)" - "Setting up Business servers" - "Setting up the First Business server" - "Creating the Interstage Certificate Environment" in the Single Sign-on Operator's Guide.

\*2 In the Interstage Management Console, click [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Authentication server] > [Settings] > [Detailed Settings [Show]] > [Communication Settings with Repository server] > [Repository server (update system) URL] or [Communication Settings with Repository server (reference system)] > [Repository server (reference system) URL].

\*3 Set up the authentication server again according to the following procedure:

1. In the Interstage Management Console, click [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [List] and delete the authentication server.
2. Click [Authentication infrastructure Settings] to set up the authentication server.

\*4 For details, refer to "Environment setup (SSO administrators)" - "Set up of Authentication server" - "SSL Communication Environment Setup".

## 21.1.2 sso00002

### SSO: ERROR: sso00002: Interstage certificate environment access denied. ServerKind=(%s1)

#### Variable Information

%s1 = Server name or command name

#### Explanation

There is no access authority to the Interstage certificate environment.

#### User Action

##### Windows32/64

Check that the "Administrators" group and SYSTEM access authority ("Full Control") are assigned to the Interstage certificate environment (the default installation path is C:\Interstage\etc\security).

If this message is output in a website environment in which the Business server is integrated in Microsoft(R) Internet Information Services 6.0 or later, check whether the Interstage certificate environment access authority have been set correctly. (\*1)

##### Solaris32/64 Linux32/64

There is a possibility that the Web server effective user name and the Interstage certificate environment access authority do not match.

Use the `scsmakeenv` command (\*2) -g parameter to change the Interstage certificate environment access authority so that it can be accessed using the Web server effective user name. (\*3)

##### Linux32/64

To upgrade the Web server (Interstage HTTP Server), change the value set for the Group directive of Interstage HTTP Server environment configuration file (httpd.conf) to one that is suitable.

\*1 For details on setting the Interstage certificate environment access authority when Microsoft(R) Internet Information Services is used, refer to "Environment Setup (Business Server Administrators)" - "Integrating into the Web Server" in the Single Sign-on Operator's Guide.

\*2 For details about the *scsmakeenv* command, refer to "SSL Environment Settings Commands" - "scsmakeenv" in the "Reference Manual (Command Edition)".

\*3 For details about the Web server effective user name, refer to "Operation and Maintenance" - "Changing Environment Settings" - "Changing Effective User for Web Server" in the Single Sign-on Operator's Guide.

### 21.1.3 sso00003

---

**SSO: ERROR: sso00003: Interstage certificate environment access refused. ServerKind=(%s1) Detail=(%s2)**

#### Variable Information

%s1 = Server name or command name

%s2 = Maintenance information

#### Explanation

Access to the Interstage certificate environment was denied because of a heavy load.

#### User Action

Close other programs and reexecute.

### 21.1.4 sso00004

---

**SSO: ERROR: sso00004: Interstage certificate environment is broken. ServerKind=(%s1) Detail=(%s2)**

#### Variable Information

%s1 = Server name or command name

%s2 = Maintenance information

#### Explanation

The Interstage certificate environment is broken.

#### User Action

Take one of the following actions:

Table 21.3 User Actions

Contents of the server or command name (%s1)	Action
Business server	Recreate the Interstage certificate environment in the business server environment. (*1)
Authentication server	Recreate the Interstage certificate environment in the authentication server environment. (*2)

\*1 For details, refer to "Environment setup (Business server administrators)" - "Setting up Business servers" - "Setting up the First Business server" - "Creating the Interstage Certificate Environment" in the Single Sign-on Operator's Guide.

\*2 For details, refer to "Environment setup (SSO administrators)" - "Set up of Authentication server" - "SSL Communication Environment Setup".

### 21.1.5 sso00005

---

**SSO: ERROR: sso00005: The specified SSL configuration does not exist. ServerKind=(%s1) SSLConfName=(%s2)**

## Variable Information

%s1 = Server name or command name

%s2 = SSL configuration name

## Explanation

The specified SSL configuration name does not exist.

## User Action

Check if the specified SSL configuration name is correct.

## 21.1.6 sso00006

---

**SSO: ERROR: sso00006: An internal error occurred in the Secure Communications Service function. ServerKind=(%s1) Detail=(%s2)**

## Variable Information

%s1 = Server name or command name

%s2 = Maintenance information

## Explanation

An internal abnormality occurred in Secure Communication Service.

## User Action

Immediately after the message is output, use the *iscollectinfo* command to collect investigation information, then contact your service engineer.

## 21.1.7 sso00007

---

**SSO: ERROR: sso00007: Secure Communications Service package is not installed. ServerKind=(%s1)**

## Variable Information

%s1 = Server name or command name

## Explanation

The Secure Communication Service has not been installed.

## User Action

**Windows32/64**

Install the Secure Communication Service.

**Solaris32**

Install the following packages:

- FJSVslr (Securecrypto Library RunTime)
- FJSVsmee (CA/EE common certificate management function, key management function)
- FSUNssl (Secure Socket Option)

**Solaris64**

Install the following packages:

- FJSVsl64 (Securecrypto Library RunTime)
- FJSVsm64 (CA/EE common certificate management function, key management function)

## Linux32

Install the following packages:

- FJSVslr (Securecrypto Library RunTime)
- FJSVmee (CA/EE common certificate management function, key management function)

## Linux64

Install the following packages:

- FJSVslr64 (Securecrypto Library RunTime)
- FJSVmee64 (CA/EE common certificate management function, key management function)

### 21.1.8 sso00101

---

**SSO: ERROR: sso00101: An error occurred in the SSL function. ServerKind=(%s1) Detail=(%s2)**

#### Variable Information

%s1 = Server name or command name

%s2 = Maintenance information

#### Explanation

An abnormality occurred in the SSL function.

#### User Action

Immediately after the message is output, use the *iscollectinfo* command to collect investigation information, then contact your service engineer.

### 21.1.9 sso00102

---

**SSO: ERROR: sso00102: Certificate has expired. ServerKind=(%s1) CertKind=(%s2)**

#### Variable Information

%s1 = Server name or command name

%s2 = Certificate type

EE= Client certificate

CA= CA certificate for the client certificate

SERVER= Server certificate of the communication partner

#### Explanation

The certificate displayed in%s2 expired.

#### User Action

Obtain the new certificate and reregister it in the Interstage certificate environment.

For details about the Interstage certificate environment, refer to "Setting and Use of the Interstage Certificate Environment" in the Security System Guide.

### 21.1.10 sso00103

---

**SSO: ERROR: sso00103: Failed in the analysis of the certificate. ServerKind=(%s1) CertKind=(%s2)**

#### Variable Information

%s1 = Server name or command name

%s2 = Certificate type

EE= Client certificate

CA= CA certificate for the client certificate

SERVER= Server certificate of the communication partner

### Explanation

The possible causes are as follows:

- The certificate displayed in%s2 is unsupported.
- The certificate displayed in%s2 is broken.

### User Action

Take one of the following actions:

- Check whether the certificate registered in the Interstage certificate environment was issued by a CA supported in Single Sign-on. (\*1)
- Reissue the certificate and reregister it in the Interstage certificate environment. (\*2)

\*1 For details about CAs supported in Single Sign-on, refer to "Overview" - "Authentication" - "Password and Certificate Authentication" - "Certificates Supported by Interstage Single Sign-on" in the Single Sign-on Operator's Guide.

\*2 For details about the Interstage certificate environment, refer to "Setting and Use of the Interstage Certificate Environment" in the Security System Guide.

## 21.1.11 sso00104

---

**SSO: ERROR: sso00104: Verification of the certificate failed. ServerKind=(%s1) CertKind=(%s2)**

### Variable Information

%s1 = Server name or command name

%s2 = Certificate type

EE= Client certificate

CA= CA certificate for the client certificate

SERVER= Server certificate of the communication partner

### Explanation

Failed to validate the certificate displayed in %s2.

### User Action

Check the certificate registered in the Interstage certificate environment.

For details about the Interstage certificate environment, refer to "Setting and Use of the Interstage Certificate Environment" in the Security System Guide.

## 21.1.12 sso00105

---

**SSO: ERROR: sso00105: Certificate was revoked. ServerKind=(%s1) CertKind=(%s2)**

### Variable Information

%s1 = Server name or command name

%s2 = Certificate type

EE= Client certificate or server certificate

CA= CA certificate for the client or server certificate

## Explanation

The certificate displayed in%*s2* was revoked.

## User Action

Obtain the new certificate and reregister it in the Interstage certificate environment.

For details about the Interstage certificate environment, refer to "Setting and Use of the Interstage Certificate Environment" in the Security System Guide.

## 21.1.13 sso00106

---

**SSO: ERROR: sso00106: Certificate has no path list. ServerKind=(%*s1*) CertKind=(%*s2*)**

### Variable Information

%*s1* = Server name or command name

%*s2* = Certificate type

EE= Client certificate

CA= CA certificate for the client certificate

SERVER= Server certificate of the communication partner

## Explanation

The certificate path list displayed in%*s2* does not exist.

## User Action

Check the certificate registered in the Interstage certificate environment.

For details about the Interstage certificate environment, refer to "Setting and Use of the Interstage Certificate Environment" in the Security System Guide.

## 21.1.14 sso00107

---

**SSO: ERROR: sso00107: Invalid certificate path. ServerKind=(%*s1*) CertKind=(%*s2*)**

### Variable Information

%*s1* = Server name or command name

%*s2* = Certificate type

EE= Client certificate

CA= CA certificate for the client certificate

SERVER= Server certificate of the communication partner

## Explanation

The certificate path displayed in%*s2* is incomplete.

## User Action

Check the certificate registered in the Interstage certificate environment.

For details about the Interstage certificate environment, refer to "Setting and Use of the Interstage Certificate Environment" in the Security System Guide.

## 21.1.15 sso00108

---

**SSO: ERROR: sso00108: Private key does not exist in the certificate. ServerKind=(%*s1*)**

## Variable Information

%s1 = Server name or command name

## Explanation

There is no private key in the certificate. The possible causes are as follows:

- The certificate registration failed.
- The certificate is not supported.
- The Interstage certificate environment is broken.

## User Action

Take one of the following actions:

- Reregister the certificate in the Interstage certificate environment. (\*1)
- Check whether the certificate registered in the Interstage certificate environment was issued by a CA supported in Single Sign-on. (\*2)
- Recreate the Interstage certificate environment.

Table 21.4 User Actions

Contents of the server or command name (%s1)	Action
Business server	Recreate the Interstage certificate environment in the business server environment. (*3)
Authentication server	Recreate the Interstage certificate environment in the authentication server environment. (*4)

\*1 For details about the Interstage certificate environment, refer to "Setting and Use of the Interstage Certificate Environment" in the Security System Guide.

\*2 For details about CAs supported in Single Sign-on, refer to "Overview" - "Authentication" - "Password and Certificate Authentication" - "Certificates Supported by Interstage Single Sign-on" in the Single Sign-on Operator's Guide.

\*3 For details, refer to "Environment setup (Business server administrators)" - "Setting up Business servers" - "Setting up the First Business server" - "Creating the Interstage Certificate Environment" in the Single Sign-on Operator's Guide.

\*4 For details, refer to "Environment setup (SSO administrators)" - "Set up of Authentication server" - "SSL Communication Environment Setup"

## 21.1.16 sso00109

**SSO: ERROR: sso00109: The data received by SSL communication is broken. ServerKind=(%s1) URL=(%s2) Detail=(%s3)**

## Variable Information

%s1 = Server name or command name

%s2 = Connection URL

%s3 = Maintenance information

## Explanation

The data received using SSL communication is broken. The possible causes are as follows:

- There is a problem in the network environment, and communication data was lacking.
- The connection (%s2) SSL server sent broken data.
- Communication data was falsified.

## User Action

Take one of the following actions:

- Check the network environment.
- Check that the connection (%s2) is correct.

Table 21.5 User Actions

Contents of the server or command name (%s1)	Action
Business server	Check that the business server environment settings authentication server URL is correct. (*1)
Authentication server	Check that the authentication server environment settings repository server (update system) or repository server (reference system) URL is correct. (*2)

- If the connection (%s2) is correct, check that the connection (%s2) Interstage certificate environment settings are correct. (\*3)
- Investigate whether there was an attack by a user with malicious intent.

\*1 In the Interstage Management Console, click [System] > [Security] > [Single Sign-on] > [Business System] > [Business system Name] > [Settings] > [Detailed Settings [Show]] > [Authentication Infrastructure Information Settings] > [Authentication server URL].

\*2 In the Interstage Management Console, click [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Authentication server] > [Settings] > [Detailed Settings [Show]] > [Communication Settings with Repository server] > [Repository server (update system) URL] or [Communication Settings with Repository server (reference system)] > [Repository server (reference system) URL].

\*3 For details about the Interstage certificate environment, refer to "Setting and Use of the Interstage Certificate Environment" in the Security System Guide.

## 21.1.17 sso00111

**SSO: ERROR: sso00111: The requested SSL cipher spec is not supported. ServerKind=(%s1) URL=(%s2)**

### Variable Information

%s1 = Server name or command name

%s2 = Connection URL

### Explanation

The encryption method requested from the SSL server is not supported.

### User Action

Take one of the following actions:

- Check that the connection (%s2) is correct.

Table 21.6 User Actions

Contents of the server or command name (%s1)	Action
Business server ssoupaci	Check that the business server environment settings Authentication server URL is correct. (*1)
Authentication server	Check that the authentication server environment settings repository server (update system) or repository server (reference system) URL is correct. (*2)

- If the connection (%s2) is correct, check that the connection (%s2) Interstage certificate environment settings are correct. (\*3)
- If the above problem does not occur, immediately after the message is output, use the iscollectinfo command to collect investigation information, then contact your service engineer.

\*1 In the Interstage Management Console, click [System] > [Security] > [Single Sign-on] > [Business System] > [Business system Name] > [Settings] > [Detailed Settings [Show]] > [Authentication Infrastructure Information Settings] > [Authentication server URL].

\*2 In the Interstage Management Console, click [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Authentication server] > [Settings] > [Detailed Settings [Show]] > [Communication Settings with Repository server] > [Repository server (update system) URL] or [Communication Settings with Repository server (reference system)] > [Repository server (reference system) URL].

\*3 For details about the Interstage certificate environment, refer to "Setting and Use of the Interstage Certificate Environment" in the Security System Guide.

## 21.1.18 sso00112

### SSO: ERROR: sso00112: The requested SSL protocol version is not supported. ServerKind=(%s1) URL=(%s2) Version=(%d1.%d2)

#### Variable Information

%s1 = Server name or command name

%s2 = Connection URL

%d1 = Major version

%d2 = Minor version

#### Explanation

The protocol version requested from the SSL server (%d1.%d2) is not supported.

Supported SSL protocol versions are as follows:

- 2.0 (SSL 2.0)
- 3.0 (SSL 3.0)
- 3.1 (TLS 1.0)

#### User Action

Take one of the following actions:

- Check that the connection (%s2) is correct.

Table 21.7 User Actions

Contents of the server or command name (%s1)	Action
Business server ssoupaci	Check that the business server environment settings authentication server URL is correct. (*1)
Authentication server	Check that the authentication server environment settings repository server (update system) or repository server (reference system) URL is correct. (*2)

- If the connection (%s2) is correct, check that the connection (%s2) Interstage certificate environment settings are correct. (\*3)
- If the above problem does not occur, immediately after the message is output, use the iscollectinfo command to collect investigation information, then contact your service engineer.

\*1 In the Interstage Management Console, click [System] > [Security] > [Single Sign-on] > [Business System] > [Business system Name] > [Settings] > [Detailed Settings [Show]] > [Authentication Infrastructure Information Settings] > [Authentication server URL].

\*2 In the Interstage Management Console, click [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Authentication server] > [Settings] > [Detailed Settings [Show]] > [Communication Settings with Repository server] > [Repository server (update system) URL] or [Communication Settings with Repository server (reference system)] > [Repository server (reference system) URL].

\*3 For details about the Interstage certificate environment, refer to "Setting and Use of the Interstage Certificate Environment" in the Security System Guide.

## 21.1.19 sso00113

---

**SSO: ERROR: sso00113: Invalid response received in SSL communication. ServerKind=(%s1) URL=(%s2) Detail=(%s3)**

### Variable Information

%s1 = Server name or command name

%s2 = Connection URL

%s3 = Maintenance information

### Explanation

The response received using SSL is invalid.

### User Action

Take one of the following actions:

- Check that the connection (%s2) is correct.

Table 21.8 User Actions

Contents of the server or command name (%s1)	Action
Business server ssoupaci	Check that the business server environment settings authentication server URL is correct. (*1)
Authentication server	Check that the authentication server environment settings repository server (update system) or repository server (reference system) URL is correct. (*2)

- If the connection (%s2) is correct, check that the connection (%s2) Interstage certificate environment settings are correct. (\*3)
- Check the network environment.
- Check whether there is a Web server or virtual host blocking communication in the connection destination (%s2).
- If the above problem does not occur, immediately after the message is output, use the iscollectinfo command to collect investigation information, then contact your service engineer.

\*1 In the Interstage Management Console, click [System] > [Security] > [Single Sign-on] > [Business System] > [Business system Name] > [Settings] > [Detailed Settings [Show]] > [Authentication Infrastructure Information Settings] > [Authentication server URL].

\*2 In the Interstage Management Console, click [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Authentication server] > [Settings] > [Detailed Settings [Show]] > [Communication Settings with Repository server] > [Repository server (update system) URL] or [Communication Settings with Repository server (reference system)] > [Repository server (reference system) URL].

\*3 For details about the Interstage certificate environment, refer to "Setting and Use of the Interstage Certificate Environment" in the Security System Guide.

## 21.1.20 sso00114

---

**SSO: ERROR: sso00114: Communication with the server was timed out. ServerKind=(%s1) URL=(%s2)**

### Variable Information

%s1 = Server name or command name

%s2 = Connection URL

## Explanation

The communication timed out.

## User Action

Take one of the following actions:

- Check that the connection (%s2) is correct.

Table 21.9 User Actions

Contents of the server or command name (%s1)	Action
Business server ssoupaci	Check that the business server environment settings authentication server URL is correct. (*1)
Authentication server	Check that the authentication server environment settings repository server (update system) or repository server (reference system) URL is correct. (*2)
Repository server	If the URL not displayed in the connection (%s2) starts with http://localhost, it means that the repository server (update system) environment is broken.  In this case, all the Interstage Single Sign-on servers must be set up again.

- Check whether the connection (%s2) server is running.
- Tune the connection (%s2) Web server.

Table 21.10 User Actions

Contents of the server or command name (%s1)	Action
Business server ssoupaci	The maximum number of simultaneous Interstage HTTP Server accesses and the client send/receive timeout in the connection (%s2) must be increased. If the connection maintenance time is increased, it might cause a timeout. In this case, reduce the connection maintenance time. For details, refer to "Web server (Interstage HTTP Server) Environment Definition" in the Tuning Guide.
Authentication server	
Repository server	 Tune the repository server (update system) TCP/IP parameters. For details, refer to "Tuning TCP/IP Parameters" in the "System tuning" chapter of the Tuning Guide.

- There is a possibility that there are insufficient Interstage HTTP Server process resources. In this case, the values set for the maximum number of simultaneous Interstage HTTP Server accesses must be reduced. For details, refer to "Web server (Interstage HTTP Server) Environment Definitions" in the Tuning Guide.
- The connection timed out because of a heavy load. Wait for a while and then reexecute the operation.  
  
If "Authentication server" is displayed in the server or command name (%s1), increasing the timeout time for communication with repository server in the authentication server environment settings sometimes makes timeouts more difficult to occur. (\*3)
- Check the network environment.
- If "Repository server" is displayed in the server name or command name (%s1) and system log sso06102 was output before this message, then solve the cause of error sso06102.

\*1 In the Interstage Management Console, click [System] > [Security] > [Single Sign-on] > [Business System] > [Business system Name] > [Settings] > [Detailed Settings [Show]] > [Authentication Infrastructure Information Settings] > [Authentication server URL].

\*2 In the Interstage Management Console, click [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Authentication server] > [Settings] > [Detailed Settings [Show]] > [Communication Settings with Repository server] > [Repository server (update system) URL] or [Communication Settings with Repository server (reference system)] > [Repository server (reference system) URL].

\*3 In the Interstage Management Console, click [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Authentication server] > [Settings] > [Detailed Settings [Show]] > [Communication Settings with Repository server] > [Timeout].

## 21.1.21 sso00115

**SSO: ERROR: sso00115: An internal error occurred in the SSL function. ServerKind=(%s1) Detail=(%s2)**

### Variable Information

%s1 = Server name or command name

%s2 = Maintenance information

### Explanation

Possible causes are as follows:

- Exclusion control processing for the SSL function failed due to heavy load.
- An internal conflict occurred in the SSL function.

### User Action

Take the following action:

- Wait for a few moments, then reexecute.
- In all other cases, immediately after the message is output, use the *iscollectinfo* command to collect investigation information, then contact your service engineer.

## 21.1.22 sso00116

**SSO: ERROR: sso00116: SSL communication could not be established. ServerKind=(%s1) URL=(%s2) Detail=(%s3)**

### Variable Information

%s1 = Server name or command name

%s2 = Connection URL

%s3 = Maintenance information

### Explanation

The SSL connection could not be established, or the connection was denied by the SSL server or the client.

### User Action

Take one of the following actions:

- Check that the connection (%s2) is correct.

Table 21.11 User Actions

Contents of the server or command name (%s1)	Action
Business server ssoupaci	Check that the business server environment settings authentication server URL is correct. (*1)  After the authentication server environment settings are changed, there is also a possibility that the authentication server was not restarted. Stop the authentication server and then restart it.
Authentication server	Check that the authentication server environment settings repository server (update system) or repository server (reference system) URL is correct. (*2)

Contents of the server or command name (%s1)	Action
ssoupri	<p>Check that the repository server environment settings 'Web server used' is correct.</p> <p>The repository server may not have been restarted after changing the repository server environment settings. In this case, stop the repository server and then restart it.</p>

- If the connection (%s2) is correct, check that the connection (%s2) Interstage certificate environment settings are correct. (\*3)
- There is a possibility that the system log was output in the connection (%s2) server. If the system log was output, check the message and establish and fix the cause of the error.
- The SSL connection could not be established because of a reason such as a high-load state. Wait for a while and then reexecute the operation.
- Check the network environment.
- Check whether there is a Web server or virtual host blocking communication in the connection destination (%s2).
- If the above problem does not occur, immediately after the message is output, use the iscollectinfo command to collect investigation information, and then contact your service engineer.

\*1 In the Interstage Management Console, click [System] > [Security] > [Single Sign-on] > [Business System] > [Business system Name] > [Settings] > [Detailed Settings [Show]] > [Authentication Infrastructure Information Settings] > [Authentication server URL].

\*2 In the Interstage Management Console, click [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Authentication server] > [Settings] > [Detailed Settings [Show]] > [Communication Settings with Repository server] > [Repository server (update system) URL] or [Communication Settings with Repository server (reference system)] > [Repository server (reference system) URL].

\*3 For details about the Interstage certificate environment, refer to "Setting and Use of the Interstage Certificate Environment" in the Security System Guide.

## 21.1.23 sso00117

**SSO: ERROR: sso00117: An error occurred while communicating. ServerKind=(%s1) URL=(%s2) Detail=(%s3)**

### Variable Information

%s1 = Server name or command name

%s2 = Connection URL

%s3 = Maintenance information

### Explanation

The possible causes are as follows:

- Communication with the connection (%s2) failed.
- The communication was closed during communication with the connection (%s2).

### User Action

Take one of the following actions:

- Check that the connection (%s2) is correct.

Table 21.12 User Actions

Contents of the server or command name (%s1)	Action
Business server	Check that the business server environment settings authentication server URL is correct. (*1)
Authentication server	Check that the authentication server environment settings repository server (update system) or repository server (reference system) URL is correct. (*2)
Repository server	If the URL not displayed in the connection (%s2) starts with http://localhost, it means that the repository server (update system) environment is broken. In this case, all the Interstage Single Sign-on servers must be set up again.

- Check whether the connection (%s2) server is running. If it is not, start it if necessary.
- Tune the connection (%s2) Web server.

Table 21.13 User Actions

Contents of the server or command name (%s1)	Action
Business server	The maximum number of simultaneous Interstage HTTP Server accesses and the client send/receive timeout in the connection (%s2) must be increased. If the connection maintenance time is increased, it might cause a timeout. In this case, reduce the connection maintenance time. For details, refer to "Web server (Interstage HTTP Server) Environment Definitions" in the Tuning Guide.
Authentication server	
Repository server	<b>Windows32/64</b> Tune the repository server (update system) TCP/IP parameters. For details, refer to "Tuning TCP/IP Parameters" in the "System Tuning" chapter of the Tuning Guide.

- There is a possibility that there are insufficient Interstage HTTP Server process resources. In this case, the values set for the maximum number of simultaneous Interstage HTTP Server accesses must be reduced. For details, refer to "Web server (Interstage HTTP Server) Environment Definitions" in the Tuning Guide.
- The connection timed out because of a heavy load. Wait for a while and then reexecute the operation.
- Check the network environment.
- If "Repository server" is displayed in the server name or command name (%s1) and system log sso06102 was output before this message, then solve the cause of error sso06102.
- Check whether there is a Web server or virtual host blocking communication in the connection destination (%s2).
- If the above problem does not occur, immediately after the message is output, use the iscollectinfo command to collect investigation information, then contact your service engineer.

\*1 In the Interstage Management Console, click [System] > [Security] > [Single Sign-on] > [Business System] > [Business system Name] > [Settings] > [Detailed Settings [Show]] > [Authentication Infrastructure Information Settings] > [Authentication server URL].

\*2 In the Interstage Management Console, click [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Authentication server] > [Settings] > [Detailed Settings [Show]] > [Communication Settings with Repository server] > [Repository server (update system) URL] or [Communication Settings with Repository server (reference system)] > [Repository server (reference system) URL].

## 21.1.24 sso00118

**SSO: ERROR: sso00118: Failed to resolve the host name. ServerKind=(%s1) Host=(%s2) Detail=(%s3)**

## Variable Information

%s1 = Server name or command name

%s2 = Host name

%s3 = Maintenance information

## Explanation

Failed to resolve the host (%s2) name.

## User Action

Take one of the following actions:

- Check that the host name (%s2) is correct.

Table 21.14 User Actions

Contents of the server or command name (%s1)	Action
Business server	Check that the business server environment settings authentication server URL is correct. (*1)
Authentication server	Check that the authentication server environment settings repository server (update system) or repository server (reference system) URL is correct. (*2)
Repository server	Check that the directory service URL in the repository server environment settings is correct when Active Directory is used at the user information registration destination. (*3)

- If the host name (%s2) is correct, there is a possibility that access to the DNS server was temporarily denied. Restart the Web browser and reexecute the operation.
- If the above action did not resolve the problem, check the network environment.

\*1 In the Interstage Management Console, click [System] > [Security] > [Single Sign-on] > [Business System] > [Business system Name] > [Settings] > [Detailed Settings [Show]] > [Authentication Infrastructure Information Settings] > [Authentication server URL].

\*2 In the Interstage Management Console, click [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Authentication server] > [Settings] > [Detailed Settings [Show]] > [Communication Settings with Repository server] > [Repository server (update system) URL] or [Communication Settings with Repository server (reference system)] > [Repository server (reference system) URL].

\*3 In the Interstage Management Console, click [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Repository server] > [Settings] > [Detailed Settings [Show]] > [Repository Settings] > [Active Directory Settings] > [Directory service URL].

## 21.1.25 sso00119

**SSO: ERROR: sso00119: Communication with Server is not established. ServerKind=(%s1) URL=(%s2) Reason=(%s3) Detail=(%s4)**

## Variable Information

%s1 = Server name or command name

%s2 = Connection URL

%s3 = Cause of the error

%s4 = Maintenance information

## Explanation

The connection (%s2) could not be established.

## User Action

Take one of the following actions:

- Check that the connection (%s2) is correct.

Table 21.15 User Actions

Contents of the server or command name (%s1)	Action
Business server	Check that the business server environment settings authentication server URL is correct. (*1)
Authentication server	Check that the authentication server environment settings repository server (update system) or repository server (reference system) URL is correct. (*2)
Repository server	If the URL not displayed in the connection (%s2) starts with http://localhost, it means that the repository server (update system) environment is broken.  In this case, all the Interstage Single Sign-on servers must be set up again.

- Check whether the connection (%s2) server is running.

Table 21.16 User Actions

Contents of the server or command name (%s1)	Action
Business server	Ask the SSO administrator to check that the Authentication server or Repository server is running.
Authentication server	Check that the Repository server is running. (*3)
Repository server	Stop the Repository server and then restart it. (*4)

- Tune the connection (%s2) Web server.

Table 21.17 User Actions

Contents of the server or command name (%s1)	Action
Business server	The maximum number of simultaneous Interstage HTTP Server accesses and the client send/receive timeout in the connection (%s2) must be increased. If the connection maintenance time is increased, it might cause a timeout. In this case, reduce the connection maintenance time. For details, refer to "Web server (Interstage HTTP Server) Environment Definition" in the Tuning Guide.
Authentication server	
Repository server	 Tune the repository server (update system) TCP/IP parameters. For details, refer to "Tuning TCP/IP Parameters" in the "System Tuning" chapter of the Tuning Guide.

- There is a possibility that there are insufficient Interstage HTTP Server process resources. In this case, the values set for the maximum number of simultaneous Interstage HTTP Server accesses must be reduced. For details, refer to "Web server (Interstage HTTP Server) Environment Definitions" in the Tuning Guide.
- If "timeout" is displayed in the cause of the error (%s3), it means that the connection timed out because of a heavy load. Wait for a while and then reexecute the operation.
- Check the network environment.
- Check whether there is a Web server or virtual host blocking communication in the connection destination (%s2).
- If the above problem does not occur, immediately after the message is output, use the iscollectinfo command to collect investigation information, then contact your service engineer.

\*1 In the Interstage Management Console, click [System] > [Security] > [Single Sign-on] > [Business System] > [Business system Name] > [Settings] > [Detailed Settings [Show]] > [Authentication Infrastructure Information Settings] > [Authentication server URL].

\*2 In the Interstage Management Console, click [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Authentication server] > [Settings] > [Detailed Settings [Show]] > [Communication Settings with Repository server] > [Repository server (update system) URL] or [Communication Settings with Repository server (reference system)] > [Repository server (reference system) URL].

\*3 In the Interstage Management Console, click [System] > [Service] > [Web Server] > [Web Server Name] > [Web Server: Status] tab to check the Repository server status.

\*4 For details on stopping the repository server, see 'Operation and Maintenance' - 'Stopping Single Sign-on' - 'Stopping a Repository Server' in the Single Sign-on Operator's Guide. For details on starting the repository server, see 'Operation and Maintenance' - 'Starting Single Sign-on' - 'Starting a Repository Server' in the Single Sign-on Operator's Guide.

## 21.1.26 sso00200

---

**SSO: ERROR: sso00200: Internal error. ServerKind=(%s1) Detail=(%s2)**

### Variable Information

%s1 = Server name or command name

%s2 = Maintenance information

### Explanation

An internal abnormality occurred.

### User Action

Immediately after the message is output, use the *iscollectinfo* command to collect investigation information, then contact your service engineer.

## 21.1.27 sso00201

---

**SSO: ERROR: sso00201: System resources are insufficient. ServerKind=(%s1) Resource=(%s2)**

### Variable Information

%s1 = Server name or command name

%s2 = Resource

FD = File descriptors

STREAMS = STREAMS resources

### Explanation

**Solaris32/64** **Linux32/64**

- %s2 is FD

There are insufficient file descriptors.

**Solaris32/64**

- %s2 is STREAMS

There are insufficient STREAMS resources.

### User Action

Close other programs and reexecute.

## 21.1.28 sso00202

---

---

**SSO: ERROR: sso00202: An error occurred in the system function. ServerKind=(%s1) Reason=(%s2,%s3) Detail=(%s4) Code=(%s5)**

**Variable Information**

- %s1 = Server name or command name
- %s2 = System function that caused the error
- %s3 = Error number notified from the system function
- %s4 = Maintenance information
- %s5 = Maintenance information

**Explanation**

An error occurred in the system function (%s2).

**User Action**

Take one of the following actions:

**Table 21.18 List of Error Causes (%s2)**

<b>Details of system function (%s2) where an error occurred</b>	<b>Response measure</b>
getaddrinfo	- Check the network environment
getnameinfo	- Failed to resolve the name due to a high load situation. Execute the operation again after waiting for a while.
Other than the above	<ul style="list-style-type: none"><li>- Rectify the cause of error number (%s3) notified from the system function (%s2) that an error occurred.</li><li>- If the server name or the command name (%s1) is one of the following, restart the Web server and execute it again.<ul style="list-style-type: none"><li>- Business server</li><li>- Authentication server</li><li>- Repository server</li><li>- Session management server</li></ul></li><li>- If Microsoft(R) Internet Information Services is used as the Web server on the business server, check that the correct procedure was followed to integrate the business server (*1)</li></ul>

If the above problem is still not resolved, restart the machine and reexecute.

If the problem is still not resolved, immediately after the message is output, use the *iscollectinfo* command to collect investigation information and then contact your service engineer.

\*1 For business server integration procedures, refer to "Environment Setup (Business Server Administrators)"-"Integrating into the Web Server" in the Single Sign-on Operator's Guide.

---

## **21.1.29 sso00203**

---

**SSO: ERROR: sso00203: Insufficient disk space. ServerKind=(%s1)**

**Variable Information**

- %s1 = Server name or command name

**Explanation**

There is insufficient available disk capacity.

## User Action

Secure available capacity by getting rid of unnecessary files.

### 21.1.30 sso00204

---

**SSO: INFO: sso00204: Service ID file was updated. ServerKind=(%s1) ID=(%s2)**

#### Variable Information

%s1 = Server name or command name

%s1 = Service ID file consistency ID

#### Explanation

The service ID file was updated.

### 21.1.31 sso00205

---

**SSO: ERROR: sso00205: Could not get IPC resource due to duplicated key. ServerKind=(%s1) Kind=(%s2) Id=(%s3) Detail=(%s4) Code=(%s5)**

#### Variable Information

%s1 = Server name or command name

%s2 = Server type

%s3 = Business server ID

%s4 = Maintenance information

%s5 = Maintenance information

#### Explanation

The attempt to obtain the IPC resources failed because they are required for running Interstage Single Sign-on.

#### User Action

Check the system log output in the server (%s1) to determine whether it was stopped normally the previous time and take the following action. The stopped system log is recorded in each server.

- The system log was stopped normally the previous time

The IPC resources required for running Interstage Single Sign-on and the IPC resources used in other applications are the same, so they must be customized. For details, refer to "Setting IPC Resources" in the Tuning Guide.

- The system log was not stopped normally the previous time

Immediately after the message is output, use the *iscollectinfo* command to collect investigation information, then contact your service engineer.

### 21.1.32 sso00206

---

**SSO: ERROR: sso00206: Lock control failed. ServerKind=(%s1) Reason=(%s2,%s3) Detail=(%s4) Code=(%s5)**

#### Variable Information

%s1 = Server name or command name

%s2 = System function that caused the error

%s3 = Error number notified from the system function

%s4 = Maintenance information

%s5 = Maintenance information

## Explanation

Exclusion control failed.

## User Action

Take one of the following actions:

- Check that the size for the exclusion control resources (semaphore) required for running Interstage Single Sign-on was set correctly. For details about the exclusion control resource (semaphore) size settings, refer to "System tuning" in the Tuning Guide.
- Establish and fix the cause of the error number (%s3) notified from the system function that caused the error (%s2).
- If the server or command name (%s1) is shown, restart the Web server and reexecute.
  - Business server
  - Authentication server
  - Repository server
  - Session management server

If the above problem is still not resolved, restart the machine and reexecute.

If the problem is still not resolved, immediately after the message is output, use the *iscollectinfo* command to collect investigation information, then contact your service engineer.

## 21.1.33 sso00207

---

**SSO: ERROR: sso00207: Operation of shared memory failed. ServerKind=(%s1) Reason=(%s2,%s3) Detail=(%s4) Code=(%s5)**

### Variable Information

%s1 = Server name or command name

%s2 = System function that caused the error

%s3 = Error number notified from the system function

%s4 = Maintenance information

%s5 = Maintenance information

## Explanation

The shared memory operation failed.

## User Action

Take one of the following actions:

- Check that the size for the shared memory required for running Interstage Single Sign-on was set correctly. For details about the required shared memory size, refer to "System tuning" in the Tuning Guide.
- Establish and fix the cause of the error number (%s3) notified from the system function that caused the error (%s2).
- If the server or command name (%s1) is shown, restart the Web server and reexecute.
  - Business server
  - Authentication server
  - Repository server
  - Session management server

If the above problem is still not resolved, restart the machine and reexecute.

If the problem is still not resolved, immediately after the message is output, use the *iscollectinfo* command to collect investigation information, then contact your service engineer.

## 21.2 sso01000 to sso01213

---

### 21.2.1 sso01000

---

**SSO: INFO: sso01000: SSO Repository server started.**

#### Explanation

The Interstage Single Sign-on Repository server has started.

### 21.2.2 sso01001

---

**SSO: INFO: sso01001: SSO Repository server stopped.**

#### Explanation

The Interstage Single Sign-on Repository server has stopped.

### 21.2.3 sso01002

---

**SSO: ERROR: sso01002: Failed to start SSO Repository server.**

#### Explanation

The attempt to start the Interstage Single Sign-on Repository server failed because of the reason shown in the error message output immediately before.

#### User Action

Check the message that is output immediately before this message to establish and fix the cause of the error, briefly stop the repository server, and then restart it.

### 21.2.4 sso01008

---

**SSO: INFO: sso01008: SSO Repository server was unblocked.**

#### Explanation

The Interstage Single Sign-on Repository server was unblocked.

### 21.2.5 sso01009

---

**SSO: ERROR: sso01009: SSO Repository server was blocked.**

#### Explanation

The Interstage Single Sign-on Repository server was unblocked.

#### User Action

Check the message that is output immediately before this message to establish and fix the cause of the error, stop the repository server and then restart it.

For details about stopping the repository server, refer to "Stopping a Repository Server in Operation and Maintenance" in the Single Sign-on Operator's Guide. For details about starting the repository server, refer to "Starting a Repository Server" in Operation and Maintenance, in the Single Sign-on Operator's Guide.

## 21.2.6 sso01010

---

### SSO: ERROR: sso01010: Allocation of memory failed.

#### Explanation

Memory space required for the Interstage Single Sign-on Repository server operation failed to be allocated.

#### User Action

Close all unnecessary programs. Alternatively, confirm whether there is enough memory space for Interstage Single Sign-on operation.

For details on the required memory space, refer to "Memory Requirements" in the "Resource Requirements" chapter of the Tuning Guide.

## 21.2.7 sso01012

---

### SSO: ERROR: sso01012: Internal error. Detail=(%s1) Code=(%s2)

#### Variable Information

%s1 = Maintenance information

%s2 = Maintenance information

#### Explanation

An internal error occurred in the Interstage Single Sign-on Repository server.

#### User Action

Check the Interstage Single Sign-on restrictions and take action (\*1).

If there are no restrictions, immediately after the message is output, use the *iscollectinfo* command to collect investigation information, then contact your service engineer.

\*1 For details about Interstage Single Sign-on restrictions, refer to 'Restrictions' in the Product Notes.

## 21.2.8 sso01013

---

### SSO: ERROR: sso01013: Invalid environment.

#### Explanation

The environment variable or registry required to start the Interstage Single Sign-on Repository server failed to be read. The possible causes are as follows:

- The Interstage Single Sign-on Repository server is not installed correctly.
- The environment of the Interstage Single Sign-on Repository server is destroyed.

#### User Action

If data containing the environment variables or registry was saved, restore it.

If saved data is not available or this message is reported even after data is restored, reinstall the Interstage Single Sign-on Repository server.

## 21.2.9 sso01014

---

### SSO: ERROR: sso01014: Allocation of memory or shared memory failed. Code=(%s1)

#### Variable Information

%s1 = Maintenance information

## Explanation

Windows32/64

Failed to get required memory for running the Interstage Single Sign-on Repository server. The memory space required for the Interstage Single Sign-on Repository server operation is insufficient.

Solaris32/64 Linux32/64

Failed to get memory/shared memory required for running the Interstage Single Sign-on Repository server. The memory space or shared memory size required for the Interstage Single Sign-on Repository server operation is insufficient

## User Action

Linux32/64

Close all unnecessary programs. Alternatively, confirm whether enough memory space is allocated for Interstage Single Sign-on Repository server operation. For details on the required memory space, refer to "Memory Requirements" in the "Resource Requirements" chapter of the Tuning Guide.

When enough memory space is allocated, use the *iscollectinfo* command immediately after the message is output to collect investigation information, then contact your service engineer.

Solaris32/64 Linux32/64

Close all unnecessary programs. Alternatively, confirm whether enough memory space is allocated for Interstage Single Sign-on operation and whether the shared memory size is correctly set.

For details on the required memory space, refer to "Memory Requirements" in the "Resource Requirements" chapter of the Tuning Guide. For details on the size of the required shared memory, refer to 'System Tuning' in the Tuning Guide.

When enough memory space is allocated and the size of the shared memory is correctly set, use the *iscollectinfo* command immediately after the message is output to collect investigation information, and contact your service engineer.

## 21.2.10 sso01015

---

**SSO: WARNING: sso01015: SSO Repository server is already running.**

### Explanation

The Interstage Single Sign-on Repository server has already started.

## 21.2.11 sso01016

---

**SSO: ERROR: sso01016: Operation of shared memory failed. Code=(%s1)**

### Variable Information

%s1 = Maintenance information

### Explanation

Windows32/64

The Interstage Single Sign-on Repository server failed to reference the shared memory already created. The memory space required for the Interstage Single Sign-on Repository server operation may be insufficient.

Solaris32/64 Linux32/64

The Interstage Single Sign-on Repository server failed to reference the shared memory already created. The memory space or shared memory size required for the Interstage Single Sign-on Repository server operation may be insufficient.

### User Action

Windows32/64

Close all unnecessary programs. Alternatively, confirm whether enough memory space is allocated for the Interstage Single Sign-on Repository server operation. For details on the required memory space, refer to "Memory Requirements" in the "Resource Requirements" chapter of the Tuning Guide.

When enough memory space is allocated, use the *iscollectinfo* command immediately after the message is output to collect investigation information, then contact your service engineer.

**Solaris32/64 Linux32/64**

Close all unnecessary programs. Alternatively, confirm whether enough memory space is allocated for Interstage Single Sign-on operation and whether the shared memory size is correctly set.

For details on the required memory space, refer to "Memory Requirements" in the "Resource Requirements" chapter of the Tuning Guide. For details on the size of the required shared memory, refer to 'System Tuning' in the Tuning Guide.

When enough memory space is allocated and the size of the shared memory is correctly set, use the *iscollectinfo* command immediately after the message is output to collect investigation information, then contact your service engineer.

## 21.2.12 sso01017

---

### SSO: ERROR: sso01017: Initialization of lock control failed. Code=(%s1)

#### Variable Information

%s1 = Maintenance information

#### Explanation

**Windows32/64**

The Interstage Single Sign-on Repository server failed to allocate the exclusion control resource required for Interstage Single Sign-on Repository server operation. The memory space required for the Interstage Single Sign-on Repository server operation may be insufficient.

**Solaris32/64 Linux32/64**

The Interstage Single Sign-on Repository server failed to allocate the exclusion control resource required for Interstage Single Sign-on Repository server operation. The memory space or exclusion control resource (semaphore) required for the Interstage Single Sign-on Repository server operation may be insufficient.

#### User Action

**Windows32/64**

Close all unnecessary programs. Alternatively, confirm whether enough memory space is allocated for Interstage Single Sign-on Repository server operation.

For details on the required memory space, refer to "Memory Requirements" in the "Resource Requirements" chapter of the Tuning Guide.

When enough memory space is allocated, use the *iscollectinfo* command immediately after the message is output to collect investigation information, then contact your service engineer.

**Solaris32/64 Linux32/64**

Close all unnecessary programs. Alternatively, confirm whether the memory space enough for Interstage Single Sign-on operation is allocated and whether the size of the exclusion control resource (semaphore) is correctly set.

For details on the required memory space, refer to "Memory Requirements" in the "Resource Requirements" chapter of the Tuning Guide. For details on the size of the required exclusion control resource (semaphore), refer to the "System Tuning" chapter in the Tuning Guide.

When enough memory space is allocated and the size of the exclusion control resource (semaphore) is correctly set, use the *iscollectinfo* command immediately after the message is output to collect investigation information, then contact your service engineer.

## 21.2.13 sso01019

---

---

## SSO: ERROR: sso01019: Lock control failed. Code=(%s1)

### Variable Information

%s1 = Maintenance information

### Explanation

**Windows32/64**

The Interstage Single Sign-on Repository server failed to perform exclusion control. The memory space required for Interstage Single Sign-on Repository server operation may be insufficient.

**Solaris32/64 Linux32/64**

The Interstage Single Sign-on Repository server failed to perform exclusion control. The memory space or the size of the exclusion control resource (semaphore) required for Interstage Single Sign-on Repository server operation may be insufficient.

### User Action

**Windows32/64**

Close all unnecessary programs. Alternatively, confirm whether enough memory space was allocated for Interstage Single Sign-on Repository server operation.

For details on the required memory space, refer to "Memory Requirements" in the "Resource Requirements" chapter of the Tuning Guide.

When enough memory space is allocated, use the *iscollectinfo* command immediately after the message is output to collect investigation information, then contact your service engineer.

**Solaris32/64 Linux32/64**

Close all unnecessary programs. Alternatively, confirm whether enough memory space is allocated for Interstage Single Sign-on operation and whether the size of the exclusion control resource (semaphore) is correctly set.

For details on the required memory space, refer to "Memory Requirements" in the "Resource Requirements" chapter of the Tuning Guide. For details on the size of the required exclusion control resource (semaphore), refer to the "System Tuning" chapter in the Tuning Guide.

When enough memory space is allocated and the size of the exclusion control resource (semaphore) is correctly set, use the *iscollectinfo* command immediately after the message is output to collect investigation information, then contact your service engineer.

---

## 21.2.14 sso01020

---

### SSO: ERROR: sso01020: Can not access configuration file. Filename=(%s1)

#### Variable Information

%s1 = Absolute path of the repository server configuration file

#### Explanation

Access to the configuration file (%s1) of the Interstage Single Sign-on Repository server failed. The possible causes are as follows:

- Upgrade of the repository server from a previous version might have been unsuccessful.
- The configuration file (%s1) of the repository server is not found.
- Access authorization required for the repository server configuration file (%s1) is not set.
- The memory space required for the Interstage Single Sign-on Repository server operation is insufficient.

#### User Action

Take one of the following actions:

- If the repository server was upgraded from a previous version, check that the upgrade procedure was correct.

- Confirm whether the repository server configuration file (%s1) exists. If it does not, rebuild the repository server using the following procedure:
  - 1. From the Interstage Management Console, select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [List] tab to delete the repository server once.
  - 2. Use the [Authentication infrastructure settings] tab to build the repository server.
- If the access authorization of the repository server configuration file (%s1) is incorrect, set the correct access authorization. (\*1)
- If memory is insufficient, close all unnecessary programs. Alternatively, confirm whether enough memory space is allocated for Interstage Single Sign-on Repository server operation. For details on the required memory space, refer to "Memory Requirements" in the "Resource Requirements" chapter of the Tuning Guide.

\*1 For details on setting access authorization, see 'Operation and Maintenance' - 'Changing Effective User for Web Server' in the Single Sign-on Operator's Guide.

## 21.2.15 sso01022

---

**SSO: ERROR: sso01022: Error is in setting of configuration file. Filename=(%s1) Item=(%s2) Value=(%s3)**

### Variable Information

- %s1 = Absolute path of the repository server configuration file
- %s2 = Configuration item name
- %s3 = Setting contents

### Explanation

The setting (setting contents (%s3) of the configuration item (%s2)) of the configuration file (%s1) of the Interstage Single Sign-on Repository server is incorrect.

### User Action

Take the following action:

- Select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [List] tab on the Interstage Management Console to delete the repository server once, then rebuild the repository sever with the [Authentication infrastructure settings] tab.

## 21.2.16 sso01023

---

**SSO: ERROR: sso01023: Setting of configuration file is omitted. Filename=(%s1) Item=(%s2)**

### Variable Information

- %s1 = Absolute path of the repository server configuration file
- %s2 = Configuration item name

### Explanation

No value is set in the configuration information required for the Interstage Single Sign-on Repository server operation.

### User Action

Take the following action:

- Select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [List] tab on the Interstage Management Console to delete the repository server once, then rebuild the repository sever using the [Authentication infrastructure setting] tab.

## 21.2.17 sso01024

---

**SSO: WARNING: sso01024: Error is in setting of configuration file. Default value is used. Filename=(%s1) Item=(%s2) Value=(%s3)**

## Variable Information

%s1 = Absolute path of the repository server configuration file

%s2 = Configuration item name

%s3 = Setting contents

## Explanation

The default value was used for processing because an unspecified value (%s3) was specified in the configuration item (%s2) of the configuration file (%s1) of the Interstage Single Sign-on Repository server.

This message is output at startup of the repository server.

## User Action

Take the following action:

- Select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Repository server] or [Repository server (reference system)] > [Settings] tab on the Interstage Management Console, then click the 'Update' button of that tab to update the repository server environment settings. Updating the repository server environment settings sets the default value.

## 21.2.18 sso01030

---

### SSO: ERROR: sso01030: Reading service ID file failed. Filename=(%s1)

## Variable Information

%s1 = Absolute path of the service ID file

## Explanation

The service ID file of the Interstage Single Sign-on Repository server failed to be read. The possible causes are as follows. (\*1)

- Access authorization of the repository server service ID file is incorrect.
- The repository server service ID file may be used with another application.
- The memory space required for the Interstage Single Sign-on Repository server operation is insufficient.
- The repository server service ID file does not exist.
- The service ID file for the business server is specified for that for the repository server.
- The contents of the repository server service ID file are damaged.

## User Action

Take one of the following actions:

- If access authorization of the repository server service ID file is incorrect, specify correct access authorization. (\*2)
- Confirm whether the repository server service ID file is not used with another application.
- If memory is insufficient, close all unnecessary programs. Alternatively, confirm whether enough memory space is allocated for Interstage Single Sign-on Repository server operation. For details on the required memory space, refer to "Memory Requirements" in the "Resource Requirements" chapter of the Tuning Guide.
- In cases other than above, select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [List] tab on the Interstage Management Console to delete the repository server once, then rebuild the repository server from the [Authentication infrastructure Setting] tab.

\*1 For details on the service ID file, see 'Environment Setup (SSO Administrators)' - 'Registering a Business System' - 'Preparations for Setting up a Business System' in the Single Sign-on Operator's Guide.

\*2 For details on access authorization, see 'Operation and Maintenance' - 'Changing Effective User for Web Server' in the Single Sign-on Operator's Guide.

## 21.2.19 sso01032

---

### SSO: ERROR: sso01032: Initialization of maintenance log failed.

#### Explanation

Windows32/64

The maintenance log of the Interstage Single Sign-on Repository server failed to be initialized. The memory space required for the Interstage Single Sign-on Repository server operation may be insufficient.

Solaris32/64 Linux32/64

The maintenance log of the Interstage Single Sign-on Repository server failed to be initialized. The memory space required for the Interstage Single Sign-on Repository server operation may be insufficient. Alternatively, there may be an error in the shared memory/exclusion control resource (semaphore) settings.

#### User Action

Windows32/64

Close all unnecessary programs. Alternatively, confirm whether enough memory space is enough for the Interstage Single Sign-on Repository server is allocated.

For details on the required memory space, refer to "Memory Requirements" in the "Resource Requirements" chapter of the Tuning Guide.

When enough memory space is allocated, use the *iscollectinfo* command immediately after the message is output to collect investigation information, then contact your service engineer.

Solaris32/64 Linux32/64

Close all unnecessary programs. Alternatively, confirm whether enough memory space is allocated for Interstage Single Sign-on operation and whether the size of the shared memory or of the exclusion control resource (semaphore) is correctly set.

For details on the required memory space, refer to "Memory Requirements" in the "Resource Requirements" chapter of the Tuning Guide. For details on the sizes of the required shared memory and exclusion control resource (semaphore), refer to the "System Tuning" chapter in the Tuning Guide.

If the problem is still not resolved by taking the above action, there is a possibility that the IPC resources required for running Interstage Single Sign-on and the IPC resources being used by another application are the same. For this reason, the IPC resources must be customized. For details, refer to "Setting IPC resources" in the Tuning Guide.

When enough memory space is allocated and the size of the shared memory or of the exclusion control resource (semaphore) is correctly set, use the *iscollectinfo* command immediately after the message is output to collect investigation information, then contact your service engineer.

## 21.2.20 sso01034

---

### SSO: ERROR: sso01034: Acquisition of SSO Repository information failed. RepositoryName=(%s1) Code=(%x2)

#### Variable Information

%s1: Repository name

%x2: Detail error code

#### Explanation

The acquisition of SSO repository information has failed.

#### User Action

Remove the cause of the error code (%x2). For a definition of the error code, see 'List of Error Codes on Acquiring Information on SSO Repository' and take suggested action.

Table 21.19 List of Error Codes on Acquiring Information on SSO Repository

Code	Description of error	Action to be taken
0x06	The SSO repository (%s1) does not exist.	Check that the SSO repository (%s1) has not been deleted. (*1) If it has been deleted, on the Interstage Management Console, select [System] > [Services] > [Repository] > [Create a New Repository] tab to recreate the SSO repository (%s1). (*2)
0x08	Interstage Directory Service has not been installed. Alternatively, the environment of Interstage Directory Service is damaged.	<b>Windows32/64</b> Install Interstage Directory Service and Interstage data store. If they have been already installed, reinstall them. (*3) <b>Solaris32/64</b> <b>Linux32/64</b> Install the following packages. If they have been already installed, reinstall them. (*3) - FJSVirep (Interstage Directory Service) - FJSVena (Interstage data store for enterprise content knowledge and document management)
0x0d	Memory is insufficient.	Close all applications no longer needed to ensure the free space of memory. For the required memory, refer to 'Memory Requirements' under 'Required Resources' in the Tuning Guide.
0x0e 0x10 0x13	The environment of the SSO repository (%s1) is damaged. Alternatively, the environment of Interstage Directory Service is damaged.	On the Interstage Management Console, select [System] > [Services] > [Repository] > [Create a New Repository] tab to recreate the SSO repository (%s1). (*2) <b>Windows32/64</b> If it cannot be recreated, reinstall Interstage Directory Service and Interstage data store. (*3) <b>Solaris32/64</b> <b>Linux32/64</b> If it cannot be recreated, reinstall the following packages: (*3) - FJSVirep (Interstage Directory Service) - FJSVena (Interstage data store for enterprise content knowledge and document management)
0x14	Possible causes of the error are as follows: - The network resources are insufficient. - The network has been incorrectly set up. - An error occurs in the network environment.	Take the following action: - Check that the network allows the communication. - If the network has been correctly set up, close all programs no longer needed. - Check that the network environment is correct. If the network environment is incorrect, reconfigure it.
Other than above	Another error occurred.	Check that a message starting with irep has been output in the system log. If a message has been output, check it to remove the cause of error. Otherwise, after a message is output, promptly use the

Code	Description of error	Action to be taken
		iscollectinfo command to collect investigation information, then contact your service engineer.

\*1 On the Interstage Management Console, select [System] > [Services] > [Repository] > [View Status] tab to check it.

\*2 For details on creating the SSO repository, 'Creating an SSO Repository' under 'Environment Setup (SSO Administrators)' in the Single Sign-on Operator's Guide.

\*3 After uninstalling them, delete all files under the following directories:

#### Windows32/64

- C:\Interstage\IREP
- C:\Interstage\Enabler

#### Solaris32/64 Linux32/64

- /opt/FJSVirep
- /var/opt/FJSVirep
- /etc/opt/FJSVirep
- /opt/FJSVena
- /var/opt/FJSVena

## 21.2.21 sso01036

### SSO: ERROR: sso01036: Initialization of access log failed. Logfile=(%s1) Reason=(%s2)

#### Variable Information

%s1 = Absolute path of the output destination file for the repository server access log

%s2 = Cause of the error

#### Explanation

The access log collection of the Interstage Single Sign-on Repository server failed to be initialized. The possible causes are as follows.

- Upgrade of the repository server from a previous version might have been unsuccessful.
- In all other cases, possible causes are listed below in the following table.

Table 21.20 List of Error Causes (%s2)

Cause of error (%s2)	Cause
Directory not found	The directory of the repository server access log output destination file (%s1) does not exist.
Not enough disk space	The amount of free disk space is insufficient
Filename is directory	The directory is set as the output destination file name for the repository server access log.
Permission denied	No access authorization is set for the output destination file (%s1) for the repository server access log.
	The output destination file (%s1) for the repository server access log may be in use with another application.
	No access authorization is set for the output destination directory for the repository server access log.
Not enough memory	The memory space required for the Interstage Single Sign-on Repository server operation is insufficient.

Cause of error (%s2)	Cause
Acquisition of shared memory failed	There was an error with the shared memory required for the Interstage Single Sign-on Repository server operation.
Operation of shared memory failed	
Acquisition of exclusive lock resource failed	There was an error in the exclusion control resource required for the Interstage Single Sign-on Repository server operation.
Exclusive lock failed	
System error	An internal error occurred running the Interstage Single Sign-on Repository server.

## User Action

Take one of the following actions:

- Check that the repository server access log file (%s1) path is valid. (\*1)  
If the path is invalid, check that the procedure used to upgrade the repository server was correct.
- In all other cases, take one of the following actions shown in the following table:

Table 21.21 User Actions for Error Causes (%s2)

Cause of error (%s2)	Action
Directory not found	Confirm whether the output destination directory (%s1) of the repository server access log exists.
Not enough disk space	Allocate a free space. This could be achieved (for example) by saving the unnecessary files.
Filename is directory	Set the file name as the access log output destination file (%s1) of the repository server. (*1)
Permission denied	Confirm whether access authorization of the output destination directory (%s1) for the repository server access log is correctly set. If access authorization is incorrect, set it correctly. (*2)
Not enough memory	<p><b>Windows32/64</b></p> <p>Close the unnecessary programs. Alternatively, confirm whether the memory space enough for Interstage Single Sign-on operation is allocated. For details on the required memory space, refer to "Memory Requirements" in the "Resource Requirements" chapter of the Tuning Guide.</p>
	<p><b>Solaris32/64</b></p> <p><b>Linux32/64</b></p> <p>Close the unnecessary programs. Alternatively, confirm whether the memory space enough for the Interstage Single Sign-on operation is allocated or whether the shared memory size is correctly set. For details on the required memory space, refer to "Memory Requirements" in the "Resource Requirements" chapter of the Tuning Guide. For details on the required shared memory size, refer to the "System Tuning" chapter in the Tuning Guide.</p>
Acquisition of shared memory failed	<b>Solaris32/64</b>
Acquisition of exclusive lock resource failed	<b>Linux32/64</b>
Operation of shared memory failed	Confirm the system parameters. For details on the system parameters, refer to the "System Tuning" chapter in the Tuning Guide.
Exclusive lock failed	

Cause of error (%s2)	Action
System error	Immediately after the message is output, use the iscollectinfo command to collect investigation information, then contact your service engineer.

\*1 To set the access log output destination, select [Security] > [Single Sign-on] > [Authentication infrastructure] > [Repository server] or [Repository server (reference system)] > [File name] in [Access Log Settings] of the [Settings] tab on the Interstage Management Console.

\*2 For details on setting access authorization, see 'Operation and Maintenance Operation' - 'Changing Effective User for Web Server' in the Single Sign-on Operator's Guide.

## 21.2.22 sso01038

### SSO: WARNING: sso01038: Can not write access log. Logfile=(%s1) Reason=(%s2)

#### Variable Information

%s1 = Absolute path of the output destination file for the repository server access log

%s2 = Cause of the error

#### Explanation

The access log for the Interstage Single Sign-on Repository server failed to be written. The possible causes are listed below in the following table.

Table 21.22 List of Reasons Why the Access Log for SSO Failed

Cause of error (%s2)	Cause
Permission denied	No authorization to write data to the output destination file (%s1) of the repository server access log is assigned.
	The output destination file (%s1) for the repository server access log or the backup file used when switching access logs (%s1.last or %s1.YYYYMMDDHHMMSS (the string after the period represents the date and time the file was saved)) may be in use by another application.
Not enough disk space	The amount of free disk space is insufficient
Not enough memory	The memory space required for the Interstage Single Sign-on Repository server operation is insufficient.
Acquisition of shared memory failed	There was an error in the shared memory required for the Interstage Single Sign-on Repository server operation.
Operation of shared memory failed	
Acquisition of exclusive lock resource failed	There was an error in the exclusion control resource required for the Interstage Single Sign-on Repository server operation.
Exclusive lock failed	
System error	An internal error occurred running the Interstage Single Sign-on Repository server.
	<div style="border: 1px solid black; padding: 2px; display: inline-block; margin-bottom: 5px;">Solaris32/64</div> <div style="border: 1px solid black; padding: 2px; display: inline-block; margin-bottom: 5px;">Linux32/64</div> The output destination file of the repository server access log may be a symbolic link.

#### User Action

Take one of the following actions shown in the following table:

Table 21.23 List of User Actions

Cause of error (%s2)	Action
Permission denied	Confirm whether access authorization of the output destination file (%s1) for the repository server access log is correctly set. If access authorization is incorrect, correct it. (*1)
	Confirm that the output destination file (%s1) for the repository server access log or the backup file used when switching access logs (%s1.last or %s1.YYYYMMDDHHMMSS (the string after the period represents the date and time the file was saved)) is not used by another application. If that file is used with another application, close another application. (*1)
Not enough disk space	Allocate a free space. This could be achieved (for example) by saving the unnecessary files.
Not enough memory	Close the unnecessary programs. Alternatively, confirm whether the memory space enough for Interstage Single Sign-on operation is allocated.  For details on the required memory space, refer to "Memory Requirements" in the "Resource Requirements" chapter of the Tuning Guide.
Acquisition of shared memory failed	<div style="border: 1px solid black; padding: 2px; display: inline-block; margin-bottom: 5px;">Solaris32/64</div> <div style="border: 1px solid black; padding: 2px; display: inline-block; margin-bottom: 5px;">Linux32/64</div> Confirm the system tuning.  For details on the system parameters, refer to the "System Tuning" chapter in the Tuning Guide.
Acquisition of exclusive lock resource failed	
Operation of shared memory failed	
Exclusive lock failed	
System error	Immediately after the message is output, use the iscollectinfo command to collect investigation information, then contact your service engineer.
	<div style="border: 1px solid black; padding: 2px; display: inline-block; margin-bottom: 5px;">Solaris32/64</div> <div style="border: 1px solid black; padding: 2px; display: inline-block; margin-bottom: 5px;">Linux32/64</div> Confirm whether the symbolic link of the output destination file name (%s1) for the repository server access log does not exist.

\*1 For details on setting access authorization, see 'Operation and Maintenance Operation' - 'Changing Effective User for Web Server' in the Single Sign-on Operator's Guide.

## 21.2.23 sso01040

**SSO: ERROR: sso01040: Access to SSO Repository failed. Code=(%x1)**

### Variable Information

%x1 = Error code posted from the SSO repository

### Explanation

When Active Directory is used as the destination to register user information, read "SSO repository or Active Directory" for "SSO repository". For details on Active Directory, refer to the Active Directory manual.

The Interstage Single Sign-on Repository server failed to access the SSO repository.

### User Action

For the meaning of the error code (%x1) posted from the SSO repository, see 'Table for Codes Posted from the SSO Repository'. Then, take action.

This message may be output when a business server administrator has updated access control information.

Table 21.24 Codes Posted from the SSO Repository.

Code	Error	Action
0x01	SSO repository processing is disabled.	SSO repository processing cannot be correctly performed, for example because the SSO repository is in process of starting.  If this code is posted continuously although the SSO repository has already been started, use the iscollectinfo command immediately after the message is output to collect investigation information, then contact your service engineer.
0x02	An LDAP protocol error occurred.	SSO repository processing cannot be correctly performed, for example because the SSO repository is in the process of starting.  If this code is posted continuously although the SSO repository has already been started, use the iscollectinfo command immediately after the message is output to collect investigation information, then contact your service engineer.
0x0a 0x20	No relevant entry exists.	Check whether the values set for the 'User Information Registration Entry', 'Role Configuration Registration Entry' and 'Protection Resource Registration Entry' repository server environment settings match the user information, role configuration, and protection resource SSO repository registration data. (*1)  When the repository server environment settings are correct, register the user information, role configuration and protection resource in the SSO repository.
0x10	Relevant attribute name does not exist.	Upgrade of the repository server from a previous version might have been unsuccessful. Check that the upgrade procedure was correct.
		The repository server environment is destroyed. From the Interstage Management Console, select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [List] tab to delete the repository sever once, then rebuild the repository server with the [Authentication infrastructure Setting] tab. (*2)
0x11 0x57	The attribute name is invalid.	The value set for [Attribute used for authentication] in [Integrated Windows Authentication Setting] in the authentication server environment settings is invalid.  In the Interstage Management Console, click [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Authentication server] > [Settings] > [Detailed Settings [Show]], set a correct value for [Attribute used for authentication] in [Integrated Windows Authentication Setting], stop the authentication server and then restart it. (*3)
0x15	Failed to update SSO repository entry	If "Active Directory" is selected in the directory service used for the information registration destination and a Single Sign-on extended schema is used, take the following action:  - The value set in [Directory Service URL] of [Active Directory Settings] in the repository server environment settings is incorrect.  In the Interstage Management Console, click [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Repository server] > [Settings] > [Repository server detailed settings [Show]], set a correct value for [Repository Settings] > [Active Directory

Code	Error	Action
		<p>settings], [Directory Service URL], stop the repository server and then restart it. (*4).</p> <p>- Single Sign-on extended schema is not set in Active Directory.</p> <p>Set the Single sign-on extended schema in Active Directory and then execute it again. (*5).</p>
0x22	The DN format is incorrect.	<p>Access to the SSO repository failed because the setting values of 'User Information Registration Entry', 'Role Configuration Registration Entry', and 'Protection Resource Registration Entry' of the repository server environment settings are not in the DN format. (*1)</p> <p>After setting a correct value for each setting value, stop the repository server and then restart it. (*4)</p> <p>The DN format is the name of the object uniquely assigned in the SSO repository, and defines the entry indicating that object and the string of the relative distinguished names (RDN) of the upper entry of that entry.</p> <p>The protection resource may have been changed using a tool such as the entry management tool, not the Interstage Management Console.</p> <p>Using the same method used at change, restore the protection resource to the status it had before change. If this restoration fails, delete the protection resource using the same method as that used at change, then select [System] &gt; [Security] &gt; [Single Sign-on] &gt; [Authentication infrastructure] &gt; [Repository server] &gt; [Protection resource] &gt; [Create a New Site configuration] tab on the Interstage Management Console to recreate the protection resource.</p>
0x30 0x31	The administrator DN or password for binding (authenticating) to the SSO repository is not correct.	<p>The administrator DN or password for the SSO repository may have been changed.</p> <p>If either was changed, stop the repository server and then restart it. (*4)</p> <p>The SSO repository port number may be in use by another LDAP server on the same machine. In this case, either stop the other LDAP server, or change the SSO repository port number. (*6)</p>
0x32	Access to the SSO repository is invalid.	<p>If this server is built as the repository server (reference system), it may have been accessed from the authentication server as the repository server (update system).</p> <p>Confirm whether the host name or IP address of the repository server (reference system) is not set for the setting value of 'repository server (update system) URL' in 'Setting Communication with the Repository Server' of the authentication server environment settings. To confirm the authentication server environment settings, display Communication Settings with Repository server. To display it, select [System] &gt; [Security] &gt; [Single Sign-on] &gt; [Authentication infrastructure] &gt; [Authentication server] &gt; [Detailed Settings [Show]] of the [Settings] tab on the Interstage Management Console.</p>

Code	Error	Action
		<p>If the repository server (reference system) is set, set the host name or IP address of the repository server (update system) again, stop the authentication server, and then restart it. (*3)</p> <p>In all other cases, check the SSO repository environment settings. (*6) (*7)</p> <p>When Active Directory is used as the destination to register user information, a user account with no access authority to refer or to update may have attempted to access user information in Active Directory.</p> <p>Check the contents of [Connection DN] in the repository server environment settings and take the following action.</p> <ul style="list-style-type: none"> <li>- If Single Sign-on extended schema is not used: <p>Set the user account value with reference authority for all user information required for Single Sign-on, in [Connection DN] and [Connection DN password], and then stop the repository server and restart it (*4, *8, *9, *10).</p> </li> <li>- If Single Sign-on extended schema is used: <p>Set the user account value with reference and update authority for all user information required for Single Sign-on, in [Connection DN] and [Connection DN password], and then stop the repository server and restart it (*4, *8, *9, *10).</p> </li> </ul>
0x33	The SSO repository is busy.	<p>The SSO repository processing is disabled, for example because the load on it is high.</p> <p>Wait until the SSO repository becomes communicable and then reexecute it.</p> <p>If a message that begins with irep is displayed immediately before this message, check the message and rectify the cause of the error.</p>
0x34	The SSO repository cannot be accepted.	<p>The SSO repository processing is disabled, for example because the load on it is high.</p> <p>Wait until the SSO repository becomes communicable and then reexecute it.</p> <p>If a message that begins with irep is displayed immediately before this message, check the message and rectify the cause of the error.</p>
0x35	The SSO repository rejected a request.	<p>The SSO administrator confirms whether the setting values for 'User Information Registration Destination Entry', 'Role Configuration Registration Destination Entry', and 'Protection Resource Registration Destination Entry' of the repository server environment settings are correct. If values are incorrect, correct them. (*1)</p> <p>When the values are correct, SSO repository processing is disabled, for example because the load on the SSO repository server is high. Wait until the SSO repository becomes communicable, and then reexecute it.</p> <p>If this server is built as the repository server (reference system), it may have been accessed from the authentication server as the repository server (update system). Confirm whether the host name or IP address of the repository server (reference system)</p>

Code	Error	Action
		<p>is set for the setting value of 'repository server (update system) URL' in 'Setting Communication with the Repository Server' of the authentication server environment settings. To confirm the authentication server environment settings, display [Communication settings with Repository server]. To display it, select [System] &gt; [Security] &gt; [Single Sign-on] &gt; [Authentication infrastructure] &gt; [Authentication server] &gt; [Detailed Settings [Show]] of the [Settings] tab on the Interstage Management Console.</p> <p>If the repository server (reference system) is set, set the host name or IP address of the repository server (update system) again, stop the authentication server, and then restart it. (*3)</p> <p>In all other cases, check the SSO repository environment settings. (*6) (*7)</p>
0x51	Communication with the SSO repository can be performed.	<p>The SSO administrator confirms whether the SSO repository is active, by selecting [System] &gt; [Services] &gt; [Repository] &gt; [View Status] tab on the Interstage Management Console.</p> <p>If the SSO repository is not active, specify the check box, and then click the 'Start' button to start the SSO repository.</p> <p>If the message is output at start of the system and the SSO repository is active, the error can be avoided by establishing a service linkage with the SSO repository.</p> <p>For details on the service linkage with the SSO repository, see 'Single Sign-on Customization' - 'Service Linkage with SSO Repository' in the Single Sign-on Operator's Guide.</p>

\*1 Confirm the repository server environment setting from the [Repository] items listed below. To display [Repository], select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Repository server] or [Repository server (reference system)] > [Repository server detailed settings [Show]] or [Detailed Settings [Show]] of the [Settings] tab on the Interstage Management Console.

- User information registration entry
- Role configuration registration entry
- Protection resource registration entry

\*2 For details on setting up the repository server environment see 'Environment Setup (SSO Administrators)' in the Single Sign-on Operator's Guide.

\*3 For details on stopping the authentication server, refer to "Stopping an Authentication Server" in "Operation and Maintenance" of the "Single Sign-on Operator's Guide". For details on starting the authentication server, refer to "Starting an Authentication Server" in "Operation and Maintenance" of the Single Sign-on Operator's Guide.

\*4 For details on stopping the repository server, refer to 'Operation and Maintenance' - 'Stopping Single Sign-on' - 'Stopping a Repository Server' in the Single Sign-on Operator's Guide. For details on starting the repository server, see 'Operation and Maintenance' - 'Starting Single Sign-on' - 'Starting a Repository Server' in the Single Sign-on Operator's Guide.

\*5 For the settings of single sign-on extended schema, refer to "Settings for Active Directory Linkage" in Single Sign-on Operator's Guide - "Use Active Directory in the directory service that registers the user information" - "Single Sign-on Extended Schema settings".

\*6 For details about the SSO repository, refer to the "Directory Service Operator's Guide".

\*7 In the Interstage Management Console, click [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Repository server], or [Repository server (reference system)] > [Settings] > [Repository server detailed settings [Show]], or [Detailed Settings [Show]] > [Repository] > [Repository Name].

\*8 For Connection DN, in the Interstage management console, click [Repository server detailed settings [Show]] from [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Repository server] > [Settings] tab, and check and set [Active Directory Settings] in [Repository Settings].

\*9 For Connection DN password, in the Interstage management console, click [Repository server detailed settings [Show]] from [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Repository server] > [Settings] tab, and set [Active Directory Settings] in [Repository Settings].

\*10 For reference or update authority to user information in Active Directory, use a tool such as ADSI Edit tool provided by Microsoft.

## 21.2.24 sso01041

---

### SSO: ERROR: sso01041: Connecting with SSO Repository failed. Code=(%x1)

#### Variable Information

%x1 = Error code posted from the SSO repository

#### Explanation

When Active Directory is used as the destination to register user information, read "SSO repository or Active Directory" for "SSO repository". For details on Active Directory, refer to the Active Directory Manual.

The Interstage Single Sign-on Repository server failed to connect to the SSO repository. The SSO repository may not be active or an error is occurring in the SSO repository.

#### User Action

Take one of the following actions:

- Using the following procedure, confirm whether the SSO repository is active:
  - From the Interstage Management Console, select [System] > [Services] > [Repository] > [View Status] tab on the Interstage Management Console to confirm the SSO repository status.
  - If the target SSO repository is not active, specify a check box, then click the 'Start' button to start the SSO repository.
- If Active Directory is being used as the destination to register user information, check the following:
  - Check that the Directory Service URL is correct (\*1).
  - If SSL is used for the connection with the Directory Service, register the certificate to be used for the connection with the Interstage certificate environment (\*2).
  - Check the network environment once again.
- For the meaning of the error code (%x1) posted from the SSO repository, see 'Table for Codes Posted from the SSO Repository' in 21.2.23 sso01040. Then, take appropriate action.
- If the above action does not take effect, reduce the maximum number of concurrent Interstage HTTP Server accesses. For details on the maximum number of concurrent accesses, see 'Web Server (Interstage HTTP Server) Environment Definition' - 'Number of Clients that can be Connected Simultaneously' in the Tuning Guide.

\*1 For Directory Service URL, in the Interstage management console, click [Repository server detailed settings [Show]] from [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Repository server] > [Settings] tab, and refer to [Active Directory Settings] > [Directory service URL] in [Repository Settings].

\*2 For the registration of the certificate, refer to "Settings to be federated with the Active Directory" - "Using the Active Directory for the directory service to register the user information" - "Setting up of the SSL communication environment." in Single Sign-on Operator's Guide

## 21.2.25 sso01042

---

### SSO: ERROR: sso01042: Authentication of SSO Repository failed. Code=(%x1)

#### Variable Information

%x1 = Error code posted from the SSO repository

## Explanation

When Active Directory is used as the destination to register user information, read "SSO repository or Active Directory" for "SSO repository". For details on Active Directory, refer to the Active Directory Manual.

The repository server of Interstage Single Sign-on failed to authenticate the SSO repository because the information to be authenticated SSO repository is incorrect.

## User Action

Take one of the following actions:

- If Active Directory is used as the destination to register user information, take one of the following actions:
  - Check that Connection DN and Connection DN Password are correct and make any changes if necessary (\*1) (\*2).
  - The Directory Service URL set in the repository server environment settings may be used by another Directory Service. If it this is the case, stop the other Directory Service or change the Directory Service URL (\*3)
- For details about the meaning of an error code (%x1) notified by the SSO repository, refer to the Table "Codes Posted from the SSO Repository" in [21.2.23 sso01040](#), and then take the appropriate action.

\*1 For connection DN, in the Interstage management console, click [Repository server detailed settings [Show]] from [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Repository server] > [Settings] tab, and check and set [Active Directory Settings] in [Repository Settings].

\*2 For connection DN password, in the Interstage management console, click [Repository server detailed settings [Show]] from [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Repository server] > [Settings] tab, and set from [Active Directory Settings] in [Repository Settings].

\*3 For the Directory Service URL, in the Interstage management console, click [Repository server detailed settings [Show]] from [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Repository server] > [Settings] tab, and check and change [Active Directory Settings] in [Repository Settings].

## 21.2.26 sso01043

---

### SSO: ERROR: sso01043: Entry is not found in SSO Repository. Kind=(%s1)

#### Variable Information

%s1 = Type of the entry not found

#### Explanation

No entry is found in the SSO repository. If the type of entry not found (%s1) is 'Role Data', the possible causes are as follows:

- 'Role Configuration Registration Entry' of the repository server environment settings is incorrectly set.
- No entry is registered in 'Role Configuration Registration Entry' registered in the SSO repository.
- 'ssoRole' or 'ssoRoleSet' is not set for the object class of the entry registered in 'Role Configuration Registration Entry' registered in the SSO repository.

#### User Action

Take one of the following actions:

- Confirm whether 'Role Configuration Registration Entry' of the Interstage Single Sign-on Repository server environment setting is correctly set. To do this, display [Repository] by selecting [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Repository server] or [Repository server (reference system)] > [Repository server detailed settings [Show]], or [Detailed Settings [Show]] of the [Settings] tab on the Interstage Management Console.

When the setting is correct, confirm whether the role configuration set in 'Role Configuration Registration Entry' of the repository server environment settings is registered in the SSO repository. (\*1)

- Confirm whether an entry is registered in 'Role Configuration Registration Entry' in the SSO repository. If it is not registered, register a role or role set. (\*1) (\*2)

- When an entry is registered in 'Role Configuration Registration entry' in the SSO repository, set 'ssoRole' or 'ssoRoleSet' for the object class. (\*1) (\*3)

\*1 For details on confirming and changing data registered in the SSO repository, see 'Environment Setup (SSO Administrators)' - 'Repository Server Setup' - 'Registering User Information and Role Configuration in the SSO Repository' in the Single Sign-on Operator's Guide.

\*2 For details on the role configuration, see 'Environment Setup (SSO Administrators)' - 'Preparation for Environment Setup' - 'Designing an SSO Repository' in the Single Sign-on Operator's Guide.

\*3 For details on the role configuration entry, see 'Environment Setup (SSO Administrators)' - 'Repository Server Setup' - 'Registering User Information and Role Configuration in the SSO Repository' - 'Role Configuration Entry' in the Single Sign-on Operator's Guide.

## 21.2.27 sso01044

### SSO: ERROR: sso01044: Invalid data in SSO Repository. Reason=(%s1) DN=(%s2) Value=(%s3)

#### Variable Information

- %s1 = Reason why the entry is determined as invalid
- %s2 = Identifier (DN) of the entry determined as invalid
- %s3 = Value determined as invalid

#### Explanation

When Active Directory is used as the destination to register user information, read "SSO repository or Active Directory " for "SSO repository". For details on Active Directory, refer to the Active Directory Manual.

Registered data of the entry indicated with the SSO repository identifier (DN)(%s2) is incorrect. The possible causes are described below:

- If the reason for the error (%s1) is one of the following, an invalid value (%s3) is set for the attribute of the user information entry registered in the SSO repository. Check the attribute value.
  - For 'ssoFailureCount is invalid', an ssoFailureCount value is invalid.
  - For 'ssoAuthType is invalid', an ssoAuthType value is invalid.
  - For 'ssoUserStatus is invalid', an ssoUserStatus value is invalid.
  - For 'ssoNotBefore is invalid', an ssoNotBefore value is invalid.
  - For 'ssoNotAfter is invalid', an ssoNotAfter value is invalid.
  - For 'ssoLockTimeStamp is invalid', an ssoLockTimeStamp value is invalid.
- If the cause of the error (%s1) is 'Role is incorrect', multiple values or no value (%s3) is set as the attribute name of the entry indicated with the identifier (DN)(%s2) in the SSO repository.
- If the cause of the error (%s1) is 'Invalid character is included', characters other than the specifiable characters are set for the attribute (%s3) value of the entry indicated with the identifier (DN)(%s2) in the SSO repository.
- If the cause of the error (%s1) is 'Data is too long. Max length is xxx bytes'(\*1), the attribute (%s3) value of the entry indicated with the identifier (DN)(%s2) in the SSO repository exceeds the maximum length.
- If the cause of the error (%s1) is 'Path configuration is incorrect', multiple values or no value (%s3) is set as the attribute name of the entry indicated with the identifier (DN)(%s2) in the SSO repository.

#### User Action

Take one of the following actions:

- Confirm the attribute of the entry determined as invalid from the cause of the error (%s1), then set a correct value. (\*2) (\*3) (\*4) (\*5)
- If the cause of the error (%s1) is 'Role is incorrect', recheck the value (%s3) set as the attribute name of the entry indicated with the identifier (DN)(%s2) in the SSO repository, then set the value again so that only one attribute value is included. (\*2) (\*3)

- If the cause of the error (%s1) is 'Invalid character is included', set the attribute (%s3) value of the entry indicated with the identifier (DN)(%s2) in the SSO repository, with characters that can be set. (\*2) (\*3) (\*4) (\*5)
- If the cause of the error (%s1) is 'Data is too long. Max length is xxx bytes'(\*1), register the attribute (%s3) value of the entry indicated with the identifier (DN)(%s2) in the SSO repository, in the range indicated in the cause of the error (%1) (\*1). (\*2)
- If the cause of the error (%s1) is 'Path configuration is incorrect', recheck the value (%s3) set as the attribute name of the entry indicated with the identifier (DN)(%s2) in the SSO repository, then make a setting again so that only one attribute value is set. (\*2) (\*5)

\*1 xxx indicates the maximum length.

\*2 To confirm and set the registered data of the SSO repository use the entry management tool, etc. For details, see 'Entry Management' in the Directory Service Operator's Guide.

\*3 For details on the role configuration entry attributes, see 'Environment Setup (SSO Administrators)' - 'Repository Server Setup' - 'Registering User Information and Role Configuration in the SSO Repository' - 'Role Configuration Entry' in the Single Sign-on Operator's Guide.

\*4 For details on the user information entry attributes, see 'Environment Setup (SSO Administrators)' - 'Repository Server Setup' - 'Registering User Information and Role Configuration in the SSO Repository' - 'User Information Entry' in the Single Sign-on Operator's Guide.

\*5 For details on the path configuration entry attributes, see 'Entry Attributes To Be Registered in SSO Repository' - 'Protection Resources' in the Single Sign-on Operator's Guide.

## 21.2.28 sso01045

**SSO: WARNING: sso01045: The role does not exist in role configuration. DN=(%s1) Value=(%s2)**

### Variable Information

%s1 = Identifier (DN) of the entry in which a non-existent role name is set

%s2 = Nonexistent role name

### Explanation

A user cannot be authorized with the role or role set (%s2) because the role or role set (%s2) set in the SSO repository identifier (DN) (%s1) does not exist in the role configuration. The role or role set may have been deleted or changed.

This message may be output two or more times at startup.

### User Action

Take one of the following actions:

- Confirm that the role or role set (%s2) is registered in the role configuration in the SSO repository.
  - If the role or role set is not registered:
 

Register or change the role or role set (\*1) (\*2), then update the role information. (\*3)
  - If the role or role set is registered:
 

Recheck whether 'ssoRole' or 'ssoRoleSet' is set for the object class of the role or role set (\*1) (\*4). If the role or role set was changed, update the role information. (\*3)
- When the role or role set (%s2) of the role configuration in the SSO repository is correctly registered, recheck the role or role set specified for the identifier (DN) (%s1). If the identifier (DN)(%s1) is one of the following configurations, take the corresponding action:
  - If the identifier (DN)(%s1) is the role set:
 

Recheck the role name of the attribute set for the role set (\*1). If the role name was changed, update the role information. (\*3)
  - If the identifier (DN)(%s1) is user information:
 

Recheck the role name of the attribute set for user information (\*1). If the role name was changed, notify a user of the identifier (DN)(%s1) that the role configuration has been changed, if necessary.

- If the identifier (DN)(%s1) is the path configuration:

Recheck the role or role set defined in the path configuration (\*5). If the role or role set was changed, ask a business server administrator to update access control information. (\*6).

\*1 To confirm and set the registered data of the SSO repository, use the entry management tool, etc. For details, see 'Entry Management' in the Directory Service Operator's Guide.

\*2 For details on the role configuration, see 'Environment Setup (SSO Administrators)' - 'Preparation for Environment Setup' - 'Designing an SSO Repository' in the Single Sign-on Operator's Guide.

\*3 For details on updating the role information, see [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Repository server] or [Repository server (reference system)] > [Update Role information] tab on the Interstage Management Console.

\*4 For details on the role configuration entry, see 'Environment Setup (SSO Administrators)' - 'Repository Server Setup' - 'Registering User Information and Role Configuration in the SSO Repository' - 'Role Configuration Entry' in the Single Sign-on Operator's Guide.

\*5 For details on updating the site or path configuration, see [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Repository server] > [Protection resource] > [Site Configuration] > [Protection path] > [Path Configuration] > [Role/Role Set] of the [Settings] tab on the Interstage Management Console.

\*6 For details on updating access control information, see [System] > [Security] > [Single Sign-on] > [Business system] > [Business system Name] > [Update access control information] tab on the Interstage Management Console.

## 21.2.29 sso01046

### SSO: ERROR: sso01046: User can not be specified. Attribute=(%s1)

#### Variable Information

When Active Directory is used as the destination to register user information, read "Active Directory" for "SSO repository".

%s1 = Identification information that cannot be specified

#### Explanation

No access can be made to the specified source because a user cannot be specified. The possible causes are as follows:

- A user cannot be authenticated because identification information (user ID) the user entered is duplicated and registered in the SSO repository.
- User information of the SSO repository cannot be specified from [Attribute Used for Authentication] specified in the authentication server environment setting.

#### User Action

Take either of the following actions:

- Confirm whether identification information (user ID) the user entered is unique in the SSO repository. (\*1) (\*3) If identification information (user ID) is not unique, change the user information through SSO repository operation so that user information becomes unique. (\*2) (\*3)
- Confirm that [Attributes used for Authentication] specified in the authentication server environment setting is the attribute the user can specify. Do this from [Certificate Authentication Settings] displayed by selecting [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Authentication server] > [Detailed Settings [Show]] of the [Settings] tab on the Interstage Management Console.

When these attribute names are correctly set, correct the registered data of the SSO repository so that the user information is not duplicated, based on the user identification information (%s1). (\*2) (\*3)

\*1 If the directory service is used in the user information registration destination, use the entry management tool, etc to confirm the registered data of the SSO repository. For details, see 'Entry Management' in the Directory Service Operator's Guide.

\*2 For details on registering user information in the SSO repository, see 'Environment Setup (SSO Administrators)' - 'Repository Server Setup' - 'Registering User Information and Role Configuration in the SSO Repository' in the Single Sign-on Operator's Guide.

\*3 For details on how to confirm Active Directory, refer to the Active Directory Manual.

## 21.2.30 sso01048

---

### SSO: ERROR: sso01048: Empty role set is defined. DN=(%s1)

#### Variable Information

%s1 = Identifier (DN) of the role set having no role

#### Explanation

The role set defined in the identifier (DN)(%s1) of the SSO repository is not set correctly. The possible causes are as follows:

- No role is set in the role set.
- Only the role set having the same name is set for the role set.
- The role or role set specified for the role set does not exist.

#### User Action

Confirm whether the role or role set is set for the role set defined in the identifier (DN)(%s1) of the SSO repository, then take action listed below. If the role configuration is registered in a multi-layer mode, make confirmation and take action for all layers. (\*1)

- If no role or no role set is set, recheck the role configuration design so that the role or role set is surely set for the role set, then register the role configuration. (\*2)
- If the role or role set is set, confirm whether that role or role set exists. (\*1)
  - If the role exists:

Confirm whether the role set having the same name as that role exists. If the role set having the same name exists, change the name of the role or of the role set. (\*1)
  - If the role set exists:

Confirm whether the role or role set is set for that role set. If the role set having the same name as the role indicated with the identifier (DN)(%s1) is set, change the role or role set to the correct one. (\*1)
  - If the role or role set does not exist:

Recheck the role configuration design to confirm that the existing role or role set is configured for the role set, then register the role configuration. (\*2)

After registering the role configuration, update the role information. (\*3)

\*1 To confirm and set the registered data of the SSO repository, use the entry management tool, etc. For details, see 'Entry Management' in the Directory Service Operator's Guide.

\*2 For details on the role configuration, see 'Environment Setup (SSO Administrators)' - 'Preparation for Environment Setup' - 'Designing an SSO Repository' in the Single Sign-on Operator's Guide. For details on the role configuration entry, see 'Environment Setup (SSO Administrators)' - 'Repository Server Setup' - 'Registering User Information and Role Configuration in the SSO Repository' - 'Role Configuration Entry' in the Single Sign-on Operator's Guide.

\*3 For details on updating the role information, see [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Repository server] or [Repository server (reference system)] > [Update Role information] tab on the Interstage Management Console.

## 21.2.31 sso01049

---

### SSO: ERROR: sso01049: Role name is duplicated. DN=(%s1)

#### Variable Information

%s1 = Identifier (DN) of the role configuration in which the same name exists

#### Explanation

Two or more roles or role sets having the same name are defined in the identifier (DN)(%s1) of the SSO repository.

## User Action

Confirm the role configuration in the SSO repository. (\*1)

Recheck the role configuration design to confirm that the role or role set having the same name is not defined, then register the role configuration again. (\*2)

After registering the role configuration, update the role information. (\*3)

\*1 To confirm and set the registered data of the SSO repository, use the entry management tool, etc. For details, see 'Entry Management' in the Directory Service Operator's Guide.

\*2 For details on the role configuration, see 'Environment Setup (SSO Administrators)' - 'Preparation for Environment Setup' - 'Designing an SSO Repository' in the Single Sign-on Operator's Guide. For details on the role configuration entry, see 'Environment Setup (SSO Administrators)' - 'Repository Server Setup' - 'Registering User Information and Role configuration in the SSO Repository' in the Single Sign-on Operator's Guide.

\*3 For details on updating the role information, see [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Repository server] or [Repository server (reference system)] > [Update Role information] tab on the Interstage Management Console.

## 21.2.32 sso01050

---

### SSO: ERROR: sso01050: Invalid request was received. IPAddr=(%s1)

#### Variable Information

%s1 = IP address of the requesting source

#### Explanation

The Interstage Single Sign-on Repository server has accepted an invalid request. The possible causes are as follows:

- An error occurs in an environment of the Interstage Single Sign-on Authentication server or business server.
- The contents of the form authentication page are incorrect.
- Request data may be destroyed due to a network environment error.
- A request from the authentication server failed to be normally processed because the Interstage Single Sign-on Repository server is temporarily overloaded.
- An external security attack may be occurring.

#### User Action

Take one of the following actions:

- Check that the Interstage Single Sign-on Repository server, authentication server, and business server session management application settings are the same.
- Check that the contents of the form authentication page are correct. (\*1)
- Confirm whether the Interstage Single Sign-on Authentication server or business server is running at the requesting source IP address (%s1).  
If the authentication and business servers are not running at the requesting source IP address (%s1), they may be under external security attack. Based on the requesting source IP address (%s1), examine the possibility of attack.
- Confirm the network environment.
- Close the Web browser, then restart it. Alternatively, reload the Web browser, then perform authentication again.
- Confirm whether a value sufficient for the client send/receive timeout time is set in the Timeout directive of the Interstage HTTP Server environment configuration file (httpd.conf). (\*2)

\*1 Refer to 'Single Sign-on Customizing' - 'Customizing Messages Displayed on a Web Browser' in the Single Sign-on Operator's Guide for details of how to customize the form authentication page.

\*2 For details on the client send/receive timeout time (Timeout), see 'Web Server (Interstage HTTP Server) Environment Definition' in the "Tuning Guide."

## 21.2.33 sso01051

---

### SSO: ERROR: sso01051: Accept of request failed. Kind=(%s1) IPAddr=(%s2)

#### Variable Information

%s1 = Server type of the requesting source

%s2 = IP address of the requesting source

#### Explanation

The Interstage Single Sign-on Repository server failed to accept a request. The possible causes are as follows:

- If the server type (%s1) is 'Authenticate':
  - The Interstage Single Sign-on Authentication server that is running at the IP address (%s2) is running in a different authentication infrastructure from that of the repository server. Alternatively, the authentication server environment is destroyed, or the session management application settings are different.
  - The authentication server is under an external security attack from an unauthorized person.
- If the server type (%s1) is 'Business':
  - The Interstage Single Sign-on Business server that is running at the IP address (%s2) is running in a different authentication infrastructure from that of the repository server. Alternatively, the business server environment is destroyed, or the session management application settings are different.
  - The business server is under an external security attack from an unauthorized person.

#### User Action

Take either of the following actions:

- If the server type (%s1) is 'Authenticate':
  - Confirm whether the environment was set by distributing the authentication infrastructure setup file to the Interstage Single Sign-on Authentication server running at the IP address (%s2).  
If the authentication server running at the IP address (%s2) is built by distributing the authentication infrastructure setup file, rebuild the target authentication server. (\*1)  
If it is not, ask the SSO administrator of the target authentication server to recheck the authentication server settings.
  - Check that the settings of the authentication server that runs using the IP address (%s2) and the session management application settings are the same.
  - If the authentication server is not running at the IP address (%s2), it may be under external security attack. Examine the possibility of attack based on the requesting source IP address.
- If the server type (%s1) is 'Business':
  - Confirm whether the environment was set by distributing the business server setup file to the Interstage Single Sign-on Business server that is running at the IP address (%s2).  
If the business server that is running at the IP address (%s2) is built by distributing the business server setup file, rebuild the target business server. (\*2)  
If it is not, ask the business server administrator of the target business server to recheck the business server settings.
  - Check that the settings of the business server that runs using the IP address (%s2) and the session management application settings are the same.
  - If the business server is not running at the IP address (%s2), it may be under external attack. Examine the possibility of attack based on the requesting source IP address.

\*1 Rebuild the authentication server using the following procedure:

- From the Interstage Management Console, select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [List] tab to delete the authentication server once.

- Build the authentication server from [Create a new Authentication server] in [Setup Repository server and Authentication server to the separate servers.] of the [Authentication infrastructure setting] tab.

\*2 Rebuild the business server using the following procedure:

- From the Interstage Management Console, select [System] > [Security] > [Single Sign-on] > [Business system] > [List] tab to delete the business server once.
- Add a business server with the [Addition of Business server] tab.

## 21.2.34 sso01052

---

**SSO: ERROR: sso01052: An error occurred in the SSO Authentication server configuration. IPAddr=(%s1) Code=(%s2)**

### Variable Information

%s1 = Authentication server IP address

%s2 = Maintenance information

### Explanation

The Interstage Single Sign-on Authentication server environment settings are incorrect. Repository server processing was stopped.

The possible causes are as follows:

- The repository server (reference system) hostname or IP address was set for [Communication Settings with Repository server] > [Repository server (update system) URL] in the authentication server environment settings.
- The repository server environment is broken.

### User Action

Take either of the following actions:

- Check that the [Communication Settings with Repository server] > [Repository server (update system) URL] settings are correct. If they are incorrect, set up the Authentication server again according to the following procedure.
  1. In the Interstage Management Console, click [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [List] and delete the authentication server.
  2. Click [Authentication infrastructure Settings] to set up the authentication server.
- If the authentication server environment settings are incorrect, set up the repository server again according to the following procedure.
  1. In the Interstage Management Console, click [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [List] and delete the repository server.
  2. Click [Authentication infrastructure Settings], and set up the repository server.

## 21.2.35 sso01060

---

**SSO: WARNING: sso01060: User was locked. UserID=(%s1) DN=(%s2)**

### Variable Information

%s1 = User ID of the locked user

%s2 = Identifier (DN) of the locked user

### Explanation

The user was locked. Alternatively, external attack may be ongoing.

## User Action

To confirm the possibility of external attack, the SSO administrator inquires of the user indicated with the identifier (DN)(%s2) whether the user was locked through operation such as continuous failure in authentication.

Suppose that the SSO administrator was able to confirm that the user indicated with the identifier (DN)(%s2) was locked by operation of the user. Based on the user ID (%s1), the SSO administrator selects [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Repository server] > [Release User Lock] tab to unlock the user.

If operation through which the user indicated with the identifier (DN)(%s2) is locked is not performed, examine the possibility of external attack.

## 21.2.36 sso01061

---

**SSO: INFO: sso01061: User was unlocked. UserID=(%s1) DN=(%s2)**

### Variable Information

%s1 = User ID of the unlocked user

%s2 = Identifier (DN) of the unlocked user

### Explanation

The user indicated with the user ID (%s1) and identifier (DN)(%s2) was unlocked.

## 21.2.37 sso01070

---

**SSO: ERROR: sso01070: Creation of credential failed. User=(%s1)**

### Variable Information

%s1 = Identifier (DN) of the target user

### Explanation

The Interstage Single Sign-on Repository server failed to generate authentication information.

### User Action

Immediately after the message is output, use the iscollectinfo command to collect investigation information, then contact your service engineer.

## 21.2.38 sso01071

---

**SSO: ERROR: sso01071: Credential is too large. User=(%s1)**

### Variable Information

%s1 = Identifier (DN) of the target user

### Explanation

When Active Directory is used as the destination to register user information, read "Active Directory" for "SSO repository".

Because the size of the authentication information has reached the upper limit (2048 bytes), the Interstage Single Sign-on Repository server failed to generate the authentication information. The possible causes are as follows:

- A large number of roles or role sets are set for the user (%s1) of the SSO repository.
- A long value is set for the role or role set of the user (%s1) of the SSO repository.
- A long value is set for the UID attribute of the user (%s1) of the SSO repository.
- The value of DN of the SSO repository user (%s1) is long.

## User Action

Confirm the following items set for the user (%s1) registered in the SSO repository: (\*1) (\*2) (\*3)

- Number of roles or role sets
- Value of the role or of the role set
- UID attribute value
- DN value

\*1 For details on the upper limit of the authentication information size, see 'Developing Applications' - 'Setting User Information Report with Environment Variables' in the Single Sign-on Operator's Guide.

\*2 If the Interstage directory service is used in the user information registration destination, use the entry management tool, etc to confirm and set the registered data of the SSO repository. For details, see 'Entry Management' in the Directory Service Operator's Guide.

\*3 For details on how to confirm Active Directory, refer to the Active Directory Manual.

## 21.2.39 sso01072

---

**SSO: ERROR: sso01072: Credential is incomplete. User=(%s1)**

### Variable Information

%s1 = Identifier (DN) of the target user

### Explanation

The Interstage Single Sign-on Repository server has generated incomplete authentication information. Alternatively, the size of the generated authentication information has reached the upper limit (2048 bytes). (\*1)

### User Action

Confirm the following setting items (%s1) registered in the SSO repository: (\*2)

- Identifier (DN)
- Number of roles set for the user

\*1 For details on the upper limit of the authentication information size, see 'Developing Applications' - 'Setting User Information Report with Environment Variables' in the Single Sign-on Operator's Guide.

\*2 To confirm the registered data of the SSO repository, use the entry management tool, etc. For details, see 'Entry Management' in the Directory Service Operator's Guide.

## 21.2.40 sso01080

---

**SSO: INFO: sso01080: Role information is updated.**

### Explanation

Role information has been updated.

## 21.2.41 sso01102

---

**SSO: ERROR: sso01102: An error occurred in SSO Session management server. Host=(%s1) Code=(%s2)**

### Variable Information

%s1 = Session management server IP address or hostname

%s2 = Maintenance information

## Explanation

The Interstage Single Sign-on Repository server received an error notification from the session management server.

## User Action

Refer to the session management server (%s1) system log, and check whether an abnormality occurred. If an abnormality occurred, take action according to the system log contents.

If there is still no improvement, immediately after the message is output, use the *iscollectinfo* command to collect investigation information, then contact your service engineer.

## 21.2.42 sso01112

---

**SSO: INFO: sso01112: SSO Session management server was restarted.**

## Explanation

The Interstage Single Sign-on session management server has restarted.

## 21.2.43 sso01113

---

**SSO: WARNING: sso01113: SSO Session management server was already stopped.**

## Explanation

Interstage Single Sign-on session management server stop processing was started, but the session management server was already stopped. For this reason, stop processing is not performed.

## 21.2.44 sso01120

---

**SSO: ERROR: sso01120: Failed to start SSO Session management server.**

## Explanation

Failed to start the Interstage Single Sign-on session management server.

Check the message that is output immediately before this message and establish and fix the cause of the error.

## 21.2.45 sso01122

---

**SSO: ERROR: sso01122: No permission for accessing the lock control file.**

## Explanation

There is no authority to operate a file required to start the Interstage Single Sign-on session management server. The possible causes are as follows:

- The Interstage Single Sign-on Repository server environment is broken.
- The Interstage Single Sign-on Repository server was not installed correctly.

## User Action

Reinstall the Interstage Single Sign-on Repository server.

## 21.2.46 sso01123

---

**SSO: ERROR: sso01123: The lock control file was not found.**

## Explanation

A file required to start the Interstage Single Sign-on session management server does not exist. The possible causes are as follows:

- The Interstage Single Sign-on Repository server environment is broken.

- The Interstage Single Sign-on Repository server was not installed correctly.

#### User Action

Reinstall the Interstage Single Sign-on Repository server.

---

### 21.2.47 sso01124

---

**SSO: ERROR: sso01124: SSO Session management server is busy.**

#### Explanation

The Interstage Single Sign-on session management server cannot receive start requests.

#### User Action

To start the session management server, wait for a while and then start the Repository server.

---

### 21.2.48 sso01125

---

**SSO: ERROR: sso01125: Timeout occurred while starting SSO Session management server.**

#### Explanation

A timeout occurred while the Interstage Single Sign-on session management server was running.

#### User Action

Immediately after the message is output, use the iscollectinfo command to collect investigation information, then contact your service engineer.

---

### 21.2.49 sso01130

---

**SSO: ERROR: sso01130: Failed to stop SSO Session management server.**

#### Explanation

The attempt to stop the Interstage Single Sign-on session management server failed.

#### User Action

Check the message that is output immediately before this message and establish and fix the cause of the error.

---

### 21.2.50 sso01132

---

**SSO: ERROR: sso01132: No permission for accessing the lock control file.**

#### Explanation

There is no authority to operate a file required to stop the Interstage Single Sign-on session management server. The possible causes are as follows:

- The Interstage Single Sign-on Repository server environment is broken.
- The Interstage Single Sign-on Repository server was not installed correctly.

#### User Action

Reinstall the Interstage Single Sign-on Repository server.

---

### 21.2.51 sso01133

---

**SSO: ERROR: sso01133: The lock control file was not found.**

## Explanation

A file required to stop the Interstage Single Sign-on session management server does not exist. The possible causes are as follows:

- The Interstage Single Sign-on Repository server environment is broken.
- The Interstage Single Sign-on Repository server was not installed correctly.

## User Action

Reinstall the Interstage Single Sign-on Repository server.

## 21.2.52 sso01134

---

### **SSO: ERROR: sso01134: SSO Session management server is busy.**

## Explanation

The Interstage Single Sign-on session management server cannot receive stop requests. Wait for a while before stopping the session management server.

## User Action

If the session management server still does not stop, immediately after the message is output, use the *iscollectinfo* command to collect investigation information, then contact your service engineer.

## 21.2.53 sso01135

---

### **SSO: WARNING: sso01135: SSO Session management server is stopping.**

## Explanation

The Interstage Single Sign-on session management server is stopping. Wait for a while before stopping the session management server.

## User Action

If the session management server still does not stop, immediately after the message is output, use the *iscollectinfo* command to collect investigation information, then contact your service engineer.

## 21.2.54 sso01136

---

### **SSO: ERROR: sso01136: Timeout occurred while stopping SSO Session management server.**

## Explanation

A timeout occurred while the Interstage Single Sign-on session management server was stopping.

## User Action

Immediately after the message is output, use the *iscollectinfo* command to collect investigation information, then contact your service engineer.

## 21.2.55 sso01210

---

### **SSO: ERROR: sso01210: User ID is not set in the user information. DN=(%s1)**

## Variable Information

%s1 = User information identifier (DN)

## Explanation

When Active Directory is used as the destination to register user information, read "Active Directory" for "SSO repository".

The user ID was not set in the user information shown in the SSO repository identifier (DN) (%s1).

If session management is used, the user ID set in the SSO repository and shown in the user information must be unique.

## User Action

Set a unique user ID in the user information shown in the SSO repository identifier (DN) (%s1).

If the Interstage directory service is used in the user information registration destination, use the entry administration tool or any such tool, to check the registration contents of the SSO repository. For details, see 'Entry Management' in the Directory Service Operator's Guide.

For details about user information entry attributes, refer to "Environment Setup" (SSO Administrators) - "Repository server Setup" - "Registering User Information and Role Configuration in the SSO repository" - "User Information Entry" in the Single Sign-on Operator's Guide.

For details on how to confirm Active Directory, refer to the Active Directory Manual.

## 21.2.56 sso01211

---

### SSO: ERROR: sso01211: More than one user ID is set in the user information. DN=(%s1)

#### Variable Information

%s1 = User information identifier (DN)

#### Explanation

When Active Directory is used as the destination to register user information, read "Active Directory" for "SSO repository".

More than one user ID was set in the user information shown in the SSO repository identifier (DN) (%s1).

If session management is used, the user ID set in the SSO repository and shown in the user information must be unique.

#### User Action

Set a unique user ID in the user information shown in the SSO repository identifier (DN) (%s1).

If the Interstage directory service is used in the user information registration destination, use the entry administration tool or any such tool, to check the registration contents of the SSO repository. For details, see 'Entry Management' in the Directory Service Operator's Guide.

For details about user information entry attributes, refer to "User Information Entry" under "Registering User Information and Role Configuration in the SSO repository" in "Environment Setup" (SSO Administrators)" of the Single Sign-on Operator's Guide.

For details on how to confirm Active Directory, refer to the "Active Directory Manual."

## 21.2.57 sso01212

---

### SSO: ERROR: sso01212: The user ID in the user information is too long. DN=(%s1)

#### Variable Information

%s1 = User information identifier (DN)

#### Explanation

When Active Directory is used as the destination to register user information, read "Active Directory" for "SSO repository".

The length of the user ID set in the user information shown in the SSO repository identifier (DN) (%s1) exceeded the maximum length permitted.

If session management is used, the user ID must be from 1 to 256 characters.

#### User Action

Set 1 to 256 characters for the user ID in the user information shown in the SSO repository identifier (DN) (%s1).

If the Interstage directory service is used in the user information registration destination, use the entry administration tool or any such tool, to check the registration contents of the SSO repository. For details, see 'Entry Management' in the Directory Service Operator's Guide.

For details on user information entry attributes, refer to "User Information Entry" under "Registering User Information and Role Configuration in the SSO repository" in "Environment Setup" (SSO Administrators)" of the Single Sign-on Operator's Guide.

For details on how to confirm Active Directory, refer to the Active Directory Manual.

## 21.2.58 sso01213

---

**SSO: ERROR: sso01213: There is an inconsistency in the extended user information. DN=(%s1) Value=(%s2)**

### Variable Information

%s1 = The path configuration entry (DN) set in extended user information

%s2 = Attribute name that is not set up in the repository server environment settings

### Explanation

An attribute that has been defined in the SSO repository path configuration (%s1) has not been set in [Extended user information] of the Repository server environment settings, therefore the access control information could not be sent to the business server.

### User Action

Take one of the following actions:

- If the repository server was not restarted after changing the repository server environment settings, stop the repository server and then restart it.

- If the attribute name (%s2) which is not set in the repository server environment settings is set in the extended user information  
In the Interstage Management Console, click [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Repository server] > [Settings] > [Repository server detailed settings [Show]] and set [Extended user information] of [Information notified to the Business System].

- If the attribute name (%s2) which is not set in the repository server environment settings is not set in the extended user information  
In the Interstage Management Console, click the path configuration displayed in the path configuration entry (%s1) set in the extended user information from [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Repository server] > [Protection resource] > [Site Configuration] > [Protection path] > [List] tab. Click the [Update] button on the path configuration setting, and update the path configuration.

If the path configuration is updated, ask the business server administrator to update the access control information. (\*1)

- If the extended user information is not notified

Check whether the attribute name "ssoUserAttribute" has been set in the path configuration of the SSO repository. If it has, delete it. (\*2)

\*1 For details on updating access control information, see [System] > [Security] > [Single Sign-on] > [Business system] > [Business system Name] > [Update access control information] on the Interstage Management Console.

\*2 To check the registration contents of the SSO repository, use the entry administration tool or any similar tool. For details, see "Entry Management" in the Directory Service Operator's Guide.

## 21.3 sso02000 to sso02057

---

### 21.3.1 sso02000

---

**SSO: INFO: sso02000: SSO Authentication server started.**

### Explanation

The Interstage Single Sign-on Authentication server has started.

## 21.3.2 sso02001

---

### SSO: INFO: sso02001: SSO Authentication server stopped.

#### Explanation

The Interstage Single Sign-on Authentication server has stopped.

## 21.3.3 sso02002

---

### SSO: ERROR: sso02002: Failed to start SSO Authentication server.

#### Explanation

The Interstage Single Sign-on Authentication server failed to start because of the error shown in the message that is output immediately before this message.

#### User Action

Check the message that is output immediately before this message to establish and fix the cause of the error, briefly stop the authentication server, and then restart it.

## 21.3.4 sso02004

---

### SSO: ERROR: sso02004: Reading configuration file failed. Filename=(%s1)

#### Variable Information

%s1 = Absolute path of the authentication server configuration file

#### Explanation

An error occurred during reading of the configuration file of the Interstage Single Sign-on Authentication server. The data in the authentication server configuration file (%s1) may be incorrect.

#### User Action

Rebuild the authentication server using the following procedure:

1. From the Interstage Management Console, select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [List] tab to delete the authentication server once.
2. Build the authentication server using the [Authentication infrastructure Settings] tab.

## 21.3.5 sso02005

---

### SSO: ERROR: sso02005: Can not access configuration file. Filename=(%s1)

#### Variable Information

%s1 = Absolute path of the authentication server configuration file

#### Explanation

The configuration file (%s1) of the Interstage Single Sign-on Authentication server failed to be accessed. The possible causes are as follows:

- Upgrade of the authentication server from a previous version might have been unsuccessful.
- The authentication server configuration file (%s1) does not exist.
- Access permission required for the authentication server configuration file (%s1) is not set.
- The authentication server configuration file (%s1) may be in use with another application.

## User Action

Take one of the following actions:

- If the authentication server was upgraded from a previous version, check that the upgrade procedure was correct.
- Confirm whether the authentication server configuration file (%s1) exists. If it does not, rebuild the authentication server using the procedure below. When it does, take the next action:
  1. From the Interstage Management Console, select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [List] tab to delete the authentication server once.
  2. Build the authentication server using the [Authentication infrastructure Settings] tab.
- Confirm access permission of the authentication server configuration file (%s1). If access permission is incorrect, set a correct one. (\*1)
- Confirm whether the authentication server configuration file (%s1) is in use with another application. If it is, close another application.

\*1 For details on setting access permission, see 'Operation and Maintenance' - 'Changing Effective User for Web Server' in the Single Sign-on Operator's Guide.

## 21.3.6 sso02007

---

**SSO: ERROR: sso02007: Error is in setting of configuration file. Filename=(%s1) Item=(%s2) Value=(%s3)**

### Variable Information

%s1 = Absolute path of the authentication server configuration file

%s2 = Configuration item name

%s3 = Setting value

### Explanation

The value specified for %s3 of configuration item %s2 in the Interstage Single Sign-on Authentication server configuration file (%s1) is invalid.

### User Action

If 'protection-resource-url' was shown in the Configuration item name (%s2), refer to Settings for Protection Resource in Appendix E, "Settings for Protection Resource in Authentication Server" of the Single Sign-on Operator's Guide to confirm the setting is correct.

In cases other than the above, take one of the following actions:

- If the management console corresponding to the configuration item (%s2) is set, correct the error with the Interstage Management Console.
- If the configuration item (%s2) indicates 'update-repository', confirm whether the host name and port number (\*1) for the repository server are correct.

When there is no problem in the host name and port number of the repository server, confirm the network environment. If a problem occurs in them, rebuild the repository server and authentication server using the following procedure:

- From the Interstage Management Console, select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [List] tab to delete the repository server once.
- Build the repository server with the [Authentication infrastructure Settings] tab.
- From the Interstage Management Console, select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [List] tab to delete the authentication server once.
- Build the authentication server with the [Authentication infrastructure Settings] tab.
- If the configuration item (%s2) indicates 'reference-repository', confirm whether the host name and port number (\*2) of the repository server (reference system) are correct.

When you have checked that there is no problem with them, confirm the network environment.

- If the management console corresponding to the configuration item (%s2) is not set, rebuild the authentication server using the following procedure:

- From the Interstage Management Console, select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [List] tab to delete the authentication server once.
- Build the authentication server with the [Authentication infrastructure Settings] tab.

\*1 From the Interstage Management Console, select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Authentication server] > [Detailed Settings [Show]] of the [Settings] tab to reference [Repository server (update system) URL] of [Communication settings with Repository server].

\*2 From the Interstage Management Console, select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Authentication server] > [Detailed Settings [Show]] of the [Settings] tab to confirm [Repository server (reference system) URL] of [Communication settings with Repository server (reference system)].

## 21.3.7 sso02008

---

**SSO: ERROR: sso02008: Setting of configuration file is omitted. Filename=(%s1) Item=(%s2)**

### Variable Information

%s1 = Absolute path of the authentication server configuration file

%s2 = Configuration item name

### Explanation

No value is set in the configuration item (%s2) of the configuration file (%s1) of the Interstage Single Sign-on Authentication server.

### User Action

Be sure to set a value in the configuration item (%s2) of the configuration file (%s1) of the authentication server.

If 'protection-resource-url' was shown in Configuration item (%s2), refer to Settings for Protection Resource in Appendix E, "Settings for Protection Resource in Authentication Server" of the Single Sign-on Operator's Guide, and set this parameter correctly.

In cases other than the above:

- Rebuild the authentication server using the following procedure:
  1. From the Interstage Management Console, select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [List] tab to delete the authentication server once.
  2. Build the authentication server with the [Authentication infrastructure Setting] tab.

## 21.3.8 sso02009

---

**SSO: ERROR: sso02009: Reading service ID file failed. Filename=(%s1) Reason=(%s2) Code=(%s3)**

### Variable Information

%s1 = Absolute path of the service ID file

%s2 = Cause of the error

%s3 = Maintenance information

### Explanation

The service ID file (%s1) of the Interstage Single Sign-on Authentication server failed to be read. (\*1)

The possible causes are as follows:

Table 21.25 Possible causes

Cause of error (%s2)	Cause
File not found	The authentication server service ID file (%s1) does not exist.

Cause of error (%s2)	Cause
Permission denied	Access permission required for the authentication server service ID file (%s1) is not set.
	The authentication server service ID file (%s1) may be in use with another application.
Invalid data	The service ID file of a different server was specified for the authentication server service ID file (%s1).
	The authentication server service ID file (%s1) may be destroyed.
System error	An abnormality occurred in the system function.
	An internal abnormality occurred while the Interstage Single Sign-on Authentication server was running.

### User Action

Take the following action:

Table 21.26 User Actions

Cause of error (%s2)	Action
File not found	Rebuild the authentication server using the following procedure: 1. In the Interstage Management Console, click [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [List] and delete the authentication server. 2. Click [Authentication infrastructure Settings] and set up the authentication server.
Permission denied	Confirm access permission of the authentication server service ID file (%s1). If access permission is incorrect, set a correct one. (*2)
	Confirm whether the authentication server service ID file (%s1) is not in use with another application. If it is, close another application.
Invalid data	Rebuild the authentication server using the following procedure: 1. In the Interstage Management Console, click [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [List] and delete the authentication server. 2. Click [Authentication infrastructure Settings] and set up the authentication server.
System error	Immediately after the message is output, use the iscollectinfo command to collect investigation information, then contact your service engineer.

\*1 For details on the service ID file, see 'Environment Setup (SSO Administrators)' - 'Registering a Business System' - 'Preparations for Setting up a Business System' in the Single Sign-on Operator's Guide.

\*2 For details on setting access permission, see 'Operation and Maintenance' - 'Changing Effective User for Web Server' in the Single Sign-on Operator's Guide.

## 21.3.9 sso02011

**SSO: ERROR: sso02011: Access to SSO Authentication server resources failed. Resource=(%s1)**

### Variable Information

%s1 = Absolute path of the message file

## Explanation

The message file (messages displayed on a Web browser) which is the resource required to start the Interstage Single Sign-on Authentication server failed to be accessed. The possible causes are as follows:

- The message file (%s1) does not exist.
- Access permission required for the message file (%s1) is not set.

## User Action

Take either of the following actions:

- Confirm whether the message file (%s1) exists. If it does not, restore the message file (%s1) from the original file. (\*1)
- Confirm access permission of the message file (%s1). If it is incorrect, set a correct one. (\*2)

\*1 For details on the message file and original file, refer to 'Customizing Messages Displayed on a Web Browser' - 'Messages that can be Customized' in the chapter 'Single Sign-on Customization' of the Single Sign-on Operator's Guide.

\*2 For details on setting access permission, see 'Single Sign-on Customization' - 'Customizing Messages Displayed on a Web Browser' - 'Setting Access Authority for a Message File' in the Single Sign-on Operator's Guide.

## 21.3.10 sso02012

### SSO: ERROR: sso02012: Invalid request was received. IPAddr=(%s1) Detail=(%s2) Code=(%s3)

#### Variable Information

%s1 = IP address or host name of the requesting source.

%s2 = Maintenance information

%s3 = Maintenance information

## Explanation

The Interstage Single Sign-on Authentication server has received an invalid request. The possible causes are as follows:

- Possible causes are as follows, depending on the maintenance information (%s2).

Table 21.27 Maintenance Information (%s2) and Possible Causes

String contained in the maintenance information (%s2)	Cause
fj-is-sso-request	The Sign-off URL, or the URL for checking the time of the previous Sign-on is incorrect.
Session management is not available.	A Sign-off or notification of the time of the previous Sign-on request was received in an environment in which session management is not used.
Http is not accepted.	A request from a business server using HTTP was denied.
COOKIE:fj-is-sso-skip-pre-signon:not available.	Mismatch occurred between the authentication server and Integrated Windows Authentication application environment settings.
Session invalid.	<ul style="list-style-type: none"><li>- Load balancer settings may be incorrect if load distribution is being performed.</li><li>- An inconsistency occurred, probably because the process took an extremely long time due to excess load on the network.</li><li>- The repository server may have restarted while the authentication process was running.</li><li>- The user may have reloaded the Web browser and resent form data.</li><li>- Multiple authentication requests may have been submitted from a single client simultaneously, because the client accesses multiple protection</li></ul>

String contained in the maintenance information (%s2)	Cause
	<p>resources simultaneously, such as from multiple frames on a Web browser.</p> <p>- It is possible there was an external security breach.</p>

- The Forced Sign-on confirmation window or Sign-off confirmation window form tag settings are incorrect. (\*1)
- The user's browser is set so that cookies are not accepted.
- The user may have reloaded the Web browser and resent the information (i.e. form data) to the authentication server before.
- When the authentication server returned status code 500 to the user's Web browser, the user may have refreshed the Web browser without closing.
- After the Interstage Single Sign-on Authentication server settings are changed, there is a possibility that the operation was performed in a Web browser running before the changes were made.
- For the authentication server environment settings, the user might have selected the 'Basic authentication' dialog in the [Input User ID/Password] of [Password Authentication Settings] and performed either of the following operations:
  - Accessed the URL for the form authentication page.
  - Executed authentication on the form authentication page.
- The contents of the form authentication page are incorrect.
- The user may have specified the incorrect URL for the form authentication page. (\*2)
- If messages displayed in the Web browser are customized, it is possible that authentication was performed on a message containing an authentication form tag. Immediately after installation it does not expect to find an authentication form tag since the messages have not yet been customized.
- If session management is used and a Web application page on the business system uses frames, there is a possibility that the Sign-off link settings are incorrect.
- There is a possibility that the <!-SSO\_POST\_REQUEST\_AUTH\_TARGET--> part in the following message files for the business server's Unauthenticated page has been changed.
  - 200postauth\_en.template or 403postauth\_en.template
- There is a problem in the Interstage Single Sign-on Business server environment.
- External attack may be taking place.

## User Action

Take the following action:

- If the system log is output immediately before this message, check the output message and establish and fix the cause of the error.
- Check the maintenance information (%s2) and take the following action:

Table 21.28 User Actions

String contained in the maintenance information (%s2)	Action
fj-is-sso-request	Check that the Sign-off URL, or the URL for checking the time of the previous Sign-on is correct. (*3) (*4)
Session management is not available.	Do not use Sign-off or notification for the time of the previous Sign-on requests. To use Sign-off and notification for the time of the previous Sign-on, change the settings so that session management is used. (*5)
Http is not accepted.	Instruct the administrator of the business server displayed in the request source IP address or host name (%s1) to run the business server using https.

String contained in the maintenance information (%s2)	Action
	<p>If the business server is running using https, the business server public URL may be incorrect. Confirm with the business server administrator that [Public URL] of [Business system Information] is https. (*6)</p> <p>If a business server that is using http is changed to run using https, or [Public URL] of [Business system Information] is incorrect, briefly delete the business server and then set it up again.</p> <p>To run the business server using http, in the authentication server environment settings change [Enable HTTP communication in Business system?] of [Communication Settings with Business system] to "Yes", stop the authentication server and then restart it. (*7)</p> <p>For details on security threats and measures, refer to the Security System Guide.</p>
COOKIE:fj-is-sso-skip-pre-signon:not available.	<p>In Interstage management console, set again [System] &gt; [Security] &gt; [Single Sign-on] &gt; [Authentication infrastructure] &gt; [Authentication server] &gt; [Detailed Settings [Show]] &gt; [Integrated Windows Authentication Setting] &gt; [Operation after authentication cancellation], and restart the authentication server and Integrated Windows Authentication application. (*7) (*8)</p>
Session invalid.	<ul style="list-style-type: none"> <li>- Check that the settings of the load balancer are correct if load distribution is being performed. (*9)</li> <li>- Instruct the user to end the Web browser, restart it and then access it again.</li> <li>- Check if the user has performed an operation resulting in authentication requests being submitted simultaneously.</li> <li>- Investigate the possibility of an external security breach based on the request source IP address or the host name (%s1).</li> </ul>

- Check that the Forced Sign-on confirmation window or Sign-off confirmation window form tag settings are correct. (\*1)

In all other cases, take action according to the following procedure:

1. Check if the user's Web browser is set so that cookies are not accepted.
2. If the user's Web browser accepts cookies, check if the user performed the operation under the following conditions. If the user performed the following operation, ask the user to stop and restart the Web browser and reaccess the page:
  - The case where data (form data) previously sent to the authentication server is sent again because the Web browser is reloaded.
  - The Web server reread was performed without closing the Web browser when status code 500 was notified from the Web browser.
  - After the Interstage Single Sign-on Authentication server settings are changed, the operation was performed in a Web browser that was running before the changes were made.
3. When performing authentication using the form authentication page (although the conditions are not met in 2), click [System] > [Security] > [Single Sign-on] > [Authentication server] > [Settings] tab from the Interstage Management Console. Then on the [Settings] tab, click [Detailed Settings [Show]] and select 'Form authentication page' from [Input User ID/Password] of [Password Authentication Settings]. If the user uses the Web browser Basic authentication dialog for authentication, they should access this dialog using the business system public URL. However, If the user uses the form authentication page for authentication, they should exit the Web browser and restart it, and then reattempt access using the business system public URL.
4. If 'Form authentication page' is selected in authentication server environment setup in 3, check if the contents of the form authentication page are correct. (\*10)
5. If the contents of the form authentication page are correct, check that the URL that the user has specified for the form authentication page is correct. (\*2)

6. If messages displayed in the Web browser are customized, check if authentication was performed with a message containing an authentication form tag. (\*11)
7. If session management is used and a Web application page on the business system uses frames, check whether there is a possibility that the Sign-off link settings are incorrect. (\*12)
8. Ask the business server administrator to check whether the <!--SSO\_POST\_REQUEST\_AUTH\_TARGET--> part in the following message files of the Unauthenticated page has been changed. If it has, ask the business server administrator to correct it. (\*13)
  - 200postauth\_en.template or 403postauth\_en.template
9. In all other cases, an external attack may be taking place. Examine the possibility of attack based on the IP address or host name of the requesting source.

\*1 For details about the Forced Sign-on confirmation window form tag, refer to "Single Sign-on Customization" - "Customizing Messages Displayed on a Web Browser" - "Forced Sign-on Confirmation Window Form Tag Specifications" in the Single Sign-on Operator's Guide. For details about the Sign-off confirmation window form tag, refer to "Single Sign-on Customization" - "Customizing Messages Displayed on a Web Browser" - "Sign-off Confirmation Window Form Tag Specifications" in the Single Sign-on Operator's Guide.

\*2 Refer to 'Password and Certificate Authentication' in the 'Overview' chapter of the Single Sign-on Operator's Guide for details of the URL for the form authentication page.

\*3 For details about the Sign-off URL, refer to "Customizing Web Pages for Sign-off" in the chapter "Single Sign-on Customization" of the Single Sign-on Operator's Guide.

\*4 For details about the URL for checking the time of the previous Sign-on, refer to "Checking the Time of the Previous Sign-on" in the chapter "Operation and Maintenance" of the Single Sign-on Operator's Guide.

\*5 For details about switching to a system that uses session management, refer to 'Switching to an Application to Perform Session Management' in the Appendix 'Notes on Previous Versions' of the Single Sign-on Operator's Guide.

\*6 To check whether the business system is running using https, in the Interstage Management Console click [System] > [Security] > [Single Sign-on] > [Business system] > [Business system Name] > [Settings] > [Detailed Settings [Show]]. This displays the setting: [Business system Information] > [Public URL].

\*7 For details about stopping and starting the authentication server, refer to 'Stopping an Authentication Server' and 'Starting an Authentication Server' in the 'Operation and Maintenance' chapter of the Single Sign-on Operator's Guide.

\*8 For details about how to stop an Integrated Windows Authentication application, refer to "Operation and Maintenance" - "Stopping Single Sign-on" - "Stopping an Authentication Server" in the "Single Sign-on Operator's Guide.". For details about how to start an Integrated Windows Authentication application, refer to "Operation and Maintenance" - "Starting Single Sign-on" - "Starting an Authentication Server" in the "Single Sign-on Operator's Guide."

\*9 For details about how to set the load balancer, refer to "Load balancer settings" in the "Single Sign-on Operator's Guide."

\*10 For more information on how to customize the form authentication page, refer to 'Customizing Messages Displayed on a Web Browser' under 'Single Sign-on Customization' in the Single Sign-on Operator's Guide.

\*11 For details about customizing messages displayed in the Web browser, refer to "Single Sign-on Customization" - "Customizing Messages Displayed on a Web Browser" - "Customizing a Message" in the Single Sign-on Operator's Guide.

\*12 For details about the Sign-off link settings method, refer to "Single Sign-on Customization" - "Customizing Web Pages for Sign-off" - "Customizing Web Pages" in the Single Sign-on Operator's Guide.

\*13 For details about customizing message files for the Unauthenticated page, refer to "Single Sign-on Customization" - "Customizing Messages Displayed on a Web Browser" - "Unauthenticated Window Tag Specifications" in the Single Sign-on Operator's Guide.

## 21.3.11 sso02013

---

**SSO: ERROR: sso02013: Communication with SSO Repository server failed. Host=(%s1)**

Variable Information

%s1 = IP address or host name of the repository server

## Explanation

The Interstage Single Sign-on Authentication server failed to communicate with the repository server. The possible causes are as follows:

- There is a problem in the Interstage Single Sign-on Repository server environment. So, no connection can be established.
- There is a problem in setting the repository server environment for the Interstage Single Sign-on Authentication server. So, no connection can be established.
- The memory space required for the Interstage Single Sign-on Authentication server is insufficient.

**Solaris32/64 Linux32/64**

If two or more repository servers (reference system) are installed, this message may be output to the same server two or more times.

## User Action

Take the following action:

<<Repository server environment>>

- Confirm whether the power to the repository server (%s1) is on. If it is not, turn it on.
- To confirm whether the repository server (%s1) is active, select [System] > [Services] > [Web Service] > [Web Server: Status] screen on the Interstage Management Console. If the repository server is not active, start it. (\*1)
- Suppose that operation is in progress with the repository servers divided into the update system and reference system. If the repository server (update system) stops due to a trouble, user authentication fails even if the repository server (update system) is operable. If this happens, confirm whether the system log is not output to the repository server (update system). If the system log is output, take action according to the related message. If it is not output, confirm whether the repository server (update system) is active, by selecting [System] > [Services] > [Web Service] > [Web Server: Status] screen on the Interstage Management Console.

For details on repository server availability, see 'Overview' - 'High-Performance and High-Reliability System' - 'Increase of System Availability' in the Single Sign-on Operator's Guide.

- The repository server may be in operation with SSL. Build the repository server with non-SSL.
- Confirm whether the repository server host name (\*2) is correct.

If there is a problem in the repository server host name, rebuild the repository server and authentication server using the following procedure:

- From the Interstage Management Console, select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [List] tab to delete the repository server once.
- Build the repository server with the [Authentication infrastructure Setting] tab.
- From the Interstage Management Console, select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [List] tab to delete the authentication server once.
- Build the authentication server with the [Authentication infrastructure Setting] tab.
- When no problem occurs in repository server, confirm the network environment.

\*1 For details on starting the repository server, see 'Operation and Maintenance' - 'Starting Single Sign-on' - 'Starting a Repository Server' in the Single Sign-on Operator's Guide.

\*2 From the Interstage Management Console, select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Repository server] > [Repository server detailed settings [Show]] of the [Settings] tab, then, reference [Repository server (update system) URL] of [Authentication Infrastructure Information Settings].

<<Setting the Repository Server Environment for the Authentication Server>>

- If no problem occurs in the repository server, use the following procedure to confirm whether the setting values of [Repository server (update system) URL] or [Repository server (reference system) URL] in the authentication server are correct.
  1. From the Interstage Management Console, select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Authentication server] > [Detailed Settings [Show]] of the [Settings] tab.

2. Confirm the values from [Communication Settings with Repository server] or [Setting Communication with the Repository Server (reference system)].

- When the repository server (update system) URL and the setting values of [Repository server (reference system) URL] of the repository server are correct, set a large value for [Timeout] of [Communication Settings with Repository server] in the above procedure.

If a timeout occurs frequently, it is necessary to increase the maximum number of concurrent accesses and the client send/receive timeout value of the Interstage HTTP Server used with the repository server. If a connection retention time value is too large, a timeout may occur. If this happens, decrease the connection retention time value. For details, see ' Web Server (Interstage HTTP Server) Environment Definition' in the Tuning Guide.

<<Authentication Server Operation Environment>>

- If the memory space is insufficient, close the unnecessary programs. Alternatively, confirm whether the memory space enough for Interstage Single Sign-on operation is allocated. For details on the required memory space, refer to "Memory Requirements" in the "Resource Requirements" chapter of the Tuning Guide.
- The process resource of the Interstage HTTP Server may be insufficient. If so, it is necessary to decrease the setting value of the maximum number of concurrent accesses of the Interstage HTTP Server. For details, see ' Web Server (Interstage HTTP Server) Environment Definition' in the Tuning Guide.

## 21.3.12 sso02014

### SSO: ERROR: sso02014: Error occurred in SSO Repository server. Host=(%s1)

#### Variable Information

%s1 = IP address or host name of the repository server

#### Explanation

The Interstage Single Sign-on Authentication server has received an error from the repository server. The possible causes are as follows:

- There is a problem in the Interstage Single Sign-on Repository server environment. So, no connection can be established.
- There is a problem in setting the repository server environment for the Interstage Single Sign-on Authentication server. So, no connection can be established.

**Solaris32/64 Linux32/64**

If two or more repository servers (reference system) are installed, this message may be output to the same server two or more times.

#### User Action

Take the following action:

<<Repository Server Environment>>

- Reference the system log of the repository server (%s1) to confirm whether an error is occurring. If the error is occurring, take an appropriate action according to the system log data.
- Suppose that operation is in progress with the repository servers divided into the update system and reference system. If an error occurs in the repository server (update system), user authentication fails even if the repository server (reference system) is operable.

If this happens, the system log is output to the repository server (update system). Reference the related message to take action.

For details on repository server availability, see 'Overview' - 'High-Performance and High-Reliability System' - 'Increase of System Availability' in the Single Sign-on Operator's Guide.

- Confirm whether the repository server host name (\*1) is correct.

If a problem occurs in the repository server host name, rebuild the repository server and authentication server using the following procedure:

- From the Interstage Management Console, select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [List] tab to delete the repository server once.
- Build the repository server with the [Authentication infrastructure Settings] tab.

- From the Interstage Management Console, select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [List] tab to delete the authentication server once.
- Build the authentication server with the [Authentication infrastructure Settings] tab.

\*1 From the Interstage Management Console, select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Repository server] > [Repository server detailed settings [Show]] of the [Settings] tab, then, reference [Repository server (update system) URL] of [Authentication Infrastructure Information Settings].

<<Setting the Repository Server Environment for the Authentication Server>>

- If no problem occurs in the repository server, use the following procedure to confirm that the settings for [Repository server (update system) URL] and [Repository server (reference system) URL] in the authentication server are correct:
  - From the Interstage Management Console, select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Authentication server] > [Detailed Settings [Show]] of the [Settings] tab.
  - Confirm the values from [Communication Settings with Repository server] or [Communication Settings with Repository server (reference system)].
- When no problem occurs in both the repository server and authentication server, confirm the network environment.

## 21.3.13 sso02015

---

### SSO: ERROR: sso02015: Negotiation with SSO Repository server failed. Host=(%s1)

#### Variable Information

%s1 = IP address or host name of the repository server

#### Explanation

The Interstage Single Sign-on Authentication server failed to communicate with the repository server. The possible causes are as follows:

- There is a problem in the value set for [Repository server (update system) URL] or [Repository server (reference system) URL] in the Interstage Single Sign-on Authentication server.
- There is a possibility that an abnormality occurred in the repository server.
- Communication is in progress with the repository server having a different authentication infrastructure, or the authentication server environment is destroyed.

#### User Action

Take the following action:

- Using the following procedure, confirm that the settings for [Repository server (update system) URL] and [Repository server (reference system) URL] in authentication server are correct:
  1. From the Interstage Management Console, select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Authentication server] > [Detailed Settings [Show]] of the [Settings] tab.
  2. Confirm the values from [Communication Settings with Repository server] and [Communication Setting with Repository server (reference system)].
- If the system log was output in the repository server (%s1), take action according to the system log contents.
- If the system log was not output in the repository server (%s1), in Interstage Management Console of the repository server (%s1), click [Update] on [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [Repository server] > [Settings] tab.
- If the above measures do not resolve the problem, use the following procedure to rebuild the authentication server:
  1. From the Interstage Management Console, select [System] > [Security] > [Single Sign-on] > [Authentication infrastructure] > [List] tab to delete the authentication server once.
  2. Build the authentication server with the [Authentication infrastructure Settings] tab.

## 21.3.14 sso02017

---

### SSO: ERROR: sso02017: Internal error. Code=(%s1)

#### Variable Information

%s1 = Maintenance information

#### Explanation

An internal error occurred in the Interstage Single Sign-on Authentication server.

#### User Action

Check the Interstage Single Sign-on restrictions and take action. (\*1)

If there are no restrictions, immediately after the message is output, use the *iscollectinfo* command to collect investigation information, then contact your service engineer.

1\* For details about Interstage Single Sign-on restrictions, refer to "Restrictions" in "Product Notes".

## 21.3.15 sso02018

---

### SSO: ERROR: sso02018: Allocation of memory failed. Size=(%s1) Code=(%s2)

#### Variable Information

%s1 = Amount of memory for which allocation was attempted.

%s2 = Maintenance information

#### Explanation

The memory space required for the Interstage Single Sign-on Authentication server failed to be allocated.

#### User Action

Close all unnecessary programs. Alternatively, confirm whether enough memory space for Interstage Single Sign-on operation is allocated.

For details on the required memory space, refer to "Memory Requirements" in the "Resource Requirements" chapter of the Tuning Guide.

## 21.3.16 sso02019

---

### SSO: ERROR: sso02019: The length of URL is too long. url=(%d1) credential=(%d2)

#### Variable Information

%d1 = URL length

%d2 = Length of authentication information

#### Explanation

The length of URL with which the Interstage Single Sign-on Authentication server accesses the business server exceeded the upper limit. The URL for accessing the business server depends on the size of the business server URL or of authentication information. The business server URL or authentication information may be too large.

#### User Action

Confirm the business server URL length and authentication information. (\*1)

\*1 For details on the URL length, see 'Developing Applications' - 'Setting User Information Report with Environment Variables' in the Single Sign-on Operator's Guide.

## 21.3.17 sso02020

---

**SSO: ERROR: sso02020: Invalid environment of validity check of certificate. EnvDir=(%s1) Detail=(%s2)**

### Variable Information

%s1 = Operation management directory name

%s2 = Maintenance information

### Explanation

An error occurs in the environment in which the Interstage Single Sign-on Authentication server checks validity of a certificate.

- The upgrade the authentication server from a previous version might have been unsuccessful.
- The Interstage certificate environment may have been deleted.
- The Interstage certificate environment is broken.

### User Action

If the authentication server was upgraded from a previous version, check that the upgrade procedure was correct.

In all other cases, set up the Interstage certificate environment again.

For details on building the Interstage certificate environment, see 'Setting and Use of the Interstage Certificate Environment' - 'Configuring Environments' in the Security System Guide.

## 21.3.18 sso02021

---

**SSO: WARNING: sso02021: Revoked certificate. SerialNumber=(%x1) Issuer=(%s1) Subject=(%s2)**

### Variable Information

%x1 = Serial number of the certificate

%s1 = Information on the certificate issuer

%s2 = Information on the certificate owner

### Explanation

The user certificate, or if session management is being used the business server certificate, was already revoked. The possible reasons for revocation are as follows:

- The private-key for the certificate was put in danger. (Private-key information was leaked to the third person.)
- The private-key for the CA certificate was put in danger. (Private-key information was leaked to the third person.)
- Use of the certificate temporarily stopped.

### User Action

Based on the serial number (%x1), issuer information (%s1), and owner information (%s2) of the certificate, the SSO administrator specifies the user who retains the revoked certificate and if necessary, asks the user to reacquire the certificate.

## 21.3.19 sso02022

---

**SSO: ERROR: sso02022: Validity check of a certificate was not performed. SerialNumber=(%x1) Issuer=(%s1) Subject=(%s2)**

### Variable Information

%x1 = Serial number of the certificate

%s1 = Information on the certificate issuer

%s2 = Information on the certificate owner

## Explanation

The Interstage Single Sign-on Authentication server did not check the validity of the certificate. The possible causes are as follows:

- CRL is not registered in the Interstage certificate environment. Alternatively, registered CRL is incorrect.
- The validity period of CRL registered in the Interstage certificate environment is expired.

## User Action

Take the following action:

- If CRL is not registered in the Interstage certificate environment, obtain CRL, then register it in the Interstage certificate environment. (\*1)
- If the validity period of CRL registered in the Interstage certificate environment is expired, obtain the latest CRL, and then register it in the Interstage certificate environment. (\*1)

\*1 For details on registering CRL, see 'Environment Setup (SSO Administrators)' - 'Setup of Authentication Server' - 'SSL Communication Environment Setup' - 'Preparations for Confirming Validity of Certificate Authentication' in the Single Sign-on Operator's Guide.

## 21.3.20 sso02023

---

**SSO: WARNING: sso02023: User certificate was expired. SerialNumber=(%x1) Issuer=(%s1) Subject=(%s2)**

### Variable Information

%x1 = Serial number of the certificate

%s1 = Information on the certificate issuer

%s2 = Information on the certificate owner

### Explanation

The user certificate has expired.

### User Action

The SSO administrator based on the certificate serial number (%x1), certificate issuer information (%s1), and certificate owner information (%s2) identifies the user that has the expired certificate, and asks the user to reobtain the certificate if necessary.

## 21.3.21 sso02030

---

**SSO: ERROR: sso02030: Invalid environment.**

### Explanation

The environment variables or registries required to start the Interstage Single Sign-on Authentication server failed to be read.

The Interstage Single Sign-on Authentication server may not be correctly installed or the environment may be destroyed.

### User Action

If data containing environment variables or registries is saved, restore it.

If there is no saved data or if this message is reported after the saved data is restored, reinstall the Interstage Single Sign-on Authentication server.

## 21.3.22 sso02031

---

**SSO: ERROR: sso02031: Network resources are insufficient.**

## Explanation

The network resource required for the Interstage Single Sign-on Authentication server is insufficient, or the network is not correctly set.

Alternatively, an error is occurring in the network environment.

## User Action

Confirm whether the network of the Interstage Single Sign-on Authentication server is communicable.

When the network is correctly set, close the unnecessary programs.

Moreover, confirm whether no error is occurring in the network environment. If the network environment error exists, set the network again.

## 21.3.23 sso02033

---

**SSO: ERROR: sso02033: Invalid system time. Name=(%s1) Detail=(%s2)**

### Variable Information

%s1 =Identification name of the request source

%s2 =Detailed information

## Explanation

An Interstage Single Sign-on Authentication server process failed because the system time of the authentication server does not match that set in the request source.

## User Action

Take the following action:

Table 21.29 User Actions

Char string included in detailed information(%s2)	Action
Request from business server.	Set the correct system time in the authentication server and the repository server (*1). Or, request to the administrator of the business server using the IP address or the host name displayed in the identification name of the request source (%s1) to set the correct system time (*1).
Other than the above	There is a possibility of an external attack. Investigate the possibility of an attack based on the identification name of the request source (%s1).

If the message is output when the system time for each server is the same, check the time zone for each server.

\*1 When setting the system time for each server, take care with the time zone settings.

## 21.3.24 sso02036

---

**SSO: ERROR: sso02036: Initialization of maintenance log failed.**

### Explanation

**Windows32/64**

The maintenance log of the Interstage Single Sign-on Authentication server failed to be initialized. The memory space required for the Interstage Single Sign-on Authentication server may be insufficient.

**Solaris32/64 Linux32/64**

The maintenance log of the Interstage Single Sign-on Authentication server failed to be initialized. The memory space required for the Interstage Single Sign-on Authentication server may be insufficient. Alternatively, there may be an error in the shared memory/exclusion control resource (semaphore) settings.

## User Action

### Windows32/64

Close all unnecessary programs. Alternatively, confirm whether enough memory space is allocated for Interstage Single Sign-on Authentication server.

For details on the required memory space, refer to "Memory Requirements" in the "Resource Requirements" chapter of the Tuning Guide.

### Solaris32/64 Linux32/64

Close all unnecessary programs. Alternatively, confirm that enough memory space is allocated for the Interstage Single Sign-on Authentication server, and that the size of the shared memory or of the exclusion control resource (semaphore) is correctly set.

For details on the required memory space, refer to "Memory Requirements" in the "Resource Requirements" chapter of the Tuning Guide. For details on the sizes of the shared memory and exclusion control resource(semaphore), refer to the "System Tuning" chapter in the Tuning Guide.

If the problem is still not resolved by taking the above action, there is a possibility that the IPC resources required for running Interstage Single Sign-on and the IPC resources being used by another application are the same. For this reason, the IPC resources must be customized. For details, refer to "Setting IPC resources" in the Tuning Guide.

## 21.3.25 sso02037

**SSO: WARNING: sso02037: The notice of message to a client failed. Filename=(%s1) Reason=(%s2)**

### Variable Information

%s1 = Absolute path of the message file for which message notification failed

%s2 = Cause of the error

### Explanation

A message notification from the server to the browser failed. The possible causes are as follows:

Table 21.30 Message Notification Errors

Cause of error (%s2)	Explanation
File not found	An attempt was made to display the message file (%s1), but it does not exist.
Permission denied	An attempt was made to display the message file (%s1), but access permission is not assigned.
Invalid data	An attempt was made to display the message file (%s1), but the format is different.

### User Action

Take the following action described in the following table:

Table 21.31 User Actions for Message Notification Errors

Cause of error (%s2)	Action
File not found	Confirm whether the message file (%s1) exists. If it does not, restore the message file (%s1) from the original file. (*1)
